Corporate Governance in the hospital is a new form of management, a determination of the Superintendence for all buildings that make up the complex Hospital of the Faculty of São Paulo; and all aspects of the processes, flows, communication, indicators, internal information have being modified to meet the new guidelines ruled in Corporate Governance. Some centers are already more advanced than others, with changes in the way of work, based on indicators seeking greater control and more accurate information; other nuclei have not yet started any modification.

In interviews with those involved directly with the corporate governance process in the hospital, one could identify that there are many difficulties to be faced and challenges to be overcome, an example is the organizational culture of employees that in many cases are resistant to change. Another point to be considered is that the hospital is a Public State institution so in some cases changes are time-consuming due to bureaucracy and conflicts of interest.

However corporate governance is being improved and managed by well-established teams in different sectors as is the case of the Specialized Center for Information Technology. Yes, there is still a long way to go in order that corporate governance may effectively and efficiently guide all activities of the hospital complex dynamics, but improvements are on its way and the learning process is active.

Abstract: The concentration of populations in megalopolises calls is actually given better living conditions, generally more present in cities than in rural areas due to the various political interests partisan or nonpartisan. Therefore, the Sustainable Cities Programme published in 2012, a letter of commitment to be intending for aimed at political parties, candidates and mayors in order assist policy makers to improve the quality of life of their populations. Concretely this document represents the commitment of municipal managers prioritize administrative practices that take into account the economic, social, environmental and cultural variables, according to the local context, from 12 thematic areas: governance, education for sustainability and quality of life, local management for sustainability, better mobility, less traffic, natural common goods, local dynamic, creative and sustainable economy, planning and urban design, local action for health, equity, social justice and culture of peace, responsible consumption and lifestyle choices, culture for sustainability and local to global. In a megalopolis such as São Paulo, one aspect of sustainability is the pursuit of urban mobility, but from sustainable practices. However, this often generates discrepancy between speech and practice with respect to local policies. Therefore this article aims to demonstrate the contradiction between discourse and practice on Sustainable Local Development in the São Paulo city. For this, it has been based on the proposals and planning Green Municipal and Environment, including the various departments linked to this public agency. In order to develop its activities related to sustainability in its various aspects, through Law No. 13,155, of 29/06/2001 was created the Special Fund of the Environment and Sustainable Development (FEMA) which together with Decree No. 52.3888 of 03/06/2011- so ten years later - want the protection of environmental areas in the city of São Paulo. In this regard, the own Municipal Secretariat for Green and Environment has a Department of Participation and Development Program of the Public Policy (DPP). However, municipal management, especially the Executive, often approves urban works or projects that clearly interfere negatively on the environment in the short-term and intermediate-term. This is before considering the very local people directly involved and affected by problems arising from the practical matter be enforced. To demonstrate this discrepancy between discourse and practice is employed exploratory and descriptive method for collecting and analyzing data, and the use of indicators that demonstrate the need to preserve the environment for the well-being and the population's quality of life. It uses qualitative and quantitative technique to explain the discrepancy between discourse and practice relating to the local public policies aimed at protecting and environmental preservation. One of these gauges or indicators is the Local Development Index (IDHS) and other indicators that can contribute and identify differences between discourse and practice present even in the state capital Target Plan.

Key words: Sustainable Cities; Public Policy; Local Development; Environment

1 Introduction

The São Paulo city even the scene of numerous activities, including at the international level to discuss the ways for Sustainable Development Local, not always consistent discourse and practice. An example in this regard is the construction of bike lanes in the city. This is visible in the construction of the 2.7km extension of the bike path from Paulista Avenue, recently opened next to the central reservation. Although necessary, the work caused numerous disorders for the population during its execution and the most serious withdrew old trees that region, which can lead a worsening in air quality already so harmful to health. This same problem occurs in other areas of the city where they are being deployed these bike paths.

Undoubtedly, urban mobility is part of the call quality of life and the use of alternative transportation one of the prerogatives for sustainability as stated in the Sustainable Cities Program, which published in 2012, a letter of commitment, aimed at political parties, candidates and mayors in order assist policy makers to improve the quality of life of their populations. Concretely this document

represents the commitment of municipal managers prioritize administrative practices that take into account the economic, social, environmental and cultural variables, according to the local context, from 12 thematic areas: governance, education for sustainability and quality of life, local management for sustainability, better mobility, less traffic, natural common goods, local dynamic, creative and sustainable economy, planning and urban design, local action for health, equity, social justice and culture of peace, responsible consumption and lifestyle choices, culture for sustainability and local to global.

In a megalopolis such as São Paulo, social mobility is one of the aspects that determine their quality of life; however, this also means improving the urban transport system especially for so-called peripheries, which are those whose service in this regard leaves much to be desired. Regarding this aspect the Master Plan of the City itself (PL 688/13) approved in 2014 by the House of councilors and already sanctioned by the current mayor causes some controversy since it determines the density in the structuring axes of transport without, however, any study to assess the environmental impact on pre-established regions.

This Plan in its Chapter V deals with the Policy and Mobility system given in Article 226, the mobility system components which are: I - road system; II - pedestrian circulation system; III - public mass transit system; IV - private public transportation system. In addition, this same article defines this same article called Cicloviação system.

Among the objectives to be achieved are: I - improving people's mobility conditions, with comfort, safety and affordability, including disabled groups; II - homogenization of the conditions of macro accessibility between different regions of the city. It also includes a reduction in travel time and improving the system integration of different public transports.

Finally, the Master Plan as regards mobility answers the call Sustainable Development, but in practice, its implementation involves a joint action among the various agencies and municipal departments in order to avoid discrepancy between discourse and practice, as has happened so systematic in multiplies actions of the Executive own generating protests not only the population, but between themselves members of the government structure.

Based on what was exposed above, this article aims to demonstrate that discourse and practice on Sustainable Local Development contradict the city of São Paulo, creating discrepancies between the provisions of the Master Plan of the City (PL 688/13) and with the central focus of urban mobility as an aspect of Sustainable Local Development. Moreover as it was already mentioned at a UNHABITAT report in 2009: *Traditional approaches to urban planning (particularly in developing countries) have largely failed to promote equitable, efficient and sustainable human settlements and to address twenty-first century challenges, including rapid urbanization, shrinking cities and ageing, climate change and related disasters, urban sprawl and unplanned peri-urbanization, as well as urbanization of poverty and informality.*

2 Theoretical Framework

This is on the assumption that urban mobility is part of the requirements for quality of life and both are features present within the definition of sustainable development. In this sense, the definition that most fits is given in Burtland Report (1987) claiming to be sustainable development in itself, “that meets the needs of the present without compromising the ability of future generations to meet their own needs”. Therefore, a concept that implicitly commits solidarity with future generations.

The document sets out some principles for this development as preserving the overall balance and value of the natural capital stock; the redefinition of criteria and cost-benefit assessment instruments in the short, intermediate and long term, in order to reflect the socio-economic effects and the actual values of consumption and conservation; distribution and equitable use of resources between nations and regions globally and regionally. Therefore, remember what we said Sen, one of the theorists who guides this research work: “The development is the removal of deprivation of liberty that limit the choices and opportunities for people to exercise their agent deliberately condition” (SEN, 2010, p.10). For this author there are five species of freedoms, which he calls instrumental: political, economic availability, social opportunities, transparency guarantees and protective security. These freedoms “bind each other and contribute to the enhancement of human freedom in general [...] Freedoms are only the primary ends of development, but also the main means.” (Ibid, p.25).

Therefore, it can be said that there is no freedom, then there is no comprehensive development be it from the perspective of human being or society, which is supported in the following Sen’s statement.

Social opportunities (in the form of education and health) facilitate economic participation. Economic facilities (in the form of participation opportunities in trade and production) can help generate personal abundance as well as public resources for social services. Freedoms of different kinds can strengthen one another [...] With adequate social opportunities, individuals can effectively shape their own destiny and help each other. (Sen, 2010, p.26)

In this perspective, the 2007-2009 crisis exposed the global economic interdependence and the need for sustainable development that enables jobs for all, as well as production and consumption. Furthermore, according to the 2014 edition of data from the annual report released by the United Nations Development Program (UNDP) Brazil rose from 80th position to 79th in regard to the Human Development Index (HDI) whose composition consists of social and economic indicators of 187 countries and territories. That is, despite being the sixth largest economy in the world, the country is among the 10 nations that occupy the last places in the HDI 2013, which confirms its bad distribution of income according to the survey universe.

This confirms the correlation between the economy, the overall development - at the individual, social and collective aspect - and the deprivation of freedoms or rights and second Sen "development has to be related mainly to the improvement of life we lead and freedoms we enjoy." (op.cit., p. 29)

In designing this author, this means that the development of a country is basically related to the opportunities offered to the public to make choices and exercise their citizenship. So "see the development from the substantive freedoms people have far-reaching implications for our understanding of the development process and also to the ways and means of promoting them." (Op.cit.,p.52)

Another aspect to consider the issue of development is the current model of 'economic democracy' which excludes 4 billion of the world population of the production process and, therefore, "to appropriate to their development, as the segments 'bottom of the pyramid' of the population, for the most part, they are not integrated into the global market economy and do not take advantage of it," as stated by Dowbor (2013, p.7).

Also, the same author points out that the: The planet's consumption model is that of the rich. Why would not every Chinese and every Indian the right also have each of your car? The collective pressure that results is disastrous, simply because the rich endowed a consumption profile whose generalization is not feasible. This policy translates into pressure on non-renewable resources than the planet can't support. [...] The current dynamic survive temporary support of an energy mix that we know to be unsustainable. (...) The XXI century homo economicus plays in our modern cities around one kilo of product in the garbage a day, and even paid for their removal. [...] The big transnational companies take financial decisions, they make technological options or cause consumption dynamics that affect humanity, without anyone to influence them. The invisible hand of the market is increasingly invisible. Economic democracy is still a distant notion. We are citizens, but the reality escapes us.

Think innovatively about the decision-making processes that govern the planet and our daily life is no longer a matter of being left and protesting, or right and satisfied: it is a matter of common sense and elementary human intelligence. And for the more informed a matter of urgency. (DOWBOR, 2013, p. 8-10)

According this situation it is possible to confirm that the current economic development not only needs to be rethought, but modified; seeking solutions that enable a new way of governing through which to perform a set of actions that generate benefits in various aspects, in view the aspirations and capabilities of this same government as well as civil society and the private sector, therefore build a sustainable development indeed. Or in other words putting the individual at the center of all aspects of the development process.

The concept of human development denotes both the process of enlarging people's choices as improve their well-being. That is, is distinguished both sides of this development: the formation of human resources, including improvements in health and / or knowledge; and the conditions for this same human being can enjoy the skills acquired for work or for leisure. The most critical dimensions of human development are: a long and healthy life, knowledge and a decent standard of living. Other concerns include social and political freedoms.

In this regard, Professor Dowbor recalls that the report on the UN Human Development suggests that we must ensure an economically viable society, socially just and environmentally sustainable. To the extent that this articulation of objectives is becoming widely accepted, with the annual provision of a global balance that crosses all three approaches, and with all the limitations of general studies, then we have a 'north' of great importance. In academia, we still have difficulties, because some scientific areas study the social, some economic, some even environmental, when the initiatives have to be seen

simultaneously in the three angles. Segmentation is becoming more clearly contested because it prevents systemic view of the process. (Ibid, p.16)

3 Conclusion

Currently there is a greater consensus both scholars as authorities and various sectors of society on the need and the importance of the propagated Sustainable development becomes more viable to the extent that it is assumed at the local level. Thus, the São Paulo city, through its Master Plan and other actions established by its various agencies at the municipal level seek to achieve this development through pre-established laws and regulations, including those relating to urban mobility. However, the lack of dialogue between the organs themselves end up generating mismatch, directly affecting the population involved. As an example, as regards the construction of bicycle lanes in several areas. This is because the environmental impact studies are not always considered when starting work involving the removal of green areas or widening of paved areas that generally cause soil sealing.

Global Warming: Ratio of CO₂ Emissions and the Size of Forests

João Monteiro¹, Arnoldo Jose de Hoyos Guevara¹, Luciano Ferreira da Silva¹

¹ School of Management, Pontifical Catholic University of Sao Paulo, Sao Paulo, Brazil.

(E-mail: jmonteiroj@gmail.com, arnoldodehoyos@yahoo.com.br, lf_silvabr@yahoo.com.br)

Abstract: A major cause of global warming on planet earth is considered to be CO₂ emissions, and this may be found going on across the globe, from production activities to cases originating in nature. Also, when it comes to greenhouse gas emissions, this is not only in rich countries. The CO₂ emissions also occur in developing countries. However, the forests, which naturally transform CO₂ into oxygen, and may contribute to the reduction of global warming, are increasingly being devastated. In this context, this research makes a balance between CO₂ emissions in the globe and describes the reality of this problem in the Ibero-American countries. In addition, it is necessary to understand the situation of forest areas, and these bring a contribution to the ground unnoticed compared to the rhythms of the forest areas and CO₂ emissions converge or not. The data base used for our study was collected from UN databases, Greenhouse Gas Inventory Data, which provides CO₂ emission data and forest area. Other information was obtained from the UN Food Agricultural Organization FAO. Comparisons were made between the two most recent years available, so that we may gain some insight into the evolution of CO₂ emissions and forest areas. Thus, it is important to observe that the reality described suggests that assertive actions need to be taken both local and global, since the consequences and the causes are not only related to be developed or under development countries.

Key words: Global warming; CO₂ emissions; Forests; Greenhouse effect

1 Introduction

The globalization of production and consumption and the search for greater competitive advantages often shows that the relationship between the environment and profit may include antagonisms and is often somehow Manichean. Companies seek to maximize their results through the use of inputs, eg, natural resources; and consequently the environment is exploited above their resilience capacity, compromising the ecosystems globally; and moreover while slamming a slew of modern trends -- the heedless worship of technology, our addiction to fossil fuels and compulsive consumerism -- the Pope Francis recently is stressing the fact that humanity's "reckless" behavior has pushed the planet to a perilous "breaking point."

Actually, only in the mid-twentieth century and early 21st century, we could see that the issue of sustainability of the planet start getting more followers, as more and more researchers and thinkers discuss the responsibility of the use of natural resources and the planetary limits (HENDERSON, 1991; SEN, 2000; HAWKEN; LOVINS; LOVINS, 2002; HENDERSON, 2003; ASSADOURIAN, 2013; ENGELMAN, 2013; MORIN, 2013).

But actually from the first industrial revolution a couple of centuries ago (1750), the atmospheric concentration of the main greenhouse gas, the CO₂ (carbon dioxide) increased 142%. According to the IPCC, at the beginning of the twenty-first century emissions into the atmosphere are of the order of 8.8 billion tons of carbon per year, that is, 32.3 billion tons of CO₂ in the atmosphere; and to this one may add the burning of fossil fuels, 7.2 billion tons, and the use of land, 1.6 billion tons. Almost 60% of CO₂ emitted are assimilated by the oceans and forests and the rest remains in the atmosphere causing problems to the environment and people's health (PINHEIRO, 2011; BBC, 2014).

Teixeira *et al.* (2010) explains that the greenhouse effect is produced by a layer of existing gases in the atmosphere that prevent heat from dissipating at levels that make the planet to cool down, which in turn produce global warming. One should become alert to the fact that that in 2013 the concentration of CO₂ in the atmosphere of the planet earth had 396 shares per million (ppm), up almost 3 ppm higher compared to the previous year (BBC, 2014).

Therefore, the main issue for discussion in this article is the action of man as the main cause of impacts to natural resources that lead to global warming. This reinforcing the idea that human activities are affecting the biosphere being damaged by factors such as the devastation of forests and the emission of GHG (Greenhouse Gases)..

This paper describe deforestation indicators seeking answers regarding the following question: How is the situation of deforestation and CO₂ emissions in Iberoamerican countries?. The purpose of the paper is to contribute to the development of a more conscious behavior by individuals, businesses and governments regarding environment, based on the ongoing discussion about the resilience of the planet and the human

action. It is an important factor for managers in the public or private sectors that have greater social and environmental concerns, without forgetting to defend the positive results to all stakeholders and somehow all giving support to the 2015 COP21 United Nations Climate Change Conference recommendations. As matter of fact the situation is becoming so critical that the US and China, by far the countries that are most responsible for CO₂ emissions are finally assuming the urgent need to develop strategic plans to overcome this global challenge; and Obama just released a Clean Power Plan saying that is *the single most important step America has ever taken in the fight against global climate change*; and that *he is convinced that no challenge poses a greater threat to our future than climate change*.

2 Theoretical Framework

2.2 The CO₂ emissions

The Industrial

Revolution has spread rapidly around the world and mechanized production no doubt brought benefits to organizations. Improvements of processes helped increasingly to maximize corporate profits, but also led to a general increase in the consumption of natural resources (LOMBARDI, 2008). In addition, until the mid-twentieth century organizations and countries believed that economic growth had as main source the exploitation of natural resources, thinking that the environment was just an unlimited source for extraction of raw materials (COELHO et al., 2008).

Moreover energy was the main feeding source of production chains, since it helps to keep the industries going on and improving production processes. However the main resources extracted from the environment to provide power for these production processes were, and still are in many cases fossil fuels. Initially burning coal, and then with technological advances there has been a change to the oil subsequently passing for natural gas.

Seiffert (2009) says that the industrial process developed in modern society is largely responsible for the imbalances of the biogeochemical cycles of carbon, nitrogen and sulfur in different ecosystems. Thus, the burning of these fuels releases excessive amounts of gases to the atmosphere, which causes an abnormal warming. Furthermore, climate change began to occur at a much higher speed than if they occurred naturally. Confirming this idea Frondizi (2009) describes the intensification of the greenhouse effect is directly linked to human activities, mainly derived from burning fossil fuels. This burning occurs in domestic and commercial uses, in transport activities in power generation, industry and agriculture.

Regarding the issue of CO₂ highlights that in 2009, OECD countries had 28% of CO₂ emissions per capita from transportation (2.7 tons per capita equivalent to 3,314 million tons of CO₂). In Latin America, the figure stood at 35% of CO₂ emissions per capita regarding transportation (3.3 tons per capita equivalent to 506 million tons of CO₂). Therefore, transportation in Latin America has a greater contribution regarding CO₂ emissions than developed countries. This situation comes from the increase of land transportation in these locations. Moreover, it's still expected an emission of 770 million tons of CO₂ by 2020 and 1413 million tons of CO₂ by 2050 (CLEAN AIR INSTITUTE, 2013).

Pessoa and Martins (2015) showed that 69.2 ha of preserved forest could overcome the impact of the annual emissions of 170 cars of the bus fleet, consisting of 19.238t / CO₂ / year. The authors also point out that in 2009, according to the final report of the Ministry of Environment (MMA) Brazilian fleet has issued about 170 million tons of CO₂, and 14% of these were related to urban buses.

Thus, it's becoming in evidence that man in this early twenty-first century is increasingly polluting more the environment with industrial processes, agricultural activities, inadequate waste disposal and increased deforestation (NETO, 2011). Lombardi (2008), reports that according to data from the Observatory of Mauna Loa NASA in 2007, there was an increase of more than 100 ppm the CO₂ concentrations in 175 years, and a corresponding increase of approximately 0.7 degree centigrade the average temperature on the surface of the planet. This planetary warming has already some consequences: melting at the poles, which causes the flooding of coastal areas; biodiversity elimination of the planet; increased areas of desertification; savannization of tropical forests; increase the frequency of droughts and floods; reduction in crop yields; damage to the health of populations as a result of heat waves; increased occurrence of hurricanes and cyclones; in addition to the spread of contagious diseases.

Therefore, the problem of climate change is directly linked to energy options, and also a result of public policies such as lack of control of authorities regarding countries deforestation (SEIFFERT, 2009). However, this relationship between who decides by public policies of each country and the causes resulting from high rates of CO₂ emissions, end up affecting across the planet because all countries will suffer the environmental, economic impacts and social caused, for example, for keep on supporting an

energy matrix based on fossil fuels.

Carbon dioxide emissions into the atmosphere affects life on the planet, but there are three ways to reduce emissions of anthropogenic carbon (RAVAGNANI; SUSLICK, 2015), namely: i) promoting energy efficiency programs, which generates less CO₂ per energy unit used in production and consumption; ii) adopting supply of renewable or non-renewable energy sources; iii) promoting CO₂ removal or capture coming from waste and then store them, or carry out carbon sequestration.

Hence focusing on the issue of greenhouse gases, mainly CO₂ should be an integrated task for several sectors, public and private, as well as taking into account actions from other countries. In this way, the struggle for survival on the planet goes through local action with a view to integrating the global vision, in this sense use of natural resources for production and consumption should be treated in a transnational way and monitoring environmental impacts.

2.2 The role of forests in reducing CO₂

The Amazon forest plays an important role absorbing and processing CO₂; as a matter of fact its contribution goes to rates of 0.8 to 7 tons of CO₂ / ha per yr (Noble, 2002). On the other hand, deforestation and the burning of forests and the planting of some cultures and land use for grazing are producing high CO₂ emission rates.

It should be noted that increased forest deforestation in the Amazon, Brazil, has considerably changed climate conditions in this region. What may also impact on neighboring countries (SHUKLA; NOBLE; SELLERS, 1990); and nowadays its even this is seen as a major reason for the water crisis in Brazil. However, deforestation also interferes in a detrimental way with the fauna and flora; in addition interrupt the carbon cycle that contributes to the absorption of considerable rates of CO₂ atmosphere. As pointed out by Fearnside and Barbosa (2013) the tropical forest soil provides a natural carbon sink for methane, removing 0.0004 t ha per yr of carbon, and cutting down the forest eliminates this carbon sinking process.

Studies of the Large Scale Biosphere-Atmosphere Experiment in Amazonia - LBA of the carbon cycle has shown that the undisturbed Amazonian forests are a strong carbon sink, with rates in the range 1-7 tons per hectare per year. However, deforestation and biomass burning represent a net emission of approximately 0.2 gigatons of carbon per year in the Brazilian Amazon (NOBRE; NOBRE, 2002; KELLER et al., 1986).

Therefore, forests act positively on carbon sequestration due to the photosynthesis of plants, which absorb carbon dioxide from the atmosphere and the fixed shaped or woody biomass material (IPCC, 2003). Thus since deforestation withdraws the ability to absorb CO₂ from the atmosphere and create an additional source of CO₂ emissions from the burning of biomass, observing changes in land cover are very important sources of monitoring dynamics of carbon stocks on the planet, because an increase in forest area also increases carbon sequestration, and the contrary is also happening affecting the whole planet (DOUBRAWA et al., 2014).

3 Methodological Procedures

Table 1 Data Description

Indicator name	Definition	Source
Forest area (% of land area)	Forest area is land under natural or planted stands of trees of at least 5 meters in situ, whether productive or not, and excludes tree stands in agricultural production systems (for example, in fruit plantations and agroforestry systems) and trees in urban parks and gardens.	http://data.worldbank.org/indicator/AG.LND.FRST.ZS
CO ₂ emissions (kt)	Carbon dioxide emissions are those stemming from the burning of fossil fuels and the manufacture of cement. They include carbon dioxide produced during consumption of solid, liquid, and gas fuels and gas flaring.	http://data.worldbank.org/indicator/EN.ATM.CO2E.KT
CO ₂ emissions (metric tons per)	Carbon dioxide emissions are those stemming from the burning of fossil fuels and the manufacture of cement. They include carbon dioxide produced during consumption of solid, liquid, and gas fuels and gas flaring.	http://data.worldbank.org/indicator/EN.ATM.CO2E.PC
Forest area (sq. km)	Forest area is land under natural or planted stands of trees of at least 5 meters in situ, whether productive or not, and excludes tree stands in agricultural production systems (for example, in fruit plantations and agroforestry systems) and trees in urban parks and gardens.	http://data.worldbank.org/indicator/AG.LND.FRST.K2

Source: elaborated by authors, 2015 (WORLD BANK, 2015).

Therefore, to analyze the situation of CO₂ in the atmosphere and the situation of forests some variables were selected to describe the situation proposed in this article for the Ibero-American countries(table 1). This paperfocus on a study of 21 Ibero-American countries (Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, El Salvador, Guatemala, Honduras, Mexico , Nicaragua, Panama, Paraguay, Peru, Portugal, Spain, Uruguay and Venezuela) using the following Indicators.

4 Presentation and Analysis of Results

Figure 1 shows, using 10 years intervals, that the only countries from the region apparently with positive results in the recovery of their areas of forests are Chile, Costa Rica, Portugal, Spain and Uruguay. The Dominican Republic is on a stable situation. Furthermore, it draws attention the aggressive deforestation regarding Honduras, although Brazil is also in bad shape.

Figure 1 Forest Area % of Land

Source: elaborated by authors, 2015 (WORLD BANK, 2015).

Regarding the emission of CO₂ in the atmosphere of the planet, Figure 2 shows about the situation of Ibero-American countries in 2011, where one may see high CO₂ emissions in Mexico, Brazil and Spain; and this may clearly be due to the country size and level of industrial development.

Figure 2 Emission CO₂ (kt) - 2011

Source: elaborated by authors, 2015 (WORLD BANK, 2015).

By comparing the forested area and CO₂ emissions, Figure 3, there are irregularities in the proportion of relationship between these variables and particularly draws attention the situation in Argentina. In addition, this chart suggests the need to further study on history and correlation between forested area and CO₂ emissions among Iberoamerican countries, in order to understanding how each country reached its current status and could better manage the situation.

Figure 3 Forest Area Vs. CO₂Emissions

Source: elaborated by authors, 2015 (WORLD BANK, 2015).

Table 2 shows how Brazil, because of the Amazon region, has the largest forest area (5.151.332 sq.km) and the highest percentage of forested area (61%), being this the case it shows the great importance of closely monitoring deforestation of the Amazon rainforest. The smallest area is Uruguay, followed closely by Argentina with 10.48% and 10.52% respectively.

Table 2 Data about forestation and CO₂ emissions in Ibero American Countries

Countries	Forest area (% of land area) - 2012	CO2 emissions (metric tons per)	CO2 emissions (kt) 2011	Forest area (sq. km) 2012
Argentina	10,57	4,67	190.034,94	289.204
Bolivia	52,23	1,56	16.120,13	565.808
Brazil	61,63	2,23	439.412,94	5.151.332
Chile	21,93	4,59	79.408,89	163.062
Colombia	54,35	1,54	72.423,25	602.970
Costa Rica	51,91	1,66	7.843,71	26.506
Cuba	27,61	3,19	35.921,93	29.392
Dominican Republic	40,81	2,16	21.888,32	19.720
Ecuador	38,13	2,34	35.727,58	94.698
El Salvador	13,43	1,07	6.684,94	2.782
Guatemala	33,08	0,77	11.257,69	35.446
Honduras	44,26	1,08	8.412,10	49.520
Mexico	33,18	3,91	466.548,74	644.916
Nicaragua	24,71	0,83	4.899,11	29.740
Panama	43,41	2,58	9.666,21	32.274
Paraguay	43,35	0,81	5.298,82	172.248
Peru	52,88	1,79	53.068,82	676.920
Portugal	37,82	4,71	49.724,52	34.636
Spain	37,14	5,79	270.675,94	185.253
Uruguay	10,48	2,30	7.774,04	18.336
Venezuela	51,81	6,40	188.817,50	456.998

Source: elaborated by authors, 2015 (WORLD BANK, 2015).

Finally it's important to consider core indicators or factors but also seek for core systemic drivers that may help to overcome the challenges of human and environmental development as shown in Figure

4. For the case of the Human Development Index (HDI) and the Environmental Performance Index (EPI), that are actually very correlated (0.878).

Figure 4 Comparing Iberoamerican Countries Using Worldwide Normalized (0 to 100) HDI and EPI

5 Final Considerations

By the end of this paper can be seen the importance of discussion of forests and human activities on the environment. The question about the survival on the planet goes through the long-term vision, rather than a hedonic satisfaction gained through inputs taken from nature that compromise the resilience capacity of the planet.

Moreover, it is not only the removal of forests to transform them into pasture or planting some cultures which are harmful to the earth's regenerative capacity (sugarcane, soy etc.). The elimination of forests withdraws the ability to absorb carbon from the atmosphere by natural action carbon sinks. What is also the other side produces the emission of CO₂ in the atmosphere by burning biomass.

The description provided in this article aimed to raise comparisons between countries that belong to the group called Ibero American. These countries share some common characteristics, but have above all a planet together. So, when draw attention to differences regarding CO₂ emissions or forested area, or cleared, you can discuss ideas and attitudes that benefit all.

Global problems require global thinking, and encourage discussion at least in groups already reinforces a sense of belonging and unity. Note that the water problem in South America. This is not only a problem of a single country, because in the long run all suffer from desertification and the scarcity of this precious life. Thus, recognizing the problem of forests and CO₂ emissions in the atmosphere between these countries we can see common solutions to global forgetfulness and other issues such as energy.

Finally it's worth mentioning the recommendations for Environmental Democracy of the World Resource Institute (WRI): *The environment and human well-being are inextricably linked. When governments, businesses and others make decisions about land and natural resources, they inevitably impact the health, livelihoods and quality-of-life of local communities.*

The Need of More Conscious Decisions on the Future of Water Production and Consumption

Luciano Ferreira da Silva^{1,2}, Karina Ribeiro Fernandes², Arnaldo Jose de Hoyos Guevara¹, Diego de Melo Conti¹

Abstract: The purpose of this study is to reflect on a more conscious and responsible production and consumption of water. For this purpose it's important to consider the role of active citizens in water consumption, which in turn influences resilient actions in the exploration and use of this resource by companies, as well as throughout society. Regarding water use and production, it is necessary to discuss their use in products in the market, especially through commodities, by using the concept of "virtual water". This fact is relevant because although Earth has two thirds of its surface covered in water, it is known that one in three people do not have it in sufficient quantities to meet their basic needs (SALVADOR; DWECK, 2008); hence the importance in particular of evaluating the use of virtual water, production, and consumer behavior. Based on analytical categories regarding the aware production and consumption of water, we analyze specific cases in São Paulo, Brazil, and highlight that the consumption of this product has changed the industry's behavior and individuals influenced by its scarcity. As a matter of fact even if people decide to consume water without worrying about other people, they will be affected as citizens. Thus, the right to consume does not absolve individuals of responsibility as citizens, which is also true for companies that suffer from changes in the availability of this resource.

Key words: Water; Production; Consumer; Conscious consumption

1 Introduction

For many years, social and environmental problems have been a concern only for the government and environmentalists, but these issues have been widely discussed by several other players of society in the early 21st century. The critics are mainly concerning traditional practices of production and consumption, and the roots of the problem lies in the fact that production and offer are not always consider the social and environmental problems of the planet (HENDERSON, 1991; HENDERSON, 2003; ASSADOURIAN, 2013).

Thus, consumption focused on individual aspirations for comfort and wealth guarantees the growth of *per capita* global consumption of several products that end up damaging the biosphere. In fact, keeping this hedonistic consumption, requires heavy investment to exploit fossil fuels and other non-renewable resources which are critical to society, and this impacts natural resources becoming increasingly expensive and scarce (HAWKEN; LOVINS; LOVINS, 2002; MORIN, 2013).

Furthermore, it could be said that non-renewable materials are the main boosters of industrial advanced economies. However, growth and development are not always linked, and the true development must be defined in terms of improvement of a sustainable human well-being, not just the growth of material consumption or *per capita* wealth (ASSADOURIAN, 2013; SEN, 2000). Thus public or private institutions exploring natural resources in a progressively largely level superior to the regenerative capacity of the planet, end up impacting its resilience (VEIGA, 2005; VEIGA; CECHIN, 2010).

With changes from the economic and financial focus to a more sustainable perspective of life on the planet, the fighting against the scarcity of resources requires a comprehensive and ongoing social effort of all players of society. Thus, the challenge is to greatly increase productivity with the least possible use of non-renewable resources, and to establish a more conscious consumption (MOORE; REES, 2013).

Based on this perspective of using resources for a conscious production and consumption, this paper aims to discuss the fact that most of the time the different social and environmental elements involved in the production process or in consumption are not being considered. Thus, it is argued that an attitude focused on conscious production and consumption could help to deal with the problems that afflict the contemporary consumer society that contributes to an unconscious and inconsequential

degradation of the environment.

The focus of this article concerns the proper use of water. It is indispensable to life, leisure, professional activities, and industrial development, besides impacting political, economic and social aspects of the planet. The paper focuses in particular on the topic of “virtual water” a condition of this resource that is not in evidence as a physical presence in the final product (ALLAN, 1998; HOEKSTRA; HUNG, 2002; CARMO *et al.* 2007). That is to say, water is used to produce in many ways but often final products do not present this feature in its final appearance. This is particularly so in the agricultural area.

Hence there is a need to build awareness with regard to the healthy consumption of water by man, who is the greatest benefitted from this natural resource, and that unfortunately has given little or no importance to its proper use and preservation. Based on this context, an important question arises: what decisions of water use in production and consumption do affect society?

The main goal of this paper is to present the direct relationship between production and consumption of water and environmental sustainability in order to foster some reflection about conscious consumption of this liquid that is so important to life.

2 Conscious Production and Consumption of Water

2.1 The use of water resources

The human body consists of 75% of water, and in case of illnesses, one of the key recommendations of doctors is to drink plenty of water. Therefore, life itself needs water to grow plants, trees, rivers, and dams. The importance of water for the survival of living beings is undeniable. It is worth to notice that about 70% of the surface of the Earth is covered by water, with a volume of nearly 1.4 billion cubic kilometers. Out of this total, 97.5% consists of seawater and only 2.5% in freshwater. Approximately 30.2% of the total volume of freshwater on the planet may be used for plant and animal life in lands since the rest is the poles, in glaciers and ice soils (INSTITUTO CARBONO BRASIL, 2014).

Freshwater and sanitation is one of the basic Millennium Development Goals set by the United Nations, whose studies estimated that 92% of the global population will have access to safe drinking water by 2015. However, according to the UN, at least 11% of the world population, which is equivalent to 783 million people, does not have access to this resource. In addition, 1.1 billion people are still with no sewage systems, and about 4.000 children die every day from diseases associated with lack of quality or lack of water treatment (ECODESENVOLVIMENTO, 2012).

Brazil has 13.7% of the planet's fresh water, and is part of the select group with water reserves (AMAE, 2014). In fact, it is necessary to understand that having this resource available in the country does not mean that everyone have access or will continue to have access to it. As a matter of fact water consumption in Brazil is divided into: 59% are consumed in agriculture, 22% in household use, and 19% industrial use (AMAE, 2014). On the issue of domestic use, much is wasted by hidden leaks, broken, unregulated or old landfills and the lack of rational use of water. We cannot forget that Brazilians uses treated water to flush and wash their streets.

Another example of unconscious waste is in the bath. A shower lasting 15 minutes with the water valve half-open consumes 243 liters of water, but if you keep the valve closed while soaping, the bath time will be five minutes shorter and you can reduce the total water consumption to 45 liters (ECODESENVOLVIMENTO, 2012). In fact water lost every day in Brazilian capitals is estimated at 6.14 billion liters per day, an amount which would meet the needs of a daily consumption of 38 million people, equivalent to the entire population of a country such as Argentina (WHATELYC, 2014).

From 2004 to 2013, the consumption of water in 33 municipalities in the metropolitan region of São Paulo increased by 26%, while production grew only 9% (BRENHA; GERAQUE, 2014). Actually it is estimated a consumption *per capita* of 150 liters a day in São Paulo (SABESP, 2012). In addition, there are other types of consumption such as in prisons (300 liters a day) and apartments (200 liters per day). Moreover some studies show that a São Paulo dweller consumes on average 27% more water than a German and 9% more than a French dweller (BRENHA; GERAQUE, 2014). In the case of Brazilian households, one of the main reasons for the boost in consumption per capita was the increasing income, since people started using more washing machines and dishwashers, washing cars more frequently, bathing with more powerful showers etc. Thus, as the standard of living improved, water irresponsible consumption tends also to increase (BRENHA; GERAQUE, 2014).

Statements about household water consumption highlight that water scarcity in the world is also aggravated by social inequality, lack of sustainable management, and use of natural resources. In regions

where the situation of lack of water has already reached critical levels of availability, and in the countries of the African continent, the average of water consumption is 10 to 15 liters *per capita* a day (CETESB, 2014). This scenario is quite different from the average of 150 liters a day in Brazil. Moreover to irresponsible consumption, one must add water lost due to irresponsible Management. In 2013, 25% of the water was lost on the way between the dams and homes which is more than twice as in the cities in Japan (only 11% lost). The goal of SABESP, agency responsible for water in the region, is to decrease to 18% of loss by 2020 (BRENHA; GERAQUE, 2014). So governments shouldn't have the option to separate the population policy from the water supply, privatizing the process. The problem in the fast urbanization processes is being reflected directly on the water quality and quantity that may supply the cities (AMAE, 2014). Moreover lately very serious hydric crises, like the one going on in California in the last few years, are also becoming a day to day reality in the State of Sao Paulo in Brazil.

Another important point is environmental pollution; one of the main factors that contribute to the degradation of water resources in Brazil and in the world (AMAE, 2014). According to the UN, 77 million people in Brazil, a number equivalent to the population of Germany, do not have safe water. In addition, 60% of the population does not have proper water treatment or sanitation. Thus, regular water supply, with uniform quality, is still a distant reality in this developing country (VEJA, 2014).

To be considered appropriate water is not required to have the same characteristics for different use purposes. The parameters for supply are different as in the household, industry and irrigation (INSTITUTO CARBONO BRASIL, 2014). This situation hampers the quality of the water when analyzing the demand and the reality of this resource at each location. European Union countries allow the use of only five pesticides in drinking water, while due to lack of control water in Brazil may contain 22 types of pesticides, 13 heavy metals, 13 solvents, and six disinfectants to be consumed (VEJA, 2014).

In the irrigation process, great part of the water is filtered by the soil, where it reaches the groundwater and is stored. One aspect that should be considered is that the water often is returned to Nature contaminated by pesticides. Due to deforestation, it is lost the process in which water infiltrates the soil through the trunks and roots of trees and other vegetation, which acts as biofilters, recharging aquifers and ensuring the sustainability of water source (TOLEDO, 2014).

Water problems are not only local, because most aquifers are located on the borders of many countries. According to an inventory of UNESCO, out of the 273 trans-boundary aquifers, 155 are located in Europe, 68 in the Americas, 38 in Africa, and 12 in Asia, and the volume of fresh water aquifers present in these sites is a hundred times bigger than that existing on the surface of the Earth. Moreover, 65% of this water is used for irrigation, 25% for human consumption, and 10% in industry (INSTITUTO CARBONO BRASIL, 2014).

As mentioned above, problems with the collection and supply also have a direct relationship to regional development, and income can also determine the quantity and quality in the consumption of this resource. In Brazil, in places where the population earns a quarter of a minimum wage there is a 35% water deficit. Already in places where income is five times the minimum wage, 95% of the population has appropriate access to water supply. For the UN, the price of water should be fixed, and their supplies, following international standards, could not represent more than 5% of a family budget (VEJA, 2014). However, the problem is apparently not related to prices. The price of water and sanitation rate in Brazil is considered low by international standards. According to the *Global Water Intelligence*, while the average rate in the country is around US\$ 1.50 per cubic meter, in Denmark, it is US\$ 8.11. Other countries also have a higher rate, such as the UK, (4.33 USD), France (4.08 USD), Canada (3.30 USD), USA (3.09 USD), and Japan (2.63 USD) (CARRERA, 2014).

According to a recent UNESCO some factors for the possible lack of water are due to intense urbanization, inadequate agricultural practices, and pollution produced in production and consumption. These factors hinder the supply of clean water in the world (UNESCO, 2015). The use of water in the production of goods and/or in services is not often recorded in all stages of the process. Note that to produce particular good water is used since its initial phase, like the production of bread, however since the very growing stage of its ingredients consumes a lot of water (GERBENS-LEENE; MEKONNEN; HOEKSTRA, 2011). According to research conducted by Arjen Hoekstra of the University of Twente, in the Netherlands, Brazil is the fifth country with the largest net export of "Virtual Water", that is, water incorporated into the production process.

Thus, water is used in the processing of grain, meat, and even in industrialized goods that a country exports. Agricultural commodities are among the main export items of Brazil. Whereas agriculture accounts for over a quarter of the national GDP, Brazilian water already appears as a highly-rated

element in the international market, and Brazil is one of the largest exporters of soybeans, beef, and sugar. In environmental terms, it means the transfer of Virtual Water to other countries where there is water shortage or is expensive (WICHELNS, 2004; CARMO *et al.*, 2007; GERBENS-LEENES; MEKONNEN; HOEKSTRA, 2011).

As a matter of fact according to UNESCO, Brazil exports about 112 trillion liters of fresh water per year, equivalent to almost 45 million Olympic swimming pools. Carmo *et al.* (2007) argue that the analysis of studies undertaken under the "Virtual Water Trade Research Program" (UNESCO) shows the relationship between world "tank-countries" of fresh water and their ability to generate foreign exchange.

However, water resources involved in the production of export goods may become scarce even in regions where there is relative abundance. Despite the water crisis, it is claimed that Brazil should not change its business profile, but make use of water more efficiently. It is possible to increase the efficiency of water use by producing the same food with less water, with better irrigation technology and best practices, avoiding waste and practicing more organic and family farming (HOEKSTRA; HUNG 2002; GERBENS-LEENES; MEKONNEN; HOEKSTRA, 2011).

3 Conclusion

Consumption of goods and services in a healthy society means establishing of appropriate sustainable relationships between consumers and suppliers. However, this relationship has become increasingly complex, especially due to the increasing demand of finite resources. From 2004 to 2013 the consumption of water in 33 municipalities in the metropolitan region of São Paulo increased by 26%, while production increased only 9%. As mentioned before on average, a São Paulo dweller consumes 27% more water than a German and 9% more than a French citizen.

Thus, habits of a society may determine the ways goods and services are produced and delivered. Such logic covers both superfluous products as well as products related to basic needs such as food and water. Water is essential to life, and it cannot run out or be based just on supply and demand. So it is now becoming vital to adopt solutions for Water Care fostering conscious consumption, recycling, and reuse. This in particular raises the need to consider more closely the question of virtual water, particularly in countries like Brazil with a high level of export regarding agricultural commodities that end up also having a great environmental impact due to excessive use of pesticides and deforestation. Moreover regarding industrial and household use, it is also contaminated when returned and is not properly treated due to lack of sewers and sanitation.

Lack or loss of water is a great problem in many developing countries like Brazil, since this leads to early age diseases and limited quality of life. Moreover even today in some underdeveloped African countries, there are people that try to survive with 10 to 15 liters of water a day, much below the 150 liters *per capita* a day estimated by SABESP in São Paulo.

Hence whether people choose to act as citizens who consume, or as consumers who act as citizens, the water is becoming a greater concern and challenge due to environmental local and global risks as well as the climate change going on. Brazil in particular, considered one of the largest hydropower countries of the planet, may be a critical example for dealing with water management challenge in particular regarding the Transnational Aquifers and the Amazon Forest.

Abstract: Innovation happens as a combination or a result of various phenomena (i.e. entrepreneurship, business environment, interactions etc.), it is almost impossible to be explained by a single discipline itself. Due to the fact that there are many facets to explore in order to cover all aspects to innovation, the present paper approaches this theme with emphasis on the sociological perspective, considering that innovation is not a solitary, but an interactive phenomenon, which firms develop connections able to reach new innovation sources, new processes and technologies. As a theoretical reference, this paper develops the argument of the importance of the firms' interaction linkages and connections and their influence on the efficiency of the innovation system. So, in this context, the authors decided to adopt the survey method to examine whether or not interaction linkages have an impact on micro and small technology-based firms' innovativeness in Brazil. So, the findings showed that interactions between firms and other innovation agents such as universities, research centers, financial institutions and other partners is very important to the development of open collaborative innovation activities and have direct impact on the level of innovativeness. Finally, this paper seems to conclude that innovation is a result of combination of various interaction linkages and not a solitary phenomenon restricted to the firm itself that may be appropriately fostered.

Key words: Open innovation; Networking-interactions; Business management and sociology

1 Introduction

In the last three decades, globalization has increasingly demanded firms and the whole economy to operate under pressure for new products and services. With the increasing speed of globalization, many scholars such as Freeman (1995), Powell, Kenneth and Laurel (1996), Porter (1998) and Etzkowitz and Leydesdorff (2000) have agreed that only innovative firms can guarantee the long term capability to prosper and gain competitive advantage. In the past, the concept of competitive advantages relied on accessing and controlling of raw materials. Nowadays, it relies on the creation of new technologies. Strategies that may have served firms before, it does not seem to work in the today or future contexts. To be competitive, companies must shift from an isolated organizational strategy to a more open mind-set, able to deal with different economic agents in different environments (local, national and even global).

This new scenario of competition has forced firms to develop products/services involving an increase amount of knowledge-intensive activities. These activities range from product design, management procedures and marketing strategies to new interaction linkages between firms and economic agents such as universities, research centers and government, able to become key elements to this new sustainable innovation mode of production. This premise suggests that technological changes have the power to establish new standards for the transformation of the whole economy (Freeman, 1988).

Despite innovation seems to depend on many factors (i.e. entrepreneurial spirit, local infrastructure, legal and political dimensions and the presence of important innovation agents), one has been highlighted as an important factor: networking. Interaction processes between firms and other economic agents, in large measure, have become an important element of competitive advantage. The creation of competitive advantage through innovation seems to suggest that firms need to reach new sources of innovation in order to develop new technologies. Thus, networking plays a key role at the heart of any discussion on competitiveness and innovativeness; therefore, the current concept of globalization, based on technological development is certainly different from globalization of the past. Innovation seems to be an economic and social phenomenon influenced by internal and external factors, establishing a new paradigm: networking permits to build new technological capability and specialization leading to the improvement of firm's innovativeness.

Overall, there is certainly no recipe to succeed in this so competitive environment, however, successful strategies to facilitate innovation initiatives and to create an environment to foster entrepreneurship and innovation, includes an understanding of the conjunction of some actors working together in a collaborative manner creating an interactive behavior able to build an appropriate innovation environment.

2 Literature Review

2.1 Innovation – modern history and concepts

Historically, the emphasis on studies of innovation began in early 1930's by economist from the Austrian School of economics mainly. Joseph Schumpeter (the so called "founding father of innovation studies") was the most prominent economist from this school of thought and defended that innovation is as a complex mechanism of the introduction of a new product, process, service, method of production, opening of a new market, new source of raw material or the establishment of new businesses (Schumpeter, 1979). He started arguing that modern capitalism was dynamic and evolutionary, and innovation was behind firms' competitiveness and country economic growth. Since then, some scholars are investigating under what conditions this is allowed to happen.

More recently, authors such as Motta (1989) interpreted innovation as the discovery of a new opportunity. It is the use of uncommon tools or something new, to give creative solution to problems detected and the final outcome of the creative process. To Tidd, Bessant and Pavitt (2001), innovation also is a result of new knowledge, experiences and abilities to create new things (i.e. products, processes and services). It has three phases: 1) Opportunities detected; 2) Choice of strategies ;3) Introduction of innovation to the market.

At micro-level, within companies, the innovation process combines both internal and external elements organized on a systematic way and always should be based on a landscape of abundant knowledge and cooperation (Chesbrough, 2003). At macro-level, considering the whole economy, innovation can be generated by a wide range of different agents such as universities and research centres; therefore, firms have to acquire new capabilities such as to manage a network of interactions with different actors and to become flexible enough to get information and knowledge retained by a variety of different actors (European Commission, 2004).

Even though the concept of innovation seems to be very broad, for the purpose of this paper, the authors consider the concept of innovation suggested by The Oslo Manual (2005): "*innovation as the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organizational method in business practices, workplace organization or external relations*" (OECD/EUROSTAT, 2005).

2.2 Networking – Concepts and Perspectives

According to Castell (1999), the 21st century seems to be characterized by three features: global, informational and networked. In this sense, innovation initiatives are increasing substantially through networks of firms and other innovation agents. The expansion of the social-networked models is directly associated to the increase of innovation initiatives (Rothwell, 1994). This premise suggests that innovation combines both internal and external factors and based on an abundant cooperation and networking environment. So, firms which not co-operate and network limit and reduce their capacity to innovate.

Oliver (1990) argued that networking was a response for the pressure of the globalization phenomenon; so, in order to reduce the pressure of the external environment, firms decided to participate in business networks. The networking approach resulted in competitive gains for firms which could not obtain by individual efforts (Balestrin and Verschoore, 2008).

Networks also involve many definitions. One of these definitions consider that business networks, in general, involve a group of firms, business units, universities, governments, customers or other actors which co-operate on a joint development project or objective in order to overcome common problems, to achieve collective efficiency and to penetrate in new markets (Unido, 2001). Other authors such as Hunt, Doyle, McDermott and McCormack (2005) advocated that business networks are about fostering cooperation, facilitating the transfer of knowledge and information between companies, enhancing the learning process, allowing firms to share costs and risks. Finally, the authors agreed with Cooke (1996) who defined business networks as a formal and informal non-hierarchical organizational arrangement in which firms make relational contracts with each other through a set of linkages to facilitate the exchange

of information and technologies.

In common, most of authors share the idea that business networks is emerging as a relevant tool to promote the development of new innovation initiatives leading to the general improvement of overall firm's performance. So, the increase of firm's innovation activities depends on the increase of the interaction linkages that they maintain (Ahuja, 2000). In the business field, collaboration manifests through collaborative arrangements and are structured according to the following typologies: alliances, joint-ventures, coalitions, consortia, cross-licensing and business network (Tidd, Bessant and Pavitt, 2001). However, there is a tendency for innovation to be associated increasingly with local and non-local interactions; therefore, firms must search for innovation sources regardless of whether they are geographically close or not (Melo, 2011).

Although it is clear that networking is of significant importance to the development of innovation activities, it does not seem to happen by itself. It depends on factors such as cooperation and collaboration. Authors such as Gray (1996) argued that collaboration offers an antidote to turbulence by building a collective capacity to respond to these conditions. This process whereby two or more parties work together for mutual benefits is of immeasurable importance and is at the heart of any discussion about networking.

Porter and Fuller (1996) argued that the main motivation for firms to co-operate is from external factors such as search for economy of scale, reduction of risks response to market pressures or the need for technology or market access. Other authors such as Huxham (1996) advocated that the key motive for firms to engage in collaborative activities is the focus on outputs which results could not be achieved individually and materialized into collaborative advantages. To Hunt et al. (2005) working in collaboration with others, firms are enabled to achieve competitive advantages faster, cheaper and with less risk and disruption to operations. Overall, benefits of collaborative activities are numerous with many cases of success of firms' improvement of competitiveness through engagement in networks. To Huxman (1996), collaboration and co-operation between firms happen due to the perception of mutual gains and it is highly motivated by self-interest, even though, it does not imply that self-interest is at the expense of others.

So in this context, it is reasonable to suggest that successful innovation initiatives are result of successful firms' participation in business networks on a collaborative mode with constant flows of knowledge, information and resources, improving innovativeness collectively.

3 Methodology

This topic outlines the basic methodological premises of this study. The choice of the authors to investigate whether or not interaction linkages have an impact on micro and small technology-based firms' innovativeness in Brazil, was based on the survey strategy under the perspective of the relationship between innovation and interaction. The presumable existence of this relationship (not causality) as well as the effectiveness of the impact on firm's innovativeness and gains in competitive advantages is defended by many other authors such as Ahuja (2000) and Balestrin and Verschoore (2008).

The key methodological points pertaining to this study are as follows: 1) Qualitative research; 2) Explanatory mainly; 3) Cross-sectional study; 4) Data collection strategy was the use of survey interviews with administration of a structured closed-ended questionnaire (the questionnaire was based on the Oslo Manual (OECD/EUROSTAT, 2005).

To approach this problem, the authors decided to perform this study in Brazil, in particular, the Brazilian micro and small technology-based firms located in the technology pole of Campinas, State of São Paulo and Porto Digital Information and Communication Technology Cluster located in Recife, State of Pernambuco. Both locations are internationally recognized as niches of excellence pole in technology.

4 Findings

In this topic, the authors describe the empirical findings regarding the investigation of firm's interaction behaviour and innovation process. These findings were results of the PhD thesis submitted by Paulo Melo to Waterford Institute of Technology (WIT) in Ireland. Topics related to interaction behaviour were focused only on those interactions aimed to the development of innovation activities.

The authors of this study summarize the main findings as follow: 1) Firms surveyed: 19 firms in Campinas and 13 in Recife; 2) Firm's size: Campinas – (74%) predominantly micro sized firms (less

than 10 employees) Recife – (69%) predominantly small sized firms (11- 50 employees);3) Overall firms engaged in innovation activities:Campinas – 18 firms (95%) and Recife - 13 firms (100%);4) Interaction behaviour.

The findings showed that 100% of firms surveyed in both locations had interactions linkages for the development of innovation activities : Campinas – 19 firms and Recife – 13 firms.

Another finding was related to the perception of the importance of interaction linkages to the development of innovative projects. According to Cortrights (2006), to improve firm's innovativeness, they should be engaged in collaborative arrangements. So, one relevant finding derived from this study showed that 94% and 100% of firms surveyed in Campinas and Recife respectively considered interaction linkages of "high" or "medium" importance to innovation activities (see Table 1).

Table 1 Importance of Interactions for Innovation Activities

Degrees of importance	Campinas No. of firms	Recife No. of firms
High	10(59%)	09 (69%)
Medium	06 (35%)	04 (31%)
Low	01 (6%)	-
None	-	-
Total	17 (100%)	13(100%)
No answer	02	-

Regarding interaction partners, firms in both locations seemed to interact with different partners (see Figure 1) in order to develop their innovation projects. In Table 2, the study shows types of interaction partners which firms had experienced interaction linkages.

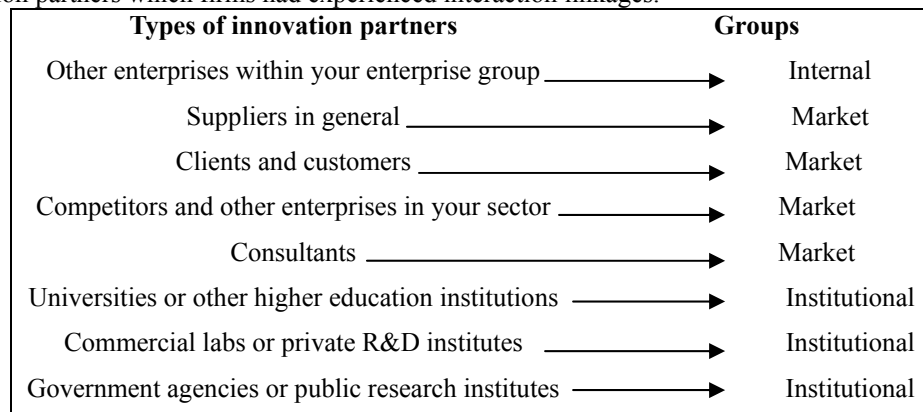

Figure 1 Classification of Types of Innovation Partners

Table 2 Classification of Types of Innovation Partners

Types of innovation partners	Group	Campinas No. of firms	Recife No. of firms
Other enterprises within your enterprise group	Internal	02 (14%)	04 (31%)
Suppliers in general	Market	05 (36%)	04 (31%)
Clients and customers	Market	06 (43%)	06 (46%)
Competitors and other enterprise in your sector	Market	07 (50%)	12 (92%)
Consultants	Market	08 (57%)	06 (46%)
Universities or other higher education institutions	Institutional	12 (86%)	05 (38%)
Commercial labs or private R&D institutes	Institutional	04(29%)	04 (31%)
Government agencies or public research institutes	Institutional	05(36%)	13 (100%)
No. of firms which answered this question	-	14 (100%)	13(100%)
No answer	-	05	-
Total of firms	-	19	13

At last, in Table 3, the study showed the geographic extent of the network of relationships for the development of innovation projects. The findings showed that 57% of firms located in Campinas and 70% located in Recife have experienced interactions within and outside the cluster and 29% of firms located in Campinas and 15% in Recife reported interaction experienced within the cluster only.

Table 3 Locations of Innovation Partners. Source: current study

Locations / No. of firms	Campinas	Recife
Within the cluster only	4 (29%)	2 (15%)
Outside the cluster only	2 (14%)	2 (15%)
Both (within and outside the clusters)	8 (57%)	9 (70%)
Total of firms which answered this question	14 (100%)	13 (100%)
No answer	05	-

5 Conclusions

Overall, the results of this study indicate that apparently innovative firms are also very active as far as networking is concerned. Firms in both locations seem to confirm that their interaction behaviour determine the level of firms' innovativeness. The findings showed that 100% of firms surveyed were engaged in innovation and interaction activities in order to develop their innovation projects.

Another finding revealed that firms interact with different partners in different locations which may lead to the conclusion that the level of interaction is not limited to geographic proximity.

These important findings seemed to be in line with Huxman (1996), Ahuja (2000) and Hunt et al. (2005) who advocated that firm's innovativeness depends on the increase of their interaction linkages, interaction with others enable to achieve competitive advantages faster, cheaper and with less risks and these interaction linkages happen mainly because of the perception of mutual gains respectively.

Finally, this paper seemed to conclude that: i. the level of firm's innovativeness is strongly influenced by their interaction linkages; ii. Interaction linkages are not restricted geographically and iii. despite spatial agglomerations seemed not to be the main locus of innovation partners, it is still relevant to the development of innovation activities, especially for micro and small sized firms; therefore, innovation seemed to be not a solitaire phenomenon restricted to the firm itself that may be appropriately fostered.

Abstract: System dynamics is an approach to analyze the behavior of complex systems, such as the productive chains, strictly considering the inherent characteristics. This approach is based on mathematical concepts of nonlinear processes developed in mathematics and physics and consolidated in engineering. The concepts inherent in this approach assists in creating a mathematical model which represents a production chain by using computer simulation. Thus, the main objective of this paper is to present the formalization of the dynamic model of assessing the sustainability of Brazilian ethanol production, its borders (external environment) and the scenarios needed for a deeper understanding of relation of cause and effect, causal loops and diagrams of flows and stocks as a result of the awareness stage, with regard to understanding the problems involved, according to methodology known as design science.

Keywords: Ethanol; System dynamics; Sustainability

1 Introduction

1.1 Ethanol production in brazil

The Brazilian supply of ethanol grew in the period 1994-1998 when a crisis period began due to high inventory levels and drop in the domestic market. During this period the price of sugar in the international market has increased and consequently the supply of ethanol in the domestic market plummeted. With the fall in demand, the share of ethanol-powered vehicles decreased from 75.5% in 1985 to 0.06% in 1997, with high financial and tax costs. This picture has reversed since 2001, when ethanol engines began to be produced again. This trend has given rise to the emergence of a new ethanol industry since 2003 when entered the scene with flexible fuel engines.

Brazilian sugar and ethanol industry gathered in the biennium 2012/2013, 602 million tons of sugarcane by 8.5 million hectares. Production accounted for 38.8 million tons of sugar and 23.9 billion liters of ethanol. This represents a share of 41.8% in the total world production of ethanol, estimated at 49 billion liters. It is expected that Brazil bend the growing area of sugarcane in the next twenty years reaching a production of 40 billion liters of ethanol.

Despite the picture above, the ethanol produced from sugarcane has turned recently the subject of intense attacks by European authorities. They see the expansion of biofuel production around the world the reason for a rise in food inflation. The United Nations (UN) sentenced the biofuels, with the Special Rapporteur statement to the High Commissioner for Human Rights, that mass production is a crime against humanity for its impact on world food prices. According to Oliveira (2009), through the expansion of biofuels remains follow in question: what are the consequences for food production in Brazil with the expansion of the sugarcane crop in the next 20 years?

Data from the Brazilian Institute of Geography and Statistics (IBGE), between 1990 and 2012, show that the reduction of food production, imposed by the expansion of planted area of sugarcane, grew in this period, more than 2.7 million hectares. Taking the municipalities that had the expansion of more than 500 hectares of sugarcane in that period verify that there was reduction of 261 thousand hectares of beans and 340 thousand hectares of rice. This reduced area could produce 400,000 tons of beans, ie 12% of national production, and a million tons of rice, equivalent to 9% of the country's total. In addition, in these municipalities the milk production was reduced to 460 million liters and the amount of cattle was reduced by more than 4.5 million.

Despite the production of ethanol is being studied in various universities, research institutions, government agencies and the private sector, regional production and distribution characteristics have not been sufficiently addressed in research, but are essential to assess the risks and the consequences of such expansion in the environment and in food production.

The picture above associated with the fact that the simulations make it possible to observe the risk factors more clearly than it is possible in real scale, given the complexity of the production-distribution

processes, justifies the development of a dynamic model of production based on dynamic ethanol system. In this simulated microcosm becomes possible to isolate the effects and causes more easily than when engaged by the complexities of the real world. (WARREN, 2008).

1.2 Application of system dynamics to sustainability studies

The system dynamics is an approach to analyze the behavior of complex systems, such as supply chains, strictly considering the inherent characteristics. This approach is based on mathematical concepts of nonlinear processes developed in mathematics and physics and consolidated in engineering. The concepts inherent to the methodology aid in the creation of mathematical models representing the productive chain may diagnose problematic points in chain structure using computer simulations employing an easy to understand representation.

Agarwal and Shankar (2008) argue that due to the causal relationship, existing in the production system, the approach of dynamic systems is well suited to capture the impact of the dynamic performance of the variables on the integration and responsiveness of the production system in a given time interval.

Researches on systems dynamic applied to sustainability studies are divided into three major groups:

- 1) Researches that contribute to the construction of theories about sustainability;
- 2) Researches using the system dynamics in solving sustainability problems;
- 3) Researches working in the development and improvement of modeling tools in sustainability.

The research of Chichakly and Eberlein (2013) is a typical example of the use of systems dynamic in theory construction. Studying IT service industry Minis et al (2010) proposed a new theory for the virtuous and vicious cycles, using an exploratory causal model to describe the interrelationship of the key success factors.

Morecroft (2007) uses the dynamic systems to solve strategy problems by developing a strategy management model for simulating several scenarios. Cha, Pingry and Thatchen (2008) investigated the amplification of demand in supply chains.

Research on the development and improvement of modeling tools in dynamic systems are an example in the work of Howick and Eden (2004) that studied the nature of discontinuities in system dynamics modelling of disrupted project. Another paper on the line is Arango and Osorio (2009), which considers also the technical, organizational complexity inherent to the system dynamics model for the world coffee market.

1.3 Research aims

The main aims from this study are to:

- 1) Identify the main variables, flows and stocks and the causal relationships of sugarcane, sugar and ethanol production processes;
- 2) Explore how the production of ethanol in Brazil is increasing and how this production is impacting food production;
- 3) Apply the modeling and simulation in system dynamics in ethanol production system.

The knowledge generated by this study allows for a more thorough discussion of the ethanol production impacts both on the environment and on food production as well as being the basis for the development of the equations that describe the behavior of variables and stocks that are at the root of the simulation process. The study concluded that beginning with the identification and characterized the elements for modeling and working with different scenarios simulation is better to understand the degree of sustainability of ethanol production.

Thus, the main objective of this paper is to present the formalization of the dynamic model of assessing the sustainability of Brazilian ethanol production, its borders (external environment) and the scenarios needed for a deeper understanding of cause and effect, causal loops and diagrams of flows and stocks.

2 Methods

The methodological framework of the study consists in the selection and justification of a method that is able to respond to the formulated research problem, to be evaluated by the scientific community and demonstrate procedures that make robust research results. These logical steps should not be seen as obstacles to the conduct of research, but as procedures necessary to ensure the impartiality, accuracy in work driving and the reliability of results. Thus, this research adopts the methodology the science design. As this research seeks to develop an artifact (dynamic model) to design science proved to be an appropriate methodology, not only dealing with the construction of an artifact but also requiring the

application of rigorous methods, both in construction and in the evaluation of the artifact design. Accuracy is often measured by the adherence of the research to an appropriate collection of data and the correct technical analysis.

To identify the variables to the model and the causal relationships, was conducted an interview during the months August and September of 2014, with a group of ethanol producers of local productive arrangement of alcohol (APLA) in Piracicaba, SP. The analysis of these interviews has concluded awareness stage with regard to the understanding of the problems involved, according to the design science methodology. Romme and Damen (2007) argue that it may be necessary to understand the issues from a broader perspective, in which systems thinking (Andrade et al., 2006), for example, could bring a significant contribution.

3 Results and Discussion

In this section we discuss the overview of the model, the causal loop diagram, the diagram of stocks and flows of ethanol production and simulation scenarios. It is used to visual system dynamics modeling tool Vensim®, software provided by the company Ventana System Inc., which enables the analyst to link words with arrows representing relations between the variables as causal relationships. The stock diagram and flow in Vensim® consists of auxiliary or constant, cash variables that represent actions or accumulations. This information is used by the equation editor to complete the modeling process.

3.1 Overview of the model

In the model, sugarcane production is considered as the most important production source, while the production of ethanol and sugar is the second level and the generation of solid waste and wastewater is the third level. The figure 1 is a schematic representation of product flows and inventory information associated with ethanol production. The model doesn't include the second-generation ethanol production, from sugarcane bagasse, because the amount of ethanol produced with this technology is small and doesn't influence the data for simulation.

The availability of land for planting is treated as being shared between sugarcane and food production, that is, it is considered a finite availability of land so that an increase in planting sugarcane implies the reduction in food crops. These increases and decreases are influenced by the planted crop productivity level. The amount of ethanol to be produced is influenced by the production of sugar, which competes in the consumption of sugar and productive resources, as well as by the level of consumption of other types of fuel such as gasoline and vehicular natural gas, in addition to suffering influence of investments in production and distribution infrastructure.

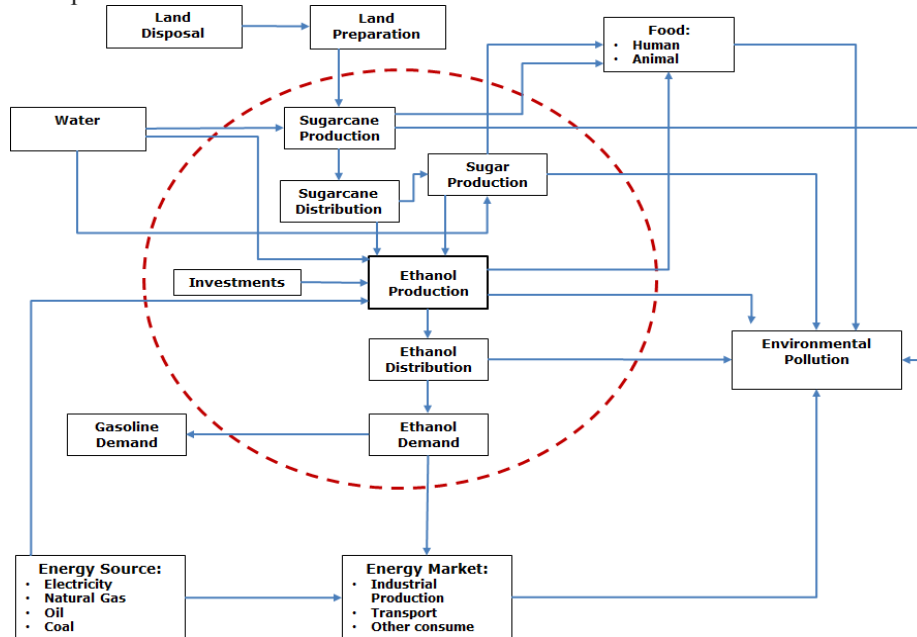

Figure 1 Overview of the Ethanol Production Model

3.2 Modeling

Modeling a system using the system dynamics is interactive and it's an ongoing process of formulating hypotheses, testing and review of formal mental models. According Sterman (2000), in modeling process a few steps should be considered, such as:

1) Problem Articulation - What's the problem? Why this problem? What are the key variables and concepts that should be considered? What time to be considered to the future? What is the historical behavior of the concepts and key variables?

2) Formulation Dynamics Hypothesis - Produce initial hypotheses, formulate hypotheses to explain the dynamics and consequences of endogenous feedback structure, develop maps of causal structures based on initial assumptions, key variables and other data available;

3) Formulation Simulation Model - Specification of the structure and decision rules, parameter estimation, behavioral relations and initial conditions, tests for stability with objectives and limits;

4) Testing – Does the model adequately reproduce the proposed behavior? Does the model behave realistically when subjected to extreme conditions? What is the sensitivity of the model?

5) New Policies and Evolution - What environmental conditions may arise? What new decisions, strategies and structures can be experienced in the real world? How can these new scenarios in the model be represented? What is the robustness of the recommended policies for different scenarios, considering the uncertainties? How policies interact? Are there any common actions or compensatory responses?

3.3 Simulation

From the perspective of system dynamics, any system natural or artificial, can be described through a language composed of four elements: stocks (levels), which represent accumulations of a resource; flows, which are the activities that produce growth or reduction of inventories; converters that process the information regarding the stocks and flows or represent sources of external information to the system; connectors which are coupling elements of information describing the relationship between stocks, flows and converters. In order to provide a simulation model behavior, it is sufficient to define the relationship and the value of each variable at time zero of the simulation, using for this the features available in the system dynamics software.

According to Agarwal & Shankar (2005), the performance of a supply chain depends on the integration of its trading partners and the ability to respond quickly to market changes. By simulating, the model for assessing sustainability of Brazilian ethanol production wants to evaluate the effect of integration and speed of response to changes in sustainability. The dynamics of interactions between the variables related to the integration of cause and effect and speed should show the importance of the behavior of sustainability in different ethanol production scenarios (represent market changes that require quick responses).

3.4 The causal loop diagram

This diagram shows the interactions and relationships between ethanol production, land use and water consumption, production of sugarcane and sugar. The figure 2 displays the causal loop diagram of the ethanol production system and the factors of influence. The diagram consists of multiple loops that show, for example, the production of sugarcane, sugarcane price, the government tax incentives, demand for ethanol and gasoline prices affect the production of ethanol.

Thus an increase in ethanol production influences reduction in the price which can increase the demand resulting in the increasing of the price. But an increase in the price reduces the demand for ethanol, hence the negative polarity of the link arrow. Once you have a reduction in the price of ethanol, there will be an increased demand for ethanol followed by the gap between the demand and supply of ethanol respectively. This can lead to both an increase of investment in ethanol and more allocation of sugarcane to produce. An arrow closes the cycle of positive polarity since an increase in the allocation of sugarcane to produce ethanol mean an increase in ethanol production. This cycle is an example of a positive self-reinforcing process.

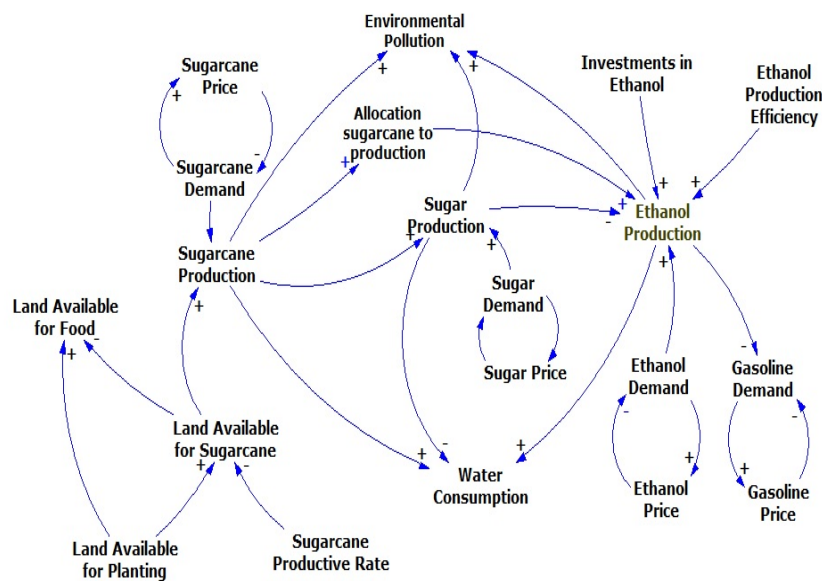

Figure 2 Conceptual Model of Ethanol Production

However, the cycle would be prevented from increasing the levels of each factor indefinitely because other factors beyond the loop, as the ethanol demand influence the price of ethanol. Gasoline demand also influence the demand for ethanol too.

Another example, an increase in yield obtained with the production and commercialization of ethanol positively affects new investments for the production of ethanol increases and the allocation of sugar for ethanol production. The effect of this is to increase ethanol production and decrease the price of ethanol by the forces of supply and demand. An ethanol lower price may reduce the profitability affecting investment levels. This subsystem tends to be inherently unstable if the acting forces do not take the self-regulation condition.

From the causal loop diagram is noticed that relevant factors for ethanol production level as investments in production, allocation of sugarcane production and profitability has a degree of dependence on production efficiency, the price of ethanol and sugar production, the availability of land for planting that can profoundly affect the needs for food and water production growth becoming unsustainable at expected levels.

3.5 Stocks and flows diagram

The equations that demonstrate the relationship between factors will be built on the basis of production data and investments of sugar and alcohol sector provided by the Department of Agriculture of the State of São Paulo, by the Council of sugarcane producers, sugar and Alcohol of the State of São Paulo and the Ministry of Agriculture.

The model is built considering four steps. The first step is the focal element ethanol and describes the dynamics of supply and demand, or deal with the production, storage and distribution of ethanol. The second stage, additional production, comes from sugar production model as a product substitute for ethanol production. The third step deals with the modeling of water consumption at various stages and land used for the production of sugarcane and food. The fourth step models the dynamics of capital, costs and investments. The forecast period begins from 2016 and extends until 2035. With this information it's possible not only to simulate the dynamic behavior of the production of ethanol, sugar and sugarcane as well as evaluate the impacts on the environment, water consumption and production foods, as illustrated in figure 3.

The flow diagram of inventory threats not only the direct demand for ethanol as well as indirect demand processes resulting mixture of ethanol and gasoline constituting a "pull" system in which the pulling is demand production. On the other hand, sugarcane harvesting system is modeled as a system "pushed" in which the sugarcane is harvested and destined for processing. In the case of the demand for sugar is less than the expected, there is no formation of a reserve stock for a short period of time to keep it in delaying the harvest field. If demand is greater than expected and the plants have available

production capacities, as there is no training of reserve stocks, you can bring sugarcane from other states since the price and shipping cost offset. In this case, the availability of sugar would be the limiting factor for ethanol production.

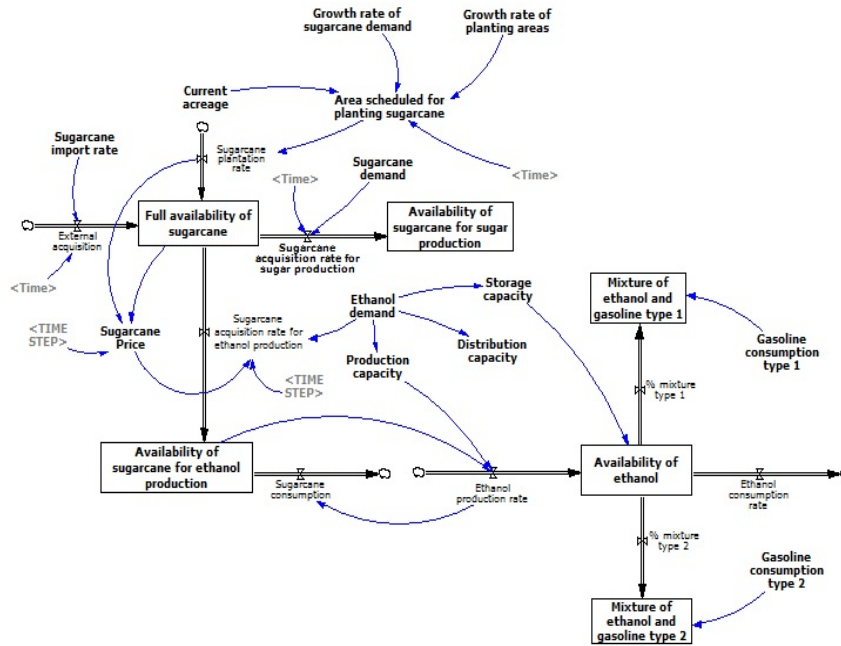

Figure 3 Stocks and Flow Diagram

The demand of sugarcane for other purposes or sugar production and other industrial applications is shaped according to the projection. The sugarcane allocated to ethanol production depends on the demand, availability and price which in turn depend on the rate of acquisition of sugarcane for ethanol production. If the acquisition rate increases, the price rises and vice versa.

The diagram of stocks and flows also considers demand for ethanol and production capacity increase in the plants in proportion to the amount of sugarcane harvested, increasing the demand of growing areas, occupying spaces before intended for food crops such as rice, beans and corn. Investments in improvements in productivity to obtain the highest percentage of sucrose, exceeding 9% margin, allow the increase of ethanol production without an increase in the same proportion planted areas. This will appear in the diagram as a mitigating factor for consumption land available for planting.

One answer that is expected with this production simulation model is to evaluate how long production remains sustainable in the face of growing demand for ethanol.

3.6 Computational model

Once modeled in Vensim® the causal loop diagrams and charts of stocks and flows, the computer model will require the introduction of the equations that will govern the causal relationships of the different variables used and the definition of simulation parameters such as unit time to be used and the simulation horizon.

The simulation will work with a set of scenarios to assess the behavior of the variables and the sustainability of production. In the simulation three scenarios apply: an optimist, a pessimist and more likely. In the first scenario, it is assumed that the first period of 120 months, changes in demand and other factors have stable growth rates. In the second scenario, it's introduced changes in production capacity in the plants, oscillating demand for ethanol, water scarcity and fluctuations in the price of the final product, while the other factors remain unchanged. In the third, it's contemplated a scenario in which demand, production capacity, price and production of sugarcane tend to stabilize in the second half of the simulation time.

The computer model allows the interface with other tools such as geographic information systems to display the variations in plantation areas in the form of maps, as well as promote and export data for processing by other computational tools.

4 Limitations of study

This article discusses the use of system dynamics modeling to model the problem of sustainability of the ethanol production system. The system dynamics modeling appears to be a useful tool for creating scenarios for such problems. However, this article considers some limitations to the use of this specific tool for modeling ethanol production. These limitations are highlighted by the ideas of system theory and by complex science (BOSSEL, 2007). There are also fundamental limitations to the correct prediction of the sustainability of ethanol production in the next twenty years, which are made clear by critics from of current production system (DeTOMBE, 1994) and chaos theory (GLEICK, 1987). These restrictions, however, do not set aside the importance of modeling and simulation tools as aid in understanding of dynamic phenomena such as sustainability.

5 Conclusion

As Mendonça (2007) pointed out: “Not long ago, biofuels were seen as an alternative to save the planet from carbon dioxide accumulation and excessive dependence on oil [...] representing a new era, the era of clean and environmentally sound energy [...]”. But, with so many contradictions, “[...] the wind shifted radically. Biofuels, almost overnight, is being considered the villain of the planet, responsible for the current food crisis, by soaring prices”. That is to say either you feed machines or you feed human beings.

This paper in particular tries to formalize a model for assessing the sustainability of ethanol production, its borders (external environment) and satisfactory solutions necessary to study the Brazilian ethanol production, its effects on the environment, food production and water consumption and future trends in three different simulation scenarios. The model considers that the importance of energy independence cannot be overestimated. Oil prices are expected to grow in coming years, as reserves are depleted and the remaining oil extraction process becomes more expensive. Ethanol is a biofuel which has an excellent history of use and relative ease of production as the basic raw material is sugarcane which can be easily cultivated. As a result, sugarcane production is expected to increase and more processing plants to be set up.

Improvements in farming technology are expected to increase productivity per hectare. However this increase may mitigate but not stop the increase in sugarcane growing areas and hence bring significant reductions in food production with serious implications for the use of sugarcane as an alternative form of energy.

The use of modeling let to work with simulation scenarios and conditions where it is possible, given the initial conditions and the quality of the model, assess what would happen to the ethanol industry if ethanol prices change in response to the availability and supply of alternative energy sources for transportation or what would happen to food prices if ethanol demand continues to grow at an increasing rate. The model should be able to allow to consider changes in: planned production of sugarcane, prices of sugarcane, capacity, demand and other factors relevant to the industry that may lead to become business continuity unsustainable, either by lack of water resources or by the need of production and food for a growing population.

To be useful models depend on quantity and quality of data used in their construction, understanding of the analysts and the inclusion of important and relevant factors. Brazil is the leading producer of large-scale biofuels and, maintaining this leadership depends on largely sustainability of ethanol production. As such, an evaluation model of sustainable production will be useful to explore the changes in market trends, assessment of impacts of new technologies of production and genetic improvement of sugarcane that may help developing a research instrument framework for the assessment of the future impacts of biofuels production in Brazil.

Mapping Basic Needs Economic Development, Progress and Sustainable Development at the Iberoamerican Region

João Almeida Santos, Maria Cristina Sanches Amorim, Arnaldo Jose de Hoyos Guevara
School of Management, Pontifical Catholic University of Sao Paulo, Sao Paulo, Brazil
(E-mail: professoralmeida@ig.com.br, cris.amorim@pucsp.br, arnoldodehoyos@yahoo.com.br)

Abstract: This article studies the performance of 132 countries ranked in 3 Regions – Iberoamerican Region(AIBER), AVECO Region (more developed countries) and OTHERS Region (less developed countries) analyzing indicators related to Basic Needs: Food, Water, Electricity, Energy. Basic Needs Conditions are closely interconnected, reflect development conditions, and may be monitored and analyzed through a set of worldwide country indicators; so they may help for a Regional Diagnosis as well as for Developing Strategic Planning. As a matter of fact the study suggests that even countries with low GDP may still improve food quality through increased investment in food production; so that appropriate public policies may find ways that lead to improve quality of life with food, water and energy where is more needed at The Iberoamerican Region. All this may Foster Sustainable Development locally and Globally speaking..

Key words: Food; Water; Electricity; HDI; Iberoamerican region

1 Introduction

The increase of the population living in big cities show that problems with the lack of clean water and food are linked to other problems such as lack of economic growth, employment, income distribution and sustainable development.

Food, water and energy are vital elements for livelihood at any place around the world. But still today one in eight people in the world were estimated to be suffering from chronic hunger. Moreover according to the UN-Water one in 9 people do not have access to safe and clean drinking water and almost 2.5 billion do not have access to adequate sanitation.

The countries of Ibero-America were colonized and have gone through many times of political instability and therefore not were able to form a satisfactory structure for the population. Today it is still very common to find people living in different countries of the region without clean water, sanitation, food in quantity and quality to have a happy life.

The difference inside the Iberoamerican Region is great when we consider the indicators food, clean water, economic growth and sustainable development. For example, Chile has economic development indicators better than Bolivia, Ecuador and Brazil in many ways. The size of the country and the internal cultural diversity are factors that affect the overall framework for evaluating economic development. In this sense, Brazil has a disadvantage because of the size of its territory, the cultural difference between people from one state to another, use of natural resources and this is seen in the HDI indicator - Human Development Index.

Only the territory size does not justify the low score of the indicators and the actual effects on the life of a population. When we approach the food issue, we must consider what other resources are necessary and must be used to produce food. For example: electric power, water, labor, machinery and equipment to prepare the land for planting and harvesting, transport and storage. Food, water, energy electricity and GDP – Gross Domestic Product – are closely interconnected regarding development conditions; and may be analyzed and monitored through a set of available indicators, as may be shown through this paper.

The use of natural resources and the creation of means for production of more food should be a priority for a good policy of government. Investing in education and manpower training to work in the field, learning how to use the agricultural equipment to better enjoy their potential are some measures that improve the result of food production.

Hélder Muteia representing the United Nations Food and Agriculture Organization (FAO) in Brazil states that in a global economic crisis situation, the demand for food of a population expected to reach 9 billion by 2050, imposes global leadership challenge to increase agricultural production in a sustainable way. "It will not be easy. To answer this demand, global food production must grow by about 70%."

The public policies must meet the growing demand for food and investments in other sectors that are the basis for agricultural production. In this regard, governments should have policies of economic growth with investments in various areas so that people can have more food, treated water, electric

power and other benefits.

The paper shows that basic needs all over the region have been improved along the time, but that there is still a long way to go and there is more and more a greater need to care not only about quantity but also about quality of products and processes if we think on Regional Sustainable Development.

2 The IberoAmerica Region

In this study, the IberoAmerican Region (21 countries) includes Portugal and Spain that left strong socio-cultural roots in the Latinamerican Region.

There are many differences between the region's countries as territory size, number of inhabitants, the availability of natural resources and wealth. Thus, we can cite the case of Chile which has a copper reserve that is a natural wealth and the basis of its economy, Venezuela has the oil as the basis of their wealth and Brazil that have natural wealth with availability of sun and water for agriculture but with problems because of the size of its territory which creates logistical problems for the transport of food and its storage.

More recently the United States and Cuba are getting closer so that should increase investment in various sectors because of the economic gap with the end of the economic embargo that was imposed to Cuba in the past fifty years.

2.1 Water and food production

The world agricultural production has tripled in the last 50 years, mainly due to higher productivity per unit of land and intensification of crops. The overall supply of food per capita increased from 2,200 kcal / day at the beginning of the 1960 to more than 2800 kcal / day in 2009. In 3370 kcal / person / day, Europe currently has the highest rate per capita average supply food. The cereal production occupies more than half of the cultivated area worldwide and is the most important source of food for human consumption. Of the 2.3 tons of cereals each year, 1 billion is intended for human consumption, 750 million tons are used for animal feed and 500 million tons are either processed by industry, used in food or wasted (FAO, 2013).

Although water is an easy product to be obtained in some places on earth, the most populated cities it has been more difficult to find. This fact is because there was a population growth unchecked in these cities and water resources was difficult to be treated to be redistributed again, because there was no natural water easy to be obtained and abundant. It is necessary for all human beings, plants and animals. For washing and cleaning in general, to cooking, maintaining the hydrated plants and eliminating thirsty animals.

Many regions in the world are increasingly facing water scarcity which constraints agricultural production and limits the incomes and livelihoods of many residents in rural and urban areas.

Both in cities and rural areas is necessary to invest in water treatment and sanitation facilities for obtaining pure and natural water is increasingly difficult. Therefore, it is necessary to invest in water treatment for it to be used several times by humans. Investments in drinking water supplies, water quality, sanitation and health care to focus on, especially women and children are essential to ensure urban and rural residents can fully use food and nutrition available. Sanitation and health will improve the effects of chronic diseases and other impediments to the welfare of families and education and increase productive opportunities (WORLD WATER COUNCIL – FAO, 2015).

Water security and energy, transport, food, land use and the environment. In a changing world (from population growth, economic dynamics, and climate change) we need flexible multi-purpose infrastructure (OECD, 2015).

2.2 Electricity

Electricity can be generated by water from fossil fuels by means of nuclear reactors, using the sun or the wind. In countries where water is abundant, they are built large plants with reservoirs in the form of a large lake for generating electric power. This can be a problem if not have a plan to avoid the lack of water for consumption when you have a drought or problems with flooding when the rainy period.

As the water is intended for agriculture and for human use, the construction of an electricity generation plant should be planned also predicting impacts on the environment because of the need to build large water reservoirs to move the turbines that will generate electricity.

Water, electric energy and food production are directly related and interdependent. The production of energy from water must be carefully managed because it can consume all existing water and not be left for food production and therefore we cannot eradicate hunger in the world (FAO, 2013). Reports indicate that 1.3 billion people lack access to electricity, 780 million people worldwide lack access to

safe water and 2.5 billion sanitation services.

2.3 HDI - Human Development Index and GDP-Gross Domestic Product

The Human Development Index (HDI) is a summary measure of long-term progress in three basic dimensions of human development: income, education and health while the gross domestic product (GDP) considers only the economic dimension of development. The Latin American region has HDI better than OTHER regions but it does not have better data that Advance Economies AVECO region where they are countries like Denmark, Germany, Japan.

GDP shows the total of domestically produced goods in one country and the higher the better economic activity to generate employment, income, the greater the supply of goods and services. On the other hand, the increase of GDP requires the use of more production resources. If production resources are employed in increasing the production of goods and services without planning and adoption of renovation policies of the funds, the company may have problems with the shortage or total exhaustion.

Between 1980 and 2000 world GDP significantly increased because of greater trade liberalization and participation of emerging countries. In this period, world GDP grew tenfold while exports have increased more than thirty times and this is due to the fact that countries such imports made by Canada and Japan for products that are produced in China and Mexico, for example and that have low production cost.

Table 1 Average Growth in% of GDP in 1980, 1990 and 2000 Selected Regions

Região	1980	1990	2000
World	3.2	2.9	4.0
Developed countries	3.0	2.7	2.4
Emerging Countries	3.5	3.3	6.4
África	2.6	2.3	5.6
Central and Eastern Europe	2.1	1.2	4.9
Commonwealth of Independent States and Mongolia	3.5	- 4.8	7.4
Developing Asia	6.8	7.3	8.1
Middle East	1.4	4.4	5.4
Latin America	2.1	3.0	3.6

Source: Parkin, 2009

The GDP growth of the regions shown in Table 1 shows the intensification of international trade in emerging countries, Africa and Middle East. The highlight is the global growth in 1990 to 2.9% and then 4% in 2000. Another important highlight is emerging that goes from 3.3% in 1990 to 6.4% in 2000. The Commonwealth of Independent countries and Mongolia leaves a negative growth in 1990 of 4.8% and less goes to 7.4%.

As for Latin America countries such as Chile, Venezuela, Colombia, Argentina, Mexico and Brazil the momentum of the trade (exports plus imports) have transformed the structure of the economy with growth of the order of a hundred percent order from 3.3 in 1990 to 6.4 in 2000; at the same time exports of commodities from China, representing the Asian continent, was responsible for this new dynamic of international trade numbers (PARKIN, 2009).

3 Methodological Procedures

For the purpose of analyzing how the Iberoamerican Region as a whole is doing regarding Basic Needs the present study compares present related development conditions of three Regions: The Iberoamerican Region (AIBER) with 21 countries, an Advance Economies Region (AVECO) with 27 countries and the rest or other countries (OTHER) with 84 countries. The study begins with an exploratory descriptive data analysis to understand behavior and relationships among indicators related to basic needs such as food, water, electricity, energy using a table with a total of 132 countries for this purpose. Regions were compared using ANOVAs to determine issues(indicators) that were more relevant to differentiate the selected 3 Regions around the world, based on the *Knoema* statistical database that allows us having a better vision about the worldwide situation today in particular regarding Basic Needs(CRESWELL, 2103).

4 Analyses and Discussion of Results

4.1 Analysis of 132 countries

After some statistical analysis eight variables were selected as more representative such as Depth of food deficit (calories / undernourished person), Access to piped water (% Of pop), Rural vs. Urban access to improved water source (absolute difference between (% of pop.) Access to improved sanitation facilities (% of pop.) Access to electricity (% of pop.), Quality of electricity supply (1 = low, 7 = high) Renewable internal freshwater resources per capita (cubic meters). Besides these Analytic Variables some Synthetic Indicators were also included in the analysis: SPI - Social Progress Index, HDI - Human Development Index, Governance index, EPI - Environmental Protection Index, HPI - Happy Planet Index, OHI - Ocean Health Index, GINI Index, EV - water resources. Figure 1 shows how these variables are intercorrelated.

Figure 1 Intercorrelations Among the Variables

This figure 1 show in particular a high degree of behavior similarity among the variables: SPI, EPI, HDI, Governance, Access to improved sanitation, Access to piped water and Access to electricity. Moreover SPI, and HDI are very closely related, so for practical purposed one may simply use this last one that is simpler and have a longer data history, and actually both are basically dealing with Social Conditions.

Table 2 ANOVA Comparing Means of the 3 Regions: AIBER, AVECO and OTHERS; As well as Fs for the variables - All variable were Normalized (0 - 100), and Positivized (the higher the better)-

3R	HDI	EPI	HPI	OHI	ELECTR	EVWATER	FOOD	GOV
AIBER	65.92	52.7	72.36	61.57	92.81	20.15	79.82	42.48
AVECO	87.36	81.39	50.58	73.15	99.73	79.35	97.88	83.25
OTHER	46.74	37.95	41.79	63.2	66.42	13.1	70.18	33.36
F	43.45	69.68	22.69	29.45	15.48	119.91	15.16	97.02

Table 2 helps to compare the 3 Regions. The higher the F the higher the difference among the 3 Regions; so that one can to what extent see that the Synthetic Indicators Governance (GOV) and EV Water Resources (EVWATER) are the ones that make more difference; this last one in particular due to the fact that AVECO Region has a much higher value (79,35) than the other two Regions. As a matter of fact countries like Denmark, Germany, Japan, and United States differ a lot regarding EVWATER as compared to countries in Africa for example that are part of the OTHERS Region. This could be seen very clearly in Figure 2 that allows more easily to visualize differences and compare the regions observing where and how much do they differ each other in relation to each of these 8 dimensions.

This Figure 2 and Table 3 in particular, show that AIBER is doing even better that AVECO, when we are talking about the Happy Planet Index (HPI). This may be so due to the important fact of large forest areas in the region such as is the case of in the case of Brazil, Costa Rica, Dominican Republic; while other countries in place of forests have large desert areas like the case of North Africa region: Egypt, Morocco, Algeria, Libya, Tunisia, Mauritania, Mali, Sudan and Chad which is the Sahara desert.

Figure 2 Means of the Regions: AIBER, AVECO e OTHERS

On the other hand no doubt more Advanced Developed Economies (AVECO) shows better conditions regarding: HDI, EPI, Food and Electricity. As matter of fact Access to Electrify shows values for AIBER and AVECO regions much higher than the OTHERS Regions although the F value is small (15,48) which is due to a large variability of this variable within the Regions itself. This variable seems to indicate shows that there is power supply to the grid of the population but it may not be constant or lack quality of supply. For example, the countryside that exists in much of the OTHERS region that concentrates the countries of South Africa, Tanzania, Togo, Mozambique and Liberia still don't have energy supply for everyone.

Table 3 ANOVA Comparing the 3 Regions Using the Happy Planet index (HPI)

One-way ANOVA: Happy Planet Index versus REGIAO					
Source	DF	SS	MS	F	P
REGIAO	2	15846	7923	22.69	0.000
Error	129	45048	349		
Total	131	60894			

S = 18.69 R-Sq = 26.02% R-Sq(adj) = 24.87%

Individual 95% CIs For Mean Based on Pooled StDey

Level	N	Mean	StDey	-----+-----+-----+-----+
AIBER	21	72.36	16.25	(-----*-----)
AVECO	27	50.58	12.84	(-----*-----)
OTHERS	84	41.79	20.68	(---*---)

-----+-----+-----+-----+
48 60 72 84

However, and as its shown in Table 4 regarding Care for the environment - EPI - Environmental Protection Index, AIBER is nearest the Region Other in the range of values between 45 and 60, while the AVECO region is doing much better distant and very near 90 in the interval between 75 and 90. of the countries in the Latin American Region the individual data shows that El Salvador, Paraguay and Peru with the worst indices close to 36%. In this region are the best: Ecuador, Costa Rica and Chile.

Table 4 ANOVA Comparing the 3 Regions Using the Environmental Protection Index (EPI)

One-way ANOVA: EPI Score versus REGIAO					
Source	DF	SS	MS	F	P
REGIAO	2	38872	19436	69.68	0.000
Error	129	35982	279

OTHERS	84	37.95	19.06	(-----*-----)

-----+-----+-----+-----+
45 60 75 90

Last, but not least, The Human Development Index HDI, as an essential leading indicator, clearly shows how the population is doing regarding basic social conditions. Table 5 shows that the AIBER is very well in the middle between the worst (OTHERS) and the best region (AVECO). Among the Countries that are doing worst are Pakistan, Yemen, Angola, while among the ones that are best examples we do have Sweden, Switzerland, Norway, New Zealand. All in all AIBER is not doing that bad but we still has a long way to go.

45 60 75 90

5 Conclusion

The Base of the Maslow’s Hierarchy of Needs Pyramid are the Physiological or Basic Needs, which in fact is very close to the next level related to Security Needs; so if one really wants to help overcoming basic human challenges in developing regions, it’s important to start from there and see how are they doing and what and where there is a greater need to improve.

This study of the performance of 132 countries of the 3 Regions – Iberoamerican Region(AIBER), AVECO Region (more developed countries) and OTHERS Region (less developed countries) is based on the analysis of indicators related to the Basic Needs of Food, Water, Electricity, Energy.

Basic Needs conditions are closely and systemically interconnected, and reflect development conditions; moreover they may be monitored and analyzed through a set of worldwide country indicators that may help for a Regional Diagnosis as well as for improving Strategic Planning.

For this purpose the indicators used on this paper shows that: a) Even countries with low GDP may still improve food quality through increased investment in food production; b) Appropriate public policies may lead to increased quality of life with food, water and energy; c) More and more is necessary to increase not only quantity but also quality of products and processes, particularly when thinking more systemically on Sustainable Development. Hence Growth may help to raise incomes and reduce hunger, but higher economic growth may not reach everyone or even if does, there may situations where or when this doesn't necessarily means a higher quality livelihood; moreover it may not lead better work conditions for all, unless policies specifically target social inclusion processes, especially in relation to those still living in rural areas. In poor countries, hunger and poverty reduction will only be achieved with growth that is not only sustained, but also broadly shared. More specifically this paper shows that even though basic needs at the Iberoamerican Region may have being improved along the time, there is still a long way to go and there is an increasing need to be concern, for Local and Global Sustainable Development Reasons, to take care not only of quantity of Basic Needs but also of Quality of Products and Processes, for present and Future Generations.

Renewable Energy Sources in Developing Countries: Challenges and Opportunities for a Sustainable Development Agenda

Jorge Tenório Fernando, Sergio Ricardo Siani, Arnaldo José de Hoyos Guevara
Pontifical Catholic University of São Paulo, São Paulo, Brazil

(E-mail: jtfernando@uol.com.br, falecomsergio@oi.com.br, arnoldodehoyos@yahoo.com.br)

Abstract: A renewable energy matrix plays a fundamental role in providing energy services in a sustainable platform and, particularly, to reduce climate change on a global basis. However, alternative energy sources usually poses extra challenges to adopters due to higher costs, mainly in the developing and emerging countries where: 1) basic needs still remain to be covered, and 2) top technologies, such as the required in those initiatives, are likely not to be promptly available. This article aims to verify the status of the current renewable energy sources contribution to the regular energy systems of some countries across the Latin American region as a measure to reduce the adverse impact over the average temperature and extreme climate events. Latin America, despite its vast territory and considerable availability of natural resources – which could well place the region in a leading position in terms of alternative energy – is still in the early stages of having the mindset and infrastructure required to respond to the current environmental challenges. This exploratory study compares the database of renewable energy and climate change drivers of some Latin American countries, seeking to verify similarities and differences, as well as the possible effect of strategies and government policies, barriers and issues in the generation of an energy system that support the region economic growth while following the key principles of sustainability. For our research, we use Multivariate Analysis based on a large set of available and updated open public indicators to establish critical areas and regional progress. The main finding is that, if not at length comparable to the leading EU countries and other advanced economies in the matter, some countries in the region have been presenting important advances to date, being able to combine economic growth to friendly-environmental practices – often a hard equation to solve – while others, on the contrary, stay behind in sustainable practices. Most importantly, at last, is the highlight of initiatives that stand out as positive examples having helped mitigate the environmental burden, clearly pointing towards solutions to the challenge of having sustainable development inclusive practices in the Latin American region.

Key words: Climate change; Renewable energy; Sustainable development; Latin america

1 Introduction

Energy is considered, on a worldwide basis, as essential to the development of a nation. From the five modern energy sources: petroleum, coal, natural gas, nuclear energy and hydro-electricity, only the last one is renewable; however its use is still relatively concentrated in some countries. With the advance of technology, electricity became crucial to keep the urban life standards.

For many decades, and especially in the years of 1970 and 1980, the governments concern and focus towards energy were chiefly economical. In that time, in many countries there have been key investments in energy infrastructure works such as hydroelectric power plants, transmission networks, and water reservoirs.

According to the site *Sustentabilidades*, the global consciousness and concern about the environment has gradually evolved internationally and can be summarized by some landmarks. It started more strongly in the 1970's, with the Stockholm United Nations Conference about Human Environment (1972), and moved on with the United Nations World Committee about Environment and Development (1983), the Rio Summit Agreements (1992), the Kyoto Protocol (1997), and Rio+20 (2012). Despite such events comprising many countries, the ones that have a full adhesion and signed commitment with clear targets to reduce emissions are the European Union members, and a few other countries like Australia and New Zealand. A major country like the United States has not signed the Kyoto Protocol, for instance. The challenge posed to the Latin American countries, and possibly to other emerging nations, is how to promote country growth to raise the social and economic standards to the population while keeping a close eye at the environment – that means make use of the least invading and damaging practices as possible to conserve nature and the environment.

According to Coviello (2003), in the decade of 1990 the United States and the United Kingdom, following recommendations of international finance institutions, have privatized the state-owned energy companies, and as a result, there has been also some deregulation in the market in Latin America.

An event marked the 1990 decade: The writing of the Rio Statement on Environment and Development (Rio 92) and the Agenda 21 during the United Nations Conference on Environment and Development (UNCED), taken place in the Brazilian city of Rio de Janeiro, when it was discussed solutions for the sustainable development on a global basis.

Still in the same decade, it is worth mentioning some other events directed towards the promotion of renewable energy in Latin America such as the energy program of the National Commission for Energy Saving (CONAE) in Mexico, the National Program of Electric Energy Conservation (PROCEL) in Brazil, and the Andean Program for Energy Saving (PAE) no Peru. (COVIELLO, 2003).

Since then, the globalization and the economic and politic competition take the agenda of the nations, and the changes in the world's energy system are consolidated in the first half of the 20th century (Barros, 2007) considering: Globalization as a reality, The growing competition of national and corporate economies, The strategic importance of energy source available for competitiveness, The energy crisis, mainly driven by the limited petroleum production level that reached all nations, exposing the degree of external dependence, which led to a re-evaluation of competitiveness and development agenda.

2 Theoretical Framework

2.1 Petroleum

Petroleum keeps on being the largest and most important energy source for modern society. Besides providing the fuel used in the thermoelectric power plants, being still a key energy source, other fuels are petroleum-derived such as gasoline, kerosene, and diesel, used both in automobiles and in the industries. The chemical industries are highly dependent on petroleum, since products such as plastics, asphalt and synthetic rubber are by-products extracted from petroleum.

Historically the petroleum prices have been raising – in the decades of 1970 and 1980 barrel prices have jumped from US\$ 5 para US\$ 33, when the famous petroleum crises took place. According to Campbell (2006), in the 1980 decade the world realized we were consuming more petroleum than we were finding – in 2005, for instance, for every five barrels consumed only one new has been found.

In view that petroleum is not found all over the world, it is worth pointing out the largest reserves, which according to the BP Statistical Review of World Energy (2012) are as follows. First is Venezuela, with the first position and 297 billion barrel reserves, over 17% of world's share, followed by Saudi Arabia, with 265 billion barreals and 16% of world's share. Then come Canada, Iran and Irak, which together have approximately 450 billion barrels in reserves, being nearly 30% of world's share.

Goldemberg (2007) highlights the challenges the world has to cope with regarding the use of petroleum:

- 1) The limits of available reserves;
- 2) The environmental impacts, particularly those connected with climate change;
- 3) Disputes to get access to petroleum in certain regions, and the use of nuclear technology, even for pacific reasons;
- 4) The pressure over the developing countries needing to import petroleum products, and consequently, the growth of their external debts. What is right is that petroleum is a key energy source available in limited quantity and as such and it is bound to be worn-out, which makes asks for long-term, sustainable alternatives.

2.2 Renewable energy

In Latin America, Brazil stands out as a large country that managed to find a sustainable alternative to fossil fuel, with sugar-cane derived ethanol. According to Janssen e Rutz (2011), besides the successful consolidated case of bioethanol in Brazil, other countries in Latin America have been progressing in creating and implementing policies that can create a renewable, alternative energy source to fossil fuel, such as Argentina with soy-based biodiesel, and Colombia, Costa Rica and Guatemala with sugarcane-based ethanol.

Coelho and others (2013) point out that, despite Brazilian widespread use of bioethanol in cars, there is an opportunity to extend that use into transportation vehicles, which currently contribute expressively to the increase of greenhouse emissions in Brazil.

As highlighted by *The Economist* magazine, the growth of bioethanol in Brazil to a high extent can be credited to the development of the flex motor cars, which can use both gasoline and ethanol as a fuel. The same article questions the expansion of ethanol as an alternative energy source in terms of government policies and incentives after the large oil source discovered recently, but anyway it asserts

that, in view of its sustainable aspect compared to fossil fuel, the sugar-based ethanol industry has a true potential to become global.

In another study, Goldemberg, Coelho and Guardabasi (2008) number what they consider the long-term consequences of the sugar-cane ethanol production: “Positive impacts are the elimination of lead compounds from gasoline and the reduction of noxious emissions. There is also the reduction of CO₂ emissions, since sugarcane ethanol requires only a small amount of fossil fuels for its production, being thus a renewable fuel (...) Negative impacts such as future large-scale ethanol production from sugarcane might lead to the destruction or damage of high-biodiversity areas, deforestation, degradation or damaging of soils through the use of chemicals and soil decarbonization, water resources contamination or depletion, competition between food and fuel production decreasing food security and a worsening of labor conditions on the fields”. (Goldemberg; Coelho; Guardabasi, 2008, p. 2086)

The paper The Independent recently reported Costa Rica stayed for about 75 days only using renewable energy. Furthermore, the article mentions their energy sources as 94% renewable, being 80% hydropower and 10% geothermal, and highlights the country’s investment in geothermal energy, taking advantage of the volcanic areas in their territory. Their objective is to be less dependent from hydropower, and, in the near future, use little or no fossil fuel energy – despite the recent discovery of rich oil sources in their coast area – to reach the carbon-neutral status by 2021. The article emphasizes the second position of Costa Rica, after Uruguay in Latin America, reached for its electricity and telecommunications infrastructure in the 2014 World Economic Forum Global Competitiveness Index.

However, Meisen and Krumpel (2009), bring a realistic, critical picture about renewable energy in Latin America. These authors assert that, different from the recurrent and somewhat optimistic widespread view, the situation in Latin America is no better than in other regions of the world. In fact, they comment that the initiatives to create renewable energy sources in the region are almost all limited to hydropower and biofuels. For hydroelectric energy, they call attention to the environmental damage required to build such huge constructions as well as the difficulties to have them to operate in a situation of dry weather and less water availability. About the biofuels, they mention that industrial biofuels, like ethanol, might not help reducing greenhouse emissions while traditional biofuels as firewood and grass could cause deforestation or not follow sustainable practices.

3 Data Analysis and Discussion

We used some key drivers and variables connected with renewable energy: *Outdoor Air Pollution Attributable Deaths, Greenhouse Gas Emissions, Use of Alternative and Nuclear Energy Sources, Combustible Renewables and Waste, Fossil Fuel Energy Consumption, and Ocean Health Index*. Then we carried out a multivariate analysis to verify similarities and differences among the Iberian American countries and of the countries of the advanced economies and the remaining countries, whose results are shown in the table 1 below:

Table 1 ANOVAs Comparing Means and F-Values for Variables – 132 countries sample

Reg/Var	FossFuel	OutAirPoll	CombRenew	AlternNuc	Greenhgas	OHI
AIBER	67.20	16.54	21.50	12.26	1.47	61.57
AVECO	70.60	21.01	9.24	22.76	0.90	73.15
OTHERS	67.68	23.52	23.67	5.91	4.87	63.20
F-Value	0.17	1.17	3.85	14.48	2.60	29.45

Source: the authors

When we compare the group of 132 countries, we observe there is no much discrimination that would allow for an adequate analysis. That is because each of the three groups comprise countries in different development stages, except for those included in AVECO. Being so, we go for a separate, detailed analysis only of the Iberian-American countries and discuss their status in terms of positives and negatives, whose main results are as follows:

3.1 Outdoor air pollution deaths

Iberian American countries have an average of 15 deaths per 100,000 people directly attributable to outdoor air pollution. Close to this figure (15 deaths) are countries like Mexico, Peru, Brazil, and Colombia. Six countries stand out with an index between 23 and 35: Cuba, Portugal, Argentina, Chile, Uruguay and Spain. In the positive extreme, we have Guatemala, Costa Rica, Panama, Paraguay, Nicaragua and Equador, presenting between 3 and 6 deaths per group of 100,000 people.

3.2 Greenhouse gas emissions

In terms of greenhouse gas emissions, we see a concentration of 12 countries ranking between 0 and 1, that is with emission that go from 1000 to 2000 CO₂ equivalents per GDP, which is considered relatively high. Costa Rica, Peru, Spain, El Salvador, Portugal, Dominican Republic, Chile, and Colombia are the highest ranked in terms of emissions, while Bolivia, Paraguay, Nicaragua, Venezuela, and Uruguay are the lowest ranked ie with less emissions of CO₂ per GDP. The outlier country here is Bolivia, with an index, 4 that is, below 100, and here we should mention is might be connected to GDP since Bolivia has one of the lowest GDPs of South America.

3.3 Use of alternative and nuclear energy sources

Overall, the Iberian American countries are far from being clean with regard to their key energy sources: averagely only 10% of the total energy employed comes from alternative and/or nuclear sources. However, two countries stand out as positive outliers with over 40% non CO₂-generating energy sources: Costa Rica and El Salvador. After those, best ranked are Spain, Brazil, Colombia, and Uruguay with 15 to 20% of their energy coming from alternative sources. The other extreme show countries presenting less than 5% of alternative energy sources: Cuba, Dominican Republic, Bolivia, and Guatemala.

3.4 Combustible renewables and waste

Overall, Iberian American countries averagely have about 20% of use of combustible renewables and waste in relation to total energy consumed. The single outlier country is Guatemala, which presents a figure of over 66%. The majority of countries ranks between 5 and 15% and include Portugal, Cuba, Colombia, Panama, Dominican Republic, Spain and Equador. With 40 to 50% usage are Paraguay, Honduras and Nicaragua, while Uruguay and Brazil reach about 30%. The three countries positioned with less than 5% are Mexico, Argentina and Venezuela.

3.5 Fossil fuel energy consumption

Overall, we see nearly 75% of fuel consumption from fossil origin in the Iberian American countries. The largest group comprising Argentina, Dominican Republic, Mexico, Venezuela, Cuba, and Equador come as the top users, with 85 to 89% of fossil fuel energy usage. The second largest group, including Uruguay, Brazil, Honduras, Nicaragua, Costa Rica and El Salvador use between 45 and 55%. Only two countries use around 30% of fossil fuel: Guatemala and Paraguay.

3.6 Ocean health index

The Iberian American countries show a relative high Ocean Health Index – average 61. It should be in view of the vast coast and the resources that are available such as fish, salt and petroleum and its importance to the national economies and the populations. Top ranked are Mexico, Costa Rica, Colombia and Guatemala, with an index between 68-75. Lowest positioned are Paraguay, Nicaragua, Uruguay, Dominican Republic and Honduras, going from 45 to 55. Paraguay seems fully justifiable, since the country has no coast, being dependent from Brazil and Argentina to have a sea access.

4 Conclusion

Overall, we notice that the Iberian American countries rank in an intermediate position, driven usually from Spain, Portugal, Chile, Costa Rica and Uruguay – excluded such countries, most probably, the region would be in a much lower position, sometimes close to average figures shown by the African countries. We also see that the best-positioned countries in terms of the policies connected with relatively sustainable practices are also those that have the highest economic performance. That is the case of countries like Costa Rica, Chile and Uruguay, which usually present some economic and social figures relatively similar to those of the advanced economies. The same occurs to Spain and Portugal, which benefit from being full members of the European Union and have to be aligned in terms of the policies of the richest and full-developed nations, which are also more advanced in these questions. In fact, it seems that Iberian America as a group presents similarities with the group of 132 countries, replicating, in a microcosm, the conditions of that macrocosm in terms of diversity. In other words, if in Iberian America we have countries very well ranked as we mentioned, on the other hand, we may have countries presenting figures comparable to those of the Sub-Saharan region, for instance. Even in the case of the few successes, we can see that, behind some positive figures there may be serious problems hidden, such as that of income inequality. Furthermore, there have been some advances with specific types of renewable energy such as hydroelectric and biofuel, and in smaller scale, geothermal, but other equally productive and perhaps less invasive alternatives are still to be explored in more depth, like solar and wind energy generation, for instance. So far, this relatively limited reach in terms of a sustainable

energy matrix, particularly in Latin America, makes more evident that numbers are cold, and, being so, in order to have a more critical view it claims a deeper comparison and contrast, checking an isolated figure with a magnifying glass and then grouping them together to allow a good inference of the results, having in mind the interdependence of the facts and their weight to the analysis and the overall performance of a country or another. Clearly, there is a long way to go in the region, and the good examples, particularly of some small countries, can be brought to open discussion as the ones to be followed along with the successful experiences and initiatives of other regions.

Abstract: The purpose of this study is to reflect on a more conscious production and consumption of water. This issue is closely linked to the responsibilities towards this liquid, which is so precious to life on Earth. Thus, a person can simply play the role of consumer, paying for the product and running out of it without worrying about the future. However, individuals may also take the role of active citizens in water consumption, which in turn influences resilient actions in the exploration and use of this resource by companies, as well as throughout society. Regarding the aspects related to water use and production, it is necessary to discuss their addition to products circulating in the market, especially through commodities, by using the concept of "virtual water". This fact is relevant because although Earth has two thirds of its surface covered in water, it is known that one in three people do not have it in sufficient quantities to meet their basic needs (SALVADOR; DWECK, 2008), hence the importance of evaluating the use of virtual water, production, and consumer behavior. Thus, the exploratory method with qualitative approach is appropriate to facilitate the understanding of the studied social reality. Based on analytical categories regarding the aware production and consumption of water, we analyze specific cases in São Paulo, Brazil, and highlight that the consumption of this product has changed the industry's behavior and individuals influenced by its scarcity. It is assumed, at the end of this research, that even if people decide to consume water without worrying about other people, they will be affected as citizens. Thus, the right to consume does not absolve individuals of responsibility as citizens, which is also true for companies that suffer from changes in the availability of this resource.

Key words: Water; Production; Consumer; Conscious consumption

1 Introduction

For many years, social and environmental problems have been a concern only for the government and environmentalists, but these issues have been widely discussed by several other players of society in the early 21st century. The criticism is mainly about traditional practices of production and consumption, and the roots of the matter lie in the fact that production and offering are not always aligned with the social and environmental problems of the planet (HENDERSON, 1991; HENDERSON, 2003; ASSADOURIAN, 2013).

Thus, consumption made by people who are focused on individual aspirations for comfort and wealth guarantees the growth of *per capita* global consumption of several products that damage the biosphere. In fact, in order to keep this hedonistic consumption, it is also required heavy investment to exploit fossil fuels and other non-renewable resources which are critical to society, since this fact enlarges the reality that natural resources become increasingly expensive and scarce (HAWKEN; LOVINS; LOVINS, 2002; MORIN, 2013).

Furthermore, it can be said that non-renewable materials are the main boosters of industrial economies. However, growth and development are not always linked, and the true development must be defined in terms of improvement of a sustainable human well-being, not just the growth of material consumption or *per capita* wealth (ASSADOURIAN, 2013; SEN, 2000). Thus, in a short-term view, public or private institutions explore the resources in a progression infinitely superior to the regenerative capacity of the planet, then eliminating its resilience (VEIGA, 2005; VEIGA; CECHIN, 2010).

With the change from the economic and financial focus to a more sustainable perspective of life on the planet, the fighting against the scarcity of resources requires a comprehensive and ongoing social effort of all players of society. Thus, the challenge is to greatly increase productivity with the least possible use of non-renewable resources, and to establish a more conscious consumption (MOORE; REES, 2013).

Based on the perspective of use of resources for a conscious production and consumption, this paper aims to discuss this reality that often does not take into account the different social and

environmental elements involved in the production process or in consumption. Thus, it is argued that an attitude focused on conscious production and consumption shall assist to deal with the problems that afflict the contemporary society, the same society which often consumes by hedonism, collaborating to an unconscious and inconsequential degradation of the environment.

Therefore, the focus of this article is the use of water. It is indispensable to life, leisure, professional activities, and industrial development, besides impacting political, economic and social aspects of the planet. It is noteworthy that one of the main concepts explored in this work is “virtual water” since this condition of the resource is not characterized by its physical presence in the final product (ALLAN, 1998; HOEKSTRA; HUNG, 2002; CARMO *et al.* 2007). In this manner, water is used to produce a specific product, but often this product does not present this feature in its final appearance.

Given this reality, it is imperative to build awareness with regard to the healthy consumption of water by man, who is the greatest benefitted from this natural resource, but unfortunately, has given little or no importance to its proper use and preservation. Based on this context, an important question arises: what decisions of water use in production and consumption do affect society? Therefore, the main goal of this paper is to present the direct relationship between production and consumption of water and environmental sustainability in order to foster some reflection about conscious consumption of this liquid that is so important to life.

As for the discussion in this article, it should be noted that an exploratory and descriptive approach was used to build lines of reasoning to understand the production and consumption of water and also to discuss and analyze the rational use of water and its theoretical and practical implications. The analytical procedure applied in this paper was a critical interpretation understood as a hermeneutical exercise.

2 Conscious Production and Consumption of Water

2.1 The use of water Resources

The human body consists of 75% of water, and in case of illnesses, one of the key recommendations of doctors is to drink plenty of water. Therefore, life itself needs water to grow plants, trees, rivers, and dams. The importance of water for the survival of living beings is undeniable. It is worth to notice that about 70% of the surface of the Earth is covered by water, with a volume of nearly 1.4 billion cubic kilometers. Out of this total, 97.5% consists of seawater and only 2.5% in freshwater. Approximately 30.2% of the total volume of freshwater on the planet can be used for plant and animal life in lands, while 69.8% are at the poles, in glaciers and ice soils (INSTITUTO CARBONO BRASIL, 2014).

Nevertheless, access to drinking water and to sanitation is one of the themes in discussion to achieve the Millennium Development Goals set by the United Nations, whose studies estimates that 92% of the global population will have access to safe drinking water by 2015. However, according to the UN, at least 11% of the world population, which is equivalent to 783 million people, does not have access to this resource. In addition, 1.1 billion people are still with no sewage systems, and about 4.000 children die every day from diseases associated with lack of quality or lack of water treatment (ECODESENVOLVIMENTO, 2012).

Brazil has 13.7% of the planet's fresh water, and is part of the select group with water reserves (AMAE, 2014). In fact, it is necessary to understand that having this resource available in the country does not mean that everyone will have access or will continue to have access to it. Translate into numbers, water consumption in Brazil is divided into: 59% are consumed in agriculture, 22% in household use, and 19% industrial use (AMAE, 2014). On the issue of domestic use, it can be said that much of the use of this liquid is related to waste. Hidden leaks, broken, unregulated or old landfills and the lack of rational use of water are some of the reasons why we are wasting this liquid out. We cannot forget that Brazilians uses treated water to flush and wash their streets.

Another example of waste is in the bath. A shower lasting 15 minutes with the water valve half-open consumes 243 liters of water, but if you keep the valve closed while soaping, the bath time will be five minutes shorter and you can reduce the total water consumption to 45 liters (ECODESENVOLVIMENTO, 2012). This is a very worrying scenario, since the water lost every day in Brazilian capitals is estimated at 6.14 billion liters per day, an amount which would meet the needs of a daily consumption of 38 million people, equivalent to the entire population of a country such as Argentina (WHATELYC, 2014).

From 2004 to 2013, the consumption of water in 33 municipalities in the metropolitan region of São Paulo increased by 26%, while production grew only 9% (BRENHA; GERAQUE, 2014). As stated

in the technical standards of Sabesp, it is estimated a consumption *per capita* of 150 liters a day in São Paulo (SABESP, 2012). In addition, there are other values for other types of consumption such as in prisons (300 liters a day) and apartments (200 liters per day). In a study conducted by Pedro Luiz Côrtes, professor of Environmental Management at USP, it was shown that a São Paulo dweller consumes on average 27% more water than a German, and 9% more than a French dweller (BRENHA; GERAQUE, 2014). In the case of Brazilian households, one of the main reasons for the boost in consumption per capita was the increasing income, since people started using more washing machines and dishwashers, washing cars more frequently, bathing with more powerful showers etc. Thus, as the standard of living has evolved, water consumption related to consumerism wishes also increased (BRENHA; GERAQUE, 2014).

Statements about household water consumption highlight that water scarcity in the world is also aggravated by social inequality, lack of sustainable management, and use of natural resources. In regions where the situation of lack of water has already reached critical levels of availability, and in the countries of the African continent, the average of water consumption is 10 to 15 liters *per capita* a day (CETESB, 2014). This scenario is quite different from the average of 150 liters a day in Brazil. In addition, consumption is not the only waste. In 2013, 25% of the water was lost on the way between the dams and homes. It is noteworthy that Japan's cities lose 11% of the water that it captures, and the goal of Sabesp is to decrease to 18% of loss by 2020 (BRENHA; GERAQUE, 2014). In this manner, governments do not have an option to separate the population policy from the water supply. The problem in the urbanization process is reflected directly on the water quality of sources that supply the cities (AMAE, 2014).

Another important point is environmental pollution; one of the main factors that contribute to the degradation of water resources in Brazil and in the world (AMAE, 2014). According to the UN, 77 million people in Brazil, a number equivalent to the population of Germany, do not have safe water. In addition, 60% of the population do not have proper water treatment or sanitation. Thus, regular water supply, with uniform quality, is still a distant reality (VEJA, 2014).

Therefore, to be considered appropriate for use, water is not required to have the same characteristics for different use purposes. The parameters for supply are different as in the household, industry and irrigation (INSTITUTO CARBONO BRASIL, 2014). This situation hampers the quality of the water when analyzing the demand and the reality of this resource at each location. While European Union countries allow the use of only five pesticides in drinking water, in Brazil the water may contain 22 types of pesticides, 13 heavy metals, 13 solvents, and six disinfectants to be consumed (VEJA, 2014).

In the irrigation process, great part of the water is filtered by the soil, where it reaches the groundwater and is stored. One aspect that should be emphasized is that the water often is returned to Nature contaminated by pesticides. Due to deforestation, it is lost the process in which water infiltrates the soil through the trunks and roots of trees and other vegetation, which acts as biofilters, recharging aquifers and ensuring the sustainability of water source (TOLEDO, 2014).

One issue that should be highlighted is that the water problem is not only local, because most aquifers are located on the borders of many countries. According to an inventory of UNESCO, out of the 273 trans-boundary aquifers, 155 are located in Europe, 68 in the Americas, 38 in Africa, and 12 in Asia, and the volume of fresh water aquifers present in these sites is a hundred times bigger than that existing on the surface of the Earth. Moreover, 65% of this water is used for irrigation, 25% for human consumption, and 10% in industry (INSTITUTO CARBONO BRASIL, 2014).

As above mentioned, problems with the collection and supply also have a direct relationship to regional development, and income can also determine the quantity and quality in the consumption of this resource. In Brazil, in places where the population earns a quarter of a minimum wage there is a 35% water deficit. Already in places where income is five times the minimum wage, 95% of the population has appropriate access to water supply. For the UN, the price of water should be fixed, and their supplies, following international standards, could not represent more than 5% of a family budget (VEJA, 2014). However, the problem is apparently not related to prices. The price of water and sanitation rate in Brazil is considered low by international standards. According to the Global *Water Intelligence*, while the average rate in the country is around US\$ 1.50 per cubic meter, in Denmark, it is US\$ 8.11. Other countries also have a higher rate, such as the UK, (4.33 USD), France (4.08 USD), Canada (3.30 USD), USA (3.09 USD), and Japan (2.63 USD) (CARRERA, 2014).

According to a report of the United Nations Educational, Scientific and Cultural Organization (UNESCO), some factors for the possible lack of water are due to intense urbanization, inadequate

agricultural practices, and pollution produced in production and consumption. These factors hinder the supply of clean water in the world (UNESCO, 2015). The use of water in the production of goods and/or in services is not often recorded in all stages of the process. Note that to produce a particular good water is used since its initial phase, like the production of bread, which since the very growing phase of its ingredients consumes a lot of water (GERBENS-LEENE; MEKONNEN; HOEKSTRA, 2011). According to research conducted by Arjen Hoekstra of the University of Twente, in the Netherlands, Brazil is the fifth country with the largest net export of "virtual water", that is, water incorporated into the production process.

Thus, water is used in the processing of grain, meat, and even in industrialized goods that a country exports. Agricultural commodities are among the main export items of Brazil. Whereas agriculture accounts for over a quarter of the national GDP, Brazilian water already appears as a highly-rated element in the international market, and Brazil is one of the largest exporters of soybeans, beef, and sugar. In environmental terms, it means the transfer of virtual water to other countries where there is water shortage (WICHELNS, 2004; CARMO *et al.*, 2007; GERBENS-LEENES; MEKONNEN; HOEKSTRA, 2011).

According to UNESCO, Brazil exports about 112 trillion liters of fresh water per year, equivalent to almost 45 million Olympic swimming pools. Carmo *et al.* (2007) argue that the analysis of studies undertaken under the "Virtual Water Trade Research Program" (UNESCO) shows the relationship between world "tank-countries" of fresh water and their ability to generate foreign exchange.

However, water resources involved in the production of export goods may become scarce even in regions where there is relative abundance. Despite the water crisis, it is claimed that Brazil should not change its business profile, but make use of water more efficiently. It is possible to increase the efficiency of water use by producing the same food with less water, with better irrigation technology and best practices, avoiding waste and practicing organic farming (HOEKSTRA; HUNG 2002; GERBENS-LEENES; MEKONNEN; HOEKSTRA, 2011).

3 Conclusion

Consumption of goods and services in a healthy society lies in the establishment of relationships between consumers and suppliers. However, this relationship has become increasingly complex, especially due to the exploitation of finite resources. From 2004 to 2013 the consumption of water in 33 municipalities in the metropolitan region of São Paulo increased by 26%, while production increased only 9%. On average, a São Paulo dweller consumes 27% more water than a German, and 9% more than a French citizen.

Thus, the habits of a society can determine the manner goods and services are produced and delivered. Such logic covers both superfluous products and products related to the basic needs such as food and water itself. As discussed in this study, the process of capturing and supplying water in Brazil and abroad has been under and in-depth analyzes. Water is essential to life, and it cannot run out or become a simple flow, free from market supply and demand. Thus, it is necessary to adopt solutions towards conscious consumption, thus improving its consumption, recycling, and reuse.

Moreover, this scenario defines the importance of understanding the concept of virtual water, and besides minimizing future impacts, it is already perceived in the present moment, as the example of what happens to the Cantareira Water Base system in São Paulo.

As above noted, most of the water is concentrated in agriculture, and its return to the environment is often hindered by the use of pesticides and by deforestation. In industrial and household use, it is also contaminated when returned and is not properly treated due to lack of sewers and sanitation.

Water problem is related not only to its absence when is necessary to take a bath or wash a car. We cannot forget that scarcity leads to diseases and limited quality of life. Furthermore, lack of water can be directly related to the level of development of localities, as in some African countries, where people survive with 10 to 15 liters of water a day, much below the 150 liters *per capita* a day estimated by SABESP in Sao Paulo.

A valid reflection is: whether people choose to act as citizens who consume or as consumers who act as citizens, the water problem is everyone's fault; a local and global problem by destination, reflection of transnational aquifers. Then, considering that Brazil is the largest hydropower in the planet, it can be concluded that to save water and use it consciously is the duty of every Brazilian citizen.

Abstract: Urban population growth rates are rising, which allows increased vulnerability to various risks. In face of such events, the World Risk Index calculated for the first time in 2011 the disaster risk for 171 countries. This index consists in 28 indicators related to four components, which are: a) exposure to natural hazards; b) susceptibility; c) coping capacities and d) adaptive capacities. The goal of this article is to analyze the relationship between governance and social progress, considering the aforementioned components of exposure, vulnerability, susceptibility, coping capacities and adaptive capacities in face of global risks in 132 countries. Data was analyzed with factor analysis and multiple linear regression techniques using MINITAB 16 software. This study has acknowledged that, regardless of however effective public policies may be in reducing risks, inherent crisis will continue to take place with potentially destructive consequences. This justifies the role of governance in developing actions that can deal with such events and enable the recovery from such events.

Key words: Governance; Global risks; Social progress

1 Introduction

In 1950, two thirds of the world population lived in rural areas. In 100 years, this ratio will be reversed and two thirds of the population will live in cities. This change began in 2007 when the 50% threshold was crossed. This reflects the new scenario of growing urban cities that need to comprise over 7 billion inhabitants. In contrast, the population in rural areas is declining.

Urban population growth rates are rising, which allows increased vulnerability to various risks. Data reveal that over 15% of the world population is in multidimensional poverty, around 80% lack comprehensive social protection, around 12% suffer from chronic hunger and nearly half of all workers are in informal or precarious employment.

Since the first Global Human Development Index Report (HDI) of the United Nations Development Program (UNDP) was published in 1990, most countries have recorded significant human development. However, society is still vulnerable to risks, which is why the latest report considered vulnerability and resilience as fundamental aspects of human development

In face of such events, the World Risk Index, published by the Alliance Development Works and United Nations University Institute for Environment and Human Security for the first time in 2011, calculated the disaster risk for 171 countries worldwide. The index consists in 28 indicators related to four components, which are: a) exposure to natural hazards; b) susceptibility; c) coping capacities and d) adaptive capacities.

The current report acknowledges that, regardless of however effective public policies may be in reducing risks, inherent crisis will continue to take place with potentially destructive consequences. This is why coping and adaptive capacities allow society to deal and recover from such events. This study aims at analyzing the relationship between governance and social progress, considering the components of exposure, vulnerability, susceptibility, coping and adaptive capacities in face of global risks.

2 Theoretical Reference

The authorities and the population need to understand the threats they face and develop a shared information base on disaster losses, threats and risks. An accountable and competent government that guarantees a sustainable development is necessary to ensure the management and organization of cities before, during and after a natural disaster.

2.1 Governance

Governance has become a key concept. Its original meaning was previously associated with a developmental and political debate where the term was used to refer to development policies guided by certain premises, such as management, accountability, transparency and rule of law of the public sector, which were determined by the United Nations (UN) and Organization for Economic Cooperation and Development (OECD).

In the current context, governance can be understood as a new generation of administrative and State reforms whose goal is joint action, performed in an effective, transparent and shared manner. This action is the responsibility of the State, enterprises and civil society, which aims at an innovative solution for social problems that could create likelihoods and opportunities for a sustainable development in the future for all.

Significant contributions on this topic have arisen from regional researches. Governance, in a first instance, can be simply understood as the structures and ways in which city regions are 'managed', in an administrative, legal, public, private, local, national and European sense. In political science, public governance is associated with changes in political management. It is seen as a growing trend towards self-management in social, economic and political spheres, and towards a new composition of forms of management.

Whether the legitimating force of public governance procedures is enough to fundament this new way of exerting power, i.e., the power of society through cooperation, is a question that needs to be raised. This would be the perspective of a polis, where citizens, in unison, would concern themselves with the nation and watch over its public organization as entities that deal with what is public and what public means.

2.2 The four components

The World Risk Report analyzed the four components related to risk: a) exposure; b) susceptibility; c) coping and adaptive capacities and d) vulnerability. The report creates the opportunity, among other results, to reflect on our capacity to deal with adverse events and recover from them.

Exposure is defined as entities, such as the population, conditions of built-up areas, infrastructure components and environmental areas that are exposed to the impact of one or more natural hazards (earthquakes, cyclones, droughts, floods and sea level rise). Susceptibility is considered the likelihood of suffering harm, loss and disruption in an extreme event. It describes the characteristics and framework conditions of a society.

The terms coping and coping capacity comprise various abilities of societies to minimize the negative impacts of natural hazards and climate change through direct action and the resources available. According to researchers at the Stockholm Resilience Centre, coping can be defined as the ability of long-term system deal with variations or changes and continue developing. For an ecosystem like a forest, this may mean dealing with storms, fires and pollution, as for a society has to do with the ability to deal with the political uncertainties or natural disaster in a way that is sustainable in the short, medium and long term.

Coping is a concept that has been used to explain phenomena that overcome or transcended unfavorable situations. It is an issue of extreme importance, because it implies greater knowledge of how we can strengthen the capacity of resistance of society and nature, learning to deal with the tensions caused by the climate change and other environmental impacts. Cities or countries resilient are those who managed to recover quickly from the impact of natural disasters or economic conditions and effects I social unfavorable or external such as riots or wars, or extreme events unforeseeable situations.

Coping capacity refers to a set of cognitive competencies and behavioral strategies used by an individual to deal with the demands of stressful situations. Adaptive capacity, on the other hand, is understood as a long-term process that includes structural changes. Moreover, adaptation focuses on measures and strategies that deal with the negative impacts of natural hazards and climate change in the future.

Vulnerability comprises the components of susceptibility, lack of coping capacities and lack of adaptive capacities, and relates to social, physical, economic and environmental factors which make people or systems susceptible to the impacts of natural hazards, the adverse effects of climate change or other transformation processes

Structural vulnerabilities create profound inequalities among groups and express generalized poverty based on the formation of socially acknowledged and established groups. Our society's scenario can be seen through child vulnerability, i.e., in every 100 children, 68 do not receive early childhood education and 25 live in poverty lacking food, sanitation and hygiene. This leads to higher risks of infection and stunted growth. Around 156 million children suffer from stunting due to undernutrition and infections, which contributes to the 35% death rate from measles, malaria, pneumonia and diarrhea.

2.3 Social Progress Index

The Social Progress Index (SPI) analyzes a countries' social progress associated with its economic growth. The aim of this indicator is to show policymakers, international development organizations,

enterprises and civil society organizations that they must see beyond economic indicators to measure a nation’s social progress. They need to have a holistic and highly rigorous vision.

Instead of using economic indicators, especially GDP, to measure a country’s progress, the index created by Harvard researchers evaluated data from 52 social and environmental indicators grouped into three main categories: basic human needs, foundations of wellbeing and opportunity.

Figure 1 illustrates the theoretical model proposed by this study to try to understand the relationship between governance and the four components related to risks, as well as, the effects of these components in social progress.

3 Result Analysis and Discussion

For our purpose we’ll be dealing with 132 countries divided into 3 Regions: the Iberoamerican AIBER (21 countries), The Advanced Economies AVECO (28 countries) and the rest of the 132 countries OTHERS (84 countries). Table 1 shows the means for each one of the 3 Regions (3R) of Synthetic Indicators such as Social Progress Index (SPI), Human Development Index (IDH), and Governance (GOV), as well as the ones concerning Analytic Indicators related to Risks to Natural Disasters (DESNAT), Exposure (NEXPO), Vulnerability (IVULN), Susceptibility (INSUCEP), Lack of Coping Capacities (CAPAFRSIT) in difficult situations and lack of Adaptive Capacities (CAPADAP); as well as the Fs of the corresponding ANOVAS.

Table 1 Means and F’s for Rescaled (0–100) and positivized Variables (the higher the better)

3R	SPI	IDH	GOV	DESNAT	NEXPO	IVULN	INSUCEP	CAPAFRSIT	CAPADAP
AIBER	64.41	65.62	42.48	72.93	68.86	58.17	71.56	71.56	61.67
AVECO	90.3	87.36	83.25	89.75	79.15	86.26	90.51	90.51	85.35
OTHERS	42.63	46.74	33.36	76.47	77.73	42.56	57.69	57.69	42.9
F ANOVA	83.97	43.45	97.02	10.87	3.24	57.93	21.77	97.08	58.52

No doubt that AVECO countries as a whole are doing better than the AIBER countries and these ones doing better than the OTHERS countries. As may be seen in the following figure 1.

Figure 1 Comparing the 3 Regions regarding the Basic Indicators

Moreover as may be seen in the Dendrogram of Figure 2, Synthetic and Analytic Indicators are closely correlated except for the case of Exposure and Risks to Natural Disasters, while Principal Component Analysis shows that by far the most representative Analytic Indicator is the one regarding Vulnerability (INVUL) followed by far by Exposition (NEXPO); and moreover one may have nice Regression Model for Vulnerability such as the following: $IVULN = - 0.48 + 0.755 HDI + 0.236 GOV$ ($R^2 = 92.7\%$, $p=0.000$ for both coefficients).

Figure 2 Dendrogram of Synthetic and Analytic Indicators

Among the 10 countries with the highest social progress index, three countries are worth noting: New Zealand with 88.24%, Switzerland with 88.19% and Iceland with 88.07%. These countries present excellent data on account of their public policies being aimed at meeting the basic needs of their citizens, at establishing the necessary infrastructure and tools to improve their quality of life and at creating an adequate environment so all may find equal opportunities to pursue their full potential

But besides Social or Living Conditions, Governance seems to be the most Critical Development Factor, as may be seen in Figure 1 the Advanced Economies (AVECO) are far away from the rest including our Iberoamerican Region (AIBER). Of course governance structures vary among countries due to various factors such as political regimen, legal system, capital market structure, historical experience with industrialization, geographical conditions and cultural conditions. The result of such an institutional and historical progress means different structures and different rates at which they can impact social progress. The top-ranking countries are Finland with 100%, Norway with 99.07% and Sweden with 99%.

The futurist Eleonora Massini used to say that among the three basic Transformations going on today, the Fastest are that ones in Science and Technology, followed by far from the Socio Cultural and these also much faster than The Institutional Ones, and no doubt this lack of Synchrony affects all systems . Moreover slowness and quickness are seen in both nature and society changes. After all, the so-called catastrophic events develop quickly in the same way societies lacking technological resources are at the mercy of the slowness of time. The countries with the highest exposure to impacts from one or more natural risks were the Philippines with 52.46%, Japan with 45.91% and Costa Rica with 42.61%.

The highest vulnerability rates regarding social, fiscal, economic and environmental aspects are seen in Niger with 77.12%, Central African Chad with 75.72% and Liberia with 72.93%. The concept of a population’s social vulnerability has been used to characterize social groups who are affected the most by stressful environmental situations, including those related to climate. Vulnerability as the characteristics of a person or group in terms of their capacity to anticipate, cope with, resist and recover from the impacts of a climate disaster.

The highest susceptibility rates, i.e., the likelihood of suffering harm, loss and disruption in an extreme event, belong to Mozambique at 69.89%, Madagascar at 65.81% and Tanzania at 64.27%. Resilience is a dynamic process which results in a positive adaptation within the context of significant adversity. Cities and coping countries prepare to react to external events to great adversities of organized emergency reducing way materials and losses of lives, as well as acting in front of the synergy and proactive global mega trends and unpredictable events. Possibly some and risks can be envisaged, of possible leveraged opportunities from management instruments, as the SWOT, and analysis of strategic foresight methodologies. The greatest lack of coping capacities in difficult situations is found in Sudan with 93.05%, Chad with 91.80% and Yemen with 91.03%.

Adaptation is when an individual has met the social expectations related to his or her development

or when there are no signs of mal-adjustment. The countries with the greatest lack of adaptive capacities were Togo with 71.08% and Niger with 68.5%.

Based on these results, we can infer that it is the responsibility of the State, enterprises and civil society to develop policies that minimize the vulnerability and increase the coping capacities in difficult situations of their citizens.

International organizations such as the World Bank and UNDP are recommending to countries the creation of centers for studies in coping, as well as the adoption of the theme at the local level regional. For this purpose, it is important to incorporate the recommendations and examples about the resilience of the Rockefeller Foundation, indicating in particular that adaptation projects are most effective when they involve infrastructure, both institutional and community side.

An example of such initiatives is that of the Government of Malaysia which has vision to the nation-building resilient promoting unity, instilling the spirit of patriotism, nurturing political maturity, cultivating a society more tolerant, with positive values and raising the quality of life as well as increasing the country's economic coping. Moreover, we can consider that social progress is related to a country's level of exposure and type of governance.

4 Conclusion

The role of governance is crucial in steering society to be able to cope with and recover from global risks. Strategies need hence to be implemented to develop coping in countries and increase the index of social progress, including:

(1) Policies to create resilience: in the year 2030, according to the UN, more than 80 of the world's population will live in urban areas; in Latin America the percentage will be even higher, reaching almost 90. The identification of the issues and the development of strategies to address these realities are vital points, as well as the establishment of policies to improve accuracy in making decisions as to investment of resources.

(2) Decentralization of the information: decision-makers require quality information and sharing experiences with leaders of other countries in order to react quickly and intelligently in crisis situations. Thus the formation of a network of Ibero-American States leaders is vital to share knowledge and good government practices.

(3) Prevention, leadership and Social Cohesion: it is necessary to involve the different actors of society in the elaboration of prevention plans and strategies to deal with adversity.

Through these actions environments with potential risks may analyze the reaction capacity and prevention or mitigation strategies may be implemented and monitored.

A participating society represents abled individuals, who work with the authorities, to make decisions and plans for their cities. This context may provide the conditions to implement measures, anticipate disasters, predict disasters with the aid of technology and protect the infrastructure, goods and members of a community, including homes, cultural heritage, environmental and natural and economic wealth.

Empirical Research on the Impact from Export Technology Diffusion to Environment Regulation: Evidence from 2007-2011 Industrial Panel Data of China*

Liu Guoxin, Wang Jin*

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: syliuguox@126.com, wj77bb@aliyun.com)

Abstract: when environmental problems are more and more acute, the technology has been an important means for environmental governance. Based on 2007-2011 China's industrial panel data which is reclassified by GB/T 4754-2002 national industry classification and SITC standard, in this paper we empirically test the impacts from export technology diffusion and independent R&D to environmental regulation. The results show that export technology diffusion of cleaning industry has a significant negative effect to environmental regulation, but in pollution-intensive industries it is significant positive effect. We also find that independent R&D has negative effect to environment regulation, but second R&D has positive effects.

Key words: Export technology diffusion; Independent R&D; Environmental regulation; Panel data; PCSE Robust variance

1 Introduction

Currently the industrialization not only promotes world economic prosperity, but also accelerates environmental consumption. While the environment gets worse, using the science and technology to improve environmental quality has become an important means of pollution control. With the rapid growth of China's industrial exports, foreign high-tech standards, industrial standards, environmental standards and so on also indirectly promote the technical progress of China's export industry, so export technology diffusion has become an important channel for technological progress. If we can clear the effect from technology to environment is positive or negative, it will help us using appropriate means to protect environment, and realize "multi-win" of technology, economic and environment.

Now the main research of technology and environment regulation mostly based on the Porter hypothesis that is felicitous environment regulations may be stir corporations to innovation, so environmental regulations will be good for the competitiveness of corporations. Different from the hypothesis, Zhang Cheng (2011)^[1] and Jiang Fuxin (2013)^[2] considered that U-type relationship exist between the environmental regulation intensity and technological innovation, while Zhang Zhongyuan (2012)^[3] and Guo Yan(2013)^[4] support the hypothesis.

Although the philosophy research and the extended research of Porter hypothesis has shown some relationship of environmental regulation and technology, but the research on the impact from technology to environmental regulation is also shortage, so the analysis of this paper may provide a guide to enterprises and governor adopt appropriate measures to realize technology, environment and economic multi-win.

2 Modeling

A Cobb Douglas production function was constructed, in addition to labor L and capital K , E was introduced as the third production factor input, and A was set as technical level, so the production function is:

$$Q = A \cdot F(K, L, E) \quad (2)$$

Assuming Q keeps constant returns to scale, based on the factor demand equation we can get the cost function:

$$C = H(P_K, P_L, P_E, P_M, A) = A^{-1} P_K^{e_K} P_L^{e_L} P_E^{e_E} P_M^{e_M} Q \quad (3)$$

P_K , P_L , P_E and P_M respectively represent the price of capital, labor, environment and raw

* This paper is supported by National Natural Science Foundation of China (71372201), Ministry of Education Project of Humanities and Social Sciences (12YJCZH196); China Postdoctoral Science Foundation (2013M531748); The Soft Science Research Program of Hubei (2015BDF085).

* Wang Jin is corresponding author.

materials, while e_K , e_L , e_E and e_M represent the price elasticity of capital, labor, environment and raw materials. According to Shepard theorem, the demand of production factors equals partial derivative of the cost function to the price of the factor, so the partial derivative of environmental factor price of (3) is solved:

$$E = \frac{\partial C}{\partial P_E} = \frac{e_E \cdot A^{-1} \cdot P_K^{e_K} P_L^{e_L} P_E^{e_E} P_M^{e_M} \cdot Q}{P_E}, \text{ if } P_Q = P_K^{e_K} P_L^{e_L} P_E^{e_E} P_M^{e_M}, \text{ then } \frac{P_E \cdot E}{P_Q \cdot Q} = e_E \cdot A^{-1} \quad (4).$$

That is, the ratio of total environment cost in total product output value has function relationship with technical level. When environmental regulation level growing, to meet the requirements of emission the manufacturer may be increase the input of environment, so the environmental regulation level can be described as the ratio of total environment cost in total product output value, ER is used to represent the environmental regulation, (4) is changed as

$$ER = e_E \cdot A^{-1} \quad (5)$$

The technical level is set as $A = e^{g(EX, RD) + \delta}$, EX and RD respectively represent export technology diffusion and independent R&D. The function $g(\cdot)$ can be set as:

$$g(\cdot) = \alpha_1 \ln EX + \alpha_2 \ln RD \quad (6)$$

Put (6) in (5), and take the logarithm on both sides of (5), the basic model is: $\ln ER_{it} = \beta_0 + \beta_1 \ln EX_{it} + \beta_2 \ln RD_{it} + \varepsilon_{it}$, then an cross term of export technology diffusion and independent R&D is set to measure the secondary innovative, so the model is:

$$\ln ER_{it} = \beta_0 + \beta_1 \ln EX_{it} + \beta_2 \ln RD_{it} + \beta_3 \ln EX_{it} \cdot \ln PE_{it} + \varepsilon_{it} \quad (7)$$

i is individual, t is time, β_0 is intercept, ε_{it} is random error term and $\beta_1 - \beta_3$ is coefficient.

3 Data Source and Processing

3.1 Regroup the industrial sectors

Because the industrial classification between national economical industry classification (GB/T 4754-2002) and SITC standard is different, basing on the research of Sheng Bin (2002)^[5] and Li Xiaoping (2006)^[6], we unified standard and regrouped 33 China's industrial sectors in which the production and supply of electric power, gas and water are excluded¹. According to the definition of pollution intensive industries by Xiao Hong (2008)^[7] and Li Bin (2010)^[8], 33 industrial sectors are divided to 17 pollution intensive industries and 16 clean industries².

3.2 Export technology diffusion

Now CH model and LP model were used widely in calculating international technology diffusion.

In CH model, $S^{fm} = \sum_j \frac{m_{ij}}{m_i} S_j^d (i \neq j)$, S^{fm} is international technology diffusion, m_{ij} is total goods

¹ 33 regrouped industrial sectors are: 1 mining and washing of coal, 2 extraction of petroleum and natural gas, 3 mining and processing of ferrous metal ores, 4 mining and processing of non-ferrous metal ores, 5 mining and processing of nonmetal ores, 6 manufacture and processing of foods (combined processing of food from agricultural products and manufacture of foods), 7 manufacture of beverages, 8 manufacture of tobacco, 9 manufacture of textile, 10 manufacture of textile wearing apparel, footwear and caps, 11 manufacture of leather, fur, feather and related products, 12 processing of timber, manufacture of wood, bamboo, rattan, palm and straw products, 13 manufacture of furniture, 14 manufacture of paper and paper products, 15 printing, reproduction of recording media, 16 manufacture of articles for culture, education and sport activities, 17 processing of petroleum, coking, processing of nuclear fuel, 18 manufacture of raw chemical materials and chemical products, 19 manufacture of medicines, 20 manufacture of chemical fibers, 21 manufacture of rubber, 22 manufacture of plastics, 23 manufacture of non-metallic mineral products, 24 smelting and pressing of ferrous metals, 25 smelting and pressing of non-ferrous metals, 26 manufacture of metal products, 27 manufacture of general purpose machinery, 28 manufacture of special purpose machinery, 29 manufacture of transport equipment, 30 manufacture of electrical machinery and equipment, 31 manufacture of communication equipment, computers and other electronic equipment, 32 manufacture of measuring instruments and machinery for cultural activity and office work, 33 manufacture of artwork and other manufacturing

² 17 pollution intensive industries: 1, 2, 3, 4, 5, 6, 9, 11, 14, 17, 18, 20, 21, 22, 23, 24, 25.

and services export from country i to country j , $m_i = \sum_j m_{ij}$, S_j^d is R&D capital stock. However, in LP model it is considered that the capital overflow of one country merged by two countries is much higher than the sum of these two countries' R&D overflow, m_i is modified to y_j which is GDP of country j , so international technology diffusion is defined as $S^{fm} = \sum_j \frac{m_{ij} S_j^d}{y_j}$.

LP model is chosen to calculate export technology diffusion in this paper, in order to measure the contribution of foreign R&D capital stock to industries, $\ln IM_{it} = \frac{m_{it}}{y_{it}} \ln S_{it}^{fm}$ is set, m_{it} are the total export from some industrial sector of country i to all trading partners on t time.

The main developed countries and some newly industrializing countries which frequently trade with China are chosen for calculating the foreign R&D capital stock, including Canada, USA, England, German, France, Italia, Japan, Russia, Singapore, Korea.

The export data of China's industries which are obtained from COMTRADE database are used to calculate m_{ij} (the export from China to 10 countries) and m_{it} (the export from 10 countries to China). y_j (GDP of countries) is obtained from the database of the World Bank. After the unit of data unified, m_{ij}/y_j can be got.

Basing on R&D expenditure ratio of 10 countries in 2013 *China Statistical Yearbook on Science and Technology*, R&D expenditure can be calculated and converted to RMB according to the average exchange rate of that year. Referring the R&D stock calculation method of Wang Jin (2011)^[9], 10 countries' R&D stock S_j^d and S^{fm} measured by RMB can be got, and then we got EX_{it} , the export technology diffusion of China.

3.3 Independent R&D

The independent R&D is obtained from intramural expenditure on R&D in industrial enterprises in 2008-2012 *China Statistical Yearbook on Science and Technology*, and the method of data processing was same as the data of export technology diffusion.

3.4 Environment regulation

The ratio of environment protection input to gross industrial production of industrial sectors was used to represent the environment regulation. Because the industrial sector data of environment protection input is difficult to obtained, so it is substituted the sum of annual expenditure of industrial waste gas treatment facilities and annual expenditure of industrial waste water treatment facilities in 2008-2012 *China Statistical Yearbook on Environment*.

3 Empirical Analysis

Table 1 The Regression Results on Different Type of Industrial Sector

Variable	Pollution Intensive Industry		Clean Industry		Whole Industry	
	Coefficient (Std. Error)	t- Statistics (Prob.)	Coefficient (Std. Error)	t- Statistics (Prob.)	Coefficient (Std. Error)	t- Statistics (Prob.)
lnEX	12.5340 (2.810541)	4.4596***	-37.3479 (7.814353)	-4.7794***	-34.8835 (7.466824)	-4.6718***
lnRD	-0.4735 (0.089074)	-5.3158***	-0.7256 (0.201086)	-3.6083***	-0.6087 (0.084355)	-7.2159***

	D.W Stat.	1.9970	D.W Stat.	1.7118	D.W Stat.	1.8684

*** was presented that parameter estimates is significant at 1%.

In order to explicitly analyze the impact from export technology diffusion and independent R&D to environment regulation, the panel data model is used respectively in pollution intensive industry, clean industry and the whole industry. During empirical analysis, the software Eviews5 was used to determine the model type through F-statistics and Huansman test; the result showed that the model had variable intercept

and fixed effect. The industries may have some correlation with each other, such as the relationship between upstream and downstream, so cross section heteroscedasticity and contemporaneous correlation are allowed in the model. PCSE robust variance model was used to evaluate the model. During evaluation process, insignificant variables were eliminated; the result was shown on table 1.

1) Export technology diffusion has significant negative effect on environment regulation in clean industry and the whole industry, while has positive effect in pollution intensive industry. Comparing the coefficient of their, the negative effect in clean industry from export technology diffusion to environment regulation is so strong to pull down the environment regulation level of the whole industry.

2) No matter in pollution intensive industry, clean industry or the whole industry, independent R&D has significant negative effect on environment regulation, but the coefficient is smaller. It maybe indicates if guided reasonably by country or industry, the positive effect will be motivated.

3) The cross term of export technology diffusion and independent R&D has significant positive effect on environment regulation in clean industry and the whole industry, that means the second R&D, which upgrades export products to meet foreign technology standard, will promote the environment regulation level.

4 Conclusions

4.1 Result analysis

1) In pollution intensive industry, export technology diffusion is benefit to the environment regulation, on one hand it maybe caused by the increasing quality demand of products, on the other hand, the growing market access conditions of China's export products such as green barriers and TBT from our trade partners has been the invisible impetus for environment regulation. Though these barriers restrict the quality and quantity of our export products to some extent, but in the view of sustainable development, this will promote the industrial sectors increase the input of R&D, enhance production efficiency and accelerate the environment technology upgrade. So the higher foreign environment regulation will drive the growth of China's environment regulation in export industrial sectors.

2) In clean industry, export technology diffusion has negative effect on environment regulation, which maybe is due to the trade partner paying more attention to the cheaper resource and labor but not technology capacity. According to the research Wang Yujing (2010)^[10], most of the export volume top 10 of industry are pollution intensive industry. Because of the great influence of extensive production and trade pattern, the negative effect in clean industry even decrease the environment regulation level of the whole industry.

3) Focusing on the extent of environment impact, most of the higher positive effect from export technology diffusion on environment regulation came from capital or technology intensive industries, so the capital and technology capacity of enterprises could well be the important safeguard for environment improvement.

In the sight of independent R&D, we should change the emphasis from expending scale to reducing pollution and energy consumption, raising productivity, and so on. Then the positive effect on environment regulation from independent R&D will appear as early as possible.

In addition, the second R&D is also an important power for environment improvement, so we should pay close attention to the trend of foreign developed production and environment technology, and then with the help of second R&D produce the high quality product that met the international standards.

4.2 Policy suggestion

1) We should objectively treat the protectionist measures as environment or technology barriers. In pollution intensive industry, the moderately enhanced environment regulation and more stringent trade policy should be carried out, which can not only motivate the environment technology R&D of substantial enterprises, but also decrease the production and export of pollution intensive product.

2) Now the positive industry policy is needed to help enterprises to conquer the extensive production and trade, and realize the industrial structure optimization, so the environment problems can be radically solved. Various technology incentives, such as financial subsidies, tax rebate, green credit, government pre-emption and price subsidies of green product, can be used to encourage R&D, upgrade the technology and product, and shift the emphasis from extensive production technology to green production and environment technology, then the greener production process, trade and high value-added product will help the whole industry realize the sustainable development.

3) The powerful enterprises of industry should play the leading role on capital, technology and

industrial standard, and promote the overall level of industrial technology to realize the multi-win of technology, economic and environment.

Necessity and Feasibility: A Study on the Redeployment of Chinese Higher Learning Institutions in the Countryside at Present

Ke Meishu

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: kelaoshi@126.com)

Abstract: With the analysis on the economic practices and literatures in the developed countries, based on the fact that China is now in the booming period in its economic development, the article puts forward the suggestion that some Chinese colleges and universities should move to the vast countryside from big cities. With the analysis on the necessity and feasibility of the emigration of higher learning institutions from big cities, the article gets the conclusion that the redeployment of Chinese higher education institutions in the countryside is economically and socially beneficial to the national development.

Key words: Necessity; Feasibility; Redeployment; Higher learning institutions; Chinese countryside; National development

1 Introduction

With the industrial and economic development, urbanization has become a general tendency in China.

Compared with western big cities, the majority of Chinese cities are super big cities even nowadays. More and more people are still moving to the cities to get more chances.

In the past, because of the underdevelopment of economy and agriculture was the dominant industry, Chinese cities were regarded as the places for better life and places for social elites to accelerate the market economy and industrialization. The major social resources were poured into them. The cities have better infrastructures, better living conditions and higher salaries. Because of this, the majority of factories, colleges and universities and governmental agencies were all there. This greatly contributed to Chinese market economic development. Because of the exemplary role of cities, urban life way has greatly changed Chinese farmers' life way and ideas, and China becomes more and more industrialized. Since the opening up and reform policy was carried out in China, China has been becoming more and more globalized. Its economy has become a key part of the world economy. China's economic development now influences the global economy. Chinese economy has shared many characteristics of other mature economies in the world. The cities in China have become as developed as the western ones. The founding period of Chinese market economy--- extensive development period has finished. It is now the turning point of Chinese economy. The next period--- booming period has begun. In order to gain durable national economic development, the urbanization of the countryside has become the main tendency.

During the booming period, economy development should focus on its social responsibility and durability. The development of Chinese cities has become matchable with the cities in the developed countries. But because of the lack of experience in the planning of modern cities, Chinese city diseases have become more and more obvious. Overpopulation, traffic jams, high apartment prices, city pollution are some of them. This makes it very costly to increase the economy in the big cities and the expansions of higher learning institutions in cities are very costly. On the other hand, the vast Chinese countryside is still underdeveloped. Except the road system, telecom systems, and power supplies, the other infrastructures in the Chinese countryside are still comparatively backward. This current situation discloses a good chance to add to the Chinese economic development and speed up the social and cultural development in Chinese countryside. Among all the businesses in big Chinese cities, from the angels of necessity and feasibility, the emigration of colleges and universities to the countryside will contribute a lot to the Chinese civilization and economy.

2 The Necessity of the Redeployment of Chinese Colleges and Universities in the Countryside

2.1 The functions and characteristics of higher learning schools

Higher learning institutions have two most basic functions: inheritance and creation. In higher learning institutions, for one thing, the older generation teaches the younger generation knowledge

accumulated by all the human beings; for another, college people create and innovate new things with their imagination, creativity and knowledge, and usually bring about new civilizations.

Colleges and universities symbolize the civilization degree of the country where they are. They can greatly improve the civilization level in the communities around them. College people are usually the social elites; they usually determine the future of their country. Colleges and universities are usually the leading power of modern civilization, their exemplary function in a society is irreplaceable.

2.2 The status quo of Chinese higher education

According to the Chinese Ministry of Education, till the end of 2012, the number of Chinese colleges and universities is 2198. By the end of 2013, the total asset size of the higher education institutions in China is over 700 billion RMB *yuan*. With the economy development, because of the steady increase of land price, the size is becoming bigger and bigger. This is a very big asset size and it is a very important part of the national economy.

In 2012, the number of college students in China is 24.681 million. The average potential consumption power of each college student is over 600 RMB a month. The total consumption of Chinese college students is very big. The consumption of the college students in a place can change the economic situation of the communities nearby.

Because of the size of the college assets and the huge number of Chinese college students, the redeployment of Chinese colleges and universities is sure to contribute a lot to the national economic development. Economically, the building of the new campuses and the new residents in a place are sure to accelerate the economic development in a place. The locals will have more employment chances, and new businesses are sure to come out in the new location. This will be an important factor to add to national economic development.

2.3 The status quo of Chinese countryside

Compared with the Chinese cities, the Chinese countryside is still very backward in many ways. At present, the majority of Chinese countryside is still agriculture-dominant. Backward and separate agriculture farming way makes it difficult for the farmers to make enough money to have a wealthy life. So many young people living in the countryside in China go to cities to find jobs there to make money. Though Chinese government has invested a lot of money in improving the infrastructures in the countryside and accelerating the urbanization of the countryside, the life and economic conditions in the countryside are still very backward. Backward educational institutions, insufficient cultural facilities, lack of employment chances all hinder the rapid development of the countryside. Up till now, nearly half of the Chinese population are still living in the countryside. The ideas of the countryside residents about life will greatly influence the national all-around development. To improve the ideas of the residents in the vast countryside is a key part to accelerate the modernization and civilization in the countryside. As the exemplary part of modern civilization, colleges and universities can serve this purpose perfectly. A college or university in a countryside community will greatly improve the local people's modern consciousness. It will not only provide necessary cultural facilities (libraries, gyms, etc.), it will also provide career educational opportunities for the farmers. What's more, the people working or studying in the college or university will bring the locals many modern ideas to accelerate the modernization of the locals' ideas.

On the other hand, the land price in the vast Chinese countryside is low; the living cost is not high, and the environment is much better for a college or university than that in the cities. Nowadays Chinese countryside can provide necessary power supplies, communications, and traffic service for educational institutions. The emigration of Chinese colleges and universities to the countryside won't have substantial difficulties. The colleges and universities are educational institutions, and they do not rely on the urban environment so heavily. Built in the countryside, universities and colleges can still function well, and this will not influence their social responsibility. What's more, emigration of colleges and universities to the countryside can greatly accelerate the modernization of the countryside; their contribution to the society is enlarged greatly.

During the booming period of China's economic development, the modernization of the consciousness of the residents in the countryside is the problem that should be solved first. Modern ideas will contribute a lot to the healthy national development. In this sense, it is necessary to emigrate the higher education institutions in Chinese big cities to the countryside (It is in fact a practice in the developed economies that most colleges and universities are not built in the cities.).

2.4 The benefits from the emigration of Chinese colleges and universities to the vast countryside for the cities and higher learning institutions themselves

For the cities, though the emigration may reduce the consumption power of the total population, the emigration of the higher education institutions to the countryside will bring them more benefits than harms. They will have more land to build more urban facilities and buildings for other businesses and the needy people. The total population in the cities will become smaller. The city diseases will be less serious. These are all great improvements for Chinese cities.

For the higher education institutions, they will have better environment and lower educational costs in the countryside. They can plan and build desired new campuses to satisfy their needs. They will be away from city diseases. And the new environment will benefit the students and the staff members a lot. After all, their social responsibility of educating citizens is not influenced at all.

3 The Feasibilities of Emigrating the Higher Education Institutions to the Countryside in China

3.1 The surplus after selling the old campus and building the new one

As for the emigration, cost is the biggest concern. If it is worthwhile, with the advantages we analyzed in the previous part, we won't have much reason to say no to it. In this part, we will take a famous university in China, Wuhan University of Technology (Suppose the university decided to move to the countryside), as an example.

3.1.1 The value of the fixed assets of Wuhan University of Technology that should be dealt with

The fixed assets of Wuhan University of Technology are the main part that will decide the value of its emigration to the countryside. Other forms of assets like intelligence property and fames etc. won't be influenced greatly by the moving of the campus.

Among the fixed assets, the campus land and the buildings are the parts that cannot move to the new campus site. The other assets like laboratory equipment, vehicles, teaching devices, etc. can be moved to the new campus. So by comparing the value of the campus land and buildings of Wuhan University of Technology in Wuhan City and the cost of building a similar-sized campus in the countryside, we can figure out whether it is worthwhile for the university to move to the countryside.

Campus size of Wuhan University of Technology:

$$4300 \text{ mu} \approx 4300 * 666.6 \text{ m}^2 = 2,866,380 \text{ m}^2$$

The average land price around Wuhan University of Technology in Wuhan City in March 2014 is 8974.23 RMB¹. The total land value of the campus in Wuhan City is:

$$2,866,380 * 8974.23 = 25,723,553,387.4 \text{ RMB}$$

The total size of campus buildings in Wuhan University of Technology is 1,640,000 m².

3.1.2 The cost of building a new campus of the same size as the old one

The construction costs in Wuhan City for per m² are as Table 1:

Table 1 Construction Costs for Per m² in Wuhan City²

Pile foundation	70-100 RMB / m ²
Steel Reinforcement	160-300 RMB / m ²
Concrete	100- 165 RMB / m ²
Masonry	60- 120 RMB / m ²
Plastering	25-40 RMB / m ²
Outer wall building	50-1000 RMB / m ²
Interior water and electricity installation	60-120 RMB / m ²
Roofing works	15- 30 RMB / m ²
Doors and windows	90-300 RMB / m ²
Earthworks, public entrances, flues and public places decorations	30-150 RMB / m ²

We choose the highest cost in each kind of construction and calculate the average as the construction cost of per square meter. So the highest construction cost of every square meter at present is: $(100+300+165+120+40+1,000+120+30+300+150)/10=232.5$ RMB

¹ The price is the price for residential land price, cited from http://fdc.soufun.com/data/land/land_wh.htm. The price is close to the average land price in the area around Wuhan university of Technology, not the highest, neither the lowest.

² The figures are cited from <http://www.hbcost.com>.

So if we build 1,640,000 m² architecture in the new campus, the highest cost at present is: 1,640,000 × 232.5=381,300,000 RMB

According to the price of land on the www.china.cn, the land price in Shenlongjia Forestry District is less than 500,000 Yuan per *mu*¹. If we buy 4300 *mu* land for the new campus (the same size as the old campus in the countryside), we can calculate the possible cost for the land. The cost for buying the new campus land of the same size is:

$$4,300 \times 500,000 = 2,150,000,000 \text{ RMB}$$

3.1.3 The surplus after selling the old campus and building a new one

With the figures we gained from above, we can easily get the surplus of dealing the old campus and building a new campus:

$$25,723,553,387.4 - 381,300,000 - 2,150,000,000 = 23,192,253,387.4 \text{ RMB}$$

We can put the figures above in Table 2 so we can have a clear view about the cost and the surplus.

Table 2 Surplus after Selling the Old Campus and Building a New One

Land value of the old campus	The cost of the land for the same size new campus	The cost of building the buildings of the same size	Surplus after getting a new campus
2,866,380 × 8,974.23 = 25,723,553,387.4 RMB <i>yuan</i>	4,300 × 500,000 = 2,150,000,000 RMB <i>yuan</i>	1,640,000 × 232.5 = 381,300,000 RMB <i>yuan</i>	25,723,553,387.4 – 381,300,000 – 2,150,000,000 = 23,192,253,387.4 RMB <i>yuan</i>

Even if we need to spend money moving the other school property to the new campus, the expenditure is too small compared with the surplus. The surplus is really a huge one which is even big enough to build two good enough universities even in some cities in China. If we use all this money as the developmental funds for the university, it will greatly improve the conditions of the university. It is enough to make Wuhan University of Technology one of the best universities in the world from the angel of facilities.

3.2 Another important concern

Another important concern is the willingness of the staff members of moving to the countryside. In the past, cities were the places of better living conditions and better welfare in China. They could provide residents better facilities and better chances of employment. And usually people living in the cities had higher salaries. That was why people wanted to go to the cities and the government had to set limitations on people's emigrations to the cities from the countryside.

Among the concerns of the staff members, the pay is the key one. But staff members in the colleges and universities are governmental employees. They are paid by the government. If the government pays them the same as they work in the cities (In fact, the government loses nothing by doing this), this won't be a problem anymore.

The staff members' another concern is about their personal property. With the economic development, apartments and family vehicles become important parts of personal property. Some staff members may have personal enterprises.

As for the apartments, because the apartment price in Chinese cities is much higher than that in the countryside, selling their apartments in the cities and buying or building new houses in the countryside will not only improve the housing conditions of the staff members, but also help them make a lot of money. For example, an apartment of 120 m² is worth 1200,000 RMB around the campus of Wuhan University of Technology in Wuhan City. But a 3-floored new house about 200 m² is about 500,000 RMB in the countryside near Huangshi City in Hubei Province. Selling the apartment in the city and buying a new house in the countryside, the staff member will have about 700,000 RMB left. This sum of money will be about a common staff member's 7 years' salary. The staff member will not only improve his or her living conditions greatly but also have a big sum of money to invest in other businesses to bring him or her other income. This is a big lure for any common person.

As for personal enterprises, the owners can still visit their enterprises in the cities in free time in their private vehicles. They can manage the enterprise affairs through the Internet. In fact, the location of the new campus usually won't be too far away from the original city. This is not a problem.

Even if the staff members have relatives who still live in the cities, they can visit them by driving

¹ The price is cited from <http://www.china.cn/paimai/1872317829.html>. The price is in fact much higher than that in other countryside area. To use this price is to emphasize the cost-effectiveness of the emigration.

their family vehicles. Nowadays, Chinese countryside can provide good enough transportation for them. This is not a problem either.

Nowadays, the small towns in China can provide colleges and universities necessary conditions. Besides, the clean air, low living cost and good nature environment are blessings for the staff members and students. With the same pay and better living conditions, people working and living in the new university have no reason to say no to the life in the countryside.

4 Conclusion

The size of Chinese higher education business is tremendous; the number of college students in China is very big; the redeployment of the Chinese higher learning institutions in the countryside will not only contribute a lot to the national economic development in a certain period, it will also contribute a lot to the modernization and civilization of the vast Chinese countryside and to the healthy national development. With good planning and strategic arrangement, it is sure to be a worthwhile measure in the economical booming period in China.

Abstract: The construction of ecological civilization is a long-term plan related to the people's living standards and the nation's future, and it is the whole process integrating economic development, political construction, cultural construction, and social construction. On the basis of fractal theory, this paper establishes Evaluation Index System of Ecological Civilization Construction Degree (ECCD), which combines the current situation of ecological civilization construction of Zhangjiakou city of China with ecological economy, ecological environment, ecological culture, and ecological management indicators. The research shows that the current degree of ecological civilization construction of Zhangjiakou City is 0.908, which means it is in the primary stage of ecological civilization. Based on this result, further countermeasures to strengthen the ecological civilization construction of Zhangjiakou city of China are proposed.

Key words: Fractal Theory; Construction of Ecological Civilization; Evaluation; Zhangjiakou City of China

1 Introduction

The Eighteenth Party Congress Report indicated that, "The construction of ecological civilization is a long-term plan related to the people's living standards and the nation's future ... We should put the ecological civilization construction in a prominent position, and make efforts to integrate the whole progress of the economic construction, the political construction, the cultural construction, and the social construction to achieve the sustainable development of China."^[1] In response to Beijing's "spillover effects" and building the new growth pole, Hebei Province puts forward the construction of "Beijing-Tianjin-Hebei Metropolitan Economic Cluster" to achieve the harmonious and win-win development between Beijing and Hebei. As an important member of the cluster, Zhangjiakou City not only gets benefits, but also faces enormous challenges, such as ecological and environmental problems. Therefore, how to optimize the environment, adhere to the sustainable development, and build an ecological civilization city have become the primary problems to solve for Zhangjiakou City.

Compared with the primitive civilization, the agricultural civilization, and the industrial civilization, the ecological civilization is a new developmental stage of human society, and it is an inevitable choice in the context of "Society-Economy-Resource" sustainable development. In recent years, the Chinese scholars have carried out extensive and in-depth studies of the concept and connotation of ecological civilization^[2-4]. Some scholars expressed different opinions of the core of ecological civilization, but they reached a consensus, namely, "harmonious development between man and nature". Other scholars, such as Wang Guizhong^[5], Guo Suoyan^[6] and Zhang Yuzhen^[7], applied the concept of ecological civilization to many fields, and they did researches respectively on the ecological tourism, the ecological compensation and the low carbon life, established new countermeasures which regard the ecological civilization as a goal. With the continuous development of the ecological civilization construction in China, Chang Junjie^[8], Qiao Li^[9], Zhu Yulin^[10], Gao Shan^[11], etc., through carrying out empirical researches on the evaluation index system of ecological civilization construction, analyzed the situation of ecological civilization construction, and the expected achievements. To sum up, practical cases about the construction of ecological civilization are relatively insufficient in China, theories and methods of evaluation are relatively simple, evaluation indexes are uneven, and a unified norm and standard has not been formed. By referring to the sustainable index abroad, this paper finds out the evaluation index in

* This research is supported by Funding by Hebei Key Research Institute of Humanities and Social Sciences at Universities; the Project of Technology Bureau in Zhangjiakou City (1411058I-28); the Major Project of Hebei North University (ZD201320); the Outstanding Academic Innovation Team Funded Projects of Hebei North University (CXTD1310); and the Youth Fund Project of Hebei North University (SQ201417).

accordance with the actual situation of Zhangjiakou City in China, conducts a quantitative evaluation and analysis by using the fractal theory, and puts forward countermeasures and suggestions to strengthen the construction of ecological civilization of Zhangjiakou City with the expectation to provide a reference for other cities in China.

2 An Overview of the Studied Area

Zhangjiakou City of China, also known by several other names, such as *Zhangyuan* or *Wucheng*, is located in the northwest of Hebei Province, with its longitude from 113 ° 50 'to 116 ° 30' E, and its latitude from 39 ° 30 'to 42 ° 10' N. At the junction of four provinces of Beijing, Hebei, Shanxi and Inner Mongolia, the city has been called "Beijing's Northern Door". In history, it is an important geographical and cultural city as well as a town of military importance. The city is 289.2 kilometers long from north to south, and 216.2 kilometers wide from east to west, occupying a total area of 36,800 square kilometers with a population of 4.68 million. The northwestern part of Zhangjiakou is highland and the southeastern part is lowland. The city is divided by Yin Mountains into two geographical regions, namely, Bashang district and Baxia district. Because of the continental climate, Zhangjiakou has clearly distinct seasons and large temperature differences between day and night, as well as cool summers. With the air quality ranking No. 1 in the north to the Yangtze River, Zhangjiakou has possessed a new ecological name card of "the most beautiful blue sky in the north of China".

At present, Zhangjiakou City is in a critical period of rapid development. In view of the general survey of the city, the municipal government puts forward the overall thinking of development: regarding scientific development as the theme, changing patterns as the main line, and catching-up by leapfrogging as the general requirement; adhering to the development ideas of "opening up and innovation, nation-wide entrepreneurship, creating excellence through features, and enriching the people and powering the city"; grasping the concept of "turning disadvantages into advantages and taking advantages to the extreme"; fully developing the modern industrial development model of "4+3"; and forging Zhangjiakou into "a central city connecting Beijing, Hebei, Shanxi and Inner Mongolia." The good news is that in November 2013, approved by the CPC Central Committee and the State Council, the Chinese Olympic Committee formally agreed that Beijing and Zhangjiakou made a joint bid to host the 2022 Winter Olympics.

3 Establishment of Ecological Civilization Construction Evaluation System

The Ecological Civilization Construction Degree (ECCD)^[8] is the level of the regional ecological civilization construction in a specific period. It relates to the construction of society, economy, environment, culture, and management, etc. Therefore, the evaluation of ECCD is a complex process; only after taking fully into account all aspects of a regional ecological civilization, it can be reflected realistically and effectively. Based on the connotation of ecological civilization construction and the characteristics of integrity, comprehensiveness, knowledge, circulation, etc., this paper takes the advantage of both domestic and foreign researches on selection method of sustainable index and expert scoring method to establish the evaluation index system of Zhangjiakou City's ECCD which fits with its actual situation, as shown in Table 1.

4 Evaluation Methods

4.1 Introduction to fractal theory

Established in 1975 by the American mathematician Mandelbrot, Fractal Theory is a new theory and discipline, which is used to solve complex problems and phenomena existing in nature. Nowadays, it has been widely used in various fields. Fractal stands for irregular, fragmented scores with self-similarity, scale, and self-affinity characteristics. The fractal object is a rough or fragmentary geometry, which can be divided into several parts, and each part can be regarded as an integral "copy" of the whole, reflecting not only in appearance, but also in the behavior, function, information, energy, time, and space, etc.^[12]

The city is not only a complex ecosystem, but also a thermodynamic system, and a dissipative self-organizing system. It shows obvious regional characteristics, such as spatial structure, and temporal characteristics, developing from simple to complex, from low to high, and possessing randomness, mutation, nonlinear, non-equilibrium, self-organization, self-similarity, and other features. Also, the process of constructing an ecological civilization city is dynamic with certain hidden rules, which makes the construction of ecological civilization city be nonlinearly controlled when it is divided into several

units and each unit presents self-similarity, and the fractal theory can reveal this rule [13-14].

Table 1 The ECCD Evaluation Index System of Zhangjiakou City of China

Overall Goals	Level Indicators	Secondary Indicators	Unit	Worst Value	Best Value	Status Value	Non-dimensional treatment
The evaluation of ECCD in Zhangjiakou City	Ecological Economy	GDP per capita	¥ 10,000	0.5	5	2.814	51.42
		the per capita disposable	¥ 10,000	0.3	3	1.844	57.19
		the added value of third industry accounted for GDP	%	8	50	40.43	77.21
		the public green area per capita Engel coefficient	m ²	11	60	32	42.86
		the public green area per capita Engel coefficient	%	100	0	35.6	64.4
		over 4A level scenic spots		5	15	11	60
	Ecological Environment	energy consumption per unit of GDP	t/¥ 10,000	3	0.3	1.537	54.19
		SO ₂ emission reduction	%	10	30	23.77	68.85
		COD emissions	kg/¥ 10,000	10000	1000	5170	53.67
		environmental investment accounted for the proportion of GDP	%	2.5	10	3.53	13.73
		air quality rate	%	50	100	74.5	49
		forest coverage	%	5	95	31.6	29.56
		garbage harmless processing rate	%	60	100	100	100
	Ecological Culture	the public participation in environment	—	60	100	59.2	0
		the public environment satisfaction rate	%	60	100	82.7	56.75
		the ecological civilization education popularization rate	%	60	100	76.3	40.75
		the cultural industry percentage of GDP	%	0	15	3.39	22.6
	Ecological Management	environmental decision-making capacity	—	60	100	65.4	13.5
		environmental regulation capacity	—	60	100	68.1	20.25
		environmental supervision capacity	—	60	100	61.5	3.75
environmental emergency response capacity		—	60	100	57.8	0	

4.2 Calculation of fractal dimension

Suppose that each index g_{ij} of the established ecological civilization construction evaluation index system can be regarded as the radius of a ball, which can be put into a container with a circular hole whose radius is r_n at the bottom of it. If all balls whose radius is less than r_n can go through the circular hole under certain conditions, then the number of leakage balls can be [15]:

$$N(r_n) = \sum_{i,j} H(r_n - g_{ij}) \tag{1}$$

The formula H is Heaviside function, when $g_{ij} > r_n$, the function value is 0, otherwise it is 1. For a set of given r_n , if there is a corresponding group of $N(r_n)$ which has a power function relationship with it, people can make the independent and dependent variables respectively logarithmic and differential, then formula (3) is got, D is the fitting slope of line equation $\ln N(r_n) - \ln(r_n)$ in the double logarithmic coordinates.

$$d(\ln N(r_n)) = dN(r_n) / N(r_n) \tag{2}$$

$$d(\ln(r_n)) = d(r_n) / r_n \tag{3}$$

$$D = d(\ln N(r_n)) / d(\ln(r_n)) \tag{4}$$

Through the comparison of ECCD evaluation index systems, people can find that, when the ECCD is low, there are more balls with smaller radius, which is easy to go through the circular hole. That means the positive index value of the status quo is smaller, and the reverse index value of the status quo is larger; conversely, when the ECCD is high, there are more balls with larger radius, which are difficult to go rough the circle hole. That means that the positive index value of the status quo is larger and the reverse index value of the status quo is smaller. By analyzing fitting straight lines of $\ln N(r_n)$ and $\ln(r_n)$, people know that the lower the ECCD is, the greater the value $N(r_n)$ is, and the more the slope of a straight line (fractal dimension D) is.

5 Sources of the Data

The basic data required for this study mainly comes from the statistical bulletin of Zhangjiakou national economic and social development in Zhangjiakou Economic Yearbook, and part of the data is from Hebei Statistical Yearbook, Zhangjiakou Municipal Bureau of Statistics, and so on. Among these documents, the worst value and the most optimal value of ecological civilization construction evaluation index property values are mainly determined by the actual situation of Zhangjiakou, China's national conditions, and the relevant literatures.

To evaluate the degree of the construction of ecological civilization, firstly researchers should standardize the original data. This paper takes dimensionless processes to g_{ij} by the means of the fuzzy membership function, and obtains the index normalized value, which will be multiplied by 100. The specific method is: to quantify the positive index with half ascendant of trapezoidal fuzzy membership function (Equation 5); and to quantify the reverse index with half trapezoidal fuzzy membership function (Equation 6).

$$x'_i = \frac{x_i - m_i}{M_i - m_i} \tag{5}$$

$$x'_i = \frac{M_i - x_i}{M_i - m_i} \tag{6}$$

wherein x_i is the specific number for the i index; M_i and m_i are respectively the maximum and the minimum of the i index attribute ; x'_i is a standard value for the i index whose values are among 0~1.

6 Evaluation Results

According to Table 1, if we calculate $N(r_n)$ of the line $\ln N(r_n) - \ln(r_n)$, and take $\Delta r_n = 10$ and then we will get a result as shown in Table 2. If we use the least squares method to fit the line $\ln N(r_n) - \ln(r_n)$ and we get the result shown in Figure 1. Among them, $R^2=0.969$ indicates a good correlation dimension; and the dimension of the line of $\ln N(r_n) - \ln(r_n)$ is $D=0.908$, which is the current degree of Zhangjiakou City's ecological civilization construction.

Table 2 The Numerical Calculation Results of $\ln N(r_n)$ and $\ln(r_n)$

Variable	Value									
	10	20	30	40	50	60	70	80	90	100
r_n	10	20	30	40	50	60	70	80	90	100
$\ln(r_n)$	2.30	3.00	3.40	3.69	3.91	4.09	4.25	4.38	4.50	4.61
$N(r_n)$	3	5	8	8	11	17	19	20	20	21
$\ln N(r_n)$	1.10	1.61	2.08	2.08	2.40	2.83	2.94	3.00	3.00	3.04

Figure 1 $\ln N(r_n) - \ln(r_n)$ Fitted Curve

Only the grade standard of construction level is determined, we can evaluate the construction level of ecological civilization city. Based on the related research home and abroad, as well as the opinions and suggestions of local experts, four grade standards of the construction of ecological civilization city are given, see Table 3. Through four grade standards, we can judge the construction level of an ecological civilization city, and then build better ecological civilization cities.

Table 3 Classifications of Construction Level of Ecological Civilization

The Construction Level of Ecological Civilization City	Advanced Ecological Civilization City	Standard Ecological Civilization City	Primary Ecological Civilization City	Non-ecological Civilization City
The Numerical Range	<0.2	0.2~0.6	0.6~1	more than 1

According to Table 3, at present, Zhangjiakou City is in the primary stage of ecological civilization. It has a beautiful ecological environment and basic infrastructure construction in line with national planning requirements, but lacks the necessary ecological functions. In recent years, Zhangjiakou attaches great attention to the construction of ecological civilization and the protection of ecological environment. By taking multiple measures, it obtains gratifying achievements in the construction of ecological civilization. Moreover, each department enforces strictly laws and regulations about environmental protection, and strengthens the city infrastructure construction and environmental remediation. In the subsystems, both ecological economy and ecological environment in Zhangjiakou are getting better and better, which is pushed forward by the Beijing-Tianjin-Hebei economic circle, where the society makes continually progresses, people's living standards have been improved remarkably, and the comprehensive economic strength gradually increases. Accompanied with the continental climate, distinct seasons, large temperature differences between day and night, cool summers, and the quality of air ranking No. 1 in the north to the Yangtze River, Zhangjiakou has possessed a new ecological name card of "the most beautiful blue sky in the north of China". However, the ecological management and culture are still in an average level, and the cultivation of citizens' ecological consciousness dominated by the government is still insufficient and monotonic, which leads to a low degree of public participation in environmental decision-making. In addition, the capacity of the government to make decisions, regulate, supervise, or deal with the emergency is quite weak. To sum up, the evaluation result is consistent with the overall situation of the construction of ecological civilization in Zhangjiakou City at present.

7 Countermeasures to Strengthen the Construction of Ecological Civilization in Zhangjiakou City

The analyses above can bring about some related preliminary results. Zhangjiakou City has been in the primary stage of the construction of ecological civilization and achieved, and it still needs to establish a scientific construction goal and determine a clear priority to the development of the planning and construction of ecological civilization system to improve the ecological civilization in Zhangjiakou to a higher stage, and finally realize the goal of building an ecological civilization city.

7.1 Making the overall planning of the development of ecological civilization construction.

The government should adhere to the principles of “being guided by ecology, spreading over all work, strengthening foundation, sustainable development, overall planning, coordinated push, low-carbon transition, green rising, deepening reform and opening up, government-leading and public participation”, respect the characteristics of local resources and the carrying capacity of environment to design Zhangjiakou’s future development locally and scientifically. Furthermore, the government should not only make the overall development plan of ecological civilization construction, but also place the concept of ecological civilization into the future implementation of Zhangjiakou’s Thirteenth Five-Year Plan, construction planning, and industrial planning etc., and put it under the supervision of the relevant agencies and departments, so that the construction of ecological civilization can be the blueprint and benchmark of urban development.

7.2 Encouraging public participation and improving the ecological civilization education system

The construction of ecological civilization requires not only the promotion of the government and the management mechanism, but also more public support and participation, which call for the public to be the main part of the construction of ecological civilization in Zhangjiakou City. Creating favorable environment and guiding the public gradually from passive to active participation, from the partial involvement to the whole involvement, endowing the public the right to speak and make decisions will benefit establishing a more open and perfect the mechanism of public participation. In order to increase public participation, we need to improve the educational mechanism of ecological civilization, provide the education training of ecological civilization for the public and group leaders, strengthen the ecological consciousness, enhance the consciousness of public participation, and raise participation ability.

7.3 Implementing ecological key projects and promoting environmental protection management

Zhangjiakou City should stick to taking the ecological environment as the lifeblood of its development, make more efforts in ecological construction and environmental protection, emphasize the construction of the “Two-oriented society”, and strive to create the environment of “blue sky and clear air, clean water and free-flowing rivers, green ground and mountains, and environmental security” by the implementation of following key projects: to highlight resource cultivation and develop eco-forestry; to stress the development of healthy food and non-pollution ecological agriculture; to strengthen the control of soil erosion; to focus on the management of “Big Five” water system”; to fully carry out the forest conservation and dry lot feeding, to implement vigorously the project of blue sky and clean water; to practice entirely efficient water-saving agriculture; to focus on building efficient water-saving irrigation demonstration area in Bashang area; to highlight the integration of resources and develop ecological tourism; and to improve living environment and develop eco-towns.

7.4 Saving resources and innovating economic development pattern

Zhangjiakou is a city that is relatively scarcity of resources, and as the upwind and water resource of Beijing, it has a special geographical position. Thus, Zhangjiakou must not only embark on the development pattern of resource-saving and strengthen the conservation of resources and recycling management, but also bid farewell to the traditional extensive mode of economic growth. The whole city need to develop solar and wind energy, and other clean renewable energy, focus on the development of green organic agriculture, tourism industry and high-tech industry, reduce energy consumption per unit of GDP, and adjust the industrial structure under the guide of the ecological civilization construction. All this will eventually benefit the achievement of the sustainable development of Zhangjiakou.

8 Conclusion

Based on the existing researches, and combined with the natural geographical features, and economic and social development of Zhangjiakou City, the paper aims to build an ecological civilization construction evaluation index system which comprises of the four major core areas, and they are ecological economy, ecological environment, ecological culture, and ecological management. In this

process, the Fractal Theory is used to estimate the current ecological civilization construction degree of Zhangjiakou City. For the construction and development of ecological civilization in Zhangjiakou, there is a long way to go. In the process of economic development, the whole city needs overall planning and all-round consideration; namely, while in the pursuit of economic benefits, the city needs to preserve the ecological environment, fulfill the social responsibilities, and realize the sound and fast development. Only in this way, the goal of ecological civilization construction will certainly be achieved at an early date.

Construction of Enterprise Carbon Accounting System under the Low Carbon Economy

Yao Liqiong, Deng Mingran

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: yaoliqiong@163.com)

Abstract: As global warming has become truth, is developing as a new economic model, The new economic development model has given rise to an important branch of environmental accounting, namely carbon accounting. At first, this paper discusses the carbon accounting theoretical foundation comprehensively, and then analyzes the environment of the construction of the carbon accounting system. The focus of the article is to build enterprise carbon accounting system, it covers the confirmation and measurement, record and information disclosure of the enterprise carbon accounting on the way of low carbon economy, its core is the processing of carbon emission rights, information disclosure mode and content, etc.; The purpose of this paper is to build enterprise carbon accounting system which is suitable for China's national conditions, in order to provide certain reference and theoretical support for the low carbon economy development of our country .

Key words: Low carbon economy; Carbon accounting confirmation; Carbon accounting system; Carbon accounting

1 The Development Background and Theory of the Low Carbon Economy

1.1 The development background of the low carbon economy

Low-carbon economy was published by the British for the first time in energy white paper" in 2003 , the concept of low carbon economy was caused the wide attention and recognition by the international community, low carbon economy is recognized as the most effective and critical way to solve the problem of global climate . In the midst of the heavy industrialization, China promotes low carbon economic development model in all levels actively for seeking a new road to industrialization , at the same time, the domestic accounting profession also began to discuss the related problems of the enterprise carbon emissions and trading accounting under the background of the low carbon economy for China's national conditions quietly , Combining with the economic situation of home and abroad, this requires that we must change the traditional development model of the dependence on resource consumption and environmental costs excessively for economic growth.

1.2 Concepts and theories of Low carbon economy

Low carbon economy is an economic development form which is in order to build a win-win between the social ecological development and environment protection. It reduces the high carbon energy consumption coal, oil, and greenhouse gas emissions as much as possible by the technical innovation, system innovation, industrial transformation, new energy development and other means under the guidance of the concept of sustainable development. The characteristics of low-carbon economy is to reduce emissions of greenhouse gas and construct economic development system of low energy consumption, low pollution , including low carbon energy system, low carbon technology and low carbon industry system. Low carbon energy system is to reduce carbon dioxide emissions by the developing of clean energy, including wind, solar, nuclear, geothermal energy and biomass energy instead of coal, oil and other fossil energy to(Ratnatunga 2012). Low-carbon technologies include clean coal technology (IGCC) and carbon dioxide capture and storage technology (CCS), and so on. Low carbon industry system include thermal power reduction, new energy vehicles, energy saving building, industry energy saving and emission reduction, circular economy, recycling, environmental protection equipment, energy-saving materials and so on.

2 The Concepts and Theories of Carbon Accounting

2.1 The concepts of carbon accounting

The development of low carbon economy has brought the development of carbon accounting; carbon accounting is the accounting system to promote deep integration and coordination between environment and economy development by reflecting and controlling the social environment resources on the basis of the traditional accounting. The latest research progress of carbon accounting is defined as a foreign currency as the main unit of measurement, mainly to the enterprise performance of the low

carbon responsibility of saving energy and reducing pollutant emissions, its purpose is to help enterprises to realize energy conservation and pollution reduction. Carbon accounting mainly related to carbon emissions associated with carbon accounting information disclosure, risk or uncertainty management and strategic development, and so on.

2.2 The theories of carbon accounting

2.2.1 External theory

For a long time, the space of carbon dioxide emission belongs to the category of public goods, externalization is obvious. Specification of carbon dioxide emissions is the main content of the carbon emissions trading (David 2008). Ultimately, the market capitalization, quantification approaches of emissions of carbon dioxide should be clear; it should become public goods and the resources which are gotten from paying a price in production and business operation process. It has replicability and exclusiveness in the process of using. The externalization of carbon dioxide is not only related to its amount but also because of not reasonable using by the human, the irrational economic structure and technology is not enough and so on.

2.2.2 Property rights theory

Property rights is very wide in the modern economics implication, it can be understood as a right which can choose the multiple uses of some economic goods through social force. It can be divided into two categories: private property and public property. Property rights theory is a kind of non-government interventionist scheme which solve the problem of externalizations by introducing the market mechanism, can be made through the trading policy of environment of economic management of emissions generally, the seller can sell pollution index from the reduction of pollution emission for the compensate of the external economy, the buyer buy the shortage of pollution index because of not to reduce pollution by the regulation, in order to realize the enterprise private cost close to its social cost, can achieve the optimal allocation of environmental resources. It is not hard to imagine that the result is the destruction of the resource, waste and excessive development if you can't definite or guarantee property rights clearly. If carbon resources rights are clear and can be transferred, carbon resource cost and value can be detailed evaluation measured; also, resources can be allocated effectively.

2.2.3 Sustainable development theory

Thought of Sustainable development is the long-term development of human society; it reflects a reflection of the relationship between the development of human beings and natural environment resources. Sustainable development is proposed by the world commission of environment and development in the report of "our common future" in 1987, the definition of "sustainable development" is to satisfy the need of modern people without hurting the ability of future generations to meet development needs in generally (Gregg 2002). Enterprises must take the environment effects from the production and business operation activities into account in the process of sustainable development, and measure, reflect and control the environmental resources, in order to provide services for improving the environment, using resources rationally and promoting the sustainable development of the enterprise. Implementation of Carbon accounting will affect the enterprise decision-making and economic benefits, the relevant transaction will also affect the enterprise's financial position, operating results, in order to meet the requirements of information users to understand the carbon accounting information, it requires companies have to provide the information system of carbon accounting information. So, the sustainable development theory is important for deepening the understanding of the "low carbon", as well as the formation and development of carbon accounting.

3 The Relationship Between Low Carbon Economy and Carbon Accounting

3.1 The relationship of the unity and opposites

The opposite of low carbon economy and carbon accounting is that low carbon economy is a description of development concept, but carbon accounting is a new form of economic development for management activities, which is material; The unity of them is mainly manifested in the consistency of the target, the main goal of low carbon economic model's is to respond to climate change and energy security, so as to promote the sustainable development of society and economy, carbon accounting is based on how to compensate the cost of natural resources and the accounting, its main purpose is to use accounting to reflect the problem of environment and resources, and make the environment and resources information to influence people's behavior. So target of carbon accounting is consistent with the low carbon economy. Visible, low carbon economy and carbon accounting attaches great importance to the ecological environment and material circulation rule, reasonable development and utilization of

resources, efforts to improve social benefit and environmental benefit, so as to achieve sustainable development. to achieve coordination between man and nature system.

3.2 Low carbon economy is the theoretical basis to realize carbon accounting

Low carbon economy is a concept and mode of sustainable development which correlates energy, environment and economy. On theory, low carbon economy is a kind of development, and accounting is a kind of management activities to reflect and control the enterprise economic activity. According to the development of economy, it can improve and enrich the traditional theories and methods, in order to reflect and control the consume energy and its external environment damage from enterprise production activities, as to make the enterprise accounting can reflect the economic activities, and assess their effectiveness fully and truly. In fact, Environment and resource factors must accounted in the economic activity of enterprise, which requires the accounting system to reflect. The establishment of low carbon economic development model provides the necessary theory preparation and practice basis for carrying the environmental resources and carbon emissions into the accounting system.

3.3 Carbon accounting is the necessary means to realize low carbon economy

Low carbon economy model is asked to reduce dependence on natural resources; we can not only achieve the efficient use of energy but should pay attention to the protection of the ecological environment in the process of social and economic development. As to realize the sustainable development of economy. As the leading force of the social production, enterprises are the body of the quantity, and the development of low carbon economy. To build and implement the feasible carbon accounting system is to apply quantitative carbon accounting information to fulfill its obligations to the environment to the enterprise, the evaluation of environmental responsibility, To evaluate whether the enterprise can reduce energy consumption, reduce pollution emission and improve efficiency is the objective requirement of low carbon economy development, also is the essential means to realize low carbon economy.

4 Construction of Carbon Accounting System

4.1 Environmental analysis of building carbon accounting system

Carbon accounting is from the environmental accounting. Its development can not leave from a certain macroscopic environment and microcosmic environment, macro environment is primarily policy factors, the micro environment factors are from the market, before the constructing of carbon accounting system, we have to analysis policy environment and market environment to prepare for it well.

4.1.1 Macroscopic environment

The clean development mechanism is our country to participate in most project mechanism, the main content is: in the Kyoto protocol, developed countries carry out the project level with developing countries by providing funding and technology, they make project investment which not only conform to the requirements of the sustainable development policy, but have greenhouse gas emission reduction effect in developing countries. In return to get some or all of the emissions reductions for investment project, as a part of its emissions reduction obligations, the lines is defined as a certified carbon emission reductions in the clean development mechanism (CDM).

Carbon emissions trading mechanisms refers to that countries transferred its carbon emissions reduction obligations which is over fulfilled to another country directly by trading. It is from annex 1 in the "Kyoto protocol", including the "emission reduction unit", "emission reduction certified", "distribution of the number of units", "removal of units" such as carbon reduction unit certified(Larry 2013).

Joint performance of the mechanism, is refers to the developed countries fulfill project based in return for carbon emission through trading in the transitional developing countries. Carbon emissions produced in the joint performance of the project is called reduction unit.

4.1.2 Micro environment

Carbon markets are the soil of accounting for growing, the development of accounting can not leave from the market environment, carbon emissions trading market is important in the development of carbon accounting market environment. In order to lay a foundation for the later construction enterprise carbon accounting system. We must understand the relevant market environment. For the moment, in carbon emissions trading market, compliance of trading market is given priority; voluntary compliance trading market is minority. According to the report by world bank in 2011, From carbon emissions trading volume and the trading amount in the global main large carbon emissions trading market, the carbon emissions trading market dominant is based on the quota of carbon emissions trading, the trading

of several large carbon emissions trading system is in large number. Carbon emissions trading on the basis of the project is mainly based on CDM project of certified carbon emissions, it makes amount of carbon emissions trading on the basis of the project, most of the joint project implementation mechanism of emissions trading unit and the number of carbon emissions trading market is little voluntarily (Janet 2008). Based on the above analysis, you can see that global carbon emissions trading market has begun to take shape, it is feasible to obtain the fair value of the carbon emissions.

4.2 Confirmation of carbon accounting

4.2.1 Confirmation of measurement principle

To distinguish the type of market. By above knowable, at present, carbon emission rights have two different types of trading markets mainly, one is a mandatory compliance, the other is a voluntary compliance trading.

To distinguish the type of transaction. Because there may be a variety of transaction type, so we cannot treat as the same even in the same transaction market. even if there is a mandatory compliance, but type can be based on the quota, may also be based on the project (Jonatan 2011).

To distinguish the purpose of use. Carbon emission rights obtained by enterprises are for different purposes, for different purposes, the choice of enterprise must be different. Even if the market and the transaction type is same, but because of different uses, the accounting measurement still have differences, so we also need to distinguish purposes.

4.2.2 To confirm the measurement content

Because of the different nature of trading, the measurement of carbon emission rights is also different, as mandatory compliance market transactions for example, make division according to the different combination of the transaction type and uses.

① Transaction type: on the basis of quota, use: emissions plan for private use. Confirm the measuring specific content as shown in table 1.

Table 1 The Confirmation of Measurement Based on Quota Trading Plan for Private Use

Project	specific content
Initial confirmation	Carbon emissions that are acquired from the government's free accounting treatment; From a government auction for carbon emissions or purchase from the secondary market on the basis of quota of processing of carbon emissions
Subsequent measurement	Emissions of greenhouse gases yes accounting: carbon emission rights value changes in accounting: amortized during the period of accounting: final carryover and cases submitted to the accounting treatment: enterprise accounting change hold carbon emissions purposes

② the transaction type: on the basis of quota, application: permits plans to sell. Confirm the measuring specific content such as table 2

Table 2 The Confirmation of Measurement Based on Quota Trading Plans to Sell

Project	specific content
Initial confirmation	Carbon emissions that are acquired from the government's free accounting process, from the government by auction of carbon emissions accounting treatment, from the secondary market to buy based on the quota of the accounting treatment of carbon emissions
Subsequent measurement	Carbon emissions accounting value changes, to sell carbon permits to accounting, the accounting treatment of the final presentation, enterprise change hold carbon emissions accounting purposes

③ Transaction type: on the basis of the project, use: emissions plan for private use. Confirm the measuring specific content as shown in table 3.

Table 3 The Confirmation of Measurement Plan to Use Based on Project

Project	specific content
Initial confirmation	Through project cooperation in carbon emissions accounting, on the secondary market to buy based on the project of carbon accounting
Subsequent measurement	The same as ①

④ Transaction type: on the basis of the project, use: permits plans to sell. Confirm the measuring specific content as shown in table 4.

Table 4 The Confirmation of Measurement Plan to Sell Based on Project

Project	specific content
Initial confirmation	Through the project cooperation in carbon emissions accounting confirmation, on the secondary market to buy based on the project of accounting confirmation.
Subsequent measurement	The same as ②

4.3 Accounting records of carbon

4.3.1 Account settings

Based on the above analysis, when the accounting account Settings to make it satisfy the requirement of conventional financial accounting work, and meet the needs of the carbon accounting work. When in the specific design, can from the following aspects:

1) Add general ledger subjects “carbon emissions”, in view of the carbon in the new situation, new business accounting and management of the new requirements set, it can reflect the carbon emissions of the specific subject, and can judge the implementation of its environmental responsibility, in a timely manner so as to take measures in a timely manner to improve governance.

2) Add detail course, set under the “carbon emissions” subject “personal use” and “sell” two subsidiary subjects, according to the different USES of company carbon emission rights classification collection summary.

4.3.2 Accounting treatment

As mandatory compliance market transactions for example

1) Transaction type: Based on the quota, application: emissions plan for private use

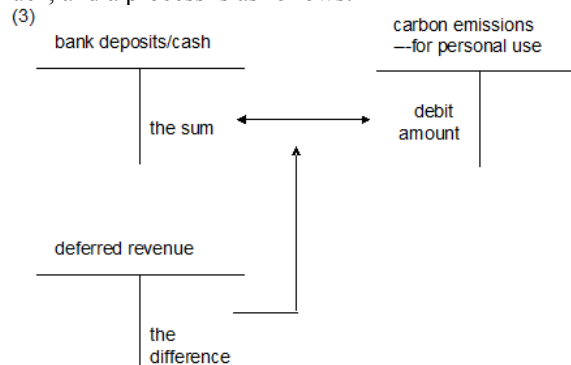

Carbon emissions way free from the government. In accordance with the fair value as obtained confirmed that involves accounting account for “carbon emissions - for personal use” and “deferred revenue”, processing is as follows:

Carbon emission right can be got from government by auction. When the sale cost is greater than the fair value, it is confirmed by auction cost. Processing is as follows:

When auction cost < fair value, at fair value, involving accounting account again, borrowers' difference “deferred revenue”, and a process is as follows:

Carbon emissions from the secondary market to buy. Carbon emission rights obtained by this way, the purchase cost is equal to the fair value, this is in the market of fair trade both parties of a voluntary

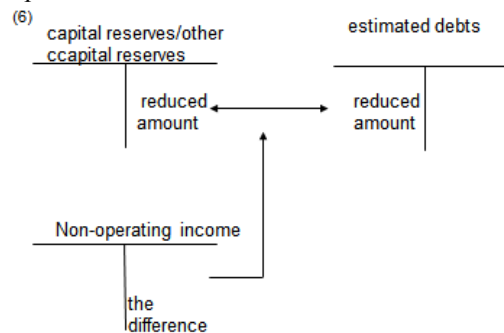

deal price, according to the purchase cost can be confirmed, involving accounting account for "carbon emissions - for personal use" and "bank/cash on hand", processing as follows.

Deferred revenue. Deferred revenue according to adjusted the book balance of the processing, the non-operating income at the current, the premise according to the use of carbon emission rights plan, and adjust the early spread of deferred earnings. When the deferred revenue is a credit balance, processing as "deferred revenue" debit, "non-operating income" lenders, when the deferred revenue for the debit balance, "non-operating income" debit, "deferred revenue" lenders. Greenhouse gas emissions. In accordance with the fair value of the liabilities, confirm the enterprise cost, fair value for emissions, and specific treatment for "manufacturing cost/management fee/cost of sales/production costs, such as "debit," estimated debts lenders. Adjustment is expected liabilities, according to the fair value of the carbon emissions(Kenneth 2004). The fair value increases, the estimated debts to adjust its book value, capital reserves also adjust accordingly; the specific process is as follows:

Fair value decrease, the capital reserves to offset (if the preexisting for appreciation and confirmation), capital reserves enough write-downs, would need to be accounted for as non-operating income account, the specific process is as follows:

The final balance sheet date accounting. The final accounting, follow the principle of first in first out, return to the government carbon emissions, and the actual emissions equivalent to the final at the same time carry forward capital reserves and carbon emission rights impairment provision, should correspond to actual emissions.

2) Transaction type: on the basis of the project, use: emissions plan for private use

Emissions through project cooperation, in accordance with the fair value can be confirmed as obtained (usually can choose acquisition cost), involving accounting accounts for "carbon emissions - for personal use" and "bank deposit cash/library", processing is as same as (2)

Carbon emissions in the secondary market to buy, and initial recognition through project cooperation in confirm the identity of the practice of carbon emissions. Described in the subsequent measurement and (1) accounting, no longer here.

3) Transaction type: on the basis of quota, use: permits plans to sell. Company plans to sell carbon permits to accounting, method is similar to in stock, but with inventory and not identical, to establish accounting account for "carbon emissions-for sale". "Is the explanation of China's accounting standards for stock inventory is refers to the enterprise in everyday activities held for the sale of finished goods or commodities, in the production process in the product, in the production process or provide labor services process consumption of materials, materials, etc." The explanation shows that companies hold for plans to sell carbon permits, the basic characteristics and the definition of inventory, but on the other

hand, from the definition of inventory, inventory is a physical form, in contrast, carbon emissions, is no physical form. In conclusion, if you plan to sell carbon permits to directly recognized as the inventory, it is not appropriate, you should add “carbon emissions – sell” course, confirm measurement of carbon emissions. Carbon emissions way free from the government. In accordance with the fair value as obtained confirmed that involves accounting account for “carbon emissions–sell” and “deferred revenue”, processing is as same as (1)

Carbon emissions from the government by auction. When the auction cost or fair value, confirmed by sale cost, involving accounting account for “carbon emissions-for personal use” and “bank/cash on hand”, processing is as same as (2)

When auction cost < fair value, at fair value, involving accounting account again, borrowers difference “deferred revenue”, a process is as same as (3)

Carbon emissions from the secondary market to buy. Carbon emission rights obtained by this way, the purchase cost is equal to the fair value, this is in the market of fair trade both parties of a voluntary deal price, according to the purchase cost can be confirmed, involving accounting account for “carbon emissions - for personal use” and “bank/cash on hand”, processing is as same as (2)

Subsequent accounting treatment is mainly related to the carbon emissions of self-use value change, can be divided into value-added and impairment of two cases. Carbon emissions rise in value, if the initial measurement involves a deferred income, carbon emissions and the book value of the deferred income increase, processing for the increase in “carbon emissions – for” debit, “deferred revenue” credit, if the initial measurement without involving deferred income, processing for the “carbon emissions – for” debit, “capital reserves, other capital reserve” lenders, in addition, still need to write down impairment provision if there is a provision for impairment loss of the original; Carbon emission rights impairment, if initial measurement involves the deferred income, when processing to reduce the forehead, “deferred revenue” debit, “carbon emissions-for private use” credit, if the initial measurement without involving deferred income, processing to reduce the amount of the asset impairment loss debit, “carbon emission rights impairment provision” lenders, value-added have previously included in the capital reserves, need to offset capital reserves.

Deferred revenue. Deferred income according to adjusted the book balance of the processing, the non-operating income at the current, the premise according to the use of carbon emission rights plan, and adjust the previous share of deferred income, treatment as “deferred revenue” debit, “non-operating income” lenders. Impairment test. Plans to sell carbon emissions if made free from the government or auction, when cost is < the fair value, to compare costs and net realizable value of carbon emissions, according to both the smaller adjust the book value. That there are two kinds of circumstances, when the entry value > net realizable value, the difference between the two confirmed as carbon emission rights impairment provision, involving accounting account for “asset impairment loss” and “carbon emission rights impairment provision”, the process is as follows:

(7)

When the entry value < net realizable value, the two cases, one if the original impairment provision, should be in the provision of the amount of the impairment of converted back and there is no provision for impairment of a second if the original is made of, does not make the accounting treatment. Plans to sell if carbon emissions from the secondary market to buy or obtained from the auction, when purchase cost or fair value, are “lower of cost and net realizable value” for impairment test. , same as above is divided into two cases. The sale of carbon emissions. Plans to sell carbon emissions in accordance with the sale income amount is recognized as the other business income, namely debit “bank/cash”, “other business income” is credited to account the corresponding cost, shall follow the principle of first in first out, and the specific processing is: borrow other businesses “cost”, credit “carbon emissions - for sale”, if there is provision for impairment loss, debit “other business cost”, “carbon emission rights impairment provision”, credit “carbon emissions - for sale”.

5 Conclusion and Prospect

With the development of low-carbon economy, the importance of carbon accounting has been self-evident, theory and practice in our country are making unremitting efforts. In this chapter, from the perspective of the enterprise accounting practice case carbon, carbon accounting practice processing has carried on the concrete discussion, and the future application of carbon accounting are further analyzed. Believe that through the joint efforts of theory and practice, the theoretical framework and method of carbon accounting system will be constantly to improve and develop, thus for enterprise development provide effective guidance of carbon accounting practice.

Measuring the Coordinated Development of Economy, Society, and Environment in Municipalities and Provinces of China

Ding Yang, Yang Qing

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(Email: y_ding@whut.edu.cn, yangq@whut.edu.cn)

Abstract: Sustainability is commonly interpreted by a triangle framework of Economy, Society, and Environment. The realization of sustainability depends on the simultaneously improvement in the three phases. Accordingly, this paper possesses a new perspective of coordinated development of Economy, Society, and Environment to track the progress of sustainability transition. Coordinated development pursues the improvements in two dimensions. One is the coordination interrelationship among the three pillars, and the other one is the general level of the three pillars' development. Based on this, a synthetic index is used to measure the coordinated development in Chinese municipalities and provinces during the years from 2004 to 2010. The result shows that the evolutions of the coordination interrelationship in cities or provinces are similar to each other in the same region. It further reflects the effects of economic development exerted on social development and environmental quality own the feature of regionalization. What's more, by analyzing the reason for the coordinated development changes in different regions, the study identified the influence factors of development strategy in China. Then a case study is followed to explain the process in detail.

Key words: Sustainability assessment; Coordinated development; Synthetic index

1 Introduction

Sustainability is the conclusion achieved by the long-term development experience of human race around the world and is the inevitable choice for future development from the perspective of system thinking. As people's perception of their interactions with the nature deepening since 1960s, the world has reached a consensus on pursuing sustainable development. However, there is still a huge gap between conceptual framework and practical measures. In China, the government has been paying great effort to promote sustainability transition from the beginning of 21 century, but the situations vary among different regions. Generally speaking, the problems caused by the discordance among economy, society and environment are increasingly severe, such as resource depletion, environment degradation and poverty.

The conceptualization of sustainability is based upon system thinking. There are three pillars that are interacted with each other inside the system, economy, society, and environment^[1]. The realization of sustainability depends on the simultaneously improvement in the three phases. Therefore, the process of sustainability transition can be considered to be the development of the three pillars while they are coordinated to act together harmoniously. Based on this, this study possesses the perspective of coordinated development to measure and analyze the sustainability levels of regions in China.

Since in the 1980s the Brundtland Report linked the environment conservation with human's development, the interactions between economy and natural environment have been extensively studied. Although there are a great number of studies on sustainability assessment, only a few of them considered the coordination among economy, society, and environment, e.g. the sustainable development index that involved system coordination indicators^[2] and a coupling model of coordination between urbanization and the environment^[3]. In conclusion, the research on coordinated development among the three pillars of sustainability still in early stages. Studies in this field mainly focused on the mechanism of the interactions between human's development and the environment, while few of them developed complete evaluation models and applied in empirical studies.

The remainder of this paper is organized in such a logic way. In the second section, a framework of coordinated development evaluation is developed consistent with the decomposition of the connotation of coordination development. Then in the third section, by collecting and processing the panel data of 30 municipalities and provinces from 2004 to 2010, the coordinated development levels of these objects in each year are calculated based on the mentioned evaluation method. Depending on the analysis result, hopefully the following questions are to be answered: (1) if the evaluation method is able to reflect the coordination relationships between economy, society, and environment? (2) if the coordinated

development levels of these regions are different from their comprehensive development levels? (3) what is the main factor that influence the evolution of coordinated development?

2 Methodology

In the framework of sustainability given by WCED, it is a complex system of three pillars that have interrelationships with each other, economy, society, and environment. Meanwhile, the three pillars are three subsystems that are constituted by multiple related actors, such as individuals, social or economic organizations, and natural capital. In the system running, each of their activities has interdependencies with others, which means how well an activity runs will influence the performance of other activities. Coordination is the management of the interdependencies among the activities in the system, while development is the comprehensive improvement of those activities' performance. The realization of sustainability transition depends on the progress in both the two dimensions. Therefore, the synthetic index of coordinated development consists of two elements: one is the coordination degree, the other one is development degree.

Before we introduce the methods of coordination degree and development degree, first the way by which we determine the development levels of economy, society, and environment has to be illustrated.

2.1 Indicator system

We use a top-down approach to select representative indicators for economic, societal, and environmental subsystems from the references for the purpose to demonstrate an in-depth understanding of coordinative relationship among the three subsystems. Firstly, the significant factors for each subsystem are identified by qualitatively analyzing the literatures. Then according to the availability of data for regions in China, we carefully developed several indicators to measure each factor (Table 1). Finally, the development level of each subsystem can be assessed by integrating the factors with their weights.

2.2 Data sources

We collected the data of all municipalities and provinces in China except Tibet (because of data unavailability) from 2004 to 2010 for the empirical study. Societal and economic data were obtained from the China Statistical Yearbook, Environment-related data were obtained from the China Environment Yearbook, Energy-related data were collected from the China Energy Yearbook.

Data normalization was performed using formula (1) and (2).

Table 1 Indicators of the Coordinated Development of Economy, Society, and Environment

Subsystem	Factor	Indicator	Unit
s ₁ . Environment	Resource	x ₁ . Energy consumption of per 10,000 yuan of GDP	tons of standard coal equivalent/10,000 Yuan
		x ₂ . Water consumption per 1,000 yuan of GDP	m ³ /person
	Environment friendly	x ₃ . Proportion of days of air quantity equal to or above Grade 2 in the whole year	%
		x ₄ . Percentage of natural reserves in the region	%
		x ₅ . Waste gas removal rate	%
		x ₆ . Proportion of industrial waste water meeting discharge standards in total volume	%
		x ₇ . Ratio of industrial solid wastes utilized	%
s ₂ . Economy	Economic level	x ₈ . Per Capita GDP	10,000Yuan/person
		x ₉ . Proportion of tertiary industry in GDP	%
		x ₁₀ . Urban Unemployed rate	%
	High technology industry	x ₁₁ . Proportion of gross output value of high-tech industry in GDP	%
		x ₁₂ . Proportion of internal expenditure on R&D in GDP	%
		x ₁₃ . Number of patents for each 10,000 people	piece/10,000 people
s ₃ . Society	Social equity	x ₁₄ . Ratio between the income of urban households and the income of rural households	%
	Social well-being	x ₁₅ . Endowment insurance coverage	%
		x ₁₆ . Engel's coefficient of residents	%
		x ₁₇ . Number of public vehicles for each 10,000 people	%
		x ₁₈ . Number of bed in health care institutions for each 10,000 people	piece/10,000 people

In the case that the highest score is the preferred score, the raw scores of indicator x_{jt} are normalized in formula:

$$x_{jt}' = \frac{x_{jt} - \min\{x_{jt}\}}{\max\{x_{jt}\} - \min\{x_{jt}\}} \quad (1)$$

Where x_{jt} is the value of the indicator j in the year t , x_{jt}' is the corresponding normalized one. $\min\{x_{jt}\}$ and $\max\{x_{jt}\}$ indicate the minimum and maximum value of the indicator j of an observation among all years.

In the case that the lowest score is the preferred score, the raw scores of indicator x_{jt} are normalized in formula:

$$x_{jt}' = \frac{\max\{x_{jt}\} - x_{jt}}{\max\{x_{jt}\} - \min\{x_{jt}\}} \quad (2)$$

2.3 Development degree

The development degree is used to represent the comprehensive performance of all the activities in economic, social, and environmental subsystems. We analyzed the level of each subsystem's development using the entropy method^[4]. The weight of each indicator was calculated according to information entropy and variations in the indicators.

First, we calculate the proportion of the indicator j in the year t :

$$y_{jt} = x_{jt}' / \sum_{t=t_1}^T x_{jt}' \quad (3)$$

Secondly, we analyze the information entropy of the indicator:

$$e_j = -\frac{1}{\ln T} \sum_{t=t_1}^T y_{jt} \times \ln y_{jt} \quad (0 \leq e_j \leq 1) \quad (4)$$

Where t_1 is the beginning year, T is the last year.

Then, the entropy redundancy is:

$$d_j = 1 - e_j \quad (5)$$

So, the weight of the indicator can be determined by the formula below:

$$w_j = d_j / \sum_{j=1}^n d_j \quad (6)$$

Where n is the amount of all the indicators in the indicator system.

Therefore, we can evaluate the development level of each subsystem as follows:

$$s_{it} = \sum_{j=1}^m w_j x_{jt}' \quad (7)$$

Where m is the amount of all the indicators in the subsystem i , w_j represents the weight of the j indicator, s_{it} represents the development level of the i subsystem in the year t .

The development degree is the integration of economic, social, and environmental subsystem. We use arithmetic mean to calculate the development degree:

$$D_t = \sum_{i=1}^3 s_{it} / 3 \quad (8)$$

2.4 Coordination degree

To judge whether a system is coordinated, the factor that has to be clearly confirmed firstly is the criteria of the optimal performance of the system, that is, what the status of each subsystem is when the whole system performs best. Then by measuring the disparity between the current status and ideal status of each subsystem, how the system is coordinated can be judged.

This paper adopts the model of distance coordination degree^[5] that takes the quantitative analysis of the system's ideal performance as the prerequisite step of the evaluation process.

2.4.1 Identify the ideal performance of each subsystem in the coordinated development

Firstly, we have to quantitatively confirm that the three subsystems have interactions with each other. That is the reason that the ideal performance of each subsystem depends on the one of other subsystems.

Table 2 ADF Test Results

Variables	Details	Probability	stationarity
Δ^2 (GDP)	With trend and intercept, lag = 6	0.0020	stationary
Δ^2 (TEC)	With trend and intercept, lag = 1	0.0000	stationary
Δ^2 (PETI)	With trend and intercept, lag = 2	0.0000	stationary

In this study, we use co-integration analysis to confirm the long-term relationships among the subsystems of economy, society and environment.

At the beginning, we choose the most common variables to represent each subsystem. We found the GDP for economy, the Total Energy Consumption (TEC) for environment, and the Percentage of Employed Persons in Tertiary Industry (PETI) for society. The data at a national level from 1985 to 2011 is collected in the China Statistical Yearbook for the analysis.

Table 3 Co-Integration Test Result

Variables	Details	t-statistic	0.05 critic value	Result
GDP-TEC	Without intercept, and trend, lag period is 1	-2.411392163	-1.955019555	Co-integration relationship exist
Cointegration equation: $GDP = -133539.5 + 1.543973TEC$			Adjusted $R^2 = 0.962045$	
GDP-PETI	Without intercept, and trend, lag period is 2	-2.3528023	-1.955680827	Co-integration relationship exist
Cointegration equation: $\ln GDP = -4.307517 + 4.787123 \ln PETI$			Adjusted $R^2 = 0.981451$	
PETI-TEC	Without intercept, and trend, lag period is 2	-2.476742178	-1.955680827	Co-integration relationship exist
Cointegration equation: $PETI = 14.74707 + 0.0000669TEC$			Adjusted $R^2 = 0.811931$	

(1) The unit root test

We test the unit root using ADF test and reach the conclusion in Table 2. Under the 5% confidence level, the variables are stationary in second-order (Table 2). There seems to be a co-integration relationship among them.

(2) The EG co-integration test

We employ EG method to test the co-integration relationship among the subsystems. As it is shown in the Table 3, there are co-integration relationships among GDP, TEC and PETI under the 5% confidence level. Meanwhile the coefficients in the co-integration equations are all positive, indicating that the economic, social, and environmental subsystems influence each other positively (Table 3).

Therefore we can assume the ideal status of the coordinated development of economy, society, and environment as follows: When the three subsystems are finely coordinated, they should develop simultaneously. Their development levels should be relatively consistent with each other and they are all encouraged to catch up the best one of them. Therefore the ideal coordination of the whole system is realized when the levels of the three subsystems are all equal to the highest value of their development degree.

$$(s_{1t}', s_{2t}', s_{3t}')^T = (\max(s_{1t}, s_{2t}, s_{3t}), \max(s_{1t}, s_{2t}, s_{3t}), \max(s_{1t}, s_{2t}, s_{3t}))^T \tag{9}$$

Where s_{it}' represents the ideal performance of the i subsystem in the year t .

Distance between the current performance and the ideal performance of the system

$$G_t = \sqrt{\sum_{i=1}^3 (s_{it} - s_{it}')^2 / \sum_{i=1}^3 g_i^2} \tag{10}$$

Where $g_i = \max_t \{ |s_{it} - s_{it}'| \}$ is the possible largest distance between the current performance and the ideal performance of the subsystems.

Model of coordination degree

$$r_t = (\sqrt{1 - G_t})^k \tag{11}$$

By the formula, when the score of r_i is higher in the range from 0 to 1, the subsystems are more coordinated. k is the adjustment coefficient, determined by the dimensionality of the subsystem.

2.5 Coordinated development index

Based on the coordination degree and development degree, an synthetic index is developed as the coordinated development index that is used to express the evolution of the system of economy, society, and environment, systematically.

$$Z = \sqrt{D_i r_i} \tag{12}$$

3 Results and Discussion

Overall, as it is shown in Figure 1, the scores of coordinated development index in municipalities and provinces are rising in fluctuations from 2004 to 2010. The eastern coast area has remained the highest level in China, while the northwest area went relatively backward, but has been maintaining a good development trend later, which in 2006 generally reached the national average. The year of 2006 was a turning point for the coordinated development index of all regions. From 2006 to 2008, the coordinated development index had declined in most parts of the country, but after 2008, recovering a good momentum with a unify trend, all economic zones continuously improve their levels of coordinated development.

The reasons of economy, society, and environment for changes of the coordinated development index can be concluded as follows:

3.1 The reason for the decline of the coordinated development index

The decline is mainly brought by the problem of unbalanced speed of economic, social, and environmental development. On one hand, the rapid accumulation of physical capital is realized by depleting the natural capital, on the other hand, the economic growth can not improve the social well-being in short term. As a result, the gaps between economy and society, environment are enlarged, and the coordination degree gets worse. So even if the development degree increased, the coordinated development index would decline.

3.2 The reason for the increase of the coordinated development index

When the coordinated development index increases, it is the process of the three subsystems to coordinate with each other and develop simultaneously. When the economics has accumulated the achievements to some extent, it will slow down and transfer the accumulation to the improvements in social development. Meanwhile, investments will be plunged into technical innovation and industrial upgrading. The low-efficient technologies are to be removed and replaced with technologies that are green and efficient in resource use. During this period, the gaps between economy and society, environment are narrowed and their developments are strengthened, the coordinated development increases.

Figure 1 The Map of China for Coordinated Development in 2010

4 Conclusion

Sustainability is commonly interpreted by a triangle framework of Economy, Society, and Environment. The three pillars of sustainability are interacting with each other according to some coordination mechanisms. So, the performance of each pillar is influenced by others. It is necessary to study the interrelationships among them in order to realize the simultaneous improvement in the three phases. In this paper, we analyze sustainability assessment framework from a new perspective, that is, coordinated development. Based on this, an index system of coordinated development index is developed and used to measure the situations in Chinese municipalities and provinces during the years from 2004 to 2010. The result shows that the evolutions of the coordination interrelationship in cities or provinces are similar to each other in the same region. It is resulted from the driving effects of economic development exerted on social development and environmental problems. In a further study of typical regions of coordinated development, the economics, political backgrounds, and geography conditions have been analyzed to explain the coordination development index.

Based on the driving effects of economy and the current development pathway in China, we highlight policies that stimulate public and private investment in development of low-carbon, resource efficient, socially inclusive innovation and technologies to drive sustainability. The pathway of coordinated development will vary considerably among nations, as it depends on the specifics of each region's natural and human capital and on its relative level of development. But first of all, for all of them, enabling conditions including policies, incentives, will be required. Any strategy to economic growth should consider the impact of environment. It is believed that government policies play a critical role within economics to encourage innovation in clean and energy-efficient technologies that is a very important drive for sustainable development. In addition, the public policies concerning the livelihoods of the rural poor are also significant for a harmonious status of human community.

Privacy Risk Identification in Social Networks Based on LDA Model

Zhang Lina, Zhou Yipeng, Fang Deying

School of Management Science and Engineering, Beijing Technology and Business University,
Beijing, P.R.China, 100048

(E-mail: linazln@126.com, yipengzhou@163.com, deyingfang@163.com)

Abstract: With the continuous development of Internet of things, cloud computing and mobile internet, social networks play an increasingly important role in our lives. People rely on the social network to send information, while the privacy incidents also occur frequently. In this paper, we apply LDA (Latent Dirichlet Allocation) to microblog's short text, and propose a social network privacy identification method. We present a Gibbs sampling implementation for inference of our model, and identify the text information may cause privacy risks. Before social network users publish information, it can provide an early warning, in order to reduce the incidence of privacy disclosure in social network.

Key words: LDA; Social network; Privacy risks; Risk identification; microblog

1 Introduction

With the continuous development of network applications industry, social network, an emerging interpersonal communication platform, has been got the booming development. But there are a lot of privacy information in social networks. While many enterprises analyze the big data to study the law of social operation, it leads to the disclosure of personal privacy and makes a serious threat to the personal information of social network users. For example, you can easily obtain our position and the daily travel data, via GPS, mobile phone positioning, etc. in the era of big data. Some research shows if you have four space points of the mobile phone positioning plus large data mining, you can determine the identity of the mobile phone holder. Therefore, the privacy protection of social network data is essential for the healthy development of network society, but also the imperative of social network research. Prospective studies are needed in the social network privacy risks for achieving the protection of personal privacy.

At present, the researches of privacy risks in social network mainly focus on method and model from the perspective of the enterprise. The initial treatment of privacy protection in social networks is based on the idea of simple anonymous, where the social graph will be replaced by the same composition. It mainly makes the identification information hidden or replaced by moot identification, which laid the foundation for the other anonymous methods. Social network privacy protection method based on clustering is widely used, which is based on the different degree of privacy, the nodes of different structures or the edge of different sensitivity to packet process. K-anonymity, L-diversity, (a, k)-anonymity are the typical models of social network privacy protection, on the basis of which a lot of improvements were made. Lan Lihui et al.(2011) regard the neighborhood information as the attacker of background knowledge to identify the target node. They put the K-anonymity into the social network privacy protection to propose a data published method of privacy protection in social network. Another example (James Cheng, 2010) (Zhang Xiaolin, 2012)reference K-anonymity, it proposes K-isomorphism in social network privacy protection.

As can be seen from the above studies, the current research on the incidence of privacy disclosure in social network is mostly concentrated in the macro level of privacy attacks and threats, not how to protect personal privacy for social network users to prevent privacy risks. In this case, this paper provides an early warning from the perspective of social network users, in order to reduce the incidence of privacy disclosure in social network.

2 LDA Model in Text Categorization

2.1 The basic idea of LDA model

LDA is a modeling method of thematic analysis for the text data, and it is a typical hierarchical Bayesian model, which is composed of three layers: documents, themes and words. The basic idea is that each document can be expressed into a mixed distribution of the underlying theme, and each them is vocabulary probability distribution of all the words. The Bayesian network diagram of LDA model is shown in Figure 1, which is determined by the parameter document collection layer (α , β). In Figure 1, α reflects the relative strength of the relationship between implicit topics in the document collection; β reflects probability distribution of a word entry in a particular topic; Random variable θ is the

probability of each theme occurring, and it is a column vector of $k \times 1$, every one of which represents the probability that each element of a topic occurrence; z indicates the implicit theme's probability of the current document on each word; w is the words of target document, and its value can be obtained by observing; M is the total number of texts; N represents the total number of words. In the boxes, it denotes this operation is repeated N times and M times.

Figure 1 Bayesian Network Diagram of LDA

In the LDA model shown above, the word of the text is observable data, and the theme of the text is implicit variable. According to the rule of text generated and the known data, topic structure can be obtained through the probability deduction in the LDA model. There are some commonly used methods, such as Gibbs sampling, variational Bayesian, expectation propagation and so on.

We use the Gibbs sampling in this paper, and its training process is as follows:

- ① Each feature word in each text is given a random theme number z ;
- ② Repeat scanning the entire corpus, and use the Gibbs sampling for each feature word to recapture its themes and updates
- ③ Repeat the above sampling procedure, until Gibbs sampling convergence;
- ④ Count the entire corpus theme- characteristic words co-occurrence frequency matrix, which is the LDA model

2.2 LDA model in text categorization

LDA model is a popular unsupervised learning algorithm in recent years, which is able to achieve automatic mining of large-scale document text theme. Compared with the traditional theme of text classification algorithm, it does not need the manual identification of corpus in LDA model, so it can realize the automatic mining of text topic, which has significantly improved the efficiency, reduce human factors on the classification results and other advantages.

The essence of the generative classification algorithm is to model for the joint distribution of (object, type), and the appropriate classification decision rule is formulated as follows:

$$\hat{c} = \arg_c \max p(x | c)p(c) \tag{1}$$

Among them, c represents the category, x indicates the target document, the core of this formula is the class conditional probability $p(x | c)$, which express the document probability x in the case of category c , where the LDA is used as the class conditional probability to get LDA classifier(Li Wenbo,2008), shown by the following formula:

$$\hat{c} = \arg_c \max p_{LDA}(x | \alpha_c, \beta_c)p(c) \tag{2}$$

LDA model is Divided into stages of training and inference. In the stage of the training, it establish the corresponding sub-LDA model for each category of document by independent training. Thus, it share a theme in the class and it is separated among classes. In the stage of the inference, it use the sub-child LDA model to generate the target document x , in order to obtain the probability of corresponding category, which is substituted into the formula (2) to infer the category of the target document x .

LDA models are generally used for long texts, but in this paper it is used for short text in the microblog. And there are some difference between the microblog text and the text of the traditional network: ①Microblogging content is usually short text data, whose length has certain limitation, such as Sina micro and Tencent micro limit their 140 characters or less; ②The writing is casual, text is a word or two, and there are serious data sparseness; ③A large number of network language, symbolic language and new words make the data noise and require higher criterion to data preprocessing; ④microblog users can publish information in real time via mobile phones, computers, and a variety of ways, with the rapid update and the large scale data. The above characteristics give the establishment of LDA topic

model challenges.

3 Experiment

3.1 Experimental preparation

In this paper, The data grab on Sina micro. It must be carried out a data pre-processing before used in the LDA model: removal of the word pause. Stop word means the pronouns, modal particle and other commonly used words, whose frequency of occurrence in the text is very high, but it is moot for theme mining. At first, a preliminary stop words dictionary is established, and then the stop word dictionary is constantly updated through the analysis of experiment data processing. Finally, it set up a suitable stop words dictionary.

3.2 Experimental results

The parameters of this paper, $\alpha=50/T$ (T is the number of themes), $\beta=0.01$, are provided with reference to (Giffiths T, 2006). The set of topic number T mainly refers to the convergence conditions of “confusion degree curve (Perplexity)”:

Perplexity is not only a commonly used indicator to measure the performance of probabilistic graphical models, but also a commonly used measure of theme modeling. It denotes the uncertainty of the forecast data, so the smaller value indicates less uncertainty, better forecasting performance and the higher generalization. The specific definition of Perplexity is as follows:

$$Perplexity(W) = \exp \left\{ - \frac{\sum_m \ln p(\omega_m)}{\sum_m N_m} \right\} \quad (3)$$

Among them, W represents the words that can be observed in the test set, namely the word entry in Figure 1; Nm indicates the number of words. We set the different parameters of α and T to calculate perplexity in order to make it optimal and determine the optimal α and T. At the moment, the model's generalization ability is the strongest. The Perplexity curve of the LDA model in this paper is shown in Figure 2:

Figure 2 The Perplexity Curve of LDA

As can be seen from the graph, when T=260, $\alpha=50/260 \approx 0.192308$, the Perplexity of the LDA model is smaller and the Perplexity curve leveled off. So the parameters of the LDA model : $\alpha=0.192308$, $\beta=0.01$, T=260. At the moment, the overall effect of privacy risks mining based on LDA model is shown in Figure 3. In Figure 3, it shows the only first eight topics in the mining. According to the corresponding keywords in each topic, you can find out: Topic 1 is identity-related topics with students. If the social network users publish this information, it will reveal the identity of their students, sometimes even disclose their qualifications and school information; Topic 2 is related to the location information. It will disclose the user's location information, and sometimes even disclose their residence and native place. It needs to be noted that, because the city data is scattered and the word frequency of single city through thematic analysis is too low, we make a pre-processing before the data input. So it makes all the specific city information instead of "city"; Topic 3 is related with the birthday. It has become a trend to express wishes to relatives and friends for the birthday through microblogs, but it will reveal the user's relationship with relatives or friends as well as their birthday date. Topic 4 is related to the physical condition; Topic 5 is associated with personal daily schedule (travel, shopping, etc.)and

personal cycle regularity activities; Topic 6 is related to Marriage status; Topic 7 is related to the social network users' mood; Topic 8 is about the relationship between the social network users with their friends and relatives. This show the model has the higher accuracy of their corresponding keywords and the stronger independence between topics.

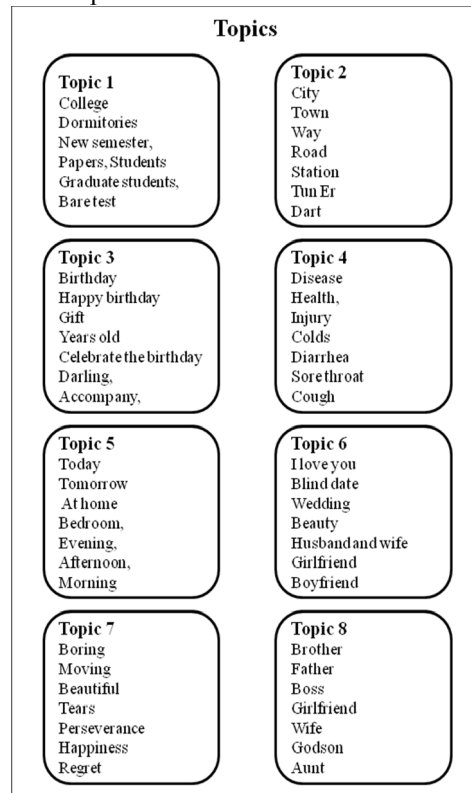

Figure 3 The overall effect of LDA model

4 Conclusion

Today, there are a lot of privacy issues in social networks, so this paper provides an early warning from the perspective of social network users, in order to reduce the incidence of privacy disclosure in social network.

This paper is mainly aimed at a message to provide an early warning of privacy risk, which the social network users publish. The further research will be focused on the analysis of all the information on the same social network users. We will exploit their potential privacy risks through the relevant method of data mining in order to provide early warning for social network users.

Path Analysis on Factors of Real Estate Enterprises Low-Carbon Competitiveness

Liu Wuwei, Yan Jingdong

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: matrixbag@live.com, yjdong02@163.com)

Abstract: Due to high carbon emissions, real estate has become the focus in the reform of saving energy and reducing emissions. After reading various literature, the author found that most scholars set research direction in evaluation index system of Low-carbon competitiveness. Therefore the author tries to find out the main factors affecting the Low-carbon competitiveness of real estate on the basis of existing research, then to find out the driving factors by assuming, calculations and conclusion. In the end put forward the suggestions to improve Low-carbon competitiveness of real estate.

Key words: Real Estate; Low-carbon Competitiveness; Path Analysis; Low-carbon economy

1 Introduction

In the strategic context of China's low carbon economy, as the main force of China's economic development in recent years, the real estate industry shoulders a huge social responsibility of energy conservation, low-carbon frequent introduction of relevant policies are aimed at deepening the reform of the industry. The author tries to discuss factors of real estate enterprise low-carbon competitiveness and find their interactions by hypothesis testing methods.

In the present analysis, the first author extracted four explanatory variables from a large number of relevant literature, they are: strategic planning for low-carbon (A), low-carbon policy execution (B), control of raw materials(C) audience to buy the concept of low-carbon (D); then selected two types of indirect indicators after principal component analysis on massive basic indicators: low-carbon technological capacity (E) and low-carbon operation capacity (F);finally selected on the basis of higher weights index, and revise the scale By Delphi method. As shown in table 1.

2 Index Design & Assumptions

Based on the definition of the above factors, it could be shown in relevant research model blow.

Then, based on the model, the author proposes the following hypothesis group:

H1a:Strategic planning for low-carbon and low-carbon technological capacity are positively correlated.

H1b:Strategic planning for low-carbon and low-carbon operation capacity are positively correlated.

H2a:Low-carbon policy execution and low-carbon technological capacity are positively correlated.

H2b:Low-carbon policy execution and low-carbon operation capacity are positively correlated.

H3a:Control of raw materials and low-carbon technological capacity are positively correlated.

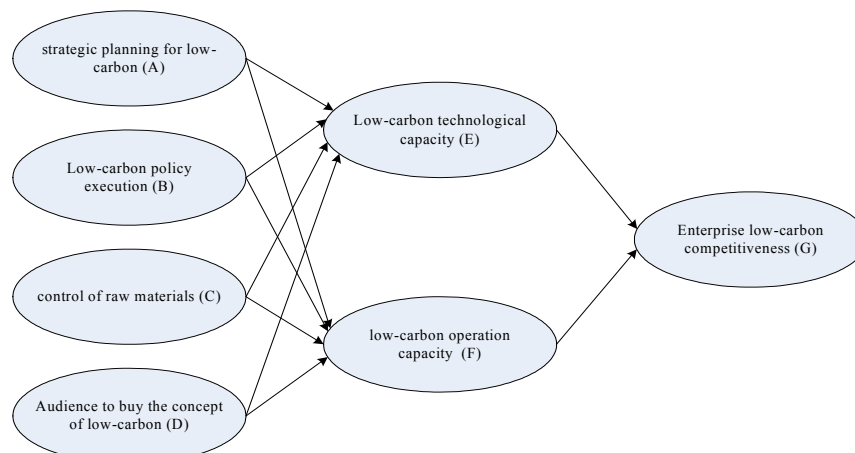

Figure 1 Real Estate Business Model of Low-Carbon Competitiveness

H3b:Control of raw materials and low-carbon operation capacity are positively correlated.

H4a:Audience to buy the concept of low-carbon and low-carbon technological capacity are positively correlated.

H4b: Audience to buy the concept of low-carbon and low-carbon operation capacity are positively correlated.

H5:Low-carbon technological capacity and enterprise low-carbon competitiveness are positively correlated.

H6:Low-carbon operation capacity and enterprise low-carbon competitiveness are positively correlated.

And in order to describe the explanatory variables, scale design in which four categories of explanatory variables are as follows:

Table 1 Explanatory Variables Scale

Strategic planning for low-carbon (A)		Low-carbon policy execution (B)	
A1	Annual business planning in low-carbon environmental emphasis	B1	both corporate profits and ecological benefits
A2	Companies mentioned in the prospectus of the proportion of low-carbon development	B2	enterprise operations carbon self-check
A3	The degree of concern about the low-carbon business forums and meetings	B3	peers carbon assessment
A4	Business-related professional talent recruitment requirements	B4	whether there received a warning and punishment of the environmental protection department
A5	companies to buy carbon emissions trading carbon credits	B5	drafting industry standard quantity
Control of raw materials (C)		Audience to buy the concept of low-carbon (D)	
C1	building insulation material known as carbon utilization	D1	audience defined the extent of carbon
C2	carbon building sound-absorbing material utilization	D2	audiences private car emissions
C3	carbon building wall material utilization audience	D3	level of support for new energy
C4	Building protective material carbon utilization	D4	Audience awareness of environmentally friendly materials
Low-carbon technological capacity (E)		Low-carbon operation capacity (F)	
E1	outdoor environment of low carbon technology capability	F1	Enterprise applications for low-carbon R & D Input
E2	The ability to maintain the structure of energy consumption technology	F2	Whether a company has the relevant corporate standards and industry standards
E3	Possible use of renewable energy degree	F3	Prospectus disclosure of business-related low carbon projects
E4	Interior carbon smart index	F4	The amount of corporate profits for three consecutive years
Real Estate Enterprises Low-carbon Competitiveness (G)			
G1	Whether the enterprise qualifications obtained ISO14000		
G2	Blowdown rate compliance level		
G3	The degree of utilization of waste		
G4	Situation in recent years to obtain the environmental protection department of special subsidies		
G5	Public recognition of the extent of the company's environmental image		

Firstly, the investigation team produced a detailed questionnaire to China's existing 40 real estate companies and 180 consumers conducted a detailed investigation, the questionnaire recovery was 75%, which is suitable for further scientific analysis.

After comparison criteria Cronbach's Alpha coefficients, the index values are above 0.8, below the acceptable range. This article refers to the heading for all low-carbon competitiveness under variable

factor analysis, KMO value reached 0.904 factor to meet the conditions for further analysis.

Finally, the author uses principal component analysis to extract four factors with eigenvalues greater than 1. From the analysis results showed that each of the major variable factor corresponding relations are relatively close, we can basically explain the four low-carbon green competitiveness variables. In addition, the total percentage of variance explained reached 70.872%, basically explained the target variable.

Therefore based on these estimates, it is believed that the reliability and validity of the survey are both reliable.

3 Results

After fitting degree test, the Corresponding IFI, RMSEA, Chi-square are fitting standard ratios, GFI, AGFI, TLI value is not reached the adaptation of standard , but basically at acceptable within range, so it is still suitable for further analysis.

Structural equation model fitting results are shown below(all path showed statistically significant (P <0.05)):

Table 2 The Structural Equation Model Fitting Results

Model Path		Coefficient	P	Hypothesis	Judge	
Low-carbon technological capacity	<---	Strategic planning for low-carbon	0.765	<0.001	H1a	True
Low-carbon operation capacity	<---	Strategic planning for low-carbon	0.402	0.006	H1b	True
Low-carbon technological capacity	<---	Low-carbon policy execution	0.606	0.012	H2a	True
Low-carbon operation capacity	<---	Low-carbon policy execution	0.411	0.004	H2b	True
Low-carbon technological capacity	<---	Control of raw materials	0.387	0.002	H3a	True
Low-carbon operation capacity	<---	Control of raw materials	-0.163	0.313	H3b	False
Low-carbon technological capacity	<---	Audience to buy the concept of low-carbon	-0.171	0.297	H4a	False
Low-carbon operation capacity	<---	Audience to buy the concept of low-carbon	0.303	0.012	H4b	True
Low-carbon Competitiveness	<---	Low-carbon technological capacity	0.319	0.005	H5	True
Low-carbon Competitiveness	<---	Low-carbon operation capacity	0.572	<0.001	H6	True

After analyzing the data table above, it comes to the corresponding variable diagram:

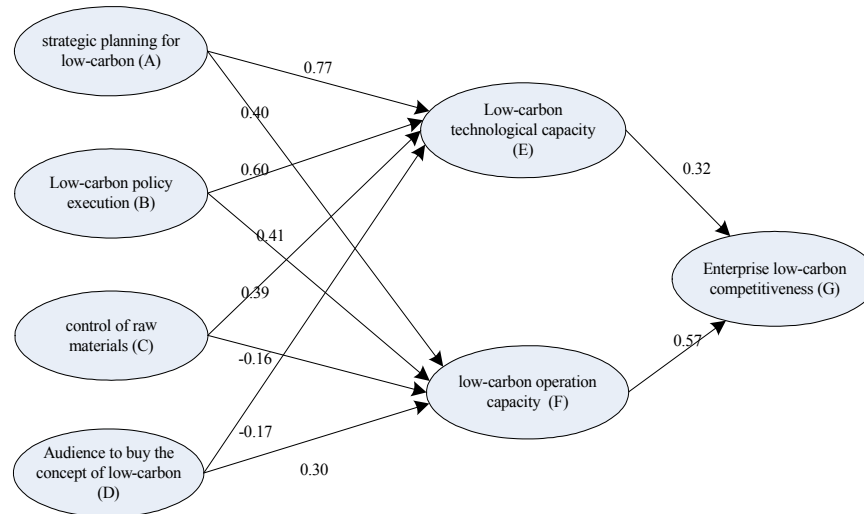

Figure 2 Fitting Relationship of the Main Variables

4 Conclusion

(1) In contrast, a positive correlation with the degree between low-carbon competitiveness and the low-carbon technological capacity is lower than expected. This shows that at this stage of China's real estate enterprises have yet to technical emission reduction in a prominent position, and more to low-carbon development from the perspective of management and operations.

(2) Product carbon raw material control and operational capacity share the poor regression effect, which hypothesis is not consistent with expectations. From this, the carbon raw material control companies and not directly stimulate enterprises to achieve a low-carbon development in the management process; in the operating mechanism of enterprises, materials and operation of low-carbon low-carbon concept is relatively independent, in the procurement chain curb carbon-containing green part only enterprise development, and not as a comprehensive assessment of green competitiveness.

(3) From the operational point of view the results of structural equation, low-Carbon strategic planning of real estate enterprises shows high impact weight; Real estate company's strategic planning have significant positive correlation, not only for Low-carbon technological capacity but also Low-carbon operation capacity.

How Is It Getting into Chinese Business Culture: A Possible Path for Foreign Enterprises to Venture inside the Country

Fernando Nelson Villaverde Chavez, Zhao Yulin

School of Economics, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: fn.villaverde@gmail.com, ylzhao@whut.edu.cn)

Abstract: The current research paper refers to the main aspects of Chinese business culture view from a foreign perspective, introducing important points which highlight the benefits of getting into the Chinese market. In the other hand; makes a meticulous study of the common Chinese executive behavior and consumer as well. Finally this work frame the significant importance of the culture influence when doing business, regarding some key philosophy Confucius' standpoints that may influence decisions-making by the time of negotiating. All of this study development intends to come out with different conclusions and suggestions in order to tender a guide towards foreign enterprises who look for doing business in China successfully.

Key words: Business culture; Guanxi (reputation); Westernization; Relationship; Global environment

1 Introduction

China raises passions, some are afraid of it and may be cataloged as the source of a serie of threats and tragic omens, while others love it, look this country with fascination and deposited in it the hope of a prosperous future. Without going into value judgments about how accurate or not these visions are: China is different and distant.

Has codes, protocols and own forms of relationship, so appealing to a pragmatic view, the only certainty is that those seeking to do business with this economy, looking to become the number one in the world in the short term, should have some clear key to its culture not to fail in the attempt elements.

China has experienced over the past three decades, one of the most rapid and dramatic economic transformations in modern history, with rates in excess of ten percent annual growth. This transformation process is causing China be among the preferred countries for international business. Not surprisingly, turns out to be the third largest economy in the world and arguably the center of gravity of the world economy that is shifting inexorably towards this country.

Its advantages in cost besides being the most populous country in the world with about one thousand three hundred million, three hundred million inhabitants of which belong to the high-middle class allowed to name it "the world's biggest potential market." For this reason, since the early eighties some countries have begun to make a significant and sustained effort to develop their presence in China.

Despite all the prosperous impact that this country displays to the world, being involved or simply take part of it for sure is not an easy job; since due of its large history background and all the cultural customs that come along linked to each other, the only fact getting used living in China, entailing all the possible daily manners that a foreigner should know by the time executing a common task, wouldn't be as simple as it sounds. Experiencing the culture itself innerly might be the best way to deeply understand different behaviors that in some way would shock us in a determine time. The interesting and beautifulness of this world is to realize its enormous diversity about customs, education, traditions, etc. So the challenge is to find out a perfect adjustment of our beliefs and thoughts, to take part in a new culture in order to follow the already system and communicate fluently regarding slenderly cultural aspects.

2 Literature Review

2.1 Attractiveness of China as a market

During the first decades of the century, the Asia-Pacific region is having and will have a major attraction for international companies. It is projected that the region will become a technological, political and economic power with a simultaneous increase in consumer demand (Czinkota and Ronkainen, 2002).

According the ranking of Foreign Direct Investment (FDI) Confidence Index, FDI is lead by China since the year 2003. This is because China has a number of advantages over the medium and long term: its high integration into the world economy, its good physical infrastructure, a development model that generates many jobs and relative macroeconomic stability (Bustelo, 2008). These advantages come

largely by China's development model, that is, the so-called Beijing Consensus, which has as key components the "state capitalism" gradualism, opening up, political authoritarianism and innovation and flexibility (Fanjul, 2009).

Figure 1 Data of Chinese GDP in the Last Years

As the graph illustrates, the growth rates of Gross Domestic Product (GDP) in China in recent years are around ten percent, providing significant opportunities to companies that choose to settle in this country. The Gross Domestic Product (GDP) in China was worth 8230 billion US dollars in 2012. Therefore it represents 13.27 percent of the world economy.

The attractiveness of China as a target market is that it is a vast market with a high middle class of three hundred million people looking through purchases of Western brands, meet the needs of social recognition, prestige and status. Is important to notice that Chinese entrepreneurs and the "beautiful Chinese people" holders of the maximum income level, have become a priority target for Western luxury brands. China is the third largest consumer in the world, luxury goods, after the United States and Japan (Sanchez-Monasterio, 2009a). Whether the aim is to do business among Chinese or towards Chinese consumers, the key is to optimize brand positioning and Western products in the mind of the Chinese consumer which respond to their needs. Basing on demographic data, it is estimated that in the next decade the number of dwellings with inhabitants of the upper middle class and age between 30 to 60 years will increase by 128%, which represents a potential market that is not at all negligible. The forecast is that in 2020, in China there will exist a high-middle class of six hundred million people (Sanchez-Monasterio, 2009b). Also, the retail sector is more developed in the densely populated areas of cities, where the large concentration of young professionals is recorded. These areas are the main focus of selling Western products. Urbanization, lifestyle changes, developing new marketing channels and communication, also differentiate the consumption pattern. However, although China is urbanizing rapidly, it remains a country of extremes and business formulas that are valid in other countries may not work if they are applied in China without having taken into account a number of features like the "culture" itself.

2.2 China: customs and traditions of an ancient people

China has become the largest capitalist market in the world, the reality is that, from a cultural point of view, values survive from an ancient culture, with strong rural roots, that makes profound differences between the modus operandi of the Chinese executives and their counterparts in the capitalist world.

When a western executive visits China to negotiate agreements (purchase, distribution, manufacturing, joint venture, etc.). Should bear in mind the differences in the Chinese business culture to succeed in their negotiations and establish stable and profitable relationships with their customers, suppliers or Chinese partners. It could be sate that there some very important cultural elements that determine, to a greater extent, the behavior of Chinese executives during negotiations with foreign companies.

2.2.1 Personal Contacts

The most important asset that Chinese executives have is not the training or experience but the personal contacts network (Guanxi), i.e. what might be called "social capital" that used to advance professionally. This network consists of family, classmates of school or college, friends, acquaintances, coworkers, etc.. The Guanxi operates on the principle of reciprocity, which the Chinese call "hui bao". When a favor is done to someone later it is expected to be returned, although not immediately, but throughout the relationship. It's like Chinese executives record an accounting of favors done and

received them back with every member of their network of personal contacts. If someone does not respond to the favors that have been made is negatively marked for future business.

2.2.2 The intermediary

Because of many invasions that have experienced, Chinese people are very distrustful and suspicious of anything that comes from abroad, on the other hand, have a certain feeling of superiority, not forgetting its denomination as “the empire of center” increased by its enormous economic and political power. This double component of superiority and mistrust make almost forced foreign companies to use an Intermediary to negotiate with Chinese companies. Choosing a good intermediary either a Chinese with good connections (in the sector of the company’s activity) or a Western that is settled years in China and has a good “Guanxi” would be crucial for success.

The Intermediary functions are multiple: to establish initial contact and set meetings, initiate business conversation, interpret the answers and gestures of Chinese negotiators, resolve differences as well as keep constant track of the agreements being achieved.

2.2.3 Hierarchy

Derived from the philosophy of Confucius, respect and obedience to superiors are essential values in Chinese culture. This cultural element has three implications in negotiating with Chinese companies: first, foreign companies must send the appropriate level of representatives to China for the agreement to be achieved, in addition, during the negotiations must show a deference treatment, recognizing their top hierarchical position towards Chinese executives of the company, and finally, keep in mind that, during the negotiations, senior executives never face the other party, or get to discuss important issues. The role of "hard" negotiator does the second-level executives.

2.2.4 Harmony in relationships

Achieving agreement requires parties to develop personal relationships based on respect, friendship and positive feelings. Building these relationships takes time and it will be necessary to get involved in the country’s culture itself as well as holding numerous meetings between parties. It helps to hold lunches or dinners in which is talked about numerous subjects except business. The case is to create a relationship of trust, which without it is unthinkable to do business.

2.2.5 Global reasoning

Because the Chinese language consists of signs (ideograms) that represent words or concepts, not a sequence of letters as in Western languages, Chinese people have a comprehensive approach to the topics and do not negotiate one by one in sequential way, that is to say, treat all issues (prices, quantities, delivery terms, etc.) together, so that the agreement reached has to be global, not item by item. That approach may delayed negotiations since cannot progress step by step as is customary in Western culture.

2.2.6 Saving

The harsh living conditions Chinese had to endure made them used to be good savers to ensure the well-being in old age since in China there is no public health system or pension. Among large countries, China is having a higher savings rate, above 50% of GDP (Fanjul, 2009). To achieve these savings Chinese appeal to both professional and personal life, such as extreme bargaining tactics: they are very aggressive when negotiating prices, reaching extremely low and very far prices from what they are really willing to pay, just as tactic to weaken the other party.

2.2.7 Reputation or lose face

An essential element of the business culture in China is the Mianzi (face) or “reputation” that Chinese people have with their personal relationships (Guanxi). Some probably negative actions that could make one “lose face” towards a Chinese negotiator are: interrupt while this person is speaking, have a direct confrontation or make the person realize about his or her mistake. Whether during negotiations got someone to “lose face” in front of his or her peers to a member of the Chinese negotiating team, will be a negative reaction and get tough to reach an agreement because decisions are made in group and the offended person will push for negotiations fail. As opposed to the concept of “losing face” there is also the term “give face” (Gei Mianzi) which might be achieved complimenting or praising one’s work in front of a superior. The latter is highly recommended as it will enhance the reputation of the person and take a more favorable position for the deal.

2.2.8 Resistance at work

The Chinese are great negotiators and their culture capacity and resistance at work is valued more than talent or creativity. This strength is reflected in different ways during the negotiations: first, hard work in preparing, analyzing all the issues to be negotiated; they prefer long sessions in which the parties exchange many questions, sometimes are repetitive in those, however they are very patient

during the negotiation and delay decision making as a pressure technique. Finally, they never lose their composure as it is considered a sign of weakness.

2.2.9 Ethic

In the West is tend to think that Chinese companies do not act ethically, at least by the standards of what is meant by “fair play” (Sanchez-Monasterio, 2009a). A good example is the practice of change and renegotiate the terms of a contract that has already been signed. To understand the concept of ethics in China, must turn to the philosophy of Confucius, one of whose maxims is that "morality is based on the circumstances of the time and not on universal principles." This statement opens the door to continuous changes in the agreed conditions, which in Western culture are considered bad practice and are even cause for judicial proceeding while in China are perfectly acceptable.

3 What is the Chinese Consumer Looking for

Apple has taken China by storm. A Starbucks can be found on practically every major street corner in coastal cities and beyond. From Nike to Buick to Siemens, Chinese consumers actively prefer Western brands over their domestic competitors. The rise of microbloggers, the popularity of rock bands with names like Hutong Fist and Catcher in the Rye, and even the newfound popularity of Christmas all seem to point toward a growing Westernization.

However cannot be deceived by appearances. Consumers in China aren't becoming “Western.” They are increasingly modern and international, but they remain distinctly Chinese. It is that successful Western brands craft their message here to be “global,” not “foreign” so that they can become vessels of Chinese culture.

Understanding China's consumer culture is a good starting point for understanding the nation itself, as it races toward superpower status. Though the country's economy and society are evolving rapidly, the underlying cultural blueprint has remained more or less constant for thousands of years. China is a Confucian society, a quixotic combination of top-down patriarchy and bottom-up social mobility. Citizens are driven by an ever-present conflict between standing out and fitting in, between ambition and regimentation. In Chinese society, individuals have no identity apart from obligations to, and acknowledgment by, others. The clan and nation are the eternal pillars of identity. Western individualism, the idea of defining oneself independent of society doesn't exist.

Chinese at all socioeconomic levels try to “win” that is, climb the ladder of success while working within the system, not against it. In Chinese consumer culture, there is a constant tension between self-protection and displaying status. This struggle explains the existence of two seemingly conflicting lines of development. On the one hand, it is seen stratospheric savings rates, extreme price sensitivity and aversion to credit card interest payments. On the other, there is the Chinese fixation with luxury goods and a willingness to pay as much as 120% of one's yearly income for a car. (Doctoroff, 2012)

4 Entrepreneurship of a Business Management in China

4.1 Cultural elements that influence business management and success

Companies need to adapt to the markets where they operate. Harris and Moran (2001) propose ten key needed for global leadership, that is, for firms operating in multicultural environments concepts. These concepts are: global leadership, intercultural communication, cultural sensitivity, acculturation (defined as the fit and effective adaptation to a specific culture, either a subculture within the country, or abroad), cultural influences on management, effective intercultural performance, changes in international business, cultural synergy, work culture and global culture. The understanding and use of these concepts are critical to the successful performance internationally.

According Grande (2004), the reasons that induce cultural adaptation are diverse: physical environment, legal environment, cultural environment, perceptions, language, tastes, ethical and religious values, ethnocentrism, symbols and forms of communication.

Therefore it is highlighted the key cultural elements that should be considered by companies from abroad that decide to market and do business in China:

Physical environment. China, due to its large size, has many contrasts and can be referred about a different set of markets with own features that pass through a transformation process parallel to that experienced by society. For example, Western China, without a developed infrastructure, desert and lower population density, is less exposed to Western products.

Legal environment. The People's Republic of China is a socialist republic ruled by the Communist Party of China. In the 1970s a series of reforms aimed at the market, among others, led to the adoption

of the Sino-Foreign Equity Joint Venture Law that was introduced in 1979 (Grande, 2004). This law established the legal framework to regulate foreign investment. During the following years, the most common way for a foreign company to operate in China was to have a local partner that has relationships and contacts with authorities. Today, in an increasingly way, foreign direct investment enters China as one hundred percent foreign companies.

Cultural environment. The vast territory of China has resulted in a great cultural diversity. In the field of business is important to highlight building relationships or interpersonal networks, better known as "Guanxi" (Adams, 2007). "Guan" means "door" and "xi" means "ties." Semantically can be defined as a door or a connection between two people created by a mutual bond between them. For foreign businesspeople working in China, building elements of trust is even more urgent than local managers. This network of relationships is key to establishing business alliances and contacts with managers, customers, suppliers and employees (Hernandez-Nieto, 2006). Therefore, it is necessary to understand the importance of "Guanxi", reciprocity, and trust by the time doing business transactions in China. Knowing the protocols and build trusting relationships are steps that cannot be ignored in the development process of "Guanxi" in a foreign company that wants to venture into China.

The symbols. They vary across cultures. In China for example, animals are seen as bearers of happiness, the color "gray" is reserved for inexpensive items and the number eight is perceived as the number of fortune. The phonetic pronunciation of the number "8" is "bā" exactly the same pronunciation as the word "progress" and "fortune". For these reasons it is frequently seen in commercial establishments, retail prices of their products that this number predominates. The opening ceremony of Beijing Olympics was on August 8, 2008 at 8:08 pm. Just to mention that buying a phone number in which the number "8" predominates costs up to 3 times more than any other mobile number.

Forms of communication and negotiation. They vary by culture. There are a number of cultural elements which are relevant for foreign companies, in particular, the following aspects should be taken into consideration:

- Hierarchical relationships and very formal style of communication.
- There is no room for individualism.
- Trust and personal relationships (Guanxi) are vital.
- They tend to take a long term vision.
- Staring bothers them.
- They have less experience of the modern legal system.

5 Design of a Differentiated Marketing Plan

Besides adapting to cultural differences, the success of foreign firms in China happens to have other considerations. For example, to target middle-class consumers, forging local relationships, leverage global networks and flexible way to trace output can be useful recommendations to establish successfully in this market (Adams, 2007). Moreover, competition from both foreign multinationals and Chinese companies themselves is very high.

Now it is necessary to take into account a number of key concepts to be included in the marketing plan to position itself successfully within this market. What becomes a complex challenge is the need to position the product so that is accepted by more consumers. For example, should pay attention to pricing decisions. Every Chinese consumer has for each product a maximum price willing to pay and a minimum price as well that if it is lower, generates suspicion on the actual quality of the product. In addition, there are considerable differences between the sales price to the public in China and the price in Europe for example; it is well known that European currency about any product may be six times more than any price in the Chinese currency.

Cannot be forgotten that in China the customer is "God" (Sanchez-Monasterio and Casaburi, 2008a). Customers become the focus of any marketing strategy. Noting that the "merchandising" in China happens to be a very effective tool that encourage the purchase of the product, something that rarely happens in Europe. The enormous potential of merchandising benefits greatly those western products that, for cultural reasons, not take part of Chinese daily consumption.

6 Conclusion

The actual size of the Chinese market for western products is three hundred million people today, and not one thousand three hundred million people, also is expected to upper the Chinese high middle class to become six hundred million people by 2020. This is an excellent critical mass which is, in turn,

concentrated in large cities such as Beijing, Shanghai, Guangzhou, Chongqing and Hong Kong, among others.

Companies should be able to operate in a global environment, respecting cultural diversity, recognizing personal needs, values, standards and expectations are culturally conditioned. This means being alert to the impact of culture shock in the successful management of transitions, and develop the skills necessary to avoid ethnocentrism.

The importance of choosing a good name, take into account the peculiarities of the Chinese consumer, not ignoring the phenomenon of censorship and legal benefits of Chinese foreign versus local companies happen to be crucial elements for Western companies to achieve enter the Chinese market successfully.

The family, forming related groups and personal relationships (Guanxi) are also primordial in Chinese culture. Thus, the traditional component is a common and consistent element in consumption patterns and becomes essential.

It has also shown the importance of establishing joint ventures with a local partner, and the importance of considering the ethical and religious as well as the type of political power. In short, the future challenges for the companies that decide to trade and sell their products or services in the giant Asian ought to consider cultural elements, trying to overcome the language barrier and establishing relationships with local partners (Guanxi), among others.

Performance Appraisalment for Innovative Green Supply Chain Based on Fuzzy Comprehensive Evaluation

Zhang Yu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 236028125@qq.com)

Abstract: This paper considers the following five aspects: financial, customer, process, development and environment of the performance of innovative green supply chain. Then, three layers' performance evaluation index system of green supply chain was constructed, which are consisted of 5 primary indicators, 13 secondary indicators and 27 thirdly indicators. On this basis, using the combined weighting method, analytic hierarchy process and entropy method to determine the weight of each index. After that, the AHP-Fuzzy Evaluation Model is established based on the fuzzy comprehensive evaluation. Thus, we can comprehensively and objectively assess the overall performance evaluation of green supply chain.

Key words: Fuzzy comprehensive evaluation; Performance appraisalment; Green supply chain; AHP; Entropy method

1 Introduction

Nowadays, sustainable development has become the target of mankind. And environment problem has got more and more people's attention. Based on the situation, green supply chain has increasingly become the research hotspot. On the basis of traditional supply chain management theory, the green supply chain management added the "green concept" and "environmental consciousness", realizing the overall green requirement during the links in supply chain, which includes product design, production, sales, after-sales service and become a waste. A scientific and standardized appraisalment index system can comprehensively and objectively assess and appraise the performance evaluation of green supply chain as a whole. Finally, the coordinated optimization of enterprise social and economic benefit can be achieved.

On the researches of relationship between green supply chain management and enterprise performance, foreign researches are mainly listed below: In 1998, Johnson^[1], who used the balanced scorecard to identify and selected the environmental performance indicators, pointed out that the improvement of environmental performance can promote economic performance; In 2000, Roland Clift and Lucy Wright^[2] studied environmental impact on the relationship between the corporate profitability by applying the method of the life cycle.

The green supply chain management in our country is still in its infancy. Most of researches are focused on aspects such as introductions of the concepts and the system structure^{[3]-[6]}, however related detailed researches are relatively blank.

Above all, on the basis of previous studies, this paper constructs the green evaluation index system by applying analytic hierarchy process and entropy value method which is to determine the index weight, using fuzzy comprehensive evaluation method to evaluate. Then, this paper makes a little contribution on providing guarantee to improve green supply chain.

2 Construction of Performance Appraisalment Index System

The expectation objective of the innovative green supply chain is to realize the overall green requirement during the links in supply chain, which includes product design, production, sales, after-sales service and become a waste. A good supply chain management ensure the effective and efficient running of the supply chain. Also, a scientific and standardized appraisalment index system can be constructed to access and evaluate the overall performance appraisalment of the innovative green supply chain. It provides the basis for decision-making and improves the healthy development of the green supply chain. Finally, the coordinated optimization of enterprise social and economic benefit can be achieved.

In this paper, the construction of performance appraisalment index system for green supply chain is based on the traditional index system for supply chain. In the traditional index system, it evaluate the performance of the supply chain from four perspectives, including financial value, customer service, operation process and development potential. As for the green supply chain, the environmental

influences are taken into consideration. The environment performance was divided into three secondary indicators. The details of each perspective can be find in the following sections.

Then, the performance appraisalment index system of innovative green supply chain can be constructed as follows. There are 5 primary indicators, 13 secondary indicators and 27 detailed thirdly indicators.

Figure 1 Primary Indicators of the Performance Sprraisalment Index System for Green Supply Chain

2.1 Financial value’s perspective

The evaluation of financial index is the key point in the enterprise performance evaluation, which can directly show the level of enterprise performance. According to the characteristics of the green supply chain , we can choose two aspects to construct the index system: the green supply chain’s perspective and shareholders’ perspective. The corresponding index higher, indicating that the better the performance of green supply chain.

Table 1 Financial Value’s Secondary and Thirdly Hierarchy

Secondary Indicators	Thirdly Indicators
Green supply chain’s perspective	Return on total assets(u ₁₁)
	Total assets turnover(u ₁₂)
	Profit growth rate(u ₁₃)
Shareholders’ perspective	Return on equity(u ₁₄)
	Assets ratio(u ₁₅)
	Debt asset ratio(u ₁₆)

2.2 Customer service’s perspective

One of the core content of supply chain management is to conduct customer management. Therefore, we selected as an indicator of customer satisfaction, which is positively correlated with the level of supply chain performance, and higher customer satisfaction means the better performance.

Table 2 Customer Service’s Secondary and Thirdly Hierarchy

Secondary Indicators	Thirdly Indicators
Product/service capability	The qualification rate of product quality(u ₂₁)
	The rate of order completion(u ₂₂)
	Demand wait time(u ₂₃)
After-sales capability	Demand repairmen time(u ₂₄)
	The rate of customers’ complain(u ₂₅)

2.3 Operation process’ perspective

The index of operational processes can reflect operating efficiency of the green supply chain. Green supply chain is different from the traditional supply chain, which emphasizes performance of operational processes, so the index of operational processes can be divided into three aspects: production, transportation and efficiency.

Table 3 Operation Process’s Secondary and Thirdly Hierarchy

Secondary Indicators	Thirdly Indicators
Production capability	The increase rate of production capability(u_{31})
	Labor productivity of employee(u_{32})
Transportation capability	The rate of on time transport(u_{33})
	Space length of green supply chain(u_{34})
Supply chain efficiency	The rate of order waiting(u_{35})

2.4 Development potential’s perspective

Evaluation system should emphasize the importance of the future rather than short-term profit and growth. Therefore, we focus on internal research capacity, new product profitability and training capacity. These three indicators is positively correlated with supply chain performance, the corresponding index higher, indicating better supply chain performance.

Table 4 Development Potential’s Secondary and Thirdly Hierarchy

Secondary Indicators	Thirdly Indicators
Research capability	Rate of accurate market forecast(u_{41})
	Development-success ratio(u_{42})
Profit capacity of new product	The growth rate of new product output(u_{43})
Employee training capacity	The rate of research investment(u_{44})
	Per employee training cost(u_{45})

2.5 Environmental protection’s perspective

Environmental performance is an important part of the performance evaluation system. Environmental performance is constituted by the three dimensions, environmental impact, resource utilization and green culture. We can separately set corresponding evaluation based on the three dimensions.

Table 5 Environmental Protection’s Secondary and Thirdly Hierarchy

Secondary Indicators	Thirdly Indicators
The environmental impact	Pollutant total amount(u_{51})
	The recovery rate of environment(u_{52})
Resource utilization	The recovery utilization rate of salvage(u_{53})
	The comprehensive utilization of resources(u_{54})
Green culture	The index of environmental awareness(u_{55})
	Customer identity of green product(u_{56})

3 Establishment of AHP-Fuzzy Evaluation Model

3.1 Introduction

Fuzzy comprehensive evaluation is a comprehensive evaluation method of the object system used fuzzy factors involved, which has the advantage towards what is in terms of fuzzy evaluation , but it lacks a clear hierarchy. The AHP is a hierarchical evaluation method, it can simplify complex issues, that the overall goal will be divided into smaller goals and then be turned subdivided into sub-objectives which can be evaluated.

In this paper, AHP and FCE will be applied together and to build AHP-Fuzzy Evaluation Model. Firstly, using AHP to determine the weight of each index layer. In determining the index weights, the entropy method will be simultaneously employed to adjust the index weight, making results more objective; Secondly, according to the each factors established centralized is to determine the membership of each element; And finally, use fuzzy comprehensive evaluation method to evaluate the outcome. Thus, we will get better performance evaluation of Innovative Green Supply Chain .

3.2 Determine the hierarchy

In this paper, the performance appraisalment index system of innovative green supply chain can be divided into three levels. It concerns five following aspects: financial value, customer service, operation process, development potential and environmental protection. Each aspect can be divided into several indicators.

The hierarchy of AHP-Fuzzy Evaluation Model can be given as follows:

Level one (the target layer):

$$U = \{ \text{Performance of green supply chain} \}$$

Level two (the evaluation criteria layer):

$U = \{u_1, u_2, u_3, u_4, u_5\} = \{ \text{financial value, customer service, operation process, development potential, environmental protection} \}$

Level three (the index layer):

$U_i = \{u_{i1}, u_{i2}, u_{i3}, \dots, u_{im}\}$ ($i=1,2,\dots,5$ is the number of primary indicators)

3.3 Determine the weight set

$$W = \{W_1, W_2, \dots, W_5\} \tag{1}$$

The weight set W is for the primary indicator evaluation item U_i . w_i represent the weight of U_i for U ; Similarly, the weight set W_i is for the secondary indicator evaluation item u_{im} .

$$W_i = \{w_{i1}, w_{i2}, \dots, w_{im}\} \tag{2}$$

Meanwhile, the following criteria should be met.

$$\sum_{i=1}^n w_i = 1, w_i \geq 0 \tag{3}$$

3.4 Determine the weight of evaluation items (AHP model)

AHP method will be used to determine the weight of each evaluation item.

3.4.1 Construct judgment matrix

$$D = \begin{pmatrix} d_{11} & d_{12} & \dots & d_{1m} \\ d_{21} & d_{22} & \dots & d_{2m} \\ \dots & \dots & \dots & \dots \\ d_{n1} & d_{n2} & \dots & d_{nm} \end{pmatrix} \tag{4}$$

The judgment matrix was given by experts. d_{ij} stands for the important value of item i in relative to item j .

3.4.2 Consistency test

Consistency test should be done when the judgment matrix are not remain consistent.

$$CI = \frac{\lambda_{\max} - n}{n - 1} \tag{5}$$

CI measures the degree of judgment matrix deviating from the consistency. λ_{\max} is the maximum eigenvalue.

$$\lambda_{\max} = \sum_{i=1}^n \frac{(AW)_i}{nW_i} \tag{6}$$

When $CR = \frac{CI}{RI} \leq 0.1$, we consider the judgment matrix has desirable consistency. Otherwise, the judgment matrix need to be adjusted.

3.4.3 Hierarchical single arrangement

Calculate the product of each element of each line in the judgment matrix.

$$Mi = \sum_{j=1}^n a_{ij}, i = 1, 2, \dots, n \tag{7}$$

$$\bar{W}_i = \sqrt[n]{Mi} \tag{8}$$

Process the vector $\bar{W} = [\bar{W}_1, \bar{W}_2, \dots, \bar{W}_n]^T$ by normalization. Then, the W is requested eigenvalue.

$$\bar{W} = \frac{\bar{W}_i}{\sum_{j=1}^n \bar{W}_j} \tag{9}$$

3.4.4 Hierarchical total arrangement

According to single arrangement, the total arrangement can be get.

3.5 Modify the weight of evaluation items (Entropy model)

The higher the order level, the larger the information entropy, and the less value the information. Based on the definition, the entropy value of number j evaluation item is H_j

$$H_j = -\left(\sum_{i=1}^m f_{ij} \ln f_{ij}\right) \div \ln m \tag{10}$$

$$f_{ij} = \frac{b_{ij}}{\sum_{i=1}^m b_{ij}} \tag{11}$$

$$a_j = \frac{1-H_j}{n-\sum_{j=1}^n H_j}, \sum_{j=1}^n a_j = 1 \tag{12}$$

$$A = (a_j)_{1 \times n} \tag{13}$$

The average of weight value calculated by AHP and entropy method should be used as the comprehensive and final weight value. The combination of the two method, fully consider the experience of the experts and make the result more objective.

3.6 Determine the evaluation set

The evaluation set of green supply chain’s performance are as follows:

$$V = (v_1, v_2, v_3, v_4, v_5) = \{ \text{Excellent, Good, Middle, General, Poor} \}$$

3.7 Determine each factor’s membership R

r_{ij} represent the degree of membership that u_i belongs to the number j item x_j in the evaluation set.

Then, we can get the single factor evaluation set of the number i factor u_i

$$r_i = (r_{i1}, r_{i2}, \dots, r_{in}) \tag{14}$$

I stands for the number of evaluation criteria indicators. R_i is the single factor judgment matrix.

$$R_i = \begin{bmatrix} r_1 \\ r_2 \\ \dots \\ r_m \end{bmatrix} = \begin{bmatrix} r_{11} & r_{12} & \dots & r_{1n} \\ r_{21} & r_{22} & \dots & r_{2n} \\ \dots & \dots & \dots & \dots \\ r_{m1} & r_{m2} & \dots & r_{mn} \end{bmatrix} \tag{15}$$

3.8 Fuzzy comprehensive judgment

Then, the evaluation results A can be get.

$$A_i = \sum_{i=1}^n (w_i r_{ij}) = (a_{i1}, a_{i2}, \dots, a_{in}), j = 1, 2, \dots, m \tag{16}$$

$$A = W \bullet R = (W_1, W_2, \dots, W_l) \bullet [A_1, A_2, \dots, A_l]^T = (a_1, a_2, \dots, a_n) \tag{17}$$

a_j is the calculated evaluation value. Based on the maximum membership principle, the evaluation level which the $a_{j \max}$ corresponds to should be the comprehensive evaluation results. It’s the evaluation level of the green supply chain.

4 Conclusion

In this paper, based on the predecessors' research, a green supply chain performance appraisalment index system has been established, combining analytic hierarchy process (AHP) and entropy value emethod to determine the weight of each index, which gives full consideration to the expert's experience. What’s more, the system makes empowerment results more scientific and objective. However, there are also some shortcomings. First of all, the selected evaluation indexes in this paper need to be further verified in practice and adjustment, which can make its can better reflect the overall performance of green supply chain. Besides, the second problem is that the model is established in a paper, instead of producing from a test.

Research on Disability-Prevention Service Chain under Sustainable Perspective*

Hu Shiyong, Zhu Wenjing

School of Politics and Administration, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: hsy30@whut.edu.cn)

Abstract: Disability prevention is an important measure to enhance the quality of our population. Based on the sustainable theory, the thesis proposes the concept of prevention mechanism, building and working methods. The thesis clarifies the chain of supply chain, object chain, demand chain and service chain relational model which links the service object, service content, service agency, and service stage and constructs the model of disability prevention mechanism. Combined with the model of disability prevention mechanism, the thesis proposed policy support, linkage mode, management mode and other aspects of countermeasures to solve these problems.

Key words: Sustainable theory; Disability-prevention service chain; Building; Countermeasures

1 Introduction

Disability prevention is a kind of fundamental work to improve the population quality and comprehensive competitiveness of a country. It is concerned with survival, health and development of all citizens of a country. To actively promote the disability prevention is the important task to develop the enterprise for the disabled in China. It is the important target of the public health and people's health, and also the important measure in the new period to improve the population quality in China in the new period. To enhance the intervention of disability prevention and reduce the occurrence of disability, is conducive to reducing the disability rate of newly-born population and improving the living standard and living quality of people. In the meanwhile, the disability prevention reflects the humanitarian spirits. It is an important aspect for the continuous improvement of a country's social civilization.

Disability prevention is targeted at the hazards leading to disabilities including heredity, traumas, development, diseases, environment and behaviors and so on. To adopt the effective measures and channels, prevent or reduce the occurrence of disabling diseases and injuries, limit or reverse the disabilities caused by diseases and injuries, and prevent the disabilities from becoming physical disabilities after the occurrence of disabilities, are the effective channels to prevent, control and delay the occurrence and development of disabilities. The government of China is always paying high attention to the disability prevention, and always insisting on taking the disability prevention as the important content to develop the enterprise for the disabled, for which, the phased achievements have been made. Cheng Kai has pointed out that the disability prevention in China has been added into the ordinances for China to develop the enterprise for the disabled. The specific projects have been carried out, the disability prevention in the key fields has been enhanced, and the precious work experience has been explored. (Cheng Kai, 2011) From this, it can be seen that since the implementation of the reform and opening-up policy, great progress has been made in the aspect of disability prevention in China, which creates the safe and reliable living environment for the broad masses of the people. However, it is undeniable that there are still problems in the disability prevention mechanism in China, which remains to be further perfected in the aspect of disability prevention mechanism. It still has a long way to go to establish and improve the disability prevention mechanism. As far as the scholars including Zheng Xiaoying and Cui Bin are concerned, the problems including the lack of systematic planning in the measures and strategies of disability prevention; unclear liability subjects; being hard to implement the policy measures and prevention; and scarce resources of the government and society used for disability prevention. (Zheng Xiaoying, Cui Bin, 2013) Towards the problems in the disability prevention in China, the scholars including Cui Bin and Chen Gong have presented the corresponding countermeasures in the aspects of establishing disability prevention mechanism, improving disability prevention system, popularizing disability prevention knowledge, carrying out the key intervention of disability prevention,

* This paper is the progressive result of a national social-science fund project "Disability Prevention Countermeasures Study of China."(09&ZD072) The study of this thesis is subsidized by innovation fund project of WHUT(Project Number: 2015VI010)--"Analysis on urban rehabilitation services for the disabled in Hubei and the level of their satisfaction, based on investigations on the disabled in the four municipalities of Hubei".(Project Number: 2014-ZZ-B1-09)

and establishing the support and guarantee environment of disability prevention and so on.(Cui Bin, Chen Gong, 2011)

Above all, at present, the researches of scholars concerning disability prevention are mostly concentrated on the development history of disability prevention, the problems in disability prevention and its countermeasures and so on, and a system perspective is lacked comparatively to analyze and solve the problems of disability prevention. Therefore, in the angle of sustainable theory in the paper, the system analysis is carried out towards the problems in disability prevention mechanism. With the continuous progress development of human society, the level of industrialization and urbanization improves continually. While the human beings enjoy the highly developed material civilization achievements, the harmonious relationship with nature gradually collapses, and problems in environment and resources emerge in endlessly and become increasingly fierce. The development of human society is in the crossroad concerning the fatal rise and fall constantly. In as early as the beginning of the 20th century, the western scholars have been worried about the issue. In *The Economics of the Coming Spaceship Earth*, Boulding put forward the “economic theory of spaceship”.(Gro Harlem Boulding, 1966) In the *A Blueprint for Survival* (Goldsmith, 1972) written by some scientists led by Goldsmith, the editor-in-chief of *Ecologist*, a British magazine, it revealed that the unharmonious development of human beings makes disastrous impact on natural environment and social environment; and the theory of sustainable development rises in response to the proper time and conditions, and gradually becomes the focus concerned by the various countries in the world.

From incubation to establishment, the concept of sustainable development undergoes a process of continuous exploration and improvement. From the view of ecology, Ridley Ford brought forward that sustainable development maintains fundamental ecological processes and the system of life supply;and makes best use of all kinds of species and ecosystem.(Rogers, 2007) From the view of society, Kuypers came up with the definition that sustainable development not only boosts the economy, but also changes the mode of life in the society.(Lan Moffatt, 2007) Among which, Brundtland’s definition of sustainable development is widely accepted and recognized by the international society, which is “the development satisfying the requirements of contemporaries and not damaging the capacity of the posterity to satisfy their requirements”.(Brundtland, 1987) Sustainable development contains rich theoretical connotations. It supplements and is closely associated with mutual development, harmonious development, equitable development, efficient development and multi-dimensional development. The above aspects supplement and are closely linked to each other. The scholar Niu Wenyuan opened a new path and presented that the understanding of human beings towards the connotations of the theory of sustainable development undergoes the long course from survival to development and then from development to sustainable development. Besides, he put forward the concepts of “external response” and “internal response”, and revealed the essential connotation of sustainable development.(Niu Wenyuan, 2012) In the aspect of specific contents, sustainable development is the harmonious unity of ecological sustainability, economic sustainability and social sustainability.(Tolba, 1990) It requires human beings to focus on ecological sustainability, highlight economic efficiency and pursue for social equity, thus realizing the overall harmonious development of human society. From the above, it can be seen that sustainable development plays an essential role to the development of human beings. Liu Zhongyan and Ji Zhong et al. hold the view that sustainable development can optimize the living space of human beings and provide the foundation for the development of human beings. It can better meet the basic requirements of human beings and promote the all-round development of human beings. Besides, it can promote the deepening of the understandings of human beings towards their own values and the values of nature, thus obtaining freedom in correctly harnessing the natural forces.(Liu Zhongyan, Ji Zhong, 2005)

In conclusion, sustainable development, after all, is the all-round development of human beings. To be people-oriented is the basic value orientation of sustainable development. As the life expectancy of population lengthens, the risks for people to be disabled gradually increases and the period of disability is also obviously prolonged, which might generate huge consumption of social resources. In the aspect of environment, disability generates many adverse effects on the living environment of human beings. Whether in educational environment or employment environment, the disabled are always in the inferior position, which largely reduces the requirements on their survival and development. In the aspect of material resources, disabilities affect people’s basic requirements on basic necessities of life, and severely limit the disabled in their daily life in different degrees. As for the group with relatively high degree of disabilities, disabilities severely affect the daily behaviors of the disabled. In the aspects human resources, the adverse effects of disabilities on human resources are mainly expressed in the two aspects, i.e. physique and knowledge & skills. Due to the limitations of the disabilities, the disabled are

always in the inferior position in living, studying and social interaction; while extremity disabilities further restrict the abilities of the disabled in grasping knowledge & skills, which is also the key factor leading to the low overall quality, low educational level and weak social adaptability of the disabled.

From the above, it can be seen that towards the adverse effects of the disabilities on social resources, the construction of the disability prevention mechanism is of great importance. And both national and foreign scholars put forward that the enterprise for the disabled should be in the perspective of sustainable coordinated development.(Gong Xiao, Wang Pingyi, 2015) Therefore, in the paper, in the perspective of the theory of sustainable development, the research is conducted towards the disability prevention mechanism in the three aspects, i.e. the theory of disability prevention mechanism, systematic disability prevention mechanism, and operational measures of disability prevention mechanism, among which the idea of disability prevention mechanism is the core to build the mechanism. Systematic disability prevention mechanism is the framework to build the mechanism. Operational measures of disability prevention mechanism are the working methods to build the mechanism. The above three are closely linked to each other.

2 The Concept of Disability Prevention Mechanism

Disability prevention is an important content that cannot be ignored in the construction of social security, it is also a kind of construction of ecological system which entails establishing a relationship with other social systems so as to acquire a stable and effective network of social resources and guarantee a normal operation of disability prevention mechanism. The *Beveridge Report* proposed that a social security program with mutual cooperation should be built for forging a good social security environment.(J·R·Hay, 1978) It also pointed out that the social security must be achieved through the cooperation between countries and individuals, it should be the common responsibility and moral duty of individuals, the state and society, it is the manifestation of collaboration among the three pillars: the state, society and individuals. Therefore, we should regard disability prevention as one of the most important aspects of the social security, and we should construct a macro, meso and micro docking system from the national government level, social organization level and individual level, forming a stable ecosystem.

2.1 The macro policy level

The “Twelfth Five Year” period is the key period of building a moderately prosperous society in an all-round way in China, it is also the crucial period of deepening reform and opening-up and accelerating transformation of the mode of economic development. Establishing and perfecting the basic public service system, and promoting the equality of our basic public services become an important national policy of China currently.

Disability prevention shows an urgent entailment of building a harmonious socialist society and maintaining social fairness and justice. It has great bearing on advancing social construction that takes people’s livelihood as its key point and ensuring the most direct and the most realistic interests people concerned about. It is of great significance in social security for the disabled and public service system in China, embodying the happiness and benefit of “healthy community” and “disabled community”. So the important position of disability prevention should be highlighted. Standing on the height of the construction of our national public service system, we should increase the proportion of disability prevention in the construction of national public service system so as to provide better services for the “healthy community” and “disabled community”.

2.2 The macro management level

Disability prevention is a matter concerning such departments as health, family planning, civil affairs, human resources, social security, transportation, safety, environmental protection and the disabled persons’ federation organization. A single department is difficult to carry out disability prevention work effectively. Therefore, a comprehensive leadership coordination mechanism should be established at the government level so as to coordinate with all parties and forge a disability prevention working committee leadership and new work pattern of each department.

2.3 Medium organization level

Among China current social organizations, disabled persons’ federation’s organization form is unique. It composes of the official working committee for the disabled, at the same time, also the semi-official managerial disabled persons’ union, and the civilian association for the disabled. This organization form has its drawbacks and its advantages. The advantage lies in that it can perfectly play a pivotal role, which is defined by the academic circles as a social organization with connecting functions.

We should make full use of the disabled persons’ federation, balancing interests among government agencies, social organizations and public concerns, thus better joining all levels of society together.

2.4 Disability prevention service chain

“Service chain theory” believes that there is a certain relation among the service agencies, like a “chain”. When the service agencies form the “chain” relationship, multiple service chains within an area will form a service system, of which each service chain comprises of nodes to meet the requirements of their own “chain”. And these service enterprises and institutions make up the nodes on the chain. The nodes on chains provide needed services, thus improving the efficiency and quality of service.

The “service chain” theory supposes that to maximize servers’ satisfaction, all kinds of related enterprises, institutions and social sectors can be organically combined and form a network. Relevant social forces can be incorporated into the network, like the government, enterprises, social groups, non-governmental organizations, etc, and, according to the requirements of the “service chain”, play different roles, and jointly provide needed services.

To apply the theory of “service chain” requires that we should construct a disability prevention service chain, to get the disability prevention service enterprises, social organizations and government parts together which form a mesh structure, that will finally maximize the quality and efficiency of disability prevention work.

3 The Construction of Systematic Disability Prevention Mechanism

Since the reform and opening-up, China’s disability prevention mechanism has witnessed a boom. However, given the “policy fragmentation” problems and realistic situation in disability prevention, the construction of disability prevention mechanism should be analyzed from systemic perspective. The principles of systemic disability prevention policy mechanism are as follows:

3.1 The macro, meso and micro docking

According to the concept of disability prevention mechanism, we should embed disability prevention mechanism into the national basic public service system, establish a disability prevention working committee at the government level, take disabled persons’ federation organization as a hub, establish linkage platform and build disability prevention service chain so as to realize the systematic docking of macro policies, macro management, meso social organizations and micro individuals.

3.2 The dynamic balance

Disability prevention, in terms of its essence, is service for “healthy community” and “disabled community” and a kind of public goods, so there is also a public product life cycle dynamic balance issue, including dynamic balance of the production, delivery, consumption, supply, termination, transfer and improvement of public goods.

3.3 The docking of all kinds of chains

According to the public products’ life cycle, service chain contains service chain, supply chain, object chain and demand chain, etc. Their relationship lies in: service chain organizes related service institutions and offers the consumer a all-around, whole-process and all-the-time service. We can regard disability prevention service chain as a kind of service network, and the supply chain, object chain and demand chain as productive network. Based on the public products’ life cycle, the relationship model of supply chain, object chain, demand chain and service chain is shown in figure 1:

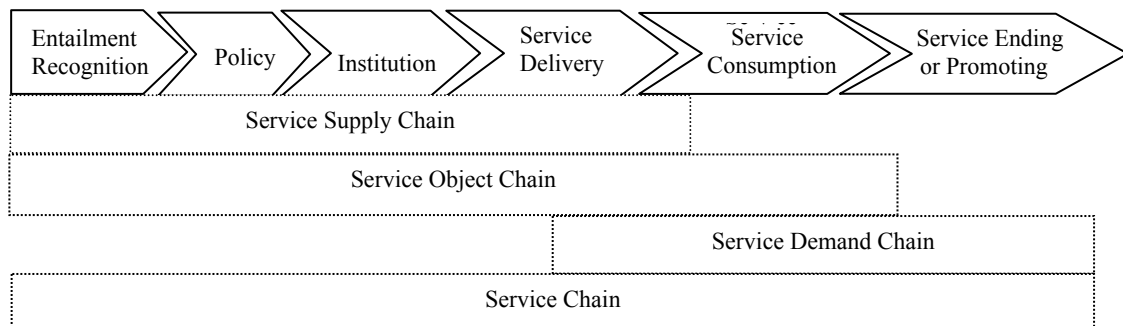

Figure 1 Based on the Public Products’ Life Cycle, the Relationship Model of Supply Chain, Object Chain, Demand Chain and Service Chain

Figure 1 shows that systemic disability prevention mechanism is the whole process of disability

prevention, so disability prevention mechanism also touches upon the management of such kind of public product. Disability prevention service can be divided into three stages: early service, mid-term service and later service.

The early service refers to the preparation before the delivery of public products, including establishment of public policy, examination and establishment of decision-making body and service institution and needs recognition, etc. The mid-term service refers to public product output, product delivery and consumption, including money, propaganda, examination of service object and service, etc. The later service refers to termination and transfer of public products supply and upgrade according to service requirement assessment. When the effect of disability prevention has been achieved, service supply ends; When disability prevention effect is ordinary, service movement can be achieved by changing service institution. Optimize service effect also can be realized by upgrading service.

According to the concept and principle of disability prevention policy mechanism, combined with public service product cycle, the model of disability prevention mechanism is shown in figure 2:

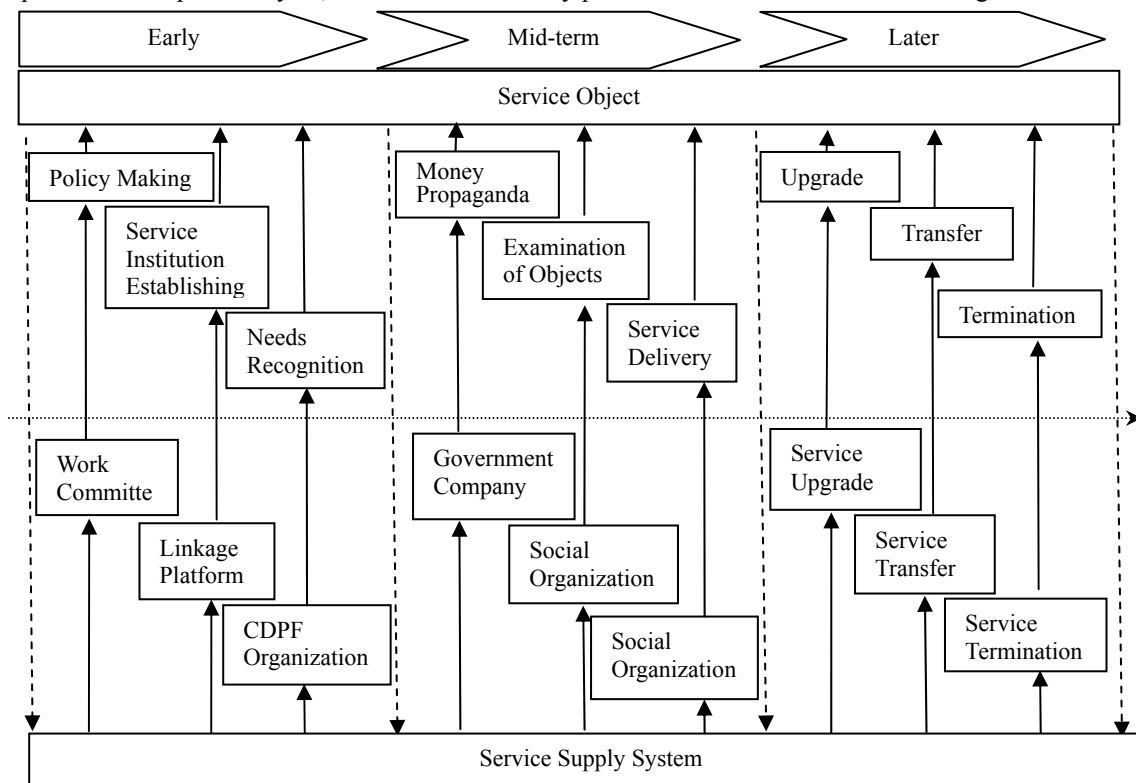

Figure 2 The Model of Disability Prevention Mechanism

4 Conclusions

By investigating the problems of disability prevention and the reality, from the perspective of the theory of sustainable development, the construction of disability prevention mechanism entails establishment and improvement of the service chain. Positive and effective measures should be carried out to crack down on problems of the mechanism. Promoting operation of the mechanism entails building foundations from such aspects as policy support, linkage mode and the management mode of ramming mechanism.

4.1 Policy support

The central committee of the communist party, on the fifth plenary session of 17, states “about making the twelfth five year plan for national economic and social development suggestion”. It pointed out that “we ought to support the development of undertakings for the disabled, and improve the service system for them likewise”, and put forward the basic national policy of enhancing China’s public service system for the twelfth five year period, and even longer. By the concept of the disability prevention mechanism, disability prevention work should be incorporated into the national public service system and be the focus of the work. The incorporation into the national public service system’s evaluating index system, and more weight it gets, will lead to more resources and spending for disability prevention

efforts.

In addition, disability prevention ordinance should be enacted at the state level. We should guide departments at all levels to strengthen the disability prevention and rehabilitation of organization and leadership, adhere to administrating according to law and earnestly perform their duties by carrying out the ordinance. And we should put forth clear requirements for establishing a perfect service system for the disabled and implementing disability prevention measures.

4.2 The way to improve the organization and linkage

Along with the continuous development of economy, disability prevention work in China has achieved a lot. However, the big base, large scale and rapid growth of the population of China and serious aging problem have negative impact on the improvement of population quality and our social economy and culture. So the disability prevention work is urgently needed.

For highlighting the principle of the development policy embedded in the concept of disability prevention mechanism, special management institution of disability prevention council should be constructed to realize direct management of disability prevention practice. Meanwhile, with the assistance from national council on disability prevention, we should establish a joint conference system, actively promoting cooperation of health and family planning, education, civil affairs, public security, transportation, safety, environmental protection and the disabled persons' federation organization.

Under the guidance of disabled persons' federation organization, we should fully mobilize social resources, such as social charity organizations, enterprises and social organizations, forming a joint effort to promote the construction of disability prevention mechanism as well as carry out disability prevention work smoothly.

4.3 The way to improve the management mode

In the management of disability prevention, we should highlight focused management, adjustments to local conditions and social governing functions.

4.3.1 Focused management

Disability is not a probability event average in social terms. During the course of human life, the likelihood of disability does not scatter evenly, and disability prevention effects also vary widely among respective periods. To improve the effects of disability prevention, the huge database should be set up, tallying up disabilities probability in the life cycle of our population and intervention recovery rates. Based on the statistical results, focus on the most needed group and at the same time work out scientific intervention measures, such as natal defects intervention, elderly disability prevention, etc.

4.3.2 Adjustments to local conditions

The second round data has shown that the disability probability has its regional attributes, and the structure and causes for disabilities vary accordingly. So in setting up policies for disabled people, the one-for-all principle is not eligible. This also requires that, when drawing out disability prevention group and intervention measures, the actual situation of local conditions should be taken into consideration.

4.3.3 The construction of informatization and managerial level

Establish a corresponding database in tune with different types of disability to form a bottom-up information management network, which paves the way for professional management and all-the-way tracking service.

4.3.4 Public awareness and spread of scientific knowledge

Mark out disability prevention as an important part of the public health propaganda, as a vital content of the media's public welfare propaganda, and none the less, as the indispensable content of spread of scientific knowledge. Fix the idea of national prevention, lifelong prevention and comprehensive prevention. Ensure the public understand and grasp the basic knowledge of disability prevention.

4.3.5 Scientific research and funds

Increase investment in scientific research over the causes for disability and put forward corresponding preventive measures. Parts of basic public health budget should be directed to disability prevention funds.

4.3.6 Social governing functions

We should give full play to the health, education, social work and various types of social organizations in disability prevention like identification of requirements, performance evaluation, rehabilitation and propaganda. Free social charity groups and enterprises' role should be played as much as possible in the process of disability prevention on fund-raising, handing-out assistive devices and the public welfare undertakings, etc.

(E-mail: 328836971@qq.com)

Abstract: The characterization and dissemination of tourist destination is one of the important factors that affect the tourist attraction, and also the key factor that stimulate tourists to choose the travel place as a travel destination. Based on the survey of Guilin image, this paper tries to put forward strategic vision to build a Guilin international tourist destination image spreading omni-media, deepen Guilin tourism brand image and make greater efforts for dissemination so as to promote the dissemination of Guilin international tourist destination image, which is of great practical significance to Guilin tourism and cultural industries.

Key words: International tourist destination; Dissemination of image; Omni-media

1 Introduction

Foreign countries have focused on research of tourism image and its dissemination since 1970s, and their rich theoretical achievements have played an important role in guiding China's tourism development. Effective dissemination of tourism image is regarded as an important way to enhance tourism appeal by tourism, theoretical circle, local government. In China, we focus on the study of tourism image from the beginning of 1990s, mainly from the research level, tourism image design study and tourism image marketing to conduct a comprehensive analysis and summary as well as present the problems about current tourism image study.

2 Study and Analysis of Dissemination Measurement Based on Omni-media

From the tourist destination perspective, this paper uses in-depth analysis and quantitative analysis, studies the methods and approaches of tourism image dissemination, that is the study of ways and means of Guilin tourism image dissemination under the Perspective of omni-media, explores effective ways of Guilin tourism image dissemination and provides a reference about tourism practices for government relevant departments.

2.1 Investigation of Guilin tourism image and analysis of dissemination measurement

The number of valid questionnaires about city image of international tourism attraction-Guilin is 1830. The respondents include people of all ages, different occupations, and different educational levels. Among the respondents, 30% are local people, 37.8% are foreigners working or studying in Guilin, 8.3% are Guangxi tourists, 19.6% are domestic tourists, 2.1% are Hong Kong, Macao and Taiwan tourists, and 1.2% are foreign tourists, which shows that the survey is representative and universal. According to the responses to the questionnaire, we conduct a statistical analysis, and find the following questions and suggestions existing in Guilin image dissemination:

2.1.1 Respondents lack understanding of Guilin's creating "International Tourist Destination"

Table 1 The Understanding Degree of Guilin's creating "International Tourist Destination"

The understanding degree of Guilin's creating "International Tourist Destination"	Percentage	Number of people
Scarcity	2.3%	42
Understand well	3.8%	69
Have a better understanding	21.1%	387
Know but not understand	51.1%	935
Hear about it and learning	10.8%	198
Completely unaware	10.9%	199

As what can be seen in the chart, in all respondents, more than half of the people only know the concept but not enough to understand the content of them "International Tourist Destination", which shows the inadequate propaganda of construction of a tourist destination, or people do not give this matter too much attention.

2.1.2 Respondents' level of acceptance of the image, international reputation of the Guilin city is not high

From the Guilin city image cognition perspective, respondents think it good account for 42.8%, ordinary account for 31.15%, not very good and below account for 16%, as well as the findings of international fame. Overall, people's evaluation of Guilin city image and international reputation cognition is not ideal, almost half of the respondents rate it below average. It can be said that Guilin, a famous international tourism city with years of business running, the whole city image evaluation has a big gap with its status, and international tourist destination target.

2.1.3 Respondents' ideal Guilin tourism image

Table 2 Respondents' Ideal Guilin Tourism Image

Respondents' ideal Guilin tourism image	percentage
Bright and sunny	28.14
Green and ecological	68.26
Comfortable and free	43.11
National customs	42.51
Cultural resources	24.55

Seeing from the table, we can know that people's expectations to Guilin tourism are of a multi-level, it is foreseen of multi-element integrated tourist destination. Those who want to experience the majority of green landscapes in Guilin is the majority, those who want it comfortable, free and have unique national customs are also accounting for a lot.

2.1.4 Respondents' suggested measures to make Guilin better integrating into the world

Table 3 Measures of Making Guilin Better Integrate into the World

As the world's famous tourist city, Guilin, with its unique tourism resources, has attracted numerous Chinese and foreign tourists, which not only promotes the development of tourism, but also promotes economic development. Nevertheless, nearly half of respondents still believe Guilin should try to better integrate into the world, 23.50% of them think that Guilin should strengthen the propaganda of image of Guilin both inside and outside.

2.1.5 Respondents' ways of understanding Guilin

In the present situation, the most adopted way of understanding Guilin is broadcast television transmission (60.60%), followed by the Internet, new media (55.36%), while the traditional print media dissemination comes in third (51.64%), television transmission, word of mouth spread and a large festival dissemination also occupies a certain weight.

Based on the above analysis of the survey data, we believe that to strengthen Guilin tourism image and dissemination, and improve the effect of urban outreach publicity, we should build the appropriate communication channels and methods, and also make a scientific assessment of the effect on the outside spread image of the city in order to avoid ineffective communication, timely adjust the communications strategy and direction for better effects of dissemination. Therefore, we try to put forward the omni-media model for Guilin tourism image dissemination and advance an image evaluation system of Guilin based on the propagation law.

2.2 Build the Guilin tourism image propagation omni-media model

2.2.1 Propagation forms and strategy of print media

Print media refers primarily to the print media, including newspapers, magazines, leaflets, tourist brochures, tourist maps and so on.

Newspapers have a large circulation and is cheap, spreading widely, read vastly, so it can be closely combined with modern tourism development features that general tourists and mass tourism areas; the magazines generally have more stable readership, it can be repeated read, enhancing memory, it has retained value over a considerable period of time, so to some degree it broadens and deepens the advertising dissemination results, it is more suitable for image transmission of long-term image positioning; the leaflets, tourist brochures, travel maps, etc. are practical, expressive, intuitive, they can achieve better targeted dissemination.

Main approaches of use of print media communication strategy: First, continue to allow "Guilin Evening News" to take the road close to the people, to continue to improve citizens learning the progress of Guilin's creating "international tourist destination" through Guilin Evening News. Second, let the "Guilin Daily" take the road authority, and constantly improves the confidence and credibility of party newspaper in the interpretation of Guilin tourism image building. Third, let the "Guangxi Daily", "China Daily" increase the coverage of Guilin tourism image, increase the propaganda of "international tourist destination".

2.2.2 Propagation forms and strategy of broadcast

At present, China has 744 middle and short wave radio transmitting and relay stations, 17,554 FM transmitters and relay stations, nearly 1.2 billion broadcast audience, broadcasting coverage rate was 94.5%. Advantages of broadcast are wide objects, spread rapidly, versatile, and strong infection.

Strategies of spread using broadcast are: First, according to the relatively large number of taxis in Guilin, and domestic and foreign tourists, we should develop the advantage that Guilin Radio has a lot of audience to deliver new, short, fast broadcast messages in order to timely and effectively propagate Guilin "International Tourist Destination." The second is to strengthen ties with Guangxi Radio, China Central Radio and moderately increase domestic propaganda. Third, make efforts to try to expand the international publicity of Guilin tourism image through foreign language radio.

2.2.3 Propagation forms and strategy of television

Television propagation refers to a means of mass communication way using the film and television. Movies and TV shows is the mass spread media combined sound picture. TV communication integrates text and images, time and space, vision and auditory organically, with its powerful advantage of spread, it has a broad and profound impact on various aspects of modern society: politics, economy and culture. Compared with simple tourism advertising, film and television can be more prolonged and more fully demonstrated all aspects of tourism places. For example, "The Third Sister of the Liu Family", starred by Huang Wanqiu in 1961, New China's first musical landscape feature film, have left a deep imprint in the hearts of several generations of Chinese people, it can be said that it really achieved a household name. This musical landscape feature film combined perfectly with Guilin scenery, which succeeded in shaping the image of Guilin.

Relevant plots showed in films and television give the audience a sense of reminding us of scenes, stimulating the tourists' travel desires; television strengthens attraction of tourist destinations, publicizes local natural and cultural resources, and accumulates intangible assets in the future for the locals. TV drama's general role to spread of tourist destinations are of two levels: one is the image transmitted to the audience to raise their visibility; the other is to show the charm of destination to arouse the audience's interest of tour.

Specific strategies of spreading tourism image using television are:

1) Actively seek cooperation of various types of films and televisions. Tourist destinations should actively seek various forms of television collaboration, the local government can also make investments himself, or invite the film and television production companies to make film and television works in the local places. In short, we should pay full attention to the vivid tourism image and the propagation of

high coverage of local tourism, making long-term plans for local tourism, economic and cultural development.

2) Create an international film base according to the actual situation. Make a good use of beautiful real landscapes to inspire the creators' inspiration; use a wide range of subjects to attract more audience's interest; create high-quality works to improve its image and make full use of local resources, and actively build an international film base, through which to show on the world's screen.

Once a film popular in the world, "Avatar", conquered the audience with the magnificent suspension mountain "Hallelujah Mountain", its director Cameron said "floating mountains" in the film prototype from Huangshan in China, but strongly questioned to be Zhangjiajie by the online users. However, no matter how it is controversial, Zhangjiajie has attracted a large number of tourists through Zhangjiajie is a fact. A large number of international blockbusters source cited Chinese elements, which indicates that Chinese beautiful natural scenery has been ringing-known in the international market. Guilin should seize the current rare international resort construction opportunity to better explore overseas markets, making Guilin tourism resources go to the international.

3) Carefully shoot personalized tourism image videos. These videos can give great visual stimulation and induced influence to the mass. They cut from the visual, auditory sense, giving people a full range of shock, at the same time of getting a feel of satisfaction, "strongly" implanting tourism image into the audience's minds, the audience unknowingly follow posts' intention to go with the flow of information in the good music and the screen, naturally keeping in mind the information of tourism.

Such as "Beautiful China" , the large TV documentary co-production of Sino-British in 2008, is the first performance China's wildlife and natural landscape from an unprecedented point of view, showing the charm of Chinese to television viewers; and Guangxi tourism image film "Beauty in Guangxi "depicts beautiful picture, beautiful commentary, changing background music to present the audience a paradise --- it lets the audience watch the film ,at the same time, feeling of people in the middle of a painting, unconsciously they are taken into the charming Guangxi.

Therefore, Guilin tourism image film shooting must fully explore Guilin tourism resources, according to the unique, exclusive and authoritative principle, personality, soul and philosophy of find Guilin tourism image.

4) Relying on the continuous reports whose main news is Guilin's creating "International Tourist destination" of CCTV, Guangxi TV, Guilin television, Guilin television International, etc., guiding the public to fully understand and really familiar with "International Tourist Destination," so that Guilin Tourism Image is growing in popularity, leading domestic people to establish Guilin tourism image.

2.2.4 Propagation forms and strategy of network new media

The use of network new media tools to disseminate tourism information is intelligent tourism, also known as smart tourism. It's the use of cloud computing, networking technology, through the Internet, mobile Internet, basing on the portable terminal access device (such as a laptop, iPad, smart phones, etc.), actively perceiving the tourism resources, tourism economy, tourism activities, tourists and other information, timely releasing, so that people can keep abreast of the information, and making timely adjustment arrangements about travel plans, so as to achieve the intelligent-sensing and easy-using of all kinds of tourist information. At present, the domestic who first propose the " Tourism of Wisdom" and to put it into practice is Zhenjiang City, Jiangsu Province, the city successfully developed the core technology of intellectual tourism "moving core" technology, and it was applied in the Beijing Olympic Games, Shanghai World Expo. At present, China has 18 cities selected the first "national wisdom tourism pilot cities," they are: Beijing, Wuhan, Fuzhou, Dalian, Xiamen, Luoyang, Suzhou, Chengdu, Nanjing, Huangshan, Wenzhou, Yantai, Wuxi Changzhou, Nantong, Yangzhou, Zhenjiang and Wuyishan.

Strategies of the use of network new media:

1)Take advantage of new media to carry out a full range of tourist information dissemination and services. Design network promotional platform, e-commerce platform, make notebook computers, smart phones, network platform and official Weibo, micro-channel a stereo integration, let multi-platform firstly disseminate tourism information, tourists know tourism information and purchase travel products.

2)Open is line with modern consumers' demand for mobile applications. With the promotion of 4G smart phones and widespread use of 3G smart phones, mobile applications have become an important and indispensable component of mobile software. For example, we can develop Guilin mobile application platform, which can be divided into travel press releases, line schemes, scenic navigation, casual dining, travelling shopping, accommodation, and so on. The platform combines the latest travel information and events, safari, car travel routes, business promotions, real-time traffic and ticket

information. After platform is successfully put into use, visitors can download the mobile application from it anytime and anywhere, and then achieving online queries and reservations based on individual needs, which is convenient and practical.

3) Set up two-dimensional code in the area of travelling. After setting a two-dimensional code and supporting Mobile Guide software, as long as the tourists scan the two-dimensional code in the area, they can hear the explanation online of the landscape, allowing visitors instantly see the detailed introduction of landscape.

2.2.5 Propagation forms and strategy of word of mouth spreading

Tourism product is typical of experiential products, necessities of life, the essence of entertainment and shopping of tourism is a sensory experience, and that of every tourist travel experience is not the same, if a tourist destination makes consumer satisfied about everything, it must encourage them to actively recommend it to friends and family around. Thus, self-advocacy role of tourists is a kind of word of mouth marketing.

Researchers believe that word of mouth spreading of tourism image can take the following strategies:

1) Apply "celebrity effect." Guilin has many cultural celebrities, such as Shi Tao, Ma Junwu, Li Zhongren, Bai chongxi, Liang Shuming, Bai xianyong and etc., those at home and abroad who have been to Guilin for travelling are Xu Beihong, Zhou Enlai, Deng Xiaoping, Chen Yi, Zhu Rongji, former US President Bill Clinton, Jimmy Carter, George Bush and so on. Tourism word of mouth marketing must make good use of "celebrity effect", we can invite and attract more celebrities and tourism critics go here for traveling, so that they can get the maximum perfect travel experience, and by all ways to make them use various channels to introduce others the tour destination, which helps the spreading of local tourism image.

2) Use the Internet word of mouth marketing strategy. Internet word of mouth marketing must enhance the accessibility of information, because more and more tourists prefer to use search engines before traveling to find information of tourist destination in order to increase the perception of variety of potential tourism products. Therefore, we can use the network tools such as forum, blog, Weibo and micro letter to realize word of mouth marketing, promoting the dissemination of tourism image.

3) Utilize interpersonal communication marketing strategy. According to the 2008 China Youth Daily's survey about word of mouth spreading, 82.93% respondents believe that the information provided by people travel back is more referred than a Tourist Guide Reference, which is tourism interpersonal communication marketing is after tourists' travel, they deliver information about tourism enterprises and their products to others. If visitors feel products of tourism enterprises may benefit their friends or familiar, they will tell the relevant product information to them.

2.2.6 Propagation forms and strategy of large festival activities

Festival activities spreading of tourist cities is actually a spreading way of tourist destination attracting tourists, the powerful appeal of events promotes reputation of the tourist destinations in a short time. Festivals mean influential events, including international conferences or exhibitions, major sporting events, tourism festivals, and other activities which have large propagation effects, such as the Beijing Olympic Games, Shanghai World Expo, Guangzhou Asian Games, the Guangzhou Trade Fair (China Import and Export Commodities Fair), Boao Forum for Asia, ASEAN Expo in Nanning, Nanning Folk Song Festival, which are all success cases.

Organizing large-scale festival events can quickly create the image of tourist destinations, planning large-scale festival activities can promote improvement of tourist destinations environment, so that the image of tourism continuously improve in the hearts of tourists, the level of management services of local government will be improved, so as the associated facilities and environment in the scenic spots.

The researchers believe that strategies of large-scale festivals can be considered from the following four aspects: First, apply the festival activities theme innovation policy; Second, take the festival activities precise communication strategy; Third, take festival activities serialization communication strategy; Fourth, travel fairs targets marketization strategy.

It is worthy of mentioned that according to requirements of "Development Plan of Guilin International Tourist Destination", Guilin will create an internationally influential and Guilin featured exhibition brand. To realize it, Guilin must make efforts from:

1) Focus on cultivating "Guilin International" exhibition series brands. Take Guilin International Tourism Fair, the International Forum on Tourism Trends and Outlook as the core, create "China Guilin International Tourism" series brands, focus on doing perfect, excellent brand exhibitions, such as China Guilin International Tourism Fair, the International Forum on Tourism Trends and Outlook, Guilin

International Landscape and Cultural Tourism Festival, Guilin International Animation Festival.

2) Dig new connotation, expand the scale and improve quality of Guilin Room • Car Festival, Guilin Famous Products Fair and other professional exhibitions, making efforts to develop them into well-known brand exhibitions.

3) Dig local cultural resources to create a series of county festival brands with strong local characteristics and combining with featured economic activities, such as Gongcheng Peach Blossom Festival, Yangshuo Lijiang fishing boat festival, Xing'an County, Guilin rice Festival.

4) Actively introduce and undertake domestic and international high-level conferences, forums and large exhibitions, focus on promoting the exhibition industry in Guilin to perfectly integrate into China - ASEAN Expo, and constantly enhance the influence of Guilin exhibition services industries. Form Guilin exhibition industry alliance, build Guilin Exhibition cloud platform, introduce and cultivate leading enterprises exhibition, actively explore development model of exhibition industry converging with other industries, innovation exhibition and tourism, implement demonstration projects of tourism and exhibition resource integration and coordinated development, vigorously promote the exhibition business tourism development, enhance the service capabilities and international level of exhibition industry in Guilin, strive to build Guilin as a "Chinese Landscape Exhibition of All", a national model city with innovation exhibition industry and tourism developing in harmony.

3 Establish Monitoring Evaluation System of Guilin Tourism Image

Image monitoring assessment refers to using scientific methods, standards and procedures for evaluating Guilin tourism image transmission performance, achievements and practical work as objective as possible. According to the management efficiency, competence, service, quality, public responsibility and public satisfaction degree, evaluate and divide inputs, outputs, performance reflected by intermediate results and final results in the government management of Guilin tourism image transmission. Assessment aims at improving the ability of communicating Guilin tourism image, continuously improving and enhancing communication performance. According to the actual situation of Guilin tourism image transmission, as well as related practical results at home and abroad, we recommend evaluation system should be based on the establishment of a large data system of Guilin tourism image.

As we all know, tourism industry is typical of experience economy. And this experience will not only remain in the customer's memory, but also publish on the web by reviews. According to statistics, in 2012, through Ctrip, eLong, a hornet's nest and other sites, nearly 9 million hotel reviews, travel information were included, at the same time, through the Weibo, micro-channel, travel experience information released are too numerous. Massive review data tend to make the tourism industry feel no clue. But the rapid spread of the network information will increase the effect of the negative feedback, if Guilin deals with relevant data slowly, it will affect the image of Guilin. We believe that integration of tourism-related data of public security, transportation, environmental protection, land resources, urban construction, commerce, aviation, postal services, telecommunications, meteorology, etc., meanwhile, cooperate with Baidu, Google, Taobao and other major Internet search engines and tourism electronic business operators, establish social data, tourism data and tourism-related data in one sector, implement digital management of tourism, carry out digital marketing to reach tourism network, FIT, and popularity with same trend.

In 2014, Hubei Province analyzed and monitored big data in "May Day" festival, and it benefited a lot. This year "May Day" holiday tourism market continues to hit in Hubei Province. The number of tourists is 11,582,900 in three days, an increase of 22.02%, a total tourism income of 5.709 billion yuan, an increase of 24.81%. Accompanying with visitors travel through the Internet to share travel knowledge, feelings, complaints, suggestions, which is an important part of the big data. In Hubei, 21 popular resorts were large data monitored, media report on network image is more than 1,100, Weibo reputation comment is 22,661. Among them, the users' Weibo comments on the Yellow Crane Tower is 11900, Wudang Mountains is 3468, East Lake is 1917, which are the top three, which is also consistent with the local tourism popularity; and media attention were paid in Macheng Turtle Mountain (395), Luotian thin blade (297) and the Wudang Mountains (74). These monitoring data analysis show that the Yellow Crane Tower, East Lake, Chennai, the Three Gorges Dam in Yichang, Enshi Grand Canyon, Yangyang Gurung have good network reputation, while some scenic spots share bad fame because the bus overturned, aerial lifts shut down, stop ticketing and other events. Traffic accidents, poor tour facilities, poor infrastructure lead to tourism accidents, which is one of the main incentives of negative public

opinions this year. What's more, full of tourists, reception with problems results in retention, and mandatory spending are also important source of negative network feedback. With the "big data", we can accurately predict traffic trends, and then take the appropriate measures to ease passenger flow; with "big data," we can know what kind of products visitors like, and then develop and construct marketable products; with "big Data", we can also know what kind of public services visitors need, thereby improving tourism public services... These are concrete ways, what can be imaginable is that a large data-based tourism service is very meaningful to enhance customers' satisfaction of Guilin Tourism.

At the same time, the establishment of Guilin Travel Image Control is also very necessary, which is the second targeted mining of large data. By CACA, we can carry out the network data content analysis on the network and Guilin tourism-related thematic content. Specifically, the application of content analysis in Guilin Tourism Network image information analysis is showed in the following aspects: First, guess the network communication theme inference tendencies and intentions, forecast tourism image public opinion trends, and provide decision support for the development of tourism image communication strategy ; Second, monitor the effect of the spreading of Guilin tourism image and analyze its trends; third, compare, evaluate, and identify the public information source of Guilin tourism image. It can not only achieve the planning, production, dissemination, monitoring, response and control of relevant information for Guilin image, but also more flexibly process information and knowledge.

4 Conclusion

Finally, set timely publication mechanism of Guilin tourism image. Information disclosure is not only an own supervision, but also a vivid public education of Guilin citizens. Occasional achieving analysis reports of large data of Guilin tourism image helps government and the public grasp Guilin Tourism actual image, make sure that the city image manager's voice is conveyed, a positive and favorable communication environment is created. In-depth understanding and actively collaborate the spread intentions of executives and public demands, and promote information interaction and dissemination between the administration and the public, improve the level of information dissemination, and fully meet the information dissemination needs of Guilin tourism image construction management and domestic and foreign residents, businesses, and visitors.

Research on Current Situation, Cause and Countermeasure of Contemporary College Students' Network Literacy

Chen Chunying

School of Philosophy, Zhongnan University of Economics and Law, Wuhan, P.R.China, 430070

Abstract: Network changes everyone's life rapidly and deeply, so cultivating college students' network literacy is one of the new subjects that we must face in Network age. Through researches and interviews, the paper reveals current conditions and reasons of contemporary college students' network literacies and puts forward a series of countermeasures and suggestions for this phenomenon, aiming to provide ideas and references to the cultivation of college students' network literacy.

Key words: Students; Network literacy; Current situation; Reason; Countermeasure

1 Introduction

As a product of the information technology revolution, the internet develops rapidly and changes people's daily life profoundly. According to the 33rd "Statistic Report of China's Internet development" published by China Internet Information Center, by December 2013, 618 million people are using internet in China, an increase of 53.58 million over the past year, Internet penetration rate reaches 45.8 %, 3.7 % more compared with 2012. College students, as the leaders of new age, have extremely intimate relationship with the internet. According to the survey, students are the biggest group of China's netizens, accounting for 25.5 %, and Internet users with junior college degree or above outnumbered more than 20 % of the total number, clearly reflecting the great amount of student netizens. College students are also the most active groups on the internet. On the one hand, they pursue free ideas and independence of thoughts, and they are willing to use internet to accept information and express their opinions. However, on the other hand, with immature self-control and of information distinguishing ability, college students are easily influenced by the negative impact of the Internet and become the victims of internet rumors, cyber violence and cybersex. It has already been an issue that is to be settled urgently to research and analyze current situation of university students' network literacy, guide students to use the Internet properly, strengthen research and education on college students' network literacy and conduct healthy and harmonious network environment in the ideological and political education field. In September 2014, the research group conducted a questionnaire survey on network literacy of undergraduate and graduate students. 200 questionnaires were sent out and 153, accounting 76.5 % of the total, were recollected in which 148 are effective ones, 96.7 % of total retrieved ones. In October 2014, the research group interviewed college students, teachers, students' parents and netizens. On this basis, this paper aims to explore the current situation, reasons and countermeasure of contemporary college students' network literacy.

2 Current Situation of College Students' Network Literacy

2.1 Favorable evaluation of college students' network literacy

Figure 1 Comment on Current Situation of College Students' Network Accomplishment

To know the evaluation and attitude of the public to college students' network literacy, the research group sets up two subject: "Your opinion on the condition of contemporary college students' network literacy" (Options : very good, good, average, poor, very poor) and "Your opinion on contemporary college students' network literacy compared with that of the public"(Options: better, similar, worse). According to the survey, about 91.22 % of the interviewees express that college students' network literacy is generally good or nice. Those who think bad or very bad respectively take up 2.70 % and 1.35 % . (As is shown in figure 1)

82.43 % of the interviewees think college students' network literacy is better than that of the public. Only 3.38 % think college students' network literacy is worse. (As is shown in figure 2)

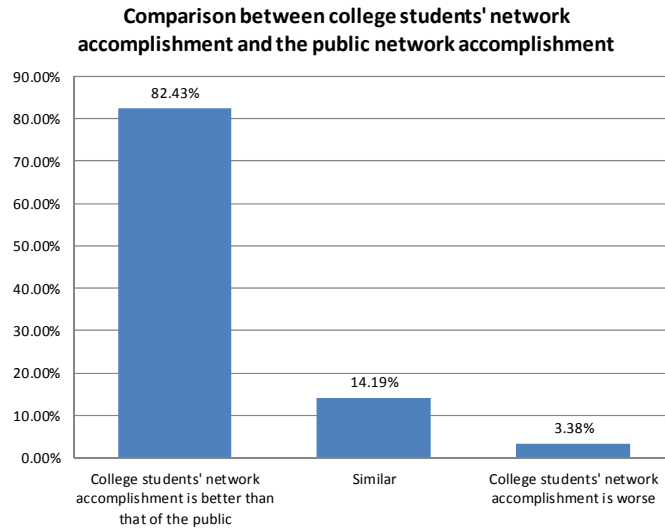

Figure 2 Comparison Between College Students' Network Accomplishment and the Public Network Accomplishment

The figure shows that the public think highly of contemporary college students' network literacy. During the research, it is found out that most interviewees have strong interest in current situation of contemporary college students' network literacy and they realize importance and urgency on cultivate and improve college students' network literacy.

2.2 Lack of network literacy among contemporary college students

Though most interviewees highly praised college students' network literacy, many students still lack network literacy in daily life. 32.43 % of interviewees think it very common that college students lack network literacy. 27.48 % of interviewees think that college students frequently behave in ways of lacking network literacy. Interviewees who think college students occasionally or seldom behave badly in network literacy respectively account 25.90 % and 24.19 % . According to the survey and individual interview, college students lack network literacy roughly in three aspects. (As is shown in figure 3).

Figure 3 Frequency of Lack of Network accomplishment among Contemporary College Students

2.2.1 Lack of information distinguishing and handling ability

The internet is the inevitable product of information explosion era, and the internet is also the biggest area of social information flow. Every internet user is faced with a variety of different information all the time. The ability to distinguish and handle the information is very important part and evaluation factor in network literacy. However, according to the survey, college students are commonly lack of the ability to distinguish and handle the internet information. According to public opinion, the frequency that college students lack the ability to distinguish and handle information commonly or frequently reaches 47.30 % and 35.81 %. The lack of ability lies in the excessive pursuit of newest, latest and largest amount of information while neglecting the necessary distinguish to the authenticity of the information. Moreover, they are not willing to understand the information in depth. They merely seek for sensory stimulation rather than learn knowledge. Thus, they cannot distinguish real information and false information, so inferior and false information gradually dominates the internet, and then leads to vicious circle.

2.2.2 Inappropriate communication behavior

As a significant link between different internet users, providing vast and convenient social platform is one of the most important functions of internet. Communication behavior also becomes one of the main behaviors of internet users. Throughout this research, commonly and frequently inappropriate behavior account 36.49% and 30.41%, including vituperation, uploading bored and vulgar messages, spamming, call-over and so on (As is shown in figure 4). On the one hand, these people obviously ignore the social property of internet, suggesting that internet is their private space. On the other hand, with little knowledge of internet, they don't regular their own behaviors even if they are behaving improperly.

Figure 4 Inappropriate Communication Behavior

2.2.3 Lack of network integrity in social network

According to Hierarchy of Needs Theory raised by Maslow, a famous American psychologist, people are expected to be accepted by certain social circles. So that the newly emerging social internet platforms like Blog, QQ zone, Renren and Wechat become one of most concentrated and active area among college students. At the same time, social network is also an area that reflecting their lack of network integrity. The lack of network integrity mainly contains: personal information fabricating, network voting deception, rumor and network defraud (As is shown in figure 5). From the frequency of occurrence, most interviewees think that college students' dishonest behavior just occur occasionally (39.86%) or seldom occur (30.41). However, among all the dishonest behaviors, rumor and network defraud are extremely harmful to the society. So we should pay more attention to these phenomena. Other behaviors may not have serious consequences, but also have bad influence on the normal internet order, like personal information fabricating (gender, age, job, education and working experience) and network voting deception (ballot rigging), which also account for a great portion of the dishonest behaviors.

Figure 5 Dishonest Behaviors of Lack of Network Integrity in Social Network

3 Analysis of Reasons of Lacking Network Literacy of College Students

According to questionnaire and personal interview, it is easy to find that the reason leading to the current network literacy of undergraduate is complex and multilateral. Not only by the influence of social environment, but also by themselves and also their family and school and so on. To be specific, it can be classified as follows:

3.1 Urgency to improve the network literacy of the whole society

As one of the active group in the society, college students are not isolated. As the internet is an open platform for all kind of social groups, the network literacy of college students is inevitable influenced by other groups. It is intimately related to the whole society. In a society with high concentration on the network literacy and comparatively high social network literacy, the network literacy of college students will obviously improve. On the contrary, in a society which ignore network literacy and has low network literacy, the college students will surely be influenced by various kinds of negative social phenomenon. Therefore, it is extremely difficult to improve and foster network literacy. The behavior of college students that lack network literacy, such as Internet defrauding, rumor, and malicious information, is closely related to the urgency of improving network literacy of the entire society.

3.2 Omission of family in network literacy cultivation of college students

Many undergraduate are studying far from their families. What's more, many parents know little of internet because of their age and knowledge structure. Internet has gradually isolated the students from their parents and family. Internet has become the private space for college students. The cultivation of network literacy becomes a blank page in family education. However, the value of parent can highly influence or even change the value of college students. Children can be unconsciously influenced by personal example as well as verbal instruction from parents. If parents, the lifelong teachers of children, lack the basic concepts of network literacy, and the family, the lifelong school, continuously absent in the cultivation of network literacy, then it is not surprising that college students lack network literacy.

3.3 Inadequate school education management

The responsibility of improving college students' network literacy should not be shouldered merely by the colleges. School education not only contains college education, but also the fundamental education of primary and junior school. However, despite the fact that the primary and middle schools provide related courses of IT, most courses focus on the introduction of Internet and IT and little focus on network literacy. In college, only students in certain majors can learn network literacy courses, thus only getting very limited effect. The traditional model of teaching "teacher keeps teaching, students just listening" is not that match with the real problem and situation. In school management, on the one hand, some managers keep old values, thinking that college students should be repelled with Internet. On the other hand, they mistake internet addiction with the proper use of internet. Some even keep such stereotype that the students who stay away from internet is a man of good conduct. In regulation system, there is merely no related standard and no samples of bearing responsibility of lacking network literacy. It can be concluded that, in current education and management of colleges in China, the cultivation of college students' network literacy is still a blended zone, which is also the reason leading to omission of network literacy of college students.

4 Countermeasures and Suggestions on Network Literacy Cultivation of College Students

In general, network literacy cultivation of college students calls for the guidance of the mainstream value of the society and good internet environment. We should put the network literacy cultivation into family education. Colleges should strengthen guidance and construction of education and management system. It mainly includes the following aspects:

4.1 Creating good social atmosphere and consolidating foundation of network literacy cultivation

Creating good social atmosphere is the foundation and prerequisite of network literacy cultivation. On the one hand, socialist core values should play a leading role in establishing harmonious internet, carrying forward the positive energy and guiding public focus on the quality and importance of internet. On the other hand, related laws and regulations and systems should be set and perfected. All the social members, including college students, should be guided and regulated in their internet behaviors. As to the behaviors that have bad social influence or even break the law should be judged and sentenced by law. In the end, we should use legal thinking to solve problems when it comes to the lack of network literacy. In addition to the legal and system guarantee that were mentioned above, we should adhere to the principle of enforcing the law strictly and punishing all offenders under the guiding of legal thinking in real life, making legal system to become effective solutions to cope with the problems resulting from the lack of network literacy. Then it would gradually reverse trends of network "jungle society", completely putting an end to problems resulted from the lack of network literacy, such as throwing down the gauntlet in blog, then coordinating the real life and internet and lay a solid foundation to the cultivation of network literacy.

4.2 Strengthening school education management and guarantee the cultivation of network literacy

The cooperation and guidance of school education in every period is an essential part in cultivating college students' network literacy. On the one hand, as the internet is developing rapidly nowadays, school education of network literacy should quicken their steps and follow the rule of "education from young period". We should bring the contact related to network literacy in basic education and give assistance and guidance to students in different stages according to their different characteristics. On the other hand, the network literacy education for college students must realize the transition of education space from classroom to the internet. New education forms, such as opening up the official account to release information, interaction, answer questions, should be applied to replace traditional classroom teaching. College students' network literacy education should innovate in languages, integrating with current internet hotspot and making the cultivation of college students' network language literacy as an important part in improving network literacy. Then we should also construct a new language system both rigorous and down-to-earth. Finally, schools, especially colleges and universities, should strengthen the management of students' network literacy. They can timely supervise, evaluate, reward and punish college students according to their performance, setting up advanced models of network literacy, criticizing a series of behavior that lacking network literacy. Moreover, schools should also record and guide the situation of the network literacy for college students and give strong support for college students' network literacy cultivation through education and management.

4.3 Promoting family influence and sticking to the base line of network literacy cultivation

Family education is a constant and lifelong education. Family influence is not only the beginning of network literacy education, but also the base line of network literacy cultivation. Integrated with each other, they promote the improvement of each other. On the one hand, Parents should pay attention to the influence of their words and actions on college students and attach great importance on the cultivation of network literacy, setting a good example to their children. On the other hand, parents should implement responsibility education for their children and teach their children to take responsibility for their own words and actions in internet. These would have an alerting effect on children's behaviors. The parents should also guide the children to establish network literacy consciousness and stick to the basic line of network literacy. Through their coordination with the society and school, they would jointly promote the cultivation of network literacy of college students.

Present Situation and Development of Urban Barrier Free Facilities Construction: Based on an Investigation in Wuhan of China

Ai Liang, Hu Sumin, Xu Danlu

Research Base for the Development of the Disabled People, Wuhan University of Technology,
Wuhan, P.R.China, 430070

(E-mail: 245429797@qq.com, 522179486@qq.com, 510647627@qq.com)

Abstract: Barrier free facilities is an important part of the modern city infrastructure construction. Since 80's of last century, barrier free facilities construction has made great achievements in China, there has also been the problem. To understand the current situation and problems in our city the construction of barrier free facilities, this research selects Wuhan of China to investigate the construction of barrier free facilities, based on the research of barrier free facilities in Wuhan of China is proposed in view of improving the barrier free facilities construction and management advice and recommendations.

Key Words: Wuhan; Disabilities; Barrier Free Facilities

1 Introduction

City construction of barrier free facilities are matching service establishment designed for the disabled, the patient, the elderly and other social members, making them safe and facilitating their daily life, and usually built on road, public buildings, residential buildings and areas, including barrier free entrance, barrier-free lift, platform, bedroom, restroom, seat, information sign in braille, traffic sound& signal facility, communication tool and other relevant appliances.

The earliest barrier free facilities appeared in Switzerland, Denmark etc. in 1930s, from then on, relevant laws and regulations had been made by America, Britain, Canada and some other nations and regions. China made a quick response to this global trend during the 1980s.

In 1989, China promulgated the "Specifications for urban roads and buildings designed for the disabled people", which was abolished in June, 2001. Another policy "Notice of the issuance of the 1998 construction of the project, the establishment of standards for the construction industry, and the amendment of the project plan" was established at the same year (Zhu guangyuan, 2005). We has been perfecting the criteria of barrier free facilities for years and moreover, we has already made a great progress in the construction of barrier free facilities, from the building of ordinary appliances like the blind way, curb slope, barrier-free lift, barrier-free toilet etc. to the construction of the public places combined with barrier-free information and service. However, there are still a lot problems in the construction of barrier free facilities.

With the instant development of the society and economy as well as the deepening of China's city construction, constructing the city's barrier free facilities and building a more harmonious society have becoming urgent requirements for the local government as a result.

Wuhan as the most developed city in the middle of China, also has the biggest popularity in this area, with resident population quite close to ten million. Owing to such a large popularity, the figure of the disabled, the elder and the people with inconveniences is very big as well and consequently has huge demands in city's barrier free facilities (Wang jiangping, Wang shu, 2012). To better understand the current status of the construction of barrier free facilities in Chinese cities, this paper, taking Wuhan as a research sample and put forward some specific suggestions as a result.

2 Current Status of Barrier Free Facilities in Wuhan of China

2.1 Basic status

Guanggu national square and nine other places were randomly selected as field survey samples. And questionnaire was randomly distributed to 400 local residents. The collecting rate was 100%, 361 valid questionnaires were got, with an effective rate of 90.25%.

2.2 Constructions of barrier free facilities

Table 1 Current Status of Barrier Free Facilities in Sample Places

	Blind way	Barrier free toilet	Barrier free seats /waiting room	Barrier free lift	Barrier free cashier desk/ticket office	Barrier free entrance	Braille marks
uanggu national	1	0	0	0	1	1	0
Qunguang square	1	0	0	0	1	1	0
Yamaodepartmen	1	0	0	0	1	0	0
Xudong	1	0	0	0	1	0	0
Fujiapo	0	1	1	0	0	1	0
Hongji passenger	0	1	0	0	0	1	0
Wuchang railway	1	1	1	1	0	1	0
Tianhan theatre	1	1	1	0	1	1	0
Hubei theatre	1	1	1	1	1	1	0

From table 1, we can clearly see that blind way and barrier free entrance show the largest number among nine field research locations, with a total number of seven. Barrier free cashier desk and ticket office were built in six places. Five places have barrier free toilet and four have barrier free seats and waiting room. Only two places (Wuchang railway station & Hubei theatre) have equipped with barrier free lift. While no braille marks can be found in these nine field research locations.

2.3 Residents' response to the facility construction

Table 2 Residents' Response to the Facility Construction(N=361)

Facilities	Blind way	Sloping path	Bus stop sound service	Barrier free footbridge	Curb slope	Barrier free toilet	Traffic sound service	other
rate (%)	82.0	68.8	38.1	39.0	36.8	53.4	52.0	12.4

According to the residents' reflect, the descending order of all the barrier free facilities are list below: blind way (82%), sloping path (68.8%), barrier free toilet (53.4%), traffic sound service (52.0%), barrier free footbridge (39.0%), bus stop sound service (38.1%) and curb slope (36.8%). Taking 50% as a minimum standard of "common", facilities such as blind way, sloping path, barrier free toilet and traffic sound service are the only items that meet the requirement.

2.4 Residents' response to the facility management

Table 3 Residents' Response to the Facility Management (N=361)

Facilities status	Occupied	damaged	intact
rate (%)	44.04	74.24	25.76

According to table 3, residents' response to facilities that be occupied is 44.04%, that is to say, nearly half the number of barrier free facilities in Wuhan are regarded to be occupied. Only 25.76% facilities are intact while 74.24% are damaged, that is, merely one quarter of them still work, the others will not because of certain degree damage.

2.5 Residents' response to the facility improvement

Table 4 Residents' Response to the Facility Improvement

site	Residential area	school	Hospital	Shopping mall	Bank	Bus stop	Railway station	Coach station
Rate	63.19	45.15	71.47	30.75	43.77	56.79	53.19	48.20

According to table 4, it is generally believed that most barrier free facilities need more improvement, the descending order are as follows: hospital (71.47%), residential area(63.19%), bus stop (56.79%), railway station (53.19%), coach station (48.20%), school (45.15%), bank(43.77%) and

shopping mall (30.75%). From the statistics, barrier free facilities in hospital, residential area and bus stop are in the largest demand while shopping mall is in the lowest.

3 Existing Problems in the Construction of Barrier Free Facilities in Wuhan of China

3.1 Quantitative insufficiency

According to the data presented in table 1, these nine selected field research sites have a relative large quantity of people daily in Wuhan while the quality of the barrier free facilities only reach the medium level. As for coverage rate, barrier free facilities only cover 49.2% (31/63) of the public places, less than half.

In terms of the construction of blind way, most field research sites have built blind way while Fujiapo and Hongji passenger station have not. As one of the places with the largest traffic, passenger station, should pay more attention to the construction of blind way. Blind way, on one hand, facilitating the blind, keeps blind people away from the crowd. On the other hand, as a “safety island” in the ticket office, blind way functioned as an alarm to tighten security. Though, in most cases, the blind are accompanied by their natives or friends when they appear in public, all the potential problems should not be ignored.

As for the construction of barrier free toilet, compared with passenger station and theatre which equipped with barrier free toilet, none can be found in Guanggunational square, Qunguang square, Yamao and Xudong shopping center. The reason that account for this phenomenon might be the mobility of the crowd. Staff mobility in shopping center is much higher than in traffic station, that is, less toilets are needed for the public.

Concerning the construction of barrier free seat, all the theatres have built it, on the contrary, shopping centers have not prepare any seat for the disabled. Wuchang railway station and other passenger stations offer “special waiting room” which can satisfy disable people’s need for barrier free seats and more room for placing wheelchairs.

With regard to the construction of barrier free lift, most buildings in this city have not designed barrier free lift yet, but Wuchang railway station and Hubei theatre have. It mainly is because of the high cost for constructing and maintaining the barrier free lift, which is not affordable for a common company.

In terms of the construction of barrier free ticket office and cashier desk, shopping malls and theatres have settled them while Fujiapo, Hongji passenger station and Wuchang railway station have not built yet, which bring a lot trouble to the disabled.

In the respect of the construction of barrier free entrance, both Yamao shopping center and Xudong shopping mall have not provided any barrier free entrance for disable people. According to the research, these two places are located in the hub of the communication and can spare no room for the construction of barrier free entrance. Although, sloping paths and railings are likely to be built in these places, the developers, for maximizing more profits, did not take it into consideration at the very beginning.

On the construction of braille mark, none of the field research sites can offer it. Braille marks, specifically designed for the disabled, can facilitate their daily life through touching them. The large shortage in braille marks shows that little attention have been attached to the importance of braille marks in public works construction by the local government.

As it shown in the questionnaires, it is not common to see the barrier free facilities for people in Wuhan. The occurrence frequencies of barrier free footbridge, bus stop sound service and curb slope are all below 40%, therefore, the current status of barrier free facilities in Wuhan are still in its initial stage and need more improvement

3.2 High occupancy rate

According to our observation and study, most blind way have been occupied and put into other uses. From Xudong to Jiedaokou, the blind way is blocked by some protruding manhole covers and some trees, even occupied by some parked bicycles and cars, which affects its function to a great degree. Due to the construction work along the right side of Qunguang square, most part of the blind way are enclosed within it, only thirty centimeters long of the blind way are left outside. Also, the public have not realized the importance of blind way, they set up stalls and pile up stuffs on it and consequently make it useless for the disabled. Most barrier free toilet in shopping centers or railway stations do not work because many of them are used as storerooms. For the sake of convenience, barrier free lifts in railway stations sometimes stuffed by able-bodied passengers and spare no room for those who really

need it.

According to the poll, about 44.04% residents regard that barrier free facilities in their neighborhood have been occupied, that is, nearly half do not work and be put into other uses.

The main reason for the high occupancy rate of barrier free facilities might be the ill management of local government, lacking in management is the common failing for the construction of urban infrastructure. Many manual power, material resources and financial resources have been invested into the infrastructure development by the city construction department while lack of effective management later. Then, most facilities become ruined soon or later.

3.3 Lack of maintenance

In the survey, many barrier free facilities in Wuhan of China are damaged and have not got any repairmen.

From table 3, in the 361 resident samples, about 74.2% residents think blind ways are damaged, only 25.76% remain intact, which can be seen in the field study as well. Blind way in Guanggu national square has become bumpy and tough, even some of the bricks are missing, which not only affects its function but also trouble the passengers. From the east of Guanggu square forward, the blind way often break down and some dislocated. It is said that this blind way has been damaged for more than one year, without any repairmen, let alone daily maintenance.

Both shopping center and railway station do not use the barrier free toilets in a proper way, and some damaged facilities were not found until the recent research.

There are also some problems for the barrier free lifts, the examination and repair for barrier free lifts are irregular in most theatres and stations. Moreover, a theatre is found that have not examined its lifts for over one year, which might pose a threat to the life security.

4 Suggestion for Improving the Barrier Free Facilities in Wuhan of China

There are still a lot to be improved in the construction and management of barrier free facilities, the existing barrier free facilities are supposed to be used to their full play and then get further development in the construction of the urban barrier free facilities.

4.1 Accelerate construction

In the survey, the total number and coverage rate of barrier free facilities in Wuhan are still very low. According to this problem, much attention should be attached to constructing barrier free facilities so that provide the disable people a “barrier free” environment through increasing the facility in number and coverage rate. As for traffic, an all-round barrier free environment should be constructed and to cover all the railway stations and bus stops in Wuhan of China in terms of sloping path, blind way, curb slope, barrier free ticket office, barrier free toilet, braille marks and etc. as for urban road, except for constructing more sloping paths and blind ways, wheelchair ramps, safety ladders or electric lifts should be set in the main footbridges and underground pedestrian passages as well. As for the public buildings, the coverage rate of barrier free facilities in business buildings, hospitals and etc. should be 100%.

4.2 Consolidate administration

Owing to the weak awareness of the importance of barrier free facilities and little attention toward the vulnerable group, many barrier free facilities have been occupied and put into other uses. Therefore, we should first increase the public awareness of the barrier free facility through the widespread broadcasting of barrier free facilities by means of radios, newspapers, TVs, internet and etc. in this way, people might pay close attention to the vulnerable groups and have a better knowledge of constructing barrier free facilities. No one is supposed to violate the rights of the disabled and the elderly to using these facilities in their favor. Then, noticeable signs should be set around the barrier free facility with bright colors and clear marks, also “no occupying” should be added as well. Besides, we must consolidate the administration of barrier free facilities and make quick response to unexpected situation by inspecting these facilities from time to time.

4.3 Examine regularly

Except for malicious damage, barrier free facilities are inevitable to be damaged by normal wear and tear. It is the responsibility of the maintenance and repair department and municipal administration department together with relevant departments to maintain and repair these facilities. On the one hand, professional groups should be built to examine, repair and maintain these facilities regularly. On the other hand, sufficient financial funding should be invested, and put the construction of barrier free facilities into the local financial budget is an effect way to cover the cost of constructing and maintaining the barrier free facilities.

5 Conclusion

According to the study, many problems are founded in the construction and administration of barrier free facilities in Wuhan of China. Construction of barrier free facilities are started later than other nations and regions, thus, various measures should be used to make these facilities better.

5.1 Strengthen rules and regulations

Proper rules and regulations are the basis of government management. The legal system of constructing and administrating barrier free facilities, however, should not be single and isolated but to be multiple and manifold. Currently, China's legislation of barrier free facilities still in its initial stage, only the notice of constructing urban barrier free facilities and regulations on constructing barrier free environment come out, which shows the drawbacks on legislation of barrier free facilities management. For this reason, changing the concept of legislation, perfecting the relevant law system and fulfill the content are of the paramount importance. To clarify the current tasks of local government and relevant departments through clear rules and regulations is the safeguarding of maintaining barrier free environment. Moreover, specific legal obligation should be clarified to every administrative subject so that to make sure the enforcement potential of barrier free laws.

5.2 Refine design system

The purpose of building barrier free facilities is to make convenient for the public, thus, these barrier free facilities should be designed with high quality and arranged in a systematic way. The design of barrier free facilities in China is currently in its initial stage and as a result, lack of tightened supervision and systematic nature. In order to better constructing barrier free roads and buildings, high sense of responsibility should be considered in the process of designing barrier free facilities. Firstly, take the specific demands of different disable people into consideration on the principle of humanity (Yan rui, 2007). Then, put an emphasis on education and training of the designers. Increase the designers' awareness of barrier free facilities and consequently improve their designing ability. At last, new project should be developed elaborately and arranged in a proper way (Zhu hui, Huang zhigang, 2006). Also, old projects should be rebuilt in line with local conditions.

5.3 Widen publicity and education

To improve the public awareness of barrier free facilities and the concept of barrier free if of urgent importance currently.

On the one hand, the correct way of using these facilities should be taught to the disabled and make the barrier free facility in their favor. On the other hand, much measure can be used to raise the public awareness of barrier free environment like TVs, newspapers, and other mass media. Also, the knowledge of barrier free facilities can be imported to both compulsory education and college education.

5.4 Building barrier free city with public effort

Barrier free city is a systematic project with generalized preferences, which need the public to make joint efforts. In the process of building Barrier free city, the local government should play a leading role in each stage of planning, designing, constructing and managing. Thanks to the systematic nature of construction and management procedure, isolated government cannot finish it alone. Therefore, tighten the cooperation between government and relevant departments is of great importance. Also, with the help of social bodies, enterprises and residents is the best way to build a barrier free city (Tan shaohua, Zhao wanmin, 2007).

Construction of barrier free facilities is the centralized reflection of Chinese political civilization, material civilization and mental civilization. This is not only the problem of technology, economy or city construction, but the concern of public recognition and respect to the vulnerable people. Therefore, we should spare no efforts to deepening the development of urban barrier free facilities and build a more harmonious society.

Discussion on Necessity of Construction of the Chinese Accounting Culture from the Perspective of a Harmonious Society

Li Xinlu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: amandalixinlu@126.com)

Abstract: This article studies the necessity of building China's accounting culture from the perspective of achieving the goal of a socialist harmonious society. Researches have shown that, the realization for each specific objective of building a harmonious socialist society will facilitate the constant development and promotion of accounting culture. The process to achieve the goal of building a socialist harmonious society is also a process of accounting culture being in great development and prosperity. Only by persevering the construction of accounting culture, and guided by the advanced accounting culture, can the goal of building a harmonious society be ultimately achieved.

Key words: Harmonious society; Chinese Accounting Culture; Cultural construction

1 Introduction

The sixth plenum of the 16th CPC central committee discussed and adopted 'the decision of a number of major issues on building the harmonious socialist society of CPC central committee', which established the goal for the party and the country in the coming long historical period, that is to build a harmonious socialist society. Five years later, the sixth plenum of the 17th CPC central committee made the strategy plan 'To deepen reform of cultural system, to promote socialist cultural development and prosperity', which opened the curtain of cultural development. Needless to say, these two major decisions and arrangements of the party are by no means isolated from each other, but rather, as an organic whole, they reflect the party's ideology of nation-building in the new historical period. To study in depth the intrinsic relationship between the two is undoubtedly of great value and significance for the profound understanding and accurate implement of the Party's policies.

As an important part of Chinese profound cultural system, accounting culture is undoubtedly the key subject of socialist cultural development and prosperity, but before the development of accounting culture, the accounting field must firstly answer a basic important theoretic question, that is, why do we need to strengthen construction of China accounting culture, or what is the necessity for the construction of accounting culture. Only by studying deeply and answering fully this question, will there exist the value and significance to discuss how to carry out the China construction accounting culture. Otherwise, any effort relevant to the construction of Chinese accounting culture will face the embarrassment of lacking in confidence. In fact, only by answering fully this theoretic question, can the thoughts and actions of all the accountants be unified to the party's principles and policies, can we then boost the development and prosperity of culture with practical actions. For this problem which is of foundational significance, theorists have done many researches and put forward many constructive concepts, but have rarely discussed from the perspective of the goal of building a harmonious society. Following this passage we will combine these two major decisions together to explore the necessities of constructions of Chinese accounting culture and to present some positions under the perspective of achieving the goal of construction of socialist harmonious society.

2 To Discuss the Necessity of Building a Harmonious Society of Accounting Culture from Each of the Specific Objective

As a better vision and the overall struggling objective of the whole Party and the people of all nationalities pursues, socialist harmonious society is not an empty concept. On the contrary, it is a collection of action plans structured by a number of specific targets. In the process of the implementation of each specific goal of building a socialist harmonious society, the Chinese accounting is not only able to but must achieve great things. We can say it is an important prerequisite and foundation to realize the goal of building a harmonious society where Chinese accounting plays a constructive role. So, how does the Chinese accounting achieve great things in the process of building a harmonious society? I believe that the key is to vigorously promote the construction of China's accounting culture. This thesis will discuss respectively the specific objectives of a socialist harmonious society below.

The first goal of building a socialist harmonious society is ‘The socialist democratic and legitimate system must be further improved. The fundamental principle of administering the country according to the law must be generally implemented. People's rights and interests will enjoy concrete respect and be guaranteed’. For this goal, its degree of realization is undoubtedly closely linked to the state of construction and the level of development of accounting culture. First, democracy in social essence will depend on the arrangements of relevant powers (especially the decision-making power), it is essentially an issue of property rights, and the clear definition and the effective protection for the property rights are always the main responsibility and the unshaken goals of accountancy. Secondly, as an important element of generalized accounting culture, accounting legal system is undoubtedly an important part of the socialist legal system. Without the former's construction and development, the perfection of the latter is difficult to imagine; and further, it will be empty and groundless when it comes to the ruling by law. In addition, there is no absolute measure about “respect and protection for the interests of the people”; it depends more on the subjective feelings and value judgments of different people; and the reason of the formation of such feelings and judgments are based on all relevant information, and so accounting information is definitely the core content of them.

The second goal of building a socialist harmonious society is ‘The widening gap between urban and rural development and between different regions shall be gradually reversed. A reasonable and orderly income distribution pattern will take shape in general; household wealth shall increase universally, thus enabling people to live more affluent lives. This is a systematic target which involves micro (business, family), mesa (region) and macro (the whole society) levels. In this goal system, whether it is the development gap or income distribution, or family property, or the level of prosperity of people's life, they are all essentially a state of objective reality, and they should be reflected by some relevant socio-economic information. Where does this information come from? It is a sacred duty given to the accountancy to generate accurately and provide information truthfully since it came into being, which means, as the premise and basis of the implementation for this project, accountancy plays a role as the provider with basic information; this is the conclusion from static perspective. From the dynamic perspective, whether it is ‘reverse’, ‘formation’, or ‘increase’ or ‘live’, its essence is the results of reasonable guidance, regulation and control to target audiences from all levels of the governments and their functional departments. In this process, accounting controls will absolutely be one of the most important controlling methods. For these two historical missions, in order to provide effectively with the relevant socio-economic information, the contents that the traditional accountancy reflects must expand in the direction of ‘household’ and ‘national plan, and gradually build accounting information based on this concept. In order to carry out economic adjustment and control, the controlled object of traditional accounting must be directed towards ‘micro’ and ‘macro’ and continue to extend to both ends, on which we based to build the accounting controlling concept gradually. It is easy to understand that the formation of the large accounting information view and control of large accounting concept is also the construction and the promotion process of Chinese accounting culture.

The third goal of building a socialist harmonious society is ‘employment rates will be relatively high and a social security system covering both urban and rural residents shall be established in general. Basic public service systems will be further improved and the government will attain relatively significant improvements in administrative and service levels’. To see from the angle of accounting, the realization of this project depends on the accounting industry making progress in two ways: first, the rise of social responsibility culture and the development of social responsibility accounting. Employment, social security, public services and other issues not only need legal norms and governmental guidance, but also depend strongly on the various stakeholders' awareness of social responsibility, which is the major issues that social responsibility accounting trying to study and discuss. Second, develop and improve of government accounting. To achieve full employment, to construct and improve social security and public service system, to improve government management and service level is undoubtedly the foremost objective of governmental work; the process of meeting the goals of the government is essentially the process of devoting the societal resources and getting the output, and this is the main problem to be solved by the governmental accounting. Objectively speaking, China's social responsibility accounting and governmental accounting is still in its infancy, which still faces many major problems to be broken through or solved. In this context, to strengthen the construction of accounting culture, especially the strengthening of social responsibility accounting and governmental accounting cultural construction clearly has its necessity and urgency.

The fourth goal of building a socialist harmonious society is ‘The ideological and moral qualities, scientific and cultural qualities and health status of the whole nation will be improved markedly and

further progress will be made in fostering a sound moral atmosphere and harmonious interpersonal relationships. Creativity of society as a whole will be enhanced markedly and an innovation-based nation will be established in general'. To achieve this goal at least three ways are required to build and develop culture as a basis of accounting. First, accounting ideological and moral qualities and scientific and cultural qualities of accounting is an important part of the qualities of the whole nation. If these qualities of more than 15 million of Chinese accountants can't be effectively improved, then the improvement of the qualities of the whole nation is unthinkable, and even if the qualities of all other employees in the industry have significantly increased, it cannot be called "universal" from this perspective. Strengthening accounting culture and improving accounting ideological and moral qualities and scientific and cultural qualities of accounting practitioners is a necessary condition to achieve improvement of qualities of the whole national goals. Secondly, to create a harmonious interpersonal relationship of the people depends on the issue of judgment for fairness and social safeguarding of the legitimate interests of the people. If there is no effective mechanism which reflects the matching condition of effort and reward, input and output of various stakeholders objectively, comprehensively and accurately, or even if there does exist such information generation mechanism, but legitimate interests of the people can't be maintained, so people may have a sense of injustice and then become devious abnormality in socioeconomic life, the result would be social frictions getting increasingly severe, and the interpersonal relationships fell out of harmony. The advanced culture to lead the accounting is not only the main mechanism of the information, but also an effective tool to maintain social benefits. It can be said that to strengthen the construction of accounting culture is an indispensable means to reconcile the human's relationships. Third, as for the creation and innovation, the premise of which is that people have the enthusiasm and environment to carry out the activities, while according to the scientific measurement through the costs and benefits of the inputs and outputs for creativity and innovation by accounting, the actors can truly feel tangible benefits brought by creativity and innovation, thus stimulate their creative potential, enhance their motivation to carry out creative activities. In addition, as a main governor of social and economic relations, accounting is the important factors which can create a favorable environment for creativity and innovation. In short, only when the accounting culture and accounting work keep a continuous development and improvement, can the creativity of our society be significantly enhanced, and the goal of building an innovative country ultimately be achieved.

The fifth goal of building a socialist harmonious society is "Public administration system will be further improved and social order made sound. Resources will be used more efficiently and the ecological environment will be improved visibly". As for this goal, the necessary condition for its implementation is to focus on the guidance of advanced accounting culture, for the reasons are: First, the improvement of the social management system and the formation of a good social order is a product of effective social control, and accounting control is to socially control one of the main means of it. To perform relevant responsibilities well, Chinese accounting must establish and continue to strengthen macro-control accounting concept. At the same time, the relevant branch of science social accounting, social responsibility accounting or something related must continue to develop and improve, it is clear that the implementation procedure of these requirements itself is a construction and development process of China's accounting culture. Second, to improve resource utilization and the eco-environment is a systematic project. As for accounting, it must scientifically solve the relationships between resources and environmental accounting elements such as affirmation, measurement, recording, disclosure and some other issues, which depends not only on the thought liberation and development of Chinese accounting culture, but also on breakthroughs of accounting theory and innovation of accounting methods.

3 Conclusion

Based on the above discussions, here come the following conclusions: (1) The development and prosperity of socialist culture is not only to build a socialist harmonious society, but also to objectively reflect the inevitable result of a harmonious society. (2) The goals of building a socialist harmonious society is set by the action plan consisting of a number of specific targets, the achievement of its each will help the continued construction and upgrading of accounting culture, and help the continuous development and improvement of accounting science. (3) To achieve the goal of building a socialist harmonious society is an important reason for the need to vigorously strengthen the construction of Chinese accounting culture; the process to achieve the goal of building a socialist harmonious society is also a process of accounting culture being in great development and prosperity. Only by strengthening

the construction of Chinese accounting culture, and led by the advanced accounting culture , can we develop a good society in which everyone fulfills their responsibility and duty and live in harmony with each other.

Abstract: The common problem faced by most countries and cities in the world is the city management lags behind the rapid development of city modernization. Especially in China, the increasing population in cities has threatened the affordability of cities, a large number of city management problems emerging. City grid management came out at this time. In this paper, through in-depth analysis the author tries to find out the general rules of the organization system, management processes and operation mechanism of city grid management with the method of an interdisciplinary research, and proposes the constructive way of city grid management innovatively which provides some reference and experience for the model of city governance in the future theoretically and operationally.

Key words: City management; Grid management; Operation mechanism

1 Introduction

With accelerated urbanization process in China and information technology widely used in city management, city grid management has been used as an innovative management model in a number of city management practices successfully, exerted great impact in the society and developed lots of the related studies explosively. By going to the literature review, the author found that the study abroad focused on application of the grid technology, digitalization of the community and information management rather than such study as city grid management proposed in China. For example, the United States' High-performance Computing Grid Project, the EU's European Data Grid Project, the British's Nomad Project, the French National Grid Plan and other projects are the representatives. These projects catalyze the change of governmental organizations. The management modal of small government, big society replaces that of the big government, multi-department, which is not only beneficial to the realization of government delayering, greatly reducing the labor and financial cost of inter-organizational coordination, but also beneficial to the realization of efficiency management, agile management with the help of information technology. However, the relevant domestic applied research on cities grid management become increasing relatively, which mainly from the three levels of the municipal, district and street. To sum up, most of these studies focused on such four aspects as the innovation of the management mode, party structure, practice and technology. At the same time the author found that the current research on city grid management in China more focused on case studies, general comments or basic research, but rare on the depth analysis grid management depth analysis of internal operation. Domestic scholars' research on the grid management focused on three aspects: First, the research focus on the development status and trends of the grid management, such as Zheng Shiyuan's the Review of Grid and Grid Management, Chen Yun's Status and Prospects of Grid Management of Government. Second, the research focus on models and mechanisms of city grid management, such as Tian Yipeng's Positioning of City Grid Pattern of Social Management and its Future, Jing Xixiao's Challenge and Change: from Grid Management to Grid Management Control. Third, the focus is the application of grid management. Such as Sun Jianjun's et al., From Control to Service: The Change of Grass-roots Social Management Model - Based on Zhoushan Grid Management. From the research point of view, despite the encouraging results, but with the development of society and the requirement of the masses for the city management, the study on grid management needs to be further improved. Therefore, to explore operational and institutional mechanisms of city grid management is the premise of dealing with difficulties of the current grid management and realizing the modern city management.

2 The Connotation, the Purpose and Significance of City Grid Management

2.1 Connotation of urban grid management

The term "grid" from English, first appeared in the field of power, such as Power Grid, and later it is conceptualized and used to refer to a new technology on the Internet. In recent years, as the concept of "grid" has been used in the field of management, the grid management emerged. In China, grid

management was first used in military, security patrols and other fields, and then it is promoted and applied in business, health, market supervision, labor and social security, and all kinds of inspection work. The reason for which the grid management is used in city management is that the traditional management methods and system has not been satisfied for the needs of modern city development. So in order to further improve model of city management, the innovation of institution, mechanisms, organization way, and method become necessary. Then the city grid management as an innovative management model gradually won the attention of scholars and city managers.

City grid management as a new concept has been interpreted in many different ways, for example, someone takes city grid management as the result of the integration of resources and their collaborative use, which is based on the website of cities government and the city's basic Geographic Information System. It makes use of "3S" (RS, GIS, GPS) technology, geographic coding technology and mobile information technology. All in all, on the basis of digital city technology the city grid management tries to apply the information technology and collaborative work model to city management, so that the city, district, department and specialty supervisor can work collaboratively and realize information resource sharing.

Someone thinks city grid management is the integration of grid management and infrastructure management with the reference of many digital city technologies. It innovates the means of real-time information transmission, creating two dimensional management of supervision and command in order to achieve accurate, quick, efficient, full-time, full coverage of city management. Someone believes that city grid management model based on information takes various resources of management and services into consideration, in particular in Community Grid, to detect and solve various problems in order to better meet people's needs and realize management.

Although the viewpoints vary greatly, the basic understanding is the same. From a practical point of view, the so-called city grid management is relying on a unified city management and digital platform to realize the separation of monitoring and disposal by strengthening managing and patrolling the grids.

2.2 The purpose and significance of city grid management

City management lags behind the rapid development of city, so the city grid management is the solution to the problem. On the process of urbanization, a lot of problem come out, for example, large numbers of people move from rural to urban areas, which gives the great threat to the city's ecological environment and public resources, as a result, the carrying capacity of the city's becomes more and more fragile. On the other hand, the traditional city management concept is a little backward, which can't meet the people's growing demand of efficient city government and high-quality public resources. Under the background, the city grid management as an advanced, scientific, innovative city management is brought into use in the city management.

The grid management means that district and county governments will have to build management centers and get inspectors to patrol their own grids. The inspectors report any problems they find to management, which in turn asks government departments and utilities to deal with them. Meanwhile, on the basis of digital technology and scientific management, city grid management is a revolutionary innovation of modern city management. it will greatly improves the level of city management.

Besides, city grid management is a bridge between government and citizens, it can form a scientific and effective coordination mechanism, so that the conflict will be handled, rational interest satisfied and service improved. At last the way of government management will be truly transformed.

3 The Organization, Management and Operation Mechanism of City Grid Management System

3.1 The organization of city grid management system

Organization system construction is the basis of city grid management. City grid management integrates resources of management and social services, optimizes the model of city management, innovating both grass-roots social management and party structure. The most notable feature of city grid management is the establishment of two axes and achieving regulatory separation of the two. One axis refers to the "axis of supervision", which is to identify problems, delivery information of problems, and evaluate problem-solving process; the other axis refers to "axis of execution", which is to receive information transferred by the supervision and then solve the problem by dispatching.

Specific practices, different cities differ slightly. In Beijing, for example, the Beijing Dongcheng District, through integrating the function of various departments of the city, namely established the supervision center and comprehensive management committee, the former known as "axis of

supervision”, the latter which is known as “axis of execution”. The Center recruited more than 400 inspectors, each responsible for inspecting about 12 grid cells, 180 000 m² and 1400 city assembly. The city's comprehensive management committee is established on the basis of Municipal Administration Commission, responsible for directing, coordinating and management departments related to 27 professional and 10 Street offices. The supervision center and comprehensive management committee are separated both on space arrangement and staff distribution. Through space consolidation and functional integration, it realized a “regulatory separation between supervision and comprehensive management” while reducing conversion costs.

3.2 The processes of city grid management

City grid management uses a closed loop workflow to operate; the process is simple and practical, fast and efficient. Based on practical experience in major cities, it is generally divided into four steps: including registration (Question acquisition, discovery registration), the dispatch, tasking and close.

1) The registration

The main sources of the problem include: hotline report, video surveillance, community inspectors, and function dispatch. The information from the four sources is accepted and registered by information officer, then dispatched for investigation and prosecution.

2) Dispatch for investigation

After registration is completed, the problems will be sent to the relevant departments for investigation. Some will be for investigation and prosecution. If not, the problems will be sent back to the information officer with the explanation, if the problems can't be solved by the street office, they will be sent up to higher district for the solution.

3) Problem

Upon receiving management issues from the relevant department, the person in charge will go to the site for processing, after the processing is complete, they will fill in the details of the process, and feedback them to the grid management center for verification.

4) Verification for the settlement

Staff of the grid management center will comprehensively decide whether the issues settled or not through the comparison before and after the solution of the problems, contrast of the video, telephone interviews.

5) Return visit

After the issue of verification closed, the problem belongs to the class of complaints, it is necessary to have the satisfaction survey or return visit.

4 The Ways to Realize the Operational Mechanism

By constantly advancing city grid management, the governments will discover and dispose city management issues rapidly. However, there are still many limitations about city grid management, such as the efficiency, scope. So it is necessary to improve the management level.

4.1 The legislation through administrative procedure, the realization of democratization

The legislation through administrative procedure will guarantee democratization of the city grid management mode. In China, the democracy belongs to the people; the People can participate in the democratic management of the country. Through various forms of democracy, the people can exercise their democratic rights. So the public as a counterpart participate in the city management model development and implementation of the process. They help the legislation of the city grid management and supervise it at the same time.

4.2 The establishment of a public participation system, improving the city grid management

Public participation is a fundamental way to ensure that public policies are consistent with public opinion and realize policy legalization. The establishment of public participation system will help strengthen transparency of the city grid management, will help improve the efficiency and effectiveness of city management, and reduce the bureaucracy and administrative inefficiency phenomenon. Meanwhile, some public service enterprises and the role of communities in city grid management also need to further develop and establish long-term cooperation mechanism. City management is not only a top-down management, but with cooperation of the community and corporation.

4.3 Improve public evaluation on the city grid management

City grid management first needs to play its function of publicity with the public's understanding and promote public recognition and acceptance. Secondly, it needs to guide public opinion to a positive, favorable direction, forming a good interaction with the public. City grid management is a “project for

the people”, so it needs to establish good relations with the public and improve their interaction. while the interaction with the public, the public's satisfaction with city management should be the content of the assessment. It will improve transparency and public evaluation and timely release relevant information to form a linkage of cities management, creating a benign regulatory environment and establishing a government for the people.

4.4 Strengthen the “software” of the city grid management

City grid management relies on the digital technology, but digital technology can't solve all the problems. The core content of the management model is the management thinking. there is no exception in the city grid management model. Behind the “digital covers” and other technical concept, there is fine management system, which is the type of feedback system and contains the democratic management philosophy. Therefore, to really put a city grid management into good use, it needs to improve the managers' quality and management philosophy, which is called the “software”. This requires us to speed up the construction of hardware facilities at the same time, to pay attention to improving the quality of the manager and their management philosophy.

5 Conclusion

The development and management of a city are inextricably linked. The construction should keep pace with the management. Today many cities in China are developing rapidly. The pace of urban construction and technology upgrading become quickly, but the quality, efficiency has not improved a lot. So at the moment, the implementation of the city grid management plays an active role in improving the efficiency of urban management, as well as the establishment of long-term mechanism. We also continue to explore and study advanced concepts and advanced technology of city grid management to promote China's economic construction and social undertakings develop better and better.

On the Role of Corporate Values in Corporate Development

Du Chaoju

School of Marxism, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: ducj2011@163.com)

Abstract: Corporate values are formed by the constant summary of staff in the practice of production. It is the core of corporate culture and the inner drive and soft power promoting corporate development, which plays an essential role in the sustainable development of the company. Corporate values involve the values of integrity management, brand values, creativity values, market values and local culture values. The article contends that corporate values are the intangible assets and lifeline of a company and its spirit power to enhance its competitiveness, to realize self-adjustment, to make the most of its advantages, to concentrate strength, to standardize regulation, to make breakthroughs and overcome difficulties.

Key words: Corporate Values; Corporate Culture; Soft Power; Sustainable Development

1 Introduction

Corporate values are formed by the constant summary of staff in the practice of production and the belief cherished by all employees. It is the core of corporate culture and the soft power of the company. This kind of soft power is formed during the long-term production and operation of the company to seek its survival and development, under the general social, economic and cultural environment. It is based on the appetency, appeal, attraction, cohesion and competitiveness, which generate from the cultural identity of the company in the international community. From the perspective of economic development, culture is conducive to economic growth, because the inner values of culture can lead the public. Its power lies in that the employees are in full love of their company, which might be unimaginable sometimes. It will play an essential role in the construction and promotion of improvement of core competitiveness. However, the cultural soft power can only play its role when it turns to the values of employees. That is to say, a corporation without values is risky. From the perspective of values formation, it is the better criterion, conception and proposition about “how to survive” chosen by the corporation after comparing, measuring and converting with its “standard values”.^[1] This values is the radical opinion of a corporation about itself, which is “the criterion guiding the concerted efforts of the staff and individual behaviors”^[2] As a result, with the increasingly fierce competition, the corporation needs to find a value idea consistent with its development and social development to maintain its power and to sustain its growth. It should be taken as the fundamental spiritual guidance to promote its development. Generally, corporate values have the following significance to corporate development.

2 The Operation Values of Integrity Are the Intangible Assets of the Corporation

The basic connotation of integrity includes “honesty” and “trust”. Honesty means earnestness and sincerity and trust means credit and belief. Economists believe that “integrity is the intangible assets of the corporation”. It is expressed in the trust and acceptance of consumers to corporate products, which attract a certain consumer groups. If a corporation loses its integrity, it will be close to shut down and go bankrupt. In addition, the lack of integrity in a corporation will pose challenge to the principle of integrity in market economy. It will endanger the market economy to fall in the bubble of danger and traps. The reason is that the entire economy is an interrelated entity. In terms of the basis of economic activities, it concludes all the trading activities based on the mutual trust and identity of different economic units. During this process, the economic activities between the individuals and companies involved are, in essence, the identification of mutual trust and integrity. It is clear that integrity is the key to the establishment and sustenance of a corporation. The history of the economic growth of human beings proves that integrity is the guarantee for all the economic activities and the basis for maintain social and economic order. With the lack of “integrity” in economic activities, could the activities go on? Could the corporation achieve development?

3 Brand Values Based on Quality Are the Inner Demand to Promote Corporate Development

A brand is a foundation for the prosperity of a company, and the upgrading of a brand results from

the practices of corporate brand values. Without the guarantee of quality, there would be no brand. An outstanding brand entails the guarantee of quality, which is the trump card for a corporation to take part in competition, and cannot be compared by any other promotion method. As a result, as the contemporary social group has a higher demand for product quality, it is essential for a corporation to ensure quality in order to win the competition, which is the inner demand for corporate development. According to a survey conducted in world-famous companies, the senior managers of two thirds of the World's Top 500 contend that product quality determines the satisfaction of customers, which penetrates the whole process of production. For instance, the good reputation of Sony products in the industry and among the customers should be attributed to the constant production concept of the company. As has been said by the company, "1% of unqualified products mean 100% disqualification."^[3]The quality-oriented production gives rise to the world brand of Sony, which is also the reason for its constant prosperity. From the perspective of market competition of products, its essence lies in the competition of quality and brand. With its unique feature and attraction, quality-oriented brand transcends the boundary of countries, nations and ideologies, appealing to people from all over the world. Therefore, such factors as product quality, technology service and price are the preconditions to dominate the market, with the ultimate target of brand competitiveness.

4 The Progressive Values of Innovation Are the Lifeline Of Corporation

Internationally, the study on the corporate values of innovation can be traced to John Peter, the economist. He coined the concept of "innovation" in economics, which became the gem of the field. As for the corporation's application and mastery of knowledge, "the dynamic ability of a corporation lies not only in the integration of knowledge, but also in the innovation of knowledge."^[4] "Innovation" covers a wide range of new activities including efficient resources allocation, technological innovation, product innovation, process innovation and institutional innovation. Based on the studies of "innovation" by John Peter, scholars make further researches and take technological innovation and institutional innovation as the areas of priority. Technological innovation is the inevitable choice for corporation to improve its productivity, and to adapt to the need of society for new technology and innovation. Institutional innovation is the change or substitution of previous personnel system and production management system, in order to adapt to the changes of corporation and market. With social and economic development, technological innovation, as well as management innovation and institutional innovation are conducive to the sustainable development of the corporation, because the purpose of innovation is to improve productivity, operating efficiency and to reduce corporate cost, maximizing its profits.

5 Global-Oriented Market Values Are the Regulator for Companies to Realize Self-Improvement

Market values refer to the opinion and view of a corporation about the activity site and objects of production, marketing and supply. It involves the perception about corporate products, service market and competitor. As for the corporation itself, it refers to the market-oriented production and operation activities. The corporation's understanding of the market directly influences and determines the fluency and constancy of production and operation activities. Therefore, whether the corporation has a sharp insight into market will exert direct influences on its survival ability and social adaptation. A sharp insight into the market is also the foundation for a corporation to understand the market and to make a reasonable judgement in order to make corresponding adjustment to adapt to the needs of the market. With economic globalization, corporations are facing inevitably fierce competition. Under the global background, the corporations with cutting-edge products, the development of core technologies and high-quality products will remain invincible. However, a corporation without market values or understanding about market will never take the dominant take in fierce competition. As the market is altering and products are replaceable and upgrading, how to adjust production with market strategy is a question that should be addressed by the market values of a corporation. All the upgrading should be achieved under the guidance of market values. Only under its guidance could the corporation improve its comprehensive management ability and competition ability, in order to ultimately realize its value.

6 The culture Values Based on the Locality Are the Unique Advantage of the Corporation

The culture values of corporation refer to the basic value conception of the role of culture in corporate development. This conception is the value judgement made by a corporation about its culture and its cultural environment. Corporation has to exist in a certain social and cultural environment. Its regional and cultural features will be inevitably expressed in corporate values. How to understand the interaction between corporate development and cultural environment has become the major content of corporate values. The culture formed in a certain circumstance is the most distinct difference between corporations and the also the foundation for a corporation's expansion. A corporation without culture but only with the input and output of money will never succeed. According to statistics, in 1971, the British constructed only less than 1000 kilometers of railway in Argentina. Twenty years later, the length exceeded 12000 kilometers. Admittedly, it is for the interests of the British. However, the construction of the railway system will inevitably promote the domestic market. The reason is that production ideas and activity motivation of Argentineans are based on the production models of the British. What they do is to sell their cheap labors. This is why the increasing investment in Argentina doesn't dramatically improve the economic conditions. Evidently, culture can only play its role after it turns into the production concept accepted by people. This concept is corporate values. Clearly, any corporation has its unique culture. When it is fully aware of its importance to corporate development and takes cultural construction as the motivation for corporate development. As a result, it can truly create a brand of its own. The corporation can dig into the connotation of local culture and make the most of the features of local culture, in order to combine local features with the demands of contemporary people, and to form a unique, distinct and local corporate culture. Digging into corporate culture is the advantage to make the most of its strength, which can never be copied or duplicated by any other corporation.

7 Conclusion

The operation values of integrity are the intangible assets of the corporation. Brand values based on quality are the inner demand to promote corporate development. The progressive values of innovation are the lifeline of corporation. Global-oriented market values are the regulator for companies to realize self-improvement. The culture values based on the locality are the unique advantage of the corporation. The five aspects constitute corporate values, which is the inner motivation and soft power of corporate development. The studies conducted by Gary Weaver and Linda Trevino indicate that the culture based on values will bring about various benefits, including the enhanced awareness of moral questions, the commitment to the organization (the reduction of conflicts between organizational and informal organizational roles), integrity of employees, the willingness to communicate problems, the willingness to report immoral cases to managers, the improvement of decisions, the willingness to listen to guidance about moral problems and the reduction of immoral behaviors.^[5] Corporate values play the guiding role, incentive role, persuasive role, cohering role and coordinative role in construction and improving the corporation's core competitiveness to unite force, to specify regulations to make breakthroughs and to overcome difficulties. It will become the soft power for corporate development and for its sustainable growth.

Abstract: The application of big data will become the key element to improve the productive and competitive power of a country and lead to global change of the whole social system in the coming future. Grassroots governments are the frontline of data collection, collation, analysis and application. Constant improvement of big data application capacity will significantly promote governments' decision-making and fine service. With literature research, investigation and data application practice of the grassroots governments, this paper makes analysis on low capacity of big data application of the grassroots governments, constructs a path framework and develops countermeasures for the improvement of this capacity within this framework.

Key words: Grassroots governments; Big data thinking; Big data capacity; Big data applications

1 Introduction

Driven by the technological change of big data, data are becoming production factors equally as important as that of material capital and man-power capital, the use of big data will become the key element to improve productivity and competitiveness in the future^[1]. Along with the change of people's life, work and mode of thinking, government functions and operation patterns, especially those in developed countries and regions, are undergoing a profound adjustment, one of which is the governments' increasing capacity of using big data, making big data application the main channel of scientific decision-making and fine service. Grassroots governments in remote poverty-stricken areas where governance relies on traditions and experiences are now challenged by data management and intelligent management. Understanding big data from the strategic level and integrating big data into thinking patterns of management are becoming a tendency in improving the application of big data and making grassroots government management more rational, digital, scientific and modern.

2 Literature review

The study about government application of big data domestic and overseas started in the 1990s and current research is mainly concentrated on the big data applications, data governance and share of government information resources, etc. In 1997, Michael Cox first proposed "big data". In 2008, Nature launched special issue Big Data. Since then, big data received extensive attention of the academia in the field. Kenneth Churchill, Mike flowers, Neelie Kroes, et al. suggested that big data should be applied in government governance and public service. Sunil Soares proposed the concept of big data management. Azande, Farah, et al. studied the development process of e-government framework. David, George Walken, WuSiLei, Paul, et al. brought forward obstacles and countermeasures of government information share.

The research on Chinese government using big data starts relatively late. CNKI shows that really significant studies on this topic began in 2012 and there are 156 papers so far around this topic, among which only 4 papers involve the government big data application. The present study focuses on the concept and characteristics of big data, its impact on governance, its importance to government management and countermeasures, etc. Liu Yeting, Wang Chunxiao, Dong Liren et al. analyzed the connotation and characteristics of big data. Tang Huangfeng, Tao Jianwu, et al. analyzed the opportunities and challenges that big data brings to the governance capacity construction. Wang Yun, Liu Yeting, Tang Sisi, et al. proposed the influence of big data on government governance mode. Hu Hongbin analyzed the insufficient capacity of national governance in the data mining, transmission, application, analysis. Chen Zhichang analyzed the demand for big data to realize governance

* This paper is supported by the special research projects on the study of the spirit of the third plenary session of the eighteenth central committee of the communist party of China. (Item No.: DSB14YB06)

modernization based on a case study of Dongcheng district, Beijing. Ni Kaomeng, Wu Jianshu, Chen Zhichang, et al. put forward the countermeasures and suggestions from the concepts of big data, decision-making, culture, platform, standard and rules, work mode, share, environment, etc., Yang Guang, Zhang Ningxi, Shi Wen and Zhang Mingkang described government big data application from the following aspects: low efficiency of big data application, emergency information system architecture, government statistics and the enlightenment of British “my data” project.

By comparing the domestic and foreign research results: At present foreign scholars focus on government big data management, technical implementation and maintenance sharing based on highly developed big data, comprehensive system mechanism and system guarantee as well as good consciousness of data resource sharing. However, domestic scholars mainly research object is at the national and provincial government level. The research on grassroots government level is very limited, especially on the issue that the capacity of grassroots governments applying big data is inadequate. As well, the countermeasure for the grassroots governments promoting the application capacity of big data and the example that research theory is used in the practical work of grassroots governments are scanty.

3 Analysis of the Low Capacity of Big Data Application by Grassroots governments

Based on the survey of six counties in Guangxi of China, such as, Guanyang, Lingchuan and Quanzhou counties of Guilin, Sanjiang, Rong’an and Rongshui counties of Liuzhou and their jurisdictional 8 townships (town) and 12 village (street), Investigation shows that grassroots government big data application is mainly manifested in the following five aspects:

3.1 The insufficient cognition of big data

At present time, big data has not yet received enough attention in the field of grassroots governance. Many governments basically know little about it, especially the cadres in the remote and poor townships and villages almost know nothing about it, much less use it. Many government departments also pay little attention to improving professional capacity of big data. Thinking of big data resource management has not yet been set up^[2]. Some grassroots governments lack strategic vision, have no “big data thinking”, are afraid of difficulties and collect data in less systematic and successional way. Data is not accumulated well from the beginning, thus it is hard to find the rules from the historical comparison. Some do not put data online and leave abundant collecting data information laid aside and neglected; some keep data confidential and private to protect their benefits. Some blindly pursuing political achievements, they conceal, falsify or refuse to submit collecting data; some keep the political data as secret resources^[3]. All these behaviors reflect weak data consciousness of grassroots governments.

3.2 Short integration of big data

The grassroots governments do not establish a unified data standard. Data source, data architecture and data system of all departments and all walks of life are different and incompatible. Big data is hardly integrated. Grassroots governments, especially remote and poor township governments, are lack of information technology and professional and technical personnel. Big data infrastructure is backward. Budget devotion is low. All of these result in less data acquisition, difficult data screening, data processing lagged behind and ill data analysis, which discount data value and make it always in a passive situation. Big data is various and mixed. With the expansion of the data scale, overall integration and operation capacity to analyze these data is not enough, so the statistical results of the truthfulness and accuracy may be compromised^[4]. That is the reason why the basic-level governments are in trouble in the big data acquisition, integration and analysis.

3.3 Short of decision-making power of big data

Big data is becoming an effective means to support the government decision-making, but quite a number of grassroots governments cannot get data in time and accurately. They dare not to make decisions based on big data and worry that they will make policy mistakes or errors depending on data. Some grassroots governments still used to use abstract analysis method based on local social reality to select sample data and to predict behavior patterns and needs of most people based on the needs of the few. Some grassroots government decision-making still strongly depends on the feeling, intuition and experience, while the awareness of big data description and big data decision is not strong. It becomes governance rituals that experience is more important than research, as the same is rough to accurate, Cause-and-effect relationship to correlativity and prevention to prediction. Decision-making errors and deviation are often happened because of insufficient decision-making ability.

3.4 The insufficient applications of big data

The current data resources still belongs to the scare resources. Though the government has

accumulated rich original data resources over these years, its usage frequency and efficiency are low and lack of unified standard, for example, e-data fragment is difficult to integrate, "data island" and "data traffic jam" coexist, thus data using is quite inefficient^[5]. As the revolution of science and technology is a "double-edged sword", big data has its pros and cons as well. On the one hand, grassroots governments dare not to apply big data hastily due to the lack of big data knowledge and technology; On the other hand, the data application at present is not widespread enough and the quality of the application is not optimal because of low application capacity and sense of responsibility of grassroots civil servants; A lot of grassroots civil servants seldom grasp skills of computer technology; Some of them lack data analysis ability and can't make the business work informationized which restricts the data value into full play, thus data application level is not high.

3.5 Short of sharing power of big data

As big data requires centralized storage, it increases risks for data leakage. At the same time, safety of basic unit government information can't be guaranteed. Data collection may leak privacy of the public, enterprises, social organizations and even the government itself at any time and cause harm to personal and national property, even physical security. Most people in rural areas know little about network and information technology, are less able to express feelings, opinions, demands and preference online, thus grassroots governments hardly can make decisions through big data or have this kind of big data thinking. As a result, the public service of grassroots governments is imbalance and uneven. Some grassroots governments often keep the data as a confidential and private resource. All above is the reason why big data is difficult to share.

4 Methodology to Promote the Big Data Application Capacity of Grassroots Governments

4.1 Erecting a big data thinking

Firstly, we should stick to big data ruling strategy. Grassroots governments should be fully aware of the importance and strategic value of big data and make an active layout from the angle of the region to guide the comprehensive development of big data. We should strengthen the education training of the government personnel at big data levels. We should continuously improve their adaptability in big data environment, thus form the cultural atmosphere of promoting government governance ability with data of. Secondly, we must set up big data values and methodology. The governance has transferred from scarce data one to broader data one which involving more big data analysis. The function of government has transferred from data collection to data analysis. We should predict the needs of society and social problems, explore diversified, multi-level and multi-angle characteristics of government governance based on big data so as to improve the capacity of big data applications^[2]. Thirdly, we need to change the governance concept. Grassroots governments must change their experience-management thinking, for example, from management to service, from information management to data management, from the traditional feeling management and experience management to data management and intelligent management transformation, in order to promote application of big data capacity.

4.2 Establishing a mechanism of big data operation

Firstly, we should build grassroots government leader group of big data. The leader group is mainly led by grassroots government leaders and is under the charge of big data management department, and other administrative departments (such as NDRC, Department of Finance, Land and Resources Bureau, Ministry of Health, Ministry of Education, Civil Affairs Bureau, Justice Bureau, Environment Protection Agency, Department of Transportation, etc.) participate in the top design of big data applications, formulate the development plans of big data, establish data standard and specification, organize supervision and inspection and improve the opening and sharing measures. Secondly, we must establish a market operating mechanism of grassroots government data resources. Grassroots government departments should strengthen the cooperation with market main bodies, be industrialization and market oriented, break monopoly data, accelerate the protection of property rights of all kinds of data as well as data acquisition, storage, processing, transmission, retrieval, license application and encourage the third party to participate in government data resources development, identify the rights and obligations of data owners, users and managers, encourage service and operation mode innovation based on big data and promote the service level of grassroots government decision-making management^[6].

4.3 building a big data system

First, we should establish and improve big data infrastructure, speed up the perfect of big data increase investment in equipment and facilities, such as computers, and absorb and cultivate the

outstanding information technology and data analysis talents. Second, we must set up big data systems in grassroots governments based on county - township (town) - village (street) three levels integrated. County government should establish a local economic and social data platform (center); Villages and towns should establish corresponding big data collection libraries; Administrative villages, streets and communities should establish big data acquisition station and organize its governed enterprises, social organizations, natural villages (groups), other units and individuals to establish a data collecting spots to integrate scattered data in different departments, trades and main bodies to make it computerized and systematic, that is, data collecting, data transformation, data release, data application and data sharing should be informationized to promote economic and social data integration, to ensure that data in all areas and all walks of life is accurate and not missed, and finally to realize the unification of the data management (see figure 1).

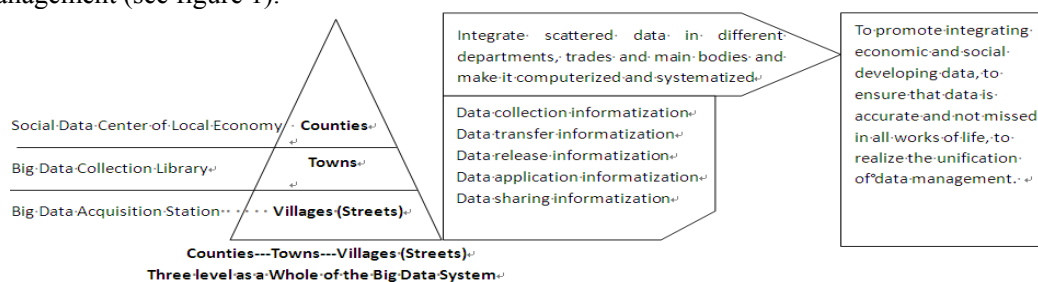

Figure 1 Model of Big Data System Construction of Grassroots Governments

4.4 Setting up big data quality management system

Firstly, we should establish a unified data standard system. According to the national and provincial standards for the construction of big data, combining the reality of grassroots governments, we should establish a unified metadata standard system as well as the standard data format of big data generation, development and distribution to facilitate data seamless integration as a whole, make originally scattered data in all departments and all walks of life integrated together, break the information island state and establish the foundation for government management. Secondly, we must set up scientific data quality assurance system. Without high quality and real data, data gathering and analysis are of no practical value, also cannot help to give a high quality of decision. To establish the measure standard of data quality, we should improve the quality management process, establish quality rescue mechanism and ensure data quality from the institutional level^[7]. Thirdly, we need to establish a standardized big data security system. We should clarify the rules of data collection and application which involves data privacy, accuracy, availability, archiving and preservation, set up information usage rights and responsibilities and ensure that the data is used in accordance with the rules and specification.

4.5 Use the big data transformation management function

Firstly, we should use big data to help us make decision scientifically. In many fields such as business and economy, decision-making will be more dependent on the data and its analysis rather than experience and intuition, thus it will be more scientific^[8]. Grassroots governments using big data technology in public decision-making can enhance the precision, prediction, equity and responsiveness of decision making and make the public decision-making more democratized and scientific^[9]. Grassroots governments should establish and improve government decision-making supporting auxiliary system, fully use the value of data to improve the ability of scientific decision-making. Secondly, we must use big data supporting service preciously. Therefore, grassroots governments should make full use of big data to predict the demands for service from individuals, enterprises and social organizations and give full play to the communication platform of the government and the public, enterprises and social organizations, such as government affairs MicroBlog, WeChat and E-Government, to provide more accurate public service and improve the public satisfaction. Thirdly, we need to make full use of big data to promote scientific management. Grassroots governments should use big data to improve management and execution ability, strengthen the political, economic, cultural, law, ecological and social construction and forge a responsible and efficient government. Fourthly, we should strengthen government its own construction by using big data. Grassroots governments should manage well public power, public funds and public officials, etc., expose itself to big data accepting the social supervision, try to build a transparent government and enhance its credibility.

5 Conclusion

The advent of big data era brings about both opportunity and hidden danger for promoting grassroots governance capacity. How to set up big data thinking and how to improve big data application capacity are the key to construct a transparent, efficient, service-oriented and responsible government. In order to realize it which not only needs grassroots government's top-level design of big data, also needs the cooperation of enterprises, social organizations, citizens and other participants in harmony to build scientific, comprehensive and effective data system together, to establish the organization, operation mechanism and quality management and other security system, to strengthen supporting system construction, such as, big data systems, infrastructure and information technology personnel, to construct benign ecological environment and optimize data acquisition, data filtering, data management, data analysis and data application comprehensively so as to form big data union and eventually condense into a resultant force to improve grass-roots government's ability of big data applications.

Study on NGO-Donor Relations in Basic Education Sector: Case of Pakistan

Warda Gul, Kong Fanbin

School of Government, Nanjing University, Nanjing, P.R. China, 210000

(Email: wardagulh@hotmail.com, kongfanbin@nju.edu.cn)

Abstract: NGOs gained the importance in last decades all over the world, same is the case with Pakistan. NGOs are participating in education sector. This paper studies the involvement of NGOs in basic education sector, being dependant on the foreign donor agencies, NGOs have to follow the agenda of donors that can create tension with the government. This paper applies qualitative research methodology to study the relationships between donors and NGOs. The findings of this study show that donors are mostly following market based approach and neo-liberal agenda that results in inequalities for people. Therefore in order to perform their duty rightfully, NGOs should look for sustainable and their own sources of finances.

Key words: NGOs; International Donors; Government; Education; Pakistan

1 Introduction

Pakistan is a country located in South Asia with a population of approximately 190 Million^[1]. The formal education structure of Pakistan is a 10-2-4-2 means that 10 Years of Secondary Education, 2 years of higher secondary education, 4 years of University professional or degree education and two years Post Graduate Education^[2]. In last decades NGOs have become stakeholder in the education sector in Pakistan, though their role is not too much clearly outlined in any policy document of government of Pakistan but under the clauses of their registration, they have continued to play heavy role in education sector and played a notable contribution. This thesis aims to explore the role of NGOs in education sector of Pakistan, educational policy crafting and implementation for Basic Education in Punjab province of Pakistan^[3].

It has been found in studies that NGOs are dependent upon foreign donors for their activities in Pakistan. The donor agencies have their own priorities and agenda and they in many cases impose their agenda on NGOs to follow. A major example is market based approach and neo-liberal agenda of International donors^[4].

As a result of this dependence on foreign donors, NGOs have to follow the agenda given by donors that result in some tensions with government as government opposes any such agenda that is being imposed by some foreign organization or is in opposition to the sovereignty of state^[5]. This tension creates a situation of rift among NGOs and government. In order to understand the nature of the relations between NGOs and their donors, researcher has conducted this study.

2 Literature Review

During past decades, there was an increased interest in education from international organizations including the World Bank and UN. Both organizations have initiated doctrines for Education, Since 1970's World Bank has been committed to a doctrine based on dominance of market forces, and education has also been seen as a form of 'human capital' that will be capable of generating high returns of economic growth^[6].

Globally, two main doctrines apparently seem to be used as guiding source for provision of education. One is Human Capital and market driven approach initiated and adopted by the World Bank and the other doctrine is Human Rights Approach of United Nations^[7]. World Bank is considered to be the largest devoter of resources for education in the world^[8]. (Ilon, 2002).

Markets have promoted inequities in education. Though the World Bank and the IMF seem to promote 'equality' in their approach the reality is that their approach has worsened inequalities in education. Markets exacerbate existing inequalities (Ball, 1993; Hill 2003; Seddon, 1997; Klees, 2010). For example, school systems in Australia and the USA, radicalized social class patterns of inequality have increased due to marketwise school systems (Hill, 2003). This is because the poor cannot afford the high tuition fees demanded by certain schools^[9-12].

As Hill, *et al* (2008:77) notes^[10]: "Increasing the role of the private sector (including for-profit) organizations at primary, secondary and tertiary levels creates unequal access to schooling based on

social class, despite compensatory measures, such as subsidies, intended to limit the stratifying effects of capitalization.”

Since the end of the 1980s, the educational systems in a number of countries around the world have been submitted to an unceasing flow of reforms^[13]. The transformation towards neo-liberalism involves both re-structuring of relations between the economic, political and social domains (including the commoditization and marketisation of fields like education - it becomes subject to the economic logic of the market), and the ‘re-scaling’ of relations between the different levels of social life-the global, the regional (e.g. the European Union), the national, and the local^[14].

Economic decline in Pakistan, as elsewhere in other parts of Asia compelled national governments to borrow heavily from international banks such as the World Bank and the IMF which resulted in many governments in Asia embracing market oriented policies due to conditionalities attached to loans. Sharp economic decline was experienced in many parts of Asia in the 1970s and 1980s^[15].

3 Research Objective and Methodology

This paper aims to investigate the NGOs-Donor relationships in Pakistan, due to the importance of donor agencies for NGOs and role of NGOs in basic education sector of Pakistan, the study will contribute significantly to the body of knowledge in the field.

For this study, researcher has applied an instrumental case study approach; it comes up with multiple data collection methods in order to have a grip on the complexity of case and looks for multiple perspectives. For this purpose, focus groups, interviews, observation and document review was applied to collect the data on roles of NGOs in education sector of Pakistan.

As per Stake (1995: ix) “A case study is the study of the particularity and complexity of a single case, coming to understand its activity within important circumstances”^[16]. According to Creswell (2007) a case study involves the study of an issue explored through one or more cases within a bounded system (i.e., a setting, a context)^[17]. For this study, a sample of 8 NGOs was selected using purposive sampling Table 10 below includes 8 NGOs (the first 8 NGOs in the table) that were included for this study. Names have been coded for purpose of anonymity

Table 1 The NGOs Included in the Study

	Name	Focus and Scope
1	AAA	<ul style="list-style-type: none"> • Campaigning and advocacy. Works with local and national NGOs to campaign and advocate for policy changes and increased accountability of service providers. • Supports vulnerable children in community schools. Works through a national NGO which supports community schools.
2	BBB	<ul style="list-style-type: none"> • Empowers rural communities by providing them with non-formal education. It promotes literacy in rural communities especially among women and children.
3	CCC	<ul style="list-style-type: none"> • Supports children’s rights in schools. It focuses on child protection and participation.
4	DDD	<ul style="list-style-type: none"> • Advocates for policies and programs that support the education of girls and women. Advocates for the removal of cultural practices that impinge on female education. <ul style="list-style-type: none"> • Supports the disadvantaged and vulnerable students by paying school fees for them especially girls and women. • Infrastructural development in schools, for example, building girls’ hostels. • Textbook provision in schools.
5	EEE	<ul style="list-style-type: none"> • Provides assistance to vulnerable families so that they can educate their children. • Rehabilitation of public schools to transform them into “Child Friendly Schools” (i.e., improving the school environment, making it conducive for learning for children).
6	FFF	<ul style="list-style-type: none"> • Supports child rights’ clubs in schools by working through local and national NGOs. • Monitoring and tracking the education budget expenditure by working in partnership with local and national NGOs.
7	GGG	<ul style="list-style-type: none"> • Supports vulnerable children in community schools.
8	HHH	<ul style="list-style-type: none"> • Lobbying and advocacy aimed at ensuring that the achievement of EFA and MDGs goals on education by 2015. • Monitoring and tracking the education budget expenditure

4 Findings of Study and Discussion

The interviews expressed and revealed that International NGOs work through their partner national or local NGOs in Pakistan to achieve their objectives including advocacy. The findings from the interview with NGO official are as follows:

“Being an international NGO, we raise voice through our partners in Pakistan that are the local

organizations. Otherwise we only issue general statements such as “The government should rectify the educational policy or bring some bill for such ratification” If we talk more, we may be told by the government or other stakeholders the fact that we are foreigner and maybe we are not required to be in some limits” (International NGO Official No. 8, 2014).

The representatives from Donor Agencies who were interviewed for this research study were of the view that NGOs are important partners for them in education development in Pakistan. Donors think about NGOs to be flexible and efficient organizations.

From the NGOs included in this case study, it has been observed that:

1) AAA provides necessary help and support to the children studying in community schools and is being funded by the Australian Aid, their program intends to help more children to be enrolled in schools.

2) BBB is funded by a wide range of donors as mentioned in the table and they work to protect Children’s right that also includes education as a basic human right.

3) CCC is also being funded by Australian Aid working in local communities to provide the financial help to deprived and vulnerable families to empower them enough to send their children to school

4) DDD is also working for the protection of children rights particularly in schools and is being funded by Save The Children focusing on child right and protection.

5) EEE is providing technical skills training in rural communities, programs are funded by UNESCO and focus is on improvement of literacy and technical skills.

6) FFF is also supporting vulnerable children studying in basic education schools, one of its sources is USAID who tend to fund NGOs to help vulnerable children to get education in their own communities.

7) NGOs like GGG and HHH are being funded by Irish and Netherlands aid to play advocacy roles for support of EFA goals.

It was observed earlier as well that GGG and HHH work for advocacy and lobbying to ensure attainment of EFA goals through these efforts. Here, it was also found from the documents review that Government of Pakistan depends on international support to undertake its development and other projects. In many instances, it has been observed that international donors can provide significant proportion in the education budget.

It has been observed that NGOs face different problems including lack of funds, less number of staff, duplication of efforts by NGOs. Most of the NGOs working in Pakistan are dependent on donors for funding from external donor agencies for their operations as they lack in their own resources. Most of the donors for NGOs include international NGOs and other donor agencies. The observations and findings of this study show that donors whether external or internal prefer and like to work with NGOs as in donors’ opinion, NGOs are efficient and they are less bureaucratic in nature and can help poor masses at the very basic and grass root level. Donors regard and treat NGOs as their important partners in achieving the goals and objectives of EFA in education sector. While observing the fact that due to various different reasons, government is unable to or lacks the capability to perform; they started depending on NGOs for the implementation of their programs. NGOs have the capabilities to mobilize the local communities and masses due to their reach to remote and rural areas where population is denser in Pakistan.

5 Conclusion and Recommendations

It is therefore recommended that NGOs in order to be self sufficient find out different ways to decrease the dependence on foreign aid for their programs and try to attain sustainability so that they might not have to follow the agenda of their donors that creates problems in their relationships with the government. The primary reason is that it is the government who controls all the policies and formulates rules and regulations for all the sectors in country and government can’t bear any interference by foreign agencies for imposition of their agenda. Therefore such NGOs that are dependent on foreign donors and have to follow their agenda will be having problems by government so such NGOs can only work peacefully if they can generate their own sources of funds.

(E-mail: 516151724@qq.com)

Abstract: With the changes of China's economic structure and consumption structure, tourism has become one of the major industries of many cities and regions. In order to fully develop the tourism industry in Henan Province of China, the analysis of the current situation of the tourism industry in Henan province of China from the perspective of “One Belt And One Road” is very important. This paper will analyze the advantages and weaknesses, opportunities and threats of the current situation of the tourism industry in Henan Province of China deeply by using SWOT analysis method. Then, this paper will put forward some strategies according to the the guiding ideology of the “One Belt And One Road”, “the combination of theory and practice”, “the combination of the advanced experience at home and abroad and actual situation in Henan Province of China”.

Key Words: Current situation; “One Belt And One Road”; Tourism industry; SWOT analysis method; Strategy

1 Introduction

We know that the strategic concept called “One Belt And One Road” has taken both the international and domestic strategic needs into account, taken the balanced development of the interests in political, economic, security, cultural and tourism and other aspects into account. As an important part of the adjustment of the strategy of national and local economy, tourism not only is the leading industry of the “One Belt And One Road”, but also will become the sustainable tourism under the background of the protection of cultural heritage and resources environment. Henan province of China is in the important node of the tourism of the New Silk Road, in the central location of the New Silk Road Economic Belt, linking the east to the west and connecting the south to the north, so it has the impressive advantages of tourism development. At present, the relevant papers at home and abroad about the analysis of the current situation of the tourism industry in Henan province from the perspective of “One Belt And One Road” are less. Therefore, this paper has a strong research value and significance.

2 The SWOT Analysis of the Development of Tourism Industry in Henan Province of China from the Perspective of “One Belt And One Road”

2.1 Strengths

1) Rich in tourism resources, especially in the historical and cultural tourism resources.

Table 1 Basic Condition of Grade 3A above Scenic Area of Henan Province of China

Item	Number	China ranking according to the number
3A Scenic Area of China	94	—
4A Scenic Area of China	72	—
5A Scenic Area of China	9	3
World Cultural Heritage	3	

According to the Table 1, we know that there are ninety-four 3A Scenic Area of China, seventy-two 4A Scenic Area of China, nine 5A Scenic Area of China, and three World Cultural Heritage. Especially, the number of 5A Scenic Area of China of Henan Province of China was ranked first in China. In addition, Henan is the most important birthplace of the Chinese nation and the birthplace of Chinese history and civilization heritage area. A large number of cultural relics have been found in Henan Province, the both numbers of underground cultural relics and cultural relics of Henan province are ranked first in China. Henan Province also has a total number of 189 national key cultural relics

protection units.

2) The geographical position is superior, and it is in the important node of the New Silk Road tourism, with the convenient railways, aviation, highways transportation linking east and west, south and north.

Henan is an extremely important comprehensive traffic hub in our country. Aviation, railways, highways and other modern comprehensive transportation system is complete, so the traffic status is very important. The north-south railways include the Beijing-Guangzhou, Beijing-Kowloon, Jiaozuo-Liuzhou Line, and the east-west railways include the Long-Hai Line and so on. Multiple north-south and east-west highway roads and highways pass through Henan Province and the percent of high-class and the number of sub high-class roads in Henan is nearly 10% of China's. In addition, the international trains from Zhengzhou to Europe have been launched successfully, opening the leading logistics channel from the central areas of China to Europe. With the good traffic condition and advantageous geographical location, Henan Province has the natural premise to undertake the role of tourism hub of the "One Belt And One Road".

2.2 Weaknesses

- 1) Tourism products are too single.
- 2) Tourist attractions do not pay enough attention to marketing.
- 3) The awareness and level of tourism service need to be improved and innovated.
- 4) The level of tourism industry agglomeration is not high enough.
- 5) The development of exit and entry tourism is relatively backward.

Table 2 Number and Income of Civil Tourists Received of Henan Province of China

Item	Number (2013 year)
Number of Civil Tourists Received (person-times)	408980000
Income of Civil Tourists Received (10000 Yuan)	3835000

Table 3 Basic Condition of International Tourism of Henan Province of China

Item	Number (2013 year)
Total Number of Star Hotel (Unit)	575
Number of International Tourists Received (person-times)	2073305
Income of International Tourists Received (USD 10000)	65997

The Table 2 and Table 3 express that the number of civil tourists received is almost 20 times the number of international tourists received, while, the income of civil tourists received is almost 9 times the income of international tourists received. We can find that the number of international tourists in Henan province of China needs to be improved. And inbound tourism income is much higher than domestic tourism.

2.3 Opportunities

1) With the changes of economic structure and consumption structure in China, tourism is becoming increasingly important and valuable, as a leading industry to build a resource-saving and environment-friendly society.

- 2) The preferential policies and government's support brought by "One Belt And One Road".

2.4 Threats

- 1) The remaining bottleneck of international cooperation of tourism— visa clearance.
- 2) The tourism competition is increasingly fierce, both at home and abroad, regional and urban .

3 The Strategic Analysis of the Development of Tourism Industry in Henan Province of China from the Perspective of "One Belt And One Road"

3.1 SO: Strengths + Opportunities (Growth Strategies)

1) Transform the historical and cultural resources to develop the capital for the tourism industry in Henan Province of China, and make efforts to build Henan as the new heights of tourism culture in the Silk Road Economic Belt.

Continue the culture of "history", and in the eye of modern and developing, interpret and explore our historical and cultural heritage, and transform it into a valuable tourism development capital. Based on the radiating capacity, influence and competitiveness of culture, open up the "History Pulse" "People

Hub” “Gold Veins” of the city, to transform our historical and cultural resources into unique tourism development capital. With the historical and cultural tourism resources, such as the Ancient Silk Road, Shaolin Culture, the Yellow Emperor Culture, the Yellow River culture, surname culture, root ancestral culture, and ancient city culture, Henan Province of China will focus on creating “Luoyang Tourism Cluster”, “Kaifeng tourism cluster”, “tourism cluster” and “The Yellow River-The Yellow Emperor tourism clusters”. Among them, the “tourism cluster” is aimed to implement the arts training performances, sightseeing, scientific archaeology, art performances, travel goods manufacturing and a series of tourism products, with the natural landscape, Shaolin martial arts, religion as the core. The “The Yellow River-The Yellow Emperor tourism clusters” focuses on building the Yellow Emperor and the Yellow River culture.

2) Speed up the tourism information construction.

With the help of the strong momentum of the “Internet +” new economic form, Henan should promote the development of Henan tourism cooperation between enterprises, promote the continuous development of the travel agencies, tourist hotels, tourism catering, shopping and tourism cultural brand, and improve the ability against market risks of Henan tourism company.

3) Pay attention to the cooperation with the New Silk Road Economic Zone and Maritime Silk Road to strengthen the construction of the Silk Road Tourism Corridor in the air.

Seize the opportunity of the construction of Zhengzhou International Airport to strengthen the construction of the Silk Road Tourism Corridor in the air. Xinzheng International Airport in Zhengzhou is one of the eight major domestic hub airports and first-class aviation port in China; The annual passenger throughput has reached 70 million and the tons of cargo is 400 million; 90 route has been opened till 2012, 84 of which are domestic routes, and navigate to 67 cities or areas at home and abroad; The passenger volume grew by 15% and the growing rate ranked second, the cargo throughput increased by 47% and the growing rate ranked first in the country. So in recent years, XinZheng International Airport has become one of the airports having the most growth capacity both home and abroad. Zhengzhou International Airport will become the international aviation logistics center, and an important gateway with the aviation economy as leading modern industrial base and an important door to the outside world in the inland areas, which is important for the development of the tourism industry in Henan Province of China.

3.2 ST: Strengths + Threat (Businesses Strategies)

1) Making full use of the geographical position advantage, Henan Province will combine the “Go out” and “Come in”, to strengthen the exchange and cooperation of tourism industry between Henan Province and the tourism at home and abroad.

Henan Province should make use of its own advantages, further deepening the regional cooperation, sharing “One Belt And One Road” tourism cooperation strategic opportunities with surrounding cities; In addition, it needs to send a team to the countries along the Silk Road and regional to promote exchange, and to invite others to Henan Province of China for communication activities, in order to promote international accessibility of Henan tourism, and make Henan tourism products go abroad and become a truly international tourist products. The strategy concept “One Belt And One Road” has got highly recognition and accept from the countries and regions, especially has got the positive response of the various countries tourism, which is a rare opportunity in the international cooperation of Henan Province of China. Henan Province should grasp this opportunity, stay one step and spearhead to become the most active and productive, the most popular among all ethnic groups along the tourist areas of cooperation. According to the national tourism sector statistics, the countries along the Silk Road Economic Belt entertain about 210 million inbound visitors a year, creating the tourism revenues of about \$12 million.

2) Grasp the opportunity based on “One Belt And One Road” to compete for policy support for tourism international exchanges and cooperation.

3.3 WO: Weaknesses + Opportunities (Torsion Strategy)

1) Improve the development of tourism market and tourism management services

Now, the tourism products in Henan region is relatively low and the line products are too single, which can't meet the demand of tourists. And there is a big gap between market support and tourism market demand. So Henan should base on the tourism resource's potential and customers' needs and desires, to develop new tourism products, which are based on different topics, different fields, different levels and different combinations of industry configuration, to promote configuration of tourism product, the development of the transportation system, and achieve to integrate tourism, culture, finance and trade, realizing internationalization, diversification and collectivization. In addition, Henan tourism can

be built as a competitive tourism belt from these aspects: such as integration of tourism planning integration of tourism elements configuration, integration of tourism service facilities, integrating of tourism service standards and integrating of tourism market mechanism.

2) Strengthen the business training of relevant departments of the tourism industry, and improve the awareness and level of the travel service staff.

3) Focus on building Henan Tourism Cluster according to the actual situation of Henan Province of China. Especially, in the basis of the Ancient Silk Road, Shaolin culture, Huang Di culture, the Yellow River culture, surname culture; root ancestral culture, ancient city culture and other historical and cultural tourism resources.

4) Introduce some preferential policies, and make the city travel agency can establish branches and open up some one-stop convenient service, such as room booking, meal reservation, car renting and other business activities.

3.4 WT: Weaknesses + threat (Defensive Strategy)

1) Overall plan, careful plan, strengthens the image of propaganda and establishes a characteristic brand.

National Tourism Administration has officially launched the overall planning of the Silk Road tourism, Henan province should be positively prepared to make a plan, ensuring the role and opportunity of the tourism industry in Henan Silk could be all exerted vividly, making every effort to build the core competitiveness of Henan tourism culture, highlighting the city's image display, strengthening external publicity, expanding continuously the space for development, broadening the tourist market, shaping a better image of the Henan's enterprises of Silk Road tourism. The way of publicity and promotion of tourism products should be various. There are some feasible ways, such as exhibition, trade fair, the festival celebration, media advertisement (newspapers, magazines, radio, television, signage), Internet, publishing for sales, tourists oral to promote sales, and other ways. In addition, the traditional modern media modes, such as literature, painting, photography, film and TV, have an unexpected effect on the artistic representation of Regional nature, history, culture, scenery, and folk customs, especially the media arts' representation, which reflects the regional folk customs, and become the important way to attract the potential tourists.

2) Make efforts to develop the immigration tourism, accelerate the process of the internationalization of tourism in Henan.

3) Coordinate the relevant units, and set up special funds for the development of the Silk Road tourism, focusing on the support for the key projects, such as the construction of the Silk Road's major scenic spots, the research and development of tourism product, and the perform of cultural tourism, and improve the construction of the element system of Tourism along the Silk Road.

4) Prepare an intellectual reserve for the development of tourism industry.

4 Conclusion

1) Henan Province of China will become the important tour center, integrated service center, tourism and shopping center and important tourist attractions by virtue of its good location, profound culture, superior resources, vast market, from the perspective of "One Belt And One Road".

2) The current situation of the tourism industry in Henan province of China from the perspective of "One Belt And One Road" is the advantages and disadvantages, opportunities and challenges coexist.

3) The government and relevant departments of Henan province should strive to grasp the macro, judge the current actual situation of the tourism industry in Henan province of China correctly, analyze the current bottleneck constraints of the development of tourism in Henan Province of China, and put forward further countermeasures and suggestions to solve the bottleneck problem, on the basis of sufficient investigation and research.

Analysis of the Social Negotiation Effect in the Process of Public Administration*

Xu Kun, Wang Zhi

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: xukun0825@126.com, wwsy1239@163.com)

Abstract: Essentially, public administration means that the citizen entrusted the right of managing the social affairs to the government. As a principal part of the public administration, the government need to take the citizens' advice to make policy and perform the public administration functions. Moreover, it's necessary for the public administration to be democratization and open. With the concept that positive conversation and equal negotiation can balance the benefit of each side, social negotiation plays an important role in participating in the public affairs for the citizens equally, realizing the nation's good governance and pushing the public administration forward. Based on the basic concept of management, this paper conducts the analysis of present Chinese public administration development status by using the method of comparative analysis and quantitative analysis. Furthermore, some shortcomings existed in the public administration are pointed out and the relationship of public administration and social negotiation is discussed. The effects and functions of social negotiation in the process of public administration are studied. Finally, such a conclusion can be drawn that social negotiation has theoretical and practical significance for realizing the scientific and democratic management.

Key words: Social negotiation; Deliberative democracy; Public administration; Social governance

1 Introduction

The research on public administration has existed for many years domestically and overseas, fruitful achievements have been got in both theoretical area and practical area. The government has focused on the society role in the public administration. Pollitt Christopher, Christensen T. per Legreid and Stephen Goldsmith, as representatives of western scholars, have rethought the public administration firstly. They hold the opinion that democratic value, such as equality, justice and civic participation, is a key factor of legitimacy of public administration. What's more, they declaimed that response type and citizen-oriented type public administration should be established with the emphasis of efficiency value of public administration. Take public administration as a key word, some relative subjects and areas can be contacted, the diagram is shown below.

Figure 1 The Relative Subjects and Areas

Presently, Chinese public administration is learning from western advanced experience positively and has realized the important role for citizen and society in the process of social negotiation gradually. At the same time, the scholars are seeking for the relationship between society and public administration. Besides, the approaches and methods for participating in the public administration are studied. The social negotiation is an special form for the Chinese government that citizen participate in the public affairs, which is based on the negotiation and democracy and play an important role in public

* This paper is supported by the National Social Science Foundation of China (Grant No. 13BDJ016).

administration. By searching the CNKI, the data listed as follow can be got, which indicates that the area and topic is novel and there are only a few research achievements.

Figure 2 Trend Diagram of Related Published Papers

Based on the analysis of relationship between social negotiation and public administration, shortcomings, which are existed in the process of public administration from the view of citizen, nation and society, should be found. Last but not least, the important role social negotiation plays in the public administration is emphasized.

2 Social Negotiation and Public Administration

Since the reform and open policy, there is a trend in society that the interest group and interest demand are more diversification with the rapid development of Chinese economy. Social contradictions are becoming more outstanding and complicated. The democratic concept and participation consciousness of citizens are becoming more and more evident. Therefore, as an effective communication bridge between government and society as well as citizens, social negotiation plays a more and more important role in the process of public administration.

2.1 Social negotiation

Social negotiation means that government and citizens or social organizations have positive talk, equal negotiation and suggestion exchange to balance the benefit of each side, decrease social contradictions, strengthen social collaboration and reach an agreement, which aims at solving the social significant problems and maintaining the vital interests of ordinary people. There are three kinds of social negotiation: social force negotiation under the nation dominance, nation force negotiation under the society dominance, internal social negotiation. Subject status equality principal, subject behavior self-discipline principal, object containment principal, orderly social negotiation principal, result share principal are the basic standard and behavior guide in the process of social negotiation. Not only can social negotiation strengthen the supervision and restriction to government power, but also it can reflect the essence spirit of democratic politics. Moreover, it has great help to the citizen to participate in politics orderly, to the government to conduct policy-making democratically and strengthen the legality of policy-making, which is beneficial to promote government function change, guarantee the society operation steadily and accelerate the development of public management.

Social negotiation is a result of nation-society relationship transition and a unique exploration for social democracy. The social negotiation in present China has important theoretical and practical significance. There is a lack of smooth interest expression, democratic participation channels and social negotiation mechanism, which leads to the masses and social organizations unable to express their suggestions and opinions. Furthermore, social contradictions and conflicts appeared in abnormal state, even in mass disturbances to express their suggestions. It indicates that Chinese government need to rely on social negotiation, which is an excellent conversation mechanism, to solve the problems existed in a society whose contradictions are more and more fierce. Social negotiation can guarantee the citizens participate in the political affairs broadly and maintain the citizens' political right reasonably. By keep contact with the masses effectively, it can improve the diaphaneity of social decision-making and management. Moreover, it is a new thought, new form, new system which can strengthen the degree of opening.

2.2 The relationship between public management and social negotiation

Public management means that public organizations provide public goods as well as public services. It doesn't focus on program and instructions, but on the results and responsibility for the results. Generally speaking, the nation is the subjective in the traditional management process and the society as well as citizens is the object. But in modern society, as the manager of public affairs and provider of public services, the government isn't compellingly put the law and policy on the citizens, it also doesn't perform the function of public management only by the sovereign right of the nation. The citizens gradually realized that they are host of the nation with the democratic concept and freedom thought spreading. Government is just a management agent of citizens and society in public administration. It's just the fiduciary of citizens to realize self-management. So the citizens are vigilant to the government

power in the public management process. Moreover, they demand that their interest appeal can be expressed effectively. Therefore, social negotiation is necessary in Chinese social management.

Presently, the Chinese social structure has changed profoundly, the government function is broadening day by day, but its ability to deal with complicated social affairs are not equal to its ambition. With the social reform happened in new term, the shortcomings of traditional public administration stand out. The public administration is not a unidirectional political process existed between government and society as well as citizens, but based on the citizens' suggestions and need. So in this context social negotiation is the premise and safeguard for the public administration. Social negotiation can collect citizens' suggestions widely and meet the citizens' demand as much as possible in the process of public policy making and conducting, which will make the public policy lay massy foundation for smooth public management. Social negotiation makes the citizens and social organizations participate in the public affairs widely which are led by government. It not only can improve the citizens' activity, but also improve the whole society's vitality. What's more, it will help to creative interaction between the public power and society and can promote the good governance of the government at a certain extent.

3 The Existing Shortcomings of the Public Administration

Public administration is a new type of social management model which appears with the development of the market economy. Public administration plays a unique role in social governance. But there are many shortcomings existing in the present public administration. The shortcomings are shown on the subject and object of public administration. To state it a bit specific, it can be divided into three aspects: citizens, nation and society.

3.1 The shortcomings of the citizens

Firstly, Chinese citizens present a state with both reason and blindness in their participation in public administration. Rationally participating is an essential and key factor to maintain the public administration order. The citizens consider their own benefits and need, at the same time, they will create impact on the public administration with their rational behaviors. Blindness participation means that citizens behave unconsciously, without any independent mind and judgment. Mostly, it's a blindness follow-up behavior which is dominated by the situation. If the citizens' reason can overcome blindness in the process of public administration, then the order of it is normal and reasonable. While in fact, blindness participation of the citizens is the leading role in public administration.

Secondly, Chinese citizens present the property of mismatching of their consciousness and ability in their participation in public administration. With the development of market economy, the consciousness of participating in public administration for Chinese citizens has improved greatly. Especially in the social transition period when social benefits are restructuring, citizens participate in public administration for their basic right as well as their benefits. While many problems are still existed, which are about the aspects of Chinese citizens' ability when they take part in public administration. For example, the citizens are lack of public reason when they participate in policy-making, they only think from their standpoint. Moreover, the citizens can't keep a smooth contact with government, even they can lead to massy incidents.

Finally, the citizens' concept of rule of law and man can usually be mixed. Public administration is the inevitable result of rule of law, whose implementation process rely on the trust of law from the citizens. For China has been experienced a long-time feudal society, Chinese citizens have been influenced by Confucian culture, the concept of whom are still dominated by rule of man. The concept of rule of man has existed steadily in the custom and amenity habits, even in some areas it has been ordinary state in life. The rule of law has been around people as the economy and politics develop so rapidly. The citizens have realized the importance of the law rule, especially in the aspects of maintaining their own interests and benefits. The present context is that the concept of rule of man and rule of law mixed in the ordinary lifestyle, which constitutes the barrier of the public administration development.

3.2 The shortcomings of the government

Firstly, the administration concept of the government falls behind. In spite of the emphasis of service-style government establishment and mode of public administration transition, the concept of the government and its staff rests on rule-style and management-style. As the only management subject of the public administration, government has great political rule function and coerciveness. The citizens existed negatively and are lack of autonomy. They are negatively managed and not the subject of the public administration. The concept of service-style public management has not been formed in the

process of government management.

Secondly, the system of public administration is not perfect. The system aims at ruling that what should the public administration do. The present system has many problems to solve. For example, the government hasn't been led by the citizens' demand in the process of public administration and social responsibility fulfillment. The corresponding feedback mechanism is also not perfect, which doesn't allow people to make options and decisions. Moreover, the citizens' drive mechanism of supervision and evaluation is defectiveness. So the service level can't meet the demand of the public service.

Finally, the public administration methods of government fall behind. The management methods rest on the traditional process, which can't keep pace on the new media time. What's more, there is a lack of electronic government management. Although some modern companies have introduced in some advanced management methods and technologies in the management process, not all company management methods can match the government management system. They are not well perfected to adapt to the government management.

3.3 The shortcomings of the society

Totally, there is a lack of interaction between the government and society in the process of public administration. Firstly, there is a lack of interaction in the policy-making process. Public policy is an important part of the public administration and a primary method of social governance. There is no citizen participation in the policy-making process for public administration. Policy-making without collecting citizens' suggestions may lead to the disagreement with the citizens' factual demand. Furthermore, it will affect the factual effect of public administration.

Secondly, there is a lack of interaction in the policy implement process. Reasonable distribution of public benefits and responsibility to people are the property and connotation of public policy. For the purpose of preventing benefit conflicts and maintaining social stabilization, public management lacks interaction with citizens in public policy implement. Furthermore, neither the management we take can meet the citizens' increasing demand, nor achieve the purpose of policy implement of public management.

Finally, there is a lack of interaction between government and society in resource integration. Multielement appears for value as the social economy develops. One of the primary goals for public administration is to integrate the social resource. Despite the increasing impact for public administration on social resource integration and its effect on social resource distribution, shortcomings are still existed in government and society. Government can't motivate the enthusiasm of the whole society and can't keep reasonable relationship with social community and social organization to integrate and distribute the social resource, which make the social resource not fully used.

4 The Effect of Social Negotiation in Public Administration Implement

4.1 The effect of citizens participation

Firstly, the introduce of social negotiation in public administration can help to cultivate rational citizens and form the concept of rule by law. The citizens will concentrate on the public policy and public affairs in the public administration. The democratic and liberalism concept have been around. The citizens have gradually realized that they are the subject of public administration and participation is their right and obligation. Moreover, the rational spirit and law-rule concept can be strengthened through the participation in public administration.

Secondly, social negotiation is beneficial to the citizens' consciousness and ability of public administration participation. The citizens can participate in the public administration by the means of social negotiation, which is the best exercise opportunity for their management consciousness and ability. A government which can satisfy its citizens is a government whose citizens have ability to participate in public administration. Citizens can supervise all kinds of social affairs and government right by participating in public administration, which not only can strengthen the host consciousness, but also improve their ability of political participation.

Finally, social negotiation is beneficial to furthest satisfy citizens' rights and interests. Essentially, social administration is the allocation of public power and social interests. The effect of social negotiation in the public administration process is to ensure the citizens' participation, which can satisfy the citizens' benefits greatly.

4.2 The effect of government administration

Firstly, it's beneficial for public administration to transfer from ruling mode and managed mode to ministrant mode. The transition of management mode has always been the important goal of public

administration. The establishment of ministrant government has great importance in this social circumstance, which is not only the need to improve the attitude and methods of the government and civil servant, but also the great measurement to realize the basic concept of public administration. At the same time, social negotiation collects social suggestions broadly and satisfies the benefits claim of citizens and social community. All these measurements are key factors to establish ministrant public administration.

Secondly, social negotiation in public administration can help government obtain trust and support of the citizens. Government wins the trust of people and gets the support from people, which are the premise and goals of carrying out public administration. Based on the talk and participation of citizens, social negotiation can get the correct results. It can have positive effect for government to acquire the citizens' support and trust.

Finally, social negotiation can realize the goals of good governance. Social negotiation means that nation and society have communications and talks on some key social issues to realize the social common understanding and correct decisions. It matches well with the concept and goals of good governance. So social negotiation is beneficial to realize good governance, which is the national goal.

4.3 The effect of social cooperation

Firstly, social negotiation can strengthen the interaction between society and government. If public administration wants to realize its basic concept and final goals, the positive interaction between government and society is needed. The interaction is civilized and ordered. The essence and concept of social negotiation are put forward. We can see that social negotiation in public administration can avoid the occurrence of sudden groupment incidents. It can improve the interaction between society and government, which is positive, civilized and ordered.

Secondly, social negotiation can help to integrate the social resources. Public management mode is a kind of management mode that can integrate regnant social resources. But there is a premise that social members and social organizations must be respected. Thus, social negotiation seems so necessary when it bears such an important mission.

Finally, social negotiation is beneficial to public policy making and implement. As an important part of public administration, public policy plays a vital role in maintaining social stabilization. Whether public policy can carry out smoothly relies on the factual conditions of citizens. It should satisfy the citizens' factual need. Therefore, social negotiation has an important intermediary effect on public policy, which helps to make and fulfill public policy.

5 Conclusion

Social negotiation has theoretical and practical significance for realizing the scientific and democratic management. Public administration is a fundamental duty of the government, and it is also an important means of governance to promote harmonious development of society. It plays an extremely important role in the development of the political, economic and cultural of the society. With the economic development rapidly, the trend of social pluralism become an indisputable fact. In order to integrate various social forces, to respect the reasonable pluralism, to respond to the demands of different groups, the public management innovation has become an inevitable trend of social development. Public Management Innovation is the foundation of citizens to participate in the Social Management, and it is the pursuit of modern political civilization. Therefore, analyze the social negotiation effect in the process of public administration can help china to build a reasonable program of public administration, and to promote the modernization of political civilization. Social negotiation has important effect on public administration, which is premise and safeguard for public administration to go smoothly. To realize win-win for government and society in public administration of modern society, the important role of social negotiation in public administration must be insisted. It can guarantee the citizens to participate in public policy making and public affairs management. Moreover, it can also help government and society form positive interactions to integrate the social resources at best.

Abstract: In July 2002 the United States enacted the Sarbanes Oxley-SOX for foreign organizations on the New York Stock Exchange. Thus, all Brazilian companies that kept ADR (American Depositary Receipts) traded NYSE (New York Stock Exchange) have adapted to the demands of the new law. From specific working group focusing on SOX strategy, hiring consultants who assisted in defining the standard documentation, the model maps spreadsheets, controls design, testing, teams trained in the certification process, which would help in the dissemination process. The Sarbanes Oxley worked for a structured corporate governance environment, minimizing and curbing actions in bad faith. This paper describes how the XYZ Bank, ranked among the largest private banks in Brazil adjusted its processes to sections of American law.

Key words: Sarbanes oxley law; Corporate governance; Financial institution

1 Introduction

To restore the confidence of the American capital market and in response to the accounting scandals involving large US companies in 2001, for example, Enron and World.com, which brought many losses to investors, the United States enacted in July 2002 Sarbanes Oxley Act SOX. The law takes the surname senator and congressman who created (Paul Sarbanes and Michael Oxley) and brought tougher rules to improve the accounting and financial controls of the companies, as well as audit and security mechanisms to make companies with securities traded New York Stock Exchange (NYSE - New York Stock Exchange) more reliable.

The law took effect including foreign organizations operating in the New York Stock Exchange and therefore registered with the SEC (Securities Exchange Commission), the body that oversees the US capital market. Thus, all Brazilian companies that kept ADR (American Depositary Receipts) traded on the NYSE (New York Stock Exchange) had to implement actions to suit the requirements of the new US law.

Among the Brazilian companies at this time there was a Bank, that we are calling XYZ, and was among the largest private banks in the country coming in full national expansion through acquisitions of public banks mostly and already showed strong interest in also expand its international market share. Ranked Brazilian multinational company with leading positions in Brazil, more than 80 thousand employees, agencies scattered throughout most of the country and abroad, has a technology driven 15,000 ATMs, great influence of credit for Brazilian companies and High international presence as the largest private bank.

With a quick and bold strategic plan, the Bank XYZ sought not only adaptation to sections of American law, but was intended to be the first Brazilian company to achieve international certification, even before the deadline required by the American market. Unlike other segments, banks have better adaptation to some sort of regulation, adaptation is easier since it is routine demand from regulatory agencies such as: Central Bank, CVM and its regulations, circular, among other instruments, according to Santos, I. D. A. A., & Lemes, s. (2007)

Important aspects related to certification are important to mention the issue of costs related to the implementation of SOX ends up being a high impediment since the results at first seem intangible despite the importance and does not appear to demonstrate its cost benefit. According Langevoort (2006), the costs that are visible from the start of implementation are associated with audit firms with their fees, generation of man cost / time of all levels involved. However, the opportunity costs become intangible to Ribstein (2005), the opportunity costs are associated with preventive issues such as: accountability of executives, CEOs and others involved in the process as a whole will likely penalties before the public information available from the company. The control environment in this process is very large even with the centralization of a team "full time" in the project, it was necessary to raise

awareness across the bank of the importance of certification as a whole for this training were conducted, business games, departmental meetings so that at the end of the process everyone was aware of the importance of certification and their need, but this process although essential also generated high costs for the organization and that it was necessary to be managed.

Considering the importance of the institution entire process carried out for the SOX certification, this report aims to describe through practical experience the major corporate actions that have been implemented for this financial institution and the mobilization of the whole group seeking certification.

2 Context Investigated

The financial market is very sensitive and at all times speculation wander behind the scenes, in the specialized news media gains and failures are used as puppets to manipulate the biased market. Andrezo, AF, & Lima, IS (2007) "conceptualizes the financial market as a set of institutions and instruments to offer application of alternative and fundraising, for the flow of funds between savers and borrowers" (p.01) .

However, with the ups and downs, ups and downs of the financial market is important to guard and see which are the best alternatives to protect themselves from speculation seeking to protect and safeguard the shareholder who invests in the company. Seeking to understand the implementation and the importance of SOX, is questioned. Why the Bank XYZ sought SOX certification in advance to the market?

With the information that companies that have shares listed on the New York Stock Exchange should be appropriate to the requirements of the Sarbanes Oxley Act better known as SOX, the XYZ Bank began a race against time seeking to be the first financial institution to be certified by SOX before his mandatory.

Certification SOX aims to generate gains for the management of processes, and assist in the control of risks that may be inherent in the process. Candide (2007), cites the risks have aspects prevention though can be viewed negatively. Several factors may be limiting for businesses since considerable investment of degree one is required generating the high cost certification.

Second, Carioca, KJF et al., (2010), "one of the main criticisms that are made to SOX relates to the costs of its implementation. There are however, researchers favorable to the thesis that the costs of implementation should not be compared with the short-term benefits, but with a new level of quality management and resulting public information of long-term benefits."

Considering a requirement for setting the Bank XYZ, we found the need to advance the law suit aimed at management in its controls and began the process of implementation of SOX Section 404 based on, for it was necessary to analyze, test and documentation of controls.

The Sarbanes Oxley Act aims to increase the responsibility of executives of public companies listed on the American market. R. Allen Stanford executives and sentenced to 110 years in prison for 700 million scheme in Ponzi scheme convicted of a crime and was arrested. John Bernard "Bernie" founder company "WorldCom", arrested for manipulating the company's accounting, fraud, conspiracy and issuing false documents

Second (Silva, 2005). The negative development on the financial market is not restricted to financial market. Paramalat company, was asked the financial issues of the company and its owner was arrested on suspicion undue appropriation, make up the balance.

The Sarbanes Oxley Act is divided into 11 chapters with 69 sections which are:

Chapter1- Creation of the Independent Monitoring Body Work Chapter

Chapter 2 - Auditor Independence

Chapter 3 - Corporate Responsibility

Chapter 4 - Increase in Financial Reporting Level

Chapter 5 - Analyst's Conflict of interests

Chapter 6 - Commission Resources and Authority

Chapter 7 - Studies and Reports

Chapter 8 - Accountability Enterprise and Criminal Fraud

Chapter 9 - Increased Penalties for White Collar Crimes

Chapter 10 - Repayment of Corporate Tax

Chapter 11 - Corporate Fraud and Accountability

Some of the SOX sections are: Section 101, 102, 103, 104, 109 is the PCAOB, auditor independence section 201, 202.203, 204, the company's responsibility to section 301.302, 304.305 and

307, improvement of financial statements with emphasis for section 404: 401, 402, 404, 406, 409, or corporate criminal liability for fraud in section 806, 807 and increase penalties for white-collar crime section 906.

Follow description of the sections of the Sarbanes Oxley Act, this report will be focusing on Section 404, which aims at evaluating the controls on an annual basis so as to guarantee monitoring of controls, Act, SO (2002).

Table 1 Main Articles Of Sarbanes-Oxley Act (S0x)

Category	Section	Attributions
PCAOB	101	Comes from the PCAOB - Public Company Accounting Oversight Board
	102	Organizes the PCAOB and its duties
	103	Establishes rules relating to audit standards, and control the quality and independence.
	104	Create program of inspection permanence of registered auditing firms in SEC.
	109	This deals with funding issues and operating rates of PCAOB.
INDEPENDENCE OF THE AUDITOR	201	Defines services that are prohibited for auditors within companies they audit..
	202	Determines the need for prior approval of the audit committee for any other service provided by the company's independent auditors.
	203	Determines the rotation every 5 years the partner responsible for each customer, accounting firm.
	204	Creates rules for communication between the contracted auditors and the company's audit committee.
COMPANY RESPONSIBILITY	301	Definition of the tasks assigned and the level of independence of the audit committee in relation to the company's board.
	302	Define the responsibility of the directors who sign the reports with statements and other financial information of a certain period included in order to ensure that the report all information is reliable. And that any adverse information should be communicated to the Audit Committee.
	303	Determines the prohibition regarding misconduct auditor by bad influence of coercion, manipulation, regardless of whether intentionally or negligently, and prohibit any influence with the auditors.
	305	Responsibility and penalizes the responsibility of company directors.
	307	Determines rules blaming lawyers must report evidence of any serious breach of the company to work reporting to the audit committee or board.
IMPROVEMENT OF FINANCIAL DISCLOSURES	401	Requires disclosure of quarterly and annual information regarding the material that are not related to the balance sheet, asset such as: transactions, agreements and other obligations.
	402	Requires disclosure of major transactions involving directors and major shareholders. No director or senior officer of a public company may receive, directly or indirectly, loans held company.
	404	Evaluation of application on an annual basis of internal controls and procedures for financial reporting. At the same time, the auditor will issue report attesting apart and assertiveness of the administration of the effectiveness of internal controls and procedures for issuance of financial reports
	406	Structures the Code of ethics for directors, senior management and management.
	409	Has the obligation of timely and current information disclosure further considered and on important changes to financial aspects.
RESPONSIBILITY FOR CORPORATE OR CRIMINAL FRAUD	802	Establishes criminal penalties for altering, destroying, falsification of documents used in survey SEC.
	806	Creation of the protective clothing for employees of companies with publicly traded denounces conduct relating to fraud in the organization working.
	807	Definition of the main criminal penalties that may harm the minority shareholders of companies with publicly traded for false information
INCREASE PENALTIES FOR WHITE COLLAR CRIMES	906	Directors and responsibility will be held responsible for financial statements and defines the penalties for infractions

The main premise of this SOX grounded in good corporate governance, second, da Silveira, ADM (2015) “corporate governance concerns the way in which society are directed and controlled, including its explicit and unspoken rules, especially the relationship between its main characters:.. board, board of directors and shareholders” (1.1 What is Corporate Governance Main Principles.para.2?)

3 Situation-Problem Diagnostics

The first step of the organization was to highlight some executives began to focus on the strategic plan of SOX, given the complexity of actions and the need for prioritization to achieve the goal. However, as the XYZ Bank was servicing a part of American law according to their level adherence to the rules of CVM (Brazilian Securities Commission), the body that oversees the stock exchange in Brazil, the executive priority was to meet the demands Section 404 of US law, which established among other things that the CEO and the CFO took responsibility for establishing and maintaining a system of internal controls to guarantee the effectiveness of controls.

The Section 404 of SOX requires a process is quite complex adaptation as organizations must invest time and money to make it happen effectively. According LIVEIRA, MC, & LINHARES, JS (2007), for the law implementation program happen perfectly according to your requirement we recommend compliance with all the sessions and their proper applicability.

Moreover, it began to demand that the independent audit to issue two opinions defined by PCAOB (Public Company Accounting Oversight Board), one on the assessment made by the Company's management and the other on the effectiveness of controls. Thus, the working group created to manage the shares was officially called "GT 404" and, besides having executive officers in its composition, shares of GT 404 were periodically supervised by Vice President of the Controller and the Audit Committee. The GT 404 also had the support of the areas of Internal Control, Compliance and Audit, each of which had an important role in the design, validation and implementation of actions and controls that allow the bank's certification. Second, Peters (2004), "Internal control is a process carried out and executed by a corporate structured set by the Board, the Board of Directors or others in the company that drive business success in three categories" (p. 35)

One of the points required by Section 404 were periodic testing of controls in the processes that generated accounting effects. However, in an organization with nearly one hundred thousand employees, thousands of cases spread between central administration and agencies, it was vital to establish a working methodology covering all control points and did not allow weaknesses were identified in the independent audit opinions.

To assist in the definition and conduct of the methodology were you hire two consulting firms: McKinsey and PwC, each focused on a scope. The first advice helped in defining the standard documentation, the model maps and spreadsheets that could easily be consolidated at the end of the process. The second helped with the design of the controls and tests, as had an audit arm with teams already trained to audit the processes in certification case, which would help in the process of dissemination of knowledge and previous tests. After the first meeting discussing "what" processes should be in scope and "how" the mapping would be done, the GT 404 has determined that the work would be carried out from the last published balance sheet, with a percentage increase of growth to ensure that no relevant account would be without the coverage of the SOX process.

Selected relevant accounts for the mapping work, documentation, development and / or validation of controls and tests, the GT 404 has delegated to teams of internal controls perform field work. 980 cases were identified that have become grouped macro processes 28. The work was carried out "backwards", ie after highlighted the most relevant accounting accounts the next step was to identify all the processes and systems that could interfere with the account balance. The mapping should consider the entire value chain from product marketing to accounting values on the balance sheet, however, the starting point was always the ledger account. Teams of internal controls were the "walkthrough" in each selected process, documenting the steps in flowchart, identified all risks and controls involved and prepared a test plan that would run from the second stage. According to Dias (2006), "Risk assessment is the identification and analysis of risks associated with not meeting the targets and operational objectives, information and compliance. This group forms the basis for defining how those risks are managed" (p. 50).

At the end of the process the team of internal controls produced the Risk Matrix, which shall contain the following information in detail: Sox Risk Control to mitigate the risk Sox and the description of the test to be performed in control.

The control test step required another strategic maneuver. In 980 cases identified by the institution were thousands of controls. For the controls tested were relevant fact, the institution determined that the test should be conducted in the "key controls", ie those in which the slightest flaw could already generate impact on carrying amounts. For controls where the failure occurred it could still be captured in another step of the process, the institution called "operational control", which had not testing

recommendation for the purposes of Sox.

For each test run was necessary to document the results in specific tools to historic guard, as well as custody of evidence (system screens, calculations in spreadsheets, documents signed etc.) which required more storage of information. Therefore, in addition to specific tools for the Sox, spaces have been expanded on servers for the storage of information that made the test. The institution knew the importance of being adherent to the requirements of US law and spared no effort and investment to achieve certification. In line with this premise, the GT 404 set a testing rule in manual controls that mostly was more conservative than the recommendations issued by the independent audit firms:

Table 2 Frequency Test

Frequency Control	Quantity testing (year)			
	Standard KPMG	Standard PWC	XYZ	
Annual	1	1	1	
Quarterly	2-3	2	3	March, September, December.
Monthly	2-4	2-5	6	January, March, May...
Weekly	5-10	5-15	18	01 for each month from January to June
Daily	15-30	20-40	48	01 for each week
Several times daily	30-6-	25-60	48	01 for each week

Source: Folheto Banco XYZ. "SOX – Sarbanes Oxley Act XYZ"

Nevertheless, in some control tests in processes and / or systems of internal control teams identified exceptions validation. For these cases they were immediately reported to the GT 404 which set deadlines for corrective actions and weekly followed the evolution of the action. As there were two lines of reporting, teams of internal controls had the status of schedule and actions in progress monthly to the GT 404 and reported the progress of this work quarterly to the Vice President of Accounting and Audit Committee. However, any relevant subject was anticipated to flow to not impact the timing of actions.

After the design of the methodology to be adopted, the delegation of actions for mapping and testing by the team of internal controls and the reporting of actions between the command lines, the next step was to involve all employees and establish classroom training between most impacted teams (Compliance, Audit and Internal Control). The Bank XYZ produced a booklet called "SOX - Sarbanes Oxley Act XYZ", in line with the company slogan used at the time and distributed to all employees, in order to generate each employee's commitment to the theme and the understanding of the extra effort to implement the necessary actions as well as the impact of smaller individual actions in the certification. Several trainings were given to the teams that would go out into the field to get up and map the information and they would spread the control culture related to SOX.

The Bank XYZ fulfilled in 2006, Section 404 of the Sarbanes-Oxley Act (SOX) related to internal control over financial reporting, and included in its Annual Report 20-F filed with the SEC, the Management Report on internal control over financial reporting, which attested that these controls were subjected to an evaluation process according to the rules of the US regulators.

4 Situation-Problem Analysis

Globalization has brought great changes to the world society any action taken in one country directly impacts other country, and to be more specific impact may be depending on the industry segment, whether this organization has capital open and linked to the Stock Exchange, this impact is greater. Second, da Silva, KL, Oliveira, MC, De, MMM, & Araújo, OC (2009), the question of ownership of public companies, conflict of interest, lack of transparency with minority shareholders are seen as negative aspect for organizations that have these characteristics.

It is mandatory the disclosure and provision of information by easily accessible channels stakeholders suit the information so that everyone can use the information for decision making. Demonstrate transparency in the organization of the information demonstrates a reliable process with related parties is internally or externally. According to the Code of Best Corporate Governance Practices of the IBGC (2004), the principle of transparency (disclosure) indicates that the communication should not be limited to the economic and financial performance, but also consider other factors (including intangible) that guide corporate action and leading to value creation.

Valuing the company in the financial market is of paramount importance for shareholders and

interested parties to contribute their values and receive dividends as market demand.

Corporate governance helps the organization on strategic issues and better corporate image to the market structure oversight bodies such as auditing generates reliability of the results generated by the organization. Financial institutions should pay attention to regulatory issues and bodies that drive the rules to be applied. The Sarbanes Oxley SOX has become a driver for audit firms with requirement to all companies with powers to appoint and establish the compensation and oversee the independent auditors as well as reviewing internal controls, audit and accounting, Act, SO (2002). Its implementation despite laborious aggregate enterprise value in bringing benefit and increasing the level of confidence in the market, shareholders and stakeholders. The Sarbanes Oxley SOX helps control process of the processes with particular frequency as the working methodology stipulated, spontaneous anticipation of Bank XYZ for certification of SOX, was frowned upon by its shareholders bringing a comfortable atmosphere before the market as a whole. The process has mobilized a considerable layer of bank employees, it was a laborious process, because it was necessary to go thoroughly the processes which brought security in the analysis of the risks and find out where there was failure, define roles and responsibilities and create an entire cycle prevention.

This research has qualitative, descriptive nature. According to Neves, J. (1996) qualitative methods are similar to the interpretation of everyday phenomena procedures. In addition, the research included bibliographic support, sites with public information in addition to participating managers to SOX implementation project.

Seek certification in advance demonstrated maturity of the institution, the Bank XYZ believes is key to its investors have an efficient internal control, seek transparency for shareholders and stakeholders as well as generating good attraction and value for investments, return increase for both company and to its investor.

5 Social-Technologic Contribution

The financial market is dynamic and fluctuates all the time in every opening and closing of the stock exchanges around the world values. Similarly, publicly held companies that hold shares on the New York Stock Exchange has a greater exposure to the labor market and automatically charging to maintain structured processes generates regulatory agency requirements such as circulars, regulations as well as international laws that adjustments impacts both the local market and the international market arising from globalization.

The implementation of the certification Sarbanes Oxley better known as SOX was not much different, trying to adapt to the international market the financial market was informed that the implementation of this certification would be necessary. As such process would generate high demand for employees, change processes, transaction cost for the entire project the Bank XYZ understand your positive anticipation of this process before the financial market. To do so, it started a fast and proactive process for the implementation of this certification.

The report aims to describe the main actions taken to implement Sarbanes Oxley certification, and demonstrate the importance of anticipating this certification for the financial market, shareholders and stakeholders. The Sarbanes Oxley brought a structured environment and corporate governance while minimizing and even curbing actions in bad faith, responsible executives who are managing the process as a whole.

It was found that was of great value to the Bank XYZ entire structure prior to the time of certification, structuring all teams draw what should be the best methodology for implementation, brought greater security. From there, all steps were detailed, employees were aware of the importance of certification for the Bank as the whole at the end of the process the certification was the result of a work of dedication and commitment of all involved and the financial market was frowned upon credibility and generating new business opportunities. Striving for excellence in the quality of its controls to comply with the laws as a commitment to their own history, in June 2006 made sure as the first bank that owns shares on the New York Stock Exchange, in advance of one year the date that the North regulator -American stipulated at the time.

A Penny for Your Thoughts: A Preference Modelling Case Study in R

A. Syahid, M. A. Tareq*

Malaysia-Japan International Institute of Technology, Universiti Teknologi Malaysia, Jalan Semarak,
54100 Kuala Lumpur
(E-mail: tareq@utm.my)

Abstract: The study of stated preferences often requires the use of specialised software or proprietary programs, which can be difficult and/or expensive to use. This study proposes to re-purpose the "support.CEs" package, a program written in the R programming language, from its agronomic roots to measure home buyer preferences for sustainable housing. These are demonstrated through a stated preference discrete choice experiment of choosing model houses with differing levels of energy savings, renewable energy generation, landscaping, soundproofing, ventilation, and price differences. A pilot study was performed using an online survey, constructed using the LMA.design tool provided in the "support.CEs" package. The survey was also separated into six blocks of six questions each to reduce the cognitive burden on respondents. The survey was distributed through social media channels. Preliminary results with a limited sample of 20 respondents with mixed income, age, and occupational demographics, analysed using the package's clogit function, that performs conditional logit estimations, have shown that the results have a statistically reliable adjusted rho-squared value and that all coefficients show the expected signs. From this study, it can be concluded that the support.CEs package can be used to model home buyer preferences and that adequate blocking allows for the measurement of a higher number of variables despite having smaller sample sizes.

Key words: Home buyer preferences; Discrete choice experiments; Sustainable housing

1 Stated Preference Modeling: A Background

Modeling stated preferences is an almost mystical science, turning something as anomalous as buyer choices into hard numbers, drawing from disciplines as disparate as marketing, psychology, economics, and statistics^[1] to conclude on the meaning behind buyers' choices. This multi-disciplinary combination of techniques equally allow preference modeling to go beyond the bounds of any one particular field, seeing applications in studies as diverse as marketing^[2, 3, 4, 5, 6], real estate^[7, 8, 9], healthcare^[10, 11, 12], environmental^[13, 14, 15], agronomic^[16, 17, 18], transport^[19, 20], and manufacturing^[21] studies.

Many techniques exist for collecting and studying buyer preferences including the analytical hierarchy process^[22], conjoint analysis^[23], discrete choice experiments (hereinafter DCE)^[1], and contingent valuation^[24]. Each technique is only situationally superior, with its own sets of strengths and weaknesses. However, the main objective all of these techniques is to elicit the monetary value of a particular good or sets of goods.

While any of these techniques could technically be used to model homebuyer preferences, the unique nature of housing as a multi-dimensionally heterogeneous good^[25] makes preference elicitation through contingent valuation tedious and analytically problematic, as this technique relies on respondents choices in response single attribute changes rather than multi-attribute choice situations^[26], which is the typical trade-off situation when choosing homes.

The analytical hierarchy process, originating in operations research, has found use in many fields^[27], as its primary objective of figuring out the importance of criteria and attributes, thus finding a home in fields as far apart as healthcare to architecture to finance^[22]. With respect to the home buying process, it has proven less useful except to paint broader strokes on home buyer preferences^[28] and is not naturally capable in providing hard numbers on the willingness to pay (WTP) for these preferences [cf. 29].

2 Discrete Choice Experiments in R

Based on the arguments that DCEs and analytical hierarchy process methods having similar predictive ability^[30, 31] and the objective of this study; to distil hard numbers on the WTP for sustainable

* Corresponding author

¹ While conjoint analysis and DCEs are often used interchangeably, this is a misnomer as the two are dissimilar choice modeling techniques that are only superficially the same [1].

homes, it would be more suitable to use DCEs to study home buyers preferences. To this end, the authors propose the use of support.CEs^[32], a program written in R to formulate surveys eliciting buyer preferences and analyse the resultant responses. Other programs exist in the open source ecosystem that could be used to carry out DCEs or conjoint analyses^[33,34], but methodological refinements have shown the support. CE program to be the best fit for this study.

Like other stated preference modelling techniques, DCEs rely on the assumptions of the random utility theory^[26] that buyers are both rational and choose alternatives that maximise their utility. However, it is different by offering a comprehensive set of characteristics with each alternatives, which more closely resembles a realworld decision^[10] than anything that could be feasibly conceived using either contingent valuation or analytical hierarchy process techniques.

This program was specifically chosen to model home buyer preferences due to both the advantages of the program itself and that of the DCE technique. The choice of an open-source program against other commercial software such as Sawtooth^[35] or proprietary codes is advantageous in allowing the primary research to be carried out at minimal cost and transparently allowing any subsequent replication and validation by other researchers. The program itself is inherently flexible and allows for minute specifications to suit many methodologies and experimental designs.²

The origins of the support. CE programs lies in agronomics, initially used to model consumer preferences for different attributes of milk^[17]. This study only tested a small number of attributes: the presence of HACCP and Good Agricultural Practice labels against prices amongst Tokyo residents. In recent literature, the support. CE program has also been used in environmental economics to measure stakeholder preferences for multiple use offshore platforms designs^[15] and in transport studies to model changes in mode of travel with differing parking options^[36].

The flexibility of the program is shown in its use to estimate respondents choice of funding two medical programmes using the constant-sum paired comparison method^[37], where respondent trade-off between two choices with a given budget constraint. It has also been combined with eye tracking technology to yield Uruguayan consumers preferences for yoghurt labels^[38].

3 Research Methodology

3.1 Experimental Design

As with all attribute-based methods for eliciting stated preferences, the one first steps in eliciting home buyer preferences for sustainable features in homes is to identify and describe the attributes that define the choices given to respondents^[39]. For this purpose, the authors have resorted to the definitions for sustainable housing used in sustainable building standards, namely the Green Building Index (GBI)^[40] to suit the Malaysian home buying public. The authors reasoned that using established standards provides a ready baseline to define sustainability in real estate and enhance the applicability of this study's results.

The award of certification and sustainability levels in the GBI is through the tally of points given for incorporating certain features in a building that enhance sustainability^[40]. These features are discretely separated into levels, which can then be directly translated into attribute levels demarcating sustainability. The choices of sustainable features were made based on its significance on residents' quality of life and could be practically addressed through building design^[41].

Figure 1 Question 1, Block 1

² The authors have tested this and found incompatibilities with certain unworkable combinations, such as excessive blocking or attribute levels not found within normal DCE experimental design.

The issue of choice, or lack thereof, is a major field of study amongst stated preference practitioners. The excessive choice effect has been shown to decrease the probability of choosing an option as the number of options increases^[42] due to the increased search costs from having more options^[43]. The Irons and Hepburn model for optimal searching behaviour stipulates that searching stops when the cost of searching one more option is greater than the expected value of the payoff from greater searching plus the reduction in regret that greater searching delivers^[44], which is consistent with a satisficing model of buyer behaviour^[45]. However, because of the need to value attributes relative to every other attribute, it is necessary to have at least two options with differing attribute levels within each choice set^[39].

Other factors that influence complexity of DCEs include the number of attributes, levels of attributes, and the number of choice sets (questions), all of which either increase or decrease the calculated WTP but almost invariably increase error variance^[46].

The experimental design of the overall survey is based on the L^{MA} design³ generated internally from the *support.CEs* program^[32], where the experimental design is directly from the orthogonal main effects plan^[48]. This experimental design is generally larger than most orthogonal main effects plan for DCEs^[49], which the authors mitigate through effective separation of the choice sets into multiple blocks; subsets of choice sets. It has also been argued that the L^{MA} design, while orthogonal is not the most statistically efficient^[49] and possibly suffers from balance, overlap, and dominated pairs^[50]. Additionally, the L^{MA} design cannot be used to determine higher order interaction effects^[48]. The latter is ignored because the authors believe further interaction effects are unnecessary for this study while the former will be offset by better internal and cross-validity indicators compared to other experimental designs^[47]. The experimental design for the choice sets used in this survey is presented in the appendix.

Based on previous evidence, the authors have decided to construct the survey based on six choice sets of two options each containing six attributes of three or two levels, separated into six blocks. The following is a sample of a question in the survey, where respondents choose options 1, 2, or neither options to indicate their preference in sustainable housing:

The authors have decided to incorporate pictorials and colour coding to allow the surveys attribute and attribute levels to be more easily understood. This follows the effects of traffic light system which enhances the visibility of pertinent information^[38]. Also, having a more game-like survey technique, which include more visual rather than textual information, leads to a more enjoyable experience for respondents^[4].

3.2 Theoretical Background

The basis of many attribute-based methods such as DCEs is the assumption that agents would choose alternatives yielding the highest utility, also known as the Random Utility Theory^{4[52]}. Assuming respondent *i* selects alternative *j* to maximise his/her utility. The utility from making the choice, *U_{ij}* can be decomposed into:

$$U_{ij} = V_{ij} + e_{ij} \tag{1}$$

where *V_{ij}* is the systematic component of the utility of respondent *i* from selecting alternative *j*, and *e_{ij}* is the stochastic component of the utility^[18]. The systematic component of the utility is assumed to be as follows:

$$V_{ij} = ASC + b_1 EN_{ij} + b_2 S D_{ij} + b_3 VN_{ij} + b_4 LD_{ij} + b_5 R_{ij} + b_6 PR_{ij} + e \tag{2}$$

where, *ASC* denotes an alternative specific constant for housing choices relative to the neither option, where the systematic component of the utility for the option is normalised to zero. The definitions for other variables are tabulated in Table 1:

Table 1 Variable Definition

Coef.	IV	Type	Definition
<i>b₁</i>	<i>EN_{ij}</i>	Continuous	Percentage of energy saved from the respondent's energy consumption
<i>b₂</i>	<i>SD_{ij}</i>	Dummy	Enhancement of interior soundproofing
<i>b₃</i>	<i>VN_{ij}</i>	Dummy	Enhancement of indoor ventilation
<i>b₄</i>	<i>LD_{ij}</i>	Continuous	Percentage of development area set aside for landscaping and recreational uses
<i>b₅</i>	<i>R_{ij}</i>	Dummy	Production of renewable energy within the development area and usage of renewable energy in common areas
<i>b₆</i>	<i>PR_{ij}</i>	Continuous	Increase in price as a function of the respondent's perception of house price

³ L^{MA} design is an experimental design, where L is the number of levels, M is the number of alternatives in each choice set, and A is the number of attributes for each alternative^[47].

⁴ A further exposition of this theory and its applications to DCEs can be found in Alberini et al.^[51]

Figure 2 Illustrated List of Sustainable Features in Homes

3.3 Survey Methodology

This survey was carried out online using Google Forms as its basis, which allowed for branching questionnaires that enabled effective separation of the choice sets into blocks that reduce the number of choice sets faced by respondents, which significantly reduce complexity ^[53] and lessens respondents' cognitive burden ^[54].

The preliminary sections of the survey include basic demographic information; age, income, education, and employment which allows the authors to separate the WTP for sustainable features against different demographic groups. Previous studies have shown that demographics affect WTP for sustainable housing features ^[55, 8], which the authors believe is also the case amongst Malaysian homebuyers.

Table 2 Summary of Respondents' Demographics (n=20)

Category	n	%
Age		
18-25	1	5%
26-35	11	55%
36-45	6	30%
46-55	2	10%
Education		
Postgraduate Degree or higher	16	80%
Undergraduate Degree	4	20%
Annual Income		
less than RM 10,000	4	20%
RM 10,000 - RM 35,000	2	10%
RM 35,000 - RM 70,000	7	35%
more than RM 70,000	6	30%
Prefer not to say	1	5%
Employment		
Student	3	15%
White collar	17	85%

The following section looks at the respondents current housing situation, including home ownership, current type of house, and future housing purchase decisions. The most pertinent of these questions is whether future house purchases is for investment or own use, which has been shown to affect WTP for sustainable housing^[56].

This survey also includes a set of primer questions that is meant to shift respondents thoughts towards sustainability and sustainable behaviour. The survey provides respondents with a list of sustainable features and sustainable behaviours^[57] for them to acknowledge either knowing or performing.

While this section of the survey is not analysed further, the authors believe it is useful to get respondents who would not have otherwise thought of sustainability and sustainable features in homes to consider thebreadth of possibilities in sustainable housing.

Following these questions, respondents are given a preamble on the main part of the survey and a choice of selecting one of six blocks prepared for this DCE. Each block consists of six questions each with two options and a null option.

Table 3 Summary of Respondents' Home Ownership

Home Ownership	n	%
Do not own current home	8	40%
Yes, for less than 2 years	4	20%
Yes, for 2 - 5 years	2	10%
Yes, for more than 5 years	6	30%

4 Results

A test run of the DCE was distributed through social media channels and received 20 responses. The table 2 shows a summary of respondents' demographics:

From the survey preliminaries, we can see that this sample consists of a good mix of first-time, long-term, and non-homeowners, summarised in Table 2. It is known that first-time homeowners, whether they have taken the property plunge or otherwise, have different priorities in their home buying decisions^[58, 59].

Table 4 represents the estimations of respondents' WTP for sustainable features in homes. The results are outputted as the results of conditional logit estimations^[60], where columns coef, exp(coef), se(coef), z, and p respectively showing the estimated coefficient, exponential function of the estimated coefficient, standard error of the estimated coefficient, z-value, and p-value under the null hypothesis that the estimated coefficient is equal to zero^[48]. Because the dependent variable; price was presented to respondents in percentages, all the coefficients here should be interpreted as a percentage increase or decrease in prices.

Table 4 WTP Estimation Results

	coef	exp (coef)	se (coef)	z	p
ASC	0.44	1.55	0.62	0.70	4.80e-1
No Renewable	-0.85	0.43	0.34	-2.5	1.20e-2
Soundproofing	0.64	1.89	0.35	1.81	7.10e-2
Ventilation	0.44	1.55	0.32	1.36	1.70e-1
EnergySavings %	0.06	1.06	0.01	4.47	7.70e-6
Landscaping%	0.04	1.04	0.02	1.76	7.80e-2
Price %	-0.03	0.97	0.02	-1.58	1.10e-1

Likelihood ratio test=93.9 on 7 df, p=0 n= 360, number of events= 120

Using the gofm() function in *support.CEs*^[32] produced the following output, which indicates the goodness of fit of the estimations above:

Rho-squared = 0.3560286
 Adjusted rho-squared = 0.3029313
 Akaike information criterion (AIC) = 183.794
 Bayesian information criterion (BIC) = 203.3064
 Number of coefficients = 7

Log likelihood at start = -131.8335

The estimated model above is shown to be a good fit as its rho-squared and adjusted rho-squared value falls within the values of 0.2 and 0.4 [61]. The Akaike and Bayesian Information Criteria are criteria used to measure the statistical quality of a model that penalises a model for both deviance and complexity [62], where lower values are preferred over larger ones [63]. However, without competing models, it is not possible to perform any comparative analysis between models. However, the functionality of such statistical information would be greatly appreciated for researchers comparing between different groups of respondents [64].

Using the `mwtp()` function in the *support.CEs* package [32], it is possible to calculate the marginal willingness to pay (MWTP) for each sustainable feature. MWTP is defined as the economic value of a small change in a non-monetary variable [48]. The MWTP of non-monetary goods in "support.CEs" calculated by first defining the monetary good and using it as a baseline to calculate the economic value of all other goods defined in the DCE, using equation 3 [48].

The results from the MWTP estimations are presented in table 5. These results show the correct signs; the absence of renewable energy generation efforts are likely to reduce house prices by 27.8%, the enhancement of soundproofing increasing prices by 20.9%, ventilation enhancements increasing prices by 14.3%, and every percentage increase of energy savings above a baseline and landscaped area within a development increasing prices by 1.83% and 1.15% respectively.

Table 5 WTP Estimation Results

	MWTP	2.50%	97.50%
No Renewable	-27.802	-234.293	155.671
Soundproofing	20.909	-94.779	166.089
Ventilation	14.352	-93.299	154.339
Energy Saving %	1.829	-9.82	14.629
Landscaping %	1.152	-6.594	11.176

method = Krinsky and Robb

An earlier review of determinants of sustainable housing demand [65] has shown that previous studies indicate positive WTP for ventilation [55, 66, 67, 68], soundproofing [67, 68], energy savings [55, 67, 68], and landscaping [69, 70, 71, 72]. However, because the current study is centred on the Malaysian home buyer, it is not possible to compare the results from this study with previous literature due to differences in sustainable development policy, purchasing power, and environmental awareness, amongst other factors.

A house's renewable energy generation capacity is positively valued in Japan [73], Australia [74], and the UK [75]. The positive valuation shown in this study could be attributed to Malaysia's newly introduced renewable energy policy that includes feed-in tariffs for household renewable energy generation [76, 77], incentivising households to install solar PV panels to generate positive cash flow. It could be possible that this positive MWTP is a manifestation of the present value of expected cash flows from this feed-in tariff [see 78]. However, it is still not possible to benchmark Malaysian home buyers' WTP for renewable energy generation with those from other countries due to policy and demographic differences highlighted earlier.

5 Conclusion

This study has proven that the "support.CEs" program [32] can be re-purposed to measure the WTP of home buyers for housing features, especially those related to sustainable development. Programming in R [79] is a useful tool for quantitative researchers, as evidenced by this and other freely available programming packages.

This study has shown that, with sufficient separation of questions into blocks, it is possible to conduct this DCE with a small sample yet still achieve statistically reliable estimates. The results from this study show the expected signs but cannot currently be compared to those from previous studies.

The results here will be used as the stepping stone towards a larger study of Malaysian home buyer preferences, now that the research tool have been proven to be suitable and effective in quantifying home buyer preferences.

Abstract: Multiple secondary databases are frequently used. However, papers rarely discuss the method of combining these databases. We report on four methods of matching data across secondary databases and show that the number of observations differ significantly based on the method used. Therefore research results might be dependent on these methods.

Key words: Secondary databases; Matching data; Research method

1 Introduction

Our review of all the studies published in one of the top journals in the field of management (i.e., the *Strategic Management Journal*) in the last six years reveals that 358 of the total 469 studies make use of secondary data, and 297 studies use data derived from multiple secondary databases, which are combined into one dataset for the analyses. Hence, 63 percent of all *SMJ* studies published in the last six years (i.e., 297 of the total 469) use multiple secondary databases. Although these studies have enriched our understanding of many managerial phenomena, only 26 of the 297 studies (11 %) that used multiple secondary databases report on the method that was used to match the data across these different secondary databases (e.g., Csaszar, 2012; Zhou, 2011; Zhu, 2013).

This large-scale absence of reporting regarding the matching methods in quantitative studies that use multiple secondary data sources results in a lack of common methods for matching data across frequently used secondary databases and many researchers are re-inventing the wheel, due to the limited possibilities for learning from prior studies. With regard to different matching methods some studies used a name-matching method (e.g., Arora and Nandkumar, 2012; Heeley and Jacobson, 2008), while others used a common identifier (e.g., Kim *et al.*, 2013; Lim and Mccann, 2013) and still others (software-aided) used name standardization and additional validations (e.g., Zhou, 2011; Zhu, 2013).

An even more important issue concerns whether research findings might be dependent on the method used for matching data across multiple secondary databases. Specifically, possible mismatches (e.g., matching data from firm “Alpha Inc.” in database I with data from firm “Alfa Corp.” in database II) can negatively influence the internal validity of studies that use secondary data. Additionally, a significant amount of information might be overlooked when the matching method is too narrow and firms that are, in reality, the same are not matched (e.g., not matching data from firm “Alpha Inc.” in database I with data from firm “Alpha” in database II). Moreover, due to a lack of attention to how multiple secondary databases can be matched, reviewers and editors might not always know what to look for and ask about during the review process, which leaves a possibly vital part of the research methodology underexposed.

This study fills this void by specifying and investigating four different matching methods for making connections between two frequently used secondary databases. The four consecutive methods for matching data across four different secondary databases are: (1) Full name matching (e.g., individual or firm “Alpha” does not equal firm “Alfa,” and firm “Beta Inc.” does not equal firm “Beta Corp.”); (2) Common identifier matching (e.g., when two firms have the same CUSIP code); (3) Full name and common identifier matching, including additional checks, such as comparing matching results for both matching procedures; and (4) Full name and common identifier matching, including additional checks and an additional fuzzy name match with additional identification variables such as corporate address. These four matching methods are successive, because each higher hierarchical step will include more positive matches and exclude potential mismatches.

* The authors are listed alphabetically and contributed equally to this paper. This paper benefited from a grant from the WU Vienna University of Economics and Business.

2 The Oretical Elaboration of Matching Methods

Two types of errors can emanate from potential mismatches between multiple databases. For example, (financial) information for firm Alpha is obtained from database I and other information (e.g., about Inter-Organizational Relations (IORs)) from database II. An initial mismatch could happen if no or not all “true” observations (e.g., IORs) in database II were matched to firm Alpha, because, say, it was registered differently in the two databases. This would mean that firm Alpha was assumed to have fewer observations (e.g., IORs) than it actually did, which we label a so-called false negative. A second mismatch might happen if more than all of the “true” observations (e.g., IORs) in database II were matched to firm Alpha. This could happen if multiple, but different, firms “Alpha” were to appear in the other database, thereby creating an assumption that firm Alpha had more observations (e.g., IORs) than it actually did, which we label a so-called false positive. In either case, a mismatch would mean that the firms were not aligned with the number of observations (e.g., IORs) they actually had or were wrongly assigned to observations (e.g., IORs) they did not possess.

2.1 Methods of matching secondary data

There are multiple methods of combining databases of which four are described. The first method uses the full name of the unit of analysis (e.g., name of the individual or firm). With this method, the observations from multiple databases can be combined if the full name in one database corresponds to that in another database. Although this seems a relatively easy method for matching data across multiple databases, individuals or firms can have slightly different names in those various databases, so that mismatches are very likely to occur when this method is used exclusively.

A second method uses a common identifier for the unit of analysis, which then must be available in multiple databases, such as firm identifiers like CUSIP or GVKEY (e.g., Kim *et al.*, 2013; Lim and Mccann, 2013). An important issue is that not all databases have the kinds of alphanumeric identifiers that seem to be common in other databases, and sometimes these common identifiers are designated with a different number of alphanumeric characters in different databases. However, when there are common identifiers, these can be rather easily used to combine observations and match data from multiple databases.

A third method of combining databases represents a combination of the first two, with additional validations. That is, researchers firstly search for observations that can be found in multiple databases based on a full name match. Then, independently of the full name match, they search for observations in multiple databases based on a common identifier match. In a third step, they combine the observations from the two matches, which can result in three categories of observations across the databases: (A) observations that are matched based on both the full name match and the common identifier match (i.e., double matched); (B) observations that are only matched based on the full name and not on the common identifier; and (C) matched observations based on the common identifier and not on the full name.

The researchers subsequently have a variety of ways for dealing with these observations. Observations that match in terms of both the full name and the common identifier are “double matched” observations, which are very likely to be the same individual or firm and therefore a true match. The two categories of observations that are matched only in terms of either the full name (B) or the common identifier (C) might either be excluded as a mismatch (Matching Method 3, sub-option I) or manually evaluated based on additional information on the individuals or firms within each database, such as zip codes or websites or as obtained through web searches (Matching Method 3, sub-option II).

A fourth method of combining multiple databases deals with so-called fuzzy name matching, which can be done in addition to the prior matching methods. With matching methods four, sub-option I: The fuzzy name matching procedure starts with the standardization of firm names. Specifically, the names of firms can be standardized by, for example, removing additions at the end of the name, such as “Inc.” or “Corp.” (e.g., Albany Molecular Research Inc. becomes Albany Molecular Research). This standardization can be achieved relatively quickly, but it does not capture the different ways in which a name might be written (e.g., Albany Molecular Research Inc. might also be registered in a database as AMRI).

Alternatively (Matching Method 4, sub-option II), specific identifying keywords can be derived from a firm name so that the different forms in which it is written can be incorporated into the matching procedure, with multiple keywords derived for every firm name. As an example, the three keywords (including search wildcards, such as the %) for Albany Molecular Research Inc. might be: ALBANY%MOLECULAR%; AMRI%; ALBANY%. A balance needs to be found when generating these keywords between words that are too generic (e.g., “research”) and will result in a high number of

potential mismatches and words that are too specific and could potentially leave out true matches for a firm that is registered differently across multiple databases.

A way to deal with this is to generate the keywords sequentially in such a way that the first words are more specifically defined and the later words more generic. Combining this ordering of keywords with matching based on the full name and the common identifier decreases the number of observations that need to be manually verified. This is because all the observations that are matched both on full name and common identifier can then be subtracted from the matches based on the first keyword. The matches that remain need to be verified based on other criteria, such as zip codes, websites, or background information found on the internet. Pending verification, these observations can be added to the full name and common identifier matches. Matching the names between multiple databases in this way is practical, provides a lot of insight into the units of analysis, and incorporates the researcher's judgment, but it is also time-consuming.

3 Different Matching Methods: Does it Matter?

In order to investigate whether different methods of matching data across multiple secondary databases can have an impact on the number of observations, two frequently used databases (i.e., Compustat and SDC) were connected by means of the four matching methods. Compustat contains financial and descriptive information on firms, while SDC contains information on the IORs of firms (i.e., non-equity alliances, joint ventures, minority investments, and mergers and acquisitions). The largest (based on number of employees) 282 US public biopharmaceutical firms in Compustat are selected and connected to the SDC database. With regard to the third Matching Method (M.M. 1) and on a common identifier (M.M. 2)) was used (i.e., sub-option II). For the fourth matching method the development of key words was used (sub-option II).

Table 1 Number of IORs per Matching Method (M.M.)

	M.M. 1.	Compared to M.M.4	M.M. 2.	M.M. 3.	M.M. 4.
Non-equity alliances	1,482	68.93 %	1,782	1,921	2,150
Joint ventures	370	61.67 %	453	484	600
Minority investments	286	70.79 %	388	358	404
M&A	1,606	67.96 %	1,856	2,014	2,363
Total # of IOR	3,744	43.83 %	5,991	6,410	8,543
# of focal firms with 1 or more IOR	185	75.82 %	215	234	244

As can be observed from Table 1, the fourth matching method (M.M. 4) results in the highest numbers of matched IORs, while the full name match (M.M. 1) captures 43.83 percent of the IORs compared to the fourth method. This table clearly shows that the number of matched records and information obtained on IORs increases consecutively from the first to the fourth method, although the amount of work also significantly increases.

Based on these differences it is interesting to investigate if these differences in the number of matched IORs are distributed equally among the firms. For this we took the top 15 (with regard to the number of IORs) for each of the four matching methods and compared them. The results are presented in Table 2. This comparison was done per year and Table 2 is based on the year 2000 (randomly selected, the year 2000 shows similar results compared to the other years). The firms are sorted based on the number of IORs based on the fuzzy name match (M.M 4).

The results show for instance that Safeguard Scientifics inc has 67 IORs based on the fuzzy name match (M.M. 4) and is positioned as the firm with the third most IORs, while there are 22 IORs found based on the other three matching methods, resulting in positions 15 (M.M. 3), 13 (M.M. 2), and 12 (M.M. 1). Glaxosmithkline plc for instance has 47 IORs based on matching methods 4, 3 and 2, while the full name match (M.M. 1) finds no IORs, resulting in a large difference with regard to the position in the top 25 (i.e., position 107 for the full name match (M.M. 1) and position 5 based on the fuzzy name match (M.M. 4)).

Table 2 Top 15 Firms with the Most IORs per Matching Method(M.M.)

Firm name	Position	#	Position	#	Position	#	Position	#
	M.M. 1	IORs 1	M.M. 2	IORs 2	M.M. 3	IORs 3	M.M. 4	IORs 4

4 Discussion and Conclusion

The aim of this study was to investigate whether the different matching methods that are used to combine multiple secondary databases for developing datasets can have an impact on research findings. We focused on four particular matching methods for combining secondary databases, as well as a number of frequently used databases containing information on IORs, as described above. The results of this study show that empirical findings might differ depending on the method that was used to match (i.e., combine) multiple databases.

We started this paper with our observation that secondary databases are frequently combined for research purposes (i.e., 63 percent of all SMJ studies published in the last six years), but that only a small amount of these studies (i.e., 11 %) report on the method that was used to match the data across these different secondary databases. Based on the found differences between the different matching methods we would recommend scholars to precisely and consciously describe the matching procedure as part of the methods section of a paper. Additionally, we would recommend reviewers and editors to explicitly ask for this. This does not only allow for an accumulation of knowledge on the different matching methods used, but also increase the clarity of the matching method conducted and enables others to replicate research findings.

Additionally, based on the results, we would recommend scholars to use a rather thorough and extensive matching method, in future studies, such as the above-described matching methods which combines the full name match with the common identifier match including the additional validation (M.M. 3) or even the additional fuzzy name match (M.M. 4). If the additional fuzzy name matching is used we can recommend the development of the hierarchical key words (i.e., fuzzy names, sub-option II), by multiple researchers independently. Based on the results we would advise scholars to refrain from using only a full name matching method.

This study is not without its limitations. First, the different matching methods were investigated based on firm data, whereas future research on the individual level (e.g. managers or inventors) could also consider the impact of different matching methods. Second, we do not claim that the proposed matching methods are superior and invite other scholars to share other creative methods to combine data across multiple secondary databases. Third, in line with other studies (e.g., Ahuja, 2000; Beckman, Haunschild, and Phillips, 2004; Hitt *et al.*, 1996; Keil *et al.*, 2008), we have only focused on large firms, whereas the differences in the number of observations might be different for privately owned or smaller firms.

Altogether, this study shows that there are large differences between difference matching methods

and that research findings can differ based on the method that is used to match data across multiple (secondary) databases and therefore calls for more attention to at least the description of the matching method used in a study.

Exploring Commercial Bank of Ethiopia Clients' Satisfaction with the CRM System

Meraf Woldemariam Bechalew

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: mafi_W@yahoo.com)

Abstract: For bank systems, Customer Relationship Management (CRM) helps organizations to use information technology and human resources to gain insight into the behavior of customers and the value of those customers. In banking sectors it incorporates people, process and technology to archive understanding on company's customer and manage the relationship between the enterprise and clients properly. Having a good CRM system in banking sector allows the bank to increase customer satisfaction, reduce operational cost and improve sales force efficiency and effectiveness. And hence, evaluating the Commercial Bank of Ethiopia clients' satisfaction with CRM system becomes the main agenda in this paper. The paper basically used seven key variables namely CRM Satisfaction, CRM Progress, CRM Improvement, Customer Expectation, CRM Application, CRM Service as well as CRM Efficiency and Effectiveness as a measuring tool to evaluate the clients' satisfaction with CRM system. After critically analyzing the raw data as well as the strategy of CRM implication of CBE using the above seven key variables, this paper suggest that there is a positive improvement in the overall performance of Commercial Bank of Ethiopia.

Key Words: Customer relationship management; Commercial bank of ethiopia; Clients' satisfaction

1 Introduction

In today's world, banks and other corporate services providers realize the importance of the Customer Relationship Management (CRM) and its potential to help retain existing customers, acquire new ones and maximize the life time value. However, having a close relationship with customer will definitely require the strong coordination of Information Technology (IT) and the marketing units to provide a long term relationship with selected customers. CRM in banking sectors integrates people, process and technology to archive understanding on company's customer and manage the relationship between the enterpprise and clients properly. In addition to this, by integrating these cross functional values CRM provides appropriate ways to use data and information to understand customers and create value.

Commercial Bank of Ethiopia is a leading bank In Ethiopia established in 1942, with the introduction of modern banking services such as ATM and Western Union Money Transfer to the country. Furtherance to this it provides various banking products and services locally and internationally. The CBE has opened various branches to broaden its customer base and carry out its social responsibility to handle the day-to-day complaints of the customers and improve its service quality.

The Ethiopian banking system is still underdeveloped compared to the rest of the world. Cash is still the most dominant medium of exchange. The operational techniques that most banks used to offer service for their customer are almost the same as before and therefore it needs to give attention to Proceed on preparation of capacity building and modernize the banking system by involving the art technology that has been used anywhere in the world. Ethiopian banks face several challenges to fully adopt and practice technologically developed applications. The key challenges for this are Low level of internet penetration and Lack of developed infrastructure for telecommunications. The current banking system is not enough to provide efficient and dependable services with the satisfaction of customers and differentiate them in a market where product features are easily cloned. The bank customers have missed to enjoy with the technological advancement in banking sectors which has been considered elsewhere in the rest of the world. Because of this the Commercial Bank of Ethiopia should recognize the need for introducing better technology advancements and try to expand its services by using CRM system to satisfy its customer and meet the need of expanding domestic and international trade, and increase international banking services.

One company must create and promote healthy environment to enhance efficient and effective services by implementing new formulation of policy or redesigned the existing one. Commercial Bank of Ethiopia started to focus on developing a customer relationship management (CRM) system to systematically arrange the economic change conditions and, in particular, to a decrease inflation rate

circumstances. CRM of the bank build a business process having the customer as a marketing, customer management, sale management, customer service and maintain, is to make the business process more automatic and more efficient and controls the communication between bank and customers. Customer is the first asset of the bank so management has to give priority to CRM. CBE can redesign or reengineer the business process of customer marketing, customer management, sale management, customer service and maintenance.

The paper will clearly show the role of Customer Relationship Management on both the Commercial Bank of Ethiopia and its most important customers. From the Commercial Bank of Ethiopia side since the bank is trying to modernize its core banking system and expand its services, the CRM can strengthen the performance of the business and can increase customer value by using some analytical methods in CRM applications. For the customer it will create closer relationships and interactions between a business and its users.

2 Literature Review

Many scholars have defined CRM as a process where financial service industry is a cyclical process which starts with definition of customer actions. However, Couldwell (1998) defines CRM from marketing phase as a combination of business process and technology that seeks to understand a company's customers from the perspective of who they are, what they do, and what they are like. In other word it is seen as a key element that allows a bank to develop its customer base and sales capacity which is the essential function of customer oriented marketing to gather and accumulate related information about customers in order to provide effective service. Moreover, Mylonakis (2009), described CRM as an innovative process to create a long term relationship and gaining trust by involving the attainment analysis of customer's knowledge in order to sell goods and services. Kumar & Rajesh (2009) state that any bank that wishes to either grow in size of its banking operation or improve its profitability must consider the challenges affecting its customer relationship. Therefore, the reasons for CRM coming to existence are the changes and developments in marketing environment and technology. However, the best definition of CRM is developed by Payne and Frow (2005) by emphasizing that it is a strategic approach that is concerned with creating improved shareholder value through the development of appropriate relationships with key customers and customer segments. Hence, CRM is a business strategy to identify the bank's most profitable customers and prospects, and devotes time and attention to expanding account relationship with those customers through individualized marketing, reprising, discretionary decision making, and customized service through the various sales channels that the bank uses. Any financial institution seeking to adopt a customer relationship model should consider six key business requirements (Chary & Ramesh, 2012), which are: (a) Create a customer-focused organization and infrastructure, (b) Gaining accurate picture of customer categories, (c) Assess the lifetime value of customers, (d) Maximize the profitability of each customer relationship, (e) Understand how to attract and keep the best customers, and lastly (f) Maximize rate of return on marketing campaigns.

Furthermore, CRM provides better opportunities to use data and information to both understand customers and create value. This requires a cross-functional combination of processes, people, operations, and marketing capabilities that is enabled through information, technology, and applications (Boulding et al 2005). Businesses use technology and human resources to gain insight into the behavior of customers and the value of those customers. Using the internet CRM can integrate and simplify customer related business processes, reducing cost of customer facing operation and increase the customer experience. CRM systems are innovation in which their requirements have often not been built-in to the existing organizational structure. Because of this to use CRM in an organization some adjustments need to be implemented, like BPR. BPR is a customer focus, top-down management effort to establish breakthroughs in the performance of inter-functional processes' (Davis, 1993). To enhance the performance of the organization as a whole CRM system incorporates set of functions and business processes. Hammer & Champy (1993) define BPR as the fundamental rethinking and radical redesign of business processes to achieve dramatic improvements in critical, contemporary measures of performance, such as cost, quality, service, and speed. With CRM system bank sectors was able to focus on profitable clients through efficient segmentation according to individual behavior. Information about 'who buys what and how much' enabled the bank to have a commercial approach based on the client and not solely on the product. Thus, the bank was able to better satisfy and retain its customers (Lindgreen Antioco).

The aim of CRM is to maximize customer value in the long term, by focusing business processes, marketing and customer service on client relationship maintenance, through the use of an information technology system. Implementation of such a system is not an answer, and is not, of itself, sufficient to transform a production oriented organization into a customer-oriented one (Kanji, 2002; Chang, 2005), which will require a wide-ranging overhaul of organizational structures, employee training and reward system, as well as appropriate IT support (Chen & Popovich, 2003). This fundamental redesign of business processes is described as Business Process Reengineering (BPR). Earl et al. (1995) state that, 'BPR has meant redesigning existing business processes and implementing new ones.

3 Research Methodology

This section outlines methods and procedures employed to perform the research task. Both primary and secondary data will have a logical contribution to the research. We collected Primary data specifically from direct customers of the Commercial Bank of Ethiopia in different branches of the capital city. I used questionnaires to collect important information on situation of relationships and interaction between the bank and its customers. Interview already conducted with different officials in Ethiopia regarding how the bank offers services for the customers. And also the personal observation of the researcher will be reflected as a primary data. To complement the primary data in the research, I used secondary data. The secondary source of information includes study reports, statistical compilations, evaluation reports, etc. I collected the secondary Data which were documented, written, archived, by other bodies from various libraries and sites. Moreover, the data published in different research journals (both national and international), books and documents from research projects were also important to accomplish the research task.

The research involves asking 120 respondents to give a response for the research questionnaires about Commercial Bank of Ethiopia CRM system. Only 90 were able to analysis. Male respondents dominated the sample which is 74 percent. These people are selected based on their age, academic, occupation, income amount per year and marital status. From the whole respondents 83% are in the age between 18 to30 years old, 8% in the age between 31 to 40 and only 10% of the respondents are age 41 and above. Majority of the respondents (50 %) are with collage graduate degree qualification. In the other hand most of the respondents are professional employees that accounts to 73%. Whereas 6 % are students, the same 1% of the respondents participates in private businesses and other. More than half (67%) of the respondents income amount per year is around \$1411 and above. Each key variable measured through the parameter starts from 'highly satisfied to highly dissatisfy which have the value ranging from five (5) to one (1). Therefore, the accumulated data was analyzed using SPSS.

4 Results

The table below indicates the level of customer satisfaction with CRM system in Commercial Bank of Ethiopia. According to the table, the majority moderately satisfied with the CRM system of the bank indexed with 51 out of 90. 20 % of the respondents were neutral in this regard and only 13 % of the respondents moderately dissatisfied with the CRM system of the bank.

Table 1 Respondents' CRM System Satisfaction

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Highly Dissatisfied	3	3.3	3.3	3.3
	Moderately Dissatisfied	12	13.3	13.3	16.7
	Neutral	18	20.0	20.0	36.7
	Moderately Satisfied	51	56.7	56.7	93.3
	Highly Satisfied	6	6.7	6.7	100.0
	Total	90	100.0	100.0	

Figure 1 elaborates the respondents' response for the Progress of CRM improvement in Commercial Bank of Ethiopia. From the respondents only 30% of them are highly satisfied with the improvement of CRM that the bank gradually shows. Meanwhile 40 % of the respondents were moderately satisfied, 3 % moderately dissatisfied and the rest are neutral.

Figure 1 Respondents' Expectation on Progress of CRM Improvement

According to table 2 below, out of 90 respondents, the majority which is 67 % are highly satisfied with CRM work improvement. Meaning that, they strongly agree that, if CRM is made better, better and attractive work will be done. It also improves productivity by either reducing the number of people required to perform the process or by increasing the volume of activities with the same number of people. Only 23 % moderately satisfied on the point, where as 10% are neutral.

Table 2 Respondents' Response on CRM Work Improvement

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Neutral	9	10.0	10.0	10.0
	Moderately Satisfied	21	23.3	23.3	33.3
	Highly Satisfied	60	66.7	66.7	100.0
	Total	90	100.0	100.0	

Today many businesses specially banks, and other service providers understand the importance of customer relationship management (CRM) and its possibilities to help them acquire new customers hold existing ones and develop their lifetime value. Table 3 explains the awareness of the clients on the use of the CRM application in banking sectors whether it's the time to use it or not. From the entire respondents 40 % of them think that it is time to make use of CMR application in Commercial Bank of Ethiopia and only 7 % of them don't agree with this idea. 37 % of the respondents moderately satisfied if CBE starts to use CRM application but 17 % of them they don't have any idea about the use of CRM application in banking sector.

Table 3 Respondents' Response on Use of CRM Application in Bank

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Moderately Dissatisfied	6	6.7	6.7	6.7
	Neutral	15	16.7	16.7	23.3
	Moderately Satisfied	33	36.7	36.7	60.0
	Highly Satisfied	36	40.0	40.0	100.0
	Total	90	100.0	100.0	

The figure below indicates that, the respondents' response for the improvement of business performance in Commercial Bank of Ethiopia by using CRM system. Running a big business is a bit challenging, more so if the business is customer oriented. Call centers which operate 24 hours a day require huge manpower to keep each transaction running smoothly and efficiently. One of the many benefits to using CRM system is the better management of customer efficiencies during peak hours of demand, which can save time and money for the company. Having a good system in the bank can also

improve satisfaction which in turn is reflected in better customer service. Having this idea in mind, around 57 % of the respondents are highly agreed that, if Commercial Bank of Ethiopia starts using a well developed CRM application, the business performance also will be improved. 30 % of them are also moderately satisfied with the idea. Whereas 13% of the respondents neutral.

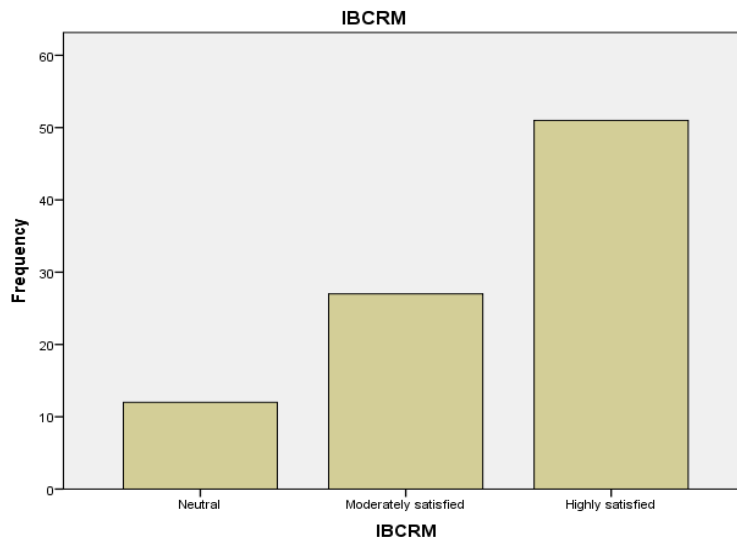

Figure 2 Respondents' Response on CRM Business Improvement

One of the most important goals of CRM is to increase in banking sector efficiency and effectiveness. This is almost always adopted by every organization. It is necessitate by the fact that increase in efficiency is required to boost success. CRM achieves this through cost reduction and customer retention. By providing sufficient CRM training for the employees, the bank can easily achieves its goal. Table 4 elaborates the respondents' response on the CRM important goal. From the respondents 63 % of them highly satisfied with the idea that CRM system is going to Increase the efficiency and effectiveness of the banking services, 23 % moderately satisfied and the other 13 % they don't have anything to say about this idea.

Table 4 Respondents' Response on Efficiency and Effectiveness of Work

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Neutral	12	13.3	13.3	13.3
	Moderately Satisfied	21	23.3	23.3	36.7
	Highly Satisfied	57	63.3	63.3	100.0
	Total	90	100.0	100.0	

The summarized result indicates that the customers are satisfied in most of the services provided by the bank, even though, the bank does not satisfy its customers in all the indicators used in this study. From the study's analytical result, the modernization of the bank and its position to adopt new technology is encouraging, though the bank has many problems in relation to information technology and communication. As per the respondent suggestion the Commercial Bank of Ethiopia should improve its CRM system in order to improve its service. Most Banks viewed themselves as exceedingly customer centric offering what they believe to be highly personalized services to the high net worth customers. The wealthier the customers, the more demanding they are and the clients expect more and more from their banks, to understand what their wants and needs are, so that the bank can be built around serving those needs. The structured approach to CRM provides various benefits to the bank. As per the demand of the customers, more than 60% of the respondents need to get new service from the bank other than the existing services with the improved CRM system (See Figure 3 below).

Figure 3 Respondents' Idea on CRM Application

5 Discussion

The issue of CRM and customer service is vital in the bank environment as customer expectations increase. The behavior of customer relationship management (CRM) is to seek and create closer relationships and interactions between a business and its most important customers. Close relationship with customers will require a strong coordination between IT and marketing departments to provide a long-term retention of selected customers. This study clearly show the role of Customer Relationship Management in banking sector and the need for Customer Relationship Management to increase customer value by using some analytical methods in CRM applications. This requires organization in developing environments to pay attention to the issues of customer needs and differentiation in order to build long term customer relationships.

Also it is so important to evaluate the key success factors in the managerial implications of these findings include a commitment to the implementation of CRM within the organization as well as a commitment to the provision of excellent customer service in order to affect the relationship building and the implementation of CRM. CRM helps companies understand and improve the customer service of personnel in order to ensure that the objectives of the CRM strategy are attained.

Specific measures that can be considered as significant business benefits which accrue from an effective, integrated Customer Relationship Management approach. These include:

1) Customer service levels are critical in establishing and developing relationships. Management need to examine existing processes and methods in which service is offered, and where necessary make changes which can improve the service for customers.

2) Continuous interaction with the customers are necessary in order continue with relationship building activities over the long term. This may require new methods and techniques in communication such as the use of email, SMS and other technological communication devises.

3) Training with respect to customer service and improvement in the service levels offered by staff. This is a key area in the development of long term customer relationships.

4) In any implementation, it is necessary to identify, differentiate and then interact with customers in order to provide customized service. This requires that management have the ability to identify customers who are important to the organization and then be able to ensure that their needs are different. This will enable them to communicate more appropriately with the customer.

Generally speaking, when we summarize the general data we can find that the majority CBE customers are satisfied with the service. And hence the basic ideas of the following figure 4 take as a finding of the research (See Figure 4 below)

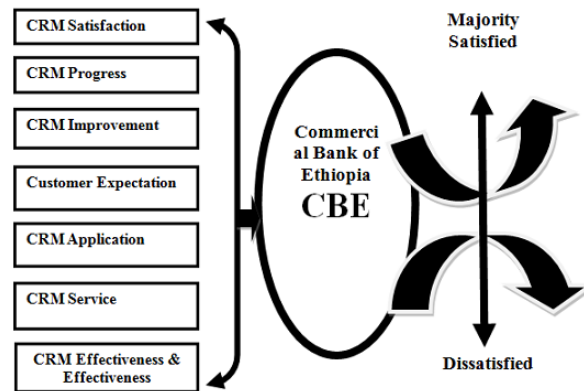

Figure 4 Findings of the Research

6 Conclusion

This paper was undertaken to explore the Commercial Bank of Ethiopia clients' satisfaction with the CRM system. It imposes the specific objectives of applying the behavior of customer relationship management (CRM), which seeks to create closer relationships and interactions between a business and its most important customers.

The study result shows the role of Customer Relationship Management on both the Commercial Bank of Ethiopia and its most important customers. From the Commercial Bank of Ethiopia side since the bank is trying to modernize its core banking system and expand its services, the CRM can strengthen the performance of the business and can increase customer value by using some analytical methods in CRM applications. For the customer it will create closer relationships and interactions between a business and its users. In the ever growing development of information technology today, CRM is widely applied in different fields, such as finance, correspondence, and transportation, etc.

Finally from the above facts we can conclude that Commercial Bank of Ethiopia needs to realize and understand the importance of CRM. It has a value and broader in term. There is no doubt that customer's interaction and satisfaction, convenience, speed of processing transactions and trust are the vital aspects that needs to be given attention. There might be different and various dimensions of CRM, but the bank need to concentrate on the CRM which is important and helpful. By using CRM system and the different benefits provided by it, CBE can enhance its relationships with customers.

Abstract: Foreign Direct Investment is regarded as the main channel of transferring technology and capital and other enterprise management factors as well as the primary way of allocating the multinational resources. However, the characteristic and environment of factors demine the strength of mobility of the enterprise management factors mobility. On the basis of the definition of enterprise management factors, this paper analyzes the factors of influencing on enterprise management factors mobility from internal characteristic and external environment, constructs the evaluation index systems of technology, labor force and capital of three kinds of enterprise management factors. Finally, this paper proposes the counter-measures for multinational firms to cultivate competitive advantages to invest outside.

Key words: Enterprise management factors mobility; Foreign direct investment; Evaluation system

1 Introduction

With the development of globalization and international division, the internal and external surroundings that enterprises faced are changing. However, Foreign Direct Investment changed traditional flow mode of factors. With the improvement of economic globalization, the mode of international division gradually transfer from inter-industrial division to factor division, including capital, technology, labor force, management and information with increasing expanding scale. As the micro subject of taking part in the international division of enterprises, enterprise management factors contain resources such as capital, labor force and technology, that the enterprises could use and is the spring of competitive advantage and core competitiveness. There are three methods to participate in international management. First, export as the final commodity is the main way of enterprise management factors mobility. Second, transfer is the other way of enterprise management factors mobility, such as the intellectual property transfer. Third, FDI is one way of enterprise management factors mobility. Blonigen(2005) considered that the enterprises could choose FDI but not export and license trade to join in the foreign market because of realizing the biggest utility with technology and management experience by FDI. At present, owing to the reemergence of trade protect, FDI gradually become the primary method of multinational management to avoid trade confliction, so enterprise management factors mobility based on FDI is becoming the main way of multinational allocation of enterprise management factors. The enterprises realize international division and optimize allocation of production factors and resources by multinational investment management and gradually reach equilibrium state with factor endowments. Therefore, enterprise management factors mobility is the important trend for the economic development all over the world, and FDI is the main channel of enterprise management factors mobility.

2 The Theoretical Knowledge of Enterprise Management Factors

Production factor is the micro research object in the traditional theory of trade division and also the central factors of enterprise management factors. With the economic development, the scope of production factor becomes extensive, including land, capital, labor force, technology, management experience, information, institution and other natural resources (e.g. mineral resources and forest). The difference of the mobility capability of land is unmovable which depend on the congenital conditions. The mobility capability of capital is affected by the economic, political, cultural factors. The difference of the mobility capability of labor force is measured by the number of labor and labor quality. The factors of technology, management experience and information is the necessary condition for realizing improvement in many developing countries.

* This paper is supported by the Educational Ministry Social Science Fund "Study on the Mechanism and Model of Enterprise Management Factors Mobility Based on Foreign Direct Investment", Fund Number: 12YJA790138.

Therefore, the factor of land is regarded as unmovable and fixed factors because of mobility difficulty all over the world, while the factor of capital is mobile with multinational risks. The traditional theory of trade division is on the basis that all factors are unmovable, so enterprise management factors mobility is replaced by suboptimal product flow to realize the relative equality of factor prices in different countries with different factor endowment.

At the early stage of capitalism, enterprise management factors mainly contain labor force, capital, and other things. The enterprises could operate if they own the required talents, operation capital, equipment, plant and raw materials and so on. According to the view of Smith (1776), labor force, capital and land constitute the factors. With the scale expansion of the enterprises, management experience is increasingly important for enterprises and becomes the fourth factor. Following, information is regarded as the fifth factor with the development of information economy. With the integration of world economy and development of globalization, the activity of participating in international economy division for enterprises becomes increasingly frequent. As the subject of multinational operation, enterprises have to face international environment and factors of impacting allocating enterprise management factors. With the increasingly apparent role of knowledge economy and information technology, the impacts of knowledge economy factors become very important (Zhang, 2002). So the impact of materialized capital on economy regularly decrease and the impact of human capital on economy rise (Niu, 2006).

According to the Figure 1, the composition of enterprise management factors mainly base on three main lines which are materialized capital, human capital and capital as follows. (1) Natural resources often are based on land, such as forests, mineral resources, energy, etc. With the development of production, the demining impact of natural resources decline compared with the factors of labor force and capital. (2) Human capital mainly contains labor force. Taking labor force as carrier, the factors of skill, management experience, and information and so on realize multinational mobility. (3) When the mobility of labor force face obstacles, the factor of capital mobility would replace the labor force and allocate the money all over the world.

Above all, enterprise management factors are the constituent parts of constituting an organic whole of enterprise which the managers use the production factors obtain economic benefit with adynamic process. Therefore, enterprise management factors are the necessary things to guarantee production of goods and exchange activities which contain labor force, capital, equipment, plant, information, skill, management experience, knowledge, property, etc.

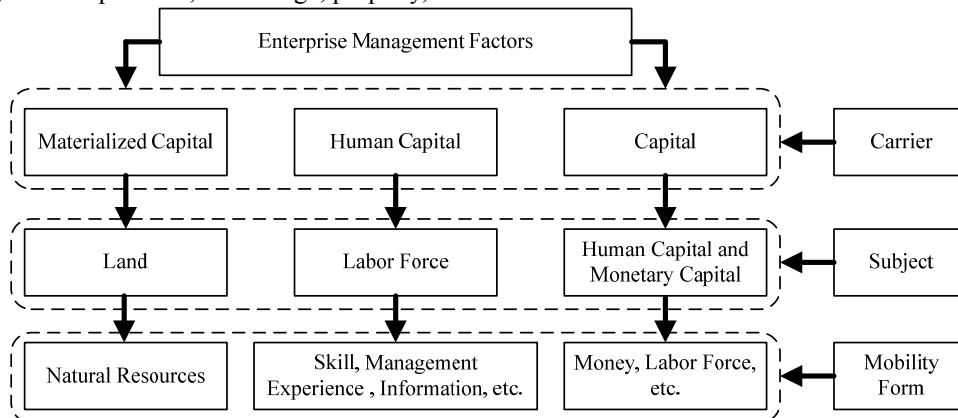

Figure 1 The Structure Chart of Enterprise Management Factors

3 Evaluation Index Systems of Enterprise Management Factors Mobility

The enterprise management factors mobility include mobility of capital, exchange of skill, the introduction of labor force, share of management experience and communication of information, etc.. To evaluate enterprise management factors mobility, this paper analyzes this problem from the nature of the factors and the macroenvironment of factors allocation. Specifically, the nature of factors determines the enterprise management factors mobility, while the macro environment of factors allocation creates the conditions for enterprise management factors mobility.

3.1 Nature of the factors

Considering the characteristic of factors, the enterprise management factors mobility is connected with factor endowment, nature of factors and the mobility cost.

Table 1 The Influence Aspects of Enterprise Management Factors Mobility

Influence aspects of Factors Mobility		Motivation of Factors Mobility	Characteristics of Factors Mobility
Factor Endowment	Degree of Abundance / Scarcity	Profit-driven Multinational Enterprise Manager	The direct of factors mobility is from countries with abundant factors to countries with scarce factor
Nature of Factors	Homogeny/Neterogeny		The flow level of factors with homogeneity is higher
	General / Special		The flow level of factors with universality is higher.
Cost of Factors Mobility	Costof Transportation/ Migration		The transportation cost is proportional to mobility of factors

According to the Table 1, the factor endowment means the factor quantity owned by a region or country which affects the price of factors, while the price of factors demines the FDI of enterprises. Enterprise management factors mobility follows the relative rule that the factors transfer from the abundant regions to the regions with relatively scarce factors. In the international investment activities, the developed countries have the monopoly advantages in technology, capital, management experiences and other factors. Owing to this, the factors of technology, capital transfer management experiences and other factors are transferred by FDI from the developed countries to the developing country. The home countries realize the improvements on technology transfer and technology diffusion by technology spillover effect (Blomstrom, 2001).

3.2 Macro environment of factors allocation

The enterprise management factors mobility is determined by two aspects of factor owners (multinational company) and the factor receivers as well as affected by the allocation environment. To evaluate accurately the relationship between allocation environment and enterprise management factors, we construct the evaluation index system of the impact of allocation environment on the enterprise management factors mobility and introduce the transfer of factors of capital, labor force and technology by the model of FDI.

3.2.1 Discussing about technology factors mobility

According to the Table 2, under the international investment environment, the level of technology factors mobility is mainly connected with technology transfer capacity and technology absorption capacity which are measured by the sum of FDI technology spillover of GDP.

Table 2 The Evaluation Index System of the Influence of Environment on Technology Factors Mobility

The First Grade Index	Measuring Method	The Second Grade Index	The Third Grade Index
Mobility Level of Technology Factor(Including Knowledge/Management Experience/Information)	Sum of Technology Spillover /GDP(Gross Domestic Product)	Capability of Technology Transfer	Sum of Inward FDI
			Turnover of Technology Market
			Average Technology Transfer Funds for Enterprises
		Capability of Technology Absorption	People of R&D Organization
			Spend of R&D Organization
			People of Technology Developers in Large and Medium Enterprises Expenditureof Technology Development in Large and Medium Enterprises

3.2.2 Discussing about labor force factors mobility

Seen from the Table 3, the labor force factors mobility is connected with the macro and micro environment of host countries, which is measured by the sum of foreign labor cooperation and foreign contract projects of GDP.

Table 3 The Evaluation Index System of the Influence of Environment on Labor Force Factors Mobility

The First Grade Index	Measuring Method	The Second Grade Index	The Third Grade Index
Mobility Level of Labor Force Factor	(Foreign Labor Cooperation+ Foreign Contract Projects) / GDP(Gross Domestic Product)	Macro Environment	Engel Coefficient
			Proportion of Higher Education
			Employment Population
			GDP

		Micro Environment	Average Income
			Living Space Per Capita
			Medical Institutions Per Capita
			Bus Number Per Capita
			Public Green Area Per Capita

3.2.2 Discussing about capital factors mobility

As it is seen from the Table 4, the mobility level of capital factor is connected with the economic condition, infrastructure condition and institutional condition, which is measured by the ratio of actual utilized FDI in GDP.

Table 4 The Evaluation Index System of the Influence of Environment on the Capital Factors Mobility

The First Grade Index	Measuring Method	The Second Grade Index	The Third Grade Index
Mobility Level of Capital Factor	Actual Utilized FDI / GDP	Economic Condition	Foreign Capital Flow / GDP
			Consumer Price Index
			Volume of Transport
		Infrastructure Condition	Road Area Per Capita
			Electricity Consumption Per Capita
			Forest Coverage Rate
		Institutional Condition	Economic Freedom Index
			Investment Safety Index
			Governance Index

4 Conclusions

It is an important part for international management to fasten the speed of FDI and optimize the multinational allocation of enterprise management factors in order to realize the equal of FDI for China. Based on the research before, this paper constructs the evaluation index system from the factors of technology, labor force and capital to benefit evaluate the mobility level of factors and cultivate advantageous factors for multinational enterprises.

Abstract: This paper takes 17 port listed corporations in China as sample, and adopts typical correlation analysis theory to carry out canonical correlation analysis of corporate governance and financial performance of port listed corporation. It reflects corporate governance from three aspects by eight variables including shareholding structure, board structure and executive incentive. It reflects corporate performance from four aspects by eight variables including the profitability, solvency, operation ability and growth ability. The conclusions indicate that ownership concentration, proportion of independent directors and the number of board meeting have significant effects on corporate performance.

Key words: Corporate Governance; Financial Performance; Port Listed Corporation

1 Introduction

The port is a transportation hub and international logistics node, which is an important pillar of comprehensive economic and social services industries. It creates national income, and leads to development of construction industry, raw material industry and heavy machinery. What's more, it spurs development of communications, telecommunications, finance, catering and other third industries. The port plays a joint role in the development of the whole national economy. Nowadays, the state-owned port operation companies of our country manage main ports, which start very early. They have gradually begun to enter the capital market and start corporate reform, which gradually implement standardized corporate operation mode. Most ports have publicly listed company, whose development of business is rapid and achievements are remarkable. However, although the modern enterprise system has gradually promoted and run in port listed corporations in our country, it lacks enough awareness to the particularity of corporate governance. Many contradictions gradually appear in the corporate governance mechanism, but the specialty of their corporate governance has not attracted enough focus. Lots of problems begin to appear in corporate governance mechanism and the performance problem that is closely related has caused increasing attention by people.

As huge nation in the world's maritime, there is a distance from maritime powerful nation for China. To achieve this goal, development of port enterprises is needed. In the global port industry that is increasingly fierce competition, how to combine the internal system reform and statistical methodology to analyze relationship between corporate governance and financial performance has the practical research significance.

2 Literature Review

There are many researches on relationship between corporate governance and performance, some scholars combine all aspects of the internal governance structure integrated into a single variable, trying to exam the comprehensive influence corporate governance on corporate performance. (Wang Geyang, Zhang Zhongyi, Song Zengji, 2013)^[1]. Newell & Wilson^[2] (2002) found that compared to the worst, the best level of corporate governance led the enterprise value's increase in 10% to 12%. Corporate Governance Research Center of Nankai University^[3] (2006) created China Corporate Governance Evaluation Index (CCGI^{NK}) and so on. Most scholars focused on a specific aspect of corporate governance (Xia Heping, Zhao Xiliang and Yuan Guanghua, 2006)^[4], such as the relationship between ownership structure and performance (Demstetz & Lehn, 1985; Klaus, 2004; Lin Lefang, 2005); the relationship between structure and performance of the board of directors (which can be divided into board size and performance (Raheja, 2001; Kusnadi, 2003); the relationship between independent directors and performance relationship (Brickley, 1994; Allen & Ernie, 2005); the relationship between the independent directors proportion relationship with performance (William, 1999; Wu Shukun, 1998); relationship between executive compensation and performance (Crystal, 1991; Richard, 2002; Xu Xiangyi, 2007) and relationship between Shareholding proportion layer manager relationship and performance (Jensen & Murphy, 1990). In recent years, more and more scholars integrated governance

and performance research firms such as Li Jiabing and Jiang Wei^[5](2011) set manufacturing companies as an example, choose the concentration of ownership of state-owned shares and legal person shares stake equity ratio to reflect the ownership structure, and discuss relationship between ownership structure and firm performance. Yang Zipeng^[6](2014) has studied on the effect of equity institutions of enterprise performance through combined foreign literature and summed up financial analysis with share price movements. He sets the financial performance, debt paying ability and development capacity as the dependent variables and the paper sets the ownership concentration and equity balance degree as independent variables.

Research on port corporations related to corporate governance is rare. Zhang Xueping^[7](2010) has set ownership concentration and equity balance degree as independent variables, return on equity and Z-score as dependent variable, in order to study the relationship between ownership structure and performance of listed port industry companies. Li Guangqin^[8](2014) uses principal component analysis to measure the performance of port listed companies, it comes out with five indexes that is profitability, debt paying ability, operating income growth ability, operation ability and asset growth ability. Li also set the five indexes as the dependent variable, ownership structure, the board of directors, manager's incentive as independent variable to study the relationship between governance structure and performance.

It can be seen that corporate governance took the wide attention of scholars both at home and abroad. Its research is also wide and the study on its theory and related empirical has been relatively mature. However, research on corporate governance and financial performance of port listed companies is not much.

3 Research Method and Variable Selection

3.1 Canonical correlation analysis theory

Canonical correlation analysis is put forward by the Hotelling in 1936. Based on the characteristics of multiple correlation coefficients, linear combination of the two sets of the original variables can be shown as following:

$$\begin{cases} \mu = a_1x_1 + a_2x_2 + \dots + a_mx_m \\ \nu = b_1y_1 + b_2y_2 + \dots + b_ny_n \end{cases} \quad (1)$$

And then it studies the correlation coefficient $p(\mu, \nu)$ of the new variables. Because there are several ways of linear combination, so it's needed to find a set of linear combination that makes the correlation coefficient maximum. So the correlation coefficient of the maximum that is also called two sets of variable canonical correlation coefficient reflects the correlation between variables. Such a set of new variable linear combination is called a pair of canonical variables. If the number of the two groups' original variables is too much, it's needed to calculate some of the canonical variables completely to express the correlation of two groups of variables, which reflects all the information between the original variables. Then, it's needed to look for a pair of linear combination of the correlation coefficient that is the maximum linear combination in two groups that variables are not related with μ_1, ν_1 . It is the second pairs of canonical variables that satisfy the condition: $p(\mu_1, \mu_2)=0$, $p(\nu_1, \nu_2)=0$. And $p(\nu_1, \nu_2)=0$ is the second canonical correlation coefficient. And so on, it's needed to calculate some of the typical variables and correlation coefficient so as to achieve the purpose of analysis of correlation between two sets of variables under complete information. The essence of difference between canonical correlation analysis and simple correlation analysis is that the former selects some representative indexes in the two groups of random variables and uses the correlation coefficient for these new indicators to reflect the correlation between the original variables. The advantage of this approach has two parts. On the one hand, it can simplify the variables reasonably. On the other hand, if the correlation coefficient is large enough, it can use a set of values to calculate the other set variables linear combination to achieve the purpose of prediction.

3.2 Variable selection

Based on research results of scholars, this paper selects eight variables of the ownership structure, board structure and executive incentive to reflect corporate governance. Specific variables are proportion of state-owned shares (X_1), proportion of the first shareholder(X_2), ownership concentration (ratio of top five shareholders' holding shares of the total number of shares, X_3) and equity balance degree (X_4) that reflects the ownership structure. Specific variables include total number of directors(X_5),

proportion of independent directors (ratio of independent directors' total number of the board of directors, X_6), and number of board meeting (X_7) that reflect the board structure. And it also includes executive compensation (average value of the top three executive salaries, X_8) that reflects executive incentive. It selects corporate performance from four aspects and eight variables including the profitability, solvency, operation ability and growth ability. Specific variables select ROA (Y_1) and ROE (Y_2) that reflect the profitability, liquidity ratio (Y_3) and cash ratio (Y_4) that reflect solvency. It also selects turnover of total capital (Y_5) and turnover of fixed assets (Y_6) that reflect operation ability, total assets growth rate (relative growth rate of total assets at the beginning of the year, Y_7), and growth rate of net assets per share (relative growth rate of annual net assets per share, Y_8) that reflects growth ability.

4 Empirical Analysis

4.1 Sample selection

The paper selects samples are listed company from Wind database statistics seaport and services sector. It eliminates the Bohai Sea Ferry, Henderson Daxin, Bonded Technology and Deep Base B that are not port logistics trade as the main business. Because Chiwan Port and Jinzhou Port are divided into two listed Corporation in A and B stock market, A share of them are chose as samples. Finally, it selects 17 port listed companies. The statistical data of 16 variables are from Wind database statistics and company annual reports in 2013. And some date is calculated for statistics.

4.2 Canonical correlation coefficient and test

Based on statistical analysis date, it uses SPSS19.0 software to study canonical correlation analysis. When statistical date is negative, it draws typical correlation coefficient with 0 instead in the analysis process. According to the statistical results, it's known that if internal correlation coefficient of the corporate governance variables is small, there is no correlation between variables. However, correlation coefficient of X_3 and X_7 is equal to -0.7326. The internal variables' correlation coefficient of performance of the company is generally small, but the correlation coefficient of Y_3 and Y_4 is large and is equal to 0.9773. From the direct relationship between corporate governance and performance view, correlation coefficient of X_3 and Y_7 is equal to 0.4494, correlation coefficient of X_3 and Y_1 is equal to 0.4059.

From canonical correlation coefficient, it's known that the first canonical correlation coefficient is 0.989, the second canonical correlation coefficient is 0.982, and the third canonical correlation coefficient is 0.958. This suggests that there is a strong typical correlation between the port governance and corporate performance of listed corporation. Compared with the simple correlation analysis, its effect is better. According to the principle of multivariate analysis of variance, this paper adopts the test method of Wilk's test the canonical correlation coefficient. The table 1 shows p value of the first canonical correlation coefficient in Wilk's test is 0.047, which suggests that it passes the test under 0.05 significant level. And several other typical correlation coefficients don't pass the test under 0.05 significant level. According to the canonical correlation coefficient and test results, it can extract a typical variable μ_1 and ν_1 to reasonably explain the correlation between two sets of variables between corporation governance and performance variables of port listed companies.

Table 1 Canonical Correlation Coefficient and Test

No.	Canonical Correlation Coefficient	Wilk's	Chi-SQ	DF	Sig.
1	0.989	0.000	84.078	64	0.047
2	0.982	0.001	55.715	49	0.237
3	0.958	0.017	30.713	36	0.718
4	0.784	0.202	12.011	25	0.986
5	0.514	0.524	4.847	16	0.996
6	0.501	0.712	2.551	9	0.979
7	0.212	0.950	0.384	4	0.984
8	0.072	0.995	0.039	1	0.844

4.3 Canonical Structure analysis

Canonical structure analysis refers to measure relativity of each original and canonical variables by calculating canonical loading. And if absolute value of loading is greater, it suggests the importance of original variables for canonical explanation will be stronger. And cross loading is the correlation coefficient between the canonical variable and another original variable. Canonical structure analysis of μ_1 and ν_1 is as shown in table 2.

Table 2 Canonical Structure Analysis of μ_1 and ν_1

Corporate Governance Variables	Canonical Loadings μ_1	Cross Loadings ν_1	Corporate Performance Variables	Canonical Loadings ν_1	Cross Loadings μ_1
X ₁	0.267	0.264	Y ₁	0.337	0.333
X ₂	0.234	0.231	Y ₂	0.353	0.349
X ₃	0.804	0.795	Y ₃	-0.194	-0.192
X ₄	0.102	0.101	Y ₄	-0.095	-0.094
X ₅	-0.123	-0.122	Y ₅	0.039	0.039
X ₆	-0.566	-0.559	Y ₆	0.063	0.063
X ₇	-0.573	-0.567	Y ₇	-0.566	-0.559
X ₈	0.114	0.113	Y ₈	0.252	0.249

As it can be seen from table 2, incanonical variables μ_1 , corporate governance variables X₃ (equity concentration), X₆ (proportion of independent directors) and X₇ (number of board meeting) have a large loadings compared to other variables, which shows that in the influence of corporate governance variables, equity concentration, proportion of independent directors and number of board meeting are very important. The increase of equity concentration not only has no bad effects on corporate governance efficiency, but also raises its efficiency, which is different from the research object of the industry. Bank industry belongs to the capital-intensive industries, low ownership concentration helps to reduce risk, and port industry belongs to the combination of capital and labor type, the appropriate promotion equity concentration helps to strengthen the company's management and operation. At the same time, the average number of independent directors in listed companies in the port industry is 4, and number of board meeting is about 7 times. It can get in the way of decision-making efficiency and effectiveness, but the proportion of independent directors is more than one third, which has a certain influence in the company decision-making. X₈ has the loading of 0.114, which may be associated with executive compensation statistics. Because the data provided by the port listed companies is not comprehensive, the paper takes the average statistics for the first three executive salaries, and part of the listed companies. With the mixed ownership reforming, port industry introduces private capital, equity absorption flow, reduces state-owned shares and state-owned legal person share proportion, and promotes equity concentration, which is helpful for improving corporate governance efficiency.

In canonical variables ν_1 , Y₇, Y₁ and Y₂ have larger loading compared with other variables. This shows the X₃, X₆ and X₇ have a close relationship with Y₇, Y₁ and Y₂. Equity concentration, proportion of independent directors and number of director meeting on behalf of corporate governance of port listed companies have effect on the financial performance, which is mainly manifested in total asset growth rate, return on total assets and return on equity. At the same time, loadings of current ratio, cash ratio, total asset turnover and fixed asset turnover are not large, that reflects financial performance of company debt paying ability, operation ability. Relationship between corporate governance is not tight, and it reflects the company's assets operation and management efficiency.

It can be seen from cross loading of X₃, X₆ and X₇ for canonical variable has a strong ability of explaining ν_1 , the loading is 0.795, -0.559 and -0.567. It illustrates that the three indicators have great influence on financial performance of port listed companies. Therefore, in order to promote port listed companies' performance, ownership concentration should be adjusted, and proportion of independent directors should be changed. What's more, companies should take appropriate measures to reduce number of board meetings, etc.

5 Conclusion

(1) In the corporate governance of port listed companies, the relationship among ownership concentration, independent director proportion, the convening times of director conference and financial performance is comparatively close. Therefore, in the daily supervision and management process, it needs to strengthen the management of these three indicators. In addition, it needs to adjust the size of the board and the proportion of state-held shares and state-owned corporate shares and to improve the

corporate governance structure and to strengthen the executive incentive constraint mechanism as well. Besides, promoting the reform of the corporate executive pay in comply with the national implementation of the reform of state-owned enterprises executive pay situation is useful. Meanwhile, corporate governance of port listed companies' impacts on financial performance mainly reflects total assets growth rate, rate of return on total assets and return on equity. These three aspects of management should be strengthened and attached more importance.

(2)The effect of ownership concentration on financial performance is more obvious. The effect of state-owned legal person share proportion and first big shareholder ownership on financial performance from is not significant. However, the vast majority of the first major shareholders of port listed companies will be state-owned shares and state-owned legal person share. Higher equity balance degree can promote financial performance. This suggests that the port listed companies can reduce the gap between large shareholders and other shareholders' share, so as to promote company risk control ability through promote equity balance degree. They can increase the ownership concentration through the introduction of large-scale private capital. This method can avoid the adverse effects that the dispersed ownership, state-owned shares and state-owned legal person.

(3)The impact of board governance on the company is mainly embodied in the two indicators that are proportion of independent directors and number of board meeting. The two indicators will bring some negative impact on financial performance. The negative impact may be embodied in that the number of board is too much, the structure of independent directors is unreasonable and decision-making is inefficient caused by that the board of directors held frequently and so on. It needs to strengthen the professional knowledge and to restructure proportion of the independent members of the board. Meanwhile, it needs to reduce the number of meetings and to promote business decision efficiency and implementation capacity.

Financing Constraint, Financial Development and the Growth of Eco-Industry

Tan Yuhan

School of Marxism, Wuhan University of Technology, Wuhan Technical College of Communications, Wuhan, PR China, 430070
(E-mail: tanyuhan731@sina.com)

Abstract: This paper selects quarterly data from 2012 to 2014 of listed companies in eco-industry and utilizes industrial financing constraint index to measure the current level of financing constraints for eco-industry. Then we make an empirical analysis of financial development and the mitigation effect of financing constraints that eco-industry is facing panel quantile regression. Empirical results show that most eco-industries are facing financing constraints. The banking system and the development of new financial dominated by venture capital can effectively alleviate the financial constraints of eco-industries, and the larger scope of development, the stronger this effect. Financial market has limited function to alleviate the financing constraint of eco-industry.

Key words: Financing constraint; Financial development; Eco-industry; Quantile regression

1 Introduction

The development of eco-industry needs much investment to R&D. Since the high-tech middle-small size enterprises dominate the eco-industry, they cannot provide enough investment to R&D, so the important status of financial supporting development of eco-industry is beyond all doubt.

Currently China has formed the indirect financing system dominated by the banking system and direct financing system dominated by security market, the financial system of supporting eco-industry is almost consummated. However, this system is forming in the transacting from the planned economy to market economy leading by government, and the government has achieved the great revenue of financial surplus and financial control in this transaction, which restricts the financial development due to lack of institutional elasticity. Which makes when the financial system distributes the resource, they discriminate the enterprises by the ownership and size. Therefore, eco-industry dominated by private-owned inventive enterprises still face serve constraint of financing.

Modern finance theory proposes that financial development is benefit for mitigating the constraint of industrial development. Now, Chinese government gradually assumes some measure to mitigate the constraint in the finance department, facilitate the financial supporting development of the real economy. Therefore, this paper focuses on the topic of eco-industry, researches the mitigating effect and its path of financing constraint of eco-industry from Chinese financial development, and provides some benefit reference for rational distribution of financial resource to support the eco-industry.

2 The Measure of Financing Constraint of Eco-Industry

2.1 Measure financing constraint

Traditional measure of financing constraint mainly includes KZ index and WW index. These indexes are all base on data of enterprise level, if we want to measure financing constraint of eco-industry, we would need the indicator to measure level of industries. Using the two-steps method by Hovakimian, (2009), firstly, we estimate the function as below:

$$(I / K)_{it} = f(\text{control} - \text{variables}) + \tau_i + \tau_t + e_{it} \quad (1)$$

I denotes investment; K denotes net value of fixed capital in function (1). The second step is to select control and after estimation of function (1), using estimating residual computes the function below:

$$cfs = \sum_{t=1}^n \left[\frac{(CF / K)_{it}}{\sum_{t=1}^n (CF / K)_{it}} \bullet e_{it} \right] - \frac{1}{n} \sum_{t=1}^n e_{it} \quad (2)$$

The function (2) is the two dimension index based on enterprise and period. Selected enterprises belong to the same industries and the same period, the cfs denotes the financing constraint of this industry.

2.2 Sampling of eco-industry

This paper selects the listed companies as the sample as well as the most papers done. Referring to the practice by Zhao Yulin and Shi Zhangming(2014), this paper selects out 480 companies from Shanghai and Shenzheng security market, strikes out the ST companies and the uncompleted data companies, left 403 listed companies totally.

2.3 The selection of variables and data source

When we select the control variables in function (1), variables such as leverage rate, tangible asset percentage and finance degrees of freedom which are included in KW index and WW index should be chosen. Eventually, considering China’s capital market’s imperfection, this paper selects five variables: finance leverage, enterprise size (natural logarithm of total assets), and tangible asset rate (the percentage of fixed asset to total asset), finance degree of freedom (cash and cash equivalent in statement of cash flows), estimation function (1) about increasing rate of operation income. Investment I selects from “purchasing fixed asset, intangible asset and other cash of purchasing long-run asset in the statement of cash flows”. All the data are collected from CSMAR database and WIND database.

2.4 Analysis of financing constraint of eco-industry

We select quarterly data about listed companies from 2011q3 to 2014q3 to estimate. The result is pooled in the table 1 as below. We can see these sub-industries in eco-industry face the high financing constraint, especially industry of energy saving and environment protection and new energy, the index of financing constraint is around 0.35 averagely. The new energy automobile is facing a medium financing constraint; the index of financing constraint is around 0.17 averagely. And the bio-medicine industry and new materials industry have a lower financing constraint; the index of financing constraint is around 0.05 averagely. Furthermore, the trend of fluctuation has a significant improvement except the industries of new energy. That is to say, the sub-industries in eco-industry are still facing a serve financing constraint.

Table 1 Pool of Financing Constraint of Sub-Industries in Eco-Industry

industry period	Bio-medicine	New material	energy saving and environment protection	new energy	new energy automobile
2011Q4	0.047913	-0.02758	2.114176	0.389539	0.396003

3 The Empirical Analysis

3.1 Modeling

Referring the common practice, this paper establishes the empirical model of mitigation effect of finance development facilitating the eco-industry:

$$Asset_{it} = \alpha_0 + \alpha_1 cfs_{it} + \alpha_2 cfs_{it} * FD_t + u_{it} \tag{3}$$

$Asset_{it}$ denotes the size of total asset of i industry at t time, cfs_{it} denotes constraint index of financing of i industry at t time, FD_t denotes the level of finance development at t time. If the sign of expected mutual term is positive, the finance development can facilitate the development of eco-industry via mitigation of constraint of financing.

3.2 Variables selecting and data source

Function (3) needs three variables including total asset, financing constraint of industry and financial development. The total asset of eco-industry is demonstrated by the total asset of classified listed companies. The financing constraint is illustrated by the cfs showing in the table 2, the crucial point is how to select the indicator of finance development, FD.

Current China has formed the system of indirect financing dominated by banks and direct financing dominated by security market. And venture capital has become an important path which can offset the disadvantages of traditional financial system in the latest years. Therefore, this paper measures the China's financial development from three aspects: size of system of finance market and size of venture capital. The data of bank system and finance market system is collected from CCER database, and new finance dominated by venture capital is collected from monthly report by Qingke data.

3.3 The empirical analysis based on panel quantile regression

This paper selects panel quantile regression to estimate function (3). Since the OSL estimation can only measure the conditional expected of explained variable by explaining variables, whereas the panel quantile regression can carve the marginal effect of explained variable from explaining variables. The financial system in China is at the period of rapidly adjusting. Measuring the marginal effect of financial fluctuation makes more sense than average effect for the policy direction. We select five representative quantile points including 10th, 25th, 50th, 75th and 90th percentile and then use the R language to make regression. The variable of financial development, FD, in the function (3) successively use scope development of bank system, FD1, scope development of finance market, FD2, development of new finance dominated by venture capital, FD3. The results are reported in the table 2-4.

First in table 2, the estimator of cfs is significant under 1% significant level, which demonstrates that the development of eco-industry has serve constraint of financing. And the sign of mutual term, cfs * FD1, is positive under 10% significant level, which demonstrates that the scope development of bank has mitigation effect of financing constraint of eco-industry. Further investigating the parameter of mutual term, cfs * FD1, at different quantile point, as the increasing the quantile point, the parameters illustrate an asymmetry shape like "U", which demonstrates that there are less and less financing constraint coming from the financing institutes like bank as the development of eco-industry and the expanding of size of total asset.

Next in table 3, the parameter of cfs is significant under 10% significant level at every quantile point, which demonstrates that financing constraint limits the development of eco-industry as well. And the mutual term, cfs * FD2, is significant under 10% significant level at the 25th percentile and 90th percentile, whereas the other three quantile point is not significant, which demonstrates that current development of scope of finance market can mitigate the financing constraint of eco-industry at some degree.

Thirdly the cfs in table 4 is significant under 1% significant level, which illustrates the constraint effect of eco-industry furthermore. And the parameter of mutual term, cfs * FD3, is significant under 10% significant level except the 50th percentile, the regression parameters of every quantile points have the characteristic that the parameters are improving with the quantile point increasing. And these evidence illustrates venture capital has the mitigation effect though, the effect's condition is the industries' size.

Table 2 The Result of Regression of Panel Quantile about the Mitigation Effect of Financing Constraint of Eco-Industry from Scope Development of Bank

	10%	25%	50%	75%	90%

4 Conclusion

This paper measures the financing constraint currently faced by the eco-industry. Then we utilize the panel quantile regression, empirical analyze the mitigation effect of eco-industry from the financial development. The result demonstrates that the eco-industry still faces a serve constraint of financing; bank system and development of venture capital have the mitigation effect of eco-industry, and the scope development is bigger, the mitigation is more effective; and the development of finance market has limited effect to mitigate the constraint of financing of eco-industry.

Firstly, under the condition of financial structure dominated by the bank system, bank credit is still the main channel of financing of eco-industry. Bank system stiffing to put out the capital for the traditional industries, big-size enterprises will loss the long-run benefit of transaction of structure of economy, and is harmful for the distribution of reasonable allocation of asset, lower their system risk. Therefore, the bank should be encouraged to slant the credit to the eco-industry dominated by the inventive middle-small size enterprises.

Next, the marginal effect of mitigation of financing constraint of eco-industry from the scope development of financial market is less than bank system, which demonstrates that the facilitating effect of finance market to eco-industry is not significant in current China. Corporation Finance theory proposes that the inventive middle-small size enterprises lean to seek debt when they seek external capital considering the control right. But China's company debt and enterprise debt still have the defect of high threshold in first market and the low fluidity in second market; these defects limit the financing of eco-industry. And the share market established the middle-small board and startup board, which are benefit for expanding the channels of financing of eco-industry though, these channels not only have an extremely high threshold, but also exist the problems of whether or not unblocked at some time. Thus, it is crucial for eco-industry to qualify and develop the finance market.

Finally, the experience in the developed countries has demonstrated that, venture capital is the main channels of financing of eco-industry. Comparing with the developed countries, China's venture capital's effect is limited. One of the reasons is the imperfect of institution of quit of capital and protection of investors. After the success of venture capital, they usually use two solutions to quit, appearing on the board and transacting the share, but since the slow perform of institution of capital market, appearing on the board is the only solution, which cannot satisfy the demand of rapid

development. And there is a harsh deflect in the transition of share due to the measure of investment protection, and this deflect makes the venture investors face some asymmetry risk, and eventually, these investors fear the risk. Thus, the mechanism of quit and institution of investor protection is another significant measure to develop finance.

Correlation Study of Independent Director's Compensation and Corporate Performance

Yang Liu, Jiang Yao

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 495940524@qq.com, 747686756@qq.com)

Abstract: With the steady progress of the independent director system in China, scholars and market participants are more and more interested in the topic of independent director's compensation. For independent director, the most important factor is independence. In other words, if one intends to take charge of the independent director of a company, he must ensure that he doesn't have any close interests relevance or conflicts with the company. Based on this premise, the compensation and allowance of the independent director can't be too high. Because when the independent director overly depends on the compensation, the independence cannot be guaranteed. But salary incentive is one of the most suitable mechanisms for the situation in China. With the focus of the correlation between independent director's compensation and corporate performance, this essay concludes the independent director system and the independent director's compensation system. The relevance between the independent director's compensation and corporate performance is found by establishing the regression model to conduct the empirical analysis, indicating that there is a significantly positive correlation between the corporate performance and independent director's compensation and some beneficial conclusions are proposed so as to provide relevant department with practical reference for policymaking. Finally we draw the conclusion that there is a significantly positive correlation between the corporate performance and independent director's compensation. Obviously, independent director's compensation incentive in our country still plays a vital role.

Key words: Independent director's compensation; Corporate performance; Incentive mechanism

1 Introduction

With the development of the independent director system in China, scholars and market participants begin to pay close attention to the construction of independent director system. The topic of independent director's compensation has attracted widespread attention. Predecessors' researches mainly focus on the structure of the independent director's compensation mechanism^[1]. However, fewer studies connect the independent director's compensation and corporate performance, thus the correlation between them remains to be explored.

2 The Situation of Independent Director's Compensation System

In foreign countries, independent director's compensation generally consists of two parts- including the allowance and transportation costs. Namely, the independent non-executive director in the board of directors is paid mainly by annual salary and conference fees in the form of payment^[2]. If the board of directors set a committee, the committee members' compensation will be concluded in the independent director's compensation. Besides, in recent years, stock option is also an alternative brought in the independent director's compensation payment, and the frequency of stock option appears in independent directors' salary is gradually increasing^[3].

In general, the independent director collect fixed allowance which counts from 3000 dollars to 5000 dollars from the board of director every year in America. Besides, every time the independent director joins the board of director or specialized committee meeting, the independent director can get extra allowance counts from 1000 dollars to 5000 dollars. Therefore, the independent director can get about 30 thousand dollars every year. In England, the independent director's compensation is decided by the law which stipulates that the independent director's compensation counts 5% to 10% of the director's salary. And in terms of research, different companies pay the independent director general low basic payment which counts about ten thousand pounds to fifteen thousand pounds, and only a few companies offers meeting allowance.

In China, independent director's compensation has five characteristics. Firstly, the overall level of compensation performs 'small at both ends and big in the middle'. Secondly, independent director's compensation is related to the corporate performance and industry status. Thirdly, some factors affect the level of independent director's compensation, such as social background and academic degree of

independent directors. Fourthly, independent directors are given a fixed compensation which is generally lower than internal director members'. Fifthly, the level of independent director's compensation is under the influence of the complexity and the risk of corporate governance^[4].

3 Model Building

3.1 Variable selection

In order to avoid one-sidedness, this paper uses Tobin's Q value as the dependent variable. The calculation formula is as follows:

$$\text{Tobin Q} = (\text{N} * \text{P} + \text{LIABILITY}) / \text{ASSET} \quad (1)$$

Of which, N refers to the company's total number of shares; P refers to the company's stock closing price at the end of one year; LIABILITY refers to the company's debt level; ASSET refers to the total assets of the company at the end of one year.

In this paper, the explanatory variable is independent director's compensation, denoted by FEE. The final results are expressed as million RMB.

The other controlled variables' selections are based on previous studies combined with the background of this paper, as shown in table 1.

Table 1 Controlled Variables' Definition

Variable	Symbol	Measuring method
Company Size	SIZE	Take the natural logarithm of total assets
Financial Leverage	LEV	The ratio of liabilities to assets, the ratio of liabilities to assets=Total Liabilities / Total Assets
Whether State-owned	TYPE	Dummy variables. If the controlling shareholder is state-owned it take 1, otherwise take 0
Concentration of Ownership	CO	Square of the top ten shareholders' proportion
Size of the Board	DI	The number of directors in companies' board

3.2 Establish the regression model

According to the research and variable definitions above, this paper establishes the regression model by using the following equation.

$$\text{Tobin Q}_t = \beta_0 + \beta_1 \text{FEE}_t + \beta_2 \text{SIZE}_t + \beta_3 \text{LEV}_t + \beta_4 \text{TYPE}_t + \beta_5 \text{CO}_t + \beta_6 \text{DI}_t + \varepsilon \quad (2)$$

$$\text{ROE} = \beta_0 + \beta_1 \text{FEE}_t + \beta_2 \text{SIZE}_t + \beta_3 \text{LEV}_t + \beta_4 \text{TYPE}_t + \beta_5 \text{CO}_t + \beta_6 \text{DI}_t + \varepsilon \quad (3)$$

3.3 The empirical test

3.3.1 Descriptive statistics

In table 2, there are the descriptive statistics results of major variables in the regression model. The preliminary understanding of the sample data can be possessed through the introduction..

Table 2 Descriptive Statistics of Some Major Variables in Regression Models

Variable		Sample number	Mean value	Standard deviation	Median	Minimum	Maximum
Dependent variable	ROE	3568	0.054	0.762	0.007	-0.837	1.616
	Tobin Q	3568	1.629	1.392	1.439	0.732	20.921
Independent variable	FEE	3568	4.732	16.718	5.102	0.000	29.104
Controlled variable	SIZE	3568	21.380	0.971	21.242	18.272	23.758
	LEV	3568	0.528	0.183	0.552	0.021	1.059
	TYPE	3568	0.512	0.324	1	0	1
	CO	3568	0.327	0.407	0.278	0.212	0.810
	DI	3568	9.472	2.849	10	21	5

As can be seen from table 2, Tobin's Q value's value is 1.629. with the maximum of 20.921 and the minimum of 0.732. The wide range of ROE indicates that there is a difference in the market value among the listed corporations. The independent variable is 47320 per capita and the largest salary per capita is about three hundred thousand while some independent directors are not paid by the listed companies, resulting the minimum value of FEE is 0. Compared with the average income of American

listed corporations' independent director, we can see that China's independent director's compensation level is still relatively low. When it comes to the control variables, the average scale of companies has reached 21.380 and there is no abnormal value. The average debt asset ratio is 52.8% and the level of debt is not particularly high. The possible reason is that the capital market in China still has some flaws, most companies prefer equity financing rather than bond financing. However, the overall asset liability ratio is still at reasonable level. The ownership concentration of China's listed corporation is high. CO average is 0.327, which means the shareholding ratio of the top ten shareholders is up to 32.7% on average. The maximum reaches 0.810, which is a very high proportion as well. The first major shareholder holds more than 50% which is state-owned shares and this is also consistent with our country's unique institutional background.

3.3.2 Correlation test

Table 3 is the correlation test among the major variables. In order to eliminate the effects of the correlation between variables on regression model, this paper carries out the Pearson correlation test of the main variables in the model. In the Pearson test, the absolute value of the correlation coefficient is higher, indicating that the correlation between two variables is stronger. In table 3, the absolute value of Pearson coefficient which is ranged from 0.001 to 0.407, all below 0.6, thus we can come to the conclusion that there are no serious multicollinearity problems among these variables conclusion.

Table 3 Correlation Test between Variables

	ROE	Tobin Q	FEE	SIZE	LEV	TYPE	CO	DI
ROE	1							
Tobin Q	0.127* (0.132)	1						
FEE	0.142* (0.009)	0.212* (0.011)	1					
SIZE	-0.076 (0.371)	-0.032* (0.704)	-0.049 (0.563)	1				
LEV	-0.28* (0.001)	0.092 (0.278)	0.076 (0.367)	0.098 (0.245)	1			
TYPE	0.169* (0.045)	0.214* (0.011)	-0.001 (0.987)	0.032 (0.705)	0.018 (0.833)	1		
CO	-0.037 (0.665)	-0.005 (0.956)	0.131 (0.119)	-0.056 (0.504)	0.304* (0.011)	-0.407* (0.026)	1	
DI	-0.071 (0.402)	0.172* (0.041)	0.082 (0.335)	-0.169* (0.045)	0.065 (0.443)	-0.037 (0.663)	0.173* (0.040)	1

Notes: ** refers to 1% level (two tailed) significantly correlated, * refers to the 5% level (two tailed) significantly correlated

From table 3, we can clearly see that the rate of return on net assets (ROE) has a significantly positive correlation with Tobin Q, so the two level measured variables of corporate performance is basically similar and the results are basically credible. ROE and FEE are significant positive correlated. Tobin Q and the independent variable are significantly positive correlated. Therefore, a surely conclusion can be drawn that there is a positive relationship between independent director's compensation and corporate performance.

3.3.3 Regression analysis

Table 4 Multiple Regression Conclusion

	ROE		Tobin Q	
	Estimated coefficients	T value	Estimated coefficients	T value
Intercept	0.315	4.819***	0.263	4.102***
FEE	0.106	1.008**	0.381	1.207**
SIZE	-0.016	-5.159***	-0.013	-4.120***
LEV	0.061	2.119**	0.017	2.934***
TYPE	0.005	9.215***	0.002	2.660***
CO	0.049	3.361***	0.005	1.478*
DI	-0.005	-1.258	-0.004	-1.035
N	3568		3568	
Adj R ²	0.266		0.485	
F value	4.526***		6.232***	

Notes: ** refers to 1% level (two tailed) significantly correlated, * refers to the 5% level (two tailed) significantly correlated

After descriptive statistics and correlation test, this paper uses the SPSS20.0 to conduct regression test. As shown the listed results of multiple regressions in table 4, no matter which dependent variable is use, the estimated coefficients of the independent variable FEE is positive and the proportion is larger in the group variable coefficient. We can draw the conclusion that FEE has a larger influence on explained variables. The adjusted R square of these two models are 0.266 and 0.485, showing that the portion of dependent variables can be explained as 26.6% and 48.6% respectively. The coefficient of independent variable FEE is positive. The level of significant $P < 0.05$ manifests that a correlation exists between our country's independent director's compensation and company performance which is positive.

4 Conclusion

In this paper, according to the study of the independent directors' system and the independent director's compensation system, the regression model for empirical analysis on the relationship between independent director's compensation and corporate performance is established. Based on the panel data of the listed corporation from 2010 to 2013, a clear conclusion can be seen: there is a significantly positive relationship between independent director's compensation and corporate performance. In other words, when the independent director's salary increases, they are likely to make more efforts in the supervision and provide more professional opinions, so that the company's performance level can be improved. It's evident that incentive effects of the independent director's compensation occupy a main status in China. Compared with the situation abroad, the independent director's compensation level in China is not very high and it has much room for improvement.

Abstract: Using the financing cash flow and capital structure to measure enterprise's financing decision, via SPSS analysis software, this paper discusses the factors affecting the financing decisions of electric power industry through multivariate linear regression. The results indicate that both net financing inflows and asset-liability ratio are negatively correlated with inflation rate, that is, the inflation will have adverse impact on the enterprise's financing decision. To effectively avoid the negative impact of the inflation on the enterprise financing decision, this paper finally suggests that enterprises should timely adjust enterprise financing channels and financing way, focus on inflation within two years and regard net financing inflows as sensitive variable to adjust and control financing decision, so as to make effective financing decisions and improve the enterprise value by financing activities.

Key words: Inflation; Financing decision; Net financing inflows; The power industry

1 Introduction

Since the beginning of this century, China has had several severe inflation, such as the inflation occurred in 2004, 2007, 2008 and 2010, all of them had a significant impact on China economy. In response to the 2008's international financial crisis, the government has taken a package of economic stimulus measures which began to emerge negative effect in 2010 and the potential inflationary pressures gradually transformed into reality. After 2011, the rapid rise in the consumer price index made the inflationary pressures continue to increase. Until 2014, it gradually calmed down. In an inflationary environment, rising prices cause the rising costs of materials for enterprise production and operation. Meanwhile, the government will take a series of tight monetary policy to curb inflation, making the market a sharply reduction in the money supply. Therefore, inflation makes enterprises face the dual problem of increased financing demand and rising financing costs, making corporate finance become extremely difficult.

About the impact of inflation on corporate financing decisions, different scholars have studied from different angle, focusing mainly on the influence of inflation on capital structure which is an important factor that affects financing net inflows. Dimitris Hatziniko (2002) studied the relationship between inflation uncertainty and capital structure, finding that inflation significantly affect the company's capital structure and reduce the company's debt equity ratio. Dong Hyeon K. and Shu - Chin, L. (2010) studied the impact of inflation risks on corporate financing structure, suggesting that the company financial leverage will reduce and the company's debt maturity structure is shifting from long-term to short-term in an environment of financial repression^[1]. Zhang Ming (2014) studied the impact of monetary policy on the enterprise financing in inflation environment, indicating that in inflation environment, government will develop a tighten monetary policy, trying to affect investment and financing and the total output negatively through the conduction of bank lending^[2]. In addition, the company's financing decision also will be affected by enterprise internal factors, such as firm size, growth, profitability, operation ability and so on. Guerrero F (2005) respectively researched 10 developing countries, the results showed that growth is negatively related to the debt levels, firm size is positively related to capital structure significantly and profitability is negatively related to the corporate debt levels^[3]. Booth etal (2005) found that the larger the company size, the higher the debt ratio. Chen Weiyun, Zhang Zongyi (2008) demonstrated that debt ratio is positively correlated with the firm size through the study^[4]. Lin Xue, Jia Xianwei (2009) analyzed 37 agricultural listed companies with multivariate regression analysis method, implying that the profitability and the asset-liability ratio are in significant negative correlation relationship^[5]. Wang Wei (2011) also found that growth is positively related to asset-liability ratio through the research on the capital structure of private listed companies in Zhejiang province^[6].

Throughout most of the existing literature, there are very few relevant researches which are about

the impact of inflation in macroeconomic on the micro enterprise financing decision, and the researches about the effects of inflation on specific industry financing decisions are especially lacked. The electric power industry, as the basis and the lifeblood of the whole national economy, plays an important role in the industrial and agricultural production. In recent years, with the rapid development of national economy, the asset scale of electric power industry rapidly expands, which makes the electric power industry requires a lot of financial support, financing has become one of the problems need to be solved badly. Meanwhile, due to the state restrictions on electricity price, during the period of inflation, the power industry is facing rising raw material costs and remained revenues. The negative impact of inflation on the power industry is significant. Therefore, this article selects the listed companies of China's electric power industry as the research object, studying the impact of inflation on its financing decision. According to the research findings, this article will put forward the corresponding policy recommendations to optimize the financing decision of listed companies in electric power industry, which is of great practical significance to promote the long-term development of China's listed companies in the electric power industry, and also has reference significance to the related research of other industries.

2 Empirical Analysis and Results

2.1 Research design

According to the said existing research results of domestic and foreign about financing decision theory as well as empirical study, combining with the actual situation of China's listed companies and securities markets, thinking about possible factors that may affect financing decisions of China's electric power industry listed companies, this paper proposes following six theoretical assumptions:

Hypothesis one: When inflation occurs, to curb increasing inflation, the government will adopt a series of tightening monetary policy, making the market's money supply drop sharply and interest rates rise, therefore, the financing cost increases and corporate finance becomes extremely difficult. Thus this paper assumes that net financing inflows of corporate and asset-liability ratio are negatively related to the macroeconomic inflation rate.

Hypothesis two: The higher the asset-liability ratio, the more money the company obtains through debt financing and the net financing inflows are also more. So the hypothesis is that the company's net financing amount and asset-liability ratio are positively correlated.

Hypothesis three: According to the life cycle theory, enterprises in the expansion stage demand for larger capital funds. To grow constantly, enterprises usually tend to get large-scale debt from outward, resulting in both of net financing inflows and asset-liability ratio rise. So it is assumed that the company's net financing amount and asset-liability ratio are positively related to the enterprise growth.

Hypothesis four: When the enterprise profit ability is strong, the enterprise may retain more surpluses, and thus can use less external financing. So assuming that company's net financing inflows and asset-liability ratio is negatively related to the corporate profitability.

Hypothesis five: Operating capacity indicator is used to distinguish whether the company belongs to the capital-intensive businesses. Capital-intensive enterprises need a large number of technical equipment and funds, so the company's financing behavior is relatively sequent and asset-liability ratio is higher. Thus the assumption is that the company's net financing inflows and asset-liability ratio are positively related to the enterprise operation capability.

Hypothesis six: The company's financing has close relationship with enterprise scale. Generally large company has stronger ability of credit than small company. It is easier for them to get a loan, so large company has more liabilities than ordinary small businesses. Thus it is assumed that the company's net financing inflows and asset-liability ratio are positively related to the firm size.

In order to verify the said theoretical hypothesis, applying the data of China's electric power industry listed companies, this section conducts empirical test. From the perspective of inflation process, the author analyzes the factors affecting the company financing decision, the variables as follows:

1) The explained variables

To reflect the company financing activities in a period of time, the best indicator is "net cash flow from financing activities" in the cash flow statement. In order to facilitate the empirical analysis, this study will receive "net financing inflows" to represent the company's financing activities, and net financing inflows (Y_1) = (net cash flows from financing activities) / (total assets). Capital structure is another important factor and it is reflected by asset-liability ratio (Y_2) = (total liabilities) / (total assets).

2) The explanatory variables

According to the assumption, this paper designs the following six explanatory variables:

Inflation: This study employs the national consumer price index (CPI) to measure the degree of inflation. Inflation is a time-series data and the company investment decision is a long-term process. Since the company will form the future inflation expectations based on changes in the trend of inflation, this paper chooses the inflation rate of current as well as the previous periods as an explanatory variable. They are respectively as follows: The current inflation (CPI0); Inflation six months ago (CPI1); Inflation a year ago inflation (CPI2); Inflation two years ago (CPI3); Inflation three years ago (CPI4).

Capital Structure: Asset-liability ratio is often used to represent the capital structure. This independent variable appears only in the case of “net financing inflows” as the dependent variable. Asset-liability ratio (Y_2) = (total liabilities) / (total assets)

Growth: This paper employs revenue growth rate to reflect company growth. Revenue growth rate (X_1) = (current operating income - previous period operating income) / (previous period operating income)

Profitability: Return on assets is applied to reflect the company profitability. Return on assets (X_2) = (total profit) / (total assets)

Operation Ability: The capital intensity is used to measure operation ability in this paper. Capital intensity (X_3) = (total assets) / (operating income)

Enterprise Scale: The scale of the enterprise is measured by natural logarithm of total assets. Firm size (X_4) = natural logarithm of total assets

2.2 Analysis of empirical results

In this paper, the data is derived from CSMAR database and Sina Finance Network. The selection of inflation sample data is subject to China's consumer price index, of which the time is from January 1st, 2011 to December 31, 2014. Corporate finance data comes from A-share listed companies of the electric power industry at Shanghai and Shenzhen Stock Exchange. Excluding * ST, ST and incomplete data company, this paper finally receives a total of 48 enterprises, and the time of data is the end of 2014. The descriptive statistics of the variables are shown in table 1 and table 2 below.

Table 1 Each Variable Descriptive Statistics

	Means	Median	Standard deviation	Minimum	Maximum
Net financing inflows	0.00018	0.00000	0.00121	-0.00001	0.00841
Asset-liability ratio	0.59350	0.61822	0.18461	0.17780	0.90272
Operating income growth rate	0.03504	0.03674	0.25325	-0.54763	0.92954
Asset returns	0.13298	0.00003	0.23199	-0.01798	1.19597
Capital intensity	7.91371	5.97760	6.85029	1.32679	34.60208
Firm size	23.10950	23.18288	1.81348	15.10749	26.29788

Table 2 The Inflation Rate

Variable	CPI4	CPI3	CPI2	CPI1	CPI0
Numerical	105.4	103.3	102.4	102.6	102.3

The multivariate linear regression equation of net financing inflows:

$$Y_1 = a + \alpha_1 CPI0 + \alpha_2 CPI1 + \alpha_3 CPI2 + \alpha_4 CPI3 + \alpha_5 CPI4 + \alpha_6 Y_2 + \alpha_7 X_1 + \alpha_8 X_2 + \alpha_9 X_3 + \alpha_{10} X_4 \quad (1)$$

Table 3 Regression Analysis Table of Net Financing Inflows Coefficient

	Unstandardized Coefficient		Standardized Coefficient	t	Sig.
	B	Std. Error			
Constant	-0.00894	0.22175		-0.04033	0.96809
CPI4	0.00008	0.00011	-0.05164	-0.75782	0.45428
CPI3	-0.00039	0.00040	-0.14200	-0.97259	0.33828
CPI2	-0.00034	0.00021	-0.23269	-1.60562	0.11850
CPI1	-0.00004	0.00021	-0.24584	-0.17930	0.85887
CPI0	0.00027	0.00017	0.21260	1.56736	0.12718
Asset-liability ratio	0.00000	0.00000	0.30652	1.82862	0.07709
Operating income growth rate	0.00011	0.00064	0.02280	0.17019	0.86597
Asset returns	-0.00055	0.00124	-0.10540	-0.44468	0.65964
Capital intensity	0.00001	0.00002	0.08176	0.63151	0.53234
Firm size	-0.00053	0.00009	-0.78873	-5.74807	0.00000

The table 3 shows that net financing inflows are negatively related with inflation CPI1, CPI2, CPI3 and CPI4 and positively related with CPI0. Overall, inflation has a negative influence on net financing inflows, thus the net cash flows of finance will decrease as inflation increasing, which conforms to the original assumption. Among other factors, the asset-liability ratio is positively related with net financing inflows, which indicates that the more debt a company has the more external financing it needs to maintain its operation, proving the original hypothesis. Operating income growth rate and net financing inflows are positively correlated with each other, indicating that enterprise growth ability will promote its financing behavior, consistent with the null hypothesis. Asset returns and net financing inflows are negatively correlated with each other. As the stronger the profit ability, the higher profitability of the company's products, the company are more good at making use of existing assets to get more return, which will accordingly reduce external financing and the net financing inflows, in line with the original hypothesis. Net financing inflows are positively related with capital intensity. The capital-intensive industry needs a large number of technical equipment and funds, so this kind of company's financing behavior is relatively frequent, in corresponding, net financing inflows will be more, in line with the original hypothesis. Enterprise scale and the net financing inflows are negatively correlated with each other, which are not consistent with the original hypothesis. The reason may be that the Chinese government will give certain allowance to electric power industry enterprise and the more the enterprise scale, the greater the subsidies.

The multivariate linear regression equation of asset-liability ratio:

$$Y_2 = b + \beta_1 CPI0 + \beta_2 CPI1 + \beta_3 CPI2 + \beta_4 CPI3 + \beta_5 CPI4 + \beta_6 X_1 + \beta_7 X_2 + \beta_8 X_3 + \beta_9 X_4 \quad (2)$$

Table 4 Regression Analysis Table of Asset-Liability Ratio Coefficient

	Unstandardized Coefficient		Standardize Coefficient	t	Sig.
	B	Std. Error			
Constant	-5657950.73338	13776569.70095		-0.41069	0.68403
CPI4	-2864.57965	6681.67708	-0.01047	-0.42872	0.67100
CPI3	-11401.45001	25052.69178	-0.06985	-0.45510	0.65211
CPI2	-3834.13367	13090.21166	-0.04471	-0.29290	0.77149
CPI1	-1626.20819	13077.55934	-0.04889	-0.12435	0.90182
CPI0	525.90511	10875.85566	0.05692	0.04836	0.96173
Operating income growth rate	59189.52010	38586.12836	0.20916	1.53396	0.13487
Asset returns	-77001.26888	76013.60416	-0.24926	-1.01299	0.31866
Capital intensity	51.76120	1428.43208	0.00495	0.03624	0.97132
Firm size	-1060.10721	5715.70414	-0.02683	-0.18547	0.85403

From table 4 we can see that the enterprise asset-liability ratio are negatively related with inflation factor of CPI1, CPI2, CPI3 and CPI4, only CPI0 are positively related with asset-liability ratio. In general, with the increase of inflation, the asset-liability ratio of the company will reduce. The increase of inflation will cause the increase of the risk-free rate of return, making debt financing costs increase, thus the enterprise will reduce debt financing. The empirical results prove the hypothesis. Among other factors, asset-liability ratio are positively related with operating income growth, for revenue growth will promote enterprise financing from outside, and then the asset-liability ratio will increase, consistent with the original hypothesis. Asset returns are negatively related to the asset-liability ratio. If the profit ability of the company is strong, the owner's equity will increase faster, in corresponding, the asset-liability ratio is smaller, attesting the null hypothesis. Asset-liability ratio and capital intensity are positively related to each other. Capital-intensive enterprises need a large number of technical equipment and funds, of which external financing behavior is relatively common, and asset-liability ratio is higher, consistent with the null hypothesis. The enterprise scale and the asset-liability ratio are correlated negatively with each other, which is incompatible with the original hypothesis. This may be due to the electric power industry belongs to the basic industries, the greater the firm size, the greater the contribution to the society, the more tend to get government support, thus obtain more financial allocation, reducing the external financing.

3 Conclusion

The research results show that the enterprise net financing inflow and asset-liability ratio are negatively related with the level of inflation, that is inflation will make an adverse effect on enterprise's financing activities through macro policy, rising prices and other transmission mechanism. Nowadays, inflation has gradually subsided, and the economy starts to return to normal, in spite of this, in the future development, inflation will certainly break out again along with the economic cycle. Based on the above analysis, in order to eliminate the negative impact of inflation on corporate finance activities, the electric power industry enterprises should take the following measures:

1) Timely Adjust Enterprise Financing Channels and Financing Way

The enterprises should increase financing channels and enrich financing ways. At present, China has emerged a large number of private loan guarantee companies and other non-governmental organizations, of which enterprise should make full use. Besides, the enterprises should actively utilize the government's multi-level financing service system, increasing the enterprise financing channels and enrich enterprise financing ways, thus to cope with inadequate capital supply caused by inflation.

2) Focusing on Inflation Occurs within Two Years

The impact of inflation occurring at different times on the enterprise financing decision must be different, according to the empirical data in table 3 and table 4, this paper finds that the negative correlation of inflation rate within two years with enterprises net financing inflows and asset-liability ratio is greater. The correlation of inflation beyond three years with enterprises net financing inflows and asset-liability ratio, although negative, but is less significant. Therefore, in the background of inflation, enterprise should focus on inflation within two years when making financing decisions.

3) Taking "net financing inflows" as Sensitive Variable Regulation

Enterprise financing decisions mainly include two key elements – "net financing inflows" and "asset-liability ratio". Through the comparative analysis of table 3 and table 4, it is found that the negative correlation between inflation and net financing inflows is more significant, while the relevance between inflation and asset-liability is less significant. Therefore, in the background of inflation, the enterprise should take "net financing inflows" as a sensitive variable regulation when making financing decision. It is also necessary to further subdivide the impact variables of net financing inflows, and then adjust and optimize the enterprise financing decision through deep analysis.

“The Belt and Road”: The New Opportunity of RMB Internationalization Development

Geng Mingying, Zhao Jun

College of Foreign Economics and Trade, Wuhan Textile University, Wuhan, P.R. China, 430074

(E-mail: 813535187@qq.com, 282762010@qq.com)

Abstract: In this paper, on the basis of a large amount of data and information, using the method of qualitative analysis, it analyzes the core connotation of “the Belt and Road” strategy and presents situation of RMB internalization and proposes a new thought of win-win development of the two strategies. Moreover, it draws to a conclusion that “the Belt and Road” as a splendid strategic conception has been officially enacted which arouses extensive attention from international society. As the strategy is gradually promoted, it will create more extensive cross-border use demands of RMB and promotes the internalization of RMB. Otherwise, RMB internalization will also provide energy and create new opportunity for win-win cooperation of “the Belt and Road”.

Key words: “the Belt and road”; RMB internationalization; New opportunity; Win-win development

1 Introduction

As related measures of smooth trade in “the Belt and Road” strategy are gradually implemented, with the deepening of the economic and trade cooperation between China and countries along the road and huge financing demands of infrastructure fields, it will create more extensive cross-border use demands of RMB and promote the internalization of RMB in terms of trade, investment, settlement and cross-border financing valuation. Meanwhile, RMB internalization will also create a new opportunity for win-win cooperation of the Belt and Road and build a Financial Net with the formation of a series of regional financial cooperation mechanism which will push the internationalization of RMB to a new stage and provide energy for the sustainable development for the internationalization of RMB.

The early definition on monetary internationalization refers to a “currencies other than the private sector and official agencies use the currency” (Cohen, 1971); Li Taokui (2008) put forward the general indicators measuring standards of RMB internationalization include three aspects: degree of circulating outside, become the international circulation tool and proportion in international trade settlement. Joseph (2012) is pointed out that the advance of currency internationalization path choice ultimately depends on the market, the government’s policy to influence the direction and process; Shi Chenyu (2010) argues that to promote the RMB internationalization should follow the path of trade and finance in hand, Gao Haihong (2011) argues that RMB internationalization should take the region into a starting point. Hu Xiaolian (2014) argues that the fundamental driving force of the development of the RMB internationalization is the market demand, “the Belt and Road” strategy will inject new sustainable development for the RMB internationalization, Zhang Rui (2014) considered that speeds up the RMB internationalization will escort for the “the Belt and Road” strategy.

This paper intends to study the new problems and new thoughts of win-win development under the new normal economy through interpretation of the Belt and Road strategy and analysis and outlook of present situation of RMB internalization.

2 Core Concept of “the Belt and Road” Strategy and RMB Internalization

2.1 The core concept of “the Belt and Road” strategy

“The Belt and Road” strategy as China’s first national strategy intends to develop globe infrastructure and trade through new Silk Road. According to preliminary estimate, there is a total population along the road of 4.4 billion and economic aggregate is about \$21 trillion which account for about 63% and 29% of the world respectively. Based on this, the core concept of “the Belt and Road” strategy includes the following aspects:

2.1.1 Opening to the outside world is core of the strategy.

After 30 years of reform of opening-up, China’s opening policy has made remarkable achievements, but influenced by geographical location, resource endowment and development foundation, the opening policy generally presents the space imbalance, namely the eastern district and costal areas develop fast and western district and plateau develop slowly. “The Belt and Road” strategy covers most of the areas in the hinterland and border areas which is bound to develop potential cooperation between China and

countries along the road. Moreover, it improves the status of emerging economies and developing countries in the structure of China's opening policy and accelerates opening-up of central and western regions in China. It also constructs a new round of opening up of one body and two wings and forms a new pattern of open economy including land and sea coordination, west and east aiding each other and globe orientation.⁵

2.1.2 Mutual benefit and common development are cardinal principles.

Countries along the road are mostly emerging economies and developing countries which are generally in the rise of economic development. Therefore, there are broad prospects of mutual beneficial cooperation. On the one hand, China's development will promote the exploitation on preponderant resources of the countries along the Silk Road and meet their demands for Chinese industrial products and production technology. On the other hand, Chinese government fully considers the realistic difficulties of relatively backward countries so it costs a huge sum of money to establish the Asian Infrastructure Investment Bank (AIIB) and Silk Road Fund. Meanwhile, it encourages outward investment of Chinese enterprises which will bring tangible benefits and interests to the countries and districts along the road with the regional cooperation between China and these countries

2.1.3 Finance is an important support.

China will rely on abundant foreign exchange reserves to lead to solve the financial problems. There are current four capital pools closely related to "the Belt and Road": Silk Road Fund, AIIB, BRICs Organization Development Bank and SCO Development Bank. It is estimated that early infrastructure investment and resource development are mainly from two international financial institutions: Silk Road Fund and AIIB. Later Domestic Policy Bank and Commercial Banks may have a deep involvement in "going out" strategy of Chinese enterprises. Domestic financial institutions are expected to be mainly composed of five big state-owned commercial Banks. All these mark the finance is an important support of the strategy.

2.1.4. Infrastructure is the main propulsion.

"The Belt and Road" strategy focuses its cooperation on five smooths (Policy communication, path connectedness, trade flowing, currency circulation and heart interlinked). The future expansion of bilateral trade between various countries will be the most direct manifestation of results of the strategy. Trade and logistics flowing is the core to expand trade volume. To expand trade, infrastructure will be carried out first and connectivity of logistics and infrastructure are forerunner of the construction. Future infrastructure construction will focus on transport infrastructure, energy infrastructure and communications network construction which will also be the main propulsion of the strategy.

2.2 Present RMB internalization

RMB internationalization began with cross-border RMB settlement of 2009. After more than five years of development, present RMB internationalization process presents the following characteristics:

2.2.1 The scale of cross-border RMB settlement expands rapidly.

Cross-border RMB settlement amount is only 3.58 billion yuan in 2009 while it has surpassed 4.8 trillion yuan in the first three quarters of 2014. The percentage of cross-border RMB payments is close to 25% of all local and cross-border payments and RMB settlement of trade import and export has accounted for more than 15% of the total. The numbers of countries involved in this event have been up to 174 and RMB has become China's second largest cross-border payment currency. SWIFT's latest surveillance data shows that from January to April of 2015, in mainland China, Hong Kong and other parts of Asia-pacific, the proportion of use of RMB is up to 31% while that of dollar in April is only 12.3% and the use of Japanese yen and HK dollar also fell. In recent three years, there is a 327% increase in the amount of payment for transactions in mainland China and Hong Kong of Asia-pacific and RMB jumps from the fifth-largest currency to the first.

2.2.2 RMB deepens its international cooperation with multinational currencies.

According to latest statistics, since 2009, People's Bank of China has successively signed bilateral currency swap agreements with 28 countries or regions and total amount is up to 3.1 trillion yuan. After consultation with the multinational monetary authorities, it successively sets up RMB clearing arrangement in Hong Kong, Macao and Taiwan regions, Luxembourg, Singapore, London, Frankfurt, Paris, Seoul and other place. In addition to the dollar, euro, yen and pound, RMB has implemented direct dealing with rouble, ringgit, Australia and New Zealand dollars. Some of the central banks or monetary authorities have already or prepared to bring RMB into its foreign exchange reserves and

⁵ Hu Xiaolian. Deepen the reform, expand the opening-up and raise sail for RMB internationalization[N], The Fifth Forum of Cross-border RMB Business, 21, October, 2014.

RMB has become the seventh largest reserve currency. According to HSBC survey, the proportion of the RMB in foreign exchange reserves is gradually increased which is expected to up to 2.9% at the end of 2015, 6.9% by 2020 and 12.5% by 2030.

2.2.3 Offshore RMB market begins to take shape.

In recent years, in addition to Hong Kong, Taiwan and Singapore as the primary offshore RMB deposits and lending markets, some of the major European countries have spared no effort to accelerate development of offshore RMB market. Since 2014 the People's Bank of China established RMB clearing bank in London, Frankfurt, Paris and Luxembourg respectively, almost every European financial centre developed RMB business actively and Europe has become the most important offshore RMB market outside Asia. At the end of 2014, offshore RMB deposits of Hong Kong, Taiwan and Singapore was up to 1.6 trillion yuan and the offshore dim sum bonds balance is close to 350 billion yuan. London is expected to become future's RMB foreign exchange trading center while Luxembourg will become active RMB fund investment center of European region.

2.2.4 The categories of offshore RMB financial products constantly increase.

As RMB has been expanding its scale of "going out", the international financial markets and financial centers develop a growing interest on RMB and start to regard RMB business and products as new opportunities for their market development and consolidating their own financial centre. At present international financial markets, there are RMB deposit and lending, RMB-FX Transaction and RMB interbank lending, in addition, the issuance of RMB bonds increases steadily and the categories include national debt, financial bond, corporate bonds, enterprise bonds and etc. Moreover, issuers cover domestic institutions, foreign governments and overseas Banks. The geography and industry distribution of enterprises and investors gradually diversified. Furthermore, RMB pricing and trade finance products, depository receipts, funds, futures and RMB derivatives also gradually increase.

3 "The Belt and Road" Strategy will Accelerate RMB Internalization

During the gradual promotion process of "the Belt and Road" strategy, infrastructure construction, service, energy resources and manufacturing are driven to participate in the process. China further deepens its cooperation with neighboring countries in trade, credit and investment. More and more countries will use RMB as the transaction currency, even as the country's reserve currency. Countries along the road are likely to form a RMB monetary area or RMB circle thus achieving larger-scale circulation of RMB and speeding up RMB internationalization. In particular, it can be analyzed from the following aspects.

3.1 Push free exchange of RMB capital project

With the impetus of "the Belt and Road", reform on capital account convertibility will be rapidly completed within the year. According to latest statistics of the State Administration of Foreign Exchange, 34 capital account transactions out of 40 items in China at present reach at partial convertibility and above level which account for 85%. This is the last year of "the 12th five-year plan" and during this period, basic convertibility of capital account will be realized. Central Bank governor Zhou Xiaochuan also puts forward that the achievement of reform on capital account convertibility needs three preparations. Firstly, inside and overseas private investment will be more convenient; Secondly, the capital market will be more open; Thirdly, according to RMB convertible framework, Regulations on the Administration of Foreign Exchange will be revised. Therefore, in 2015 China will make capital accounts convertible and RMB close to a freely usable currency which will eliminate the last institutional constraints and make a big leap to RMB internationalization.

3.2 Further expand RMB settlement in trade and investment

From the strategic planning of "the Belt and Road", more than 60 countries involve in the plan with a population of 4 billion. Only central Asia, Middle East and Eastern Europe and other countries on Silk Road Economic Belt account for 10% of all exports in China. China and these countries are complementary in industrial structure. Besides, Due to low capital stock of countries along the road, China can increase direct investment to further provide overseas financing with settlement of RMB. By the end of 2013, China's direct investment in the region was about \$31.3 billion, although compared with that of 2008 the compound growth rate was up to 34%, it only accounted for 4.8% of total ODI (overseas direct investment). Along with the advancement of the Belt and Road strategy, RMB stock market will continue to expand.

3.3 Accelerate construction of domestic financial market and deepen the process of RMB internationalization

The advancement of “the Belt and Road” strategy will accelerate construction of domestic foreign exchange, bonds, stocks and other financial markets and deepen the process of RMB internationalization. First, monetary internationalization at least requires the marketization of exchange rate formation mechanism to change the pattern of single overseas assets held by the central bank under the unilateral appreciation. The floating exchange rate of RMB Since 2013 shows the effect of system reform. Second, monetary internationalization needs to speed up opening up domestic financial market to foreign investors and widening channels of domestic residents investing in overseas markets so as to realize the bidirectional cross-border flow of capital. Therefore, China has advanced the QFII, RQFII, QDII and Shanghai-Hong Kong Stock Connect and other institutional arrangements. Statistics shows that the deposits, bonds and stocks and other domestic assets held by foreign investors increased from 2.87 trillion in 2013 to 4.49 trillion in 2014. Meanwhile, in February 2015, overseas investment on QDII increased to \$87.5 billion.

4 RMB Internalization will Also Provide Energy for Long-term Development of “the Belt and Road”

There are current more than 170 countries using RMB. Future RMB internalization will also provide energy and create new opportunity for long-term development of “the Belt and Road”. First, the formation of four capital pools and a series of regional financial cooperation mechanism will build all-around financial service network for development of “the Belt and Road”. At present under the proposal of Chinese government, a \$40 billion capital under the sponsorship of the Silk Road Fund and a \$100 billion of the Asian Infrastructure Investment Bank (AIIB) are set up. Furthermore, existing BRICs Development Banks, SCO Development Bank, four large capital pools of financial service network and a series of regional financial cooperation mechanism have been formed. Countries along the road will get financial support from them and promote the connectivity. (See Table 1)

Table 1 General Information of Four Large Capital Pools

	nature	investment	orientation	Initial investment	timetable
Silk Road Fund	sovereign investment funds	Countries and districts along the road	Infrastructure, resource development, industry cooperation and financial cooperation, etc.	Total: \$40 billion. First period: \$10 billion. Foreign Exchange Reserve accounts for 65%.	undetermined
AIIB (The Asian infrastructure investment bank)	Regional Multilateral Financial Development Institutions	24 member states that signed the Memorandum on the Preparation of AIIB	infrastructure construction	Statutory capital is \$100 billion and China's initial subscribed capital is about \$50 billion, accounting for 50%. Capital of first period of trial operation of next year is \$5 billion in which China pays \$2.5 billion.	It is expected to complete the negotiations of regulations and signing work by the end of June, 2015 and put into operation by the end of 2015
BRICs Development Bank	Regional Multilateral Financial Development Institutions	5 BRIC countries: Brazil, Russia, India, China and South Africa	infrastructure construction	The initial capital is \$100 billion with average contribution of five founding members.	Set up in 2016
SCO Development Bank	Regional Multilateral Financial Development Institutions	Six SCO member states: China, the Russian federation, Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan	demonstration projects of energy, transportation and modern information technology between SCO organization	undetermined	undetermined

Source: China's Financial Information Network

Second, the increasing number of bilateral currency swap agreements and expansion of offshore markets will provide more security for International investment and regional cooperation under the Belt and Road planning. As previously mentioned, in recent years, RMB deepened its international

cooperation with multinational currencies and successively signed bilateral currency swap agreements with 28 countries or regions with a total amount of 3.1 trillion yuan. Meanwhile, the layout of globalization in offshore RMB centre spread from Asia to Europe, North America, South America and other regions. It is not only beneficial to attract international investors to invest in RMB-denominated financial instruments but also helps to strengthen the cooperation between offshore markets, monetary authorities, supervision departments and financial institutions. Besides, it reduced transaction and management costs of market participants and effectively promote RMB's international appeal and market confidence.⁶

Third, RMB Cross-border trade and investment and settlement expanded rapid which escorts Chinese enterprises' going-out process. As our country is becoming more and more integrated into the process of economic globalization, more and more enterprises cross border and the urgent need to avoid risk and reduce the cost stimulates the strong demand for cross-border trade and investment and settlement. The Chinese government will further build cross-border trade, cross-border investment and credit payment and settlement system based on the current situation to improve its level of financial services and international operation. Meanwhile, it will promote Chinese-funded financial institutions' layout in China's trading partners and offshore RMB centre and enhance the competitiveness of overseas branches. In addition, it will also gradually develop trade financing and asset management, improve the export credit insurance market, develop overseas investment risk, improve enterprise risk prevention capacity and escort Chinese enterprises' "going out" process.

5 Conclusion

"The Belt and Road" is a grand strategic thinking in the process of China's economic development. The core content includes opening-up, mutual benefit, infrastructure and financial system construction. Initial conditions of RMB internationalization combined with this has been relatively mature, but they are still in early stages. With the advancement of this strategy, a wider range of RMB cross-border use requirements will be produced and RMB internationalization will be promoted. Meanwhile, RMB internalization will also provide energy and create new opportunity for win-win cooperation of "the Belt and Road". However, the win-win development is an important and sensitive project. During the operation process, it will promote the opening up of capital account, accelerate the pace of reform on financial system and stabilize the exchange rate; meanwhile, it focuses on geopolitical risk, credit risk and security risk to maximum guarantee the smooth achievement of goals.

Abstract: Firms always face a pressure for better performance. A lot of indicators are being studied with respect to their effect on firm's performance. Banking sector plays a vital role in terms of financing firms for their different projects and future investments. This paper is quite significant as it is targeting the low addressed area of Pakistan. A vital contribution is made by this research in order to understand the relationship of banks and firms and how the firm's performance is affected by number of banks in relation with firm. It further opens the new horizons of research to investigate this relationship in depth. The bank relationship is remained a topic of interest in developed countries but meagre research was done in developing and emerging markets. This paper attempts to explain the firm-bank relationship and its impact on firm's performance with the help of OLS regression analysis with robust errors. The data for 180 listed firms is collected from Karachi Stock Exchange (KSE). We use two proxies for bank relationship. A dummy variable is used for bank relations (1 if number of bank relations is more than 5 otherwise 0) and the second variable is actual number of relations a firm is maintaining with banks. Return on asset (ROA) and return on equity (ROE) are used as dependent variables as an indicator of firm performance. It concludes that the number of bank relations do affect firm's performance significantly but negatively. As far as the bank relation dummy is concern it shows significant relation with ROA but no such relationship with ROE. After investigating the initial relationship, it can be said that bank relations are important for firms but there must be optimal number of banking relations.

Key words: Multi-Bank relationship (MBR); Firm performance; Return on Asset; Return on Equity

1 Introduction

Banking sector is the back bone and main source of capital for firms, so a lot of studies have been carried out on their relationship with firms (Berger et al. 2008). It is even more important to investigate the role of banking sector in emerging markets as the market characteristics are quite different than developed markets so their role can be quite different in emerging markets (Barth et al., 2006). Therefore, it became necessary to study this firm bank relationship in developing and emerging markets.

Bank relationship is associated with firm performance as it increases access to capital. In a study of German firms, Agarwal and Elston (2001) proposed that the firms in relation with banks must have high profitability and growth. However, they found no evidence for such hypothesis for Germany. The exclusive bank relation benefits firms in order to access capital, better project choice and increase profitability (Petersen and Rajan, 1995).

Although as a research interest bank relationship is not a new topic yet a very few attempt is made regarding developing markets (A.N. Berger et al., 2008) like China, India and Pakistan but as per authors knowledge it is the first attempt to investigate this relationship in context of Pakistan.

This paper investigates this less addressed developing market in order to formulate an opinion about the impact of multiple bank relation with a firm performance. Literature suggests mixed effects of bank relationship with firms and their performance. One stream of research is in favor of more than one bank relationship while the other stream suggests one strong bank relationship. Bank can help by providing valuable capital and monitoring (Gorton and Schmid, 2000). In contrast, bank relationship may affect the firm's performance negatively (Mahrt-Smith, 2006).

As evident from previous literature, the phenomena of banking relation with respect to firm performance remains an interest to researchers. Though there is a lot of research in this regard but very few are in context to developing nation and emerging markets. This paper tries to explore the relation between firm performance and banking relation in Pakistan as a case. The study particularly focusses on the impact of multiple bank relations on firm performance. As no previous study has focused on this issue therefore this is very eminent study in order to explore the impact of multiple bank relations.

In the next session we will discuss the literature on banking relationship, multiple relationship and determinants of firm performance. Remainder part will discuss the banking sector of Pakistan then the data and methodology will be presented. In the end we will discuss the results and conclude with some

suggestion for future research in Pakistan context in this regard.

2.1 Literature review

The firm's close relationship with the banks is always remain beneficial for them as documented in the previous literature. The close relationship allows firm to raise additional capital (Hoshi, Kashyap and Scharfstein, 1991). Another benefit of close banking relation is reported that it will reduce the bankruptcy cost and improve capital investments during financial distress (Hoshi, Kashyap and Scharfstein, 1990; Nakatani, 1984). In spite of above mentioned benefits, Prowse (1990) posits that close banking relationship like equity ownership sometimes alleviates problems like agency cost of debt.

However, it is also evident from literature that there are some costs associated with close banking relation as well. Explaining his theoretical model Rajan (1992) posits that trusting on single bank relation may undermines the performance and owner's determinations. Weinstein and Yafeh (1998), during their study on Japanese banks find that they charge relatively high interest rates from the closely related firms.

The empirical evidences from literature are quite diversified as some of the researchers supports the close relationship between firms and banks while some don't. Johnson (2003) posits that using short-term bank debt can reduce negative effects of underinvestment problems on leverage but it will result in the rise of liquidity risk. For market to book value of equity, Gorton and Schmid (2000) found some evidence of positive effect with respect to close banking relations. If a firm maintain a close and single banking relation for a longer time it will help the firm to earn better credits from that bank. As per result, the firm can reduce financing costs and collaterals.

As close banking relationships have mixed evidence in literature same is the case for multiple bank relationship. Some researchers argue their benefits and some argue their negative impact. Degryse and Ongena (2001) are of the view that the negative impact may be the high transaction cost while maintaining multiple bank relations. Lower hold-up costs or larger overall credit lines are the benefits of the multiple relations with bank as advocated by Von Thadden (1994). There are also some studies that attempt to explain the factors that determine the number of banking relationships and whether the number of banking relationship has as impact on value. While doing the study on domestic bank and foreign bank relationship Fok, Chang and Lee (2004) report that domestic bank relationships are negatively related with firm performance but the same relations with foreign banks have positive impact on firm performance.

It is quite evident that banking relations have impact on firm performance and profitability. Most of the researches are attempted to explain this relationship in the developed markets and only few examples are there for developing nations and markets. There are certainly many other factors involved in firm performance and their effect is being tested and argued by many researchers.

Another attribute of better performance and profitability is Liquidity of the firm. Liquidity is the ratio of firm's current assets to current liabilities. Liquidity helps in capturing firm specific attribute as it reflect the ability to manage working capital and acquire a greater quantity of cash balance relative to current liabilities which reflects better performance and profitability of the said firm.

2.2 Hypothesis

As the researches in the developed countries, the impact of bank relations have some impact on the performance because of their controlling effect on the firm decision making specially in Japan. But some other researchers reported mixed effect. For our research we expect positive effect of multiple bank relations on firm performance so we have built our hypothesis as follow:

H1: There is a significant relation between number of bank relation and firm's Return on Asset (ROA).

H2: There is a significant relation between number of bank relation and firm's Return on Equity (ROE).

H3: There is a significant relation between multiple bank relationship and firm's Return on Asset (ROA).

H4: There is a significant relation between multiple bank relationship and firm's Return on Equity (ROE).

2 Methodology and Data Analysis

As most of the researches focuses on developed markets, for this research we have taken Pakistan as our area of interest being the emerging market and developing country. Total number of listed firms on Karachi stock exchange (KSE) are 581. 75 firms are from financial and equity investment sector.

This reduced the number of firms to 506 in which 24 listed firms are commercial banks. 32 firms are from insurance sector which reduced our sample of interest to 450 listed companies. We have taken data of 180 non-financial firms (for which data is available) listed on Karachi stock exchange (KSE) from 2008 to 2013 and total number of observations is 1056. The data was collected from published annual reports of the companies, their respected websites and stock exchange. Different variables are taken into consideration like ROA, ROE, Size, liquidity and leverage. Bank relations is the variable of main consideration in this piece of research. In order to remove the bias from our model we have controlled the effect with the other determinants of the firm performance.

We use return on asset (ROA) and return on equity (ROE) as an indicator of firm performance. The multiple bank relationship (MBR) is taken as dummy variable in order to explain its effect on the performance of the firm. The dummy is valued as 1 if there are banking relations more than 5. In order to further explain the bank relationship we use number of bank relationship as second parameter. To explain the other variation in firm performance, we include some frequently used variables i.e. firm size, leverage and liquidity as control variables for our research. Onaolapo and Kajola (2010) posits significant relationship for debt to asset ratio (leverage) with firm performance so we use it as an explaining variable of performance. Large size firms, with an effective implementation of operations, can generate better performance than smaller firms (Penrose, 1959). So it can be said that the size and performance relationship is of mixed nature and both sort of evidence can be found.

Data analysis is done with the help of descriptive statistics and OLS regression. The OLS regression is done separately for ROA and ROE. In first model we have checked the effect on ROA and in second regression on ROE as performance indicators.

1st Model

$$ROA = I + \beta_4 NBR + \beta_5 MBR(Dummy) + \beta_1 SIZE + \beta_2 LIQUIDITY + \beta_3 LEVERAGE + \varepsilon \quad (1)$$

2ND Model

$$ROE = I + \beta_4 NBR + \beta_5 MBR(Dummy) + \beta_1 SIZE + \beta_2 LIQUIDITY + \beta_3 LEVERAGE + \varepsilon \quad (2)$$

Return on asset ranges from negative (-1.21) to positive value i.e. 3.12. The firms have ROA is 0.0431 as an average. The mean value for ROE is quite low as 0.1011 but it vary from minimum -17.74369 to maximum 11.57286. These statistics depict that many firms reported negative equity due to heavy losses over time. Mostly the firms are maintaining more than 1 bank relations as the average is 9.3131 with a range from 29 to 1. MBR is a dummy variable for number of bank relationship which is valued as 1 if relations are more than 5. MBR mean value is also high (0.7228) that also verifies that firms have more than 5 bank relations on most of the occasions. SIZE has a maximum value of 27.72644 and minimum value 14.60215. The mean value is 21.936 with a standard deviation of 1.8189 because the firms in data set are the largest firms in Pakistan. The result shows that the firms are not highly leveraged and on average, leverage is 13% of total assets.

The figures and values for correlation matrix shows that there is no value higher than 0.8 so the problem of multicollinearity does not exist in our variables.

Table 1 Regression Results for ROA

Regression Table for ROA					
Variable	Expected Sign	Coefficient	t-Statistic s	Robust std. Err.	P>t
NBR	+	-0.0013	-1.10	0.0012	0.003
MBR	+	-0.0263	-1.53	0.0172	0.060
SIZE	+	0.0261	3.47	0.0075	0.011
LEVERAGE	-	-0.0963	-1.64	0.0589	0.212
LIQUIDITY	+	0.0187	2.53	0.0074	0.004

ROA is return on asset. ROE return on equity. NBR is number of bank relationship. MBR is dummy variable for multiple bank relations is 1 (if number of bank relationship is >5). SIZE is natural log of sales. LEVERAGE is the ratio of debt to assets. LIQUIDITY is ratio of current assets to current liabilities

The regression results of our 1st model is shown in Table 1. The regression analysis for return on assets is done using OLS method with robust standard errors. Return on asset ROA is used as dependent variable for the above regression analysis. The results show that number of bank relations (NBR) has a significant impact on firm performance at 1% which is as expected but the sign is opposite so hypothesis H1 is accepted. The dummy variable for the presence of bank relationships more than five has also

shown significant and negative impact on firm performance (ROA) at 10% level. SIZE and LIQUIDITY are positively related to ROA and significant results are depicted at 1% level. However, the results for LEVERAGE are not significant for the study.

Table 2 Regression Results for ROE

Regression Table for ROE					
Variable	Expected Sign	Coefficient	t-Statistics	Robust std. Err.	P>t
NBR	+	-0.0008	-0.13	0.0061	0.0128
MBR	+	-0.0201	-0.26	0.0786	0.1753
SIZE	+	0.0460	2.80	0.0164	0.0136
LEVERAGE	-	-0.0133	-0.08	0.1733	0.3554
LIQUIDITY	+	0.0176	1.89	0.0093	0.0008

ROA is return on asset. ROE return on equity. NBR is number of bank relationship. MBR is dummy variable for multiple bank relations is 1 (if number of bank relationship is >5). SIZE is natural log of sales. LEVERAGE is the ratio of debt to assets. LIQUIDITY is ratio of current assets to current liabilities

Table 2 shows the results for 2nd regression with same method as earlier for return on equity (ROE). In this model the ratio of ROE is used as dependent variable. The above model is also passed by F-statistics i.e. 2.36. Results for number of bank relations, NBR is almost same as it has negative and significant effect on ROE of the firm at 5%. But our dummy variable for bank relationship has not shown any significant relationship with ROE. LEVERAGE is also insignificant for ROE which is due to firm's negative equity in our data set. Whereas, the results for SIZE and LIQUIDITY remain significant at 5% and 1% respectively.

3 Discussion and Conclusion

The main purpose of this paper is to investigate the nature of relationship between banks and listed firms in Pakistan. We focus on the number of banking relations a listed firm is maintaining and how this relationship is affecting their performance. The results show that the number of bank relations have a negative effect on firm performance which is consistent with Degryse and Ongena (2001). Our research suggests that the firm must maintain a few banking relations in order to achieve high performance.

Banks are the biggest source of funding for financing in Pakistan. But it is a question of interest that how many banking relations must be maintained or what is the optimal number of bank relations. The firms are approaching banks in order to get financing for future investments and meeting current requirements of the business. On average the listed firms in Pakistan are maintaining 8 bank relations which is quite high. In contrast, the firms in developed countries are loyal in their relationship with banks and maintaining a single main bank relationship which is beneficial for the firms and their performance. This can be concluded for Pakistani firms that the number of banking relations should be reduced in order to reduce its negative impact on firm performance. Another reason for these different results is the high interest rate prevailing in Pakistan than the developed countries.

This paper has contributed in order to understand the initial understanding of bank relations and firm's performance as no such research has been done before in this respect, to the best of author's knowledge. This research can be further enriched by adding different avenues. Future research can be done including bank ownership type, firm's ownership type and bank relationship type.

Correlation Analysis of Money Supply and Economic Growth in China

Zhang Xuan, Shang Xiuting

School of Economic Management, Changchun University of Technology, Changchun, P.R. China, 130012
(E-mail: zhangxuan@ccut.edu.cn, shangxiuting1467@126.com)

Abstract: This article mainly uses the method of quantitative analysis, selects data from 1991 to 2014, through building single-element regression model of the money supply and economic growth to analyze the correlation of the two factors, but the empirical results show that there is no direct correlation between them. By introducing the inflation rate to build multivariate regression model of the three, we use co-integration test and Granger Causality test to analyze the relationship among the rate of money supply, inflation rate and economic growth. The results show that economic growth and money supply have a positive relationship, economic growth and inflation rate have a negative correlation. This proved that Currency non-neutrality theory put forward by Keynes is suitable for China and provided a theoretical basis for the establishment of China's monetary policy.

Key words: Money Supply; Inflation Rate; Economic Growth; Granger Causality Test

1 Introduction

The money supply and economic growth are two important factors in the process of macroeconomic policy formulation and implementation. In 1936 Keynes put forward the theory of Currency non-neutrality theory, and he thought that in long-term the money supply can eventually change the economy. But monetarists represented by Friedman refuted Keynes's monetary non-neutral theory, they thought money is neutral, changing the money supply would not influence the economic growth. About this issue, Kormendi and Meguire (1984)^[1] pointed out through the research that in the short term the monetary impact on output was effective, but in the long term there was no impact. Boschen and Mills (1995)^[2] by using empirical analysis method, through the VAR model and impulse reaction analysis, found that the currency impact is neutral. In the domestic, Xie ping and Liu bin (2004)^[3] deduced that currency is neutral in China, but has an impact on price. Shen Weiwei and Lan tian (2008)^[4] to Analysis of money supply and economic growth from 1991 to 2014, found that they had a significant positive correlation, that is to say, China's monetary policy can result in a significant macroeconomic management operating results.

In conclusion, regarding the issue whether the money is neutral or non-neutral, scholars do not have a unified point of view now. This paper will discuss the applicability of the theory of Keynes's Currency non-neutrality in China, namely economic growth can be stimulated by changing the money supply, providing the formulation base and implementation for monetary policy.

2 The Money Supply and Economic Growth Relations Empirical Analysis

Based on the above, the author will test the money supply in Chinese impact on economic growth. In order to test the relationship between them, this article selects annual data from 1991 to 2014 as sample for empirical testing.

2.1 Index selection and model selection

This article uses Gross Domestic Product to measure economic growth, namely GDP. Using the money supply released by People's Bank of China's broad money supply M2 representatives. Data from the national bureau of statistics website(<http://www.stats.gov.cn/>) and the people's bank of China website(<http://www.pbc.gov.cn/>). Due to the nature of the process of building the model sample data have certain requirements and restrictions, the author repeatedly verified, and ultimately selected the year-on-year growth rate of GDP and year-on-year growth rate of M2 to test, for RGDP, RM2. Accordingly, the first order difference respectively represents the change of economic growth, the change of money supply growth rate. See model below:

$$RGDP_t = \alpha + \beta RM_{2t} + \varepsilon_t \quad t=1991, \dots, 2014 \quad (1)$$

2.2 Stationary test

In the time we obtained time series data, in order to prevent spurious regression phenomenon, we need to determine stability data. General using ADF unit root test method test whether smooth. The test results are shown in Table 1.

Table 1 RGDP,d(RGDP), RM₂, d(RM₂)Stationary Test

variable	Type test(C,T,N)	ADFstatistics	Prob	conclusion
<i>RGDP</i>	(C,T,1)	-2.2492	0.4426	Non-stationary
<i>d(RGDP)</i>	(C,T,1)	-5.2313	0.0019	stationary
<i>RM₂</i>	(C,T,1)	-1.8686	0.6377	Non-stationary
<i>d(RM₂)</i>	(C,T,1)	-4.3011	0.0133	stationary

Note: The test form (C, T, N) represents a constant term, C on behalf of the intercede, T on behalf of the trend term, N on behalf of the lag order; d represents the differential.

ADF test shows under the 10% significant level, the original time series RGDP, RM₂ is not passed ADF unit root test, that it accepts the existence of the unit root null hypothesis, namely the original time series are non-stationary. The first difference RGDP, RM₂ respectful ADF test again, the results show that under the significance level of 5% rejects the null hypothesis, RGDP and RM₂ for the first-order single whole sequence.

2.3 Cointegration test

In the study of relationship between RGDP and RM₂, the author uses two variables Granger causality test whether the two factors are cointegration, and if they are cointegration, that means there is a long-term and stable relationship between RM₂ and RGDP.

2.3.1 Least square method

Firstly, respectively RGDP, RM₂ as the dependent variable and the explanatory variables, using least square method to test RM₂ and RGDP, the equation is obtained:

$$RGDP_t = 6.1985 + 0.1964 \times RM_{2t} + \varepsilon_t \tag{2}$$

(t = 5.8258) (t = 3.8603)

(Note:t in parentheses represents the corresponding estimate of test statistic).

2.3.2 Residuals stationary test

Based on least square method, extracting the residual sequence, the sequence defined as e, e smoothness test sequence, select ADF test, the test results shown in Table 2.

Table 2 Residuals ADF Unit Root Test

variable	Type test (C,T,N)	ADF statistics	Prob.	conclusion
e	(C,0,1)	-3.0467	0.0453	stationary

Note: The test form (C, T, N) represents a constant term, C on behalf of the intercede, T on behalf of the trend term, N on behalf of the lag order.

As it can be seen from Table 2, at the 5% significance level sequence e rejects the null hypothesis, as a stationary time series. The presence of co-integration relationship exists between RM₂ and RGDP, namely long-term stable relationship, which means the existence of long-term stable relationship between money supply and economic growth.

2.4 Granger causality test

From the analysis above that there is a long-term equilibrium relationship between RGDP and RM₂. Nonetheless only from the co-integration relationship between the two has not determined statistically significant causal relationship. Based on this, the author uses the method of Granger causality to test whether there is a causal relationship between RGDP and RM₂, results as shown in Table 3.

Table 3 Granger Causality Test

Null Hypothesis:	F-Statistic	Prob.	Lags	Conclusion
<i>RM₂ dose not Granger Cause RGDP</i>	1.7151	0.2052	1	accept
	2.1031	0.1527	2	accept
	1.6931	0.2141	3	accept
	0.6519	0.6374	4	accept
	0.7003	0.6387	5	accept

In according with the results in Table 3, when lag of 1-5 and a significant level of 5%, RM₂ does not Granger Cause RGDP, the longer lag order RM₂, the impact of RM₂ for the more deviation RGDP.

Through the above analysis shows, RM₂ has a little impact on RGDP, RM₂ does not Granger cause RGDP, but both of them have cointegration, so it can be deduced that RM₂ does not directly affect

RGDP, but it may indirectly affect RGDP by other indicators, which means is the money supply cannot directly affect economic growth, but indirectly through other variables affect economic growth.

3 The Money Supply, Inflation and Economic Growth Relations Empirical Analysis

3.1 Data sources

By the theory reviewed above, some scholars use the price level as an intermediate conductive medium, and also include the influence factors of the price level in GDP statistics, so the author selected the rate of inflation as the money supply intermediary index in the process of analyzing impact on economic growth. In order to be consistent in data processing, the author used the consumer price index year-on-year growth rate on behalf of the inflation rate, for RCPI. Data selected from 1991 to 2014.

3.2 Stationary test

To investigate whether RCPI sequence is smooth, we can use the unit root test. General using ADF unit root test method to test whether it is smooth, test results as shown in Table 4.

Table 4 RCPI Stationary Test

variable	Type test(C,T,N)	ADF statistics	Prob.	conclusion
<i>RCPI</i>	(C,T,1)	-3.1799	0.1139	Non-stationary
<i>d(RCPI)</i>	(C,T,1)	-4.1401	0.0193	stationary

From table 1 and table 4 we can know that RGDP, RM2, RCPI original series are non-stationary series, and the first order difference sequence for stationary time series can be co-integration test.

3.3 Cointegration test

Cointegration test of three time series should use E-G test, so this part we chose to use the Johansen cointegration to test cointegration. Three time series of Johansen cointegration test should first establish the var model, but the Var model required sequence for stationary time series, therefore, choose *d* (RGDP), *d* (RM2), *d* (RCPI) build Var model, determine the marvelous lag order number for order 4, lag order inspection results as shown in table 5. Finally, according to the laws of the AIC and SC to determine the Johansen cointegration test, the optimal lag order to 1 order.

Table 5 Var Model Lag Order Inspection Results

lag	LogL	LR	FPE	AIC	SC	HQ
0	-136.5288	NA	480.0559	14.6872	14.8364	14.7125
1	-114.5813	34.6540*	125.1971*	13.3243	13.9208*	13.4253
2	-105.4592	11.5226	135.2212	13.3115	14.3553	13.4882
3	-96.1568	8.8129	167.0594	13.2797	14.7709	13.5320
4	-82.4646	8.6477	179.2498	12.7858*	14.7243	13.1138*

So building the Var model is as follows:

$$d(RGDP_t) = \alpha + \beta d(RGDP_{t-1}) + \eta d(RM_{2,t-1}) + \mu d(RCPI_{t-1}) + \varepsilon_t \quad t=1991 \dots 2014 \quad (3)$$

On the basis of building the Var model, test cointegration using Johansen cointegration test, the results as shown in Table 6.

Table 6 d(RGDP),d(RM₂) and d(RCPI) Cointegration Test Results

Hypothesized No. of CE (s)	Eigenvalue	Trace Statistic(Prob.**)	Max-Eigen Statistic (Prob.**)
None*	0.7425	55.8938(0)	28.4914(0.0038)
At most 1*	0.6120	27.4024(0.0005)	19.8830(0.0058)
At most 2*	0.3010	7.5194(0.0061)	7.5194(0.0061)

As can be seen from table 6 inspection results, under 1% significance level, the *d* (RGDP), not only there is cointegration relationship between *d* (RM2) and *d* (RCPI), but also has two collaborators whole vector, namely *d*(RGDP), *d*(RM2) and *d*(RCPI) between the long-term stable relationship. Cointegration equation is:

$$d(RGDP_t) = -0.2420 + 0.0553 \times d(RGDP_{t-1}) + 0.6219 \times d(RM_{2,t-1}) - 0.3072 \times d(RCPI_{t-1}) \quad (4)$$

By the formula (4) it can be seen that the money supply affects economic growth significantly superior to formula (2).

3.4 Granger causality test

Through the method of granger causality test to verify *d*(RM2) and *d*(RCPI) is the granger

causality of $d(RGDP)$, the results are shown in Table 7.

Table 7 Granger Causality Test

Null Hypothesis:	χ^2 -statistic	Prob.	Lags	Conclusion
$d(RM_2)$ dose not Granger Cause $d(RGDP)$	3.0858	0.0290	1	reject
	3.2550	0.0464	2	reject
	4.2372	0.2370	3	accept
	2.7032	0.6087	4	accept
	1.3541	0.9293	5	accept
$d(RCPI)$ dose not Granger Cause $d(RGDP)$	3.6182	0.0356	1	reject
	3.2027	0.0425	2	reject
	1.1371	0.7681	3	accept
	1.5877	0.8110	4	accept
	2.1458	0.8286	5	accept

Combining with the above said we could deduce, in the long run, you can adjust the supply of M2 to influence prices, and influence GDP through the mechanism of price **transmission**.

3.5 Impulse response and variance decomposition

3.5.1 Impulse response analysis

Based on $d(RGDP)$, $d(RM_2)$ and $d(RCPI)$ Var model impulse response analysis, impulse response diagram is shown in figure 1, figure 2.

Figure 1 Response of D(RGDP) to D(RM₂)

Figure 2 Response of D(RGDP) to D(RCPI)

As can be seen from figure 1 and figure 2, when $d(RGDP)$ is given a positive impact of $d(RM_2)$ and $d(RCPI)$ respectively, $d(RGDP)$ response to the fast rising and falling fast in the first two period respectively, and in the second period reached highs and lows, starting from the 3 period leveled off gradually, which suggests that $d(RM_2)$ by an external shock, after the market transfer $d(RGDP)$, to $d(RGDP)$ synthetic impact, and $d(RCPI)$ after a certain impact by external conditions, to $d(RGDP)$ reverse impact. Giving the money supply is a positive impact, it has obvious positive impact on economic growth significantly, and giving the price level is a positive impact, it has obvious negative effect on economic growth, at the same time, the absolute value of the maximum value is greater than the absolute value of the minimum value. That is to say, adding the inflation rate as an intermediate transmission medium, the influence of money supply on economic growth significantly becomes greater than its original effect directly.

3.5.2 Variance decomposition.

Impulse response is to measure the response of variable degree when impacted by other variable, but variance decomposition is to study the contribution of each of the endogenous variables. By the former co-integration analysis, the $d(RGDP)$, $d(RCPI)$ and $d(RM_2)$ have a co-integration relationship among them. In order to see $d(RGDP)$, $d(RCPI)$ and $d(RM_2)$ mutual effect, this paper uses variance decomposition to study $d(RM_2)$ and $d(RCPI)$ impact on $d(RGDP)$. The results see at table 8.

Table 8 Variance Decomposition of $d(RGDP)$

Period	S.E.	$d(RGDP)$	$d(RM_2)$	$d(RCPI)$
1	1.3388	100.000	0.0000	0.0000
2	1.4616	84.3146	10.3249	5.3606
3	1.4941	84.5014	10.1401	5.3586
4	1.4979	84.1384	10.3641	5.4975
5	1.4995	84.0943	10.3920	5.5137
6	1.4997	84.0897	10.3954	5.5149
7	1.4998	84.0855	10.3979	5.5166
8	1.4998	84.0857	10.3978	5.5166
9	1.4998	84.0854	10.3979	5.5166
10	1.4998	84.0854	10.3979	5.5166

From table 8 we can know that the contribution rate of $d(M_2)$ on $d(RGDP)$ in the second period is 10.32%. The fluctuation contribution of $D(RCPI)$ on $d(RGDP)$ is small, the contribution rate in the second period is 5.36%, basically stable at 5.51%. So the impact on economic growth resulted from the money supply is bigger than that from the price level

4 Conclusions and Recommendations

We can draw the following conclusion: in China, there is a long-term co-integration relationship between money supply and economic growth, but the influence of M_2 on GDP alone is not strong. M_2 , the inflation rate and GDP establish equilibrium relationship in the long run. Money supply and inflation rate together have greater influence on economic growth than money supply. Therefore, in the long run, money is neutral. Analyzing the results of granger causality test, we know that M_2 and inflation rate are the granger reason of GDP, the strongest granger causality in the lag phase 2. Through the conclusion of the impulse response and variance decomposition can be seen, economic growth mainly comes from the money supply. From formula (4) we can see a positive relationship between GDP and M_2 , with a negative relationship with inflation rate, and the interaction between the three can make the economy in the short term artificially high, but in the long term restricts each other and promotes each other, which means economic development can be done by regulating the money supply.

The author thinks that Chinese monetary policy should improve the monetary policy transmission mechanism, standardize the interbank borrowing market and bond market, and improve the strength of the people's bank of China open market operations. We should also analyze the magnitude of the intensity of monetary policy and the effect and time lag and so on. We should also take the money supply and inflation into consideration when we evaluate the economic growth. Economic growth should be attained with the goal of monetary policy "low inflation, high growth". We should also strengthen the coordination between monetary policy and other macroeconomic policies, and effectively enhance the expected effect of monetary policy.

Through the study of this article, the author verified the applicability of Keynes's Currency non-neutrality in China, which means that the money supply has a positive correlation with economic growth, and therefore, we can stimulate economic growth by expanding the money supply. There is no direct impact on the two factors, but the two factors indirectly achieve some impact through inflation. Due to the fact that the rate of inflation and economic growth have a negative correlation, monetary authorities should set reasonable monetary policy to deal with the relationship between inflation rate and economic growth, so that China can realize the ultimate goal of monetary policy—"to maintain price stability on the basis of high growth".

Impact of Corporate Social Responsibility on Firm's Financial Performance: The Tanzanian Perspective

Juliana Isanzu, Xu Fengju

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: julianaisanzu@yahoo.com, xufju@163.com)

Abstract: There has been a significant growth of interest in the field of corporate social responsibility and the debate is still hot. There are however very few studies done in the least developed countries on the subject matter. The main objective of the study was to investigate the impact of CSR on Firm Financial Performance in the least developed countries, Tanzania being the country in question. The aim of this paper is to find out if there is a significant difference in financial performance of firms that engage in CSR relative to those that do not practice CSR. Independent sample t-test was used to test hypotheses. The data set included randomly selected 101 firms operating in Tanzania using accounting based measures of financial performance namely Return on Asset, Return on Equity. The findings presented revealed that there is a significance difference in financial performance favoring those firms that do Corporate Social Responsibility, implying that CSR has a positive influence on firm financial performance. Firms should then engage in corporate social responsibility so as to improve their financial performance and managers should not underestimate the contribution they make by committing their time and resources to make sure their CSR programs are effective in order to achieve the competitive advantage.

Key words: Corporate Social Responsibility (CSR); ROA; ROE; Tanzania

1 Introduction

As stakeholders become more aware of what is going on with regards to their favorite businesses' operations and the contribution the firms can make to the development of the communities around them. Pressures have increased on businesses to act more socially responsible. This has forced firms to evolve from their primary goal of profit maximization to the new goal of shareholder's wealth maximization which requires firm to take into consideration the demands of the different stakeholders as they go about their daily operations and inclusion of social and environmental factors in their decision making (Karaibrahimoglu, 2010).

CSR is seen as a duty the firm has to minimize unethical behavior such as waste reduction and emission, to maximize efficiency and protect the environment for future generations (Mushi, 2007). In Africa businesses have a major role to play to speed up the transformation process and the best way to contribute is through CSR though there is still a need for improved corporate governance, poverty eradication programs, fairer trade practices and capacity building (Visser, 2005).

When firm's engage in CSR they demonstrate the change in behavior that benefits both the firm and the society resulting in a multiple effect, a firm is said to be socially responsible when it becomes a leader in improving the well being of the community and environment around it. The firm accepts the role to balance the expectations of different stakeholders as they are crucial for its survival (Tsoutsoura, 2004).

CSR evolved after the problems that rose when firms turned their backs on the society and ignored their moral/ethical responsibilities.

Many companies were caught off guard by social responsibility controversies such as food companies when they denied obesity as not their problem, Nike and Gap sweatshops issues said the workers were not hired by them directly, the giant de beers denied causing unrest over diamonds in Liberia and Angola (Zadek, et al. 2009). After their brand reputation and licenses were at stake they learnt their lessons and slowly started to acknowledge their responsibility to the community and environment around them. These experiences have opened their eyes to know that CSR goes beyond the law and concerns responding to the environment, social and economical issues that affect the long term performance of the firm.

In the mining sector when environmental pollution occurs and the surrounding communities get affected when they drink polluted water from the toxics that come from the industry waste and the vegetation and the law suits that are expensive arise when people demand to be compensated (Heal, 2008). The reputation of the firm is tarnished as the news spread and people around become aware of the irresponsibility of the firm. This may render the firm to lose its important stakeholders, be sanctioned

from operating in some countries, confiscation of the plants and products and lose a reputation that it has built through hard work and commitment for so many years.

Jody, et al (2012) reported that Anglo Gold Ashanti allegedly took some plot of the school near by the mining premises still the school had no water, toilets and the areas where the water pipe passes people were prohibited to use water for irrigation nor livestock drinking. Furthermore compensation was never paid for the surroundings villagers whose live stocks died from drinking polluted water near the mines. Collapsing of 52 houses nearby from the blasts in Nyakabale mine in 2000 and increasing miscarriages of the women in nearby villages because they use water from the springs which were contaminated from the spills of nearby mines.

In November 1995 Ken Sarowiwa and 8 Ogoni people were brutally murdered by hanging in Nigeria in the protest of their right to clean air, water and land from the environmental degradation which was caused by Dutch British Shell's oil drilling in the Niger Delta (Green Peace International, 1995).

Conservatives have the notion that CSR comes at an extra cost that will wear down the firms' profitability and eventually its overall competitive advantage, but there is new evidence from developed markets showing that the two are not necessarily mutually exclusive (Berns, et al 2009).

A few studies have been conducted by researchers (Tsousoura (2004), Fauzi (2007), Ntoi (2010), Bolanle (2012) to understand the relationship between CSR and FFP in African countries but the results are still inconclusive, with researchers getting mixed results and fewer studies which have been done here in Tanzania with regards to the subject matter which were purely qualitative. Corporate Social Responsibility can play a great role in economic, social and environmental development of the country. This has motivated the researcher to carry out a similar study in Tanzania. The research seeks to assess the impact of Social Responsibility on Financial Performance by showing whether or not there is a significant difference in financial performance of firms practicing corporate social responsibility relative to those that do not practice CSR.

2 Literature Review

Corporate Social Responsibility (CSR) is the action in which the firm takes into account their involvement in the social activities as well as mitigating the effects of their business on the community and natural environment. Initially CSR was only limited to what the company does to its workers and their families but now it extends further to reach out to many people who are called stakeholders (Fauzi, 2007).

Firm's Financial Performance is a subjective evaluation of how well a firm can use assets from its primary mode of business and generate revenues. The term is also used as a general measure of a firm's general financial health over a given period of time, and can be used to compare similar firms within the same industry or to compare industries or sectors in aggregate (Fauzi, 2007).

The study results on the CSR and FFP link have never been in accord, as some studies determined negative correlation, some determined positive correlation, while others determined no correlation at all.

The perspective for positive correlation between CSR and FFP suggests a company's explicit costs are opposite of the concealed costs of stakeholders, therefore, this viewpoint is anticipated from the perspectives of avoiding cost to major stakeholders and bearing in mind their satisfaction. The proponents of positive relationship like Sweeney, (2009) found that there is a positive relationship between CSR and financial performance and it's because it affects the company's reputation, employee attraction and loyalty. It is also said that the stakeholders are indispensable since the very existence of the company depends on them. These are the people without their support the firm would definitely collapse. The researcher viewed CSR as those responsibilities extending beyond the law, a pursuit of policies that add value to the firm.

2.1 Overview of CSR in Tanzania

In Tanzania social responsibility came about with increasing competition as many companies flooded the country from various countries it gained momentum because now consumers have many options to choose from (Mushi, 2007). Now days CSR is used as a marketing tool for creating competitive advantage, ever since the number of firms doing CSR in the country has been on the rise. Recently a CSR award has been introduced which seeks to reward firms that make a greater contribution in the community through their CSR practices and also encourage other firms that are yet to incorporate CSR in their strategies to do so. Recently Tigo has partnered with a Swedish NGO on a pro child reach for change initiative that is aimed at improving the welfare of children (Daily News, 2012). This is a

very interesting move because some of the challenges seen on CSR implementation were proper identification of the community needs and pooling of resources which will be correctly addressed by entering into joint partnerships like this.

Mushi further stated that the Tanzanian community is characterized by problems of unemployment, diseases, poor infrastructure and the businesses depend on these people to support their operations by buying their products and services. This means the prosperity of the firm solely depends on the community, then what ever can be done to alleviate the community problems will be rewarded by the loyalty and reciprocity of the community.

2.2 Studies in other countries

Markets in developing countries face different challenges as to those in the first world. Firms find themselves in countries run by post war governments with significant budget deficit, heavy burdens of diseases and major skills shortage Ntoi, (2010). While there is so much evidence in support of positive impact of CSR on FFP, very little is published on its execution and impact on emerging markets. Ntoi, (2010) examined the difference in financial performance between SRI and Non SRI of companies listed on the Johannesburg stock exchange market. Using market based measures to assess the impact of investor behavior on social responsibility and its importance on financial performance. The findings revealed there is a difference in performance and further supports the positive link of CSR and FFP. The results show that Corporate Social Responsibility is rewarded by the stock market as their shares fetch higher price. Sustainability is a fairly new concept in Africa viewed most commonly in the context of charity which supports the bottom line (People, planet and profit).

Bolanle et al; (2012) carried out a study in Nigerian banks using Regression Model and found that there is a significant positive relationship between CSR and Firms Profitability because CSR reduces tax paid thus improving the overall firm's profitability. The researcher recommended that CSR commitment should not be underestimated despite some bad managers misusing the funds and claiming they have done CSR which can mislead the findings and eliminate the benefits that can be seen if you carry out the study under such a situation.

Uadiale and Fagbemi,(2011) using a Pearson correlation analysis carried out the study on a sample of Nigerian listed Company's and found that there is a significant relationship between CSR and Financial Performance and recommended that firms should commit their resources on CSR activities to enhance their image/reputation thereby increasing their returns. The researcher originates the driving force of CSR to the entry of multinational companies in the country.

Zadek et al, (2009) found that there is a need to view CSR more strategically by producing high quality products, environmental protection and minimizing its negative impact of the firms' activities on the environment and community. Corruption remains to be the biggest impediment in Africa as far as CSR implementation is concerned. Public services are unequally distributed and people are poorly paid making it hard to control corruption although the media is playing a major role in exposing the malpractices and corrupted businesses. Corruption hinders the social and economical development that is needed for sustainable development. Social investment also needs to be emphasized especially on areas like construction of schools and hospitals.

Tsoutsoura, (2004) pointed out that some shareholders regard CSR as a symbolic management skill, CSR is a symbol of status and the company reputation is improved by actions to sustain the community, resulting in positive influence on sales. Thus, when a company increases its costs by improving CSR in order to increase competitive advantages, such CSR activities can enhance company status and in the long run FFP can be enhanced, by sacrificing the short term FFP. The study stresses the importance of integrating CSR into the business culture and strategy for successful implementation, goes further to show that reputation and brand image as benefits of doing CSR it helps attract capital and trading partners, reduce costs from low employee turnover, recruitment and training costs.

Wanderly, et.al (2008) critically showed that the lack of academic literature on the impact of CSR on FFP in developing countries could be a reason why there is little disclosure and engagement of local firms. Practicing CSR may increase the company's avenues for capital access and entry into markets that take CSR as of paramount importance. The identified drivers of CSR in his paper include pressures from stakeholders, government and dependency on foreign business partners.

The proponents for negative correlation between CSR and FFP such as (Rapti and Medda, 2009) suggested that the fulfillment of CSR will bring competitive disadvantages to the company as need to bear other costs arise when firms are carrying out CSR activities. The increased costs will result in little gain if considered in economic interests. While when neglecting some stakeholders, such as employees or the environment, this results in a lower CSR for the enterprise, then FFP may be enhanced.

3 Data and Methodologies

Audited financial statements were used to obtain data of variables used in the study of financial year 2010 to 2012. 101 Companies were picked at random, some listed and others not listed in the stock market from different industries. Content analysis of annual reports was done to separate companies into two groups, those doing CSR and those that do not as used by Karaibrahimoglu, (2010) and Ntoi, (2010). Independent sample t test was used to check the significant of mean differences between CSR and non CSR companies. The test was under the following null hypothesis

Ho1: There is no significant difference of ROA between CSR and Non CSR firms

Ho2: There is no significant difference of ROE between CSR and Non CSR firms

4 Results and discussion

According to the criteria we applied 50 companies were practicing CSR and 51 companies were not, we called them non CSR. As it can be seen from table 1a the group statistics mean of CSR Return on Asset 0.093 is greater than that of Non CSR -0.0022.

Table 1 Group Statistics of ROA

	Group	N	Mean	Std. Deviation	Std. Error Mean
ROA	CSR	50	.092980	.0835012	.0118089
	Non CSR	51	-.002215	.0683699	.0095737

From table 2 levene's test for equality of variances has a significance of 0.076 which is greater than 0.05 level of significance this means the null hypothesis holds that the variances are the same, but the mean difference in profitability performance between the two groups is different since the significance of 0.000 of the t-test is less than 0.05 level of significance. Hence the null hypothesis is rejected and alternative accepted. This means there is a statistically significant difference on ROA between CSR and Non CSR firms.

Table 2 Independent Samples Test of Return on Asset

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper	
ROA	Equal variances assumed	3.216	.076	6.274	99	.000	.0951952	.0151722	.0650904	.1253001
	Equal variances not assumed			6.262	94.551	.000	.0951952	.0152021	.0650133	.1253771

As it can be seen from table 2a the group statistics mean of CSR Return on Equity 0.226 is greater than that of Non CSR 0.017. This means that CSR firm's perform better than Non CSR firms.

Table 3 Group Statistics of ROE

	group	N	Mean	Std. Deviation	Std. Error Mean
ROE	CSR	50	.22614	.142037	.020087
	Non CSR	51	.01706	.160626	.022492

From table 2 levene's test for equality of variances has a significance of 0.252 which is greater than 0.05 level of significance this means the null hypothesis holds that the variances are the same, but the mean difference in profitability performance between the two groups is different since the significance of 0.000 of the t-test is less than 0.05 level of significance. Hence the null hypothesis is rejected and alternative accepted. This means there is a statistically significant difference on ROE between CSR and Non CSR firms.

Table 4 Independent Samples Test of Return on Equity

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
ROE	Equal variances assumed	1.327	.252	6.925	99	.000	.209079	.030193	.149170	.268989
	Equal variances not assumed			6.933	9.797E1	.000	.209079	.030156	.149235	.268923

Hypothesis 1: *The findings revealed that there is a significant difference between ROA of firms that do CSR in comparison to those that do not practice CSR which lead to the rejection of the null hypothesis.*

The findings conforms with Poddi and Vergalli, (2008) also found that there is a positive relationship between social responsibility and financial performance stressing on the importance of reputation and risk reduction as factors that lead to a better financial performance of firms that are socially responsible. Ching, et al, (2009) also found a positive impact on the Return on Assets for the next period. Arguing that when a company is in good terms with its stakeholders, it will promote its own image and build brand awareness. Consumers will believe that the company has a better reputation, which improves the competitive edge of the company, as customers would become loyal and willing to purchase company's products. It also promotes the morale of its employees in turn reducing costs associated with labor turnovers and improving productivity.

Hassan et al, (2012) also found similar results. Through globalization companies pursue growth, and active involvement in community beneficial programs which provide competitive advantage to the company as they pursue such goals. Companies operating in several nations are often required to play a substantial role in community issues of the particular nations, otherwise government regulations, environmental restrictions, labor exploitation issues and can cost companies millions of cash. Under such circumstances, Corporate Social Responsibility will increase both long term profitability and sustainability of the company while enhancing the reputation of the organization.

Hypothesis 2: *The findings revealed that there is a significant difference between ROE of firms that do CSR in comparison to those that do not practice CSR which lead to the rejection of the null hypothesis.*

Chen and Wang, (2011) found that there is a positive relationship between social responsibility and financial performance because shareholders feel guaranteed that their interests are being protected and their funds are also used to improve the well being of their societies by donations made on different CSR projects and environmental protection. This in turn reduces the transaction costs of obtaining external funding since the shareholders have no fear of adding more assets to the company.

Uadiale and Fagbemi, (2011) also found similar results, CSR have the potential to make positive developments in the society and businesses. Organizations are beginning to see the paybacks from setting up strategic CSR programs. The increasing attention to CSR is based on its proficiency to influence firms' performance.

All findings are in favor of companies that practice social responsibility confirming that indeed CSR has an impact on financial performance and it is a positive one since companies practicing CSR perform better than that do not practice CSR.

5 Conclusion

The aim of the study was to test if there is a significant difference in financial performance of companies that engage in CSR relative to those that do not. The results showed that there is a significant difference in performance supporting the existing body of knowledge for the positive impact of CSR on financial performance.

Corporate social responsibility increases the firm's brand awareness, leads to tax relief because of the deductibility of CSR expenditures before taxes are charged. Corporate social responsibility builds a good relationship with the stakeholders through full optimization of the supply chain that leads to efficient use of resources and increased operational efficiency. Social Responsibility improves customer loyalty, leads to reduced risks that normally stem from expensive lawsuits and compensations and also

lowers the firms cost of capital. Corporations have become more powerful since the largest global economies are dominated by them; therefore it's only sensible for them to have an increased role in addressing social problems. If you look at the issues of environmental degradation, employees' welfare and poverty state of the communities around them, they are best positioned to address and alleviate these challenges faced by the communities.

Policy implications also arise from practicing CSR; it is recommended that companies should be ranked in terms of Social Responsible performance and publishes even a list of those not qualifying as socially responsible to make consumers aware of the firms they deal with. The practice will revolutionize and the efforts will transform the community that is guaranteed.

Underdeveloped countries have been offering less stringent regulations, investment incentives, subsidies to increase FDI and growth of MNCs but this has added adverse effects on the states' ability to enforce laws and regulations which protect employees, environment and communities as a result developing countries have failed to encourage responsible business practices. Furthermore the government lacks the financial, legal and administrative resources to enforce strong regulations and their actions are further diluted by the lobbying and sponsorship of prominent politicians and trade associations by the corporations.

On Business Finance Flexibility and Its Influence on Financial Risks: A Case Study of Listed Companies on GEM

Xi Xiahui

Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 281284747@qq.com)

Abstract: With 402 sets of data from 134 listed companies on GEM from 2001-2013 as samples, this paper uses multi factor linear regression model to reveal the relation between financial flexibility and financial risk and comes to a conclusion that they are negatively correlated, specifically, financial flexibility can remarkably reduce risk through model testing and analysis of Empirical results.

Key words: Financial flexibility; Financial risk; Listed companies on GEM

1 Introduction

With rapid technological reform, global competition and rapidly changing market environment, enterprises find it is difficult to predict and master market trends, thus to quickly respond to the changes of the market. Enterprises' rigid financial management has been unable to cope with the uncertainty of the market. So scholars explore the flexible financial management model in response to increasingly diversified market. Deng Mingran (2002) defines the financial flexibility as enterprise's ability to take measures quickly and efficiently when faced with environmental changes and the resulting uncertainty. At the same time he classifies financial flexibility as financing flexibility, investing flexibility, operational flexibility, and the flexibility of benefit distribution.^[1]

Gem-listed companies are always fast-growing innovative companies which, especially high-tech companies, are faced with more financial risks compared to the traditional enterprises. At present, gem enterprises of China are lack of financial flexibility. To explore the relationship between financial flexibility and financial risks can help gem-listed companies to use financial flexibility to maintain a reasonable level and reduce risks.

2 Literature Review

Christian (2004) argues that flexibility can increase various capabilities for enterprises and it is also an effective strategy for risk reduction. Dreyer and Gornhaug (2004) think that financial flexibility can cope with the uncertainties facing the company. Financial flexibility is critical for enterprises to avoid financial risks and build competitive advantages. In 2005, Lie Eric in *Financial Flexibility, Performance, and the Corporate Payout Choice* discussed the impact of financial flexibility on the corporate spending choices. The company's decision of changing spending levels conveys the information about revenue and business risk change.^[1]

Ge Jiashu and Zhan Meisong (2008) hold that financial flexibility does not only affect the profitability of enterprises and assessment of future cash flow, but also have an impact on enterprises' risk assessment. High or very high financial flexibility could reduce the risk of business failure^[3]. Zhao Hua and Zhang Dingzu think that financial flexibility directly aims to financial risk management. Financial flexibility is an integrated ability which consists of buffering capacity, adaptability, coordination skills, and creativity.

To sum up, research on financial risks is relatively comprehensive at home and abroad, but research on the relationship between financial risk and financial flexibility is not much. Based on GEM-listed companies, the paper is going to study the correlation between financial flexibility and financial risks through financing flexibility, investment flexibility and operating flexibility.

3 Theoretical Analysis

3.1 Financing flexibility and financial risk

3.1.1 Internal financing flexibility and financial risk

Compared with the main board listed company, gem-listed companies are of small scale, and sits in relatively unstable start-up and growth stage in the industry life cycle, so the development is not mature enough. This kind of enterprise has higher risks than main board-listed companies, so the funds mainly come from internal financing of enterprises. Higher internal financing flexibility means lower financing risks, thus, the financial risk is decreased accordingly. Therefore companies can improve internal

financing flexibility to achieve the goal of reducing financial risk.

Assumption 1: the more flexible the internal financing, the lower the financial risk will be.

3.1.2 External financing flexibility and financial risk

Single financing can only provide limited amount of money and inadequate funding will have limit on enterprise development. Sufficient external financing can help listed companies on the gem make reasonable and flexible options for low-cost and reasonable bailout package in response to environmental changes as well as to ease funding pressures. Therefore it can achieve the goal of reducing or mitigating financial risk.

Assumption 2: the more flexible the external financing, the lower the financial risk will be.

3.2 Investment flexibility and financial risk

3.2.1 Flexibility in choosing investment projects and financial risk

It is necessary for enterprises that want to be successful to have enough projects to choose. Enterprises can adjust investment according to the changes in the external environment and flexibly respond to various problems. The more options companies have in investment projects, the more easily they can respond to market changes, and the more successful they can have a foothold and stable development in the market.

Assumption 3: the more flexible in choosing investment projects, the lower the financial risk will be.

3.2.2 Flexibility in investment innovation and financial risk

Innovation not only brings competitive advantages to enterprises, but also poses a huge risk to enterprises. Flexible investment innovation is the enterprises' innovation ability to succeed in a changing environment. The more flexible in innovative investment, the greater possibility there will be to succeed in innovation. Many studies have shown that successful innovation can bring enterprises core competitiveness, increase enterprises' efficiency, and reduce financial risks.

Assumption 4: the more flexible in investment innovation, the lower the financial risk will be.

3.3 Operative flexibility and financial risk

Gem-listed companies compared with the main board-listed company face even greater environmental change and uncertainty. In complex and changing environment, if a company wants to survive, not to be out of the market, it must adjust the production and operation according to market changes, maintaining the operational flexibility to adapt to market changes.

Assumption 5: the more flexible in operation, the lower the financial risk will be.

4 Research Design and Configuration of Samples

4.1 Variable selection

4.1.1 Financial risk measure

Many empirical studies have shown that Z-score model can be used to measure the financial risk of listed companies in China. It has a strong applicability used by all kinds of stakeholders of listed companies as well as academic research as effective tools for analysis of listed companies' financial risk. In the paper, the measurement method used by other scholars will be applied, as well as the Z-score model to measure financial risk of sampling data of selected listed companies. Models are as follows:
 $Z = 1.2X_1 + 1.4X_2 + 3.3X_3 + 0.6X_4 + 0.999X_5$

In which: $X_1 = \text{working capital} / \text{total assets} = (\text{final current assets} - \text{final current liabilities}) / \text{final total assets}$;

$X_2 = \text{retained earnings} / \text{total assets} = (\text{final surplus reserves} + \text{final unappropriated profit}) / \text{final total assets}$;

$X_3 = \text{EBIT} / \text{total assets} = (\text{pre-tax profit} + \text{interest expense}) / \text{final total assets}$

$X_4 = \text{total market value of common and preferred shares} / \text{book value of total liabilities}$;

$X_5 = \text{sales revenue} / \text{total assets}$

In order to get easy access to data, in X_4 the market value of the final shareholders' equity total is replaced by gross book value of the final shareholders' equity as an alternative.

4.1.2 Financial flexibility measure

This paper puts profit distribution into financing flexibility, and classifies financial flexibility measures as financing flexibility measure, investment flexibility measure and operational flexibility measure. The specific measurement methods are shown in the following table:

Table 1 Financial Flexibility Measure of Gem-listed Companies

Flexibility		Metric	Measure
Financing flexibility	Internal financing flexibility	Internal funding adequacy (FCR)	The ratio of retained earnings and accumulated depreciation & amortization at the beginning of the year and the total assets at the end of the year
	External financing flexibility	External financing flexibility (FCN)	The total financing amount of capital that enterprise has used from external parties
Investment flexibility	Flexibility in choosing investment projects	Number of investment projects	The number of development items disclosed in the annual report of the research
	Flexibility in investment innovation	R&D strength (RDI)	R & D investment ratio
Operational flexibility	Operational flexibility	Operating cash flow adequacy (CF)	Ratio of net operating cash flow and total assets at the end of the year

4.2 Pattern design

According to the above, following model is presented:

$$\text{Risk} = \beta_0 + \beta_1 \text{FCR}_{i,t} + \beta_2 \text{FCN}_{i,t} + \beta_3 \text{RDI}_{i,t} + \beta_4 \text{N}_{i,t} + \beta_5 \text{CF}_{i,t} + \beta_6 \text{size}_{i,t} + \beta_7 \text{LEV}_{i,t} + \beta_8 \text{LRV}_{i,t} + \beta_9 \text{NPR}_{i,t} + \varepsilon$$

ε signifies residuals, symbolizes I company; t signifies the t year, β_0 is constant term. According to assumption 1 to 5, β_1 - β_5 is positive, according to the influence of control quantity on financial risk, β_6 , β_8 , β_9 is positive, β_7 is negative.

4.3 Configuration of sample

The paper selected totally 402 sets of data from 134 gem-listed companies (2011-2013) for study.

5 Empirical Analysis

5.1 Described analysis

Table 2 Described Analysis of Variables

	Sample No.	Min.	Max.	Mean	Standard Deviation
Rise	402	-2.2365	189.88	16.6678	21.744293
RDI	402	0.16%	98.39%	7.4693%	9.64771%
N	402	1	68	11.21	8.512
FCR	402	.0105	.3337	.112271	.0490240
CF	402	-.2423	.3635	.026187	.0688335
FCN	402	1	6	2.00	.984
Size	402	18.7602	22.5661	20.787611	.5819370
LEC	402	1.78%	52.15%	18.4078%	13.53888%
LRV	402	.5789	64.8006	8.799369	9.2464310
NPR	402	-99.23%	104.49%	16.4568%	21.17871%
Valid No.	402				

In Table 2, it indicates that a certain part of enterprises are faced with financial risk, but the majority of the enterprise's financial risk is relatively small. Gem-listed companies' ability to obtain cash is poor, thus they are faced high financial risk; minimum amount of external financing is 1 and the maximum value is 6, and most businesses have few sources from external funding.

5.2 Relevant analysis and model testing

In table 3, while $\alpha=0.05$, among the independent variables, internal financing adequacy is positively related to research and development intensity; the number of projects is positively correlated with the number of external financing channels. When $\alpha=0.01$, among control variables, asset-liability ratio is negatively correlated with investment intensity in research and development, and is positively related to external financing amount; and the size of enterprise is positively related to internal financing abundance and the number of external financing channels; net profit is positively related to investment intensity in research and development, the adequacy of internal financing, operating cash flow abundance; current ratio is positively related to internal financing abundance and negatively correlated

with the number of external financing channels. It can be seen that there exists multicollinearity between independent variables and controlled variables. We can conduct multilinear test through tolerance, Vif, and condition index. The test results are shown in table 4 and table 5.

**_significant related on two sides at 0.01
*_significant related on two sides at 0.05

Table 4 Tolerance and VIF Test

	RDI	N	FCR	CF	FCN	size	LEV	LRV	NPR
Tolerance	.886	.919	.743	.798	.745	.841	.541	.555	.757
VIF	1.129	1.089	1.346	1.253	1.342	1.190	1.847	1.802	1.321

Table 5 Condition Index Test

	RDI	N	FCR	CF	FCN	size	LEV	LRV	NPR
Condition Index	2.452	2.834	3.035	3.371	4.502	4.726	5.021	6.433	7.929

Variable tolerance is close to 1.VIF is between 1 to 2, and less than 10. All of condition indices are less than 10. There is multi-collinearity among variables, but of low level of colinearity within an acceptable range. So we can judge multi-collinearity among variables in this paper will not have a substantial impact on results.

5.3 Regression analysis

Based on the financial risk as the dependent variables, adequacy of internal financing and external financing amount and intensity in research and development, the number of investment projects in research and development, the adequacy of operating cash flow as independent variables, and firm size, assets and liabilities and net profit margin ratio, current ratio as control variables, the paper uses access methods to have a regression analysis of multivariate linear model. The regression results are shown in table 6.

Table 6 Regression Results

Model		Non-Standardized Coefficient		Standardized Coefficient	t	Sig
		B	Standard(Error)	Trial Version		
1	Constant	-5.408	1.741		-3.107	.002
	FCR	5.612	1.029	.158	5.454	.000
	FCV	.118	.051	-.067	2.310	.021
	RDI	.001	.005	.004	.144	.885
	N	.012	.005	.059	2.269	.024
	CF	4.980	.707	.197	7.042	.000
	Size	.283	.820	.094	3.474	.001
	LEV	-.025	.004	-.196	-5.771	.000
	LRV	.101	.006	.535	16.000	.000
NPR	.017	.002	.211	7.367	.000	

1) When $a=0.01$, the adequacy of internal financing is positively related to the risk. As the higher the risk is, the smaller the financial risk will be, that is the adequacy of internal financing is negatively related to financial risk when $a=0.01$: the more ample internal financing is, the smaller the financial risk will be, supporting assumption 1.

2) When $a=0.05$, the amount of external financing channel is positively related to the risk. As the higher the risk is, the smaller the financial risk will be, so the amount of external financing channel is negatively related to financial risk when $a=0.05$: the more the external financing channels there are, the smaller the financial risk will be, supporting assumption 2.

3) During reporting periods, when $a=0.05$, the amount of R&D projects is positively related to the risk. As the higher the risk is, the smaller the financial risk will be, so the amount of R&D projects is negatively related to financial risk when $a=0.05$: the more the R&D projects there are, the smaller the financial risk will be, supporting assumption 3.

4) There is no significant relationship between research and development intensity and risk, not supporting assumption 4. With ever-accelerating pace of today's market, research and development projects have to be put into operation and be listed as soon as possible so as to be likely to achieve market leadership, bringing healthy profits to reduce the financial risk. But always the effects of investment in research and development cannot be seen immediately in the period. So there is no significant correlation between the intensity of research and development and the financial risk.

5) When $a=0.01$, the adequacy of operating cash flows is positively correlated with the risk. As the higher the risk is, the smaller the financial risk will be, so the adequacy of operating cash flow is negatively correlated with financial risk when $a=0.01$: the ampler the company's cash flow for operating activities, the smaller the financial risk will be, supporting assumption 5.

6 Conclusion

Study has shown that financial flexibility could significantly reduce financial risk. In the volatile and uncertain market environment, flexible financial management is very important for enterprises. They should use the traditional rigid financial management while adding a flexible management style.

6.1 Enhancing financial flexibility

With the increasing uncertainties of the market environment, companies face growing financial risk. So traditional purely rigid management is no longer suitable for enterprises, and enterprises should pay attention to flexible management and the combination of rigid and flexible financial management financial to further reduce the financial risk of enterprises.

6.2 Appropriate financial flexibility

The greater the financial flexibility is, the higher the cost will be. When cost reaches a certain level, financial flexibility is going to cost more than the benefits it brings to the enterprise. On the contrary, it will increase the burden of companies. Enterprises' financial flexibility should have a certain boundary. Too high or too low is not scientific. The enterprise should adjust the financial flexibility according to their ability and the degree of environmental, keeping it within a reasonable range.

6.3 Reducing financial risks by various ways

Empirical studies find that financial flexibility could reduce the financial risks, but enterprises cannot rely solely on financial flexibility to manage financial risks. Financial flexibility has hysteresis nature and of high cost, so enterprise should not rely too much on financial flexibility to minimize financial risks while ignoring other means. Enterprises should combine financial management flexibility with many other instruments to reduce the financial risks within a scope that the enterprise can bear.

The Role of Individuals' Characteristics in Marketing Information Systems (MIS) Decision Making

Alowaidi Mahmoud Ghazi A, Wang Hu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: mghazi_123@hotmail.com)

Abstract: In this we examine a role of marketing information system in decision-making. The link between certain individuals' characteristics and their decision-making process is conceptualized. Consequently, the thesis is formed that marketing information system based decision-making is also impacted by individuals' characteristics. We suggest that there is a connection between decision-making styles of individuals and the decisions they make based on the marketing information systems. In our study this notion is substantiated through examination of prior literature, and a foundation is built for future exploration. We recommend that future studies should aim at explaining how individual traits directly influence decision-making. Additionally identifying different decision-making types and in what measure they influence the decision-making process is required. Finally, explaining the influence of the marketing information system and the way reach favorable decision-making outcomes is a key aspiration of future research.

Key words: Marketing information system; MIS; Decision-making; Marketing performance

1 Introduction

As the consumption and market demand of consumers become more sophisticated, marketing operations of companies are getting more focus within firms. Marketing processes such as marketing research, new product development, and customer relationship management are vital part of any company (Armstrong and Kotler, 2010). Increasing pressure from the competition additionally drives companies to make wise and well-informed business decisions, while gathering information continuously from sources inside and outside an organization. Informed decision will enable the decision maker to consider the alternatives and make an optimal decision (Obrenovic and Obrenovic, 2012). The marketing information systems role in companies' decision-making is increasingly growing. According to Armstrong and Kotler (2010), timely marketing information provides the basis for decision-making and can have a formidable result on the decision-making process itself. Nevertheless, a solely marketing information system that generates systematized information is not the only factor upon which decisions are made. Decision-making is a conscious human process and is guided by human emotions, abilities, and other characteristics. Furthermore, there are different types of decisions. Different benchmarks exist in determining on how decisions are made. The nature of decision and the level of authority are divided into four different criteria, according to Drucker, and they include: qualitative factors, the future times involved, the repetition, rareness or routine of a decision and whether the impact of a decision is on other function, areas or on the businessman as a whole. Therefore, given the inherent characteristic in people and considering a complexity of the business situation it is fit to regard marketing information system more as a tool that facilitates the decision-making process than as a determinant of high quality and effective decisions.

User characteristics and their decision-making styles are therefore important features that may impact the way a decision is made and how marketing information is processed. Therefore, in the conceptual study we aim to explore the link between decision-making characteristics of marketing information system users and decisions made based on the marketing information system. This study will also determine in which ways these managerial characteristics may or may not overlap with one another and in consequence influence the decision-making process and organizational outcomes. First, we introduce and elaborate on the concepts of marketing information systems, and decision-making. Next, we illustrate the role of individuals' characteristics and their decision-making styles in marketing information system based decision-making. The conceptualized model is visually represented in the third section. Finally, the suggestions for future studies are given, followed by the conclusion.

2 Marketing Information Systems and Decision-Making

According to Kotler "A marketing information system is a continuing and interacting structure of people, equipment and procedures to gather, sort, analyze, evaluate, and distribute pertinent, timely and

accurate information for use by marketing decision makers to improve their marketing planning, implementation, and control". Decisions are still predominately made, not based on calculated data, but on so called "gut feeling" of the managers, which reflect their recognition of general market trends and their experience. For the most part, the decision-making process mainly relies on intuition and "gut feeling", according to McDonald, because the information system does not make the actual decisions, although information reduces uncertainty and helps marketing managers to see the likely effects of various decisions. The marketing information system within companies is mainly universal, which means that the system is not specifically tailored to meet the requirements of different user levels in terms of experience, knowledge and other user characteristics. Not all workers create the same output, they are not capable to do so based on the level of experience, intuition or because of a knowledge factor. This is limiting because not all managers are the same, they do not have the same performance and cannot be equally efficient (Kotler, 2003). This means not all decisions are made in the same manner because the marketing information system does not have the same effect on everyone, specifically not in the desired measure.

According to McDonald, the marketing information system has to be precise and efficient to properly influence all managerial levels in making the right and appropriate decision. This type of a marketing information system transforms the decision-making process into concrete actions, along with its plans, policies and scopes. Planning leads to sound decision-making and that implies the selection from alternatives course of actions (Jobber et al., 2006). Making the right choice or decision is often very difficult to achieve as the individuals, or in this case company managers making the decisions have to include other factors in the decision-making process, such as experience and judgment, which may or may not overlap but definitely influence the decisions being made. Depending on the decision types, different decisions require different application of the marketing information system, simple decisions may not require much thinking and contemplating over so the marketing information system in that case may not have much influence on the decision-making process itself. As the decisions get tougher and more complex, the marketing information system and its role increases, and with that there is more room for error and for the decisions not to reach the desired outcome (Kotler, 2003). As the decision-making process gets more difficult, different factors come into the equation and become relevant, for example, was there any prior knowledge or experience regarding the decision or was intuition applied in the process (McDonald, 1996).

3 Decision-making Styles

Before actually proceeding to decision-making, one has to realize that it is a conscious human process. To decide implies to choose a particular course of action from among a set of possible alternatives, and reach a resolution. Decision-making is defined as the "conscious and human process, involving both individual and social phenomenon based upon factual and value premises, which concludes with a choice of one behavioural activity from among one or more alternatives with the intention of moving toward some desired state of affairs" (Fremount, et, al., 1970),. Despite minor variations in terminology it is clear that many of the critics of the narrow view of the role of marketing research are advocating a common concept—"the concept of careful search to generate a flow of ideas and information which will help executives make better decisions. According to (Fremount, et, al., 1970)" The notion of a sustained flow of decision-information leads to the term, "marketing information system".

A marketing information system is a structured, interacting complex of persons, machines, and procedures, requiring the coordinated efforts of many departments and individuals, including: Top management, marketing management, brand management, sales management, new product groups, market research personnel, control and finance departments, systems analysts and designers, operations researchers, statisticians, and model builders, programmers and computer equipment experts and suppliers (Harmon Robert R. (2003). Given that these individuals possess distinctive characteristics which guide their decision making process, it is advised that an information system they utilize fits not only the task, but their individual style of information-processing and making decisions.

Decision-making styles are significant strategies for approaching information system use decision dilemmas. Therefore, decision-making is a fundamental aspect of managerial and employees' behavior not only in information system use but other areas and the notion of decision making style is commensurate with individual difference paradigms in which there has been a resurgence of interest (e.g. Allinson and Hayes, 1996; Riding and Rayner, 1998; Sadler-Smith, 1998). Certain decision-making

style that is inherent in the individual himself may have an impact on the decisions made. When it comes to more complex decisions marketing information system is used to facilitate the decision making process. Regardless of the existence of MIS, and the organizational standards of MIS proposed use, an individual will rely on his personal “software of the mind” when processing information coming from MIS, or from other external sources. Consequently, a personal decision-making style may influence a decision made based on MIS. Finally, we propose that the quality of the reached decisions has an impact on marketing performance, and other organizational outcomes.

Figure 1 Research Model
(source: Ghazi, Hu)

4 Recommendations for Future Studies

Future research should focus on different managerial and employee characteristics and the decision making process based on the characteristics of marketing information system. Additionally, an effect on the organizational outcomes, such as marketing performance, financial, market performance should be examined. The studies will be an extension of the existing studies that have started to explore the causes of people’s decision-making, in particular managerial decision-making based on information systems. A sample of decision makers from various companies that have implemented the marketing information system should be studied in an effort to further explore business operations concerning marketing information systems. The problem exists that the marketing information system awareness in many companies has not yet reached sufficient levels for it to have a greater impact on the decision-making process itself. The degree of IT penetration and information use in business processes is not yet at the point where e-commerce and market data collection has become a routine practice.

In future studies we suggest creating a research model in which specific relationships between variables from the domain of marketing information systems and decision-making will be tested. Such study would explore and explain whether manager and employee characteristics influence marketing information system based decision-making. Moreover, we would find out which human characteristics lead to favorable marketing decisions and what kind of characteristics guide decision-making to produce favorable marketing outcomes. Consequently, we would suggest organizations on how to effectively foster marketing information system decision-making. By examining individual traits of different managerial levels and how they directly influence decision-making a contribution toward identifying different decision-making types and in what measure they influence the decision-making process will have been achieved. Explaining the influence of the marketing information system and how to reach favorable decision-making outcomes would provide a clear identification on which marketing information processes contribute most to successful decision-making outcomes.

5 Conclusion

The main objective of the paper was to substantiate the thesis that human characteristics affect decision-making based on marketing information systems. We have accepted the definition of decision-making as the “conscious and human process, involving both individual and social phenomenon based upon factual and value premises, which concludes with a choice of one behavioural activity from among one or more alternatives with the intention of moving toward some desired state of affairs”. As these individuals possess distinctive characteristics that guide their decision-making process, we posit that an information system suits their individual decision-making style. Through a review of key studies, we were able to conceptualize a link between the concept of decision-making styles that are inherent in human characteristics and decision that are based on marketing information systems. Additionally, we suggested future studies to evaluate the current state of decision making, marketing information system use and marketing outcomes and to explore if and to which extent managers in companies are applying marketing information systems to make relevant marketing decisions and if the decision making is driven more by their individual characteristics and decision-making styles. Future studies should provide empirical evidence upon which effective management initiatives can be implemented. Decision-making is a domain worth further exploring given that it is a fundamental aspect of managerial and employees’ behavior. Therefore, recognizing different managerial types and discerning the manner in which they reach favorable outcomes in the decision-making process is

required.

The Multilateral Relationship: Chinese Yuan and Other ASEAN Currencies

Alvaro Martin Saavedra Chavez, Miraj Ahmed Bhuiyan, Xu Fengju
Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: martinsaachz2012@gmail.com, Ahmed.miraz@gmail.com, Xufju@163.com)

Abstract: Scholars and researchers in the international finance have long puzzled over the lack of an empirical relationship between exchange rates and fundamentals and theoretical exchange rate models are difficult to verify using actual data related to fundamentals. This may be related to the length of the sample period or the choice of bilateral/multilateral exchange rates. Chinese yuan is going to play a vital role in terms of regional, sub regional and bilateral trade between china and its counterparts. The co-integration relationships between multilateral exchange rates and fundamentals were found, and short-run fluctuations in multilateral exchange rates contribute to forecast changes in fundamentals. We surmise that the reason for this is that multilateral exchange rates provide more comprehensive empirical information, which can enhance the explanatory power of conventional exchange rate models in empirical applications.

Key words: Multilateral Exchange Rates; Asian currencies; Currency co-integration; Multilateral relationship

1 Introduction

China's emerging economy is a big issue for several decades. As well as its own currency (RMB) exchange rate has got lots of supporting and criticisms. Alike with other national china has also its own currency policy. Despite of international criticism china is trying to maintain its own strategies. PRC has experienced rapid growth over the past two decades, and has taken steps towards internationalization of the yuan. However, the yuan continues to be tightly managed and has a long way to go before it can become fully convertible. Hence, as pointed out in several studies such as Kawai and Takagi (2005), Ogawa and Shimizu (2007) and Girardin and Steinherr (2008), it would be appropriate to create a basket of appropriately weighted regional currencies.

1.1 Objectives and scope of the research

The main objectives of the research are to resolve:

- 1) To find a relationship between RMB and other Asian currencies.
- 2) Impacts on Asian economies of RMB depreciation and appreciation
- 3) Importance of Chinese Yuan on Asian economy.

1.2 Methodology

Secondary information sources are main sources of data for this report. Wide range of related topics from several books, journal, articles, and publications were covered while accomplishing the paper. Trusted governmental websites are also another major source of our data. Some data we have used for some calculations. We have tried to explore some newspapers that deals with related topics.

1.3 Literature review

According to (Akhtar and Spence, 1984), Exchange rate volatility is a source of concern as currency values partially determine the price paid or received for output/goods and, consequently, this affects the profits and welfare of producers and consumers. so the exchange rate volatility has a good relation with the volume of goods traded internationally by making prices and profits indeterminate. By using a popular model of exchange rates-ex- tended by Frankel (1979) on the basis of an earlier version proposed by Dornbusch (1976)-we also hope to lay the ground for more satisfactory tests of its theoretical foundations. Secru and Uppal (2000) showed the theoretical possibility of both positive and negative relationships, and Bacchetta and Wincoop (2000) illustrated a theoretical model exhibiting no relationship between these variables. Numerous studies showing the high degree of volatility of exchange rate movements have led policy makers and researchers to investigate the nature and extent of the impact of such movements on volume of trade, both exports and imports.

2 RMB or US Dollar? Medium of transactions between ASEAN and China

Major currencies in ASEAN region have had a long history of following the US dollar. After the Asian financial crisis, some countries adopted more flexible exchange rate regimes, but empirical works have shown that US dollar was still the de facto anchor currency for many of them (Benassy-Quere, Coeure and Mignon, 2006). McKinnon and Schnabl (2004) used "dollar standard" to describe the return

of US dollar peg in the regional exchange rate regime from 1999 to 2003. More recent works also verified the importance of the US dollar (Frankel and Wei, 2008, Frankel and Xie, 2010). In fact, according to the latest exchange rate arrangement classification reported by the International Monetary Fund, among all economies in the ASEAN region, Cambodia officially use US dollar as exchange rate anchor while two others adopt a de facto exchange rate anchor of US dollar (Lao PDR and Vietnam). And for other countries, although US dollar is not the nominal anchor, it remains an important currency in their de facto currency baskets (Frankel and Wei, 2008, Frankel and Xie, 2010). Recently studies of the region's exchange rate regimes have started to assess RMB's influence on the currency baskets, in addition to the traditional anchors such as US dollar. Evidence seems to show that since China adopted a more flexible exchange rate in July 2005, RMB has become a more independent and increasingly important force in determining the region's exchange rates (Chen, Peng and Shu 2009, Henning 2012). Some authors even claim that RMB has become a reference currency and a RMB bloc is already formed in East Asia (Subramanian and Kessler, 2012). Nominal exchange rate movements of the major ASEAN currencies vis-à-vis the US dollar since July 2005 seem to suggest that a number of them do follow to some extent the fluctuations of the RMB, especially during the two periods when the RMB exchange rate exhibited higher volatility and gained the most appreciation against the US dollar (July 2005 to June 2008 and July 2010 to end of the sample at March 2013). Correlations between RMB and other major ASEAN currencies in the different sub periods also indicate that the co-movements of exchange rates tend to be higher when the RMB was floating more freely.

Furthermore, empirical results also show that the expedition of the cross border use of RMB in 2009 might have further increased the weight of RMB in some currency baskets. Similar results are obtained when the currencies are denominated in the Swiss franc, other than in the SDR. Due to potential collinearity between USD and RMB, we also explore whether the RMB weight will change substantially if the effect of the USD on the movement of the RMB is excluded to get the pure RMB effect on regional currencies, and the results are consistent. The underlying causes for the increasing importance of RMB in the region's currency baskets can be several. Increasing trade integration between China and these economies during the past decade or so is perhaps the most important factor (Subramanian and Kessler 2012). Annualized growth of exports and imports with China exceeded 20 percent for ASEAN economies, and more than 10 percent for Japan and Korea. Our analysis shows that closer trade and financial linkages as measured by bilateral trade and investment activities are indeed the major reason why the RMB is becoming more important. The business cycle factor is found to be insignificant. In addition to the economic factors, we notice that the deeper trade and financial integration is perhaps also a result of the more active policies pursued by the Chinese government, such as the push for the RMB to "go out" during the financial crisis and further liberalization of the capital account. We thus formally include a policy factor in our analysis and find that it has also contributed to the rise in the weight. Despite the rapid rising of RMB and the broad attention it gets as the latest new candidate for the international monetary system, the internationalization of the RMB is still at an early stage. The international use of RMB is still limited by certain aspects, such as its weight in global trade and financial transactions, foreign exchange reserves and other measures. This contrasts with China's share in global economy and trade. Wider cross border use of RMB will depend on further development of the capital markets and higher convertibility of the currency, and when that takes place RMB would presumably become a more important anchor currency in the ASEAN region.

3 RMB as an offshore in ASEAN

We believe China will play an increasing role as an exporter of capital into ASEAN due to its high level of savings, the saturation of domestic sectors, rising costs of production, and domestic de-regulation of investment. The creation of the ASEAN Economic Community (AEC) in 2015 will have an additional positive impact on this investment. With the uncertain direction of the US dollar and the euro being weighed down by continuing debt concerns, ASEAN business and banking communities have been increasingly using the RMB as an alternative trade and investment currency. The flow of RMB into ASEAN countries typically goes through Singapore. The RMB-denominated deposits in Singapore grew from 195 billion yuan at the end of 2013 to 220 billion yuan in the first quarter of 2014. RMB-denominated loans in Singapore, mainly trade financing, grew by almost 25 percent to reach over RMB 300 billion. Singapore accounted for about 60 percent of RMB trade finance outside mainland China and Hong Kong, based on SWIFT data. ASEAN economies will lead the global pack in adopting RMB as an international currency, expanding from trade settlement to infrastructure financing and

broader investment opportunities as the region's dependence on and loyalty to the US dollar declines. But for the currency to become a truly international reserve currency, China would need to open its capital account and achieve full convertibility. (Noel Quinn, HSBC)

Malaysia and Singapore's governments, competing for a share of bond issuance in a globalizing Chinese yuan, are finding big-cat branding alone isn't enough to challenge the dominance of Hong Kong. Cagamas Bhd. raised 1.5 billion yuan (\$244 million) earlier this month in Malaysia's inaugural offer of Tiger Emas bonds, the first issue in the Chinese currency to be cleared locally. The new securities join Lion City debentures in Singapore and Formosa bonds in Taiwan, which started last year and together comprise about 5 percent of a market that's dominated by Hong Kong's Dim Sum notes, Bloomberg data show. Singapore's position as a regional private banking hub, and Malaysia's stronghold as an Islamic center will bring new investors into the offshore yuan bond market. Hong Kong's advantage lies in its head start in opening up trade and investment in the currency. Yuan deposits in the city are approaching the 1 trillion yuan mark, versus some 254 billion yuan in Singapore as of June. Singapore is emerging as ASEAN's hub for offshore RMB, receiving more than half of China's foreign direct investment into the region up until 2010, an HSBC Holdings Plc report said last month. China shares a border with several ASEAN economies including Vietnam. "Since we started promoting offshore yuan bonds out of Singapore, we've seen additional interest and queries from Singapore-based investors and issuers," said Clifford Lee, the head of fixed income at DBS Group Holdings Ltd., the top-ranked arranger of Singapore dollar bonds since 2009. "Singapore is the first offshore clearing center truly outside of China. It's a welcome step in the development of the RMB." Yet it's still unclear what exactly denotes a Lion City bond. Unlike Swiber and notes sold by Hainan Airlines Co., which were cleared and listed in Singapore, the 3 billion yuan of securities sold by Bank of China Ltd.'s Singapore unit are listed on the Singapore Exchange, but not cleared in the city. "The RMB market will be an important one for Malaysia's Islamic finance industry," Steve Wang, the head of fixed-income research in Hong Kong at BOCI Securities Ltd., a unit of China's fourth-largest bank, said in a Sept. 22 phone interview. It will "sharpen their lead in Islamic finance if they can capture the opportunities in the offshore yuan market." So far only Khazanah Nasional Bhd., Malaysia's sovereign wealth fund, has sold a Dim Sum bond that complies with Islamic law. Those 500 million yuan of 2.9 percent three-year notes due next month are yielding 4.06 percent, Royal Bank of Scotland Group Plc prices show, compared with 3.24 percent at the start of the year.

4 ASEAN policies regarding international trade

Like all other nations or region ASEAN also has some its own trade policies. These policies may vary country to country, country to regions and other bilateral trades depending on trade terms and conditions. Also may differ as they have some special or common agreements. Here are some trade policies that related to international trade and transactions.

4.1 ASEAN exchange rate policy

In tandem with the active negotiation and completion of regional trade agreements with their East Asian neighbors, perhaps another contributing factor to the rapid growth in East Asia's trade is that before the 1997–98 East Asian crisis, most Asian countries maintained de facto dollar pegs, which worked to stabilize exchange rates within the region. With the adoption of more flexible exchange rates following the 1997–98 East Asian crises, intraregional exchange rate volatility has risen significantly. East Asian exchange rate arrangements cover a wide spectrum of regimes of varying degrees of flexibility ranging from the crawling peg of the PRC to independent floating regimes in the Republic of Korea, Japan, and the Philippines. The only exceptions are Brunei Darussalam; and Vietnam, all three of which operate a fixed exchange rate arrangement anchored on a single currency. One contributing factor for the move toward more flexible exchange rate arrangement in these East Asian countries is that after the Asian financial crisis, almost all of the crisis-affected countries, i.e., Indonesia, Philippines, and Thailand, chose to abandon a conventional pegged exchange rate regime in favor of flexible exchange rates, while Malaysia implemented a conventional pegged arrangement until 2005 but has since shifted to a managed floating exchange rate regime (ADB 2010). In other words, most East Asian monetary authorities have not willingly assumed the responsibilities that come with operating a rigid peg let alone the alternative of a clean float. To be more specific, by and large, the middle has not really become hollow for the exchange rate policies of these East Asian economies, and more of them have the desired preference of managing exchange rates that are edged toward flexible exchange rates albeit not free floating. The implication of the above analysis is that moving forward with deeper integration in the

region requires solving the exchange rate problem. This task is made more complex by a current understated nuance of East Asian middle-ground exchange rate management of less willingness to tolerate exchange rate appreciations. Part of the reason for the unwillingness has to do with the potential of losing competitiveness against other East Asian neighboring economies that compete with each other in markets within and outside of the region. As a consequence, the scenario of a beggarthy-neighbor competitive depreciation strategy, which can be costly to the region in terms of a large and unnecessary reallocation of resources across the region, always looms large on the horizon (Kawai and Takagi 2012). Richard Pomfret and Victor Pontines adb work paper explains the increasing impact of the RMB on the region's exchange rate determination also has policy implications for the ASEAN members. While higher trade and financial integration is the major force behind the RMB's rising importance, the deeper integration also means that the region might be increasingly subject to the spillover effects of China's domestic macroeconomic policies and structural reforms. The exchange rate risk might be mitigated through more use of RMB in cross border trade settlement, but other risks could also arise with economic integration with China and closer policy coordination between countries are needed regarding risk management and control. (Chuling Chen, Reza Y. Siregarand Matthew S. Yiu 2013)

4.2 ASEAN bilateral trade policies

Trade relation between china is a crucial factor that ASEAN countries have to consider when formulating their trade policy. According to Professor Ba Shusong from the Department of Finance of the State Council of the People's Republic of China, the Chinese Government decides on the exchange rate adjustment according to the trade imbalances among its major trade partners. Obviously Chinese government will try to get the favor of the exchange rate by imposing or restructuring its trade policies. In this case ASEAN countries also have to take some measures on this regard or the take some actions in reply. In case of ASEAN For those industries that may be exposed to negative impacts from the adjustments, the respective government can treat it in one of two different ways: if the industry falls into the category the government intends not to develop in the future, it will allow the industry to fade away through market processes; if the opposite is the case, the government will subsidize the industry in various ways to maintain and help it grow in the future. Before the adjustment is implemented, the government can organize a nationwide conference to explain to the firms that will be affected most directly, the reasons, consequences and responses to such an adjustment. In most cases the domestic firms will follow the advice from the government, even though a small number of joint ventures and wholly foreign-owned firms may not fully follow the recommended measures. The latter situation leads to a policy adjustment that is less than fully implemented or effective. Thus, whether and how the exporters actually respond to changes in the RMB exchange rate is an interesting and important question to explore.

One prime example is Singapore's soft-peg exchange rate system. The Singapore dollar exchange rate is managed and set against a trade-weighted basket of currencies of its major trading partners. The trade-weighted Singapore dollar is allowed to float within a target band as the economic environment changes. The Monetary Authority of Singapore keeps the trade-weighted dollar within the band through foreign exchange interventions (Kapur 2005). The policy is in part also designed to help Singapore maintain the 'soft peg' that has been crucial for its export-led strategy of economic development. Singapore's successful maintenance of its soft peg defies the conventional wisdom that soft-pegs are not viable. (xiao bing feng, Pacific economic papers,2006)

5 Conclusion

The composition of ASEAN-China trade has evolved considerably. Resource-based commodities especially hydrocarbon, wood, and fat and oil products accounted for two-thirds of the total export value of ASEAN to China in the early 1990s, but only 22 per cent in 1999. The relative share of manufacture goods electrical machinery and computer equipment especially – went up from 12 to 38 per cent in the same periods. Meanwhile, ASEAN imports from China have been comparatively more diversified. The top five imports (namely electrical machinery, computer equipment, hydrocarbon products, cotton and tobacco) accounted for almost two-fifths of the total import value in the early 1990s, and 57 per cent in 1999 (with cereals plus ships and boats replacing cotton and tobacco in relative importance).

The Relationship Between Intellectual Capital and Financial Performance of Banks in Tanzania

Janeth N. Isanzu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: ntogwisa@yahoo.com,)

Abstract: This study examines intellectual capital (IC) performance of banks operating in Tanzania, and investigates the relationship of IC on financial performance. It identifies the IC components that may be the drivers of the traditional indicators of bank success. The study uses the Value Added of Intellectual Coefficient VAIC™ methodology, to measure the Intellectual Capital efficiency of the Banks using a four years period data set from 2010 to 2013. The results of a survey, show that intellectual capital performance of Tanzania is low and it is positively associated with bank financial performance indicators. However, when VAIC is split into its components, the relationships between these components and bank financial performance indicators vary. Three value efficiency indicators, Human Capital Efficiency (HCE), Capital Employed Efficiency (CEE) and Structural Capital Efficiency (SCE) which are the components of VAIC™ ratio, were used in the analysis.

Key words: Intellectual Capital (IC); VAIC™; ROE; ROA; Banks; Tanzania

1 Introduction

In this 21st century which is widely recognized as the era of knowledge economy with the advent of knowledge based economy, the traditional bases sources of competitive advantage that depend on tangible assets such as labor and capital in creating firm value and sustaining competitive advantage begun to fade (Pablos, 2002). Intellectual capital (IC) is a relatively recent line of research that has received increasing scholarly interest with the continuing growth and development of the global knowledge economy, the study of Intellectual capital has attracted many researchers from all over the world and accordingly some studies have been conducted on different aspects of intellectual capital.

In emerging economy such as Tanzania the banking system is the most active sector and plays a significant role for growth of economy. Banks play significant role to facilitate the financial transactions. Tanzania has more than 50 years history of banking sector. By the end of 2012 the banking sector continues to expand and remain profitable, highly liquid and adequately capitalized. The volume of deposits increased by 17.9 percent to TZS 14,175.57 billion during the year ending March 2013 from the level recorded in the corresponding period in 2012. The number of banking institutions increased from 49 in March 2012 to 51 in March 2013 (Financial Stability Report, 2013)

At the end of 2013, the licensed banking system in Tanzania consists of 53 banking institutions consisting of 34 commercial banks, 12 community banks, 5 financial institutions and 2 deposit taking Microfinance Company. The ownership structure of the banking institutions for the period ending 2013 comprised of five (5) state-owned and forty eight (48) privately owned banking institutions. On the other hand, twenty seven (27) banking institutions were majority locally owned while twenty six (26) were majority foreign owned. (Directorate of Bank Supervision, 2013)

A study conducted by (Pedrini, 2007; Green, 2007) shows that Intellectual capital can be used for multiple needs simultaneously; intellectual capital eliminates the scarcity that typically limits the use of physical resources. Since intellectual capital can improve the financial performance of organizations, create value, and provide sustainable environment for competitive advantage globally, the use of intellectual capital should become one of the priorities of all organizations (Cohen and Kaimenakis, 2007). Ahuja and Ahuja (2012), recognizes that an efficient utilization of IC is essential for success for bank to have competitive advantages than other industries, in order to deliver high quality services by a bank depends on its investment in items related to IC such as its human resources, brand building, systems and processes

This study adopts the value added intellectual coefficient (VAIC) developed by Pulic (1998) to measure intellectual capital performance of banks in Tanzania. This study further investigates whether intellectual capital (IC) and its components influence banks' financial performance measures, namely return on assets (ROA) and return on equity (ROE). The famous model which is very popular in many countries and has been used to measure intellectual capital is Value Added Intellectual Coefficient (VAIC™) developed by Pulic (1998). VAIC™ does not measure IC itself, but it measures the impact of IC management (Ulum, 2009b; Ulum, et.al 2008). The assumption is, if a company has a good

intellectual capital, and also managed well, there will be a good impact for the company.

Therefore, the main objective of this study is to examine the intellectual capital and bank financial performance of Tanzania banking sector. It will also determine the components of the intellectual capital (Human capital efficiency, Structure capital efficiency and Capital efficiency) and their influence on bank performance.

This study contributes significantly in that it provides Tanzania's banks with a simple method in understanding and evaluating performance, as well as enhancing the management of intellectual capital. The intellectual literature will also help in deciding the potential role of IC efficiency in the financial performance of banks in Tanzania, an emerging country which lacks such research. This paper is organized as follows. The second section presents the literature related to the study and hypotheses development. Next, in the third section, we discuss the research methodology and data employed in the study.

The fourth section presents the results of the study. Finally, we conclude the paper in the fifth section.

2 Literature Review

2.1 Definition of intellectual capital

Intellectual Capital is being evolved rapidly over the last decade. There are many and varied definitions of intellectual capital. Many author(s) has defined intellectual capital in context of knowledge base economy and how intellectual capital works in generating value creation.

Yang et.al (2009) argued that traditional financial reporting cannot be used to calculate the real value of the firm because it measures only short-term financial and tangible assets. But in the recent years companies are interested in measurement of intellectual capital for reporting to stakeholders and they seek to find a method for evaluating internal intangible assets. According to Edvinson & Malon (1997) intellectual capital can be defined as the gap between book value and market value. Increasing gap between market value and book value of companies has attracted the attention of many researches to find the missing value of the financial statements.

Sharma et al. (2007) definition refers to the knowledge, skills and technologies applied to create a competitive edge for an organization. Stewart (1997) contended it encompasses intellectual resources such as knowledge, information and experience, that could be used as tools of wealth creation and defines intellectual capital as the new wealth of organizations. In addition, Stewart (1997) went further in trying to give a more accurate definition as "packaged useful knowledge." He explains that this includes an organization's processes, technologies, patents, employee skills, and information about customers, suppliers, and stakeholders.

Table 1 Definition of Intellectual Capital

Author	Definition of IC
Roos et al., 1997	The sum of knowledge of company's members and practical translation of this knowledge like trademark, patents and brands
Brooking and Motta, 1996	IC is the term given to combined intangible assets which enable the company to function
Sullivan, 2000	Defines IC as knowledge that can be converted into profit
Union Fenosa, 1999	IC represents a set of intangible values that can enhance corporate capability for future value creation.
Skaikh, 2004	IC as knowledge that can be converted into value, or intellectual material (knowledge, information, intellectual property and experience) that can be used to create wealth.
Bontis, 2001	The collection of intangible resources and their flows
Bradely, 1997	IC as ability to transform knowledge and intangible assets into wealth creating resources.
Caroll and Tansey, 2000	Knowledge and creativity available to the firm to implement a business strategy that maximize stakeholder value

2.2 Intellectual capital and performance

Ahangar (2011) conducted the study by using the VAIC™ to measure the intellectual capital performance and its impact on financial returns of Iranian companies. The results showed that Human Capital Efficiency (HCE) has significant and positive impact on financial returns of companies whereas the relationship of structural and physical capital was not significant with financial performance of companies. Furthermore, Joshi et.al (2010) conducted the study to measure the IC performance through VAIC™ model. In the study it was found Human Capital Efficiency (HCE) has positive and significant

relation to increase the efficiency of Australian Owned banks rather than Structural Capital Efficiency (SCE) and Capital Employed Efficiency (CEE) which means more investment on human capital will increase the more efficiency of banks.

In a study Mohiuddin et al., (2006) showed the performance of these banks during 2002-2004 through Value Added Intellectual Coefficient (VAIC) method based on the data drawn from 17 banks operating in Bangladesh. In other study Chu et al. (2011) examine the impact of intellectual capital on business performance in Hong Kong. They find that there was no relationship between intellectual capital (Value added intellectual capital) and the components of business performance (Market to book value, Return on asset and Asset turnover). Hussain et al. (2010) in Bangladesh found marginal evidence regarding the significance of intellectual capital in influencing market value and financial performance of firms. Zéghal and Maaloul (2010) reported the positive association between VAICs and stock prices. Clarke et al. (2011) sustained that there is a positive relationship between performances and the components of VAIC. Chan (2009a) conducted a similar study using the VAIC model in Hong Kong, while Rahman (2012) finds no strong evidence supporting the association between VAICs and firms' market values. Deol (2009) conducted a case study on Indian banks to validate and support another study by Kamath (2007) who used the VAIC method as the measurement method.

Abdullah and Coskun (2007) conducted a research on quoted banks on Istanbul stock exchange market to measure their intellectual capital performance, and also the effect of intellectual capital efficiency on financial performance. Data were taken for the period 1995-2004, and VAICTM is used for measurement of intellectual capital and data envelopment analysis is used for testing the impact of intellectual capital on profitability. Tan, Plowman, and Hancock (2007) investigated the influence of intellectual capital in Singaporean companies and the financial achievements. The researchers used data from the financial reports of 150 companies in Singapore between the years 2000 and 2002. The findings indicated that intellectual capital had a positive influence on company performance.

As the banking sector is a sector that utilizes intensive IC components, it was foreseeable that studying the role of IC on banks' performance would advance (Goh, 2005; Najibullah, 2005; Belkaoui, 2002; Saengchan, 2008). To measure performance by way of IC, it will allow a details understanding how capital coefficient, human capital as well as structural capital contribute to the banking's financial performance.

3 Data and Methodology

3.1 Research questions and hypothesis

The foremost purpose of this study is to address the intellectual capital performance of banking sector of Tanzania and its relation with financial performance indicators of banks. The most important objective of this is: Does intellectual capital performance has significant impact on financial performance indicators of banks? For that purpose we extract the following proposed hypothesis with the help of extensive literature review.

H1a: There is a positive relationship between components of VAICTM (HCE, SCE and CEE) and financial performance indicator of banks (ROE).

H1b: There is a positive relationship between components of VAICTM (HCE, SCE and CEE) and financial performance indicator of banks (ROA).

H2a: There is a positive relationship between VAICTM and financial performance indicator of banks (ROE).

H2b: There is a positive relationship between VAICTM and financial performance indicator of banks (ROA).

3.2 Methodology

Ante Pulic (1998) developed VAIC to help managers enhance their firms' performance. The greater the value of VAIC, the more efficiently a company manages its resources. Unique measurements provided by VAIC can be used for comparative analyses across various companies, time periods, and industries, both internationally and locally, to develop business strategies (Appuhami, 2007). Over the years, VAIC has been used in many academic research publications (e.g. Firer and Williams, 2003) and business sectors (e.g. Public, 1998, 2000a, b). Williams (2001) discovered that companies with higher levels of VAIC try to reduce their disclosure in respect to intellectual capital, since it might reduce competitive advantages.

The Value Added Intellectual Coefficient (VAICTM) is very important and latest methodology for measuring the IC performance of banking sector. This approach is developed by Ante Pulic (1997, 1998,

2001 and 2002) in Austrian IC Research Centre. It is also known as Austrian Approach. Pulic has applied this approach into many studies like (2000, 2001, 2004 and 2005). Human Capital Efficiency (HCE), Structural Capital Efficiency (SCE) and Capital Employed Efficiency (CEE) are the components of VAIC™.

The purpose of using this approach is to evaluate the IC performance and its impact on financial performance of banking sector of Tanzania whereas the financial performance is measured by ROE, ROA. The data is collected from audited annual reports six banks for the year of 2010 to 2013. Many authors have considered VAIC™ approach for IC performance like (Mavridis 2005; Kujansivu and Lonnqvist 2005; Tan, Plowman and Hancock 2007; Ahangar 2011; Zeghal and Maaloul 2010; Joshi, Cahill and Sidhu 2010; Basuki and Kusumawardhani 2012; Pew et al. 2007; Mohiuddin, Najibullah and Shahid 2006; Maditinos et al. 2011; Widarjo 2011; Yalama and Coskun 2007; Makki, Lodhi and Rahman 2008; Kamath 2007 and 2008; Clarke et al., 2010; Kamukama, et al., 2010; Kamukama, et al., 2011; Goo and Tseng 2005; Laing, Dunn and Lucas 2010; Tovstiga and Tulugurova 2007; Ulum 2009a; Firer and Williams 2003; Iswati and Anshoria 2007; Ji-jian, et al. 2006, Santoso 2011 etc) formula is as follow;

. Output = Gross income.

. Input = Operating expenses (excluding personal costs).

. Value added = Output-Input.

. HC = personal cost, which is considered as an investment.

. CE = Capital employed (both physical and financial capital).

. SC = VA – HC (an appropriate proxy for structural capital), a result of human capital's past performance.

. HCE = VA/HC (shows of human capital efficiency).

SCE = SC/VA (shows structural capital efficiency).

. CEE = VA/CA (shows capital employed efficiency).

. VAIC = HCE + CEE + SCE (Value added intellectual coefficient).

We propose the following model in order to rest the relationship of IC and financial performance of banks operating in Tanzania.

The sample for the above study is taken from banks operating in Tanzania, DSE (Dares Salaam Stock Exchange) on the basis of net sales. Based on the availability of data 6 banks have been selected for the above study. The time period for the study is four years i.e. 2010-2013. The span of more than four years would be helpful to establish the consistency and predictability for research conclusions.

4 Analysis and Results

The following table 2, shows the performance of the banks in terms of VAIC™ values. The following table shows that 'Bank 6' has the highest VAIC™ values. This bank has been up and showing a down trend in recent years in terms of VAIC™ in the value but averagely this bank has the highest VAIC™ value. Averagely the 'Bank 2' is second and 'Bank 3', is in the third place while 'Bank 2', 'Bank 4' and 'Bank 5' stands 4th place while 'Bank 2', 'Bank 4' are on the 5th and 6th place respectively.

Table 2 VAIC=HCE+SCE + CEE

Bank	2010	2011	2012	2013	AVERAGE
Bank 1	2.967336	2.368738	3.054421	2.957415	2.386989
Bank 2	3.37678	3.309268	3.67515	3.621327	3.488447
Bank 3	4.101786	2.763893	2.397641	2.350826	2.903537
Bank 4	0.532124	1.167801	0.579599	1.214594	0.873529
Bank 5	2.467661	3.083894	2.780639	2.96075	2.823817
Bank 6	5.040497	4.038505	3.158768	2.990382	3.807037

The correlation coefficient related to the whole data between 2010 and 2013 of the six banks Operating in Tanzania is described in the following table.

The above table 3, shows that VAIC and ROA have strong positive relation. So the ROA and VAIC have correlation of 0.842 and are significant to each other. Human Capital Efficiency and Return on Assets also keep competitive correlation of 0.797 and are significant for both of them. The correlation between Structural Capital Efficiency and ROA is 0.88 which is strong and positive. These two variables are also significant in relation to them which is 0.886. The correlation between Capital Employed Efficiency and ROA is also positive 0.65. This is lower compared to Human capital efficiency and Structural capital efficiency. Capital Employed Efficiency and Return on Assets also has positive

correlation of 0.695 but it has less correlation of SCE and VAIC with Return on Assets. Capital Employed Efficiency (CEE) and VAIC also bear correlation of 0.392. The correlation between CEE and VAIC is less than SCE, HCE and VAIC, thus SCE, HCE and VAIC are significant to one and other. The correlation between the Capital Employed Efficiency and Human capital efficiency and Structural capital efficiency is 0.362 and 0.402 respectively.

Table 3 Correlations between ROA, HCE, CEE, SCE and VAIC

		ROA	HCE	CEE	SCE	VAIC
ROA	Pearson Correlation	1	.797**	.695**	.880**	.842**
	Sig. (2-tailed)		.000	.000	.000	.000
	N	24	24	24	24	24
HCE	Pearson Correlation	.797**	1	.362	.886**	.992**
	Sig. (2-tailed)	.000		.082	.000	.000
	N	24	24	24	24	24
CEE	Pearson Correlation	.695**	.362	1	.402	.392
	Sig. (2-tailed)	.000	.082		.051	.058
	N	24	24	24	24	24
SCE	Pearson Correlation	.880**	.886**	.402	1	.936**
	Sig. (2-tailed)	.000	.000	.051		.000
	N	24	24	24	24	24
VAIC	Pearson Correlation	.842**	.992**	.392	.936**	1
	Sig. (2-tailed)	.000	.000	.058	.000	
	N	24	24	24	24	24

** . Correlation is significant at the 0.01 level (2-tailed).

The result describes that the SCE and HCE values are more significant to VAICTM and ROA than Capital Employed Efficiency (CEE) value of Banks in operating in Tanzania.

Table 4 Correlations Between ROE, HCE, CEE, SCE and VAIC

		ROE	HCE	CEE	SCE	VAIC
ROE	Pearson Correlation	1	.758**	.652**	.894**	.816**
	Sig. (2-tailed)		.000	.001	.000	.000
	N	24	24	24	24	24
HCE	Pearson Correlation	.758**	1	.362	.886**	.992**
	Sig. (2-tailed)	.000		.082	.000	.000
	N	24	24	24	24	24
CEE	Pearson Correlation	.652**	.362	1	.402	.392
	Sig. (2-tailed)	.001	.082		.051	.058
	N	24	24	24	24	24
SCE	Pearson Correlation	.894**	.886**	.402	1	.936**
	Sig. (2-tailed)	.000	.000	.051		.000
	N	24	24	24	24	24
VAIC	Pearson Correlation	.816**	.992**	.392	.936**	1
	Sig. (2-tailed)	.000	.000	.058	.000	
	N	24	24	24	24	24

** . Correlation is significant at the 0.01 level (2-tailed).

The above table 4, shows that VAIC and ROE have strong positive relation .So the ROE and VAIC have correlation of 0.816 and are significant to each other. Human Capital Efficiency and Return on

Equity also keep competitive correlation of 0.758 and are significant for both of them. The correlation between Structural Capital Efficiency and Return on Equity is 0.894 which is also strong. These two variables are also significant in relation to them. Capital Employed Efficiency and Return on Equity also has positive correlation of 0.652 but it has less correlation of Human Capital Efficiency, Structural Capital efficiency and VAIC with Return on equity. Capital Employed Efficiency (CEE) and VAIC also bear correlation of 0.392. The correlation between CEE and VAIC is less than that of Human Capital Efficiency, Structural Capital efficiency and VAIC, thus are significant to one and other. The correlation between the Capital Employed Efficiency and Human capital efficiency and Structural capital efficiency is 0.362 and 0.402 respectively. The result describes that the SCE and HCE values are more significant to VAIC TM and ROE than Capital Employed Efficiency (CEE) value of Banks in operating in Tanzania

5 Conclusion

The paper empirically examines the extent to which intellectual capital contributes to the performance of banks operating in Tanzania. Data on components of intellectual capital and business performance variables were obtained from the financial statements of selected banks in Tanzania. The components and variables include Human Capital, Structural Capital, Capital Employed, Return on Assets and Return on Equity. Using six banks and their audited financial statements for four years, this paper examines the impact of intellectual capital on business performance measured with Return on Assets (ROA) and Return on Equity (ROE). The results show that intellectual capital has a positive and significant relationship with the performance of banks in Tanzania. These results reinforce the accumulating body of empirical support for the positive impact of Intellectual capital on firm performance. Based on the findings, the study recommends that corporate entities in Tanzania.

To conclude this study is very helpful to the researchers and the managers of the Banks because in Tanzania research conducted on this topic is still scarce in term of developing the strategy relating to Intellectual Capital. Intellectual Capital is very important factor in the organizational performance in knowledge economy. From the above literature review and result, it is obvious that the efficiency of the Intellectual Capital increases the financial performance of the banks. The banks should focus and pay more attention to the Intellectual Capital.

Countermeasures of Problem Platforms in P2P Net Loan Industry of Hubei Province

Yan Wensheng, Yang Yihui

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: ywsheng69@163.com, 1399687217@qq.com)

Abstract: Hubei P2P net loan industry has been developed rapidly in recent years, but the problem platforms are also emerging continually, those problem platforms have bring great harm to investors, and ultimately close down, leave or even have be sealed up by the police. Based on the analysis of problem platforms in Hubei P2P net loan industry, the article sums up the characteristics of those problem platforms and deeply studies the cause of the problem platforms. Finally through summarizing the Commonness of those failed platforms, the paper respectively puts forward proposals from the perspective of P2P industry and government for the healthy development of P2P net loan platforms in Hubei Province.

Key words: P2P; Hubei Province; Peer to peer landing; Problem platforms

1 Introduction

P2P lending is the individual crediting behavior which is based on Internet ideology and independent of the formal financial system, and exceeds the limitations of traditional acquaintance society^[1]. P2P lending appears to meet the financial needs of the public and develops so fast that it has arouse concern of the industry and the regulators .

P2P industry on abroad started early, platform building is quite ideal and the financial system and credit system developed maturely, so the foreign studies of P2P lending are much deeper and comprehensive, especially for analysis of the borrower, the borrower information protection and network joint guarantee (Freedman and Jin, 2008; Jentzsch , 2007; Rainer and Stefanie, 2010; Siegel and Duarte, 2010), this is also the important manifestation of emphasis on financial consumer protection in foreign researches^{[2][3]}.

Researches on P2P landing in china start later and mainly focus on three aspects: First, the studies of platform mode (You Ruizhang , Zhang Xiaoxia, 2010; Xie Ping, Bu chuanwei, 2012)^{[4][5]}. Second, the researches on the problems and risks of P2P net loan platforms. Xiaoyu Miao (2012), Feng Niu(2013) discusseed the main risks in the industry, revealed the issues such as regulatory vacuum, lacking of credit rating standards and others, finally put forward the recommendations^{[6][7]}. Third, P2P network lending regulatory issues. Zhang Hongbo (2013), Song Xiuqian (2013) discussed the impact of the Internet on traditional banking and financial regulation, and described supervision ideas for net loan in china and issues which need to be considered in regulation^[8].

Those related researches put forward a number of worthy learning views on the analysis of issues and policy recommendations, but the majority of studies are regard to the normal platforms. For P2P industry, learning lessons from the problem platforms is equally important.

2 The Overview of P2P Industry in Hubei Province

After P2P lending model spread to China , it started explosive growth since 2011, net loan operations platform has reached 1575 by the end of 2014. However, with the rapid expansion of market scale, P2P lending industry is becoming more competitive, the industry risk continued to gather and intensify, platform issues are increasing.

At present, the development of the net loan industry has gradually formed four echelon among all provinces in China, Hubei Province ranked second echelon, with the increasing number of platforms, its net loan volume grows steadily. By the end of 2014, the number of Hubei P2P net loan platforms reach 35, ranked tenth in China, increased 169% compared with 2013. Wuhan platforms occupy the vast majority, accounting for 76%. Compared to other cities although Wu Han Net loan started later, the business scale of Wuhan platforms is large, small and micro enterprises are active, the history of private finance is long , financial formats are rich, these conditions provides fertile to carry net loan business and obtain rapid development. The outbreak of problem platforms also presents geographic distribution , more in Guangdong, Zhejiang and Shandong Provinces. Although it seems that Hubei net loan industry is running well generally, but the problem platforms incidence of Hubei Province is as high as 20% or

more. According to incomplete statistics, by the end of June 2015, the problems platforms in Hubei Province accumulated to 23, many of them are new on-line this year. Those problems platforms mainly include three types: withdrawing difficultly, running, closing down. Running generally divided into two kinds: capital chain break running and fraud running, and the majority is fraud running, the ratio reached 39%, and even “quadruplets” platforms appeared. Hubei problem platforms’ types are shown in Figure 1.

Figure 1 Types of Hubei Province Problem Platforms between 2013.07 and 2015.06

“hot as ice” is the portrayal of the current P2P industry, one side the new platform is increasing, the other side the problem platforms broke frequently, the collapse of P2P platforms has very broad impact, and it related to the interests of most investors, it is also different to safeguard legal rights after its collapse, so the inclement of P2P industry is far more than the general industry. Therefore, discussing countermeasures for platform is urgent and has realistic meaning.

3 The Characteristics and Causes of Problem Platforms in Hubei Province

3.1 The characteristics of problem platforms in Hubei Province

Through analyzing the problem platforms between 2013.07 and 2015.06, we found that these platforms have three basic features: first, the operating cycle is short, the average survival time is only 5.2 months, some platforms (such as Wan Jun CaiFu) survived only two days, the longest platform lasted only 16 months. Second, the comprehensive interest rates are high, for current steady operating credit P2P platforms, the annual rate of return is usually less than 15%. For problem platforms, most of the websites provide an annualized yield of more than 30%, and this way of borrowing costs is applicable to high-risk groups, so it is prone to breaks the capital chain. Third, the term of investment is short, sometimes even dismantling the object, P2P credit investment period is usually from two month to two years, however, for most of problem platforms, the investment term is only one month or not to one week, and sometimes there will be “second object” (the loan is repaid within one day).

Table 1 Problem Platforms between 2013.07 and 2015.06 in Hubei Province

name	Problems appear	Register date	Registered fund	Problem event type
Wuhan loan	2015.06	2014.06	5 million	Withdraw difficulty
Wang jun wealth	2015.05	2015.05	50 million	Run
Shengying capital	2015.05	2014.12	10 million	Withdraw difficulty
Zhongli venture	2015.04	2015.01	10 million	Withdraw difficulty
Xinconglicai	2015.02	2014.07	0.50 million	Run
Eshang loan	2014.12	2014.07	5 million	Withdraw difficulty
Shenghe finance	2014.11	2013.05	110 million	Run
Nanhui wealth	2014.10	-	5 million	Run
Dingfeng investment	2014.10	2014.07	15 million	Run
Xiangren investment	2014.10	2014.07	11 million	Run
Gaoli investment	2014.10	2014.07	12 million	Run
Yiyi investment	2014.10	2014.07	15 million	Run
Chuying loan	2014.09	2014.06	1 million	Run
Jingyi loan	2014.04	-	-	Run

Dadi loan	2014.02	2013.09	3 million	Close down
XiaoyaP2P	2014.01	2013.12	-	Close down
Fuhao investment	2014.01	2013.10	30 million	Withdraw difficulty
Yinxin loan	2013.10	2013.09	-	Withdraw difficulty
Yutai investment	2013.10	2013.08	-	Withdraw difficulty
Yingtong investment	2013.10	2013.01	-	Withdraw difficulty
Tianliloan	2013.09	2013.04		Run
Zhongcaizaixian	2013.07	2012	-	Withdraw difficulty
Minglian loan	2013.07	2013.03	-	Withdraw difficulty

3.2 the causes of Problem platforms in Hubei Province

Successful platforms have its own characteristics, while problem platforms often have similar mistakes, by detailed case observation, we find the root cause of the problem platforms can be attributed to the following two categories.

3.2.1 Congenital deficiency and malicious fraud

Congenital problem platforms' cause is sole, mostly due to that criminals aim at the entry threshold gap, they make use of internet banking and lure investors with the promise of high yield, and attract funds with "second kill", "cluster", "lucky Draw", "grab object and give gifts" and other activities, finally the platforms collapse or run at the end.

Manifestations of congenital issue platforms are relatively simple, technical strength is poor, art designing is rough, operating practices and staffing are single. Usual means of liar platforms are as follows: (1) leaning on "big trees" to build background; (2) promising high returns; (3) shell company, business license, business address and telephone are fake; (4) making use third-party certification to increase the credibility; (5) soft advertisements are around, promoting in the mainstream media and the Internet; (6) using luxurious office, real estate license, vehicle license and others as proof of strong assets.

In summary, fraud platform is relatively easy to identify, the reason why part of the fraud platforms could be effective is strongly correlated to investors' strong speculation, poor awareness of risk and hasty investment behavior. Therefore, to enhance investment education and cultivate mature rational investment principles can effectively prevent the occurrence of such incidents.

3.2.2 Poor management lead to postnatal deficiency

Through detailed analysis of Hubei Province problems platform, operational issues show mainly in the following three aspects: First, credit checking methods lag behind, Many entrepreneurs of P2P platforms simply put the private lending on the Internet, there are many non-standard issues on corporate governance, credit checks are subjective and arbitrary, it is prone to the problem that the funds can not repay. Second, building cash pooling and operation period mismatches, investors and borrowers have different needs in the loan term, such a contradiction forms the natural power for platforms to involved in telling apart object in the period of, thus leading many platforms to be disoriented, and finally fall into the column of problem platforms. such as Wuhan Z platform, after suffering hacker attacks, a large number of investors apply for withdrawing, in the case of a maturity mismatch and funds could not return, soon capital chain breaks and the platform can not operate. Third, risk identification capacity is low, ignoring the risk. P2P industry has a high-risk property and face multiple risks such as technology risk, market risk, liquidity risk and so on, if the Company operations teams lack of operational experience, technical strength, risk control ability, the company can easily lead to problems, in the example above, the Wuhan Z platform did not identify technical risks and fall into a crisis.

After operator problems appeared, the crisis spread rapidly, the company can not be able to handle in the least. This also reflected the short life cycle of P2P problem platforms. For deep analysis on the causes of the rapid development of crisis and why enterprises can not quickly and effectively deal with the crisis, the paper summarizes the evolution of P2P platform crisis mode, which is shown in Figure 2.

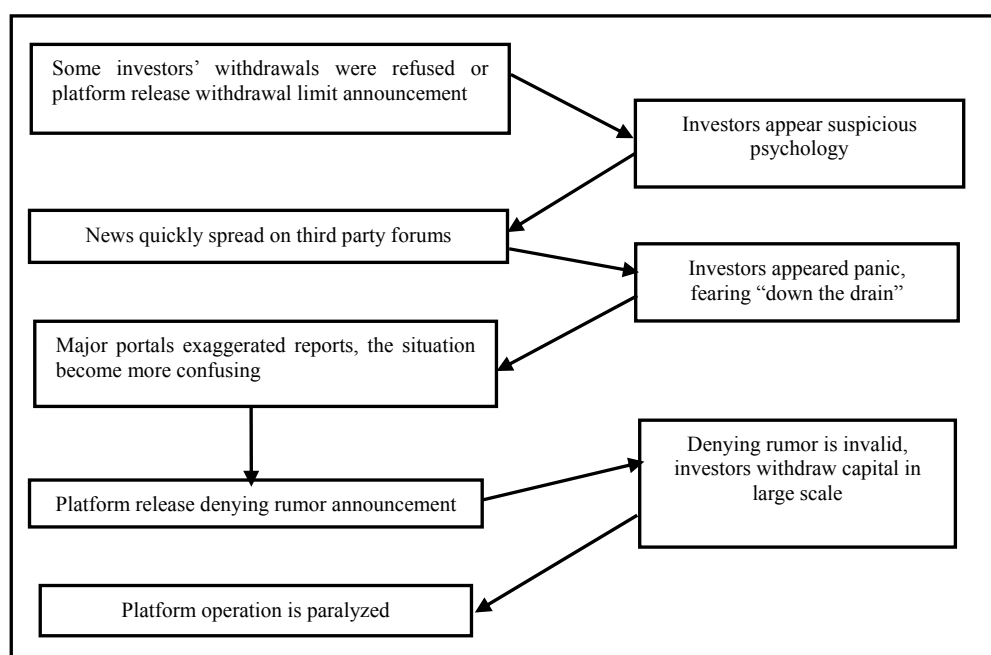

Figure 2 The Evolution of P2P Platform Crisis Mode

By analyzing the evolution of the crisis we can find that for a P2P net loan investor, no matter how seemingly he trusts a P2P platform, he still lacks a psychological support. P2P net loan industry is characterized by low investment threshold so that the industry is filled with a lot of investors whose abilities to resist risks are weaker, they are attracted high interest but can not afford big losses. So when problems appear, investors would make divestment decision immediately, while for fears of squeezing, the platform will refuse to cash application, so more investors believe the rumors are true, and lead to a vicious circle, and finally platforms are dragged into the abyss. In fact, the lack of psychology support is our country, P2P industry has been separated from the system, it does not have the guidance of the corresponding laws and supervision of the relevant departments and regulations, it is tantamount to a lack of endorsement and protection by the state.

In summary, in order to avoid problems caused by postnatal deficiency, not only platforms themselves need to make great efforts, but also the government need to accelerate the pace of supervision and management.

4 Countermeasures for Healthy Development of P2P Industry in Hubei province

The problem platforms' emergence is the aftermath in P2P industry's rough style development, in some ways it seems that those problem platforms can be considered to the pain of self-correction for investor and the soreness of growth path for industry to go through .

4.1 The perspective of P2P industry

With the emergence of P2P problem platforms, P2P industry will continue to be survival of the fittest. Learning lessons from the failure of platforms, improving deficiencies and making proper preparation for risk management can help the industry remain invincible in such confused environment.

1) To strengthen the construction of the platforms themselves

The platform should develop a reasonable risk control guidelines according to their actual development. Providing good guidance for new staff who are lack of technical abilities and working experience in risk management. Formulating risk assessment criteria and accountability system for violations of employees, so net loan companies can call to account according to the actual losses caused..

2) To strengthen industry self-discipline

Establishing an information sharing platform in the industry, especially in credit information sharing and blacklist publicity mechanisms, and best reaching a normal sharing mechanism for record with industry platforms. Establishing a necessary self-regulatory organization, to undertake moral monitoring and warning responsibility.

3) Team building

Net loan industry is at the end of the chain of financial industry, lacking of specialized excellent personnel is a common problem which permanently plagued the industry. Building an efficient, high-quality and professional team can moderately lower part of the moral and operational risk.

4.2 The perspective of government

we can clearly see the negative impacts that supervision has been in the discussion but not be substantially implemented in Chinese society stage caused. In Chinese tradition, the “state” is not just a political geography concepts, it is the most valuable credit entities, platform spent millions on advertising are often not as good as an official license on reassuring the people. Therefore, the state should clear regulatory principles, establish a supervising subject and supervision system as soon as possible, in order to effectively ensuring the effective functioning of P2P platforms.

1)Legislating first to provide legal protection for the platform development

Accelerating the introduction of industry-related laws and regulations to implement, giving the legal status of P2P net loan platform, truly realizing “sunshine operation.” Establishing market access threshold to prevent violations platform “free rider” phenomenon, ensuring the legitimate rights and interests of regular platform. Clearing exit mechanism, integrating acquisitions, restructuring, bankruptcy and other ways to strengthen risk diversification and to issue platform to exit steady.

2) Classification regulation, transparency of information, improving regulatory efficiency

Making a comprehensive risk rating according to platform governance, executive management and internal risk control abilities. By strengthening information disclosure to improve the effectiveness of market surveillance and reduce regulatory costs. To intensify illegal punishment to improve illegal costs and lower social costs of non-compliance.

3)Broadening investment channels for residents to diversify investment risks

P2P illegal fund-raising reflects the narrow investment channels to some extent, broadening investment channels, so that investors have more investment options, thus investors can diversify the risk by investing in a combination.

5 Conclusion

P2P lending industry is developing rapidly in china, however it has been in a legal gray zone of regulation since the birth, there is no clear regulatory supervision development so its development lack of standardization. Its hidden risks increasingly exposed and various collapse incidents continue to occur which may endanger the stability of the financial order. But P2P industry has played an indispensable role in promoting economic development, so the government should strengthen its supervision and reasonable persuasion, embarking P2P industry on the standardized and transparent way, and creating greater value for society.

The Identification and Management of Accounting Fraud

Wu Min

Department of economy and management, Wuhan University of Technology Huaxia College,
Wuhan, P.R. China, 430223
(E-mail: wuming030@qq.com)

Abstract: This paper uses the methods of combination of practice and theory, social investigation, statistics and financial analysis and then proposes the strategy to manage accounting fraud. False accounting information disturbs the order of market economy in China, damages the interests of country, society and public, and causes investors to make wrong judgment and decision. According to construct the prevention measures of accounting fraud, the conclusions can be reached that improving the quality of accounting information, maintaining the capital market and promoting the harmonious development of market economy.

Key words: Accounting; Accounting fraud; Fraud means; Governance

1 Introduction

Accounting fraud means the illegal behavior of the perpetrator in accounting treatment. It is the behavior that the actor takes the benefit of the economy or other aspects as the purpose, and causes the losses of accounting on purpose. The false accounting information will bring great harm. At present, the phenomenon of accounting fraud is growing rapidly, and accounting information reveals illegal events endless, which has aroused the concern of the whole society for the accounting integrity. It is the urgent matter to analyze the reason of accounting fraud and seek the countermeasure and measure to manage the accounting fraud.

2 Domestic and Foreign Research Survey

2.1 Foreign research survey

2.1.1 GONE theory of accounting fraud (four factors theory)

The “GONE” theory was proposed by Bologua et al. In 1993. The theory argues that the fraud is made up of four factors, G (Greed), O (Opportunity), N(Need), E (exposure). They interact with each other, and they jointly decide the degree of fraud risk. The GONE theory essentially expresses four conditions of accounting fraud. Firstly, the fraud has greedy heart. Secondly, they need money. Thirdly, they have the chances. Fourthly, they think it will not be found afterwards. Once four conditions form, they must be corrupt. According to GONE, greed and need are related to the individual, opportunity and exposure are more related to the organization environment, the fraud motivation is explained as necessary, the moral value orientation is interpreted as greed, and it adds an “exposure” factors, thinks the possibility of fraud detection and disclosure, and the penalty after being discovered and exposed, will affect whether the fraud is implemented or not.

2.1.2 The theory of accounting fraud risk factors

This theory which bases on the GONE theory is the most perfect fraud motivation theory developed by Bologua et al. Fraud risk factors are divided into individual risk factors and general risk factors. Individual risk factors differ from man and man and exceed the scope of organization control, including moral quality and motivation. General risk factors are the element that controlled by the organization or entity, including the chance of fraud, the probability of fraud being discovered and the nature and extent of punishments after the fraud was discovered. When the general risk factors and the individual risk factors are combined, and are considered advantageous by frauds, the fraud will happen.

Table 1 The Relationship Between the Fraud Risk Factor Theory and the Four Factors Theory

Fraud risk factor theory		The four factors theory
Individual risk factors	moral quality.	G(Greed) factor
	motivation	O (Opportunity) factor
General risk factors	the chance of fraud	N (Need) factor
	the probability of fraud being discovered	E (Exposure) factor
	The nature and extent of punishments	

2.2 Domestic research survey

China's research on accounting fraud started late, but in many ways also achieves fruitful results. Jiang Yihong presided key issues of the Ministry of Finance--The research on the actuality, cause and Countermeasure of accounting information distortion in 2002. Studied respectively from accounting report gloss problem and empirical study of profit manipulation of listing corporation, he has made a deep analysis and discussion on false accounting information. The study of Liu Feng showed that the existing institutional arrangements themselves exclude high-quality accounting information and induce the illegal distortion of accounting information in 2003. The research of Chen Hanwen showed the relationship between corporate governance structure and accounting information quality. The researches of Jiang Shuncai, Liu Xuehui and Liu Yingxin showed the optimal level of accounting information disclosure is that the marginal cost of accounting information disclosure is equal to the marginal revenue in 2004.

3 Identification of Accounting Fraud

3.1 Using accounting statements to analyze and identify accounting fraud

According to account balance and accrual, fiscal statement fills in the column directly, reflects the financial situation of a specific date and the operating results of a certain period of the enterprise. Through the analysis of the overall rationality to the accounting statements and check to accounting report item of some logical relationships, we can preliminarily judge the fraud of the audited units.

3.1.1 Analysis of the overall logic of accounting statements

Because of the relationship between economic business and the account of the double entry bookkeeping, fiscal statement shows special corresponding relationship between various projects. Mainly include: balance sheet, account of business, articulation relationship of profit distribution table, the main business income and the main business tax, total profit and income tax, financial costs, short-term loan, cost charged depreciation and depreciation expenses and original value of fixed assets in cost and so on. Through the analysis of the above correspondence, the abnormal phenomenon is found, and the behavior of accounting fraud is detected through the detailed audit.

For an example, a company's balance sheet reflects that undistributed profit increase 26.23 million Yuan yuan, account of business reflects the current net profit of only 680 thousand yuan. Under normal circumstances, the additions of undistributed profit should be less than or equal to the net profit, obviously, the company's profit distribution is contradictory. According to a detailed audit of undistributed profits subject, the company put the profit of 25.55 million Yuan that subordinate subsidiary turn over into undistributed profit subject, but the company haven't pass the check computation for investment income subject. As a subordinate subsidiary of high-tech enterprises, implement corporate income tax discount tax rate of 15%, but income tax rate of the corporate is 25%, resulting in evade taxation of 2.555 million yuan (2555x (25% to 15%)]

3.1.2 The analysis of gross profit margin

Gross profit margin is gross profit as a percentage of sales revenue and gross margin is the difference between sales and cost of sales. The formula is as follows:

$$Gross\ profit\ margin = \frac{Main\ business\ income - Main\ business\ cost}{Main\ business\ income} \times 100\% \quad (1)$$

This indicator reflects the profitability of a company's main business, which is the most important financial analysis indicator for the auditor to make a statement analysis. Individual companies in order to gloss over the report or complete the economic indicators, the main means of fraud are inflated gross profit. As the sales income is inflated, there is no corresponding cost expense, so the sales gross margin tends to be high, through the analysis for the index, significant and obvious fraud can be found. We can analyze the index in three levels. Firstly, compare total sales gross margin with historical data comparison. Secondly, according to the main types of business, we can calculate the gross profit margin and compare it with historical data, industry level, or the experience value. Finally, we calculate a single main business sales gross margin month by month, analyze its rationality, find abnormal from it and determine the audit priorities.

For example: a listing Corporation's main products including: rice starch sugar, rice protein powder (feed grade, edible grade), rice bran oil and edible rice and other products.

Table 2 A Company's Analysis Table of False Gross Margin and Actual Gross Profit Margin

	Glucose powder	Maltose syrup	Albumen powder
False gross margin	22.08%	21.84%	25.99%
Actual gross profit margin	5.75%	10.88%	14.07%

Firstly, the total sales gross margin is 12.55%, increase than last year over the same period 3.52%. Through analysis audit staffs think that the company processes agricultural products for my main point, compare it with last year without big changes, but gross margin increase rapidly that is rational. We should keep caution and focus on attention, so that do the further analysis. The results are: corrected data from a company's financial statements show that actual gross profit margin of glucose powder, maltose syrup and albumen powder respectively is 5.75%, 10.88% and 14.07%. But the gross margin that previously reported up to 22.08%, 21.84%, 25.99%. Commodity sales revenue, expenses are the key point of the audit and carry out a detailed audit. The results of the audit show that the company false increases the main business income for accomplishing the business target.

Table 3 A Company's List of Inflated Income Unit: million

	Glucose powder	Maltose syrup	Albumen powder
statement income	1400	12200	2754
Real income	43	2000	352

From the data issue by the company's newspaper can also see, prior to the report shows the fraud income in first half yea which is 163.54 million yuan, after the correction of this data is only 82.17 million yuan, the total revenue false increase 81.37 million yuan. Even more surprising is that company successfully listed on the approaching 4.25 billion of funds from the stock market circles, just over nine months performance on "face" -- loss 11.17 million yuan.

3.1.3 The analysis of average collection period

Average collection period is the ratio of the main business net income and the average receivable balance in a certain period of time. The formula is as follows:

$$\text{Average collection period} = \frac{\text{Core business net income}}{\text{Average accounts receivable balances}} \times 100\% \quad (2)$$

Due to fierce market competition, enterprises in order to expand the market share, keep credit sales for increasing sales is very normal, but the index is too high or too low, should cause the attention of the auditors. Too low, this shows that average receivable balance is relatively large amount relative to the main business income. There may be false sales income generated by the associated transactions, produce the corresponding false accounts receivable. Too high, this shows that average receivable balance is relatively small amount relative to the main business income. There may be malicious fictitious sales income, this part of the sales income doesn't produce normal accounts receivable.

3.2 Identify accounting fraud by understanding the financial situation of an enterprise

The study of the symptoms of accounting fraud indicates that the management of the company trapped in financial distress is more likely to corrupt for disguising the financial difficulties. The main contents of the financial analysis including: short term solvency analysis, long-term solvency analysis, asset operating efficiency analysis, profitability analysis, investment returns analysis, and cash flow analysis. The financial situation of the enterprise can be analyzed from the aspects of asset quality, debt paying ability and operation ability etc.

Table 4 The Standard of Common Financial Ratio Analysis

financial ratio	standard
Current ratio	2: 1
Quick ratio	1: 1
The ratio of total indebtedness and net tangible assets	1: 1
Net working capital	<80%
Debt Asset ratio	<70%

The financial ratio analysis system was established by Alexander in 1919. The financial ratio is widely used in the analysis of the debt paying ability of the enterprise, the operating capacity and the profitability. When the investors analyze the financial statements, the enterprise financial ratio can be

compared with the vertical and horizontal, so as to find significant or abnormal fluctuations and determine whether accounting information is reliable. Such as comparing the financial ratios of the present period with the prior, planned or budgeted, and the comparison with other enterprises, industry averages, etc. The standard of the evaluation of the financial ratio is usually experienced, historical, industry standards. etc.

4 Management Methods of Accounting Fraud

4.1 To strengthen the construction of legal system and strengthen the legal responsibility

To strengthen the construction of laws and regulations, and exert the legal effect norms of accounting behavior, taking "Accountancy law" as the leading factor, and taking "Accounting Standards for Business Enterprises" as the core. A clear distinction between accounting fraud and legal accounting behavior and the boundaries of the accounting fraud and accounting errors, To avoid fraud drilling legal loopholes or be still unpunished for unclear responsibilities. For different subject of responsibility, as soon as possible to improve the relevant accounting fraud legal provisions and put into practice, to strengthen the sense of responsibility for the personnel and enforce financial discipline. Firstly, the civil liability should be emphasized and the civil compensation mechanism should be established. Secondly, to improve the accountability system of the administrative law enforcement, enforce the law strictly, prevent the rent-seeking behavior of the administrative regulators.

4.2 To improve the accounting management system, strengthen internal audit and supervision

The one of key measures for solving the distortion of accounting information is how to change the accounting personnel's working conditions and environment, actively explore accountant appointment system or the accounting concentrated calculation system, implement the oversight of accounting personnel, protect the legitimate rights and interests of accounting personnel. At the same time, by strengthening internal audit and supervision, so that the accounting fraud disappear in the source. Internal audit is the important part of enterprise internal control, and it is the re control of internal control.

4.3 To strengthen the role of social audit and government supervision

To strengthen the accounting supervision and effectively exert the function of accounting is a powerful challenge to the phenomenon of fraud in the current economic field. In the accounting supervision, it is not enough to emphasize the internal supervision, and it is necessary to strengthen the external supervision of the accounting work, that is, the social audit and government supervision. The social auditing supervision means the certified public accountant accept the entrust, objective, fair and comprehensive evaluation for economic activities of the audited units in the independent third party status, It is legally responsible for the authenticity of the accounting report which is disclosed publicly by law. Government supervision mainly refers to departments of finance, auditing, taxation, people's Bank and securities supervision, in accordance with relevant laws and administrative regulations to carry out the accounting supervision and inspection of the accounting material of the relevant units and carries out Macro-economic Control.

5 Conclusion

The causes of accounting fraud is complex, not only existing the problems of corporate governance structure, the internal control system is not sound, and also having the problems that managers don't abide by the law drive by interest etc. In view of the illegal phenomenon of company fraud and its new developments, the following conclusions are drawn:

- 1) To strengthen the construction of legal system, strengthen the legal responsibility.
- 2) To improve the system of accounting management, strengthen internal audit and supervision
- 3) To strengthen the role of social audit and government supervision.

The New Direction of Talents Cultivation in the Context of Accounting Informationization

Xia Jing, Du Guoliang

Finance Department, Wuhan University of Textile, Wuhan, P.R. China, 430200

(E-mail: callidora2015@163.com, 95255286@qq.com)

Abstract: Accounting informationization is the necessity of information age. Accounting, as the basic economic management work, makes full use of new information technology and functions as an effective way in which accountants serve the enterprise. For the reform of accounting information processing in China now in the context of accounting informationization and its impact on accountants, this paper brings forward the necessity of talents team construction and also makes specific analysis of the new direction of accounting talents cultivation in the information age in the hope of promoting talents team construction.

Key words: Accounting; Informationization; Talents cultivation; The new direction

1 Introduction

With unceasingly accelerating process of information construction, the informationization of accounting becomes an inevitable trend and there will be more urgent demand for talents in accounting informationization, the “talents” problem will be the major difficulty hindering the enterprise’s accounting informationization development. The outline of the 12th Five-Year Plan for accounting reform and development makes the following statement: making full implementation of accounting talents planning and strengthening talents team construction is related to national talents development strategies implementation and innovative country construction and it exerts great and profound influence on promoting economic and social development, on adopting the “going out” international strategy and also on advancing reform and development of accounting in China. In the context of accounting informationization, the outline provides new guidance for accounting talents cultivation and also poses new opportunities and challenges for enterprises. Therefore, how to ensure the new direction in accounting talents cultivation and making feasible talents cultivation plan becomes a valuable research topic. The current research mainly focused on the domestic accounting informationization construction, including the analysis regarding its necessity and existing problems, as well as relative solutions. With a view to the direction of talents cultivation, this paper discusses the new direction of vocational existence and development, which are closely related to accounting practitioners.

2 Meaning and Characteristics of Accounting Informationization

2.1 The meaning of accounting informationization

Accounting informationization means treating accounting information as management information resource and then making comprehensive use of computer and network communication to obtain, process, transmit, apply information and so on to provide adequate, real-time, omni-directional information for the enterprise’s management. Accounting informationization is the product of information age and also the developing direction of accounting in the future. Accounting informationization is not only about introducing advanced information technology such as computer, network, communications and so on to the accounting field to integrate it with traditional accounting work to serve business calculation, financial transaction etc, it also contains deeper contents itself, like basic accounting theory informationization, accounting practice informationization, accounting education informationization, accounting management informationization and so on. As a means by which to design according to enterprise managers’ needs and to serve the enterprise managers in the network environment, it is the necessary measure that enterprise accountants take to adapt to the information age.

2.2 Basic characteristics of accounting informationization

As the combination of accounting and information technology, accounting informationization is a new requirement that information society brings up for financial information management in enterprises and it is also a necessary measure that enterprises take to adapt to informationization trend. Its basic characteristic is the application of computer, network and modern information technology to accounting field to render the collection, providing, processing of accounting information convenient and efficient

so as to achieve the purpose of making information resource diversified and highly shared and so on. As a main medium for enterprise leaders to obtain information in the network environment, accounting informationization also helps to enhance the enterprise competitive ability and decision-making ability.

3 The Reform of Accounting Information Processing

Traditional accounting work regards calculation and supervision of accounting as its basic function. Hence, traditional accountants focus on the basic work of bookkeeping, checking, reporting, filing etc of accounting document. The concept of accounting information usefulness in decision-making is widely accepted in the academic world and practice circles. The aim of financial report is to offer accounting information that is useful for decision-making to its users(including investors, creditors, government, related departments, the public and so on) and reflect the fulfilling results of an entrusted responsibility in enterprise management stratum and it also helps the users to make economic decisions. In information age, due to myriad sources, numerous dissemination channels and numerous related people of data, its degree of openness continues to increase. In spite of time and space, data can be obtained timely through various information technology such as cloud computing, Internet of Things, internet, sensor and intelligent terminal and so on. Thus, enterprises are able to provide more timely and abundant data than they were before and they also become more complicated in structure. Information that is useful for decision-making will be further expanded. Not only accounting information but also other relevant decision-making information is becoming increasingly conspicuous. Thus, what information should accounting information system provide and in what form should the information be provided?

Different from traditional accounting information, non-accounting information have complicated sources and various forms, including both structured data and unstructured data. The abundant structured and unstructured data inside or outside the enterprise needs to be filtered and then be based on historical data to effectively to break data segmentation between departments and between business lines by means of big data software processing to achieve the updating of current information.

There exists a problem with non-accounting information, namely quantification difficulty. How to solve this? Victor Mayer Schnberger in his *Age of Big Data* points out that one of three changes in nature and concept of data processing in the age of big data is that effect is more important than absolute spirit. Because of the large amount of data, people don't need to worry about the bad influence that error in a certain data point brings to the whole system analysis. In small data age, information accuracy must be emphasized, for the data that can be collected is sparse and a single mistake might bring about huge decision-making errors and even affect the final qualitative results. This kind of high accuracy requirement makes it difficult for people to grasp big data. The gains brought by big data techniques to the information users will outweigh the loss caused by accuracy error. From the cost and benefit principle, decision makers can accept the existence of inaccurate data.

4 The Impact of Accounting Informationization on Accountants

A survey of American institutional investors carried out by the international accounting firm Price Water House Coopers in 2012 shows that 65% of the interviewees hold that accountants can't only count on accounting record, preparation of financial report, cost control and so on. Economic globalization, intensified stock market fluctuation as well as the pressure of company growth brings the following changes to the work of company accountants: workload of decision support will rise from 25% now to 45%; internal control will decrease from 45% to 10%; workload of external report will remain at 15% or so; risk control will rise from 15% or so now to 30% or so. The rise of decision support and risk control suggests that the role of accountants might change greatly and even might be defined again in the future and the financial department is very likely to change from service department to the core position in strategic decision. As a job, accountancy will face great opportunities and challenges, either becoming the core of enterprise or dying out. What should we choose?

With the development of new information technology like internet, Internet of Things, cloud computing and so on, computer is very likely to grab the job of traditional financial staff, just as machine has done to traditional industrial workers. The development of data standardization enables original data on the information system platform to automatically produce financial data or other data needed by the enterprise. Traditional accountants will become the true "bookkeeper". How should we choose?

5 Increasingly High requirements for Accountants in The context of Accounting Informationization

Whether they can make successful transformation depends on accountants themselves. In addition to grasp of solid accounting knowledge, mastering of more management skills is also necessary, which just fits the requirements of transition from “financial accounting” to “management accounting” and helps to relieve the pressure of desperately short supply of senior financial management personnel in the next five years. To transform into administrative staff and to have close cooperation with IT management department and so on, accountants must possess the ability to integrate accounting information and non-accounting information and excel in using new information technology to evaluate enterprise performance, enterprise risk etc. In the future, accountants are required to have deeper development in the direction of “being a generalist” and get more involved in all the procedures of enterprise management. Handling, controlling, and managing all kinds of data will be the core function.

5.1 Accounting knowledge

Accounting informationization poses greater challenges for accountants’ knowledge structure, which can be classified into core knowledge and relevant knowledge. Core knowledge refers to the knowledge that is closely related to accountants’ work, including domain knowledge, technical and craft knowledge, strategic management, corporate governance, financial strategy, financial report, risk management, cost management, merger and acquisition, tax planning, value management, comprehensive budget management, audit and internal control etc. Relevant knowledge includes knowledge in information technology, financial information system and ERP, investment and financing, economics, economic law, international business, management duty and asset management, behaviorist, foreign language and so on. Therefore, accountants should strive to improve the level of accounting professional knowledge.

5.2 Management function

Accounting will enter into an information age where a large amount of accounting information and non-accounting information will come together in the financial department of the enterprise and forms big data. Financial department must change from “storing data” to “using data” and accountants need to grasp more knowledge and skills about management and do more non-financial work. Hence, most resources will be allocated to the use of accounting information and non-accounting information and more work is for providing service support for decision-making. For accountants, they will concentrate on using mass data to provide support for decision-making and striving to raise the management level of the enterprise.

5.3 New information technology

To promote the construction of accounting informationization, accountants need to enhance their learning of accounting professional knowledge and also improve management skills to become compound talents able to use new information technology. New information technology that accountants should grasp is listed below: information retrieval and acquisition, computer cultural foundation, office automation, use of basic processing software tools, electronic collection, information safety, commercial information techniques (e.g. electronic commerce system), management information system, software development and maintenance, system analysis and design and so on.

5.4 International vision

In addition, accountants need to have overall consideration of the external environment of the enterprise, including the developing trend of global economy and the latest industry. Also, they should have a broad international vision and clear up the developing thoughts of the company from a more macroscopic and complicated situation and help the enterprise to make wiser decisions through better analysis and judgment. Meanwhile, creative thinking produced by knowledge collision will bring economic benefits to enterprise and promote its development and also render outsiders to give positive evaluation of the enterprise.

5.5 Professional ethics

In the future, the content and responsibility of accountants’ work poses higher requirements for them. The authenticity and accuracy of the accounting information provided by accounting, which is the important basis of market economic activities, have direct impact on stakeholders like investors, creditors, the public and also influence the economic order of the whole society. Enterprises should proceed from their actual conditions, strengthen ongoing training of accountants, improve professional ethics, hold firm professional integrity, emphasize honesty, justice and impartiality and pursuit of truth, and strive to build high quality accounting talents team.

6 Conclusion

The requirement for accountants is becoming higher and higher due to the special nature of accountancy. Especially for now, China is in the stage of promoting informationization and moving toward internationalization. Accountancy will face new opportunities and challenges. Therefore, completing comprehensive quality construction of accounting talents team, conducting in-depth study of accounting professional knowledge, improving overall service quality and management level of accounting, making accountants broaden their international economic views and receive necessary professional ethics training have remarkable social significance for promoting sustained economic development in China and optimizing the economic structure.

Determinants of Dividend Policy: Evidence from Banking Industry in Pakistan

Akhtiar Ali, Xu Fengju

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: akhtiar.ali@hotmail.com, xufengju@whut.edu.cn)

Abstract: The purpose of this study is to know the determinants of dividend policy in financial sector. The domain of study is commercial banks listed on Karachi stock exchange operating in Pakistan. Lintner (1956) model is extended using new variables with context to Pakistan. Multiple regression with fixed effect (i-e LSDV) model is used to test the relationship among study variables. The empirical results suggest that size, profitability, dividend paid preceding year and loans loss provision are key determinants of dividend policy in banking sector since all of variables are positively and significantly correlated with current dividend payment. The empirical results support the evidence that banks in Pakistan tend to follow stable dividend policy.

Key words: Dividend policy; Banks in Pakistan; Profitability; Size

1 Introduction

It is generally acceptable that the wealth maximization of shareholders is a key objective of managers. Wealth maximization does not end at generating one time profit as businesses are ongoing concerns so the wealth maximization needs to be ongoing in nature. Besides many other factors, financing is considered significant for smooth operational activities and grabbing potential projects for sustained growth. At the end of financial year it becomes important to decide the portion of profit to be ploughed back for future projects and the portion that to be distributed among shareholders. The portion of net income that is distributed among shareholder is called dividend. Hence the study of possible effects of dividend policy on different parameters of business becomes inevitable. It is significant for managers to consider the possible effect of their dividend decision on share prices (Bishop et al. 2000). Deciding dividends is not a one-time decision. Abor & Bokpin (2010) term dividend policy as a critical decision since it influences other real or financial investment decisions.

Based on literature study following are possible dividend policies followed by firms at different situations and countries. 1. Coherent dividend policy that firms tend to stabilize dividend payment trend hence they pay dividend at end of each financial year. 2. Non-coherent dividend policy that firms pay higher dividends in case of higher profits and lowers at times of lower income. So they tend to follow random and non-coherent dividend policy. 3. No future growth that firms tend to pay dividend in case of non-attractive potential projects. 4. Potential growth that firms avoid to pay dividends since they fund potential projects through internally generated funds. The study of extant literature shows that researchers have studied dividend policy of non-financial firms in variety of ways. But in comparison with non-financial sector, very few studies have explored determinants of dividend in financial sector. Hence this study is significant in nature since it has tried to explore the determinants of dividend of banking sector in Pakistan which in its context is novelty of a kind.

2 Research Methodology

Ordinary least square is used to test panel data. Based on result of Hausman test, fixed effect model (i-e LSDV model) is used for further analysis.

2.1 Data collection Method

Yearly based data on study variables from 2005 to 2012 is collected from official websites of sample banks, Karachi stock exchange and official website of state bank of Pakistan. All the banks listed on Karachi stock exchange constitute the sampling frame. Commercial banks both private and public banks that paid dividend throughout study period are taken for further analysis. Hence 18 banks with 144 observations make up the final sample of study.

2.2 Model of the Study

Lintner (1956) proposes that the intended (“target”) dividend payment for firm i at time t is a percentage of earnings, or

$$DIV_{it}^* = r_i EPS_{it}$$

On basis of chosen study variables the current work uses the following model.

$$DIV_{it} = \alpha_t + \beta_{1t} Prof_{it} + \beta_{2t} Div_{it-1} + \beta_{3t} Size_{it} + \beta_{4t} LossProv_{it} + \varepsilon_{it}$$

Whereas :

Prof	Profitability
DIV_{it-1}	dividend payment of prior year,
Size	Total Assets of a Bank
LossProv	is Loan loss provision
ε_{it}	is error terms.
β_{12t}	is coefficient of variable for time t.
EPS_{it}	is earnings per share for firm i at time t,
DIV_{it}^*	is the target dividend payment per share, and
r_i	is the percentage rate

3 Literature Review and Hypothesis Setting

Profitable and mature firms tend to distribute stable dividend pattern since they generate enough funds to finance potential project at the same time pay dividends. Adaoglu (2000), for firms listed on Istanbul stock exchange, found that current year profitability has positive and significant effect on determining dividend payment. In other words, profitable firms pay dividends to convey their good financial performance (Aivazian et al., 2003). Fama and French (2001) concluded that profitability, size of firm and investment opportunities are key determinants of dividend payout. Barclay (1995) based on empirical results concluded that there is a negative association between profitability and dividend payout. Profitable firms tend to pay low dividends since they put surplus earnings to finance new projects so they choose to distribute less dividend (Okpara&Chigozie, 2010). Firms tend to stabilize dividend payment so they choose to distribute a certain amount of profit each year. So dividend paid in preceding year serves as a signal of future dividend payment. Rehman (2012) studied firms in Nigeria and study revealed a positive relation between current dividend payout with dividend payout of preceding year. He further suggested that managers strive to maintain dividend payment trend and sometimes even try to increase payout ratio. Lintner (1965) concluded that companies tend to adjust current year dividend payment around target dividend payout ratio. Hence they choose to follow stable dividend payment pattern and increase the dividend payments gradually as per target payout ratio. Thus study suggests a positive relationship between current and preceding year dividend payments. Firms operating in India choose to set lower dividend payout in beginning hence they need to make high dividend payment adjustments to set a stabilize dividend trend (Pandey, I. and R. Bhat, 2007). Few studies found no relation between current and preceding dividend payments. Sheikh and Wang (2011) carried a study on banking industry in Greece. They concluded that preceding year dividend is not estimator for dividend in current year. Study further suggests that earnings in banking industry have been quite volatile hence financial managers choose not to follow stable dividend payout ratio.

In fact, there is big difference in working, domain of work, management style and ease of financing between small firms and larger ones. Mature firms enjoy stable earnings and have little growth prospective, at the same time, have greater and less costly access to equity market, hence they tend to pay high and stable dividends. Mature firms enjoy cheap and easy access to financial markets, depend less on internally generated funds, hence, they tend to pay more dividends Mark (1998). Eriotis (2005) found positive and significant relation between size of firm and dividend payment. Author argued that investors perceive large firms less risky; higher chances of raising funds compared to new or small size firms and the management too prefers to pay higher dividends. Al-Malkawi (2007) found positive relation between size of firm and dividend payout. He argued that large firms have enough residual cash flow after meeting all potential projects; hence they tend to pay higher dividends to reduce significant agent cost. Afza (2010) found that size is significant factor that influence dividend. Author based on empirical results argued that larger firms are perceived to hold high asset and have better potential projects for growth; have high chances of raising funds from financial markets so they tend to pay higher dividends. Mayne (1980) studied financial firms and found size a significant factor determining dividend. The sample includes 12,000 banks operating in U.S. The study concluded that larger banks tend to pay more dividends. Few studies based on empirical results suggest negative or insignificant relationship between size of firm and dividend payout. Hafeez (2009) large firms tend to invest profit in acquiring assets hence they tend to pay low dividends. Shah (2010) based on empirical evidence conclude that in china small firms tend to pay higher dividend whereas in Pakistan large firms distribute

more dividend among shareholders.

Risk may have different forms based on perspective that you want to analyze. Investors may treat a firm as risky based on unstable earnings or divided policy. Management may find risk in pursuing new project or risk in shape of costly source of financing. In this study the researcher has taken cost on equity as proxy for risk from management point of view. Firms mostly rely on internally generated funds if cost of equity for floating new shares is higher. Hence in such given situation management would prefer to pay low dividend in order to avoid high cost of equity financing. Based on this rationale, the study postulates a negative relationship between cost of equity financing and dividend payment.

Although there are many ways of income for banks such as commission, fees, consultancy but interest income is main source of earning of banks. Banks lend money to individuals, corporations or government entities on different and conditions and receive back principal plus certain agreed upon interest income at certain regular intervals. All lending decisions do not perform as per agreed terms. Hence banks provision a certain percentage for non-performing loans every year. Higher the provisioning percentage makes future income less reliable and inconsistent. Hence higher the percentage of provisioning lowers the income of banks. Based on this rationale, the study postulates a negative relationship between dividend payment and provisioning for non-performing loans. Following hypotheses are developed for empirical analysis

H1: There is positive relationship between dividend payment and profitability.

H2: There is positive relationship between dividend payment and size of bank.

H3: There is positive relationship between current dividend payment and dividend paid preceding year.

H4: There is negative relationship between dividend payment and loan loss provision.

4 Robustness of Test

There are few small and big banks in final sample. Hence to get rid of outliers and normalize the data, natural log of following variables were taken before taking their normality tests: Current dividend amount (i-e dependent variable), dividend paid last year, assets (i-e proxy for size of bank), and provisioning for non-performing loans. The Jarque-Bera, P-value for all variables is above five percent except lnloanlossprovision variable. The P-value for Correlated Random Effects-Hausman test is less than 5 percent hence the study used fixed effects (i-e LSDV) model for further analysis.

5 Empirical Results

Assets, dividend paid preceding year, loan loss provision and profitability have P-value less than 5 percent. Hence all study variables are significant and have positive relation with dependent variable. Same conclusion can be made by looking at t-statistic that is greater than 2 for all explanatory variables.

Table 1 Determinants of Dividend

Variable	Coefficient	Prob.
C	-0.068243	0.9804
LNASSETS	0.346095	0.0223
LNDIVPREYEAR	0.160137	0.0084
LNLOANLOSSPROV	0.152117	0.0037
PROFITABILITY	17.62835	0.0002

Table 2 Fitness of Model.

R-squared	0.816616	Mean dependent var	12.06976
Adjusted R-squared	0.785050	S.D. dependent var	1.749883
S.E. of regression	0.811293	Akaike info criterion	2.559389
Sum squared resid	80.30001	Durbin-Watson stat	1.946576
Log likelihood	-162.2760		
F-statistic	25.87003		
Prob(F-statistic)	0.000000		

F-statistic, P-value indicates that model is good for analysis. Hence conclusions reached basis on

this result are reliable. Adjusted R-square is 0.785 which represent that almost 78.5 Percent variation in dependent variable is explained by explanatory variables of model. Durbin-Watson static is close to 2 that indicate that model is free of serial auto correlation.

6 Conclusion

Annual data of eighteen commercial banks listed on Karachi stock exchange operating in Pakistan, were taken for analysis. Loan loss provision is used as proxy for risk. As per best of my knowledge this variable was not used before, so this a novel point of this study. The empirical findings suggest that size, profitability, loan loss provision and dividend paid preceding year positively and significantly affect the dividend payment of current year. The results are consistent with findings of (Fama and French (2001); Okpara&Chigozie (2010); Al-Malkawi (2007); Eriotis (2005); and Rehman (2012)). Study suggests that banks in Pakistan tend to follow stable dividend policy irrespective of ofrisk factor (i-e changes in loan loss provision). Furthermore, results are consistent with agency cost theory since banks tend to distribute dividends regularly to avoid management and principal disputes. Banking industry in Pakistan is well regulated and they tend to pay dividends regularly, hence it is a better choice for individual or institutional investors to invest in this sector.

The Effect of Innovative Islamic Profit Rate Benchmark on Pricing Islamic Derivatives Securities

Ra'fat T.M Al-Jallad

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: rafat.jallad@gmail.com)

Abstract: The growth of the Islamic capital market depends on the success in developing and structuring risk management products, in particular financial derivative securities that are Shari'ah compliant. The financial engineering industry succeeded in developing Islamic derivatives that provide the same economic benefits provided by conventional counterparts and that are Shari'ah compliant. The developed securities include: Islamic Profit Rate Swap (IPRS), Islamic Cross Currency Swap (ICCS) and others. The pricing and valuation of Islamic derivatives follows the same mechanisms that are used to price the conventional derivatives. A major input to the pricing is the discount rate or equivalently, the profit rate in Islamic finance. This paper examines the effect of misspecification of the profit rate on the pricing and valuation of Islamic derivatives in the context of Islamic Profit Rate Swap. The paper employs a case of an Islamic profit rate swap contract where two widely accepted benchmark rates are used to price the contract namely LIBOR and Government bond yields. The results which indicate that the variations in benchmark rates lead to very large variations in the cash flow profiles of the contract's counterparties lead to a conclusion that the development of an innovative Islamic benchmark rate that is universally acceptable and applicable is necessary for the continuous development of Islamic capital market.

Key words: Islamic derivatives; Islamic profit rate swap; Profit rate curve; Islamic Interbank Benchmark Rate

1 Introduction

Financial derivatives play a vital role in modern financial markets. The risk management industry as well as the financial engineering within investment banks relies on those instruments to develop and structure new products. The Islamic financial markets have witnessed a tremendous growth in all its sectors and subsectors including the derivatives market. The advantages provided by financial derivatives of managing and avoiding risks make it necessary to develop Islamic financial derivatives that are equivalent to conventional securities and that comply with Shari'ah principles. Developing Shari'ah compliant derivative securities has been stressed by Islamic scholars, practitioners, and credit ratings agencies such as Moody's and Standard and Poor's. As a result, a number of Islamic derivative securities have been developed including: Islamic Profit Rate Swap (IPRS), Islamic Cross Currency Swap (ICCS), and others.

The importance of the interest rate in conventional finance and the profit rate in Islamic finance to the pricing and valuation of all derivative securities cannot be overemphasized. A number of alternative approaches have been proposed during the past to model the proper Islamic profit rate curve that enables the effective pricing and valuation of those securities (Jallad, 2015), but none of those models has been acceptable universally on economic and well as Shari'ah basis. This paper aims to measure the effect of the pricing errors caused by the misspecification of the profit rate in the context of Islamic Profit Rate Swap (IPRS).

The IPRS is an OTC product comprised of bilateral agreement between parties to make regular payments to each other at agreed intervals. IPRS is used to hedge against adverse profit rate movements through the exchange of fixed cash flows to floating cash flows (or vice versa) within the same currency. The terms of the swap (the amount, the period of time between the regular payments, and reference rate) are negotiable and can be customized according to the client's and bank's needs. At each settlement date, the commodity transaction is used to facilitate the transfer.

The fixed rate is determined at the start of the contract and remains the same until the end of the tenure and agreed reset date. Whereas, the floating rate is referenced to an index (LIBOR or any other reference rate) and is determined at every settlement date. The notional may or may not be exchanged. Usually, the net-off amount is exchanged at each settlement date.

This paper is organized as follows: the second section provides literature review of swap pricing. This section also discusses the dynamics of the Islamic profit rate swap (IPRS) and provides an

overview of its characteristics. The third section discusses data and the methodology used in the paper. The fourth section outlines the results, whereas the fifth section sums up the conclusion.

2 Literature Review

Chance & Rich (1998) study is considered one of the early studies in pricing swaps. Arbitrage-free replicating portfolios argument was used to derive pricing formulas for a number of equity swaps such as plain vanilla equity swaps, variable notional swaps, and cross currency swaps. Kijima & Muromachi (2001) developed a model where a stochastic interest rate are assumed for equity swaps. The model was assumed to follow a Wiener process and the volatilities of the interest rates and of the equity prices were assumed to be deterministic functions of time. Liao & Wang (2003) provided a generalized formula for pricing equity swaps where they assumed a constant notional principal. The results of their study show that foreign equity swap value is dependent on both the dynamics of the equity price process and the exchange price process. The pricing of the Islamic profit rate swap (IPRS) requires the determination of the following three items:

- 1) The cash flows of the floating rate leg.
- 2) The discount factors that are to be applied to the cash flows to determine the present value.
- 3) The amount of default spread of the counterparty.

In Islamic finance, those rates are estimated using Islamic Interbank Benchmark Rate (IIBR) or other interest based benchmark rates such as LIBOR. The general framework of pricing the IPRS requires determination of the present values of the fixed rate leg and floating rate leg. The difference of these two leg has to be paid from one party to another. The fixed rate leg imposes no problem, as the fixed cash flows are discounted using the contractual flat fixed rate. The present value of the floating leg is determined using the following equation:

$$P_0^{IPRS} = \frac{CF_1 + P_N}{(1+r_1)} \quad (1)$$

Where:

P_0^{IPRS} : market price of floating rate leg.

CF_1 : cash flow of first scheduled payment, this amount equals to the notional principal multiplied by the profit rate available at initiation date.

P_N : notional principal of the contract.

r_1 : profit rate of period one.

The first task requires finding out the expected future forward profit rates. In conventional finance, those rates can be extracted using a number of methods (Ravindran, et al., 2011):

- 1) Zero Rate Term Structure
- 2) Black Derman Toy (BDT) recombining tree method
- 3) Heath Jarrow Morton (HJM) bushy tree method

2.1 The Dynamics of IPRS

The dynamics of the IPRS create the mechanism through which the Islamic profit rate swap is Shari'ah compliant is equivalent to the conventional interest rate swap. This transaction is usually performed by a bank (financial institution) and a client. An Islamic profit-rate swap is implemented through the execution of a series of underlying Shari'ah contracts, which combine wa'ad contract (promise) with commodity Murabaha contract. Parties to the IPRS enter into Murabaha contracts to sell Shari'ah-compliant commodities (often London Metal Exchange-traded metals) to each other for immediate delivery but on deferred payment basis. A term Murabaha is used to generate fixed payments and a series of corresponding reverse Murabaha contracts are used to generate the floating rate payments. The wa'ad contract is being used to ensure the swap reaches maturity where one party unilaterally bind itself to perform what is agreed upon. A wa'ad is given by each party before each commodity Murabaha stage and reverse Murabaha stage, respectively. Through the use of commodity Murabaha or Tawarruq or Musawamah, the Islamic bank carries out the IPRS in the following manner:

2.2 First Murabaha Agreement ("fixed profit rate leg")

The fixed leg of the IPRS is accomplished through a number of steps as follows:

First Leg: Client buys commodity from Islamic bank

- 1) Client buys commodity through Islamic bank from trader B.
- 2) Islamic bank buys commodity from client at cost plus fixed rate at x% per annum.
- 3) Islamic bank sells off the commodity at cost.

2.3 Second Murabaha Agreement (“floating profit rate leg”)

The fixed leg of the IPRS is accomplished through a number of steps as follows:

Second Leg - Islamic bank buys commodity from client

- 1) Islamic bank buys commodity from trader A.
- 2) Islamic bank sells a commodity for a client at cost plus current benchmark (LIBOR/IIBR) plus an agreed spread.
- 3) Islamic bank assist the client to sell the commodity at cost.

On each settlement date, the net result of these trades is the amount of commodities sold under each Murabaha, which will be netted off by way of sales to a third-party broker. The net beneficiary (of the difference between the fixed and floating rate) is dependent on whether the fixed or floating rate was higher.

3 Data and Methodology

To test the hypothesis that changing benchmark rates lead to large variation in IPRS price and the resulting net cash flow profile of the contract parties, we price an IPRS using two profit rates. The first profit rate is the one derived from Malaysian government bond zero curve. The second profit rate is LIBOR benchmark rate. The fixed and floating rate legs payments of the swap are calculated and netted at each settlement date and the net position is determined at the initiation of the contract. The contract is assumed to have the following characteristics:

- 1) The yield rates of Islamic bonds with *semiannual* maturities.
- 2) The notional principal is US\$100,000.
- 3) The term of the Swap is five years.
- 4) The fixed rate is 10.9 percent per annum.

The yield rates of government Islamic bonds on the run whose maturity is closer to every semiannual end were obtained from (Ravindran, et al., 2011). As of July 2010 and for each settlement date once in six months for five years commencing from 31st December 2010 until 30th June 2015. The term structure and forward rates are computed through backward and forward iterations. For LIBOR rates that cover the same settlement dates, the rates are obtained from HSH Associates Financial Publishers. It is noted that a large difference exist between the government rates and LIBOR rates, which is partially due to country risk premium. Accordingly for the initial rates of December 31, 2010, we calculated the difference between the government yield and LIBOR rate, which is 3.17% and consider this as a country risk premium. We added this premium to every floating rates.

4 Results

The table below summarizes the calculation of the position of the fixed rate and floating rate payers at each settlement date under the two floating profit rate curves namely, Government yields curve and LIBOR rates curve. Under each curve, the bootstrapping method was used to construct the implied forward rate curve, floating leg. The fixed payment at each settlement period is fixed at \$5,450 ($0.109/2 * \$100,000$). At each settlement date, a netting process is performed where one of the parties need to transfer money to the other party. For instance, the first settlement period in the table represents a case where the fixed rate payer is obligated to pay \$5,450, whereas the floating rate payer is obligated to pay \$3,630. Accordingly, the fixed rate payer is obligated to settle his obligation of \$1,820. This process is repeated at each settlement date. It is apparent from the table that under the government forward rate curve during the first four semiannual periods the floating rate payer will receive net cash flows, while, the fixed rate payer will receive net cash for the remaining six semiannual periods. On the other hand, under the LIBOR curve, the fixed rate party is a net payer during the whole period of the contract.

The pricing and valuation of the IPRS is performed using the present value of the net cash flows. Therefore, at each settlement date the continuous compounding was used to determine the present value of each net payment. Under the government yield curve, the difference between the total present values is the swap value which is US\$667 is in favor of the fixed payer. The fixed rate payer should be compensated by an upfront payment of US\$667. This amount will equalize both the parties in terms of present values. On the other hand, under the LIBOR forward curve, the net result is that the floating rate payer will be receiving a total of US\$16,595 at the contract initiation.

Table 1 Cash Flows of IPRS for Contract's Counterparties

Settlement Period	Gov't Yield						LIBOR Rates

Dec-15	5.2	6.85	\$6,848	\$5,450	\$1,398	\$1,106	3.51	3.67	3,670.63	5,450.00	(\$1,779)	(\$1,519)
Jun-15	5.48	8.64	\$8,643	\$5,450	\$3,193	\$2,428	3.59	4.30	4,303.46	5,450.00	(\$1,147)	(\$958)
Total			\$56,443	\$54,500	\$1,943	\$667			\$36,187	\$54,500	(\$18,313)	(\$16,595)

5 Conclusion

The current practice of pricing and valuation profit rate swap is based on money market benchmark rates (LIBOR, IIBR, KIBOR,..etc). This practice is considered acceptable by practitioners as there is no truly Islamic alternative that is widely acceptable and provides the ability to price and value derivative securities.

The paper shows, without any doubt, that pricing the same IPRS contract with different benchmark rates leads to large variations in pricing and the net position of contract counterparties and their cash flows profiles.

This result enforces a conclusion that a universally accepted and applied Islamic profit rate is a necessity and the innovation in the Islamic asset pricing is needed for the continuous development of Islamic capital market in general and derivatives securities in particular.

Analysis of Financing Difficulty and Its Countermeasure for Chinese Enterprises Overseas Merger and Acquisition

Zhou Jun

Wuhan Textile University, Wuhan, P.R. China, 430077

(E-mail: 1051884820@qq.com)

Abstract: The sustainable development of Chinese enterprises cannot be realized without world market. Making use of various resources in the world market is the shortcut for the Chinese enterprises' development. In the "Going out" of Chinese enterprises, success or failure is more or less related to financing and financing way, since capital is the scarce resource in every enterprise. Therefore, how to finance effectively becomes an extremely important and basic activity for the enterprise, which needs careful analysis and study. In terms of the choice of financing way, this article proposes personal opinions for reference and critical thinking.

Key word: The overseas merge and acquisition; "Going out"; Financing difficulty; Financing way

1 Introduction

Since the middle and late of 1980s, Chinese enterprises, whether the state-owned enterprises or private enterprises, have made considerable progress in capital, technology, management and productivity after more than 30 years of introduction, digestion and absorption. Also, the enterprise size is not what it used to be and today in the international market Chinese enterprises can compete face to face with European and American enterprises.

Liu Zhengyu (2014) and Wen Ruixu (2015) propose that Chinese enterprises need focus on the mergers and acquisitions (M&A) financing when they are to go global and implement their overseas M&A. The enterprises can solve their financial difficulty in overseas M&A through the internal financing, the external financing and the leveraged buy-outs. Zhang Xiangqin (2012) puts forward that Chinese enterprises should innovate financing ways, reduce the M&A costs and scatter the M&A risks by combining the multiple financing ways such as the preferred stock financing and the buyout funds. Wang Di (2015) believes that the results will be different because of the different ways of M&A. Chen Wei and Wang Wanzhou (2009) points out that the trust has an incomparable advantage in M&A.

While numerous products "made in China" become famous in the world, the transaction environment facing Chinese enterprises is becoming increasingly tough. "Going out" becomes the only choice for Chinese enterprises. However, is the financing market and capital market in China well-prepared to go out of China?

2 Analysis of Financing Difficulty for Chinese Enterprises Overseas Merger and Acquisition

2.1 The financing way of Chinese enterprises overseas merger and acquisition lacks the market operation space

In the past 30 years of reform and opening up, the development of capital market is obvious to all. But because of the deficiency in national policy and law, the Chinese capital market is still at the initial development stage and has numerous formidable barriers in providing financing support for the Chinese enterprises overseas merger and acquisition. As is built into the law of the 43rd article of Temporary regulation for stock issue and stock transaction, "not a financial institution can provide loan for stock transaction"; The 133rd article in the "securities law" also states that "bank capital are forbidden to flow into the stock market". But selling enterprise bond makes the public not have enough confidence because of the enterprise popularity, enterprise self-restraint mechanism, enterprise credit capacity, enterprise management level, enterprise bond liquidity and so on. These subjective and objective reasons have all led to the failure of internationally accepted financing way in China, namely depending on the stock or the bond market for financing for overseas merger and acquisition. But from the international experience, native enterprises' participation in the international merger and acquisition cannot go without the support of prosperous native capital market.

2.2 Chinese commercial banks don't provide enough support for overseas merger and acquisition financing

The listing of Farmers Bank of China completed stock system transformation of all our commercial

banks and geared to international convention in terms of system. But in everyday operation, the use of bank loan is actually subject to related laws and regulations. For example, item 3 of the 21st article of “General loan rule” stipulates clearly that the loan is forbidden to be used in the capital stock equity investment. Also, the “commercial bank law” is not clear about whether to provide loan for enterprises merger and acquisition. These laws and regulations try to guarantee loan security and guard against market risk, but they also reflect that the bank credit system lacks flexibility in providing loan for merger and acquisition.

In addition, the loan implements lifelong responsibility system, therefore, in terms of the overall business ability of our commercial banks, the specialization degree is not competent to carry out effective participation, supervision and control in enterprises merger and acquisition and even the mortgage loan mechanism can't effectively control credit loan risk, causing financing failure in enterprise merger and acquisition.

2.3 The financing channel of Chinese enterprises overseas merger and acquisition is unclear and there remains doubt for the source of capital

In the construction and development of the market economic system in China, the private enterprises gain leap development and become the most dynamic economy in our country. But when carefully examining the development process of private economy, it is not difficult to discover that most of them depend on endogenous development to become strong and don't get market resources which are in direct proportion to their contribution to national economy. Also in the “going out” process, the support that private enterprises get is little. The proportion of private enterprises increases unceasingly in the enterprises which go out of China. In the capital market and loan market in China, private enterprises have problems getting capital and these problems not only enhance difficulty in private enterprises overseas merger and acquisition but also bring about doubt to the capital source of private enterprises. For example, when Sichuan Tengzhong Heavy Industrial Machinery proposed the plan in 2009 to purchase the Hummer brand of US General Motors, what people cared most was not whether the acquisition was feasible but whether Tengzhong had plenty of muscle for this acquisition and where did the capital come from?

2.4 The proportion of policy fund in the Chinese enterprises overseas merger and acquisition is large

Different from private enterprises, the Chinese state-owned enterprises (especially the central enterprises), which are the main body of overseas merger and acquisition, have various channels to gain fund and are financially competent to deal with the merger and acquisition that needs large amounts of money. However, the road of these enterprises in overseas merger and acquisition is also not smooth due to the unclear source of capital. For example, the Aluminum Corporation of China in 2009 spent 19 billion US dollars purchasing Australian mineral company despite its operating loss. However, the policy loan caused anxiety of the opposite party, thus, the failure of this transaction was reasonable. Based on the analysis of existing information, the state-owned enterprises in China are more likely to achieve successful overseas merger and acquisition in the developing countries. And the acquisition failure more occurs in the developed countries, which is largely due to the nature of loan.

3 Suggestions for Solving Financing Difficulty of Chinese Enterprise Overseas Merger and Acquisition

From form, currently there is no lack of main financing tools in the financing market in China compared with the mature overseas financing market. However, in the actual process of merger and acquisition financing, available financing way for merger and acquisition is limited and also the financing channel is not unimpeded. The bank loan and internal financing are two main financing ways, which largely restricts the overseas development of enterprises in China.

3.1 Revising and improving existing laws and regulations to make the financial market worthy of the name

The financial capital market is the main battlefield that merger and acquisition occurs. How to make use of native financial capital market to provide convenient financing method and means of payment not only depends on the advancement the financial capital market internationalization but also depends on the environment of native financial capital market. Therefore, the first of the urgent matters now is to revise the the inopportune chapter and article in the current laws and regulations such as “securities law”, “temporary regulation for stock issue and stock transaction”, “general loan rule” and “measures for selling convertible bonds in listed companies” and so on. Secondly, enterprises and

commercial banks should be encouraged to creatively use various financing tools to obtain merger and acquisition funds under the condition of not violating the existing laws and regulations; thirdly, importance should be attached to using the existing laws and regulations to regulate and control the loan behavior of enterprises and commercial banks. And efforts should be made to reduce limits from other methods (laws and regulations excluded) as much as possible to achieve free management and provide genuine support for the enterprises overseas merger and acquisition.

3.2 Establishing and improving the enterprise credit system and bringing various financing tools into play

The perfect and real credit system is the cornerstone on which the financial capital market establishes and it serves as the foundation for sound and orderly development of capital market. In the initial development stage of financial capital market in China, the government, enterprise and society should play a role in the credit construction from different aspects. Firstly, the company should actively improve corporate governance structure, implement scientific and rational decision-making mechanism and set up transparent information disclosure system to make enterprise public company in the real sense; Secondly, credit system should be established through the government or the bank to supervise and manage the good faith construction of whole society and promote the public sharing process of credit information; Thirdly, credit service market should be cultivated under the guidance of market demand and various, complementary and legally operated credit service organizations with market credibility should be encouraged to provide specialized, diversified and multi-level market credit service for the whole society; Finally, great efforts should be made to promote good faith education and severe punishment should be given to market body breaking faith. Franklin once put it: "Credit is also money". In the increasingly competitive world market now, the credit competition will be the main form of future market competition and only good faith can bring convenience to the enterprise financing.

3.3 Treating various economic entities fairly and openly and ensuring their basic market rights

The proportion of private enterprises increases unceasingly in the enterprises that go out of China (though there is no authoritative data to prove it). However, the way or the channel of private enterprises' getting merger and acquisition fund is not expanded yet. Now this issue has finally aroused the attention of the senior leadership. "Risk management guideline for merger and acquisition loan of commercial banks" issued in 2008 by China Banking Regulatory Commission strengthens the status of state-owned enterprises and also mentions local enterprises and private enterprises. But "some suggestions about encouraging and guiding privately operated economy and other non-public economies" issued by the State Council in 2010 was pasted "non-public economy 36", in which increasing the fiscal and financial support for non-public economies and solving the narrow financing channel problem is specially pointed out. Although it is just a beginning, we have reason to believe that in the future the non-public economies or the private economy will enjoy the same or similar market rights as state-owned enterprises with the revision of a series of laws and regulations^[1].

3.4 Transforming the function of relevant government departments and changing the participator into service provider

Adam Smith in the Industrial Revolution advocated the government to act as the "night watchman" and objected to government's gesticulating to the market operation and proposed that market issues should be solved on its own. For Chinese enterprises' overseas merger and acquisition, government needs to accurately identify their market position. The central enterprises in China are the extra large monopolist enterprises group with Chinese characteristics. Basically they are established in the form of separating government functions from enterprises and enjoy various resources that other enterprises can hardly attain, thus they have obvious inherent advantage in the overseas merger and acquisition. However, what this inherent advantage brings to the enterprise is not success. From CNOOC's purchasing American Unocal (Unocal) to ACH's buying stock of Australian ore company, what is shown obscurely in the shadow of defeat is the act of government. Therefore, the government must actively realize its role-positioning. Just as "11th five-year plan" stressed, the realization of economic and social development goal "mainly depend on the improvement of market mechanism and interest guiding mechanism. Government must create good system and policy environment to stimulate the enthusiasm and creativity of market entity through mechanism innovation and policy improvement, making government thoroughly get rid of the role of "positive economic subject" and returns to its role of "system safeguard, market environment founder, the fair mediator and service provider" and well safeguard the overseas activity of enterprises.

4 The Overseas Merger and Acquisition Financing Should Depend on Innovation to Find a Way out

4.1 Encouraging financial service development in enterprises and exploring new financing way for enterprises

For numerous domestic enterprises, either inwardly depend on the so-called endogenous development to raise merger and acquisition fund or outwardly cast eyes on bank loan or the government support fund, very few consider carrying on the overseas merger and acquisition financing through enterprise financing which requires small investment but raises much money. The going-out pioneer enterprise Haier profoundly analyzed the GE pattern (GE is one of the world's top 100 enterprises that realizes industrial multiplication successfully through enterprise finance) and formed original ideas about developing the enterprise finance. Its leader Zhang Ruimin thought that to develop enterprise finance, firstly, internationalization should be realized through two wheels, namely industry and finance; secondly, to develop enterprise finance helps to achieve production resources distribution globally; finally, to develop enterprise finance helps enterprises to integrate into the local wholesale and retail and financial service effectively and help to seek leap development opportunity for enterprises.^[2]

4.2 Using leverage buyout to finance for acquisition

The leverage buyout (the abbreviated form is LBO) is one special form of enterprise capital operation and its essence is leverage buyout, namely an acquisition in which the enterprise uses a small amount of equity money (about 10%-15%) and takes the property of acquired enterprise and future earning capacity as collateral to raise fund for merger and acquisition. Leverage buyout financing is different from other debt financing methods and it mainly depends on the future economic gains of the acquired enterprise or depends on selling some properties of the acquired enterprise to pay the debt. Thus, the leverage buyout is featured by its low cost but much gains, high risk, high income and high skill. Leverage buyout financing enables enterprises that lack massive merger and acquisition fund to rely on external financing to achieve merger and acquisition by creating win-win situation.

At present, the enterprises in China needs to use the leverage buyout to solve the following problems: the first is to solve the problems that conflict with existing laws and regulations. According to "law of corporation", when a company invests other companies (the investment company and holding company excluded), the accumulated investment can not surpass 50% of this company's net assets. But the leverage buyout might make all the registered capital invested to the target company, which obviously goes against "law of corporation"; the second is to solve debt ratio for enterprises in China. The essential requirement of leverage buyout is low debt. But for enterprises that are suitable for leverage buyout in China, many have a debt ratio of more than 100% and don't have the ability to finance; the third is to improve the developed capital market.

4.3 Cooperating with mature overseas investment fund to avoid risk

When carrying on overseas merger and acquisition, state-owned enterprises should actively cooperate with world famous PE (PE is short for private equity), especially PE that focus on buy-out/buy-in (namely buyout fund). They should make use of their status as investor and also its characteristic of rich experience as manager and strong ability to take and manage risk to downplay their state-owned and politically-driven feature, reduce the possibility of refusing merger and acquisition plan and policy authorization detention from related parties, and increase the possibility of success^[3].

4.4 Collaborate with native enterprises or the internationally prominent companies to carry on acquisition

Chinese enterprises' merger and acquisition in European and US developed countries often break down because of politics. General Manager of the Beijing Changmao Consulting Company, HuangTeng, thinks that the key to solving this problem is making use of joint venture to remove doubts and meanwhile keep a low profile so as not to overemphasize control force and interest of the invested company and invested country should be highlighted. For example, CNPC and Shell's participation in the takeover bid of Australian CBM Company Arrow in the name of Shell Energy Holdings Australia should be a new attempt. Different demands of shareholders can be met on the basis of providing fund and market and approval can be obtained from the opposite party.

4.5 Actively cultivating overseas business of investment bank and developing different financing channels for merger and acquisition

When analyzing management veins of Goldman Sachs, Merrill Lynch and other internationally famous investment bank, we can find that selling on consignment, transaction, brokerage and other early business models have been gradually substituted by merger and acquisition, financial adviser, structured

financing, asset securitization, asset management, derivative transaction, direct investment of stockholder's rights and other services. Selling on consignment is the high-end and brand business of investment bank and plays a leading role to other business, but its earning only accounts for 10% of gross profit. The investment bank in our country should draw on the successful experience of large international investment bank and focus the business of overseas investment bank on adviser consulting, merger and acquisition, property transfer, asset securitization, direct finance and other main lines, open up financing channels (e.g. contacting trust company to arrange seller financing, applying to trust company and various investment fund for stock collateral loans, introducing institutional investors, providing bridge loans for high-quality enterprises) for our enterprises' overseas expansion and support merger and acquisition enterprises to raise necessary merger and acquisition fund^{[4][5]}.

5 Conclusion

Chinese enterprises overseas merger and acquisition is a positive phenomenon, explaining that the Chinese economy is integrating into the world economic system in a more extensive field and at a higher level. The analysis of overseas merger and acquisition financing of Chinese enterprises helps various enterprises in our country to better develop the international market, effectively guarantee resources supply and quickly gain crucial technology to make Chinese enterprises multinational company with strong international competitiveness.

Empirical Study of Earnings Management by Listed Companies Film and Television Industries

Zhao Dizhen

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 335050286@qq.com)

Abstract: As cultural industries take a more prominent role in China's economic development, the State Council has announced positive policies to promote the film and television industries. The goal is to drive this industry to become a pillar of the China's economy. The film and television industries hold half the market share of the cultural industry. However, with the corrections and improvement of accounting practices to comply with international standards and the diversification of investments, what will the difference of earnings management be in this particular industry? I have chosen the China's financial statement data of 20 listed companies as research samples, and used SPSS19.0 software and corrected Jones model to undertake significant tests and multivariate linear analyses, and have come to a conclusion.

Key words: Film and television industry; Listed company; Earnings management; Empirical research

1 Introduction

With the further reformation of China's economic system and the boom in investment markets, China's accounting environment has become more complicated. The users of accounting information now pay more attention to the quality of accounting information. The earnings of a company are one of the top concerns. Because of inadequate accounting rules and related systems, some companies will control earnings for listing, rationing shares, or expanding influence. The film and television industry is a specialized economic form. It has become the endogenous variation of economic and social development. It is a very important and difficult task to develop the film and television industries to meet the cultural demand of the masses, especially the younger generations. That is why I chose the film and television industry as my research subject to empirically analyze the earnings management of listed China's companies.

2 The Redefinition of the Management of Earnings

Earnings management is different from the profits control. The experts from different areas have different opinions about the concept of management of earnings, which in essence is an academic subject. First, let's define management of earnings:

The American accountant William K Scott considers earnings management as the process of maximizing the operator's own benefit by choosing the best accounting policy under GAAP's permissible methods.^[1] Another American accountant, Katherine Schipper, considers earnings management as an act of intentionally influencing the process of financial reporting to obtain some private gain^[2].

These two American accountants tell us the characteristics of earnings management: First, the person who chooses which model to follow is usually the senior executive. Second, the object of earnings management is to manage the total profits reported by the company. Third, the methods of earnings management are comprehensive, including accounting methods and non-accounting methods. Fourth, the purpose of earnings management is to maximize the economic benefits.

Obviously, we can define earnings management according to different users:

1) When the report is mainly for internal users, earnings management is a process by which a company accomplishes financial goals by using multifaceted legal means. It is to manage accounting profits by the executive while following the laws and new accounting rules.

2) When the report is mainly for external consumption, earnings management is a management behavior which is against accounting professional ethics. It is to shade the financial report to influence investors to make economic decisions and affect the governmental judgment of earnings information.

In the spirit of people-oriented principal and considering the interests of different people, the following empirical research focuses on external users.

3 An Overview of the Film and Television Industry

3.1 The definition of the film and television industry

According to UNESCO, the culture industry is defined as a series of activities of production, reproduction, storage, and distribution of cultural products and services, in accordance with industrial standards.

At present, the culture industry is separated into different categories: network culture industry, the film and television industry, audio-visual industry, culture and entertainment industry, performance industry, tourism, works of art, art training, and books and periodicals.

The Film and television industry incorporates a particularly larger and more comprehensive industry chain - including literature, publishing, photography, art, lighting, cosmetics, clothing, scenery, performance, advertising, animation design, production management, etc.

3.2 The development process of film and television industry

In 2000, the fifth plenary session of the 15th China's Congress of the CPC, "culture industry" first appeared in the official documents of the Central Committee. In 2002, the 16th China's Congress of the CPC report discussed cultural construction, and strongly encouraged the development of the cultural industry. On July 22th, 2009, the State Council passed "cultural industry promotion plan", which greatly promoted the rapid development of the whole cultural industry, including the film and television industry. In 2012, the government responded to national conditions, triggering the climax of the development of the cultural industry. In the six plenary session of the 17th China's Congress of the CPC, in a meeting it was proposed to make the development of the cultural industry into a pillar of Chinese industry by 2020. It also introduced supportive fiscal policies which would help usher in the intensive development of the cultural industries published period.

At The Chinese Media University Film and Television Industry Research Institute, the director of the academic committee, Yong Feng Qi, believes that the "12th Five Year Plan" will act as a development stage for the culture industry, and the "13th Five Year Plan" will be an international stage for the culture industry. China's cultural industry will ipso facto fall in line with the international market. It has become an international cultural power. "The demand for cultural consumption has been suppressed by 90% ~ 99%." Independent planner A. Ying said, when interviewed by the "Outlook Weekly", "Releasing this demand is our most important responsibility, by increasing the supply"^[3].

With the development of the cultural industry, the rapid rise of China's film and television industry has played a leading role in the economic and social development of the nation. In recent years, network radio and network TV have become new bright spots in the development of the film and television industry. Radio and television including digital cable television provides a larger forum for the development of the film and television industries. In a period of financial crisis, the film and television industry unexpectedly kept financially sound, especially during prime time and holidays, when people were lining up in front of cinemas. It was difficult for the populace to obtain a ticket. The film and television industry was flying against the wind, and moving forward. This added more confidence and hope to the rapid development of China's film and television industry. At present, China has become the world's second largest film market. The influx of capital has been the direction of the development of Chinese film, suggesting that the Chinese film industry in the capital market has staged a war of cross-border integration and has surged ahead of as new trends are formed. It now has international influence and competes significantly.

4 The Characteristics of Earnings Management of Listed Company in the Film and Television Industry

The Chinese film and television industry started relatively late. With governmental support, the companies in this industry have good prospects. However, listing in A-share is demanding which leads to fewer listed companies with small scale. In order to keep their salaries and positions, and achieve the aspirations of the majority of shareholders, and meet the listing requirement and supervision, the managers will adjust earnings report by earnings management. At present, the government puts great emphasis on the development of the film and television industry and has announced all kinds of preferential policies. The earnings management of listed company in film and television industry has the following characteristics:

1) The manager has great pressure upon him or her. The earnings management has become the decompression medicine.

Elements of pressure on earnings management can be divided into four kinds: economic pressure,

work pressure, bad habits pressure, and other pressure. Pressure comes when the target is more than their own ability. When the operator's scientifically plans the company's development strategy by analyzing SWOT and PEST, makes full use of its resources, reasonably manages averse internal and external risk, the pressure is controlled in the range of ability. In this situation, the pressure is positive, otherwise it is negative. Trying to do something that is known to be impossible deliberately will promote earnings management and fraud.

2) The policy temptation is so big that the motivation of earnings management is obvious.

Restructuring of the state-owned film and television industry supports the private capital to participate. Social capital can establish share-holding film and television productions, performing arts, screening, and entertainment, printing, and exhibition enterprises. "Debt-to-equity swap" allows implementation in the process of cultural enterprise restructuring. The broadening of the cultural enterprise registration authority, the cultural companies of which the registered capital is less than 5 million Yuan, can reflect directly to the local county administration of industry and commerce. The individual businesses and farmers' professional co-operatives are allowed to develop special tourism, the local culture customs, folk culture and other culture activities. Listed companies in film and television industry have preferential policies in land acquisition and usage, finance, taxation, access and other aspects, which makes managers strive to portray earnings management to provide a good image of the company.

3) It has plenty of human resources with many earnings management means.

Our listed company of film and television industry has a great number of talents. These highly knowledgeable managers are good at using cunning means of earnings management. In addition to the accounting estimation, the error correction of early stages and the changes in accounting policy, the government subsidies, or contingencies, the affiliated party transactions, the fair value, merger goodwill are used for earnings management.

5 An empirical study of earnings management of listed companies in film and television industry

5.1 The hypothesis of research

The domestic and abroad accounting scholars come to the same conclusion through the empirical analysis study of earnings management: The earnings management behavior of listed companies exists in various industries. But, no one has been able to confirm whether there is earnings management misbehavior and its degree in listed companies of film and television industry through empirical research. According to experience so far, the first assumption is made:

Hypothesis 1: listed companies of film and television industry have different levels of earnings management behavior every year.

In 2007, with international convergence, new accounting standards have been enacted in China. The new accounting standards will further modify government subsidies, the fair value measurements, and asset impairment losses. It also put forward the stricter requirements to the subjective judgment of accounting estimates and accounting policy changes. These should be able to inhibit earnings management behavior theoretically. So according to this, the second hypothesis is made:

Hypothesis 2: From 2009 to 2011, the degree of earnings management operated by the managers of listed companies in the film and television industry is declining year by year.

5.2 The selection of model

General methods include Hayley accrued profit model, Di 'Angelo model, the Jones model, modified Jones model etc. Considering the uniqueness of listed companies in film and television industry and the efficiency of the data collection the modified Jones model is finally chosen for empirical study of the listed companies in film and television industry.

5.2.1 The total accrued profit method

Overall accrued profit is based on the profits and losses of the cash basis accounting and accrual accounting profit produced by the difference. Generally speaking, under accrual accounting, those that have been implemented in current income and expenses or have occurred, regardless of whether the payment is cashed, should be treated as revenue and expenses. Those that do not belong to the current income and expenses, even if they have been cashed, should not be included as current revenues and expenses. But under the cash basis, when payment is actually received, confirms income, and when actually paid is to confirm expense. John Jason defines overall accrued profit as the difference between net income and cash flows from operating activities ^[4].

Namely:

$$TA \text{ (Total accrual)} = NIN \text{ (Net Income)} - CFO \text{ (Cash Flows from Operating activities)} \quad (1)$$

According to the manipulability, overall accrued profits can be divided into two kinds: controllable accrued profits and incontrollable accrued profit.

Namely:

$$TA \text{ (Total accrual)} = DA \text{ (Discretionary Accrual)} + NDA \text{ (Non-Discretionary Accrual)} \quad (2)$$

$$DA \text{ (Discretionary Accrual)} = TA \text{ (Total accrual)} - NDA \text{ (Non-Discretionary Accrual)} \quad (3)$$

The key of the overall accrued profit method is to measure discretionary accrued profits, and regard it as an index of earnings management.

5.2.2 The modified Jones model

Hayley assumes non-discretionary accrued profits of a company are stable every year. It should be subject to the distribution of white noise with zero mean value. It comes to a conclusion that the expected non-discretionary accrued profits are equal to zero. If the overall accrued profit is not equal to zero, then the earnings management behavior exists. This is the Hayley model. Considering special circumstances of the Hayley model, the Di 'Angelo model improves the estimation period into the event period the year before.

Through research, Jones thought the Hayley model and the Di 'Angelo model do not consider the influence to non-discretionary accrued profits made by the changes of a company scale. Jones considers that the increase of the company's main business income will lead to the increase of accounts receivable project. The increase of original value of the fixed assets will lead to the increase of the accumulated depreciation. Accrued profits will be increased. He makes the following model^[5]:

$$TAt / At-1 = \beta_1(1/At-1) + \beta_2(\Delta REVt / At-1) + (PPEt / At-1) + \varepsilon \quad (4)$$

$$NDA_t / At-1 = \beta_1(1/At-1) + \beta_2(\Delta REVt / At-1) + \beta_3 (PPEt / At-1) \quad (5)$$

TAt = Overall accrued profit of t year

At - 1 = t-1 year's total assets

ΔREV_t = t year income - t - 1 year income

PPEt = t year original value of fixed assets

ε_t = residual

NDA_t = t year Non-Discretionary Accrual

On the basis of the Jones model, Daiqiu found that many companies have credit sales (sell on credit). There should be receivable accounts and even the possibility of bad debts. The existence of credit sales is likely to lead to earnings management behavior. Jones model takes the change of total operating income as a part of non-discretionary accrued profit. This will inevitably produces large errors. The model will underestimate the earnings management behavior and overestimate the non-discretionary accrued profit. Therefore, Daiqiu et al. corrected the Jones model and made the modified Jones model. This model deducted the part of the increased credit sales from income increase. Modified Jones makes formulas as follows^[6]:

$$NDA_t / At-1 = \beta_1(1/At-1) + \beta_2(\Delta REVt / At-1 - \Delta REct / At-1) + \beta_3(PPEt / At-1) \quad (6)$$

Δ the REct = the net value of receivable accounts of t year - the net value of receivable accounts of t-1 year β_1 、 β_2 、 β_3 are the coefficient, can be obtained from the following regression model:

$$TAt / At-1 = \beta_1(1/At-1) + \beta_2(\Delta REVt / At-1 - \Delta REct / At-1) + \beta_3(PPEt / At-1) + \varepsilon_t \quad (7)$$

To achieve the purpose of the study, by using the Modified Jones Model, we can estimate the discretionary accrued profits and non-discretionary accrued profits of Chinese listed companies in film and television industry more accurately.

5.3 The sample selection and data sources

5.3.1 The sample selection

Chinese film and television industry experts Xiao Ming Hu has published more than 30 listed companies on the A-share. He takes out extensive cultural and marginal culture (including tourism) of five listed companies and selects 20 well-operated listed companies, which have complete data as samples to do empirical testing of 2009-2011 data. I have chosen 2008 data of 20 listed companies because of variables used in the model.

5.3.2 The period of the empirical analysis

The period of the empirical analysis is from 2009 to 2011. I study 3 years of data of the selected 20 listed companies in 2009, 2010 and 2011. Due to the conclusion of the model requires the previous year's data, the data of 2008 is also selected.

5.3.3 The data sources

All data is from sina (sina finance and economics) published balance sheet: the receivable net

accounts, the original value of fixed assets and assets of the total amount of data of the selected sample company from December 31, 2008 to December 31, 2011. Income statement: the data of revenue and net profit of the selected sample company from 2008 to 2011. The cash flow statement: the data of net operating cash flow of the selected sample company from 2008 to 2011. The used statistical software is Microsoft Excel 2010 and SPSS19.0 Chinese version.

5.4 The empirical results and analysis

5.4.1 Regression analysis of the correlation test

1) 2009 data test results

Table 1 R analysis Results

Model	R	R Square	Adjusted R-squared	Standard error of estimate
Modified Jones Model 1	0.627 ^a	0.393	0.28	0.126

Note: a predictor variables included: 1 / prior year total assets, fixed assets / total assets last year, (the amount of change in operating income - change in accounts receivable) / Total assets last year, (constant).

Table 2 Anovab

Model	Square and	df	Mean Square	F	Sig

5.5 Positive conclusion

From the results of table 1, table 3 and table 5, we can see that r-squared and adjusted r-squared of 2009 and 2011 of the selected samples are less than 0.5. The r-squared and adjusted r-squared of 2010 are more than 0.5, but also less than 0.9, which proves that the data in the model fitting degree is relatively poor. That is to say, in the sample company annual report, overall accrued profit is more than non-discretionary accrued profits. There is a considerable part of discretionary accrued profits. The reason is the managers do earnings management purposely. It proves the hypothesis is correct. These listed companies of film and television industry do have different levels of earnings management behavior every year. We can also see that the r-squared of 2011 is small. The r-squared of 2009 is modest. The r-squared of 2010 is the biggest. It shows that the sample companies took obvious earnings management in 2009 and 2011. The earnings management behavior is not obvious in 2010. The reason is the managers carried on the earnings management behavior with strong purpose in order to smooth the trace of earnings management and evade supervision. In contrast with the previous year they did a surplus of adjustment. Therefore, it denies the second hypothesis of this article. The promulgation of the new accounting standards does not gradually inhibit earnings management behavior.

In addition, though the empirical study on earnings management behavior throughout the academic study of real estate, manufacturing, etc. it can be seen that the degree of earnings management of listed companies in film and television industry is relatively small. It proves that the importance of film and television industry in China is high. The regulatory policy is more strict.

From the data in table 2, table 4 and table 6, we can see that 1 regression analyzed F value of 2009, 2010, 2011 is relatively low, which means the effect of whole regression equation is relatively poor. It also confirms that the ratio of discretionary accrued profits in the overall accrued profit is large. Again, it proves the accuracy of hypothesis. From the data, we can see that the F value of 2010 is the biggest. The F value of 2009 is modest. The F value of 2011 is small. It also confirms that in 2011, the earnings management behavior of sample companies is most obvious. In 2009, the earnings management behavior is modest. In 2010, the earnings management behavior is least obvious. It denies the second hypothesis.

From model test result of significant regression parameters, the returns of 2009, 2010 and 2011 are not obvious. In other words, the scale change of the selected sample listed companies does not significantly affect the growth of non-discretionary accrued profits. Discretionary accrued profits can greatly influence the change of the sample company's overall accrued profit, which also proves that the earnings management behavior exists in financial reporting of listed companies in the film and television industry.

According to the above empirical analysis, we reach the following conclusions:

1) In the annual financial report of the listed company in film and television industry, there are different levels of earnings management behavior. The earnings management behavior in 2010 is not obvious. The earnings management behavior in 2009 and 2011 is more obvious.

2) The promulgation of the new accounting standards does not gradually inhibit of the listed companies' earnings management. In order to smooth earnings management trace, the managers do the opposite surplus adjustment each year.

6 Conclusions

Through the empirical analysis we can see that the phenomenon of earnings management exists in Chinese listed companies in the film and television industry. This is suggestive of the fact that the film and television industry is becoming more developed. But the excessive earnings management cannot truly reflect the profitability of a company's financial conditions which leads to accounting information distortion. It seriously affects the function of optimizing the allocation of resources in the capital markets. It has become an important factor that blocks the healthy development of China's film and television industry. It also is a huge inconvenience to management, which caused the financial turmoil, heavy loss of the company's economy and the credibility. In order to reduce the negative impact of earnings management, the listed company's earnings management should be standardized. According to this, we can take actions from the following aspects:

1) To strengthen and improve the system of accounting standards and accounting construction to reduce the space of earnings management as much as possible. In China, market economy development is immature. The relevant laws and regulations are not regular. The relevant departments do not enforce law enforcement strictly. It provides great latitude for earnings management, thus affecting the quality of the earnings information. The earnings management of listed company is inevitable, but we can constantly improve accounting standards and accounting systems, forcing the film and television companies to narrow their surplus space to regular earnings management as much as possible. Laws and regulations must be improved. Stricter rule systems must be established to make the company's actual financial operation accept the necessary binding. It can reduce the subjective intent of the financial processing, and prevent the company from taking too much risk.

2) Speed up the governance of the internal structure of listed companies, and standardize the internal constraint mechanism. Corporate governance institution is an internal supervision mechanism to restrain earnings management. With the current situation, the internal governance structure of listed companies is not perfect^[7]. The case that big shareholders infringe the interests of small shareholders happens occasionally. Independent director systems are not perfect since they lack independence. In some companies it simply does not exist. The target interests of owner and operator are inconsistent. The company incentive mechanism is not perfect etc. The companies should adjust internal mechanisms, balances the behaviors of each interest group, which will in fact inhibit some earnings management behavior. For example, it can decrease the proportion of state-owned shares equity and adjust the irrational equity structure. A company can also improve the system of independent directors, and build a dual function mechanism which can not only protect the interests of investors but will also inspire operators. As an example, the director system, concerning the independent director and the interest relationship in the listed companies, the company can take in accreditation system of the third party to get independent directors to rid themselves of the dilemma which he has to subject to listed companies and large shareholders, and be responsible for the market. The independent director is totally independent from the company and his compensation and performance is separate from the company. In addition, we should straighten out the relationship between independent director and board of supervisors and redefine both functions in order to take its responsibility so that we can avoid management effectiveness due to the fight for power and money.

3) Strengthen external supervision functions and improve the quality of the auditing profession and service quality.

Supervision and management of China's listed companies are mainly composed by CSRC. The justice department cannot effectively play a role. It has virtually increased the space of earnings management. We should improve the securities market supervision system, strengthen the supervision of securities regulators, correct related management system errors and reduce the policy incentives. Furthermore, we should strengthen the connection between administrative supervision and the criminal justice department to reinforce the regulation of listed companies and crackdown on the illegal behavior. According to the current relevant laws and regulations in China, the level of company surplus has

become a major indicator which determines whether a company is qualified to list, distribute shares, and avoid delisting. Most of the listed film and television companies will employ earnings management in order to insure the qualifications of listings, distribution shares and delisting. Therefore, we should change the existing rules of securities law, set up scientific evaluation systems for listed companies. Relevant hard indicators should not only consider earnings level, but also pay attention to the quality of earnings and future potential. For example, the CSRC will change share offerings from the quota system into an authorization system. To a certain extent, this can reduce incentive of new pricing for earnings management. Additionally, considering the company's characteristics, growth, and loss of properties etc. as the main reason, the regulation of the stock suspension and Termination of the listing can be adjusted. The conditions of losses for other financial indicators can measure three consecutive years, such as cash flow, and solvency. According to the space-time characteristics of the earnings management, we can establish a long-term supervision mechanism, to change the current regulation, which is seasonal, sometimes intensifying, and sometimes loosening^[8]. Securities regulators should also further transform their ideas and ways of work. They can make full use of modern information means and banking supervision systems to improve the regulatory frequency, efficiency, and effect.

4) Shift audit trading patterns and strengthen the supervision of the intermediary function.

Under the current pattern, the accounting firms are employed by the listed companies, and they audit the accounting information in order to ensure the quality of accounting information. The expenses are paid by the employers. This largely weakens the firm's independence, and seriously affects the reliability of accounting information. Therefore, we should change the current auditing mode to unify consumers and buyers of the auditing suggestions. It can enhance its independence to prompt them to carries on the objective and fair audit to audited listed companies. For example, a listed company should deliver a certain proportion of funds to set up special account according to its assets or profits. The accounting firm is paid from this account. Meanwhile, we should improve the professional judgment ability and set up a civil compensation mechanism for certified public accountants^[9]. If the accountant fails to find significant accounting fraud or gross negligence, which makes investors and creditors suffer huge losses in the process of auditing, the certified accountants and his firm shall bear the corresponding civil liabilities.

From what has been discussed above, the Chinese market economy developing system is inadequate. The related laws and regulations are uncompleted. Especially the lack of self-discipline and heteronomy makes earnings management of listed company in film and television industry incur and cause more harm than good. Information asymmetry damages the information users, especially the interests of investors and creditors. Related government departments should pay attention to it.

Real Options Used in the Evaluation of Intangible Assets: Take Mobile Game Rights Evaluation as an Example

Mu Yao

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 644746858@qq.com)

Abstract: In the internet economic time, smart phones are growing to be widespread, just like they have become an indispensable part of people's life. Mobile games, as important applications, which attract customers and traffic, are being paid more and more attention. It's critical to reasonably evaluate mobile games' value, which is also an important way to boost the mobile games market. There are some limitations in traditional cost method, market method and income method when evaluating the value of copyright in mobile games. This paper introduces the real option method and put forward new methods to assess the value of copyright of mobile games and analyzes the basic idea and applicability of traditional valuation methods. All those bring important reference to reasonably value mobile games' right.

Key words: Mobile games; Value Rights; Real Option

1 Introduction

Mobile games, referred to as "mobile games" that runs on the game software on the phone. According to the mobile games of networking properties, mobile games are divided into mobile stand-alone games and mobile network games.

1.1 What copyrights are involved in mobile games?

According to mobile games patterns and income sources, the copyrights involved are as follows. Firstly, Mobile games, in the form of software, exists on various Internet, customers download and install via different channels, which mainly related to the reproduction rights of mobile games, distribution rights and communication right of information network. Secondly, allowing all regions except Chinese mainland, including Honking, Macao and Taiwan, to use and distribute mobile games incurs agency fees and revenue share, which is primarily related to the right of reproduction, distribution, translation and so on. Thirdly, adapting the hand travel into TV series or movie and developing other derivatives are mainly related to the filming rights and adaptation rights. In summary, the mobile games copyright, mainly covers the reproduction right, distribution right, information network transmission, translation rights, filming right and the adaptation's right.

1.2 Mobile game revenue model

In general, mobile games revenue in three ways: selling props, downloading with pay and developing derivative products. For now, almost all of the "free" mobile games, achieve profitability from the sale of games props and other virtual items, which takes a large proportion of the income. Moreover, the users' downloading the installation package by one-time pay through the relevant platform is another way to get the benefits of mobile games. In addition to the above two methods, achieving profitability from the further development of derivative products is also another business model. Usually the development of mobile games derivative production is built on high awareness and the large number of users. The development of mobile games' side-line derivatives is still not perfect in China. In the United States, Korea and Europe, the scale of mobile games derivatives industry has been several times larger than that of hand games industry. As the quality of mobile games improves, derivatives will be an important market.

1.3 The research status of mobile games copyright valuation

Currently, many people around the world use the traditional assessment to value mobile games. With time going by, the traditional way is clearly facing many challenges on the applicability of the games. But there isn't any complete mobile games valuation systems proposed. In consideration of the option feature of the mobile games copyright, the paper aims at introducing this option model to build valuation methods which conform to the trend of the times.

2 Background and Significance of Hand Travel Rights Assessment

In the era of the Internet economy, people who can attract users and traffic can create huge profits. Mobile games, one of the mobile applications which attract users and traffic, now has become the

market that all these major Internet giants rush to grab. In 2013 the market size of mobile games in China broke through the 10 billion mark, reaching 11.2 billion Yuan. With the expanding of market scale, the market set off a frenzy of trading because of the huge market potential and profit expectations. However, the development of the mobile games market faces two major difficulties: The first is the game copyright cannot be priced effectively. The innovation can't realize its value effectively, which not only obliterates the enthusiasm of related personnel, but also impedes the effective transactions of mobile games copyright market. Secondly, Chinese copyright-related laws and regulations are imperfect, not giving effective protection to the trading of mobile games copyright, which hindered the hand travel market's prosperity. In this paper, we use the real option pricing method to calculate the value of hand travel copyright in a new way, which has important theoretical and practical significance to copyright pledge financing, copyright trading and value realization. Theoretically, it expands the range of applications of real option and enriches the intangible assets - copyright value assessment method; practically, it provides the basic of the pricing of mobile games copyright and the conditions for the prosperity of mobile games deal.

3 Review the Conventional Evaluation

3.1 Factors affecting the value of mobile games copyright

Mobile games copyright value is generally affected by five factors: cost consumption, production elements, years of the income, operating channels and the external environment. High investment and luxury production have great influences on mobile games' quality, and then products with high quality are more likely to be popular with consumers in the future. The longer the proceeds of earnings years are, the higher the value of copyright will be. Channels and operating platforms are the conditions of the mobile games' launch, and they are the important external factors that decide the value of the mobile games. The Macro Economic environment, media technology environment, legal policy environment and market supply which can influence the value of the mobile games are also the external environment factor that should be considered.

3.2 The basic ideas and applicability analysis of costing method

Evaluating the cost from the point of buyers, we assume that there is no buyer willing to purchase when purchasing price is higher than the cost of asset price. Using the cost method involves four basic elements: a functional replacement cost of assets, loss of tangible assets, depreciation of obsolete assets and economic depreciation of assets. Because there is no visible loss of intangible assets, we do not consider the loss of tangible assets. Buyers who purchase copyright assets are concerned that copyright assets can bring future earnings rather than cost of copyright assets. Mobile games works' future earnings are not determined by its costs, because high cost does not mean high-yield and low-cost mobile games works can also get a good market. What's more, due to the formation of a copyright work relies more on investment which can't be measured including human intelligence, creativity and living labor, its visible costs, such as artificial cost, office cost, investment of equipment and other direct and indirect costs, tend not to fully reflect its real cost levels. The copyright value of the mobile games works, to some extent, is influenced by the development and the investment cost, but cost is definitely not the determining factor of mobile games' value of copyright.

3.3 The basic ideas and applicability analysis of market method

There are three conditions to assess the value of mobile games works copyright by using the market value method: first of all, there must be an public active mobile games copyright trading market and the relevant transaction data; secondly, there must be similar trade cases of mobile games copyright assets to provide the reference for appraisers; finally, the difference between evaluation objects and comparable transaction objects can be adjusted quantitatively.

Market law basic formula:

$$P = P^I \times S_1 \times S_2 \times S_3 \times \cdots \times S_n \quad (1)$$

P is the assessment of the value of mobile games copyright; P^I is the trading price of mobile games copyright in comparable transactions cases; S_1, S_2, \dots, S_n are all the correction factors. But there is currently no active mobile games copyright trading market in the country, so the transaction price may deviate from the intrinsic value of the copyright. There is little comparability of other mobile games copyright's trading price, so it's not applicable to simply use the market approach to assess the value of mobile games copyright.

3.4 The basic ideas and applicability analysis of the income method

The income method is based on how much the revenue that copyright assets can bring in the future.

The formula is:

$$P = \sum_{i=1}^n \frac{R_i}{(1+r)^i} \tag{2}$$

P is the assessed value of mobile games works copyright; R_i is the i years mobile games works of net income; n is the earning years of mobile games works copyright; r is the appropriate discount rate. The value of mobile games copyright depends on its how many profits it can bring to the copyright owner. The income method considered the future cash flow that copyright's future earnings can bring to the owners, and therefore, the evaluation which as the copyright investment, transfer, pledge for purposes often use this method in the appraisal. However, the Income approach also has its shortcomings. Income method assumed that future operating environment is stable and the future cash flows can be predicted based on historical data. However, in the mobile games works, there may exist a lot of uncertainty in the future operation. If the future mobile games works are widely accepted in the market, it will derive other types of copyright value, which can't be considered by income approach. In summary, among the three traditional assessment methods, the income method is the most widely used, the most scientific method in existing mobile games copyright value evaluation, though it was unable to consider the option features of mobile games works. In order to assess the value of mobile games copyright in a better way, we need further exploration on new methods.

4 Real Option Method in Valuing Mobile Gaming Rights

4.1 The basic idea

According to the Real Option Method, the future earnings of mobile games' copyright mainly consists of two parts. The first part is the value of future cash flows identified by the traditional income approach, that is, the present value of the business benefits by the basic application of mobile games copyright. The biggest flaw of traditional income approach is that it ignored the adjustments that would be made by managers and policy makers in the future, that based on development of objective situation, namely earnings posed by avoiding risks. Instead of considering the benefits caused by its flexibility in this section, supposing no matter how the future situation is, and still proceeding in accordance with the beginning of the business decisions, can absolutely not reflect the real value of copyrighted works fairly. The second part is the excess value of the rational exploitation of copyright goods, and the gain of the value in this part is based on that of the first part.

To sum up: value of mobile games copyright = value of mobile games copyright applications + option value of mobile games copyright

$$P = \sum_{i=1}^n \frac{R_i}{(1+r)^i} \tag{3}$$

P is Rights of the mobile games; R_i is the profits or net cash flow brought by applications of mobile games copyrights after i years; r is the appropriate discount rate; n is profit years of mobile games copyrights; Mobile games option value can be calculated by the Black-Scholes model (B-S equation). As the investment in copyright mobile games can be seen as a call option (if the future market situation is good, then executive the option, otherwise, abandon the execution).

Call option is calculated as follows:

$$d_1 = \frac{\ln(\frac{S}{X}) + (r + \frac{\sigma^2}{2}) \times T}{\sigma \sqrt{T}} \tag{4}$$

$N()$ indicates the cumulative probability of a normal distribution. Where: c is option value of mobile games copyright; S is the current price of the underlying assets of the option; X is the exercise price of option; r is the annual risk-free yield rate; σ^2 is the standard deviation of annual rate of return on the investment options; T is the length of option's mature time, generally on an annual basis. In a practical application, copyright of mobile games works may include many options, except the basic use. When determining options to be considered, there are two main standards: the value of the options as well as the possibility of implementing this option in the future. For those options with little value, little future-implementation possibility, we don't need consider their value. For example, when considering the option brought by purchasing mobile games copyright, if the buyer has identified the future strategy on developing derivative products based on the market situation, the right of development on derivative products is the option whose value needs to be taken into account. In general, among mobile games copyrights, the most valuable and possible to executive is the development rights of derivative products.

4.2 Determine the specific parameters

In the practical assessment, first of all, we must analyze what specific options the mobile games copyrights include. In general, the option value of mobile games copyright is mainly the development value of derivative products. When assessing the value of the derivative product development, attentions must be paid on what kinds of products there exist. For example, the mobile games works not only can be adapted into movies, TV dramas, but also carry on for the development of peripheral products. We need to assess the value of the options separately for each product development project.

S is the current price of option underlying assets, which can be calculated in the income method. Firstly, we need to predict the cash flow after conducting this product option, and then select the appropriate discount rate to discount the present value. Besides, when confirming the value of S , we should consider a problem, that is S is the present value of the expected benefits of the project options, rather than the present value brought by basic applications of mobile games works. When determining the value of S , we need to consider that after purchasing mobile games Rights, about how many years later, the option project will be conducted, namely the development of derivative products. For example, we expect to decide whether to invest in the option project after T years, imaging that the project is to invest the adaptation right of mobile games works for n year. We have to determine the sum of the benefits after works being adapted in these n years, (notice that the time point if the value is the T th years) and then we discount P to the time point when purchasing mobile games work to get the value of S .

X is the exercise price of option projects. Be specific to mobile games copyright, it is the needing of beginning input costs when making investment of project option. For instance, the necessary costs happen when we decide to adapt the mobile games works, including the costs of buying adaptation rights, work adaptation and so on.

σ is the volatility of annual return for the options investment, that is standard deviation of benefits. It is one of the parameters that is difficult to ensure in option pricing model. We can only use the past historical data to predict the standard deviation of option programs' benefits. And that also relates to selecting the annual rate of return standard deviation data of products' investment which is similar to option programs. Experts are supposed to predict future earnings' volatility of options investment according to the yield rate's volatility of similar assets investment.

T is the length of option expiry time, usually calculated by year. In valuation of specific mobile games rights, T is the interval between time point of gaining the copyright and time of option project being performed. For example, when purchasing the mobile phone's distribution rights, if it is expected to decide whether or not to develop derivative products within five years, T values on five.

R is the risk-free rate. It should choose the Treasury rate whose period is closed to the Expiration Date T . for example, the Expiration Date of option are 5 years, so we should choose 5-year treasury rate as the risk-free rate.

5 Conclusion

5.1 Summary and suggestions

Using reasonable assessment methods to determine the value of copyright is significant for the development of mobile games industry. As for the assessment methods, firstly, given the value of copyright mainly comes from bringing future economic benefits to the holders, rather than depending on their acquisition cost, so the cost method is not suitable for assessing the value of copyright under general circumstances. Secondly, the high demand of the market method for market conditions and information sources make the using of this method been greatly restricted. From this perspective, the proper use of the income method to assess the value of copyright works is the most scientific and rational choice. And what can not be ignored is that the mobile games works have obvious option characters. So we introduce real option valuation method to supplement the present income method.

5.2 Prospect

Through the research we may conclude that the mobile games works can be considered as a call option. And we applied "Black - Scholes" model in real option valuation and discussed the issue of determining the parameter. (Specific parameters determination is shown in Table 1).

Table 1 “Black – Scholes” Mobile Games Assess the Value of Copyright Definition Parameters

Parameters	Current meaning
S	The present value of the expected benefits derived from the project in the assessment time point
X	For the full cost of development of derivative projects
r	Bonds yield to maturity
T	time interval from the valuation date to the expected exercise of the option program
σ	volatility of annual earnings on derivative project investment, that is standard deviation of field rate

But it should be noted that the model is based on many assumptions, and there will be many unreasonable aspects when applied into reality, thus making the theory physical will be a focus direction of the research. And option model has great significance in terms of asset valuation. There is no doubt that in the future it will be applied to more areas of valuation.

Analysis of SMEs Financing Difficulty Based on Nash Equilibrium

Xu Jun

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: weedxj@163.com)

Abstract: Financing difficulty is one of the major problems of Small and Medium Enterprises (SMEs) which restrains their development. This paper analyzes the financing difficulty faced by SMEs in a mechanism design theory and Game theory framework. The model results indicate that financing difficulty is an example of Nash equilibrium. Under the premise of self-financing nature of commercial banks as well as private capitals, coupled with severe capital constraints of SMEs, market behavior and market standards that are desirable in well-endowed economies are misplaced. Therefore, governmental preferential policies are in urgent need to facilitate SMEs financing.

Key words: Small and Medium Enterprises (SMEs); Financing; Nash Equilibrium; Mechanism Design

1 Introduction

The number of Small and Medium Enterprises (SMEs) account for 95% of that of the country's enterprises. SMEs contribute substantially to the national economy. The development of SMEs not only boosts the overall level of national economy, but also helps solve many social contradictions and social problems. However, SMEs still face many difficulties in obtaining capital, technology, personnel as well as information. Among them, financing difficulty has always plagued the development of SMEs. In 2014, the executive meeting of the Chinese State Council has referred to the problem of enterprise financing eight times; CPC Central Committee, the Chinese State Council, relevant departments and local governments at all levels have issued a series of policies and measures to support the development of SMEs, including increase the share of special funds in national budget and innovate the investment and financing mechanism etc. These measures should have played a positive role in pushing forward the development of SMEs, however, environment constraints make these policies seldom put into practice. Based on Mechanism design theory and Game theory, this paper analyzes the financing difficulty faced by SMEs.

2 SMEs Financing Model Based on Mechanism Design

2.1 Environment

The financing channels of SMEs can be divided into two categories: direct financing and indirect financing. However, direct financing are not frequently used in SMEs financing because of the imperfect capital market system, asymmetric information in credit market and opaque financial situation of SMEs. When SMEs are facing financial strain, 90% of them will choose indirect financing i.e. to loan from financial institution. However, as banks don't fully trust SMEs and often implement credit rationing, some SMEs have to turn to private capitals to raise capital.

We consider 3 agents, agent 1: a bank; agent 2: a private capital provider; agent 3: a candidate SME; the set of agents is denoted $N=\{1,2,3\}$.

2.2 Set of (physical) outcomes

We let Z^i denote the set of (physical) outcomes. Outcomes of this model are as follows: Z^1 denotes the situation, where agent 3 accepts the loan offered by agent 1, this directly implies the sustainable development of a SME; Z^2 denotes the situation, where agent 3 accepts the loan offered by agent 2; Z^3 denotes the situation, where agent 3 does not accept any loan offered by agent 1 and agent 2. In this case we let Z consists of three elements. $Z=\{Z^1, Z^2, Z^3\}$, where the superscript enumerates the elements of Z .

2.3 Utility functions

Agents' preferences are assumed to be represented by a utility function $U_i, i \in N$, which maps from the set of (physical) outcomes Z , to the set of real numbers R ; i.e. $U_i : Z \rightarrow R$. Letting P_1, P_2 denote the price quote per unit of loans (i.e. loan interest rate) of agent 1 and agent 2 respectively, $c > 0$ the cost of supplying a unit of loans (it includes risk compensation, labor cost, contract cost, opportunity cost etc.), and $R_3 > 0$, the reservation price per unit of loan of the candidate SME, we define agents' utility functions $U_j(Z^i)$ as follows. Note that subscript j indexes agents and superscript i enumerates the elements of Z . The three outcomes are:

$$\begin{aligned}
 U_1(Z^1) &= P_1 - c, \quad U_2(Z^1) = 0, \quad U_3(Z^1) = R_3 - P_1; \\
 U_1(Z^2) &= 0, \quad U_2(Z^2) = P_2 - c, \quad U_3(Z^2) = R_3 - P_2; \\
 U_1(Z^3) &= U_2(Z^3) = U_3(Z^3) = 0;
 \end{aligned}$$

We assume that $P_1, P_2, c, R_3 \in R^+$, where R^+ denotes the set of positive real numbers.

It should be noted that cost, c is not indexed, which implies that agent 1 and agent 2 are assumed to have identical operating costs.

2.4 Assumptions

Assumption ①: we assume $P_i - c \geq 0$, ($i = 1, 2$) as special restrictions δ , apply to agent 1 and agent 2, capturing the idea that both commercial banks and private capitals are self-financing. They always keep their profit-seeking nature. If the agency is unable to cover its expenses by the fees it earns from giving loans, it must close down.

Assumption ②: we assume $R_3 - c < 0$, capturing the idea that the financial resources of the candidate SME are very modest. We rule out the case where the entrepreneur becomes a client of both the private capital and banks.

3 Game Form of SMEs Financing

We adopt agent strategy domain S_1, S_2, S_3 together with payoff function π_1, π_2, π_3 to define the game.

3.1 Strategies

Each agent i , $i \in N$, has a set of admissible actions, S_i (no bribery, rent-seeking, menace or other illegal behaviors). For agent 1 and agent 2, we define P_1 and P_2 to represent the price quote per unit of loans, i.e. $i = 1, 2$ $S_i = P_i$, $S_{1,2} = R^+$.

We assume that agents 1 and 2 submit their price quotes, $s_1 = P_1$ and $s_2 = P_2$, simultaneously, i.e. without observing each other's quotes. We assume that agent 3 observes the pair of price quotes $(s_1, s_2) = (P_1, P_2)$ and subsequently accepts one of two particular price offers or rejects both offers, i.e. $(P_1, P_2) \cup \{\emptyset\}$. Generally, agent 3's action is dependent on the history action of agents 1 and 2, we let $\varphi: s_1 \times s_2 \rightarrow s_3$ denote a correspondence, which associates with every history of actions $(s_1, s_2) \in s_1 \times s_2$, a subset $\varphi(s_1, s_2)$ of s_3 . We call $\hat{S}_3 = \{\varphi(s_1, s_2)\} \cup \{\emptyset\}$ agent 3's constraint set.

Agent 3's pure strategy is to accept one of two particular price offers, or reject both offers, i.e. for $i = 3$, $S_3 = \{S_3: S_1 \times S_2 \rightarrow S_3 | S_3(s_1, s_2) \in S_3\}$, $S_3 = R^+ \cup \{\emptyset\}$. As we assume all three agents' strategy as pure strategy, we define $S = S_1 \times S_2 \times S_3$ with typical element $s = (s_1, s_2, s_3)$ to be the joint strategy space.

3.2 Payoff Functions

Since outcome function can determine how physical outcomes are derived from agent's actions, so we let h denote the outcome function, whose argument is a typical strategy profile $s \in S$, and which maps into the set of physical outcomes Z , i.e. $h: S \rightarrow Z$, therefore $Z = h(s), s \in S, Z \in S$. Agent i 's payoff function represent the utility of participants' joint strategy $S = (S_1, S_2, S_3)$, the value of outcome function h depends on the physical outcome of S , so we define agent i 's payoff function $\pi_i: S \rightarrow R$, as the composition of i 's utility function U_i with the outcome function h , for $i \in N, \pi_i = U_i \circ h$, such that $\pi_i(s) = U_i(h(s))$, and we write $\pi = (\pi_1, \pi_2, \pi_3)$.

3.3 Nash equilibrium

In order to determine the equilibrium of this type of model we extend the game form to a game, so that we can use an equilibrium concept of non-cooperative game theory: Nash Equilibrium. The main difference between a game form and a game is that an essential component of a game form is the outcome function, and the corresponding component of a game is the payoff function. So we adopt the outcome function of g as the outcome function of the mechanism. Given a game form g , let $N_g: E \rightarrow S$ denote the pure strategy Nash equilibrium correspondence, so that:

$$N_g(e) = \{s^* = (s_i^*, s_{-i}^*) \in S: \pi_i(s^*) \geq \pi_i(s_i, s_{-i}^*), \forall s_i \in s_i, i \in N\},$$

where (s_i, s_{-i}^*) denotes the strategy tuple derived from $s^* = (s_i^*, s_{-i}^*)$, s_i denotes agent i 's available strategy, and s_{-i}^* denotes other agents' strategy which remain invariant.

4 Results of SMEs financing model and its policy implication

According to the model results, there are four types of Nash equilibrium, and they are outcome equivalent: the candidate SME rejects both loans.

Nash equilibrium①: If $P_1 > R_3, P_2 > R_3$, then Z_3 ;

Because if agent 3 accepts the loan, its utility $R_3 - P$ will be under zero, therefore, agent 3 will not accept the loan either from agent 1 or agent 2.

Nash equilibrium②: If $P_1 > R_3, P_2 = R_3$, then Z_3 ;

As $P_2 = R_3$, for agent 3, whether to accept private capital loan doesn't make much sense. However the acceptance, by agent 3, of agent 2's loan is not part of Nash equilibrium, because in the case agent 2's price offer is not a best response to player 3's acceptance of such offer. It would give negative utility to agent 2. Agent 2 would be better off to change to the strategy of offering a price that exceeds agent 3's reservation price, i.e. $P_2 > R_3$, in this case the result would be same as the one in Nash equilibrium①, i.e. agent 3 would reject both loan interest rate offer of agents 1 and 2.

This case illustrates that, when SMEs are under conditions of severe constraints on financial resources, i.e. when $R_3 - c < 0$, even if agent 3 accept the loan price of private capital $p_2 = R_3$, it still does not come to a loan contract.

Nash equilibrium③: When $P_1 = R_3, P_2 > R_3$, the equilibrium result is Z_3 ; the commentary is analogous to that of Nash equilibrium 2.

Nash equilibrium④: When $P_1 = R_3, P_2 = R_3$, the equilibrium result is Z_3 ;

Analogous commentary as for equilibrium 2 applies; agent 3 is indifferent between accepting and rejecting the price offers. However in the case agent 3 accept the offer, agents 1 and 2's price offer are not best responses to player 3's acceptance of such offer (they would get negative utility). Agents 1 and 2 would be better off to change their strategy to gain a better utility, therefore, finally agent 3 would reject both loan interest rate offer of agents 1 and 2.

From the above four types of equilibrium, we can draw a conclusion that they are outcome equivalent: agent 3 rejects the affordable loan price offer. The government encourages commercial banks to loan to SMEs, but as the commercial banks are self-financing, they would not change their profit-seeking nature, if they offers a price that is low enough to be affordable by the candidate SME, they makes a loss and is not economically viable. For those commercial banks with monopolizing resources, they could loan the capital for much higher profit. If, on the other hand, the commercial banks offer a price, at which it is economically viable, then it prices itself out of the local market. On the other hand, suppose that the candidate SME were able to afford market prices, there would be no need for commercial banks in the first place, since private capitals could offer loans at market prices. That is to say, the dual constraints of self-financing for commercial banks and private capitals $P_i - c \geq 0$, together with the extremely low ability to pay of SMEs $R_3 - c < 0$, result in the dilemma that commercial banks, private capitals and SMEs cannot achieve a win-win situation through cooperation.

5 Conclusion

In the framework of mechanism design theory and game theory, we present a game model with three agents including commercial bank, private capital as well as SME. The model analyzes four types of equilibrium and produces an equivalent outcome, i.e. the dual constraints of self-financing constraints of commercial banks and private capitals $P_i - c \geq 0$, coupled with insufficient capital constraints of SMEs $R_3 - c < 0$, prevent SMEs from getting loans from both commercial banks and private capitals. This model illustrates that even though the government encourages commercial banks to offer SMEs loans, but as long as commercial banks maintains their self-financing and profit-seeking nature, the finance difficulties facing SMEs will still remain, preventing SMEs from financing from bank loans and private capital. From the perspective of mechanism design, the goal of this design is to subsidize the development of SMEs; the rule of this mechanism lies that commercial banks are self-financing; the outcome of this mechanism design seems that no loans is obtained by SMEs from commercial banks. therefore, this mechanism design is failed under specific environment (SMEs are under capital shortage and cannot afford high interest rate of loan). This model results further illustrate that indiscriminate application of market criteria may be counterproductive in an environment characterized by severe constraints on material wealth accumulation. Therefore, government should take the responsibility to formulate preferential policies and take adjustment measures to help SMEs financing.

Foreign Direct Investment (FDI), Trade and Its Contribution to the Mining Sector of Guinea

Kimberly Racquel Elizabeth Chin

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: kymchyn@hotmail.com)

Abstract: In order to objectively analyze Foreign Direct Investment (FDI) contribution to Guinea's mining sector, the granger casualty test was used to determine the relationship among variables and to determine whether any of these variables affect others and how. The variables used are Gross Domestic Product, Government Income, Trade, FDI inflow into Guinea mining sector and the exchange rate. The granger casualty test produced evidence of a bidirectional casualty relationship which suggests that FDI's influence on efficiency lies in the government relaxing its dependency on the mining industry for economic growth.

Key words: Foreign Direct investment; Economic growth; Mining sector

1 Introduction

Guinea is one of the richest countries in West Africa in terms of its mineral resources. Around one third of the world's reserves of bauxite are found in Guinea.

The economy relies heavily on the Mining sector as this attracts major foreign investment.

In general, mineral exports accounted for more than 90% of the country's total export about 35% of government revenues. Export share of GDP growth was in 2001 (3.8%), 2002 (4.2%), 2003(1.2%), 2004(2.3%), 2005 (3%), 2006(2.5%) 2007(1.8%), 2008(4.9%), 2009(-0.3%) 2010(1.9), 2011(3.6%), 2012(4.7%) respectively. This investment is for an amount comparable to the country's annual GDP. Mining industry is dominant sector in the Guinean economy and main source of foreign exchange. The role of the foreign direct investment (FDI) has been recognized as a growth-enhancing factor in the developing countries. Campos and kinoshita (2002) wrote: 'the positive impact of foreign direct investment (FDI) on economic growth seems to have acquired status of stylized fact in the international economic literature'.

2 Overview of Guinea Mining Sector

The mining sector in Guinea contributes around 25% of the country's income, with bauxite production by far the most important contributor.

It is estimated that Guinea contains an estimated 24% of global bauxite reserves. Guinea accounts for 94% of Africa's bauxite production. Bauxite accounts for 20% of Guinea's GDP and 90% of exports. Gold and diamonds are also major export products. Although Guinea has significant commodity reserves, the country has been poorly explored and future potential exists for gold, base metals, iron ore and diamonds.

Guinea is underlain by the extensive Archaean West African craton.

3 Literature Review

In Guinea the Mining sector is still the most important of the Government Economy. FDI is one of only a handful of mining companies to have successfully commercially mined the ocean. Gold and Diamond Fields' strategy has capitalized on that experience to target, obtain and develop promising marine mineral prospects such as Guinea Conakry West Africa. Soon it became the most important sector in the mining industry.

Policies target at improving funding either through public sector or private sector investment will not help to meet the mining sector needs of the ever-bulging populace but also help socio-economic problems that come with such increase, one of which for example is unemployment in Guinea.

However, Guinea remains involved in two of the stages in the bauxite to aluminum chain, namely bauxite mining and alumina refining. During the period 1987-90, real growth in the mining sector averaged 5.7 per cent annually, compared with GDP growth of 4.1 per cent(Economist Intelligence Unit,1995b:20).

Therefore, the foundation of national wealth is essentially the mining sector. Development on how the mining sector can best contribute to overall economic growth and modernization must be explored.

The mining sector has the potential to be the industrial and economic catalyst from which a country's development can take off.

Ayanwale (2007) argued that most countries strive to attract FDI because of its acknowledged advantages as a tool of economic development. Africa and Guinea in particular joined the rest of the world in seeking FDI as evidenced by the formation of the New Partnership for Africa's Development (GEPAD), which has the attraction of foreign investment to Africa as a major component.

Improved research interest in FDI stems from the change of perspectives among developing countries. An important aspect of international economic integration is the larger role of foreign direct investment (FDI) in different economies.

4 Research Methodologies

4.1 Research design

The econometric model used to examine this study is Gross Domestic Product (GDP) as a dependent variable and Foreign Direct Investment (FDI), Government Income (GOVI), Trade volume (TRV), Exchange Rate(ER) as independent variables.

4.2 Granger Causality Test

Granger causality test was conducted to identify causal relationship between the variables Gross Domestic Product, Government Income, Trade, FDI inflow into Guinea mining sector, Exchange rate, and to determine whether the current lagged values of one variable affect another. The granger test may be explained with the help of the following equations.

$$X_t = a_0 + \sum_{j=1}^m a_j x_{t-j} + \sum_{j=1}^n b_j y_{t-j} + e_t \tag{1}$$

$$Y_t = c_0 + \sum_{j=1}^m c x_{t-j} + \sum_{j=1}^n d_j y_{t-j} + w_t \tag{2}$$

Bidirectional causality exists if the null hypothesis, that X_t does not strictly Granger-cause Y_t , is also rejected.

4.3 Modelspecification

The model estimation will be done through the use of the ordinary method of estimation.

$$GDP_t = f(GOVI, FDI, TRV, ER,) \tag{3}$$

Where

GDP_t is Gross Domestic Product

GOVI_t is Government Income

FDI_t is Foreign Direct Investment inflows

TRV_t is Trade volume

ER_t is Exchange rate

μ_t is stochastic random term

In a more explicit and econometric form, equation (1) can be stated as

$$GDP_t = \alpha_0 + \alpha_1 GOVI_t + \alpha_2 FDI_t + \alpha_3 TV_t + \alpha_4 ER_t + \mu_t \tag{4}$$

5 Dataanalysis Ofempiricalresult

5.1 Correlation test result

We want to examine the negative and positive relationship between all the variables and to determine if the p-values or significance values are more or less than 5% to make a decision.

Table1 Correlation Test Results

Variables	GDP	FDI	GOVI	TRV	EXR
GDP	1	0.70278	0.90593	0.71944	0.8249
FDI	0.70278	1	0.70082	0.69055	0.75538
GOVI	0.90593	0.70082	1	0.74221	0.76783
TRV	0.71944	0.69055	0.74221	1	0.77631
EXR	0.8249	0.75538	0.76783	0.77631	1

Finding: The result of the table shows that the observation correlation relationship of each pair is positive, it can be concluded that each of the variables in this corresponding analysis testing has a positive significant correlation. This means our variables have a strong linear relationship with each other by +1.

5.2 Unit root test for order of integration

Table 2 Unit Root Test

Null Hypothesis: D(GDP) has a unit root				
Exogenous: Constant				
Lag Length: 3 (Automatic - based on SIC, maxlag=6)				
Lag Length: 3 (Automatic - based on SIC, maxlag=6)	Lag Length: 3 (Automatic - based on SIC, maxlag=6)	Lag Length: 3 (Automatic - based on SIC, maxlag=6)		
			t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic			-73.86446	0.0001
Test critical values:	1% level		-8.033476	
	5% level		-4.541245	
	10% level		-3.380555	
Augmented Dickey-Fuller Test Equation

Sample (adjusted): 3 5				
Included observations: 3 after adjustments				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
D(GDP(-1))	-1.770991	0.023976	-73.86446	0.0086
C	-0.031396	0.005613	-5.593854	0.1126

ADF and Philips Perron at first difference with intercept and trend at 0.05 level of significance

Finding

From the result of table 2 the null hypothesis of the unit root shows all the variables are not stationary at conventional level since their p-value both ADF and PP test are not significant at all conventional levels of significance. We can therefore reject the null hypothesis and accept the alternative hypothesis.

Table 3 Granger Causality Results

Null Hypothesis:	Obs	F-Statistic	Prob.
FDI does not Granger Cause GDP	25	1.44655	0.2590
GDP does not Granger Cause FDI		3.66212	0.0441
GOVI does not Granger Cause GDP	25	0.99521	0.3872
GDP does not Granger Cause GOVI		0.50656	0.6101
EXR does not Granger Cause GDP	25	12.7336	0.0003
GDP does not Granger Cause EXR		5.45199	0.0129
TRV does not Granger Cause GDP	25	5.12698	0.0159
GDP does not Granger Cause TRV		0.96879	0.3967
GOVI does not Granger Cause FDI	25	1.26060	0.3051
FDI does not Granger Cause GOVI		1.78824	0.1930
EXR does not Granger Cause FDI	25	21.5382	1.E-05
FDI does not Granger Cause EXR		3.35995	0.0552
TRV does not Granger Cause FDI	25	7.25881	0.0043
FDI does not Granger Cause TRV		0.11011	0.8963
EXR does not Granger Cause GOVI	25	19.9202	2.E-05
GOVI does not Granger Cause EXR		2.30919	0.1252
TRV does not Granger Cause GOVI	25	1.56940	0.2328
GOVI does not Granger Cause TRV		0.53805	0.5921
TRV does not Granger Cause EXR	25	2.38872	0.1174
EXR does not Granger Cause TRV		7.94733	0.0029

Finding

FDI does not Granger Cause GDP and interchangeably GDP does not Granger Cause FDI. However there is a unidirectional relationship between the two variables which means the causal relationship between them (FDI > GDP) signifies FDI has improved the country's productivity which affected

rapid GDP growth.

Furthermore, the results indicate that the variable trade volume TRV does not Granger Cause FDI. However, FDI Granger Cause TRV which means that they are unidirectional between the two variables, which mean that there is an improvement of the mining trade system to attract more foreign direct investment to the sector. However, with inefficient policies and political instability, private investment and investment in research and development are struggling in the sector. Boosting local economic growth in mining and other sectors will only be profitable if the government is able to access new technologies to assist in attracting FDI and improving R&D investment.

The result shows that Exchange rate EXR Granger causes GDP while GDP does not cause Exchange rate EXR. This indicates there is a bidirectional causality relationship which means they are statistically significant in explaining changes in the economic growth of the country due to the fact that exchange rate plays a significant role in determining the import and export in the country.

6 Conclusion and Policies Recommendation

In this research on Foreign Direct Investment (FDI), Trade and its Contribution to Guinea's Mining sector our investigation indicates there is a bidirectional causality relationship which means they are statistically significant in explaining changes in the economic growth of the country due to the fact that exchange rate plays a significant role in determining the import and export in the country.

Therefore, in order to attract FDI that improves efficiency in the mining sector; the government should prioritize the sector and reduce its dependence to grow the economy. Macroeconomic stability must be ensured and distinct, it should also be predictable and have an "easy-to-access" policy environment inclusive of incentives. There is also the need to improve infrastructural development especially in both primary and secondary infrastructures and this investment will lead to higher productivity which in turn increases productivity and improves efficiency in all sectors of the economy. This creates a multiplier effect which stimulates job creation, economic growth, productivity, national welfare and investment and functional development.

Thus, we conclude that if Guinea wants to increase the mining production it is imperative to develop effective FDI policies. However, the expansion of agricultural production, reduction in reliance of import, and attainment of food security requires capital, energy, technology, and international business connections. This is the second list of factors that Guinea is lacking, but FDI can serve as a channel to supply such inputs.

1) Government should seek additional FDI for the Mining sector since the success of the sector is essential to the attainment of true economic stability.

2) Factors such as foreign ownership restrictions and multiple corporate taxes that discourage Foreign investors should be reviewed and addressed.

3) Government should not just focus on attracting FDI to the sector but on attracting the type of FDI that seeks to enhance the capacity of investment.

4) The Government of Guinea must further target specific types of FDI that are able to generate spillover effects in the entire value chain of the Mining sector and by extension the overall economy.

A Review on the Importance of E-Commerce for SMEs in Pakistan

Asadullah Khaskheli, Yun Jun

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: asadullahkhas@hotmail.com, yunjunwh@163.com)

Abstract: E-commerce becomes important factor of success for both large organizations and Small and Medium Enterprises (SMEs) as it helps to reduce transaction cost, approach larger untapped markets and avoid intermediaries. However, the published research has mainly focused on the role of e-commerce in large organizations compared with SMEs. Based on a comprehensive review of the past literature, we have highlighted the importance of e-commerce in the SMEs, especially how it is important in the setting of developing countries and its potential role in the SMEs of Pakistan. Given the lack of scholarly discussion on the topic, the present paper will enhance the understanding on the importance of e-commerce in SMEs of Pakistan. Recommendations for future research are proposed.

Key words: E-Commerce; SMEs; Developing countries; Pakistan

1 Introduction

E-commerce refers to “the buying and selling of information, products, and services via computer networks” Kalakota (1997) is transforming the way business is done traditionally and transactions are carried out between trading parties. Scholars believe that e-commerce has tremendous potential to contribute in economic growth more so for developing countries than the developed ones (Lituchy (2000); Kshetri (2001); Kofi (2001); and BBC News (2003)). It may be because there is a more room for improvement in the developing countries, owing to larger population and huge untapped markets dispersed on a wide geographic area. Research indicates that e-commerce is not only one of the most important tools for large companies, but is also imperative for small medium enterprises (SMEs) to progress and sustain. According to Molla (2005) e-commerce helps SMEs not only to reduce transaction cost but also helps to get rid of intermediaries gives more convenience of selection from a range of products and services available on storefronts.

Extensive research has been conducted on the use of e-commerce, however; there is more need for scholarly effort on the role of e-commerce in SMEs in developing countries. Hence, we have conducted a comprehensive review of the published literature on the importance of e-commerce for SMEs in the developing countries; especially in Pakistani setting since majority of previous scholars have mainly focused on the developed regions where socio-cultural, economic, political and technological factors differ greatly from those in the developing regions. Even the same economic development level and the region does not imply that the studies can be generalized because of various country specific factors, such as form of government economic conditions and other factors. The present effort therefore contributes to better understand the ties among e-commerce and SMEs in the developing country and indicate the potential avenues for adopting e-commerce in SMEs of Pakistan to grow and sustain. We discuss the importance of SMEs in Pakistan, and a brief discussion on potential role of e-commerce in the next section.

2 Literature Review

2.1 Importance of SMEs in Pakistan

SMEs work as growth engines for a country's economy (Dawn (2002); and Poon (1999)). SMEs make up approximately 80% of world economic growth (Dawn (2002)). Despite such importance of E-Commerce and SMEs and extensive studies on subject; unfortunately there has not been a single standard definition among researchers for the two terms. Different researchers describe them in a different way; For instance, Simpson (2004); Cloete (2002); Mac Gregor (2004); and Chitura (2008)). SMEs are business entities employing a maximum of 250 full time employees European Parliament (2000). It is agreed among researchers that E-commerce and ICTs can benefit organizations in general.

Small and Medium Enterprises Development Authority (SMEDA) established in 1998 is the premier institution of the Government of Pakistan for policy formulation to better develop SMEs, it works under the ministry of Industries. SMEDA defines, SMEs as business units having full time employees up to 250, annual sales up to PKR 250 Million (USD 2.5 Million approx.) and paid up capital up to PKR 25 Million (USD 0.25 Million approx.). SMEDA's eServices/IIN provides various E-marketing services to SMEs using several digital technologies that link E-marketing with technical

and innovative aspects of the internet, using Search Engine Marketing (SEM) and Search Engine Optimization (SEO) along with email marketing and web technology 2.0 strategies www.smeda.org.pk. Web technologies 2.0 are widely used by E-commerce sites, as they focus on user-generated content; it allows users to interact with each other like a social media. Further, it enables customers to give feedback about the product or services offered on E-commerce site or ask for opinions and share their purchase experiences with others on the site. Most of the SMEs in Pakistan are involved in the production of export-oriented items. These SMEs contribute 30% of the total export receipts www.smeda.org.pk.

SME sector in Pakistan is pivotal for economic growth, contributes greatly in employment generation, poverty alleviation. SMEs account for over 90% of all enterprises in the country and there are approximately 3.2 Million SME units in Pakistan www.smeda.org.pk. SMEs in Pakistan contribute 40% to GDP (Economic Survey of Pakistan 2010-11) and an estimated 70.49% labour force other than agriculture is employed by manufacturing sector (Labor force survey 2009-10) and the same also has 25% share in the exports.

During the period (2003-2013) world exports grew at 14% per annum while Pakistan's growth during the same period had been just 11%. Whereas, the annual export growth of our neighbour countries was more than 3 times that of Pakistan. India and China showed remarkable export growth rate of 39% & 37% respectively. One of the reasons being exposure to world market through their well-established E-Commerce channels.

Moreover, SMEDA's next 5 year plan estimates exponential growth in emerging and traditional SMEs selected on the basis of their potential to generate employment, contribute to GDP and enhance exports, as presented in Table 1.

Table 1 SMEs and The Economy of Pakistan

Indicators	2013*	2018	Incremental Change
Employment	14.85 Million	25.00 Million	10.00 Million
GDP	\$73.95 Billion	\$193.50 Billion	\$120 Billion
No. of Enterprises	1.73 Million	2.00 Million	0.27 Million
Exports	\$18.21 Billion	\$54.20 Billion	\$36 Billion

*The figures pertain to indicators in 13 priority sectors having large SME presence.

2.2 E-commerce in the context of Pakistan

Currently, Pakistan lags far behind in terms of E-commerce infrastructure and business volume compared to the other countries in the region, such as China, India, Turkey and others. The current statistics report that e-commerce is really thriving in the immediate region of Pakistan, For instance: Alibaba Group of China set a world record when it got listed at the New York Stock exchange in September, 2014 raising huge Initial Public Offering (IPO) of \$ 25 Billion, making it the biggest IPO in the world, taking lead from Walmart the world's largest old discount store chain.

Until 2009 when India launched 3G, the Internet penetration in Pakistan used to be higher historically, 3G boosted the internet usage in India and E-commerce grew exponentially. In the region, Sri Lanka was the first one to launch 3G in 2006, followed by India in 2009 and recently Pakistan also joined the 3G club in 2014; (Source: Worldbank). Although Pakistan is late to the party but still has immense potential and huge increase in internet penetration rate is estimated. According to one estimate, Pakistan's Internet users' number is estimated to increase from 30 Million users today to 56 Million in 2019. Whereas, the online purchases in Pakistan stand at \$ 30 Million annually which is expected to grow multiple times and reach \$ 600 Million by 2017.

E-Commerce facilitates the progress and growth of SMEs in developing countries due to the ability of the internet technology and ICT to reduce cost of transactions, to eliminate intermediaries and facilitating linkages to the global supply chains Molla (2005). To admit the significance of E-Commerce, over 20% of SMEs in Pakistan implemented it in their business to take competitive advantage not only locally but also in international market Khan (2014). Electronic Supply Chain Management applications in SMEs enable them cut operation cost, provide better customer service, better inventory management, reduce order cycle, receive customer feedback, maintain customer profiling, hence can satisfy customers better and achieve an overall competitive edge Chuang (2000).

Country is witnessing online brands allocate sufficient advertising budgets for TV commercials, Newspapers in addition to advertising on social media. Several foreign companies have already entered Pakistan to cash on the highly potential e-Commerce market. For Instance: OLX by Nasper South Africa, Asani by Schibsted Norway and Rocket Internet a German internet company which is running tow

e-Commerce sites in Pakistan namely Daraz.pk and Kaymu.pk recently raised a huge \$8.2 Billion IPO in October, 2014. And the two will be bringing huge capital into E-Commerce market not witnessed in the country before. Many other local online companies are also expected to follow the trend. On the other hand there over 650,000 SMEs presently registered at the world's biggest Business-to-Business giant, Alibaba group and this number is expected grow rapidly. This growing industry will gain more credibility; as a result consumer trust in e-Commerce will spread through word of mouth.

Electronic payment systems are also growing rapidly in Pakistan which means that in future there will be huge potential of E-commerce websites. Currently due to lack online payment systems, over 95% of online purchases are completed through Cash on Delivery (COD), which is not one of the most preferred and convenient payment method. Well-developed electronic payment system is indispensable for the growth and sustainability of E-commerce. Multiple payment options encourage more online shopping as customers feel ease and convenience. In China for example, E-commerce is of enormous volume and there are various payment options available to customers. Such as, online bank payment, debit card payment, credit card payment powered by UnionPay, COD, WeChat etc.

TCS, BlueEX, Leopards, OCS, and other couriers are providing COD services across over 150 cities of Pakistan. The data indicates a very lucrative avenue to the businesses revealing that over 1/3 of the orders are from the cities other than 3 major cities of Pakistan. In major cities more people buy online, however, the value for shoppers living outside major cities is higher as many products they can't find in the markets nearby. Hence, this large untapped market segment will changeover to shopping online.

SMEs in Pakistan have the largest e-commerce platform to market their products globally through Alibaba.com, as the Pearl Shine Group International (PSGI), a Pakistan based firm has inked a strategic partnership agreement with the world's largest B2B portal as per the agreement, PSGI has been authorized to verify SMEs for registration at Alibaba.com's B2B portal, this will bring manufacturers in contact with suppliers for online trade globally. <http://www.psgint.com/press-relese.html>. Publish: November 8, 2012 <http://tribune.com.pk/story/462414/pakistani-firm-authorised-to-verify-smes-for-alibaba.com/>

Over 650,000 SMEs from Pakistan are at present members of Alibaba.com and this agreement of partnership will help expand business and give opportunity to more Pakistani SMEs to enjoy great exposure, (Timothy Leung, Alibaba's group head of Global Supplier Development and sales.)

3 Conclusion

Based on the above discussion and the relevant facts and figures, we conclude that the e-Commerce has great potential for SMEs in Pakistan, especially SMEs for export development of the country as the world's Business to Business giant, Alibaba.com has authorized a Pakistani firm to verify SMEs in the country for listing on its website, this will showcase the country's products to rest of the world. SMEs are already contributing significantly in employment generation and poverty alleviation as discussed above; in future this contribution is expected to increase. As SMEs are businesses with lesser resources in comparison to large enterprises hence they cannot reach out to mass markets and allocate huge advertising and marketing budgets, this major problem of SMEs can be overcome to a large extent through e-Commerce, and this will enable them to compete with their larger business rivals on relatively level playing field. Future studies are recommended to explore the potential relationship of e-commerce and its relevant sources such as use of social media in ecommerce in the context of SMEs in Pakistan. As previous studies are largely quantitative in nature, a qualitative study on the topic is highly recommended to get in-depth understanding on the topic and to explore untapped findings.

(E-mail: 719441559@qq.com, 282432285@qq.com)

Abstract: The influencing factors of ship equipments repair cost are various, and its uncertainty is huge. It is very difficult to accurately predict ship equipments repair cost. The change of ship equipment repair cost is nonlinear. The traditional BP algorithm is improved by Levenberg-Marquardt optimize theory to adjust the network weights and thresholds. Meanwhile, the original value of traditional GM(1,1) is the first value of original data, which may affect forecast accuracy. The structure method of original value is improved by least gradient algorithm. On the base of this, the optimal forecast combination method is proposed to combine forecast results of the ahead two forecast models. Both the results of analysis and forecasting indicate the validity and feasibility of the researching methods.

Key words: Ship Equipments Repair Cost; Forecast Combination; BP Neural Network; GM(1,1)

1 Introduction

Modern war draws various innovative and high technologies to weapon system. Ship equipments become more and more complex. Its repair cost proportion in life cycle cost is continuous rising. The forecast effectiveness directly affects the efficiency of ship repair cost. Because of the influencing factors of ship equipments repair cost are various^[1], whose acting mechanism is not clear, the traditional linear regression methods cannot meet practical demand. This paper is going to improve the traditional BP neural network and GM(1,1) algorithm, and use the optimal forecast combination method to combine forecast results of the ahead two forecast models. The novel forecast method can reduce the forecast risk and boost the benefit of ship equipments repair cost.

2 Improvement of BP Neural Network

Traditional BP neural network algorithm revises its weights by steepest descent method, which result in slow convergence, local minimum objective function, and other issues^[2]. Aiming the nonlinear of ship equipments repair cost, the traditional BP algorithm is improved by Levenberg-Marquardt optimize theory to adjust the network weights and thresholds. The basic theory idea is to adjust the weights and thresholds not only in the direction of negative gradient but also in other direction, allow the search make error inferior. Meanwhile, the network weights are self-adaption adjusting between steepest descent method and Newton method to optimal. Then, the networks can valid convergence. The convergence speed and generalization of BP neural network is improved greatly.

The adjust formula of L-M optimizing algorithm can express as:

$$\Delta w = (J^T J + \mu I)^{-1} J^T e \quad (1)$$

Where, e is error vector; J is the Jacobi matrix of error differential to weights; μ is a scalar, and when μ increasing, it approaching the steepest descent method with less study speed, while μ descent to zero, it become the Gaussian-Newton method. Therefore, L-M optimizing algorithm is a kind of smooth adjusts between steepest descent method and Gaussian-Newton method. The step of L-M optimizing algorithm as follows.

(1) All study samples are input to BP neural network. The network output vectors are calculated by basic algorithm of BP neural network. Then, the output vectors are compared with the object vectors, and the error square sum of all study pair in samples is calculated.

(2) Calculate the Jacobi matrix of error differential to weights

First, the Marquardt sensitivity is defined as

$$S_i^m = \frac{\partial E}{\partial n_i^m} \quad (2)$$

It express the variation sensitivity of E to i^{th} element in layer m , where, n is the weighting sum of every layer network.

The network sensitivity is Back Propagation from the final layer to the first layer. The recurrence

relationship formula express as

$$S_p^m = E(n_q^m)(w^{m+1})^T S_q^{m+1} \tag{3}$$

Finally, the elements of Jacobi matrix calculate as follows:

$$J(h, j) = \frac{\partial e_{k,q}}{\partial w_{i,j}^m} = \frac{\partial e_{k,p}}{\partial n_{i,q}^m} \times \frac{\partial n_{i,q}^m}{\partial w_{i,j}^m} = S_{i,h}^m \times \frac{\partial n_{i,q}^m}{\partial w_{i,j}^m} = S_{i,h}^m \times a_{j,q}^{m-1} \tag{4}$$

(3)Calculate Δw by weights adjust formula.

(4)Calculate $w + \Delta w$ by iteration formula, and then the error square sum is calculated. If the new sum less than the result in step (1), then μ divide θ ($\theta > 1$), and let $w = w + \Delta w$, and skip to step (1); else, μ multiply by θ ($\theta > 1$), skip to step (3). When the error square sum decreases to object error, the algorithm is thought convergence.

3 Improvement of GM(1,1)

The computational formula of traditional GM(1,1) forecast as follows^[3]:

$$x^{(1)}(t+1) = (x^{(0)}(1) - \frac{\mu}{\alpha})e^{-\alpha t} + \frac{\mu}{\alpha} \tag{5}$$

From the formula, it is obvious that the accuracy of GM(1,1) is not only depend on α and μ , but also depend on the original value $x^{(0)}(1)$. So the fitting and forecast accuracy of GM(1,1) can be increased by choosing a better original value. The selection of original value is first point in original data in traditional method, but there is without any support in theory, which may reduce the accuracy of GM(1,1) in modeling and forecasting. To improve the forecast accuracy of GM(1,1), a kind of novel algorithm is introduced to format the original value.

Let the original value in model $\beta x^{(0)}(1)$, and use it to replace the original value in traditional GM(1,1), the equation as follows:

$$x^{(1)}(t+1) = (\beta x^{(0)}(1) - \frac{\mu}{\alpha})e^{-\alpha t} + \frac{\mu}{\alpha} \tag{6}$$

The residual error index function is defined as:

$$M = \sum_{t=1}^n [\hat{x}^{(1)}(t) - x^{(1)}(t)]^2 = \sum_{t=1}^n \{[\beta x^{(0)}(1) - \frac{\mu}{\alpha}]e^{-\alpha(t-1)} + \frac{\mu}{\alpha} - x^{(1)}(t)\}^2 \tag{7}$$

When the residual error index function achieves the minimum in least gradient algorithm, the revised parameter β can calculate as follows:

$$\frac{dM}{d\beta} = \sum_{t=1}^n \{[\beta x^{(0)}(1) - \frac{\mu}{\alpha}]e^{-\alpha(t-1)} + \frac{\mu}{\alpha} - x^{(1)}(t)\}x^{(0)}(1)e^{-\alpha(t-1)} = 0 \tag{8}$$

Let $b = \sum_{t=1}^n e^{-2\alpha(t-1)}$, $c = \sum_{t=1}^n e^{-\alpha(t-1)}$, $d = \sum_{t=1}^n x^{(1)}(t)e^{-2\alpha(t-1)}$, then

$$\beta x^{(0)}(1)b + \frac{\mu}{\alpha}(c - b) - d = 0, \quad \beta = \frac{\mu(b - c) / \alpha + d}{bx^{(0)}(1)} \tag{9}$$

When the revised parameter β is obtained, the improved GM(1,1) can be applied to forecast.

4 Forecast Combination

For a certain forecasting problem, assume the actual value in period t is x_t ($t = 1, 2, \dots, n$), and there are m forecast candidates available. Moreover, let x_{it} ($i = 1, 2, \dots, m$) represent the forecast produced by the i^{th} forecasting method. Assume forecast error of the i^{th} forecasting method is $e_{it} = (x_t - x_{it})$ in time t. Let $\mathbf{w} = (w_1, w_2, \dots, w_m)^T$ represent the weights vector of m kinds of forecasting methods in combination of forecasts, then, the general formula of forecast combination can

describe as follows.

$$x_{ct} = w_1x_{1t} + w_2x_{2t} + \dots + w_mx_{mt} \tag{10}$$

$$e_t = x_t - x_{ct} = \sum_{i=1}^m w_i e_{it} \tag{11}$$

If the error square sum of forecast combination is represented by J , then

$$J = \sum_{t=1}^n e_t^2 = \sum_{t=1}^n \sum_{i=1}^m \sum_{j=1}^m w_i e_{it} w_j e_{jt} = \mathbf{w}^T \mathbf{E} \mathbf{w} \tag{12}$$

Where, $\mathbf{E} = (E_{ij})_{m \times m}$, $E_{ij} = \mathbf{e}_i^T \mathbf{e}_j = \sum_{t=1}^n e_{it} e_{jt}$, $i, j = 1, 2, \dots, m$.

Depending on the rule of error square sum minimum, the optimal forecast combination model can construct as follows:

$$\begin{cases} \min J = \mathbf{w}^T \mathbf{E} \mathbf{w} \\ \text{s.t. } \mathbf{R}^T \mathbf{w} = 1 \end{cases} \tag{13}$$

Where, $\mathbf{R} = (1, 1, \dots, 1)^T$ represent m -dimension vector with all element 1.

Assume the error vector of m forecast model is linear independence, applying the Lagrange multiplication, then the unique optimal solution of formula (13) as follows:

$$\mathbf{w}^* = \frac{\mathbf{E}^{-1} \mathbf{R}}{\mathbf{R}^T \mathbf{E}^{-1} \mathbf{R}}, \quad J^* = \frac{1}{\mathbf{R}^T \mathbf{E}^{-1} \mathbf{R}} \tag{14}$$

5 Application and Results

Assume the statistics data of some ship equipment repair cost is showed in table 1. In order to make it easy for the comparison of different forecast methods, we adopt the former 22 samples (which form 1 to 22) as the calibration sample for modeling and the later 3 samples (which form 23 to 25) as the samples to evaluate different models in forecasting period.

Table 1 Statistics Data of Some Ship Equipment Repair Cost

Serial	Real	Serial	Real	Serial	Real	Serial	Real	Serial	Real
1	26.0216	6	45.6144	11	50.6082	16	51.1856	21	54.4845

5.1 Forecast by BP neural network

1) Sample divide and data pretreatment

To quicken the training speed of network, the data must be normalization. The method used is that every element in original data divide the magnitude of maximum, in this experiment, it is 100. Then the Serial of normalization is obtained.

Step 1: Study the samples from 1 to 10, and then forecast the 11th by the trained network.

Step 2: Ahead one step, study the samples from 2 to 11, then forecast the 12th by the trained network.

Step 3: In proper order, it is continue to train until the network trained completely. Then, the neural network can be applied to forecast.

Step 4: Ship equipment repair cost can be forecasted by forecast data and the trained network.

2) Confirm the construct of network

The theory of neural network has probed that the 3 layers BP neural network can approach any kind of function when it is studied sufficiently. Therefore, the 3 layers BP neural network is choose in this experiment. And the notes in input layer ascertain 12 by testing repeatedly. The amount of nodes in the middle layer is not any generally accepted method, in the most moment, the convergence quickly most method is selected in the same whole error.

The amount of nodes in the middle layer select 5 by synthesizing various factors in this example.

And the performance target of network is 0.001. The Matlab tool box on neural network is applied to calculate and the results are showed in table 2, where, the error criterion is the absolute value of error percentage.

Table 2 Comparison of the Forecast Value and Relative Error among Various Models

Serial	Real	neural network		GM(1,1)		Equal combination		Optimal combination	
		forecast	error	forecast	error	forecast	error	forecast	error
11	50.6082	51.577	6.86%	47.138	1.91%	49.357	2.47%	51.183	1.14%
12	50.9577	51.634	5.31%	48.254	1.33%	49.944	1.99%	51.334	0.74%
13	51.5021	50.029	4.09%	49.396	2.86%	49.712	3.47%	49.973	2.97%
14	50.9933	53.220	0.84%	50.566	4.37%	51.893	1.76%	52.984	3.90%
15	49.9536	52.984	3.62%	51.763	6.07%	52.373	4.84%	52.875	5.85%
16	51.1856	51.222	3.52%	52.988	0.07%	52.105	1.80%	51.379	0.38%
17	50.1031	48.790	8.26%	54.242	2.62%	51.516	2.82%	49.274	1.66%
18	50.7732	49.388	9.36%	55.526	2.73%	52.457	3.32%	49.933	1.66%
19	51.2371	50.913	10.94%	56.841	0.63%	53.877	5.15%	51.439	0.39%
20	51.4948	58.186	12.99%	51.914	0.81%	55.050	6.90%	52.471	1.89%
21	54.4845	59.564	9.32%	54.422	0.11%	56.993	4.60%	54.878	0.72%
22	61.7835	60.974	1.31%	57.580	6.80%	59.277	4.06%	57.881	6.32%
23	66.2113	62.417	5.73%	63.160	4.61%	62.789	5.17%	63.094	4.71%
24	67.2784	63.894	5.03%	68.160	1.31%	66.027	1.86%	67.782	0.75%
25	70.8557	65.407	7.69%	72.160	1.84%	68.784	2.92%	71.561	1.00%
Average error in fitting		6.37%		2.53%		3.60%		2.30%	
Average error in forecasting		6.15%		2.59%		3.32%		2.15%	

5.2 Forecast by GM(1,1)

The Matlab 7.2 is used to calculate the GM(1,1) and the results are showed in table 2. Since the BP neural network can only fit and forecast the ship equipment repair cost after 11th data, in order to make it easy for the comparison of different forecast methods, the results of GM(1,1) show only the data after 11th data. Finally, the posterior difference test is necessary in GM(1,1). The posterior difference ratio can calculate as $C = s_2 / s_1$. The small error probability can calculate as $P = P\{\varepsilon^{(0)}(t) - \bar{\varepsilon}^{(0)} < 0.6745 s_1\}$. By calculating, the posterior difference ratio in this example is $C = 0.3971$, and the small error probability is $P = 96\%$. The accuracy of this GM(1,1) is above the qualitative.

5.3 Forecast combination

The BP neural network can only fit and forecast the ship equipment repair cost after 11th data. Thus, the equal weights combination and the optimal combination are only from the 11th to 25th. The combination results and corresponding error is showed in table 2. From table 2, the average error in calibration samples and forecasting samples are also performing good. And the optimal forecast combination method performed best. It is not only surpassing any individual forecast model, but also surpasses the equal weight combination method^[4], which performed well in practice.

6 Conclusions

The influencing factors of ship equipments repair cost are various, whose acting mechanism is not clear; the traditional linear regression methods cannot meet practical demand. The accuracy and stability of forecast cannot be controlled, which result in the risk of invalid forecast. This paper aim at above characters of ship equipment cost, the traditional BP neural network and GM(1,1) are improved. On the base of this, the optimal forecast combination method is proposed. The optimal forecast combination method can synthesize the information from BP neural network and GM(1,1), so can provide more

accurate and stabilized forecast results. The idea provided in this paper can offer some reference for other equipment repair cost forecast.

Abstract: GDP growth, money growth, exchange rate and inflation play critical role in the macroeconomic stability of an economy and have a direct effect on policy making process. This paper examines the relationship between exchange rate, GDP growth, money growth and inflation in Sierra Leone from 1980 to 2013 using descriptive statistics and regression methods for the data obtained from the world development indicators (WDI) data base. Inflation was the dependent variable while its potential macro elements were explanatory variables. The correlation result revealed that, there is an absence of multicollinearity among the variables in the model. The result of the long-run co-integrating relationship in the model shows that GDP growth has significant negative effect on inflation in Sierra Leone whereas exchange rate, foreign price level and money supply growth have a positive effect. Given the implication of these macroeconomic indicators, it is imperative on government to ensure that the liquidity specifications be broaden in order to incorporate foreign currency deposits held at commercial banks so as to establish efficient control over money supply. This study would be of great value to policy makers in facilitating macroeconomic stability.

Key words: Inflation; Exchange Rate; Co-integration Test; Sierra Leone

1 Introduction

GDP Growth, Money Growth, Exchange Rate and Inflation are amongst the key economic indicators for measuring macroeconomic performance for any economy nation. These indicators are closely connected to the external sector and provide critical information with regards the stability of an economy. The external sector measures the performance of an economy with respect to the rest of the world. Increase in price level/inflation causes the demand of money to increase, which in turn causes the interest rate and then the higher interest rate causes intensification (Case and Fair, 1992). On the other hand, a reduction in consumption brought by an increase in interest rate enhances a decrease in output (Case and Fair, 1992). Sierra Leone is a British colonized country which gained independent in April; 1961 and shared boundary with Guinea to the north and extended to northeast and Liberia in the southeast and to the west of the Atlantic Ocean. Like many Sub-Saharan countries, Sierra Leone is part of the Least Developed Countries (LDC), and participates in Heavily Poor Countries (HIC) initiatives. The country, once an exporter of cocoa, coffee, piassava and diamond is now one of the least developed countries in the world. During this period, its annual economy growth was high as compared to many developed countries by standards. Moreover, the economy increased approximately by 4 percent in the early 1970s. However, the performance on the external balance of Sierra Leone has been poor since the 1970s, balance of payments problems is persistent, the country's economy began to fall exponentially as a result of the crude oil crises in the Middle East. Consequently, the country lost its international competitiveness in terms of real exchange rate- an indicator used in international trade to measure the competitiveness of a country as a result of political instability, unstable macroeconomic policies and adverse effects of peripheral shocks. Hence, the GDP growth was low and there was high inflation, high unemployment rate and huge budget deficits. Furthermore, the weakness of the country's economy was near collapsed in the 1980s. The nominal exchange rate depreciated uninterruptedly as a result of adverse effect of global financial crisis on diamond exports from 16 percent in 1980/81 to 5 percent in 1985/86 together with devaluation in the country's tax base. From 1991 to 2000- the ten year brutal armed conflict, with dramatic economic growth decline, the real GDP declined by -4.27 percent with 80 percent of the population lives in poverty. Sierra Leone, like many other countries launched the Structural Adjustment Program (SAP) and the floating exchange rate in 1986. These were aimed to increase the competitiveness of the country's export, as well as retaining a fixed exchange rate and nominal volatility to ensure a smooth, competitive and efficient financial sector to stimulate the

development of the economy.

The aim of the present study is to contribute to the existing literature on the grounds of analyzing the association of exchange rate, GDP growth and monetary policies for inflation in Sierra Leone towards the transformation of the economy of the country so as to attain a middle income economy. Moreover, based on results of rigorous empirical studies about occurrence of the global financial crisis and its attendant repercussions, it is necessary for Sierra Leone to focus on economic policy.

1.1 Inflation and the monetary policy scheme in Sierra Leone

Inflationary exposure in Sierra Leone reached its highest level in 1987 hitting 178.7 percent before declining to 110.9 percent in 1990. There were further reductions in the 1990s compared to the 1980s where inflation was on the high. Inflation was compromising in the first half of 2000s where it was a single digit until 2004 when it attained double digit of 14.2 percent before falling to 12.1 percent in 2005 and a further devaluation to 9.5 percent in 2006 and 11.7 percent in 2007. To reverse the deterioration in the economy since 1980, Sierra Leone like any other less developed Country in Africa embarked upon several transformations in the financial sector following the worsening economic performance and the systemic problems that encapsulated the financial sector during the 1980s. These rectifications embodied the liberalisation of interest rates and trade, removal of some foreign exchange controls, elimination of price controls, ratification of a volatile exchange rate, and confirmation of indirect controls of monetary policy based on market related instruments.

Monetary policy in Sierra Leone is controlled by the Bank of Sierra Leone (BSL) with market-based instruments. The primary goals and objectives is to facilitate sustainable price stability especially providing a low alternative indivisible digit inflation, rebuilding foreign reserves and downsizing inflationary pressures. The BSL achieves these goals and objectives by admonishing the domestic assets growth. At present, the main instrument of monetary policy is open market operations. Operations are however concentrated in the primary market for government securities. Reserves requirement is also employed as a monetary policy instrument. Reserve and liquidity ratios are used as prudential measures and because of the small size of the financial market, and the high liquidity of commercial banks there has been very little activity in the secondary market. Monetary policy is conducted within the framework of a monetary targeting regime. The operational target is Reserve money and is used for day-to-day (or week-to-week) policy to attain the ultimate between the central bank's ultimate policy goals and the operating target. Quarterly targets on Reserve Money are set within the framework of International Monetary Fund (IMF) supported and monitored programmes and these are consistent with programme targets on inflation and economic growth

2 Review of Literature

The study conducted using data from 1960-90 obtained from Turkey to investigate on nonlinear three-stage least squares estimation revealed that unanticipated devaluations have positive effects on output but unanticipated devaluations do not exert any significant effect on output (Domac, 1997). Another study conducted to examine the relationship between output, money and real exchange rate using Korean quarterly data over the period 1971-1974. The data was tested using Johansen's co-integration and error-correction techniques and the results revealed that there exists a long run relationship between output, money and real exchange rate. They affirmed that real depreciations were unfolding in the long run and the most significant unfurling impact of real depreciations came into view with a lag of three quarters (Bahmani-Oskooee and Rhee, 1997). The study conducted on the impact of exchange rate depreciation on output and inflation in Nigeria using Quarterly data for the period 1970-1995 with an impulse response function revealed that expansionary impact of exchange rate depreciation on output in both the medium and long run but a contractionary effect in the short run (Oduola and Akinla, 2001). The use of error correction mechanism to examine the relationship between monetary growth, exchange rate and inflation in Ghana, found the existence of a long run equilibrium relationship between real income, inflation, exchange rate and money supply (Mahamadu and Philip, 2003). The analysis on the dynamics of money supply, exchange rate and inflation in Nigeria using secondary data obtained from the International Financial Statistics from 1986Q1 to 2008Q4 using vector error correction mechanism integrate both the long run and the short run effect is predicted concurrently. The study confirms that there is significant long run relationship among the variables. Money supply and exchange rate have significant negative effect on inflationary pressure, although real output growth and foreign price changes have direct effects on inflationary pressure. Furthermore, the test of short term relationship of these variables on inflation; only money supply is the significant variable in support of

the apriori theoretical expectation (T.O.Akinbobola, 2012). The use of Johansen multivariate cointegration, granger causality test and variance decompositions to find out the dynamic interactions among macroeconomic variables by using quarterly data from Pakistan over the period 1972Q1 to 2009Q4 found an existence of a stable long run equilibrium relationship among the macroeconomic variables from the cointegration test. The Granger causality tests tend to support the non neutrality of money in accordance with the Keynesians and the monetarists in the short run. Their findings show that inflation is not purely a monetary phenomenon rather structural factors play a key role in affecting in Pakistan (Faiz Bilquees et al. 2012). An investigation of Exchange rate volatility and Employment Growth in Ghana's manufacturing sector using OLS regression technique revealed that interest rate has a negative relationship; GDP has a positive relationship with employment growth (Mensa et al, 2013). Another study on the relationship between exchange rate and inflation in Zimbabwe using Granger causality test during the period 1980 to 2007 revealed that both the exchange rate and inflation have equilibrium condition and share a common trend in the long run and reveals that the order of causality in annual tests is normally bi-directional, from inflation rate to exchange rate conversely (Wellington Madesha et al 2013). An examination of the relationship between exchange rate and interest rate in Namibia using unit root tests, cointegration tests, impulse response and variance decomposition for the period 1993Q1 to 2012Q4 treasures that there is no cointegration among the variables and was unable to clear systematic relationship between interest rates and exchange rates. However, the variance decomposition revealed that the errors in the forecast of both the exchange rate and interest rate are dominated by itself (Johannes Payavali Sheefeni Sheefeni, 2014). An investigation on the impact of macroeconomic variables of GDP growth of Pakistan using correlation coefficient, regression analysis and Granger causality using annual data for the period 1980 to 2013 revealed that inflation and exchange rate have a unidirectional causality whilst exchange rate and Foreign Direct Investment (FDI) indicates significant impact on GDP growth. The study also confirms that FDI, Interest rate, exchange rate and inflation demonstrate significant impact on GDP growth (Umar Kibria et al, 2014).

3 Methodological Discussion

The study adopts an econometric approach, data series were sourced from the world development indicators (WDI) data base for a period of 34 years (1980-2013). We used Ordinary Least Square (OLS) method to analyse the relationship between inflation, GDP growth, exchange rate, foreign price level and money supply. In order to predict the impact of the above mentioned variables in the Sierra Leone economy, the General Multiple linear Regression was adopted to take the following specification;

$$INF = F(GDP, EXR, FPL, MG) \quad (1)$$

From equation (1), the econometric form of the equation is specified in natural logarithm as;

$$\ln INF_t = \beta_0 + \beta_1 \ln GDP_t + \beta_2 \ln EXR_t + \beta_3 \ln FPL_t + \beta_4 \ln MG_t + U_t \quad (2)$$

Where; INF = Consumer Prices Index Inflation, GDP = Gross Domestic Product, EXR = Exchange Rate, FPL = Foreign Price Level, MG = Money Supply Growth and U_t = Error Term

β_0 is a constant and β_1 to β_4 are the parameters to be estimated.

4 Analysis of Empirical Results and Discussion

The empirical investigation commences with an analysis of the descriptive/summary statistics of the variables under investigation. The mean was used as measure of central tendency, whereas the standard deviation is used as measure of dispersion. The results in table 1 show that all the variables have a positive mean and standard deviation with highest standard deviation recorded for Exchange rate and its lowest value recorded for Foreign Price level. Skewness and Kurtosis denotes the measures of Skewness and Peakedness respectively and the maximum and minimum values for each variable are also computed (table 1.). Both skewness and kurtosis are positive and that kurtosis curve for INF, GDP and FPL are leptokurtic.

In an attempt to detect the problem of multicollinearity in the model, a correlation matrix was done to determine the degree of correlation among the variables under investigation. Correlation explains the changes that occur in one variable due to change in other variable. If a high correlation is found between variables, it can lead to multicollinearity. The table below shows the result from the matrix.

The rule of thumb is that if multicollinearity among two variables is 80% and above, then it is a cause of concern. However, the current study does not show any severe case of multicollinearity between the variables as the highest value of correlation is 71% between inflation and money supply.

This confirms the absence of multicollinearity among the variables in the model.

Table 1 Descriptive Statistics

	INF	GDP	EXR	FPL	MG
Mean	33.64	6.38	1521.04	3.54	34.92

4.1 Unit Root Test Analysis

Under existing practice the unit root test is conducted to check the stationarity of data series. This step is very vital because if non-stationary variables are not identified and used in the model, it will lead to a problem of spurious regression, the results suggest that there is a statistically significant and meaningful relationships between and amongst the variables in the stated regression model where in actual fact all that exists is contemporaneous correlation rather than meaningful causal relationships. The Augmented Dickey-Fuller and the Phillips-Perron tests were carried out and the test results are presented in table 3.

Table 3 Results of the Test for Stationary: Using Augmented Dickey Fuller and Phillips-Perron Tests

Augmented Dickey-Fuller Tests					
Variable	Level/ Δ Level	Calculated ADF	ADF critical values	Included in tests equation	Conclusion
lnINF	Level	-3.1524	-4.2627	Intercept & trend	I(1)
	Δ Level	-6.8082	-4.2733***		
lnGDP	Level	-2.0564	-2.6369	None	I(1)
	Δ Level	-8.5726	-2.6392***		
lnEXR	Level	1.7648	-2.9540	Intercept	I(1)
	Δ Level	-3.5900	-2.9571**		
lnFPL	Level	-4.2169	-4.4163	Intercept & trend	I(1)
	Δ Level	-6.1454	-4.4407*		
lnMG	Level	-3.4830	-4.2627	Intercept & trend	I(1)
	Δ Level	-7.8095	-4.2733***		
PHILLIPS-PERRON TESTS					
lnINF	Level	-2.9428	-4.2627	Intercept & trend	I(1)
	Δ Level	-11.7002	-4.2733***		
lnGDP	Level	-1.7897	-2.6370	None	I(1)
	Δ Level	-12.6302	-2.6392***		
lnEXR	Level	2.5806	-3.6463	Intercept	I(1)
	Δ Level	-3.2837	-2.9571**		
lnFPL	Level	-1.2051	-3.6220	Intercept & trend	I(1)
	Δ Level	-4.3138	-3.6329*		
lnMG	Level	-3.3964	-4.2627	Intercept & trend	I(1)
	Δ Level	-8.0871	-4.2733***		

Note: ***, ** and * indicates that the variable is stationary at the 1 %, 5% and 10% level of significance respectively.

The unit root test result reveals that all the variables in the model are non-stationary at their levels but become stationary at first differencing. This suggests the use of co-integration analysis since the concept of co-integration requires variables must be stationary after differencing at least once I (1).

4.2 Co-integration Test Analysis

The stationary linear combination is termed the co-integrating equation and can be infer as a long run equilibrium relationship between the variables. The common objective is to determine the most stationary linear combination of the time series variables under consideration. Consequently, Johansen and Juselius (1988, 1990) co-integration technique has been employed for the investigation of stable long run relationships between inflation, GDP growth, exchange rate, foreign price level and money supply growth in Sierra Leone by using both the Trace and Maximum-Eigen tests statistics. The results are presented in table 4 and 5.

Table 4 Unrestricted Co-integration Rank Test Result (Trace)

Hypothesized No. of CE(s)	Eigen value	Trace Statistic	0.05 Critical Value	Prob.**
None *	0.758152	98.43549	69.81889	0.0001

Source: E-views output

The results of both the trace test (table 4) and the maximum-eigen test (table 5) indicate that co-integrating equation exists at the 5% significance level. Therefore the null hypothesis of no co-integrating equation is rejected. Consequently, it can be concluded that there is a significant long run relationship between the given variables. Since variables can either have long run or short run effects, then an error correction model (ECM) is used to disaggregate this effect.

Table 6 Result of the long run co-integrating relationship

Independent variables	Coefficients	Standard Errors	T-Statistics	conclusion
lnGDP	-1.0135	0.2318	-4.3723	significant
lnEXR	0.0023	0.0040	0.5750	insignificant
lnFPL	16.6826	2.7144	6.1460	significant
lnMG	2.0296	0.2393	8.4814	significant
constant	-620.0248

Source: computed by author from e-views output

The result of the long-run co-integrating relationship in the model shows that GDP growth has significant negative effect on inflation in Sierra Leone whereas exchange rate, foreign price level and money supply growth have a positive one.

4.3 Short run dynamics (ECM)

Source: computed by author from e-views output

The coefficient of GDP growth -0.5062 has a negative and significant impact on inflation. There is an inverse relationship between GDP growth and inflation. This implies that a 1% increase in the GDP growth leads to approximately 0.51% decrease in inflation in Sierra Leone. This outcome is in line with theories and previous studies that an increase in economic growth has the tendency to reduce the rate of inflation in an economy.

With regards to exchange rate, the sign of the coefficient reveals that an appreciation of the Leones will cause a decline in the rate of inflation in Sierra Leone. However, the relationship is insignificant for the study given that the probability value is greater than 5%.

Unlike GDP growth, the coefficient of foreign price level 0.6636 has a positive and significant impact on the rate of inflation. There is a direct relationship between foreign price level and inflation. This implies that a 1% increase in foreign price level can lead to approximately 0.66% increase in the rate of inflation in Sierra Leone. This finding is in conformity with theories and findings from previous studies that there exists a positive relationship between them.

Similarly, the coefficient of money supply 0.3943 has a positive and significant impact on the rate of inflation. There is a direct relationship between money supply and inflation. This implies that a 1% increase in money supply can lead to approximately 0.39% increase in inflation in Sierra Leone. This finding is also in conformity with theories and findings from previous studies that there exist a positive relationship between money supply and inflation.

The coefficient of the error correction term indicates the speed of adjustment in eliminating deviation from the long run equilibrium. It shows how much time would be taken by the economy to reach at long run equilibrium. Its coefficient is statistically significant -0.9345. This shows that the speed of adjustment is approximately 0.93% implying that if there is a deviation from the equilibrium, approximately 0.92% of inflation is corrected annually as the variable moves towards restoring equilibrium. The adjusted R-squared value is 0.526394, implying that approximately 52.6% of the variation in the inflation rate is explained by the independent variables, which is an indication of a very good fit. The Durbin-Watson statistic is high suggesting that there is no first order autocorrelation. The overall equation is statistically significant as shown by the probability value of the F-statistic (0.008407).

5 Conclusions

This paper intended to find the link between inflation, exchange rate, GDP growth and money supply growth in Sierra Leone. The empirical and econometric analysis performed in this paper showed that there is existence of long run functional relationship between inflation as a dependent variable on one side, GDP growth, exchange rate, foreign price level and money supply growth as explanatory variables on the other side. Furthermore, results from the short run relationship indicated an inverse relationship between GDP growth and inflation. This implies that a 1% increase in the GDP growth leads to approximately 0.51% decrease in inflation in Sierra Leone. This outcome is in line with theories and previous studies that an increase in economic growth has the tendency to reduce the rate of inflation in an

economy. With regards to exchange rate, the sign of its coefficient reveals that an appreciation of the Leones will cause a decline in the rate of inflation in Sierra Leone. However, the relationship is insignificant for the study given that the probability value is greater than 5%. Unlike GDP growth; the coefficient of foreign price level 0.6636 has a positive and significant impact on the rate of inflation. There is a direct relationship between foreign price level and inflation. This implies that a 1% increase in foreign price level can lead to approximately 0.66% increase in the rate of inflation in Sierra Leone. This finding is in conformity with theories and findings from previous studies that there exists a positive relationship between. Similarly, the coefficient of money supply 0.3943 has a positive and significant impact on the rate of inflation. There is a direct relationship between money supply and inflation. This implies that a 1% increase in money supply can lead to approximately 0.39% increase in inflation in Sierra Leone. This finding is also in conformity with theories and findings from previous studies that there exist a positive relationship between money supply and inflation. Therefore, a policy recommendation is that the liquidity specifications should be broadened to incorporate foreign currency deposits held at commercial banks to establish efficient control over money supply. Finally we look forward to future studies on GDP growth, inflation, Exchange rate, money growth issues with a view to further provoke policy discourse; such study could be the nexus between Monetary policy and economic growth for the Sierra Leone economy.

(E-mail: liumingfei5223@163.com, zhanghuan0805@126.com, visualkid@163.com)

Abstract: Electronic Banking Service capability not only is an important power of regional modern service industry, but also is an important indicator to measure regional economic development. On the basis of the full study of the relevant literature, two dimensions on the growing power of industry and carrying capacity of resources constructed evaluation index system of electronic banking services. By SPSS19.0 analysis tools, the principal component analysis is to analysis the data from the six major regions of the country for the relevant comprehensive evaluation from 2003 to 2012. Use the Gini coefficient (GINI) and Theil index (GE_0 & GE_1) to measure and decompose difference of 6 large areas between the electronic banking service capability. The results showed that: among the regional differences were gradually narrowing.

Key words: Electronic banking; Service capability; Assessment system; Regional difference; Change trend

1 Introduction

As one of the emerging modern service industry, electronic banking industry with the network technology and electronic business platform showed explosive growth in the last decade, but the electronic banking service capability of the domestic various regions showed significant regional differences. Regional differences of electronic banking service capacity not only exacerbate the imbalance of regional economic development, but also affect the stability of the regional financial markets. Over time, the changing trend of this regional difference is widening or narrowing, for the formulation and adjustment policies played a key role.

China Banking Regulatory Commission defines electronic banking as the banking financial institutions such as commercial banks, for the public use of open communication channel or open public networks and banks establish specific self-service facilities or customer private networks, to provide the banking services. In the factors affecting the development of electronic banking in the region of the macro, we use questionnaires to analyze the four major barriers to impact the development of Iran's electronic banking: professional technical barriers, legal and social barriers, policy barriers and financial and economic barriers (Mehdizadeh et al., 2012). The system and institutional factors, management factors and technological level of the bank belong to internal factors, and the structure of financial markets, financial innovation are external factors, so internal and external factors are together on the scale economy of electronic banking (Lu Xinghua, 2008); The regional, the development process, system, scale, talent, technology and other intrinsic factors are the reasons that cause development gap among various regional commercial banking (Zhai Yibo, 2012). Regional differences in measurement tools, the Gini coefficient, Theil index and mean logarithmic deviation are used to comprehensively measure Provincial Disparity of China's financial development, eastern Midwest financial development differences and differences in urban and rural areas from 1978 to 2004, and the use of R/S analysis to quantitatively analyze long-term change trends in regional financial development differences (Li Jing et al., 2008); Timing Global Principal Components Analysis is used to measure a comprehensive level of development of commercial circulation of western 12 provinces from 2005 to 2010, on the basis of the analysis, western commercial circulation area will be divided into three categories by cluster analysis, using the Theil index measures regional differences and decomposition (Chen Shan et al., 2013).

Based on the above views of scholars, paper is from the perspective of regions of six areas, such as Northeast, North, East, South, Southwest and Northwest, based on the country's 31 provinces (cities, autonomous regions) of data from 2003 to 2012, using principal component analysis electronic to evaluate and score banking service capability of each region, and the use of the Gini coefficient and Theil index to comprehensively compare differences and change trends in the national

electronic banking service capability.

2 Construction of Evaluation System of Electronic Banking Services Capability

Electronic banking service capability impacts the investment and operations within the industry ,and outside resources of the entire industry also play an important supporting role. Therefore, the evaluation system of electronic banking service capacity is divided for two dimensions, namely growing power of industry and carrying capacity of resources. Electronic banking includes online banking, telephone banking, mobile banking and self-service banking, so when selecting indicators, the financial sector, telecommunications, postal services, e-commerce services industry indicators should be taken into account.

Principles for selecting the level of development of electronic banking index (Liu Mingfei & Zhou Menghua): First, scientific principle; second, operability principles; third, the principle of comprehensiveness.

Based on the above principle of evaluation index selection, combined with the availability of data, the final paper selected 21 indicators to build evaluation system of nationwide electronic banking service capability, as shown in Table 1:

Table 1 Evaluation System of Electronic Banking Service Capacity

Level indicators	Secondary indicators	sign	Level indicators	Secondary indicators	sign
growing power of industry	Financial added value (hundred million yuan)	X ₁	carrying capacity of resources	Per capita GDP (yuan/people)	X ₁₂
	Financial fixed assets investment (hundred million yuan)	X ₂		RMB savings deposit balance at the end of urban and rural residents (hundred million yuan)	X ₁₃
	The number of telecommunications and Other Information Transmission Services employment (people)	X ₃		The added value of transportation, warehousing and postal service (hundred million yuan)	X ₁₄
	Telecom business volume (hundred million yuan)	X ₄		Residents' consumption level (yuan)	X ₁₅
	Fixed telephone talk time (Ten thousand minutes)	X ₅		whole society fixed asset investment of Information transmission computer services and software (hundred million yuan)	X ₁₆
	Mobile SMS traffic (hundred million messages)	X ₆		The local finance general budget spending (hundred million yuan)	X ₁₇
	At the end of mobile phone users (Ten thousand Users)	X ₇		Delivery quantity (Ten thousand items)	X ₁₈
	3G mobile phone users (Ten thousand Users) ①	X ₈		The postal outlets (place)	X ₁₉
	Fixed telephone end users (Ten thousand Users)	X ₉		the amount of domestic patent applications to accept (items)	X ₂₀
	Long-distance fiber optic line length (Ten thousand kilometers)	X ₁₀		Technology Market Turnover (hundred million yuan)	X ₂₁
	Internet users (Ten thousand people)	X ₁₁			

Note: ① 3G mobile phone launched from 2009, so the data before 2008 are zero.

3 Principal Component Analysis of Electronic Banking Services Capability

3.1 Data collection and pretreatment

In this paper, the study involved data of 31 provinces (cites ,autonomous regions) from 2003 to 2012 , and the sources of data include the province (cites, autonomous regions) of the “Statistical Yearbook” “Financial Yearbook” and national statistical offices, the China Economic Information Network statistics database.

3.2 Assessment of regional electronic banking service capability

3.2.1 National electronic banking industry growth potential assessment in 2012

For example, the data in 2012, Use SPSS19.0 to measure 11 indicators of growing power of industry in the KMO test and Bartlett test of sphere city. Get KMO is 0.840, greater than 0.5, Bartlett's test of sphere city was significant probability is 0.000, less than 0.05, and therefore suitable for factor analysis. Factor analysis to obtain results as shown in Table 2:

Table 2 Principal Component Extraction of Growing Power of Industry and Component Analysis of Rotated Factor Loading Matrix

comp onent	The initial eigenvalues			Extracting square and load			principal component	
	sum	Variance (%)	Accumulation(%)	sum	Variance(%)	Accumulation (%)	F ₁	F ₂
1	8.586	78.055	78.055	8.586	78.055	78.055	0.869	-0.378
2	1.115	10.135	88.19	1.115	10.135	88.19	0.829	-0.076
3	0.47	4.274	92.464				0.76	-0.259
4	0.393	3.575	96.039				0.988	0.064
5	0.225	2.045	98.084				0.867	-0.083
6	0.116	1.054	99.137				0.962	-0.031
7	0.071	0.648	99.785				0.972	0.151
8	0.011	0.104	99.89				0.987	0.058
9	0.007	0.066	99.956				0.98	0.032
10	0.003	0.028	99.984				0.302	0.92
11	0.002	0.016	100				0.969	0.118

Table 2 shows, the first two principal components corresponding to the characteristic values are greater than 1, and the cumulative contribution rate is 88.19%, so extract the first two factors F₁, F₂ as a main component.

By calculating the coefficients for each indicator of two main components to give each principal component score formula, namely:

$$F_1 = 0.3X_1 + 0.28X_2 + 0.26X_3 + 0.34X_4 + 0.3X_5 + 0.33X_6 + 0.33X_7 + 0.34X_8 + 0.33X_9 + 0.1X_{10} + 0.33X_{11} \quad (1)$$

$$F_2 = -0.36X_1 - 0.07X_2 - 0.25X_3 + 0.06X_4 - 0.08X_5 - 0.03X_6 + 0.14X_7 + 0.05X_8 + 0.03X_9 + 0.87X_{10} + 0.11X_{11} \quad (2)$$

The weight weighted is calculated by the each of the main components variance contribution rate to occupy all the main component variance contribution rate, evaluation formula of growth potential of the national electronic banking industry can be derived in 2012: $A_1 = 0.885F_1 + 0.115F_2$

It can calculate the scores of National Electronic banking industry's growth potential on each principal component in 2012, the results shown in Table 3:

Table 3 National Electronic Banking Industry's Growth Potential Principal Component Scores in 2012

Area	scores(A ₁)	Area	scores(A ₁)	Area	scores(A ₁)
Beijing City	1.102	Anhui Province	0.203	Sichuan Province	1.787
Tianjin City	-2.165	Fujian Province	0.378	Guizhou Province	-1.666
Hebei Province	0.971	Jiangxi Province	-1.272	Yunnan Province	-0.729
Shanxi Province	-0.916	shandong Province	3.026	Tibet Autonomous Region	-3.165
Inner Mongolia Autonomous Region Province	-0.966	henan Province	1.085	Shanxi Province	-0.319
Liaoning Province	0.750	hubei Province	0.368	Gansu Province	-1.873
Jilin Province	-1.557	hunan Province	0.565	Qinhai Province	-2.894
Heilongjiang Province	-0.691	guangdong Province	9.497	Ningxia Hui Autonomous Region	-3.168
Shanghai City	0.457	Guangxi Zhuang Autonomous Region	-0.696	Xinjiang Uygur Autonomous Region	-1.560
Jiangsu Province	4.512	Hainan Province	-3.038		
Zhajang Province	3.666	Chongqing City	-1.691		

3.2.2 National electronic banking resources carrying capacity assessment in 2012

The same method of industry growth assessment assess the carrying capacity of resources of the national electronic banking in 2012. Use SPSS19.0 to measure 10 indicators of carrying capacity of resources in the KMO test and Bartlett spherical test ,results showing KMO value is 0.734, significant probability of Bartlett's test of sphere city is 0.000, and therefore it is suitable for factor analysis.

Through factor analysis, extract the first two factors F₃, F₄ as a main component, to give each principal component score formula, namely:

$$F_3 = 0.24X_{12} + 0.38X_{13} + 0.32X_{14} + 0.27X_{15} + 0.36X_{16} + 0.34X_{17} + 0.35X_{18} + 0.34X_{19} + 0.33X_{20} + 0.17X_{21} \quad (3)$$

$$F_4 = 0.51X_{12} - 0.14X_{13} - 0.24X_{14} + 0.49X_{15} - 0.01X_{16} - 0.27X_{17} + 0.02X_{18} - 0.28X_{19} - 0.1X_{20} + 0.52X_{21} \quad (4)$$

The weight weighted is calculated by the each of the main components variance contribution rate to occupy all the main component variance contribution rate, evaluation formula of carrying capacity of resources of the national electronic banking can be derived in 2012: $A_2 = 0.783F_3 + 0.217F_4$

It can calculate the scores of National Electronic banking industry's growth potential on each principal component in 2012.

3.2.3 National electronic banking service capabilities integrated assessment in 2012

On the basis of computing the scores of two dimensions of national electronic banking service in 2012 ,the weight is the ratio of variance of each layered score capacity as the total variance,the force of industry growth (A₁) is calculated right weight 0.516, arrying capacity of resources (A₂) the weight is 0.484, calculating the weighted national electronic banking service capabilities composite score in 2012, as shown in Table 4:

3.3 Regional electronic banking service capabilities integrated assessment from 2003 to 2012

The method ,according to the 2012 regional electronic banking service capabilities integrated assessment, respectively calculating the data from 2003 to 2011, the finally summary the main component score data from 2003 to 2012, as shown in Table 4:

Table 4 The Score of Principal Component of Six Regions of the Electronic Banking Services from 2003 to 2012

Years	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012
A score of Northern Region(A)	0.328	0.469	0.383	0.459	0.380	0.647	0.479	1.450	0.777	0.398
A score of Northeast Region(A)	-0.225	-0.538	-0.265	-0.554	-0.551	-0.569	-0.787	-1.085	-1.217	-1.192
A score of eastern Region(A)	9.003	9.052	8.928	9.195	9.446	9.279	10.088	10.803	10.694	10.630
A score of South Central Region(A)	5.027	4.973	5.048	5.157	4.989	4.682	5.019	3.589	4.739	4.900
A score of Southwest Region(A)	-5.843	-5.75	-5.878	-5.862	-5.669	-5.496	-5.74	-5.915	-5.901	-5.822
A score of Northwest Region(A)	-8.285	-8.200	-8.217	-8.394	-8.597	-8.543	-9.055	-8.842	-9.095	-8.912

4 An Empirical Study on Regional Differences of Electronic Banking Services Capability

4.1 To select Indices of differences of regional electronic banking service capability

Indices has yet to measure a special area of the electronic banking service capability differences, therefore we use the Gini coefficient (GINI) and Theil index (GE₀ & GE₁)^[4] to reflect the income gap as the Indices of the area of electronic banking services capabilities Difference.

4.1.1 Gini (GINI) coefficient of differences of electronic banking service capability

The Gini coefficient, a numerical reflection of the overall income gap is widely used in international economic circles. The ability to reflect regional differences in the electronic banking services Gini coefficient is calculated as follows:

$$GINI = \frac{-(n+1)}{n} + \frac{2}{n^2 \mu_y} \sum_{i=1}^n iy_i \tag{5}$$

In which, *n* represents the number of samples; *y_i* represents the electronic banking service capacity after high from low to the *i* individual service capabilities; *μ_y* is the average value of electronic banking service capabilities.

4.1.2 Theil index of electronic banking service capability to calculate the difference

Theil index (GE₁) and log mean deviation (GE₀) as a measure of regional inequality index is often used, which is calculated as:

$$GE_0(y) = \frac{1}{N} \sum_{i \in N} \ln \frac{\mu}{y_i} \quad GE_1(y) = \frac{1}{N} \sum_{i \in N} \frac{y_i}{\mu} \ln \frac{y_i}{\mu} \tag{6}$$

In the above two equations, *N* is the number of regions; *μ* is the average national level of electronic banking development; *y_i* represents the variable value of the electronic banking service ability in each area.

4.2 Analysis the measurement and change trend of the difference of regional electronic banking service capability

According to table 6 ,we obtain scores of the principal component of electronic banking service ability from 2003 to 2012, because of the standardization process and produce a negative, so the data translation process for non-negative. According to the formula (1)、(2) ,we can calculate the six regions of the country in electronic banking service capabilities ability of GINI coefficient (GINI) from 2003 to 2012, the logarithmic average deviation (GE₀) and Theil index (GE₁), as shown in table 5:

Table 5 Difference of Regional Electronic Banking Service Ability of GINI Coefficient, Logarithmic Average Deviation (GE₀) and Theil Index (GE₁) from 2003 to 2012

year	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	average
GINI	0.332	0.332	0.331	0.339	0.342	0.336	0.359	0.359	0.369	0.365	0.346
GE ₀	0.264	0.255	0.259	0.276	0.292	0.280	0.357	0.332	0.372	0.343	0.303
GE ₁	0.196	0.193	0.194	0.203	0.208	0.200	0.233	0.23	0.243	0.235	0.2135
The growth rate of GINI	-	-0.0014	-0.0023	0.024	0.0091	-0.0184	0.0694	0.0002	0.0278	-0.0106	0.0109
The growth rate of GE ₀	-	-0.0318	0.0135	0.066	0.0572	-0.0405	0.2766	-0.0711	0.1217	-0.0795	0.0347
The growth rate of GE ₁	-	-0.0171	0.0068	0.0458	0.0257	-0.0372	0.1646	-0.0149	0.0602	-0.0343	0.0222

The results showed that regional difference between electronic banking services is widening from 2003 to 2012 : GINI coefficient increased from 0.332 to 0.365, the logarithmic average deviation(GE₀) increased from 0.264 to 0.343, Theil index (GE₁) increased from 0.196 to 0.235. Contrasting the fluctuation range of three indicators differences, the change of regional electronic banking service ability difference has distinct phases:(1) From 2003 to 2005, China has entered the popularity of e-banking industry, major banks launched a complete electronic banking products and services, users in the regions gradually accepted this emerging industry, and therefore the regions did not have a huge difference.(2)Since 2006, the height of access to electronic banking, regional differences emerged between surges, at the same time banks began to enrich the type of e-banking products and services, these services were associated with the level of economic development in the region, the size of banks and Internet penetration , so the gap between the regions was widening. (3)Since 2009, the difference between various regions was to further expand, mainly due to the rise of e-commerce platform for online banking payment transaction behavior, the development of electronic commerce was associated with the area of the development of traffic transportation and the development of the logistics industry , leading to the growth rate of the three difference index peaked at the same time.(4) In 2012, the regional electronic banking development had entered a stable period, yet it continued to stimulate the emergence of new business development, and early the more backward regions in the past decade had increased the development of electronic banking, logistics, telecommunications and other related industries ,so the intensity of regional differences in growth will therefore fall trend.

5 Conclusion

In this paper, electronic banking service capacity in 6 large areas were evaluated by principal component analysis method. The results showed that the level of development of electronic banking in East China is much higher than in other regions, while the level of electronic banking Northwest region is relatively backward. This paper uses the Gini (GINI) coefficient, logarithmic tomean deviation (GE₀) and Theil index (GE₁) to measure the ability of regional differences in the electronic banking service. The results show that there are significant differences between the 6 large areas of electronic banking service capacity and regional differences expanded gradually in the decade from 2003 to 2012. But in recent years, the increase in regional differences of expansion is narrowing. This shows that in the next few years the regional differences of our country's electronic banking service capacity may show narrowing trend.

Countermeasures and Suggestions for Students Internet Businesses

Qiao Yunli, Yang Shanshan

Social Cooperation Development, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 56853633@qq.com)

Abstract: In the increasingly severe employment situation, many students turn their attention to their own businesses on the road. Internet businesses based on their strengths, generally welcomed by university students, but how to improve the success rate of Internet businesses, be placed in front of college students and universities a problem. By analyzing typical problems students in the network business, proposes Students should select the appropriate network entrepreneurship, a reasonable position, improve their overall quality, improve risk awareness, entrepreneurship and education countermeasures system.

Key words: College Students; Network business; Comprehensive Quality

1 Introduction

In recent years, the severe employment situation, the network business has become one of the most popular entrepreneurial way college students. First domestic "Chinese Internet business studies students" showed that up to 97.62 percent of the students support and recognition of the network business, there are 68.78 percent of college students network business is full of longing. However, Chinese college students each year choose entrepreneurship ratio of 5% average success rate of entrepreneurship was only 3 percent, and the United States 20 percent success rate of entrepreneurship Students have 7-fold difference. The low success rate of Chinese students' network business reflects the many problems which exist.

2 Students' Network Entrepreneurship Problems

2.1 Passion but no power

In the "Forbes" magazine out of 2010 in the world's youngest billionaire, 25-year-old Facebook founder Mark Zuckerberg tops the list. This started from Harvard University dormitory, the magnificent transformation of the world's youngest billionaire entrepreneur story once again ignited the passion of entrepreneurship among university students, college students in mind to become a benchmark figure. But many college students blindly follow the network business boom, without careful consideration of their suitability in the online business. When the venture blindly optimistic, I believe that after the company opened soon to achieve profitability, the recovery of funds, once the business is facing difficulties, resulting in the gap between dreams and reality, they begin to lose confidence, suspicion, complaining, negative, and finally back. Students' Internet business startup projects generally rush to focus on low barriers to entry of goods clothing, skin care products, prepaid card, there are few college students do detailed market research, combined with their expertise and interest, entrepreneurial direction reasonable position. Investigation and analysis of the lack of entrepreneurial projects, resulting in network product homogeneity is serious, network operators lack of features, it is difficult to obtain a place in the fierce competition in the market. Faced with the rapid development of the network at the same time, many entrepreneurs lack of deep thinking on the network business profit model, the estimated rate of return on investment is too optimistic, after the Web site operators often find it difficult to achieve the expected profit, leading to run soon into funds shortage dilemma.

2.2 No risk awareness

Venture refers to various uncertainties affect students achieve business objectives in the entrepreneurial process. Entrepreneurship involves many aspects, including technical factors, markets, capital, and management, while students in the school and community have little contact, in the forging, the overall quality of culture accumulation of knowledge, ability and entrepreneurship needed ability there is not a small gap. Feasibility of students in the business for the selected network venture lacks rigorous analysis, the market potential of the project products face how much competitors status, what their own competitive advantage, and is able to break through the technical problems, Whether able to obtain a stable supply, there is no clear understanding. Poor risk awareness has led many entrepreneurs in the early days, on premature mortality, escape the "business namely unemployment," the curse. Some entrepreneurs although across the threshold of the early days, difficult to obtain the living space, but companies need to step into a stable period of development, there are often disagreements team situation,

because there is no timely establish a standard operating system, the lack of team cohesiveness of the building, resulting in the initial success has been obtained in vain. Although the network business compared to the traditional business model, with low investment, high return characteristics, but the financial risk is still one of the major risks faced by business students. For most avid Internet entrepreneurs, how scientific financial planning is always a big problem on the road to business success. When college students think they have a great business idea, there will always desperate to put where, until driven to the wall, will clearly recognize the importance of financial planning. Many people think the Internet is a "burn" the industry, do not know how the rational use of college students entrepreneurs with limited funds, it is facing a huge financial risk.

2.3 Lack of marketing knowledge

Internet business is a network for entrepreneurs in the form of the carrier, so entrepreneurs are required to have some knowledge of the network. Current students network business model is mainly online shop, opened the portal to become the online freelancers like. Online shop, is open a virtual store online sale of goods or merchandise auction, by merchandise sales to profit; creation of professional portals that build online platform to provide products such as transaction-specific customer groups, online dating, search, software downloads, games and other services; there are many students to become online freelancers, such as the creation blog, forums, writing novels and other networks. Shop opened at present is the lack of start-up capital of Students generally choose the mode, but many college students lack knowledge of e-commerce, do not understand the B2B, B2C, C2C basic connotation, the characteristics of the importance of e-commerce transactions, transaction security, credibility, online payment means of lack of deep understanding, can not take full advantage of network operations and services performed. No matter what online business model selection, network marketing knowledge are essential. Core business is the marketing, the core of e-commerce network marketing. Faced with a growing number of shop, a growing number of professional websites fellow travelers, students start to become more difficult road. How to seize the precise positioning through their own customer base, how the difference of marketing, how to reduce marketing costs, how to improve the visibility and credibility, is a university student entrepreneurs in winning the competition at all.

2.4 Lack of technical training

In recent years, more and more emphasis on entrepreneurship education in colleges and universities, but the social needs and the overall situation, not enough attention and popularity. Entrepreneurship courses in addition to the current Chinese Universities Entrepreneurship foundation courses, such as "college students KAB entrepreneurship base," "entrepreneurship", but most are "career planning", "career guidance" series, start a single type, and many more electives based, did not form independent entrepreneurship curriculum, not throughout the entire process of education and training, more of a contingency introductory training education. In the teaching, the current Speaker of entrepreneurship education teachers are mostly "academic" teachers, mainly from the administrative department in charge of student employment and responsible business education teaching departments, most of these teachers lack practical experience and entrepreneurial business experience. In recent years, some universities in order to strengthen practical entrepreneurship education, and also hired a group of entrepreneurs or entrepreneurs as business mentor, but the lack of institutional guarantees and financial support on the whole, than add your entrepreneur or entrepreneurs lack teaching experience, teaching the result is not satisfactory.

3 Students' Internet Business Suggestions

3.1 Reasonable position

First, college students should combine their expertise and interests, study the market, choosing the right network business areas. Determined to do a particular focus on commodity trading e-commerce sites, or do to meet the students, white-collar workers or business people dating and social networking site gaming needs. In this process, you must do the characteristics of the industry and consumer groups, in-depth analysis, we found gaps in the market, try to avoid the highly competitive field of the blind get together phenomenon. Secondly, in the chosen field in a reasonable position, differentiated competition, establish their own unique competitive advantage, build brand image. Do B2C e-commerce Eslite to low-cost fashion brand image, with nine dollars stockings, T-shirts 29's, 59's canvas shoes quickly attracted many fashionable men and women; then the watercress for the review site Example, "Art, Petty, elegant" is the beginning of watercress inception adhere to brand identity, watercress reading, watercress movie, watercress music interpretation of all three major sections such brand connotation. For Internet

companies, adhere to a clear unique position, it is the most effective way to change the direction of movement of the user's mouse. Positioning requires an appropriate policy to support. For the ivory tower boys and girls, respect for individuality, like innovative ideas, we provide the kind of goods or services? For fast-paced life, urban white-collar life stress, what should provide the kind of goods or services? Differences in consumer demand, the goods or services we offer must be clear for the needs of the target audience.

3.2 Improve the overall quality

Students' Internet entrepreneurs to have a good overall quality, including psychological, as well as certain management, e-commerce, financial and other professional knowledge, improve their organization and leadership, coordination and communication skills. If the funding, the project as a "hardware", then the overall quality of the entrepreneur is essential "software." Overall quality of entrepreneurs often decide the future of the enterprise. College students, as a passionate group, with a network of young, fashion, full of opportunities has a natural fit. But dream must have perseverance in the face of setbacks brave can survive and develop in the fierce competition. Meanwhile, college students venture must possess the necessary management knowledge, it is possible, based on careful market research, the maximum tap the potential demand of customers. A direct impact on sales prices that double-edged sword, artistic use, flexible adjustment is necessary to ensure profits, because the price is too high and will not become a barrier obstacle consumer spending. In addition, the entrepreneur should have a good network to promote the ability to promote their products and services to target consumers through various promotional means, including the use of search engines, with the well-known e-commerce platform, using forums, QQ group, blog and so on. Given the special nature of online transactions, such as the authenticity of parties to the transaction, the online provision of goods described as accuracy, timeliness logistics and distribution, leading to consumer credit has become a key factor affecting network. Internet entrepreneur must clearly recognize the importance of establishing credibility, develop good service awareness, improve customer loyalty. Students of leadership for Internet businesses success. Alibaba's business team has been called the most successful entrepreneurial business team, which is totally based on strong leadership Ma team spirit. Internet is a new media, both in the event of a new thing every day, in the online business in the process, the team members will inevitably be divided about the direction, operation mode view, the situation appears to split the team, so college students should consciously cultivate their team leadership.

3.3 Improve risk awareness

Financial risk is the main risk college students network entrepreneurs, funding strand breaks early Internet businesses often become unable to break through the bottleneck. When college students to create a site, you need to consider the construction costs itemized site, built on the line after marketing costs, distribution costs, etc., analyze how long it takes to recover the cost, how long it can begin to profit and other issues. There is not enough money, there was a lack "winter" of the capital, the second is the lack of "blood" function, can not be profitable, these two issues have become many sites "Achilles heel." While most college students choose to invest less open shop, but the shop to purchase a going concern requires continuous Distribution, we need to have some cash flow on the book. If the market situation is not good, there will be inventory, no doubt to the poor financial risk tolerance shop cause greater financial pressure. Online business, you need to establish a smooth, reliable, and have the advantage of sourcing, can students start early, demand is unstable, often only fragmented supply organizations, which will bring greater business risks. First, scattered high purchase price, plus profit margins, sold to customers in the inevitable price too high to attract customers; the second is the channel instability, when the customer needs, it is difficult to find immediately affect customer confidence in the shop; three It is their favorite styles and varieties of customers may not like it, will cause the product backlog; four varieties, specifications incomplete, too single product, customers will turn to choose other products richer, more complete listing of different specifications. Therefore, the students should recognize the sources of risk online business, try to look for flexible delivery methods, to establish a stable supply partnerships.

3.4 Right training

Internet entrepreneurship education is to guide students through the network platform entrepreneurship education, its content needs to keep up with the development of network information technology, to adapt to the social demand for e-commerce, Students' entrepreneurial learning ability in network technology and network management aspects of practice and innovative ability. In addition to school choice and practical, cutting-edge materials, employ highly qualified, than there is considerable practical experience of teachers, you can also try other innovative training model, for example, can be

combined with each other between the universities, to break the sectarianism, share resources, learn from the experience. Talents in the network program development, related professional and curriculum development, teaching skills, curriculum implementation, conduct all-round cooperation in practice substantive training base and so on. At the same time, the effective implementation of and cooperation among network companies, employing a network of successful people and senior technical talent as the network business mentor, entrepreneurial real guidance. In addition, students are encouraged to participate in a variety of network Venture Challenge, take advantage of multiple opportunities and platforms, training college students' ability for Internet businesses.

4 Conclusion

In recent years, as the network environment continues to improve, more and more consumers began to accept and love on the Web to shop, began to try a variety of network products and services, a vast network of market potential, which is faced with enormous pressure on employment of the students through the network platform. It provides an opportunity to achieve their business dreams. However, college students can not rely on the entrepreneurial passion, should be in-depth analysis of the risks for Internet businesses, improve their overall quality; entrepreneurial universities should play a guiding role of a good college students, college students network entrepreneurs together to improve the success rate.

Empirical Research on the Affect from Industrial Technology to Ecological Efficiency: Based on SE-DEA and Panel Data*

Wang Jin

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wj77bb@aliyun.com)

Abstract: Technology-environment paradox argues that technology can be both the origin and remedies of environmental change. The accelerated development of China's industry not only brought technology progress and industrial prosperity but also resulted in a series of ecological problems. Based on the calculation of 2005-2011 SE-DEA eco-efficiency of China's industrial sectors, this paper used industry panel data to analyze the impact of industrial technology on eco-efficiency. The results show that: 1) a large number of low eco-efficiency industries pull down the overall industrial eco-efficiency, the growth of TFP is mainly dependent on technology progress; 2) innovation efficiency represented by patents have a significant positive effect on the eco-efficiency, the commercialization represented by new products has a significant negative effect; 3) industrial independent innovations show a significant positive effect on industrial eco-efficiency, but its lagged variable of the first phase shows a significant negative effect.

Key words: Ecological Efficiency; Technology Innovation; Innovation Achievements; Super Efficiency DEA; Panel Data; PCSE Robust Variance

1 Introduction

In recent years, PM2.5 index stays high in the most areas of China, which has focused the public's attention on the environmental hazard. Industrial technological progress has accelerated industrial development but has also quickened deterioration of ecological environment. Technology-environment paradox argues technology can be both the origin and remedies of environmental change. Coordinating the double-edged sword effect of technology to achieve ecological technology is important to establish industrial ecological civilization of resource-saving and environment friendly.

At present, research of ecological technology largely starts from the philosophical perspective. For instance, Peng Fuyang (2003)^[1], Hu Yuanqing (2007)^[2], Yi Xianfei (2013)^[3] and Du Juan (2013)^[4] analyzed and defined the connotation of ecological technology respectively from the perspective of social development, complexity thinking, value orientation and sustainable development. In the view of realization of ecological technology, Peng Fuyang (2006)^[5] argued that the obstacles of ecological technology were mainly the understanding gap, low innovation ability, lack of good environment for innovation, etc., while the significant increase of the economic strength and science and technology level, the establishment of outlook of scientific development and stable political environment were conducive to ecological technology development. Chen Xicheng (2014)^[6] proposed the driving force behind the ecological technology from three aspects, resource availability, actual living space for human and further need for expanding human activity space.

Although the philosophy research theoretically indicates the direction of technology development, it still needs to combine reality for specific analysis in the management practice, which is hard to be achieved by the basic philosophy. Taking philosophy as its key link, this paper analyzed the impact of industrial technology on eco-efficiency, which not only pointed out the real path for industrial technology, but also provided the basis for the government to formulate policies.

2 Modeling

World Business Council for Sustainable Development formally proposed the definition of eco-efficiency in 2000: it is to provide product or service with a competitive price, which can meet the human needs and ensure the life quality and gradually reduce the ecological impact and resource consumption intensity, which is consistent with the earth's carrying capacity. The formula can be described as follows:

* This paper is supported by Ministry of Education Project of Humanities and Social Sciences (12YJCZH196); China Postdoctoral Science Foundation (2013M531748); The Soft Science Research Program of Hubei (2015BDF085); National Natural Science Foundation of China (71372201).

$$EE = (P_q \cdot Q) / E \tag{1}$$

EE is eco-efficiency, P_q is the produce price, Q is produce output, $(P_q \cdot Q)$ is economic value of product, E is the resources and environment impact of product, in this analysis we define it as resource consumption and pollution emissions.

In order to further analyze the relationship between industrial technology and eco-efficiency, a Cobb Douglas production function was constructed, in addition to labor L and capital K , E was introduced as the third production factor input, and A was set as technical level, so the production function is:

$$Q = A \cdot F(K, L, E) \tag{2}$$

Assuming Q keeps constant return to scale, based on the factor demand equation we can get the cost function:

$$C = H(P_K, P_L, P_E, P_M, A) = A^{-1} P_K^{e_K} P_L^{e_L} P_E^{e_E} P_M^{e_M} Q \tag{3}$$

P_K , P_L , P_E and P_M respectively represent the price of capital, labor, environment and raw materials, while e_K , e_L , e_E and e_M represent the price elasticity of capital, labor, environment and raw materials. According to Shepard theorem, the demand of production factors equals partial derivative of the cost function to the price of the factor, so the partial derivative of environmental factor price of (3) is solved:

$$E = \frac{\partial C}{\partial P_E} = \frac{e_E \cdot A^{-1} \cdot P_K^{e_K} P_L^{e_L} P_E^{e_E} P_M^{e_M} \cdot Q}{P_E}, \text{ if } P_Q = P_K^{e_K} P_L^{e_L} P_E^{e_E} P_M^{e_M}, \text{ then } \frac{P_E \cdot E}{P_Q \cdot Q} = e_E \cdot A^{-1} \tag{4}$$

put (4) into (1), we get

$$EE = e^{-1} \cdot A \cdot P_E \tag{5}$$

Clearly, the eco-efficiency can be expressed as a function of the technological level and the price of resources and environment. The technical level is set as

$$A = e^{g(RD, NP, PT) + \delta} \tag{6}$$

There are three technical indicators which can reflect the technical level: RD can be used to reveal to technology innovation ability and strength, patents PT to measure the innovation efficiency and new product NP to measure commercialization so as to illustrate the practicability and effectiveness of technological innovation. the function $g(\cdot)$ can be set as:

$$g(\cdot) = \alpha_1 \ln RD + \alpha_2 \ln NP + \alpha_3 \ln PT \tag{7}$$

Put (6) and (7) into (5), and take the logarithm on both sides of (5), the basic model is:

$$\ln EE_{it} = \beta_0 + \beta_1 \ln RD_{it} + \beta_2 \ln NP_{it} + \beta_3 \ln PT_{it} + \beta_4 \ln PE_{it} + \varepsilon_{it} \tag{I}$$

For an easier identification, in model (I), PE is used to replace P_E without the meaning changed, i is individual, t is time, β_0 is intercept, ε_{it} is random error term and $\beta_1 - \beta_4$ is coefficient.

3 Determination of Eco-efficiency of Industries

3.1 Eco-efficiency model and index selection

Data envelopment analysis is a nonparametric method for production efficiency first raised by operational research experts A. Charnes and W. W. Cooper in 1978. The basic model of DEA is CCR model, and the BCC model can be obtained with convex constraints added. It is difficult for CCR or BCC model to make comparison and evaluation for multiple decision units in forefront surface, but though converting the decision-making unit on the forefront surface, SE-DEA model can exclude a decision-making unit from the set of decision making units, and further compare the efficiency of perfect decision-making unit. Referring to the research of scholars such as Wang Enxu (2011)^[7], we also used SE-DEA as the main tool for the evaluation of eco-efficiency.

According to the definition of eco-efficiency given by WBCSD, and combining with the research of Zhang Bing (2008)^[8] and Gao Feng (2011)^[9], the evaluation system of SE-DEA eco-efficiency can be divided as three parts: economic system, resource system, and environment system (Tab.1). The environment system as non-expected output is similar to the nature of input, that is, the maximum

economic output is expected with minimum input, so the environment system was included as input.

Table 1 The Evaluation System and Index of Industrial Sector Eco-Efficiency

System	Type Of System	Index
Economic System	Output	Gross Industrial Output Value (Y)
Resource System	Input	Consumption Of Water (X1), Coal (X2), Fuel Oil (X3), Nature Gas (X4), Electricity (X5)
Environment System	Non-Expected Output /Input	Industrial Waste Water (X6), Industrial SO ₂ (X7), Industrial Soot And Dust (X8), Industrial Solid Wastes (X9)

3.2 Calculation of eco-efficiency for each industry field

Using DEA, the amount of decision units should at least reach two times of selected input and output indices, and the evaluation index should have obvious correlation and should avoid the multicollinearity. Then we got the data of indices in table 1 from *China Energy Statistical Yearbook 2012* and *2006-2012 China Statistical Yearbook on Environment*. SPSS16.0 was used to conduct multicollinearity and significance test on these indices, and the result showed that X1, X8, X9 was not significant (Sig.>0.05); the variance inflation factor was inspected, x6 had the collinearity (VIF>5), finally 5 optimized variables including X2, X3, X4, X6 and X7 were obtained.

Because SE-DEA model can sort efficient DMU, the software EMS1.3 was used to calculate SE-DEA eco-efficiency of industrial sector. As a static analysis, the eco-efficiency reflects the distance between each sector and corresponding production frontier boundary in a specified period; meanwhile the Malmquist index was used to calculate TFP of ecology environment so that the dynamic change of TFP could be mastered and its contribution source could be further analyzed (Tab. 2).

Table 2 2005-2011 The Eco-Efficiency and Efficiency Index of 37 Industrial Sector

Sector	EE	Tech	Pech	Sech	Tfp	Sector	EE	Tech	Pech	Sech	Tfp
1	0.081	1.124	1.067	0.995	1.193	20	0.285	1.057	1.096	1.025	1.187
2	0.277	1.247	0.957	1.004	1.198	21	0.132	1.056	1.038	1.050	1.150
3	0.117	1.075	1.032	1.158	1.285	22	0.204	1.175	0.987	1.002	1.163
4	0.144	1.065	0.983	1.132	1.184	23	0.768	1.207	0.881	0.978	1.040

14	0.995	1.237	1.000	1.000	1.237	33	1.079	1.174	1.000	1.000	1.174
15	0.091	1.056	1.084	1.025	1.173	34	0.553	1.411	0.811	0.985	1.127
16	0.555	1.344	0.914	0.954	1.172	35	0.079	1.093	1.057	0.987	1.140
17	1.244	1.252	1.000	0.910	1.140	36	0.218	1.252	1.202	1.133	1.704
18	0.097	1.212	0.990	0.986	1.182	37	0.414	1.341	1.073	0.863	1.241
19	0.056	1.077	1.183	0.936	1.193	Mean	0.454	1.155	1.055	0.994	1.211

Note: Because data acquisition is not complete, the sector of mining of other ores and recycling and disposal of waste were not concluding in analysis.

3.3 Analysis of eco-efficiency in industrial sector

1) Within seven years, the whole condition of eco-efficiency in industrial sectors is not optimistic. Although eco-efficiencies in four traditional clean industries are relatively effective (EE>1), the eco-efficiency of whole industry fields is not satisfactory (averaged EE<0.5). There are only 10 sectors with EE≥0.6 in the industry sectors and totally 21 sectors with EE<0.3 (Fig.1). The eco-efficiencies in most of industry sectors are low, and this reduces eco-efficiency of the whole industry.

Figure 1 The Industry Number on Different Interval of Eco-efficiency Value

2) From industry characteristics, eco-efficiencies in the fields such as communication field and electronic field regarded as traditional clean industry fields are relatively effective, and eco-efficiencies of the industry fields with high energy consumption and high emission are very low; the preceding conclusion meets industry production characteristics of China's industry. It is noted that equipment manufacture industry is one of the key industries that China mainly develops, and based on empirical result, its eco-efficiency has more gaps with what is expected, especially the scale efficiency on resource and environment is obviously lower than average level of the whole industry. Li Shaodong (2011)^[10] pointed out that although the international competitiveness of China's equipment manufacture was continuously strengthened in the four leading countries (USA, Japan, Germany and China), environment protection (CO₂ emission per unit USD off GDP) and resource saving (energy consumption per thousand USD of GDP) of these industries were the worst and technology innovation was far behind those of the other three countries. It is similar to this research, indicating that China's equipment manufacture industry still possibly does not break away from extensive development; science and technology innovation should be strengthened, the added value of products should be improved, the whole intensive development of R&D- production-product should be realized.

3) From the Malmquist index, TFP of resource and environment in industry fields is increased by 21%. The TFP increase mainly comes from technology progress, pure eco-efficiency index is slightly increased, and scale efficiency of environment and resource is decreased slightly.

4 Research on the Impact from Industrial Technology on Eco-efficiency of China

The preceding analysis has shown that the influence was obvious from technology to eco-efficiency. Basing model I, the panel data analysis was used to calculate the actual impact.

4.1 Data source and processing

The indices in model I are as follows: 1) the eco-efficiency for industry fields were calculated by SE-DEA model; 2) the data of industry independent innovation were calculated by "R&D funds for industrial enterprises above designated size" in 2006-2012 *China Statistical Yearbook on Science and Technology*, and then converted by price index of science and technology (Wang Jin, 2011)^[11]; 3) new product data used ex-factory price index of industry manufacturer to deflate "industry total value of out-put of new products of industrial enterprises above designated size in all the industrial fields" in 2006-2012 *China Statistical Yearbook on Science and Technology*; 4) as for patent, "patent application amount" in "patents of industrial enterprises above designated size sorted by the field" 2006-2012 *China Statistical Yearbook on Science and Technology* was used; 5) Liu Ruijie's social payment willingness (2012)^[12] by environment product was take as the reference to represent the price of unit environment product, which multiply the amount of three kinds of resources consumables (coal, fuel oil, nature gas) and five kinds of main emitted pollutants (COD, SO₂, industrial soot, dust, solid wastes) got the environmental price, and the amount data were found on 2006-2012 *China Statistical Yearbook on Environment*.

4.2 Empirical analysis

During empirical analysis, the software Eviews5 was used to determine the model type through F-statistics and Hausman test; the result showed that the model had variable intercept and fixed effect. The industries may have some correlation with each other, such as the relationship between upstream and downstream, so cross section heteroscedasticity and contemporaneous correlation are allowed in the model. PCSE robust variance method was used to evaluate the model. Meanwhile, in consideration of

time lag for the effect of R&D, the lag variable of R&D was set. During evaluation process, insignificant variables were eliminated; the result was shown on table 3.

Table 3 The Regression Results of Each Type Industrial Eco-Efficiency

Variable	Effective Industries		Ineffective Industries		All Industries	
	Coefficient (Std. Error)	t- Statistics (Prob.)	Coefficient (Std. Error)	t- Statistics (Prob.)	Coefficient (Std. Error)	t- Statistics (Prob.)
lnRD			0.037195 (0.010412)	3.572340***	0.038570 (0.009453)	4.08000***
lnNP	-0.350211 (0.07039)	-4.97467***	-0.161184 (0.022118)	7.287562***	-0.157655 (0.021656)	7.27988***
lnPT			0.103526 (0.014418)	7.180246***	0.094723 (0.014387)	6.58383***
lnPE	-0.958015 (0.19275)	-4.97011***	0.191611 (0.012998)	-14.7414***	0.186286 (0.012806)	-14.5472***

Note: *** was presented that parameter estimates is significant at 1% .

4.3 Empirical conclusion

1) Between ineffective industries and all industries the fitting results have similar characteristics of each index coefficient, but with effective industries there is biggish difference on index coefficient. Firstly it may be due to different technical index plays different roles in different types of eco-efficiency industries. In addition, the limited samples (only 4 effective industrial sectors) may be lead to the deviation of empirical results.

2) Innovation efficiency has a significant positive effect on the eco-efficiency, while commercialization has significant negative effect. It is important to note that industrial independent innovation has a significant positive effect, but its lagged variable of the first phase has negative. This result is not only highly consistent with the coefficient characteristics and economic implications of innovation efficiency and commercialization, but also echo the preceding results which is that the average scale efficiency of resources and environment is less than 1, that mean the utilization efficiency of resources and environment has slightly down.

3) Same as expected, the price of resource and environment has significant positive effect on ineffective industries and all industries. Possibly due to the limited samples, the price of resource and environment has significant negative effect on effective industries.

5 Conclusion

1) In the 37 industry sectors, there are only 4 effective sectors in term of eco-efficiency from 2007 to 2011, and the sectors with extreme low eco-efficiency occupy more than half, which reduces the eco-efficiency of the whole industry. TFP of resource and environment of industry fields is increased by 21%, and its contribution mainly comes from technology progress; the pure eco-efficiency improvement index is basically unchanged, while the scale efficiency improvement index of resource and environment is slightly reduced. In this regard, the government and the industry, on one hand, can guide the industry fields with effective eco-efficiency such as communication, electronics and instrument manufacture to give play to their technology advantages so as to promote the diffusion of ecological technology among industry fields and, on the other hand, they should pay much attention to the upgrade of industry structure, support and guide traditional extensive industry to transform or upgrade into new intensive industry so as to really realize ecological promotion.

2) Industry technology progress is subdivided into independent innovation, innovation effect and innovation achievement transformation to further analyze its influence on the eco-efficiency, and the following conclusion can be drawn: the innovation effect measured by the patent in industry fields plays positive function for the ecological technology, while commercialization measured by new product still does not break away from extensive characteristics. Corresponding to the conclusion, industry independent innovation attaches importance to the ecological sustainability in the early stage, but with R&D development, the enterprises start to value the economic benefit associated with non-intensive

development. Therefore, the government and industry should guide industry technology to develop towards two-oriented characteristics: on one hand, they should reinforce the R&D and commercialization of production and environment technology on consumption and emission reduction; on the other hand, focusing on the product, they should guide the enterprises to accelerate product and technology upgrade, improve quality and the added value of products.

A Study on Member Satisfaction and Management Strategies in Commercial Fitness Club

Zhang Xiaobo

Division of Physical Education, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: liyanhh74@sina.com)

Abstract: The commercial fitness club provides the platform for people's fitness, while the member satisfaction is one of the key factors affecting the club's survival. This study investigated the 1250 members' satisfaction in 20 commercial fitness clubs in Wuhan, Hubei. The results showed that there were different degrees of satisfaction to the course, coach, equipment, price, service and facilities. The satisfaction of those not related to the individual member needs is relatively high, while the satisfaction related to the individual needs is relatively low. Suggestion should be given that the club should optimize the management strategy, putting focus on meeting the members' individual and special needs.

Key words: Fitness Club; Member; Satisfaction; Management Strategies

1 Introduction

With the rapid economic development and the continuous improvement of life standard, the commercial fitness club emerged and gradually became an important and new physical exercise organization and platform for people's health. Although the main aim of commercial fitness club is to attract consumers and then realize profits maximization, but they should also provide high quality fitness products and health services for members, to promote their health and wellness and improve the quality of daily life. With commercial fitness clubs widely distributed in lots of cities, they are facing seriously competition situations. More and more managers of clubs are aware that the competitiveness of fitness clubs is the service quality, and member satisfaction can reflect the quality of service. Therefore, in recent years, the relevant research regarding member satisfaction of the commercial fitness club has gradually developed. At present, in China, the research on the commercial fitness club mainly concentrates on course designing, coach hiring, management idea, business operation mode, and so on. However, these kinds of studies are mainly from the perspective of the club building but rarely from the perspective of members. This means little attention is paid to the member satisfaction of the fitness club when they participate the fitness exercise. In contrast, researchers and practitioners in foreign countries focus more on member satisfaction of fitness club, such as the comparison of satisfaction of members with different income or social status or socioeconomic background, the effect of government policy on member satisfaction, the relationship between religious belief and member satisfaction, etc. These studies have greatly promoted the development of fitness club abroad, and improved the member satisfaction. We urgently need to strengthen this research in China. This research will take Wuhan city as an example, aiming to explore the factors that affect the member satisfaction, and then raise a targeted management strategy so as to provide scientific evidence and basis for fitness club development.

2 Data and Methodology

2.1 Questionnaire survey

Based on the literature review and practical experience summary, questionnaire with title *The Effect Factors on Member Satisfaction of Commercial Fitness Clubs* was designed, instrument validity and reliability were also established. Member satisfaction was defined in terms of the fitness course, coach, equipment, price, service and facilities variables. Instrument with a five-point Likert scale indicated the level of member satisfaction (5=high satisfaction, 4=satisfaction, 3=middle satisfaction, 2=low satisfaction, 1=none satisfaction). This study randomly selected 1500 participants from 20 different commercial fitness clubs in Wuhan, Hubei, 1420 questionnaires were collected, and 1250 were valid, of which 520 were from men and 730 were from women aging from 10 to 80 years old.

2.2 Interview

This study randomly selected 10 participants from different commercial fitness clubs with various background. A semi-opened interview was conducted to everyone, targeting to explore the different effect factors of member satisfaction, and collect their comments and suggestions that may be inspiring to the managers in club management.

3 Results

According to the questionnaire, we generally defined the research results satisfaction as (high satisfaction + satisfaction + middle satisfaction), and defined the unsatisfaction as (low satisfaction + none satisfaction).

3.1 Satisfaction of the fitness course

Regarding to the fitness course(see Figure 1), the members have highest satisfaction in time arrangement of courses, accounting for 87.2%, followed by the colorful course types (85.3%), the proper difficulty of courses (77.1%), the course with a great attraction (75.3%). However, only 65.2% members is satisfied with course updates. This shows that although there are many different courses in the current commercial fitness clubs, the content is traditional and fail to introduce the latest fitness methods into the course.

Figure 1 Data of satisfaction of the fitness course

3.2 Satisfaction of the coach

The coach can directly contact with the members in commercial fitness club, their main duty is to provide scientific fitness guidance to members. Study results showed that, the member thought coach has professional sports skill and teaching ability (89.1%), can tell members with good fitness philosophy (80.7%), effectively control the members' exercise intensity and load (78.3%). However, Only 67.4% of the members thought that their coaches are good at creating a good class atmosphere and fully mobilize the enthusiasm of members with interpersonal and communication skills(65.2%), eager to help members solve problems in the process of exercise(55.1%). From the data, we can conclude that although the coach has high professional skills, they may not have strong enthusiasm to communicate with members and help members. The reason may be that most of the coaches are part-time jobs, most of them major in physical education in colleges. These students have high sports skill but lack practical experiences.

Table 1 Member Satisfaction of Coach

Coach has professional sports skills and teaching ability	89.1%
Coach can tell members good fitness philosophy	80.7%
Coach is good at creating a good class atmosphere and fully mobilize the enthusiasm of members	67.4%
Coach are eager to help members solve problems in the process of exercise	55.1%
Coach can effectively control the members' exercise intensity and load	78.3%
Coach have strong interpersonal and communication skills	65.2%

3.3 Satisfaction of the equipment

Fitness equipments are the basic carrier for members' exercise. The results showed that members generally considered the fitness equipments are advanced and functional (90.1%), the placement and layout are reasonable (87.4%). In contrast, members have lower satisfaction in terms of safety performance, hygiene condition, equipment maintenance, the percentage of which were 70%, 69.3% and 71.2% respectively (see Figure 2). we can conclude that the fitness equipment in the club are good, the club probably spent lots of money on buying equipments, but the hygiene and health associated with the equipment are not very satisfying.

Figure 2 Data of Satisfaction of the Equipment

3.4 Satisfaction of the price

About the price, 87.9% of the members think the overall charges is reasonable, and there are also plenty of activities for the initiation (86.6%). But their satisfaction about service that matches with the price is not high. Only 69.9% of the members considered the club's service quality is consistent with the price, while only 52.1% considered the club's price can meet the needs of customers at different levels (see Figure 3). This means that although the average cost of the members is reasonable, the customer's price expectation with different economic situation level is neglected.

Figure 3 Data of Satisfaction of the Price

3.5 Satisfaction of the service

In the aspect of satisfaction of service, the members considered the service from commercial fitness club is very convenient (83.2%), various fitness activities are frequently organized (95.5%), personal fitness information are regularly provided (80.1%), relevant service information is released timely (87.2%). However, members have lower satisfaction in terms of problem solving for customers and service individualization, which account for 72.6% and 70.3% relatively (see Table 2). This showed that the fitness club may provide a lot of external services, but they need to upgrade, personalize, enhance the quality of service to individuals.

Table 2 Member Satisfaction of Service

Service for customers is very convenient	83.2%
Solve customers' problem timely	72.6%
Frequent organization of various fitness activities	95.5%
Service individualization	70.3%
Provide personal fitness information regularly	80.1%
Timely release of relevant service information	87.2%

3.6 Satisfaction of the facilities

Facilities are very important for the development of fitness clubs, which sometimes plays a decisive role. The results showed that fitness clubs members have high satisfaction in basic facilities (90.1%), location and traffic situation (95.2%), fitness exercise environment (85.1%). However, Members are not satisfied in special facilities for disabled people (45.2%), the old people and children (43.9%). The results demonstrated that the fitness club rarely cares for special groups with different fitness exercise needs (see Figure 4).

Figure 4 Data of Satisfaction of the Facilities

5 Conclusion

Commercial fitness club members have different satisfaction levels of course, coach, equipment, price and facilities. In general, they have higher satisfaction for those that is not related to the members' personal factors, but lower satisfaction for those related to members' individual demand and internal factors. So we can come to the conclusion that the external satisfaction of member in commercial fitness club is higher, meanwhile the internal satisfaction of member is lower.

Based on the conclusion, suggestion were given that the commercial fitness club should adjust the management mode and actively to optimize the membership management strategy. Some detailed suggestions is as following: 1) Try to introduce the latest fitness program from domestic and international background, provide most cutting-edge fitness information to members, stimulate their curiosity and interesting for exercises. 2) In the process of hiring coach, the club managers should not only pay attention to the skills but also to the investigation of their comprehensive quality. They need to improve the overall quality of coaches and request more communication between the coach and the member. In addition, they need to build a stable and professional coach team and minimize part-time coaches. 3) Recruit full-time specialist to manage the fitness equipment, clean and disinfect the equipment timely, improve the hygiene and health condition of the equipment, reduce the potential danger of harmful germs, eliminate the worry of the member on the health status of equipment. 4) Investigate the member's opinion and suggestion on the price, adjust the price according to the members so that the member can experience the fitness benefit that can match with the cost. 5) Provide more personalized fitness services to members, give them more choices such as introduce some special fitness services for the targeted specific groups, strengthen the characteristics, meet the personalized needs of individual members. 6) Build the fitness facilities for disabled people, old people, children and other special groups, provide more fitness opportunities for special populations, expand customer groups and finally improve the member satisfaction.

R&D Talents Flow of Chinese Manufacturing Firms: A Case Study*

Guo Zhaohui

School of Management, Wuhan University of Science and Technology, Wuhan, P.R.China, 430081
(E-mail: guozh888@126.com)

Abstract: R&D talents are the key forces of manufacturing firms' technical innovation and have an important influence on business operation. In order to describe the R&D talents flow situation of manufacturing firms under China's new normal and improve human resource management, this paper used state transition equation conducting empirical research on a Chinese manufacturing enterprise's R&D talents flow in recent four years. It shows that the flow of R&D talents is inevitable and the contest for R&D talents is more fiercely. Therefore, Chinese manufacturing enterprises should take effective measures, such as salaries and stocks policies, technical qualifications certification, work-life balance programs and employer brand construction etc., to attract and retain R&D talents.

Key words: Manufacturing firms; R&D talents flow; State transition equation; Human resource management

1 Introduction

With China's economy stepping into the new normal state, in order to realize the change from 'the large manufacturing country' to 'the strong manufacturing country', China's traditional manufacturing enterprises need to improve their own core competency by sticking to the road of innovation driven development. The R&D talents are the strategic human resources of enterprises, and the key power of manufacturing enterprises' technological innovation. Reinforcing the R&D talents development is the inevitable demands of upgrading and transition of manufacturing enterprises. However, in this process, in face of fierce external competition in talents war, some of the enterprises experienced relatively high talents turnover rate, exerting unfavorable influence on enterprises' normal manufacturing operation. According to the research report released by 51job, the renowned domestic human resources agent, the talents turnover rate of manufacturing enterprises in 2013 is 3% higher than the average rate, reaching 19.1%, among which the R&D talents ranked high. The free flow of R & D talents is beneficial to the optimization of human resources, but also poses great challenges to human resources management for enterprises. Judging from the present practice, the talent flow management in manufacturing enterprises is still rather weak, sometimes even the supply is inconsistent with the demand. To ensure the sustainable development of enterprises, it is necessary to strengthen the analysis and prediction of R & D talents flow, enhancing the supply and demand balance of R & D talents in manufacturing enterprises.

American scholar Wright (1992) emphasized that the nature of strategic human resources management is a planned human resources allocation mode. This mode can enable the enterprises to reach its business objectives. Strategic human resources management stresses that the organization must timely formulate insightful human resources plan according to the development strategy, goal as well as external environment change to provide necessary talents guarantee for organization development. Raymond A. Noe, etc (2012) considered that issuing the the key procedure of human resources plan is predicting the supply and demand of human resources. However, as to human resources prediction, John M. Ivancevich (2010) predicted that at present many enterprises still lacked effective scientific method on the analysis of talents flow, overly relying on management

staff's instinct. To better analyze the flow state of R&D staff in manufacturing enterprises and enable the human resources plan designed by enterprises to adjust to the dynamic changes of the environment, it is necessary to construct a more effective prediction model to help enterprises make rational decisions.

2 Methodology

2.1 Model

Way and Johnson (2005) pointed out through predicting to realize the adjustment of human resources range to the organizational need is the focus of formulation of human resources strategy. But

* This paper is financially supported by the foundation of humanities & social science project of Hubei provincial department of education (14D006) and the foundation of science research project of Hubei provincial department of education (W20151102).

at present scientific and effective analysis and prediction instrument is still in shortage. Cascio, etc. (2010) considered that the major quantitative method for human resources prediction are trend model, regression model and state transition equation model. Th first one is the single variable model based on time, mainly about predicting the future changes based on the past historical figures. The second stresses using the mutually dependent relations between human resources number and other quantitative variables. The state transition equation comprehensively takes into consideration of all kinds of staff flow influences such as promotion, demotion, quit, as well as the state transition as time moves on, predicting the staff flow from the latest to the distant. Compared to the previous two quantitative prediction method, state transition equation model only needs latest materials, not large quantity of historical data. The calculation is relatively easy, and can better analyze the trend of the enterprises talents structure change as time moves on.

The state transition equation model is brought up by Russian mathematician A.A.Markov in 1907. He found that some things' change process has something to do with their recent state, but not the past state. That is to say, the result of the n time, usually is determined by the $n-1$ time experiment result. When the system initial state is known, after K times transition, the probability of i state is $S_i^{(k)}$, and

$\sum_{i=1}^n S_i^{(k)} = 1$, n is the incompatible state number of the system. According to Chapman Kolmogorov

equation, $S_j^{(k+1)} = \sum_{i=1}^n S_j^{(k)} \cdot p_{ij}$ ($k=0,1,2,\dots$). If we use the vector $S^{(k+1)} = S^{(k)} \cdot p$, we can infer that $S^{(1)} = S^{(0)} \cdot p$, $S^{(2)} = S^{(1)} \cdot p = S^{(0)} \cdot p^2$, ..., $S^{(k+1)} = S^{(0)} \cdot p^{(k+1)}$. Therefore, the general form of the state transition equation is $S^{(k+1)} = S^{(0)} \cdot p^{(k+1)}$. The state of the system at one time node is decided by initial state and the state transition probability. The equation of matrix multiplication is as follows:

$$S^{(k+1)} = S^0 \begin{bmatrix} p_{11} & p_{12} & \cdots & p_{1n} \\ p_{21} & p_{22} & \cdots & p_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ p_{n1} & p_{n2} & \cdots & p_{nn} \end{bmatrix}^{k+1}$$

2.2 An enterprise sample

According to the definition by OECD, R&D talents specifically include three types: researcher, Technicians & Equivalent staff and Supporting staff, namely those are directly engaged in R&D work and those who provide direct service for R&D work. The research sample in this paper is a manufacturing company in central China, Hubei province, mainly engage in valves, hydraulic machinery, environmental equipment, machine tools' research and development, with fixed asset worth of 0.82 billion. The staff number at the end of 2014 is 671, 120 are R&D staff, accounting for 17.8% of the total staff number. In 120 R&D staff, Males accounts for 81.67%, females accounts for 18.33%. In respect to age, staff above 50 accounts for 13.33%, 40~49 is 34.17%, 30~39 is 37.5%, under aged 29 is 15%. As to the education level, master degree and above accounts for 11.67%, bachelors degree is 59.17%, three year college degree and below is 29.17%. The detailed distribution are shown in table 1.

Table 1 The Composition of R&D Talents

Item	Distribution	Number	Ratio(%)
Gender	Male	98	81.67
	Female	22	18.33
Age	Above 50	16	13.33
	40~49	41	34.17
	30~39	45	37.50
	Under 29	18	15.00
Education level	postgraduate degree or above	14	11.67
	Undergraduate degree	71	59.17
	College degree or below	35	29.17

2.3 Talents flow analysis

The R&D talents flow in enterprises both includes the inflow (hiring) and the outflow (turnover, and retiring, etc.), and internal transition between different levels. As the inflow number is mainly determined by the outflow number, this paper mainly deals with the last two situations when applying the model to

analyze the talents flow. According to the qualification system of this company, the talents are divided into three levels: senior, middle and junior. At the end of 2014, number of 3 levels of R&D talents are respectively 41, 52 and 27. At the end of 2013, there are 137 R&D talents, among which the senior level is 45, the middle level is 58, and the junior level is 34. The talent loss in 2014 is altogether 17. Judging from the last three years' historical data (2011~2013), we discovered that the state of talents flow is steady, the average flow ratio can be seen in table 2. According to the flow probability, we can assume under the condition of small changes of external situation, in any year, 85% of the senior level are still working, 15% leaving, 75% middle level remaining, 5% promoted to middle level, 20% loss; 70% Junior level remaining, 10% promoted to middle level, 20% loss.

Table 2 The flow Probability of R&D Talents

Item	Senior (S)	Middle(M)	Junior (J)	Loss (T)
Senior	0.85	0	0	0.15
Middle	0.05	0.75	0	0.2
Junior	0	0.1	0.7	0.2
Loss	0	0	0	1

If two conditions for stability and independence are satisfied, we can use state transition equation to analyze and predict the enterprise's R&D talents flow. The specific procedures are as follows:

Step 1, ascertain the starting state of the R&D talents. Here, the R&D talents number in 2013 is the initial state vector, that is $S^{(0)}=(45\ 58\ 34\ 17)$.

Step 2, establish the state transition probability matrix of talents flow. According to the R&D flow state exhibited in table II, it is possible to establish the state transition probability matrix P.

$$P = \begin{bmatrix} 0.85 & 0 & 0 & 0.15 \\ 0.05 & 0.75 & 0 & 0.2 \\ 0 & 0.1 & 0.7 & 0.2 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Step 3, using the model to predict. This paper assumes that China's new normal would not change in short time, the external and internal changes in recent years are not huge, the state transition probability matrix P remains the same, namely the state vector of 2014 is as follows:

$$S^{(1)}=S^{(0)}P= (45\ 58\ 34\ 17) \cdot \begin{bmatrix} 0.85 & 0 & 0 & 0.15 \\ 0.05 & 0.75 & 0 & 0.2 \\ 0 & 0.1 & 0.7 & 0.2 \\ 0 & 0 & 0 & 1 \end{bmatrix} = (41\ 47\ 24\ 42)$$

The state transition equation predicts that by the end of 2014 the numbers of senior, middle and junior R&D talents are 41, 47 and 24, the loss is 42. Since 120 R&D talents at the end of 2014 include 6 new hires, the predicted results are basically consistent with the actual situation, the error rate is only 1.67%. This shows that the state transition equation is used to analyze the flow of R&D talents is feasible. So we can forecast the talents flow situation in 2015, 2016 and so on by this way. The vector of R&D talents flow at the end of 2015 is $S^{(2)}=S^{(1)}P=(37\ 38\ 17\ 62)$, and the vector of R&D talents flow at the end of 2016 is $S^{(3)}=S^{(2)}P=(33\ 30\ 12\ 79)$.

Step 4, trend analysis. Taking into consideration of the above prediction data, it is possible to get the talents flow trend of the enterprise. In the next several years, the overall flow rate of the R&D talents in the enterprise will keep an upward trend, the number of senior R&D talents being stable, the middle and junior R&D talents keeping a rapid downward trend. It can be shown in figure 1.

Figure 1 The Flow Trend of R&D Talents

3 Discussion

The above analysis shows that: (1) The R&D talents turnover is rather serious in that enterprise, keeping an upward trend in recent years. (2)The junior and middle R&D talents number is decreasing fast. (3)The number of youth under 30 is relatively low, the loss rate is high. The R&D talents confronts a “fault zone”. (4)The promotion space is small, opportunities are few, and also “upward instead of downward”. The reasons behind this include the external market and industry competition, but also internal management void.

To better improve the competitiveness of talents in the new normal state, it is suggested that:(1)Design enterprises' R&D talents development plan, through widening hiring channels, positively bring in R&D youth talents, making up for the position vacancy left by the talents flow, and also rely on the internal development, avoid the the vacuum of R&D talents. (2)Perfect the enterprises' qualification management system, establish clear qualification criteria, increase the different technical levels for R&D talents, build the horizontal development tunnel for R&D talents, and create sound organization environment for talents, especially young R&D talents' individual development. (3) Adjust the enterprises benefit policy, Increase the income level of R&D talents to some extent, reinforcing the contribution oriented income values, and enable the design of wages and salary program to satisfy different levels of R&D talents. (4)Enforce the “work-life balance program, pay attention to the mental health of R&D talents, regularly organize some healthy cultural and physical activities, paying attention to staffs' psychological consultation and guidance, ease the mental pressure of them. (5)Establish the employer brand, popularize the enterprise name, reputation and market influence, reinforce the consciousness of management staff serving the employees, create sound culture, enhancing the talents pride and sense of belonging to the organization, boost the cohesion between talents and organization.

4 Conclusion

The analysis and prediction results suggest that the flow of R&D talents is inevitable and the contest for R&D talents in manufacturing enterprises would be more and more drastic. The flow of R&D talents increases the risks of the operation for enterprises. Strengthening the flow prediction and management of R&D talents is the inevitable requirement for the enterprises to deal with fierce market competition. The R&D talents flow in manufacturing enterprises has some patterns, the prediction of the flow possibility is relatively stable, and the next year R&D talents number only has something to do with last year. All of these match the state transition equation's usage requirement. Proved by the concrete example, applying state transition equation model in prediction and analysis of the R&D talents flow doesn't need too many complex influence variables, and has a low requirement on historical data, easy operation, relatively accurate prediction result, is suitable to be applied. One thing worthy of notion is that the market fluctuation and business objectives adjustment would result in the changes of talents supply and demand. The enterprises would also make up for some R&D talents according to their reality. When the state transition equation is used year by year to make the long-term prediction, it is necessary to make adjustment according to the real situation.

Analysis on Technological Innovation Capability of Industrial Robot Industry

Chen Wenjing, Yan Jingdong

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wjchen0923@163.com, yjdong02@163.com)

Abstract: Industrial robot industry is the fundamental and strategic guide industry of the national economy, is the embody of a country or region's industrial scientific and technological level, and it showed frontier nature of science and technology. This paper constructed the evaluation index system of technological innovation capability of industrial robot industry from 4 aspects: technological innovation environment support capability, technical innovation investment capability, technological innovation transformation capability and technological innovation output capability. And establish SEM of technological innovation capability of industrial robot industry.

Key words: Industrial robot industry; Technological innovation capability; Evaluation index system; SEM

1 Introduction

1.1 Necessity of the research

As a technology-intensive industry, technological innovation is the driving force of industrial robot industry's growth and development. The level of the technological innovation capability will not only affect the development prospects and the pace of development of industrial robot industry, it will also affect the pace of development of the national economy. Technological innovation capability is so important for survival and development of industrial robot industry that it is necessary to design the evaluation index system of technological innovation capability of industrial robot industry to evaluate it scientifically. Furthermore, the industrial robot industry in China is still lack of technological innovation capability, and the level of technology intensive is not high. Chinese and industrial robot enterprises must pay attention to technological innovation, and improve the technological innovation capability of industrial robot industry.

1.2 Literature review

1.2.1 Research on industrial robot and its technological innovation capability

The industrial robot was put forward by US "Metal Market" in 1960. The industrial robot was defined as a reprogrammable multifunctional operation mechanism which is used to transport material, components, tools or special equipment according to pre-programmed action which can complete a variety of jobs by US IRA.

Currently, the definition of industrial technological innovation capability is not unified. Fu Jiaji et al. (1998) argued that technological innovation capability includes manufacturing, digestion and innovation capability. Fores et al. (2011)^[1] defined it as a catalyst which make learning effect on business performance from the level of the process. Xu Fengwei(2011)^[2] put forward industrial technological innovation capability is the combination of intra-industry enterprise innovation activities from the synergy perspective, rather than simply adding them. Zhang Jiaqing et al. (2015)^[3] deemed that technological innovation capability refers to the ability to use input elements in the process of technological innovation.

1.2.2 Research on evaluation index system of industrial technological innovation capability

Different scholars chose different indexes because of different perspectives. Most scholars were based on input - process - output perspective, they constructed evaluation index system of industrial technological innovation capability in many aspects such as technical innovation investment capability, technological innovation transformation capability, technological innovation output capability and so on. Some scholars also considered technological innovation environmental factors. Sana et al. (2009)^[4] believed that R & D has a significant impact on technological innovation capability. Xu Fengwei(2011)^[2] thought the factors that influence technological innovation capability of equipment manufacturing industry also include co-factors which consists of internal and external collaboration capabilities.

The existing research results about industrial technological innovation capability are all take high-tech industry or equipment manufacturing industry as study objects. And there is no specific research on technological innovation capability of industrial robot industry. We know that industrial robot industry belong to both high-tech industry and equipment manufacturing industry,so the Existing

research results about evaluation index system of industrial technological innovation capability have a high reference value to construct evaluation index system in this paper. However the existing evaluation index systems of industrial technological innovation capability did not combine with input - process - output and synergism of industrial internal and external environment. This not only can not fully reflect the industrial technological innovation capability, but also not conducive to enterprises or government formulate policies and measures about improving industrial technological innovation capability.

2 Technological Innovation Capability of Industrial Robot Industry and Its Restrictive Factors

Industrial technological innovation capability is the capability relying technological innovation to improve the competitiveness of enterprises and promote enterprises development. It is a comprehensive capacity can conduct and complete technological innovation behaviors which are constituted by very many factors. On the based on the existing research results and combining with the characteristics of industrial robot industry, this paper argues that technological innovation capability of industrial robot industry specifically includes 3aspects: technical innovation investment capability, technological innovation transformation capability, technological innovation output capability and 2 dimensions: industrial internal environment support capability and industrial external environment support capability. Here referred it as the "three aspects and two dimensions " system, shown in Figure 1.

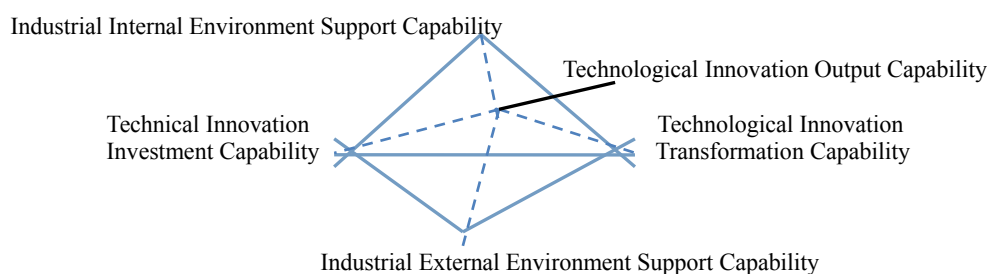

Figure 1 "Three Aspects and Two Dimensions" System

2.1 Factors affecting technological innovation environment support capability

Technological innovation environment support capability of industrial robot industry includes industrial internal and external environment support capability.

Industrial internal environment support capability refers to the internal support capability for technical innovation activities. Technological innovation must be based on technical capability and economic foundation. Industrial internal environment support capability is advantageous to ensure technological innovation of industrial robot industry success. It is mainly in the industrial technological capability and industrial economic strength. Therefore, its main factors are technical ability level and economic strength level of industrial robot industry.

Industrial external environment support capability is the external support capability for technical innovation. It coordinated with industrial internal environment to enhance the promotion of technological innovation capability of industrial robot industry jointly, including supports of government and universities, research institutions. Tax incentives and financial support of government, research cooperation are important factors of technological innovation environment support capability.

2.2 Factors affecting technological innovation investment capability

Technological innovation investment is fountainhead of technical innovation activities. Its magnitude directly determines the magnitude of technological innovation capability. So it is an important indicator to measure technological innovation capability of industrial robot industry. Its main manifestations are quantity and quality of the resources invested in technological innovation process. Factors affecting it are primarily industrial robot industry's revenue degree of Human, material and financial resources in terms of technical innovation.

2.3 Factors affecting technological innovation transformation capability

The ultimate goal of technological innovation is transforming new technologies, new crafts into practical productivity. Technological innovation transformation capability reflects the degree of transforming knowledge and technology into practical productivity. Its influencing factors are industrial robot industry's digestion and absorption ability, re-innovation ability of technology introduction and the ability of converting technological achievements to new products.

2.4 Factors affecting technological innovation output capability

Technological innovation output is the ultimate effect of technological innovation. Its level represents the magnitude of technological innovation capability, and is the most direct parameter to measure industrial technological innovation capability. Technological innovation output capability includes direct profit in the process of technical innovation activities and future economic benefits of put new technologies and new products which will soon be researched and developed into production field. Innovation ability of intellectual property, the mastery level of key technologies, technical output of new products, direct profit of technological innovation and export competitiveness of technological innovation are the major factors affecting technological innovation output capability.

3 Construction of Evaluation Index System

The evaluation of technological innovation capability of industrial robot industry is a complex system engineering. In this paper, we follow the principle of scientific, operational, dynamic and systematic, construct the evaluation index system from 4 aspects: technological innovation environment support capability, technical innovation investment capability, technological innovation transformation capability and technological innovation output capability. According to the analysis on restrictive factors of technological innovation capability of industrial robot industry, we establish evaluation index system as shown in Table 1.

Table 1 Evaluation Index System of Technological Innovation Capability of Industrial Robot Industry

First Grade Indexes		Second Indexes	Quantification	
Technological Innovation Environment Support Capability X1	Industrial Internal Environment Support Capability	Scientific and technological institutions	Number of the enterprises have scientific institutions / Number of enterprises in industry (X11)	
		Labor productivity	Gross output value in industry / Employment in industry (X12)	
		Total profit	Total profit in industry (X13)	
		Net value of fixed assets	Original value of fixed assets - Accumulated depreciation of fixed assets (X14)	
	Industrial External Environment Support Capability	Support of government		Increasing the proportion of tax relief compared with last year's (X15)
				The specific gravity of financial funds in scientific and technological activities raise funds (X16)
				The specific gravity of financial organizations' loan in scientific and technological activities raise funds (X17)
		Support of universities and research institutions	Number of universities, research institutions engaged in the study of industrial robot (X18)	
Technical Innovation Investment Capability X2	Input intensity of technical staff	Number of technical staff / Employment in industry (X21)		
	Input intensity of R&D	R & D funds / Sales income of products (X22)		
	Input intensity of non-R & D	(Technological introduction funds+Technological transformation funds)/ Sales income of products (X23)		
Technological Innovation Transformation Capability X3	Digestion and absorbability of technology introduction	Digestion and absorption funds / Technology introduction funds(X31)		
	Development rate of new products	Number of new products development / Number of items of scientific and technological activities (X32)		
Industrial External Environment Support Capability X4	Number of patent applying for	Number of patent applying for (X41)		
	Number of patent possess	Number of patent possess (X42)		
	Output rate of new products	Output value of new products / Gross output value of industry (X43)		
	Selling rate of new products	Sales income of new products / Sales income of products (X44)		
	Export rate of new products	Export revenue of new products / Sales income of new products(X45)		

4 Establishment of Evaluation Model

As described above, the evaluation index system of technological innovation capability of

industrial robot industry is constructed from 4 aspects: environment support capability, investment capability, transformation capability and output capability. The 4 first grade indexes affect each other. We draw SEM of Technological Innovation Capability of Industrial Robot Industry by AMOS17.0 and consider the relationship between first grade indexes, shown in Figure 2. The step to evaluate technological innovation capability of industrial robot industry by SEM is shown in Figure 3.

According to Figure 2, the mathematical expressions to evaluate technological innovation capability of industrial robot industry are as follows:

$$X_i = \sum_{j=1}^{n_i} X_{ij} W_{ij} \tag{1}$$

$$X = \sum_{i=1}^4 X_i / 4 \tag{2}$$

Among them $i=1,2,3,4$, $n_1=8, n_2=3, n_3=2, n_4=5$, W_{ij} are weights of observation variables, X is the evaluation score of technological innovation capability of industrial robot industry.

Figure 2 SEM of Technological Innovation Capability of Industrial Robot Industry

Figure 3 The Flow Chart of SEM

5 Conclusion

This paper designed evaluation index system of technological innovation capability of industrial robot industry from the theoretical level. It explained the meaning of technological innovation capability of industrial robot industry, constructed its evaluation index system, and quantified the 18 second indexes directly or indirectly. Design of evaluation index system and establishment of model is only the preparatory work to evaluate technological innovation capability of industrial robot industry. Then we can correct indicators and model combine with empirical data.

A Case Study on Pricing Behavior of User Innovation in Supply Chain*

Chen Yun, Li Bin, Tian Hanmei

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: chenyun135@126.com; 18672971935@163.com; thm@whut.edu.cn)

Abstract: In a duopoly competition market, the existence of innovation is likely to bring differentiated competitive behavior. This paper considers that two different supply chains in a duopoly market, in which the manufacturers in the first supply chain is assumed to take a closed innovation pattern, whereas the manufacturers in the second supply chain is assumed to take

advantage of user innovation. The paper presents a case study of mini vehicle industry in western China.

Key words: Supply Chain; Pricing Behavior; User Innovation; Bertrand Duopoly Model

1 Introduction

The so-called user innovation refers to innovation by users, that is, users play an important role in the process of innovation. In 1962, Enos J. L.^[1] studied the important refining processes and equipment innovation and found that the users of the refining processes and equipment are the major innovators of the significant inventions and improvements. Afterwards, many studies have shown that user innovation exists widely in industry, such as, Freeman C (1968)^[2], Knight K. (1963)^[3], and Rosenberg (1976)^[4].

In 1988, Eric Von Hippel firstly put forward the “user innovation” concept based on the sources of innovation theory, and he believes that users are one of the critical sources of innovation. For the research background of user innovation, Eric Von Hippel explained in details in his book “Democratizing Innovation”, where he believes the research on user innovation stems from the differences in user needs.

2 Case Description: Mini Vehicle Market in Western China

Mini vehicle, also known as minivan, can be used for passenger and cargo. After China's reform and opening up, Mini vehicles have been poured into China market from abroad, simultaneously, a number of China's famous mini vehicle manufacturers have been nurtured and developed, which is known as an industrial miracle in China. In western China, there are two mini vehicle manufacturers, one is SMG Company located in the west of China, and another is CAM Company located in Xi'an of China. The two companies occupy the main market in western China (including Guangxi, Gansu, Qinghai, Guizhou, Yunnan, Xinjiang, Gansu and Shaanxi), and there are fierce competition between this two companies. Although in the whole China, the mini vehicle market is not strictly under Duopoly, if only considering the western market of China, as well as taking into account the intense level of competition SAM and CAM, the mini vehicle market in western China is very similar and close to a duopoly market conditions.

SAM is a Sino-US joint venture company to produce mini vehicle based, supplemented by the production of cars. CAM company's original main business was also mini vehicle, while then, CAM turned their attention to the production of cars, paid less attention and investment to mini vehicle market, so that, starting from 2006, SAM won the competition of mini vehicle market share and took the first place from CAM in mini vehicle market in western China.

From Table 1, which shows the mini vehicle sales of various companies in western China, it can be seen, in 2013, SAM remains the first position in the market shares in western China, and in 2013, the total sales of SAM and CAM are accounted for 86.2% of the whole market share. Therefore, the mini vehicle market in western China can be roughly considered as a duopoly market.

In terms of end-users' participation in the whole vehicle innovation, SAM set prizes to attract end users (farmers users) involved in product innovation in 2001, according to the need of “big load, fast speed” in countryside, SAM increased the space of mini vehicles, selected hardwearing tires, and brought Light brand mini vehicles mass into the rural market, continue to catch up on CAM company in

* This paper was supported by Soft Science Project fund of Hubei Province under Grant <No: 2014BDF080>; Wuhan Youth Chenguang Program of Science and Technology in China under Grant <NO: 201271031387>; and Independent Innovation Research Fund of Wuhan University of Technology(2013-iv-002).

mini vehicle market. SAM finally won the first place over the CAM in mini vehicle market in 2006. From 2008 to 2011, SAM company also found that subtle changes in farmers' demand for mini vehicles, from the pursuit of "big load, fast speed" to "comfort and better design", so SAM company attracted customers to experience test drive and set prizes for solicitation views through their sales network, making the direction of mini vehicles production toward the development direction of famers' needs and expectations.

Table 1 Sales of Mini Vehicle in Western China Market in 2013

No.	Mini Vehicle Companies	Sales in Western China (Units)	Market Share in Western China (%)
1	SAM Mobile	197400	51.3
2	CAM Mobile	134196	34.9
3	DF Xiaokang	19661	5.1
4	HF Mobile	11175	2.9
5	JL Mobile	6049	1.6
6	CH Mobile	5610	1.5
7	HM Mobile	5256	1.4
8	QR Mobile	4970	1.3

Data source: Extracted from China Gaishi Automobile Web: CAPA

In the aspect of the whole vehicle manufacturers' participation in the innovation activities of engine manufacturers, to some extent, SAM and CAM are all involved in process innovation of the upstream engine manufacturers.

Figure 1 shows that SAM participates in process innovation of the upstream engine manufacturers. In concrete, SAM is directly involved in the innovation activities of LZ Motors and SAM Motors, the innovation fruits help LZ Zuofeng by technology transfer, SAM offers technical guidance and training to LZ Liuji and WX Liujia. Figure 2 presents that CAM participates in process innovation of the upstream engine manufacturers. In concrete, CAM is directly involved in the technical development of JL Machine, but not involved in the innovation of SUZIKIG.

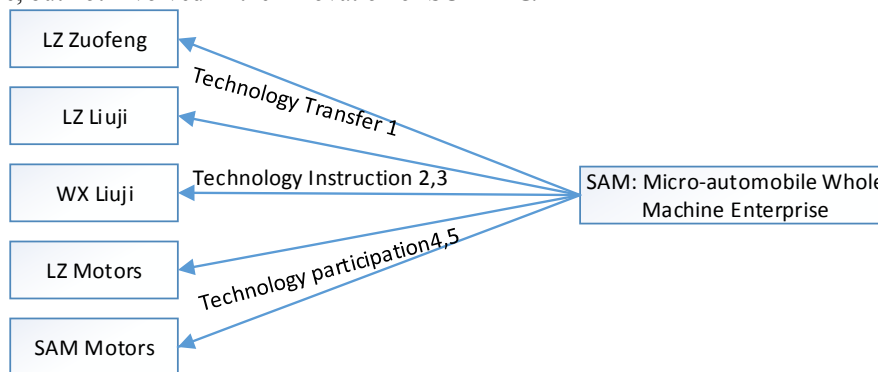

Figure 1 SAM's Participation in the Process Innovation of the Upstream Engine Manufacturers

Figure 2 CAM's Participation in the Process Innovation of the Upstream Engine Manufacturers

3 Case Modeling

According to the specific circumstances of this case, there is some characteristics: (1) the engine is only one part of the whole vehicle cost, rather than its full cost; (2) in this case, SAM has both process innovation from the first layer to the second layer, and product innovation from the second layer to the third layer; while CAM is not completely without user innovation, but the presence of process innovation from the first layer to the second layer.

For the first question, we can assume that the engine cost accounts for a certain percentage of the total cost of the mini vehicle, let it be k_{A1} (from the first layer to the second layer in SAM supply chain) and k_{B1} (from the first layer to the second layer in CAM supply chain), based on the Bertrand model, we

can get the two stage prices P_{A1}, P_{A2} in the first stage and second stage of supply chain A respectively, and the two stage prices P_{B1}, P_{B2} in the first stage and second stage of supply chain B respectively :

$$\begin{aligned}
 p_{A2} &= \frac{2e_2(b_2P_{A1}/k_{A1} - a_2) + c_2(d_2 - e_2P_{B1})}{4b_2e_2 - c_2f_2} \\
 p_{B2} &= \frac{2b_2(e_2P_{B1}/k_{B1} - d_2) + f_2(a_2 - b_2P_{A1})}{4b_2e_2 - c_2f_2}
 \end{aligned}
 \tag{1}$$

Where, $a_1, b_1, c_1, d_1, e_1, f_1$ are parameters, and satisfy: $a_1, b_1, c_1, f_1 > 0$; $b_1, e_1 < 0$; Also, $a_2, b_2, c_2, d_2, e_2, f_2$ are parameters, and satisfies: $a_2, d_2, c_2, f_2 > 0$; $b_2, e_2 < 0$.

Meanwhile, the extent of SAM's involvement in the innovation of the engine manufacturers higher than CAM, it can be assumed that $C_{A1} < C_{B1}$.

From 2010 to 2013, the prices of mini vehicles manufactured by SAM and CAM are basically stable. The retail price of SAM's Light type is from 29,800 RMB at the minimum configuration to 48,000 RMB at the maximum configuration. The retail price of CAM's Star type is from 25,000 RMB at the minimum configuration to 46,900 RMB at the maximum configuration. As can be seen, at the same or similar configuration, SAM's price is higher than CAM's price, whereas, surprisingly, the sales volume of SAM is higher than the CAM. This seems inconsistent with the law of demand. When we look at the reasons behind, the main influence factor is that the SAM's end users' involvement in the innovation of the whole vehicle, which makes its products much easier to meet the needs of users.

4 Conclusion

This paper has discussed pricing behavior problems in different supply chains by using a two-stage model of dynamic Bertrand game, based on the previous assumptions of the two different supply chains, one chain adopts user innovation, and the other does not have user innovation. Taking two mini vehicle manufacturers accounted oligopolistic position in western China as an example, the paper has analyzed user innovation and pricing behavior of these two mini vehicle manufacturers.

Analysis on the Mobile Enquiry Service Model of Commodity Information Based on E-Commerce

Liu Yan

Library, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: hard-well@163.com)

Abstract: The mobile enquiry service model of commodity information based on e-commerce is constructed with the focus on online purchase, virtual retail and mobile retail. This paper analyzes the synergic and causal effect of online industrial chain structure, brick-and-mortar retail and online retail, and recommends the architecture of mobile enquiry system for commodity information as well as the open access repository platform that the system's functional modules and mobile enquiry service depend on. The mobile enquiry services of commodity information contain position-based service, mobile transaction service, mobile information service and multimedia information service. These services rely on the synergic effect of brick-and-mortar retail and online shopping, and can be innovatively developed by university library. Thus, the library must employ the existing mature technical platform to provide the customized services available everywhere.

Key words: E-commerce; Commodity information; Mobile information; Service model; Mobile retail; Repository platform; Synergic effect

1 Introduction

Mobile e-commerce is an e-commercial system integrating mobile phone, PDA, laptop and wireless internet access technology as main communications technologies. Users can surf the internet, get information, make an order and book services, etc. anytime anywhere, which is not only convenient and expedient but also time saving. Mobile e-commerce has the redundancy to handle millions of users and their simultaneous transactions^[1]. The mobile e-commercial services include: (1) position-based service: offer community services and identify the location to realize positioning for traffic, weather report, restaurant, ticket booking and emergency service; (2) mobile transaction service: mobile shopping, mobile finance, mobile business, online monetary transaction (E-wallet); (3) mobile information service: provide news, finance and other information; (4) multimedia information service: display numerous multimedia contents, such as, images, audios, videos, data and texts.

At present, 45% of domestic enterprises have the demand for mobile business and partner with Nokia, Motorola and all WAP networks to expand the mobile business market and provide some attractive mobile services for users. Docomo and Sonera release some simplest applications, which are widely welcomed by users.

2 Industrial Chain of Online Shopping

The industrial chain of online shopping refers to a chain that supports the whole process of commodity transaction between the buyer and the seller. The industrial chain of online shopping involves store owner, buyer, logistics company, supermarket, shopping network, B2B (business-to-business) e-commercial website, payment platform and many other parties. Online shopping is categorized into B2C (business-to-consumer) and C2C (consumer-to-consumer), involving goods flow, information flow and cash flow. The industrial chain of online shopping is presented in Figure1. :

Figure 1 Industrial Chain of Online Shopping

Now, online shopping has played an important part in people's life. As a new type of shopping, it

can effectively lower the cost of transaction, but it also increases the risks of shopping for consumers. Compared with the traditional shopping, online shopping can more reliably evaluated and more measurable, and its cost of after-sales service is lower. In addition, the risk of default is lower since consumers can check the information of commodity with brick-and-mortar store, supermarket or department store by person, and make a purchase decision through commodity analogy. Nevertheless, online shopping can hardly verify the authenticity of product information, so it has to depend on the decision-making mechanism of “perceptive effect” (“perceive the value of use”, “trust”, “perceive the existence of risk” and then “make a purchase decision”)^[2].

A consumer can learn about a seller’s product and the quantity of sold products, and evaluation the credit rating of the seller, the proportion of consumers giving good or bad comments and the duration of transportation offered by logistics company. These are traceable, so network effect is easily recognized, which can improve the “perceived usefulness” of consumers to some extent, reduce the risks of online shopping and make consumers more willing to purchase.

2.1 Virtual business

Virtual business utilizes such advanced information technologies as internet of things, cloud computing and big data to combine corporate production chain with commercial supply chain^[3]. The flow of people is effectively managed together with goods flow, energy flow, resource flow and information flow, so as to realize their comprehensive integration and overall optimization and combination. With virtual business, the franchise stores of virtual retailers transform from sale of commodity to provision of service and realize the profit from service instead of simply depending on the difference between the buying and selling prices. Under the same brand, a retailer can unify the purchase and distribution for all stores, gradually abandon the chain stores and distribute all commodities to franchise stores. The brick-and-mortar network and B2C network can realize directory shopping and offer commodity collection, storage, delivery, return and experience services, and take part in the distribution of profits.

2.2 Mobile retail

Retailers should determine the omni-channel business model for mobile shopping based on the type of own commodity and the composition of different service elements^[4]. The business model of retail depends on “commodity + service”. In other words, the output of retail is not only commodity, but also the unique services offered by retailers to consumers in the industry, including commodity service, location service, environment service and information service.

3 Synergic and Causal Effect Between Brick-and-Mortar Retail and Online Retail

Brick-and-mortar retail and online retail are subject to and affected by customer demand, enterprise development demand and cost demand, etc., which may promote or obstruct retail and even cause any conflict. If the conflict can be properly resolved, the synergy between brick-and-mortar retail and online retail will be strengthened to improve the sharing percentage of advantageous resources among enterprises.

3.1 Factors affecting the synergy between brick-and-mortar retail and online retail

Figure 2 presents the synergy between brick-and-mortar retail and online retail.

Figure 2 Schematic Diagram of Synergy Between Brick-And-Mortar Retail and Online Retail

Figure 3 Schematic Diagram of Synergic and Causal Effect Between Brick-And-Mortar Retail and Online Retail

The synergy between brick-and-mortar retail and online retail is affected by such factors as: (1) customer demand, (2) enterprise development demand and (3) cost demand. It is shown in Figure2.

(1) Customer demand

Customer demand comprises market demand, so a market needs to attract customers by finding out their actual needs, so as to bring benefits and incomes to enterprises. Brick-and-mortar retail can make customers enjoy the actual experience of shopping and the face-to-face sale service, while online retail is advantageous for its low price, convenient distribution and no restriction by time and space. Customer demand involves shipping environment and after-sales service. The change of customers may affect the synergic effect between brick-and-mortar retail and online retail.

(2) Enterprise development demand

Retail enterprise is the main player, so its development affects the progress of synergy between brick-and-mortar retail and online retail in terms of time. Enterprise development demand can be divided into three parts as follows:

(a) Technical development demand: An enterprise should have its own open platform for sale system to propagandize itself, promote the development of brick-and-mortar retail and attract more sellers.

(b) Large-scale development demand: If the construction of a business model beneficial to its development is affected, a powerful enterprise may develop brick-and-mortar retail and online retail simultaneously and combine their functions, so as to build its own retail channel.

(c) Management development demand: It can strengthen the management of customer service personnel, improve their awareness of service and increase customer satisfaction.

(3) Enterprise cost demand: Cost is an important motivator to enterprise development. The operation and maintenance of network technology require very high cost, while the process of synergy also costs money. Meanwhile, the cost of entry into third-party platform and operation network may also restrict the development and collaboration of brick-and-mortar retail and online retail.

3.2 Causal effect of elements on synergic effect

Figure.3 reveals the causal effect of elements on synergic effect. In Figure3. , the evolution of market pattern shows the causal effect with related demand, that is, customer demand→ synergy between brick-and-mortar retail and online retail→ increase of income→ enterprise development→ more investment and cost→ a new level of synergy between brick-and-mortar retail and online retail.

Also, another new level of synergy between brick-and-mortar retail and online retail is achieved in the following path: customer demand→ improved reputation of service →increase of enterprise income→ enterprise development→ more investment and cost→ a new level of synergy between brick-and-mortar retail and online retail.

Meanwhile, the market share of a retail enterprise and its high quality and level of information gathering and feedback are positively correlated with the synergy between brick-and-mortar retail and online retail.

4 Architecture and Functional Modules of Commodity Information Enquiry System

For university library, a way for innovation of its service model is constructing the mobile enquiry system of commodity information and the online information platform. Library is interconnected with online shop, so its information platform can provide the transaction service. However, commodity information should be dynamically combined and integrated through gathering, processing, storage,

enquiry, transmission and application, etc., so as to make it more possible and convenient for e-commerce users to access commodity information quickly. In this way, university library can improve its shopping service and quality level, and users can have the mobile enquiry for commodity information via Ipad, Iphone, portable terminal, popular third-generation 3G mobile communication technology and wireless network.

In Reference [6], the System of Electronic Reference for Teaching in the Service of Teaching Resources for Teachers and Students constructed by Shanghai Jiao Tong University converted teaching resources into business information, and placed them into the architecture and functional modules of the Mobile Enquiry System of Commodity Information applicable to e-commerce, as shown in Figure4. and Figure5.. Also, Mobile.e-Pay mobile service network was introduced (Figure6.).

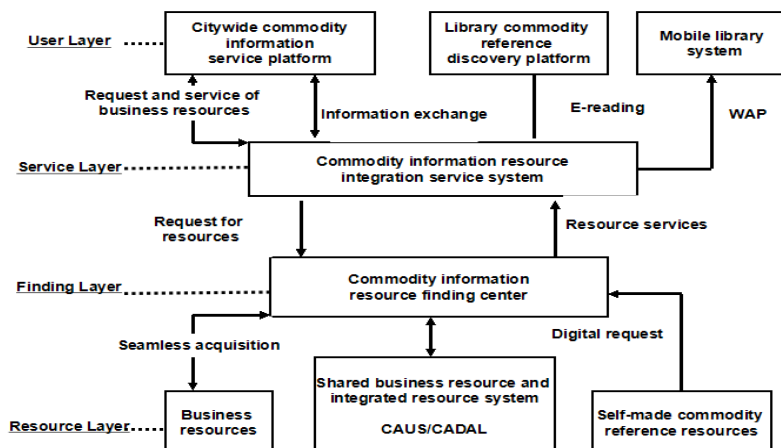

Figure4 Architecture of Mobile Enquiry System for Commodity Information

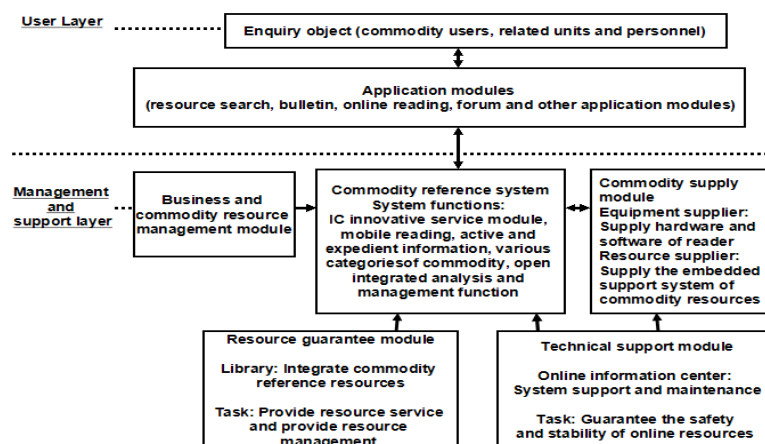

Figure 5 Main Functional Modules in Mobile Enquiry System of Commodity Information

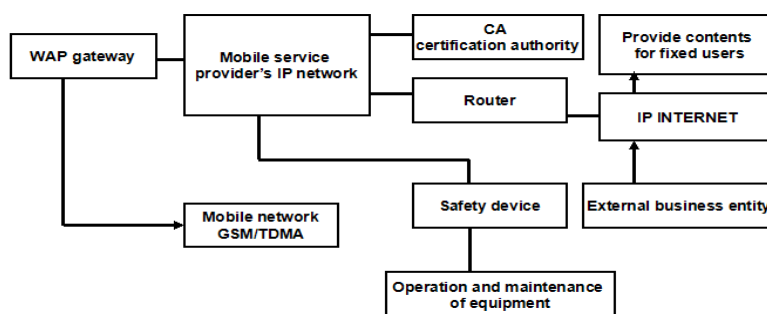

Figure 6 Structure of mobile.e-pay mobile service network

The requirements for the indexes of mobile enquiry platform of commodity information and its system

and modules are as follows:

(1) Openness and inclusiveness of platform and system: Platform and system can be opened to satisfy user’s demand for commodity enquiry and be interactive. The inclusive service function allows to contain and operate other platform and system, so as to provide the open and customized data and information “readily available” to users as well as the convenient references for commodity.

(2) Embedding of system functional modules: Functional modules of system can be embedded, so commodity information is not limited to the business information platform. By embedding modules into mobile equipment, commodity resources become “readily available” to satisfy the needs of users in the current technical environment;

(3) Conversion of fixed network into mobile terminal: The structure of Mobile.e-Pay mobile network in Figure. 6 applies the fixed network protocol to the operation, management, interview and maintenance of mobile terminal, and supports the payment function and the browsing function of mobile terminal (OA@M). Also, it supports the interaction of back-end system and the business trade can be completed via mobile phone;

(4) Scientific and active push of business information: Commodity information should be actively pushed to PC, Ipad and smart phone, so as to be “readily available” to users.

(5) Customized and convenient push of commodity information: It should not only satisfy the special needs of users and their requirements for customized services, but also guarantee the expedience and convenience of logistics and services and reduce the cost of payment;

(6) Mobilized channel of enquiry: Wireless network environment and 3G technology are employed to shatter the barrier that a library only collects fixed commodity information, stores it in the immobile database and keeps it away from reading on the commercial mobile terminals, so as to make the references of commodity “readily available anytime anywhere” and provide the commodity information more readily for users;

(7) Collaboration among commodity information departments and diversification of commodity information: Commodity information requires the collaboration among various departments (supermarket, department store, shop, commercial bureau, department of commerce, retail store and so on), so as to take into account the needs of all departments in all aspects. By integrating commodity information, it can realize the collaboration among departments and diversify the contents of commodity information.

5 Supportive Backstage for Mobile Enquiry Service---Open Access Repository Platform

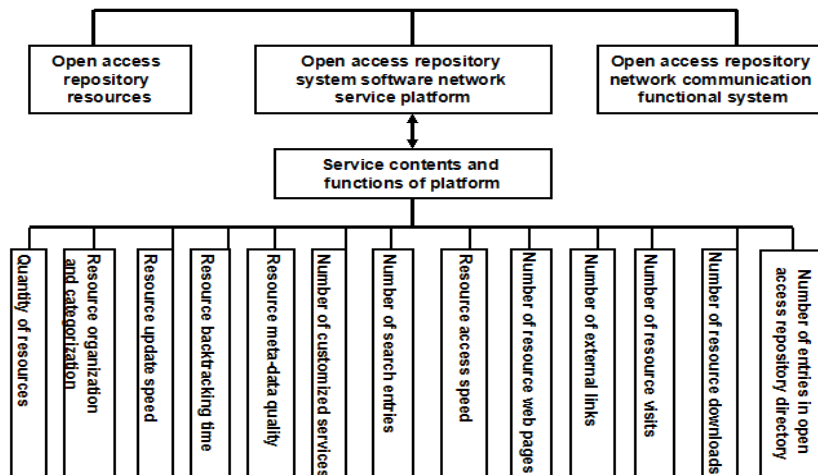

Figure 7 Open Access Repository Platform for Mobile Enquiry Service

Commodity information is an important and strategic resource of e-commerce. In the cooperation and communication between storeowner and users, it is necessary to share commodity information, which must be supported by backstage technology. Reference [7] recommended the platform with the structure as presented in Figure. 7, which can be borrowed to give the open access to business information to storeowner and uses for effective application. It should contain (1) type of access; (2)

content accessed; (3) utility of access.

5.1 Main components of open access repository platform

Open access repository platform is mainly composed of knowledge repository and institutional repository.

Knowledge repository: Knowledge repository gathers, sorts out, organizes, integrates and stores business information for long-term storage and wide application. Thus, it facilitates the sharing and utilization of information between two parties, and can be combined with the expert system of artificial intelligence, so as to intelligently obtain the commodity information. Artificial intelligence expert system refers to the book coauthored by Zhou Dixun and Zhouji whose research achievements depend on knowledge repository.

Institutional repository: The business resources stored in knowledge repository can be divided into the business resources of a business institution for open sharing, and the institutional repository can provide exclusive services for a business institution.

Knowledge repository and institutional repository can alleviate the imbalance between user's acquisition and demand of information, and satisfy user's demand for high-quality and free business information.

5.2 Functional requirements for access platform

- (1) Abundant content: Have a large quantity of stored resources;
- (2) Satisfaction: Satisfy the needs of users and realize many enquiry accesses and quick access;
- (3) Supportiveness: Have high management level and competency, quick update and short period of backtracking;
- (4) Effectiveness: Users have good attitude toward the quality of resources and the effectiveness of information acquisition is high;
- (5) Usefulness: High rate of access and application.

The evaluation indexes for open access repository platform include practicality, timeliness, value, reliability, novelty, openness, history of actual application and advancement of actual software.

Open access repository platform mainly employ the advanced software including Dspace, Eprints and Opos.

6 Conclusion

This paper analyzes the synergic effect and causal relation between brick-and-mortar retail and online retail under the network industrial chain. By consulting with the mobile reading system of electronic teaching and educational resources for teachers and students in References [6] and [7], the author improves and establishes the mobile enquiry system of commodity resources and its supportive backstage, that is, open access repository platform of commodity information. The mobile services of commodity information consist of position-based service, mobile transaction service, mobile information service and multimedia information service. These services depend on the synergy of brick-and-mortar retail and online retail, so it highlights on the requirements of each platform and system. By expand these requirements, the quality of mobile service is improved as well.

Innovation Research of Supply and Demand System Docking of Agricultural Science and Technology Information *

Deng Mingran, Li Huian, Yang Weijiao

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: fvszg2000@163.com, Yangweijiaowhut@163.com)

Abstract: Modern agriculture gradually evolved into “stereoscopic, established, ecological, automatic, integrated, biological, park style”, and corresponding agricultural science and technology information is also undergoing great changes from supply to demand quantity, quality, and structure. In order to effectively push docking of supply system and demand system of agricultural science and technology information, must from the system, structure, management innovation driven docking two system, must perfect relevant laws, specify institution functions, increase policy support; not only highlight the government supply main body function, but also develop in the diversification direction, combine with market and social attributes of agricultural science and technology information. It must develop standardized, institutionalized, standardized procedure, scientific management measures, planning reasonable investment, incentive, operation, feedback mechanism, and human resources.

Key words: Agricultural Science and Technology Information; Supply System; Demand System; Innovation Driven; Docking

1 Supply and Demand System and Docking of Chinese Agricultural Science and Technology Information

Agricultural science and technology information refers to the technology information of agricultural production, rural life and agricultural products processing. The demand content of the agricultural science and technology information mainly includes the agricultural science and technology information, production information, varieties, market information, rural life information, online education information, policies and regulations, etc^[1]. Taking advantage of college students' summer vacation to practice, we have carried on the questionnaire survey of the above problems. We obtain the grassroots farmers' demand information of agricultural science and technology information, at the same time, grassroots agricultural workers' relevant information of the way, usage, category, obstacles of obtaining agricultural science and technology information. The supply and demand docking of agricultural science and technology information refers to the degree of the supply meeting the demand. When supply and demand just meets each other, that is, to achieve a total supply and demand docking, otherwise it is part of the docking. To implement the supply and demand docking of agricultural science and technology information depends on three aspects. First, the quantity of docking. The supply quantity of agricultural science and technology information quantity just meets the actual demand of agricultural departments and personnel. Second, the structure of docking. The supply structure of agricultural science and technology information is corresponding to the demand of agricultural science and technology information. Third, the quality of docking. The supply quality of agricultural science and technology information are in conformity with the demand degree of the agricultural science and technology information. The supply and demand docking of agricultural science and technology information must satisfy the quantity, structure, and quality of docking at the same time. If any conditions are not satisfied, namely belongs to butt off form, it is unable to realize the effective link of supply and demand docking of agricultural science and technology information.

We use Figure 1 to represent the situation of supply and demand docking of agricultural science and technology information. When the intensity of the demand of agricultural science and technology information is bigger (D), but the intensity of the supply of agricultural science and technology information is smaller (A), supply and demand docking deviates from the docking position (G) (which means the supply and demand docking deviation). When the intensity of the demand of agricultural science and technology information is smaller (C), but the intensity of the supply of agricultural science and technology information is bigger (B), excessive supply (F) also can appear the supply and demand docking deviation (as shown in Figure 1).

* This paper is supported by 2013 Annual National Soft Science Research Plan Projects: “Effective Supply and Demand Docking Mechanism and Policy Innovation of Chinese Science and Technology”(2013GXS4D134)

Figure 1 Supply and Demand Docking Of Agricultural Science And Technology Information

When docked conditions for agricultural science and technology information are not met, the supply and demand of agricultural science and technology information presents deviated form. That form mainly show as quantity deviation, structure deviation, and quality deviation.

Supply and demand quantity deviation is mainly less supply or oversupply, mainly for less supply. The gross supply of agricultural science and technology is affected not only by the government's fiscal system, decision-making mechanism and the internal assessment mechanism, but also by the agricultural market perfection and agriculture organization. If the government finances insufficient, inefficient benefit farming policy, coupled with agricultural market perfect degree is not high, agricultural research institutes from the practical demand, the development of agricultural organization, led to the supply cannot meet the demand of large-scale popularization of agricultural science and technology information.

Supply and demand structure deviation is the mismatch between supply and demand. The demand structure of agricultural science and technology information does not correspond to its supply structure; the actual demand of the demand side is out of the all or part of the agricultural science and technology information provided by the suppliers, the suppliers provide a large number of agricultural science and technology information most of which is not real demand sides' demand. Agricultural science and technology information supply and demand can't one-to-one correspondence is caused by the difference between supply and demand of motivation. From the perspective of supply, the government, universities and research institutes decision-making supply of agricultural science and technology information held by the government and even the central government; From the perspective of demand, the demand of the agricultural science and technology information constrained by regional characteristics, farmers, education level, arable land, crop species, production methods and local economic development level, is a diversified needs. Demand of diversified agricultural science and technology information and the supply of top-down model is asymmetric, and agricultural science and technology information lack of effective diversified demand expression mechanism, which aggravated the supply and demand in the agricultural science and technology information structure deviation.

Supply and demand structure deviation manifestations included the degree of demand and supply of agricultural science and technology information quality is not consistent, supply quality is low or high, main performance for supply quality is low, is a higher level of requirements for the supply of agricultural science and technology information. Financial investment, preferential agricultural policy, agricultural markets will affect the quality of the supply of agricultural science and technology information. And agricultural science and technology information systems, the quality of personnel may also affect quality of the supply of agricultural science and technology information. It leads to cannot achieve professional and high quality, resulting in the supply and demand of agricultural science and technology information quality deviation.

Modern agriculture is transforming from the "flat-style" to "three-dimensional" ,from the "natural

style” to “facilities-style”, from “conventional type” to “eco-style”, from “mechanical” to “automatic”, from the “one-way” to “comprehensive formula”, from “formula” to “biological type”, from “farm style” to “park-like”^[2], corresponding to the needs of agricultural science and technology information supply quantity, quality, structure also changed dramatically. In order to effectively promote the docking of supply and demand of agricultural science and technology information systems, it is must to make some innovations to drive the docking of two systems in institution, structure and management.

2 System Innovation of Supply and Demand System Docking of Chinese Agricultural Science and Technology Information

From a strategic point of view, during a given period, the country or region has to plan and decide the supply and demand docking of agricultural science and technology information, for it is a global, decisive, long-term problem. By deciding the objectives, priorities, procedures and measures of docking, we set out medium-term planning and long-term planning in the three aspects of system, structure and management. From the institutional point of view, the government management system should embody the guiding ideology and policy objectives of the supply and demand docking of agricultural science and technology information. The adopted organizational system, organizational forms and management methods should be reflected in the management methods and measures of supply and demand docking of agricultural science and technology information. Although constrained by many factors of natural resources, economy, society, science and technology, we can conduct institutional innovation by improving relevant law, defining institutional function, strengthening policy support and other aspects (as shown in Figure 2).

Figure 2 System Innovation of Supply and Demand System Docking of Agricultural Science and Technology Information

Foreign organization of agricultural science and technology information supply can be divided into three categories. The first is the government organization dominant: primarily directly lead by the government department of agriculture, and the agricultural sector is responsible for the organization, management and implementation, Japan, Netherlands, and Italy belong to this type. The second is the government acts as leader, universities act as organizers, conduct agricultural education, research and extension, and take response of the organization, management and implementation of agricultural science and technology information, the United States and India fall into this category. The third category is government provides subsidies, farmer association act as contractors, government provides subsidies and the land tax are fully transferred to farmer association, France and The United Kingdom belong to this type. These three types all have robust legal system and organizational systems, with high degree of standardization, normalization and systematization, high quality human resource, well-funded, content-rich supply of information, these experiences are of important significance for the supply and demand docking of Chinese agricultural science and technology information.

(1) Soundness legal guarantees the supply and demand docking of agricultural science and technology information. The deviation of the supply and demand docking of Chinese agricultural science and technology information is mainly resulted from the lack of legal basis, and mostly depended on the attitude of local government officials. Despite the enactment of the "People's Republic of China Agricultural Technology Promotion Law", relevant funding, staffing, incentives and other relevant provisions are lack of effective operability. And subject of law enforcement has not been clearly defined, therefore, there are some difficulties in law enforcement. Therefore, we should promulgate related regulations about the supply and demand docking of agricultural science and technology information according to the actual situation in the region. We should formulate specific implementation measures and supporting operational measures to make the supply and demand of agricultural science and

technology information can really dock. Therefore, we improve the legal system to promote the stable development of the supply and demand docking of agricultural science and technology information.

(2) Make clear each institution's function and promote the supply and demand docking of agricultural science and technology information. Due to its fundamentality and strategy, the supply and demand docking of agricultural science and technology information should make clear the main duty of governments at all levels. And clearly define functions of relevant government sectors. Each institution ought to be reasonably set and optimized, and the duty ranges of scientific and technological information supply and demand should be made explicit based on the idea that "public welfare is the basis and operation is properly controlled"^[3]. Government's main duty is to formulate project and plan, organize and coordinate each body to realize the supply and demand docking of agricultural science and technology information. The expenses of public welfare organizations should be paid by finance sector. Government must gradually separate from administration, production and management. It should not engage in any profitable activities and leave them to professional intermediary agencies. In this separate way, public welfare is guaranteed and agricultural scientific and technical personnel are stabilized. Make a good job of services in each process of the production. Import, demonstrate and promote practical techniques and good stocks in agriculture. Carry out knowledge training of science and technology, encourage and give aid to the technology promotion, operation management and information consultation of some economic entities. Meanwhile, the profits of organizations, which are autonomous and flexible in supply, process, transportation and sale, need to be protected.

(3) Intensification of policy support of the supply and demand docking of agricultural science and technology information. Our country needs to support and protect the foundation and weak industry which lacks equal competitive condition compared with industrial and commercial industry. The agricultural science and technology information has the characteristics of public goods, that is, the marginal cost is almost zero, so it's possible to reduce the actual agricultural production cost. From this point of view, supply and demand docking of agricultural science and technology information should apply charge free service which can benefit the whole society. Our government should support supply and demand docking of agricultural science and technology information. It should use economic leverage to promote agricultural science and technology information to serve in practical production, encourage social industries to get involved in the supply and demand docking of agricultural science and technology information under the macro policy guidance, coordinate the relationship between agriculture and its social environment, modify the cooperation among different departments and professions and intensify policy support for departments, industries, units and individuals that are involved in docking service, giving appropriate preferential to profit distribution and tax policy in order to ensure that farmers' effective practical technology can be satisfied. The smooth progress of the supply and demand docking of agricultural science and technology information needs the strengthening of the construction of legal system, strengthening of the government macroeconomic regulation and control, overall planning and comprehensive arrangement of reserve and regulation fund of supply and demand docking of agricultural science and technology information. The government should proceed macro-control in the implementation of supply and demand docking of agricultural science and technology information, use rural industry investment funds reasonably, effectively and fully, as well as mobilize and strengthen the social from all walks of life to each perform its capital, strengthening agricultural elementary education, secondary education, higher education and vocational education and investment in them so as to lay the foundation for establishing agricultural science and technology information talents.

3 Structure Innovation of Supply and Demand System Docking of Chinese Agricultural Science and Technology Information

The major objects who demand for agricultural science and technology information are households. The docking process must be shorten, which depends on the adjustment of both the demand sides and the structure of supply institutions. Steps can be simplified, we can absorb new practical information by face-to-face direct docking to reach the goal of rapid application into agricultural production. As supply side, the government administrative organs, agricultural institutions of higher learning and scientific research institutes, agricultural leading enterprises and intermediary agencies should optimize the combination. We should make a batch of rural science and technology model households, cultivate a group of farmer technology messengers closely associated with soil, develop a group of agricultural talents who have a good knowledge of technology, business and management, mobilize the innovative and aggressive farmers, making them become leaders of

agricultural science and technology information supply and demand docking and helping them firstly accept the new science and technology information in order to form a backbone team of farmer science and technology information. We should establish a level 4 united and innovative docking network among model households, village-level service organizations, rural agriculture management stations, and county and municipal level administrative organizations of agricultural science and technology, organically combining practical ability of farmer technical talents with the agricultural science and technology information providers related to government and playing docking roles of the two to make the demand of the agricultural science and technology information be sent to suppliers in the path as short as possible and at the speed as soon as possible and try to shorten and reduce the intermediate procedures^[4]. In the process of farmers' pursuit of behavioral objective, the driving force mainly comes from the requirement of economic development, science and technicalization of agricultural service, improvement of policy environment and the strengthening of external contact. Encouraging to establish all kinds of agricultural cooperative organizations and enterprise groups, developing intermediary organizations in agricultural economy and forming a multiple supply and demand docking of agricultural science and technology information are the basic requirements of rural market economy. To conform with the unbalanced conditions of regional economic development in the countryside and adapt to the needs of rural science and technology market are the important conditions of improving the efficiency of agricultural science and technology information.

The supply and demand docking of agricultural science and technology information should not only highlight the role of the government as supply main body, but also develop in the direction of diversification, combining fully market and social attribute of agricultural science and technology information. First, we should encourage and support civil organizations represented by farmer specialty technology association, the agricultural professional cooperation to serve in the supply and demand docking of agricultural science and technology information and play its connecting role which offers agricultural science and technology information and reflect the real requirements of farming practices as well to build the bridge for both the supply and demand sides. Secondly, encourage multi-functional integrated enterprise with technical services as the center to carry out supply and demand docking business of agricultural science and technology information, support some agricultural leading enterprises to establish services department to provide technical information for the whole production process of agricultural, and encourage some success agricultural science and technology experts and technicians to start their own company or establish intermediary services company as co-founders, and to become the subject of both the supply and demand sides of the agricultural science and technology information, realizing effective docking of supply and demand^[5]. Third, guide farmers to adapt to the level of the current productivity and establish self-organization to improve the organizational ecology, to develop a variety of agricultural professional cooperative organizations and professional associations of farmers. By government's promotion and market mechanisms, to promote loose or tight farmer organization, to improve the demand strength and ability to undertake agricultural science and technology information (as shown in Figure 3).

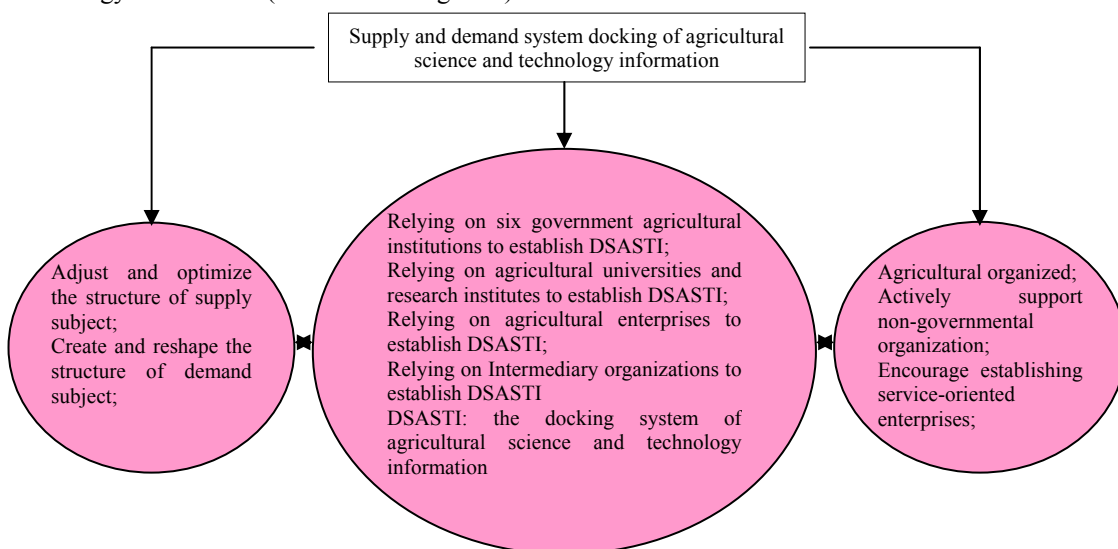

Figure 3 Structure Innovation Of Supply And Demand System Docking Of Agricultural Science And Technology Information

Relying on six agricultural government institutions to establish supply and demand docking system of agricultural science and technology information is to optimize the government's current six agricultural sectors, unify the dispersive departments of agriculture, agricultural development office, aquatic products, agricultural machinery, horticulture, animal husbandry and veterinary. Reform the institutional settings, separate administrative units and public institutions, each performs its own functions, and improve service efficiency. Ensure the demand information of agricultural science and technology are collected in time and feedback to the relevant departments, in the meantime introduce the latest scientific research achievements and timely practical techniques to agricultural producers, form the comprehensive supply and demand docking services center for agricultural science and technology information.

Depending on agricultural universities and research institutes to establish supply and demand docking system of agricultural science and technology information is to take full advantage of the favorable opportunity of the restructuring of universities and the reform of research institutes, to establish various forms of platforms integrated by agricultural, universities and scientific research institute. Use agricultural universities and agricultural research institutions to improve the cultural quality of farmers and agricultural workers, training inter-disciplinary talents both master agricultural production knowledge, technology, skills, and are familiar with the rural market development. Use this platform to graft new knowledge, new technology and new product.

Relying on leading enterprise to establish supply and demand docking system of agricultural science and technology information is to highlight the dominant position of agriculture-related enterprises. By means of its own strength and effective marketing system, to realize market-oriented integration business of agricultural production, circulation of agricultural products, agricultural science and technology research and development, agricultural management and agricultural information service. Use market leverage to guide the supply direction of agricultural innovation knowledge, and use profit mechanism to stimulate farmers to transform innovative achievements into practical productive forces, which is an effective way of supply and demand docking of agricultural science and technology information. Therefore, the government should guide agricultural research institutions into the agricultural leading enterprises, guide agricultural research institutions restructuring to be enterprises, and cultivate demonstrative enterprise of supply and demand docking of agricultural science and technology information, and promote agricultural enterprises to gradually establish modern enterprise system.

Depending on intermediary organizations to establish the supply and demand docking system of agricultural science and technology information is to organize farmers with the help of intermediary organizations, adhere to the voluntary, private, cooperative principle, improving management practices, based on the common demand-oriented of science and technology information, and dock with the supply side of agricultural science and technology information as soon as possible. Using macroeconomic policy to improve the degree of farmers' organization, absorb and use the new agricultural technology, new technology as soon as possible, and strengthen specialization and network collaboration. Rely on agricultural markets, agricultural research and development, agricultural consulting services to form a self-development supply and demand docking entities of agricultural science and technology information.

4 Management Innovation of Supply and Demand System Docking of Chinese Agricultural Science and Technology Information

Supply and demand docking of agricultural science and technology information is regulated by the provisions of the agricultural and rural economic development policies. We must develop standardized and institutionalized, routinized, scientized management measures. Aiming at a series of activities: preparation, reporting, implementation and acceptance of the supply and demand docking of agricultural science and technology information, we should plan the investment system, incentive mechanism, operation mechanism, feedback mechanisms, human resources support(as shown in Figure 4).

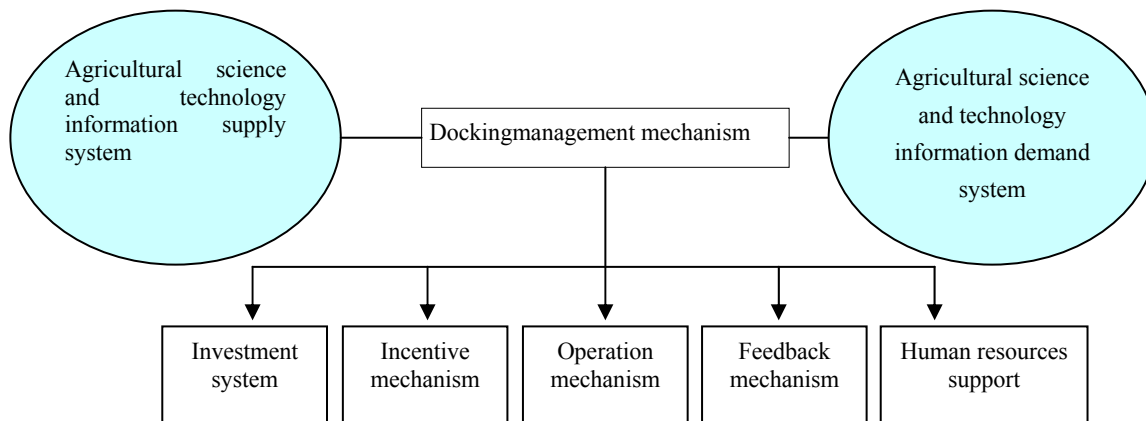

Figure 4 Management innovation of supply and demand system docking of agricultural science and technology information

(1) Establish diversification and social investment system of the supply and demand docking of agricultural science and technology information. Low investment is the main factor that affects supply and demand docking activities of agricultural science and technology information. Peasant household are in the management state of individual, scattered, small-scale, and low-efficiency. Agricultural science and technology information supply companies do not have sufficient capacity for self-development, cannot gain profit by charge information query cost from farmers. Therefore, we need to establish a multi-form, multi-channel and multi-component supply input mechanism of agricultural science and technology information. Because the supply and demand docking of agricultural science and technology information focus on obvious public interest and mainly generate social benefit, so the main source of funding on the supply and demand docking of agricultural science and technology information is government grant. Government investment is mainly concentrated in the public welfare and fundamental agricultural science and technology information supply. Carry out full budget management and financial supervision and audit system, and increase capital investment in infrastructure construction. In order to improve the efficiency of government funding, we need to strengthen the main channel of financial allocations, fully use financial, banking, business, foreign investment and individual investment funds, form a diversified investment structure, and establish the agricultural development fund and the incentive fund^[6]. Non-government investment should focus on high return on investment, the supply of scientific and technical information adjusting flexible according to market. Banks, other financial institutions and tax authorities arrange certain special purpose loan and low-interest loan for agriculture-related enterprise, intermediary and agricultural cooperative organization, aiming at supply and demand docking of agricultural science and technology information, and keep increasing investment, encourage direct investment to agricultural production and the circulation field, to increase revenue of operating service, and improve investment efficiency.

(2) Establish an effective incentive mechanism for supply and demand docking of agricultural science and technology information. Arouse the enthusiasm of related personnel of supply and demand docking process of agricultural science and technology information, form agricultural science and technology information talent market system, introduce competition mechanism, put personnel system into the orbit of the agricultural technology market mechanism, and actively promote the improvement of income and living conditions of relevant personnel. Improve the supervision and restraint mechanisms, establish distribution mechanism of coexistence of various forms, expand department internal income distribution autonomy, allow individuals to participate in secondary allocation in form of proprietary technology and intellectual work, lay emphasis on performance and contribution, and giving priority to efficiency, take count of equity simultaneously, mobilize the enthusiasm of scientific and technological personnel, implement preferential policies in aspects of wages, bonuses and housing, give priority to outstanding talents and key positions; and establish and improve job management, evaluation, resignation, dismissal and other systems, form various forms of independent and flexible allocation incentives system.

(3) Establish operational mechanisms for supply and demand docking of agricultural science and

technology information. Guide a large number of high-quality personnel to rural areas, directly contact farmers and agricultural enterprises, select a number of staff from agriculture-related government departments, universities, research institutes and other departments to the town and village taking a temporary post to guide the farmers use of agricultural science and technology information. Allow selecting personnel to carry out paid service about supply of agricultural science and technology information, and encourage becoming a shareholder by capital or technology to form interest community with professional peasant household or agricultural production, circulation and processing enterprises, form constraint mechanism that shares interests, and risk. Adhere to service connecting, typical demonstration and projects driving, cultivate strong village, important town, big peasant household, typical enterprises, family farms, agricultural science and technology area. Develop and use agricultural science and technology information, by the typical demonstration effect, strengthen horizontal cooperation and collaboration, reengineer county, town, village, and household quaternary network system, and form of communicating and connecting at all direction, multi-level and multi-functional supply and demand system of agricultural science and technology information.

(4) Establish human resource system for supply and demand docking of agricultural science and technology information. In the four factors of system, technology, human resources and investment, the change of human resources will induce changes in system, technology and investment. Therefore, the supply and demand docking of agricultural science and technology information should increase the training of the supply side and the demand, to improve the scientific and technological ability and literacy of farmers by introducing talent and improving the human resource structure of agricultural science and technology information supplying staff. The human resource system of supply and demand docking of agricultural science and technology information need to constantly update their knowledge, improve their own quality, and strengthen the training of on-the-job personnel^[7]. Broaden their knowledge by short-term training, encourage on-the-job personnel conduct correspondence, self-study examination and other academic education, combined with practical needs and in certain target to improve the level of knowledge of agricultural science and technology information related personnel, and make plans to send young talent to universities or research institutes to study related professional degree. Implement certification system of agricultural science and technology information, dismiss some unqualified personnel to ensure the basic knowledge and skills to enhance the efficiency of supply and demand docking of agricultural science and technology information. Improve the treatment of personnel of supply and demand of agricultural science and technology information, implementing the "universal allowance" system, narrowing the gap with other industries.

(5) Establish feedback mechanism for supply and demand docking of agricultural science and technology information. To change the one-way, top-down departure of supply and demand of agricultural science and technology information, and break through top-down, layer-by-layer select and decision mode of agricultural science and technology information. Strengthen the feedback of technology application at basic level, and excavate information needs desires of basic farmers and agricultural enterprises, and establish the channels and mechanisms for their meaning expression. Scientific and technological information docking deviations will not occur in the choices and decisions that are made by the full participation and common decision. Previously, the supply side of the establishment of the supply and demand docking of agricultural science and technology information was in a dominant position or a powerful position, and it was regular government-owned organization, not the user-oriented, not to mention the participation of farmers. Therefore, farmers union, rural specialized cooperative association, farmer civil organizations and other farmers organizations must play a role in the supply and demand docking of agricultural science and technology information. On the basis of fully aware that the farmers and agricultural enterprise are the main demand subjects of agricultural science and technology information, the government should transform the thinking of "work for the farmers to the working practice of "with the farmers", to change the traditional thinking radically. The low level education of farmers', the lack of market information, the backward of economic status, and the low level of technology hindered the individual farmer's pursuit of high yield and efficiency, high quality and other goals. The expressing method or channel of farmers' expressing demand is not appropriate, thus suppressing the farmers' demand desire and motivation on agricultural science and technology information. We must develop farmer "reen Certificate" project and the agricultural vocational education projects to improve farmers' agricultural science and technology level and scientific and cultural qualities, and strengthen various training. Therefore, everyone can contribute to and benefit from supply and demand docking of agricultural science and technology information.

Research on Factors Influencing Music Products Purchase Intention Based on the Consumer's Perceived Value Framework

Li Yang

School of Art & Design, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 3882710@qq.com)

Abstract: Given that music products attach with typical characteristic of subjective perception, this paper adopts consumers' perceived value framework to study on the relationship between music products inner value dimensions (influencing factors) and its purchase intention, which will provide referential meaning for its production and marketing strategy and help to achieve its market development. Based on the exploratory factor analysis and linear regression test, it finds that cognitive deviation exists in music products, factors including experienced function value, social identity value, psychic healing value, professional promotion value (the influencing effects from strong to weak) have positive influence on music products purchase intention but the perceived cost element impact on that turns out to be negative.

Key words: Music products; Consumer's perceived value; Purchase intention; Music economy

1 Introduction

Music is one kind of art expression reflecting people's feelings and thoughts, which plays a more and more significant role in people's spiritual world and real lives. With the evolution of the times, the typical way to realize the music spread and expand popularity is through music products in the currency exchange actions. Therefore, the music product has becomes music commodities with exchanging value making development in the economic and social life. Both of the fashion to embrace modern music products and the participation in the modern music cultural activities in the general public can be simplified as a kind of market behavior, in which people have to pay in economy, namely is actually a kind of economic consumption behavior. As commodities toward to the market, the production and promotion of music products must follow the rules of the market and music business and industry theories have been explored and constructed since the nineties.

However, considering the music marketing environment have changed a lot, more practical and theoretical insights are needed to enrich or promote the process of music business. Take the account of both music characteristics of sentiment experience and commodity attributes, consumer's perceived value framework is adopted to make analysis and research on factors influencing music product purchase intention of customers, following the core of the supply and demand discipline in the marketing environment.

2 Theoretical Foundations

2.1 Consumption Behaviors in Music Market

As the cultural and experiential mass carrier in the market circulation, all kinds of music products can be classified into three types: form of cultural goods, such as MP3, CD record, music journal or book, cultural relics, music cards, software and related audio equipment, instrument, etc., form of music experience respectively goods, such as music show, paid music works, on-demand music service, radio and TV channels, etc., and the form of music auxiliary goods, such as background music of shopping malls, restaurant coffee house, film or television works (Wang Yanan, 2013)^[1]. The forms of cultural goods and experience respectively goods are mainly research scope in this paper. Lacher (1989) introduced hedonic consumption paradigm into the music products and revealed music products focused on the experiential aspects with subjectively base including the sensation seeking, emotional arousal and fantasizing^[2]. Additionally, music products are not something discrete being diffused but a sociable networked entity with roles, identities, qualities and practices to produce, reproduce and consume (Gander, 2011)^[3]. Reilly et al. (2013) intended to open up the 'black box' of music market and to shed more light on the relation between music, markets and consumption, which emphasized the focal point of the exchange relationship^[4].

2.2 Consumer's Perceived Value Framework

The balance theory of gain and loss reveals that consumer's perceived value is a psychological balance index reflecting the customer perception between product performance and cost and the

empirical base has proved that customer's willingness to spend is likely to increase with the perceived value (Zeithaml, 1988)^[5]. There is multi-dimension framework in the consumer's perceived value toward the given product, which embodies the interaction of preferences and attributes, resulting in the purchase intentions (Woodruff, 1997)^[6]. A lot of empirical analysis has been conducted with the consumer's perceived value framework to seek confirmation of the relationship between consumer's perceived value and product purchasing willingness to propose suggestion for the marketing (Pi-Yun Huang, 2011)^[7]. As to the new entrant or commodity with new era characteristics, Mohd Rizaimy Shaharudin et al. (2010) have implemented an empirical analysis with genetically modified product and proved that the same significant positive correlation also exists in the relation between consumers' perceived value and consumption intention^[8], which possesses important reference significance for the customer's behavior in the music product market.

2.3 Consumer's Perceived Value in Music Market

The theory of music product used to focus on the production, diffusion and application part, the close or empirical study on the purchasing intention is ignored to some degree. Classical theory of marketing has laid a sound ground for music products production and marketing practice, but it is still a necessity to analyze the factors influencing the purchasing decision, which can propose the mechanism of the music products consumption in the customers' ground. In addition, since the music products consumption is based on the interaction and experience, this paper introduces consumer's perceived value framework for the analysis of the influencing factors in the consumption process.

3 Conceptual Framework of Music products' Perceived Value

3.1 Music Products' Perceived Value Inner Dimension Exploration

Based on the subjective characteristics of customer perceived value, combined with the background scene, there is great distinction presenting in different products in different stages of the customer perceived value dimension and the researches in view of the music of the product customer perceived value are also very limited at present. Therefore, scientific and reasonable means are utilized to develop the music product customers' perceived value scale based on the perspective of the theory of dimension and explore the music internal dimension of the customers' perceived value for further segmentation. Through in-depth interviews, this paper can get the discipline that when customers' consumption needs are not met, consumption motives will be generated, being motivated to music product consumer action that is buying music product, so as to satisfy the value of demand. According to key words in the interview, the most frequently demand motive mentioned by 16 interviewees are chosen and classified into the dimension framework combining with the original selection. Hence, there are five inner dimensions of music products consumers' perceived value including experienced function value, social identity value, psychic healing value, professional promotion value and perceived cost.

3.2 Research Hypothesis

Supported by a large number of literature, a high degree of consumers' perceptive value leads to high degree of willingness to spend propositions is a topic with well verification, and under the background of the theory of economics, the supply and demand curve reflects the value perception also increase or decrease in the probability of occurrence and buying behavior of positive or negative effect.

Experienced function value is in accordance with the essence of hedonic consumption, meaning that music products can affect the emotional experience of the audience and create the certain atmosphere in the given circumstances bringing the joyful and fantastic feeling namely optimizing people sense of well-being (Lacher, 1989; Hoyer & Stokburger-Sauer, 2012; Taylor, 2013)^[2, 9, 10], which can promote the buying decision to formulate. Therefore, the hypothesis (H1) that experienced function has positive influence on music product purchase intention is developed. Music products are not only as the individual commodities but at the level of the society group which means they will help to facilitate interaction beyond words and through the emotional sharing reactions they promote the specific group identities or images (Miell, MacDonald, & Hargreaves, 2005; Taylor, 2013)^[11, 10]. Given that the social group background, this paper develops the hypothesis (H2) that social identity value has positive influence on music product purchase intention. Based on the powerful medical evidence, the music product can stir therapeutic effects on the audience in the way of listening or activating in all kinds of musical activities (Hurt-Thaut, 2009)^[12]. Hence, the hypothesis (H3) that psychic healing value of music products has positive influence on music product purchase intention. Since the study range contains the music relatedly audio equipment and professional instruments and the role of expertise affecting the judgment of consumers (Hoyer & Stokburger-Sauer, 2012)^[9], which provides groundwork

for the hypothesis (H4) being developed that professional promotion value of music products has positive influence on music product purchase intention. Perceived cost consists of the cost of financing, energy and time spent during the whole purchasing process and sported by the base of rule in the economy and customer praxeology, this paper developed the hypothesis (H5) that perceived cost of music products has negative influence on music product purchase intention.

3.3 Observation Items and Method

Based on the music products' perceived value inner dimension exploration through the in-depth interviews, the perceived value inner dimensions consist of experienced function value, social identity value, psychic healing value, professional promotion value and perceived cost and the influencing factors are classified into these five dimensions. However, previous research is limited and maturity scale is lack of so that in this paper it is a necessity to design a scale for the variance measurement. On the basis of the dimensions with the related research foundation, a good validity of the reliability of the test items have been used in related literature and the depth interview will be adopted into the scale for the study measurement and Likert scale will be adopted for data collection.

Using econometric model as the operational theoretical model of this study, this paper applies the social science statistical software of SPSS19.0 for data and quantitative analysis to conduct exploratory factor analysis and regression analysis. Through conducting the exploratory analysis for the reliability and validity in the pre-test inspection analysis process of the measurement items, some items are deleted and the rest are recoded and the final result of the questionnaire scale.

4 Empirical Analysis

4.1 Exploratory Factor Analysis

4.1.1 Reliability Analysis

Reliability test is the scientific method to judge whether the scale tool has the consistency and stability through testing the data collection and its average difference degree. Likert scale reliability analysis usually uses Cronbach's Alpha coefficient method for the reliability test. The value range of the coefficient is from 0 to 1 and the closer to 1 indicates that the credibility of the scale is higher and when the reliability value more than or equal to 0.60 can be accepted meaning the result is reliable. The reliability test results of the questionnaire scale in this paper is shown as table 1, in which every dimension Cronbach 's Alpha coefficient are higher than 0.7, indicating that the questionnaire has high reliability.

Table 1 Questionnaire Reliability Test Result

Influencing Factor	Measurement Dimension	Cronbach's Alpha Coefficient
Consumers' Perceived Value	Experienced Function Value	0.765
	Social Identity Value	0.841
	Psychic Healing Value	0.782
	Professional Promotion Value	0.817
	Perceived Cost Factor	0.822
Purchase Intention		0.879
Questionnaire Scale		0.873

4.1.2 Validity Analysis

The reliability and validity test result of the inner dimensions of music product consumers' perceived value is shown as Table 2. The KMO value of 15 factors in the overall questionnaire scale is 0.812, the chi-square in Bartlett's sphere test is 2036.008 and the related significance probability (Sig) is less than 0.001 namely highly significant, which proves this questionnaire scale is suitable for using factor analysis method.

Table 2 KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.812
Bartlett's Test of Sphericity	Approx. Chi-Square	2036.008
	df	105
	Sig.	.000

Principal component factor analysis is carried out on the whole questionnaire scale, and characteristic value greater than or equal to 1 common factor number is five. As shown in the scree plot, the value of characteristic root: $\lambda_1=5.103$, $\lambda_2=1.719$, $\lambda_3=1.621$, $\lambda_4=1.363$, $\lambda_5=1.177$.

The cumulative explained variance of five common factors is 78.207%, meeting the minimum requirements of 60% (see Table 3). To take five dimensions as the questionnaire scale dimension number has high structure validity of the questionnaire. According to the inner dimension exploration, the factors coded with EXFU is named experienced function value, the factors coded with SOID is named social identity value, the factors coded with PSHE is named psychic healing value, the factors coded with PRPR is named professional promotion value and the factors coded with COST is named perceived cost factor.

Table 3 Variance Factor Loading Matrix after the Worst Orthogonal Rotation

	Rotated Component Matrix ^a				
	Component				
	1	2	3	4	5
EXFU2	.879	.101	.104	.077	.055
EXFU3	.803	.081	.133	.109	.244
EXFU1	.791	.158	.065	.210	-.022
SOID2	.128	.872	.110	.151	.148
SOID3	.102	.833	.088	.087	.159
SOID1	.161	.723	.361	.177	-.015
PSHE3	.086	.183	.885	.144	.146
PSHE1	.067	.242	.812	.163	.163
PSHE2	.149	.043	.741	.286	.087
PRPR1	.133	.188	.062	.808	-.003
PRPR2	.151	-.145	.263	.742	.145
PRPR3	.121	.275	.277	.699	.075
COST1	.026	.132	.084	.127	.877
COST3	.226	-.067	.136	-.119	.786
COST2	-.011	.210	.182	.235	.736
Characteristic Root	5.103	1.719	1.621	1.363	1.177
Variance Devoting Rates %	36.788	14.927	10.874	8.566	7.052
Cumulative Explained Variance 78.207%					

Additionally, the exploratory factor analysis of purchase intention has the result that all of the four factors with the load above 0.8, far more than the minimum requirement of 0.6, and the load factor of intersection are below 0.5, cumulative explained variance reaches 76.309%, which shows good criterion validity.

4.2 Regression Analysis

Multivariate linear regression analysis is used to establish equation, based on the analysis of its reflect the relations of variables to analyze its fitting effect should be taken before inspection. Shown as Table 4, fitting degrees of the regression model analysis namely R^2 is 0.646, the adjusted R^2 is 0.632, which indicates that there is a good fitting degree and the predictors can explain 63.2% variance in the purchase intention. The change of F is 217.022 and Sig. F Change is approximately 0, which implies that there are linear relationship between every factor and purchase intention respectively. In addition, the test value of Durbin-Watson is 2.33 indicating residual value is independent of each other.

Table 4 Effect Parameters of the Regression Model

Model Summary ^b							
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics		Durbin-Watson
					F Change	Sig. F Change	
1	.783 ^a	0.646	0.632	0.90104	217.0222	0	2.033

a. Predictors: (Constant), Experienced-Function, Social-Identity, Psychic-Healing, Professional-Promotion, Perceived-Cost

b. Dependent Variable: Purchase Intention

The standard regression equation in the regression is as:

$$\text{Purchase Intention} = 1.845 + 0.278 * \text{Experienced Function Value} + 0.256 * \text{Social Identity}$$

Value+0.210*Psychic Healing Value+0.186*Professional Promotion Value-0.193*Perceived Cost

5 Conclusions

According to the regression coefficients, all of the five hypotheses are tested to be valid meaning that experienced function value, social identity value, psychic healing value and professional promotion value have positive influence on the music products purchase intention respectively and perceived cost has negative influence on the music product purchase intention. The effect order from strong to weak is experienced function value, social identity value, psychic healing value, perceived cost, professional promotion value. These findings are in good accordance with the classical music marketing theory especially the hedonic consumption and the facilitation in the social network interaction. Combined with the consumers' perceived value factors influencing the buying decision, the production, marketing and reproduction strategy can be design to meet the consumers' deep requirement.

Preliminary Works of Art Marketing Model under the Theory of 4V

Wang Yuanyuan

School of Art and Design, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 114618389@qq.com)

Abstract: In recent years, the development of the art market is in full swing, with the advent of the era of experience economy, the art of marketing innovation also appears more and more important. Art has the unique value of creative, aesthetic and spiritual and the essence of marketing fits theory 4v. Reference the four elements of literature and art that Meyer Howard Abrams "the Mirror and Light" put forward proposed more in line with the four elements in the art marketing: the art, the universe, artists and consumers. On this basis, through the analysis of the art market environment generalized interpretation of art value, then linked to the concept of combination of marketing theory 4v, art marketing model is constructed, and combined with the model of art marketing implementation approaches in brief in this paper.

Key words: 4v; Artworks Marketing; Artists; Consumers; Culture Enterprises

1 Introduction

With the development of the times, people are no longer satisfied with the simple needs of material and tend to a higher level of culture, for example, art, etc. Art market is in full swing and it becomes a new field of investment that a lot of money was poured into the art market works of art. It is the inevitable outcome of the art market that the combination of art and marketing, the current pattern of art market marketing is: auction for the high-end market, galleries, art exhibition and trade fair in the end, to antique collection for low-end market.

Both rely on the traditional marketing platform, and the modern virtual network way, more concentrated on the study of the art marketing ways and strategies in the context of marketing, communication, etc.

Art marketing not only follow the general property market circulation of commodities, but also has a unique aesthetic features, and its unique aesthetic is the essential difference among other commodities. There are two tendencies existing in the current research status: its marketability and aesthetic in art marketing equivalent of or too much emphasis on its commodity attribute. The unique aesthetic should be as the cornerstone in the art marketing research, rather than using the method of marketing, market demand for the creation of art.

2 The Meaning and Purpose of Art Marketing

Art generally refers to the model of art works, including ink painting, oil painting, calligraphy, porcelain, etc. Art marketing refers to the marketing theory which is on the basis of special methods and techniques, for the analysis of art market profile and the selection of target market, marketing and strategy, marketing, effective control of all activities. In a sense, the decisive factor in art price is not just the value and number of work of art itself, but the attention that art can attract in. Art marketing general through traditional media, shops, conference and exhibition, individual sales and auctions to launch and possess the market. With increasingly fierce competition in the art market, companies promote enterprise concept and product characteristic by designing systems. The meaning of art lies in maximizes the realization of art value, to meet the diverse needs of consumers, maintain the healthy sustainable development of enterprises.

3 The Overview of 4V Marketing Theory

4V marketing theory was put forward in the early new century. 4V marketing theory is known as marketing model in the new economic era.

4V means the mix theory of "Variation (differentiation)", "Versatility (functional)", "Value (added value)", and "Vibration (resonance) of the marketing. It emphasizes the differentiation that the customer requirements and the enterprise to provide the diversification of the function of the goods, by providing high value-added in order to make customers and enterprises to achieve resonance (See Table 1).

Table 1 4V Marketing Elements and Interpretation

4V	Variation	differential	Constant innovation to keep the uniqueness of their product or service
	Versatility	functional	By “single-function multi-function - full function” in the direction of development, functional flexibility
	Value	Value added	Remove the function of the product itself unexpected additional value culture, spirit, etc
	Vibration	resonance	Provide consumers with satisfies its maximum value innovation

4V theory is the sublimation of 4P, 4C, 4R theory, which is under the new era background and in-depth consumer demand. 4P (Product, Promotion channels, Price, Promotion) mixed marketing was put forward since the late 1950s by Jerome McCarthy and has been regarded as the classic marketing theory. In the 1980s Lauteborn put forward 4C theory (Consumer, Cost, Communication, and Convenience) which is aiming at the existing problem of 4p marketing In the 1990s, a famous American scholar Don. E. Schltz follows the development of marketing practices proposed 4R theory (Relevancy, Reaction, Relation, and Reward).

4P, 4C, 4R, 4V have their own advantages, each focus. Overall, 4P can be seen as a result of commodity marketing, 4C can be seen as an object of study on the market, 4R can be seen as the maintenance of market relations, and 4V embodies the core values of the art of marketing. Western marketing strategy experiences from "product center" to the "customer center".

The change from a "product" to the "customers" is more emphasis on customer interests, to consider whether products meet the needs of the customers. The transition from "the price" to "cost", is the cost more to consider customers, rather than the enterprise's profit target. From "distribution channel" to "convenient", consider more customers to buy goods, reduce circulation costs and benefits to customers. The change from a "promotion" to "communication" is more emphasis on interactive communication with customers, rather than a one-way information output of the enterprise. 4V theory is based on the traditional 4P, 4C, 4R marketing theory; pay more attention to diversity, experience and creativity.

4 Building Art Marketing Model under the 4V Theory

There are many similarities between Art production activity itself and 4v theory fits the essence of art aesthetic and the universal law of marketability and it is a feasible attempt that using the theories of 4V art marketing attempts to establish the new model.

In 20th century, the theorist of American literature and art Abrams made his famous four elements of literary theory in his book “The Mirror and the Lamp”: Art Work, Universe, Artist, and Audience. (See Figure 1)

Figure 1 “The Mirror and Light” in the Four Elements and the Relationship Between Literature and Art

The relationship of the four elements can form a triangle. The artwork creation and evaluation also follow this logic and relationships, on the basis of the evolution of marketing for conforms to the art of four key elements and their relations: works of art, the world, artist and consumer.

In the art market, and external factors associated with the world of art can be narrowly defined as the art market in another subject, namely cultural enterprises, both an art market in the body, but also the spread of mediator artwork. Therefore, based on the analysis of the art market, the elements of environment contain art, cultural enterprise, artist and consumer. Combined with 4V marketing theory, art marketing should be based on the value of art embodied 4V combination as the core, through the study of consumer demand. 4C, by cultural enterprises and other market players’ deal with the relationship 4R, which showing itself to reflect the product and consumers design result value 4P. (See Figure 2)

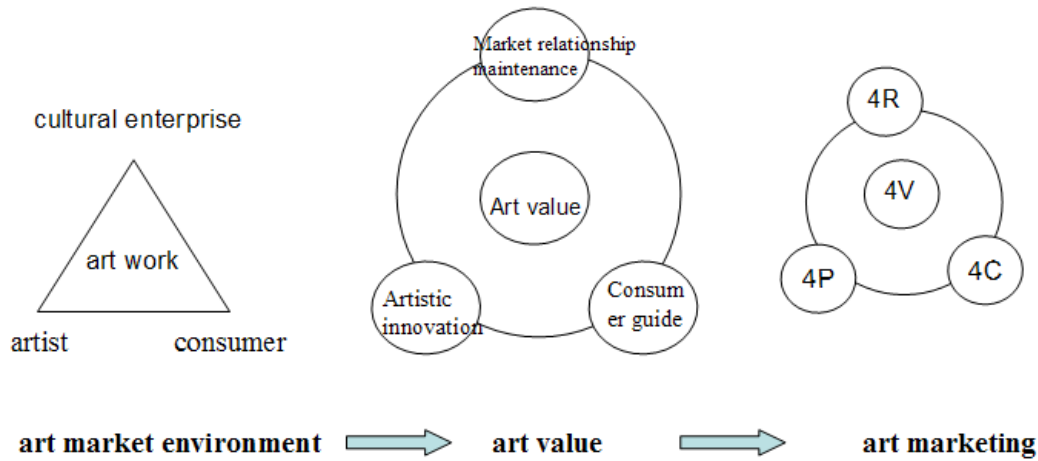

Figure 2 From the Art Market Environment to the Art of Marketing

5 Art Marketing Approach under the Guidance of 4V Theory

There are deeper cultural core values in Art in the cultural market in addition to the high profit target. Combined with elements of 4V marketing theory, the author draws art marketing approach as shown below. (See Figure 3)

Figure 3 Art Marketing Approach

1) Reaction ↔ Consumer ↔ Product: Art market must pay attention to the rapid response to the market and the changes of consumer demand. Consumers' aesthetic habits and aesthetic level changing along with the development of the era, such as the traditional ink painting gradually left out, the new ink has the spirit of the times, abstract paintings have become the new darling of young consumers.

2) Relevancy ↔ Convenience ↔ Place: Art absolutely need certain channels or bridge among consumers. In addition to the traditional channels, in the new economic era, the network has become a major platform that businesses compete. As the major auction companies in the online auction conducted, as well as in the days of cat art trading platform.

3) Relation ↔ Communication ↔ Promotion: Cultural enterprises must be good at using various sales platform to promote their own ideas and heritage, and establish good interaction with customers and gain aesthetic and emotional resonance.

4) Reward ↔ Cost ↔ Price: Cultural enterprises should not only aim at profiting, but also from the perspective of consumers' interests and the cultural market benign development, build a good market environment for the industry and create good art market ecosystem.

6 Conclusion

This article combines the classic theory of 4V and art marketing and construct the model of art marketing through the analysis of the art market environment and generalized interpretation of art value and briefly described the art of marketing combined with the model to achieve pathway, it is of great significance to making the aesthetic of art as essential attributes and the guidance on the art market macro healthy development.

(E-mail: 18202776704@163.com, lsx@whut.edu.cn)

Abstract: With the rapid development of the global economy, people's living standards continue to be improved, which makes automobile consumption demand increase continuously. However, a large number of sales will lead to many scrap automobiles. Faced with the serious problem, the reverse logistic in the automobile industry arises at the historic moment. But now the existing system of scrap automobile reverse logistics is still in a relatively primary stage and has not yet formed a comparatively perfect system, which has many disadvantages such as not harmonious mechanism, not unobstructed information, low efficiency and high cost. To sum up, the optimization study of reverse logistics system is imperative.

This paper researches the optimization of automobile reverse logistics system based on the Internet of things by choosing the Internet of things as the introduction to technology, holding the scrapped automobiles as the research object, and citing the reverse logistics system as the research content. Thus solving the uncertainty and complexity effectively and eliminating the information barriers in the automobile reverse logistics and improving the efficiency of the automobile reverse logistics and reducing operating costs.

Key words: The Internet of things; Reverse logistics; Automobiles; System optimization

1 Introduction

With the progress of science and technology and improvement of people's living standard, car is becoming more and more popular. At the same time, the increasing upgrading of automobile products makes the quantity of scrapped automobiles increase year by year. In order to make the resources get the reasonable and effective application of scrapped automobiles, it is very important to establish a reasonable and effective scrap automobile reverse logistics optimization system. The Internet of things is a network through the laser scanner information sensing device such as the radio frequency identification (RFID), infrared sensors, global positioning system (GPS), which connects any item with the Internet and proceeds information exchange and communication according to the contract agreement, realizing intelligent identification, location, tracking and monitoring and management^[1]. Its architecture can be divided into three levels^[2]. The bottom is used to aware of data layer and the second layer is the data transmission network layer and the top is the content of the application layer. With the changing of logistics technology, as one of the focus on the development of new industry in China the Internet of things shown by diversified terminals, comprehensive perception, network transmission, safety of processing, the application of intelligent characteristics, realizes non-contact processing in the reverse logistics system of collecting, sorting, inspection, rework process implementation, and achieve information sharing through the network, which has good effects on solving the problems that the reverse logistics system operation mechanism is not in coordination, information is not unobstructed, the efficiency is low, the cost is too high, so as to achieve efficient management of scrap automobile reverse logistics supply chain system^[3]. Therefore, the article will research the scrapped automobile reverse logistics system optimization based on the Internet of things, bringing the reverse logistics of scrapped automobiles to high efficiency and low cost.

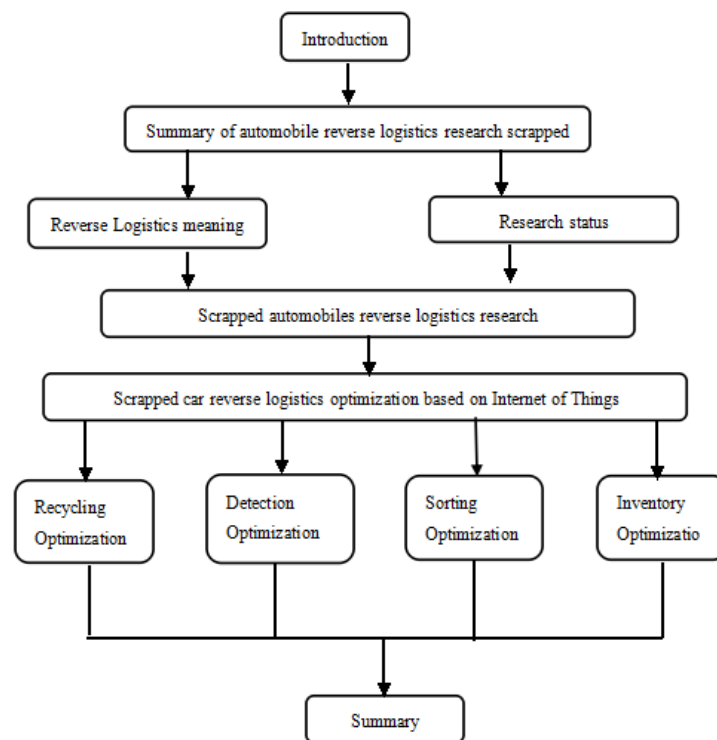

Figure 1 Framework of This Dissertation

3 Relative Study Scrapped Automobiles Reverse Logistics

3.1 Research status of reverse logistics in foreign

Reverse logistics can be achieved scrap and recycling of automobile, which is the important part of car circular economy. In the early days, many developed countries had begun the study of automobile reverse logistics, and up to now, it has gradually formed a reverse logistics network, including network planning, reverse stock and recycling production planning and control. For example: The United States as the world's largest auto producer and consumer countries, from late last century emphasis on recycling scrap cars, has become one of the world's automobile recycling fruitful country. General Motors, Ford, DaimlerChrysler and other auto companies are actively to join the ranks of auto recycling, and the recycling rates per vehicle parts up to 80%. In Germany, Recycling of materials and automotive spare parts have reached Reuse rate of 85% and the recovery rate of 80%. Mercedes-Benz from 1992 to recycle old cars. Removing the manufacturing process decomposition in reverse, engine, metal frames, plastic, wire, and other rare metals are categorized stacked together; intact parts were sent to an auto repair shop use as a spare, and the rest as a recycled material is regenerated^[4]. In Japan, the use of automobiles reached almost 100% in number by legal constraints and policy guidance. The most representative of Toyota Company, who cooperates with relevant enterprises, attaches great importance to improve the possibility of re-use from vehicle development to disposal at various stages^[5].

3.2 The development of automobile reverse logistics in China

Domestic automobile reverse logistics of a late start, most research is consistent with foreign, mainly staying in basic concepts, network optimization design, inventory control, recovery mode and so on, but did not form a relatively complete system. On the demand forecast, Wang Lihua (2005) put forward regional logistics demand analysis and demand analysis index system overall size distribution prediction method^[6], Rui Weina (2006) and others to build the model provides a fuzzy logic inference system recovery levels for older products (recovered amount and recovery time) effective method^[7]; In the Inventory control, Da Qingli and Huang Zuxing (2005) investigated the seller to return the product optimal control model, Yang Jie and others (2006) were based on inventory control theory, a continuous inventory control model, Li Xinjun and Da Qingli (2006) were extended with classical EOQ model and established waste treatment (M, 1) (1, R) EOQ model; In terms of mode of operation, Fan Jianghua (2004) studied the factors to implement reverse logistics and divided reverse logistics operation mode into four categories: Self Reverse Logistics Model, Social welfare agencies responsible for Reverse

Logistics Model, Company jointly established Reverse Logistics Model and Reverse logistics outsourcing model^[8].

4 The Current Research Status of Scrap Automobile Reverse Logistics

Automobile manufacturing industry has the characteristics of different from forward logistics, which has more complexity and uncertainty, and there exists a tardy and the characteristics of the high cost. It's mainly shown in the following aspects. Firstly, the information dependence of automobile reverse logistics is very strong. As a result of information acquisition for the recycling car types, sources and damage degree plays a very important role in remanufacturing and reusing for automobiles, so It's very important for the automobile reverse logistics to the acquire and excavate information. Secondly, the diversity of automobile reverse logistics has a variety main body. Automobile reverse logistics is not only involves the supplier of scrapped automobiles but also involves the consumer from the car to the retailers, dealers and manufacturers, who have mastered the information of a certain degree of scrapped automobiles. Thirdly, the reverse logistics information has a long tracking span. In the whole cycle of car use, any point may be the beginning of recovery time, so it's another key point of reverse logistics success to realize the information sharing between automobile reverse logistics service provider and can automobiles owners. Automobiles reverse logistics are as below figure 2:

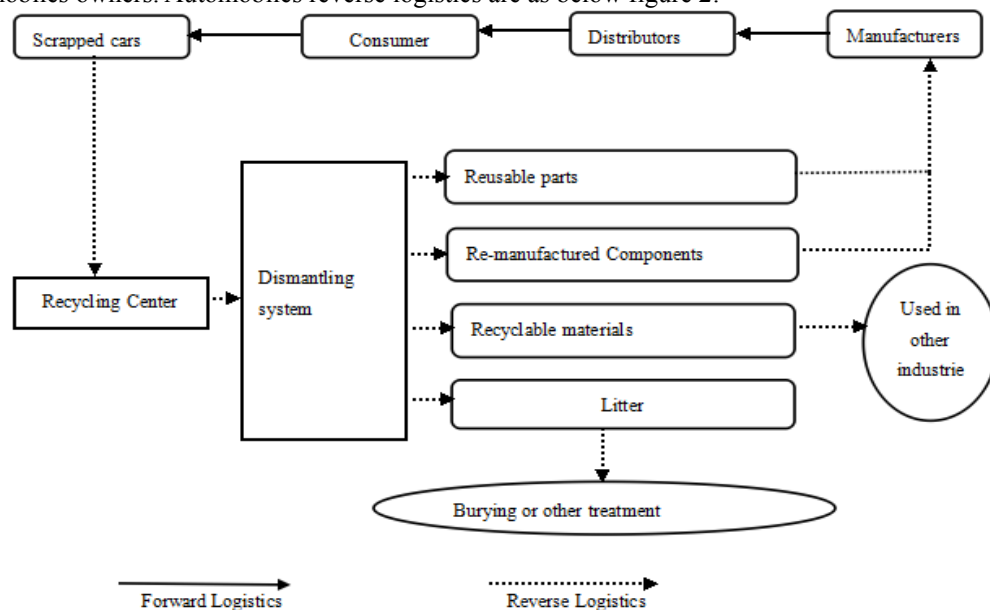

Figure 2 Reverse Logistics Flow Chart

5 The Specific Optimization Measures

Current logistics can be divided into forward logistics and reverse logistics. reverse logistics have information dependence, subject diversity, information tracking span, information updates and maintenance difficulties and other characteristics, so its operation is more difficult than forward logistics. These features make the traditional technologies simply can't adapt. However, Internet of Things technology has met reverse logistics requirements based on its features of identified, perception, processing and information transfer, and has ability to cope with the development of reverse logistics problems, but also for improving the overall service level of logistics created the basic conditions.

Optimization of automobile reverse logistics system based on the Internet of things is on the basis of the existing reverse logistics, combined the technology of Internet of things system, will reform the operating system of reverse logistics intelligently, will record logistics information and resource information intelligently involved in reverse logistics through perception, and on this basis to achieve full integration of reverse logistics system optimization^[9]. Due to the long life cycle of the car, which can be extended to the forward logistics, the specific measures are as follows:

At the beginning of the manufacturing, Car related components is identified, so car information throughout the process can be reserved. Until the car scrap recycling, the reading device can be used to obtain information on these properties, and on this basis, completing the reverse logistics in the process

of recovery, testing, sorting, inventory and other aspects of the data collection automation. So as to ensure the process works smoothly, improve operational efficiency, and realize information sharing. Specific process shown in Figure 3:

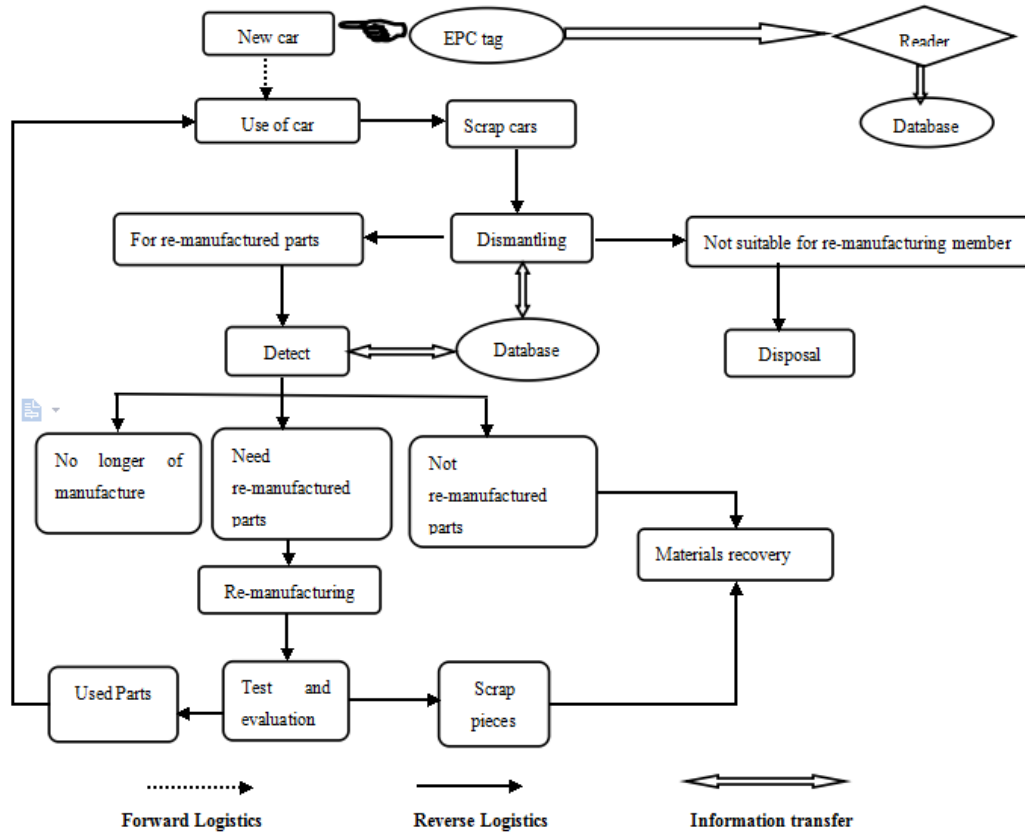

Figure 3 Automotive Reverse Logistics Systems Based on Things

5.1 The optimization of the recycling process

Long cycle car makes uncertainties scrap cars more than other reverse logistics, resulting in recycling difficult and inefficient. Internet of things technology uses in the production car in the process, namely the relevant EPC code embedded in its main components. That is the car networking, Auto repair replacement parts in the process of car use information kept by the maintenance department record and input into the database. Thus when the car is recycled, collection points and other relevant departments will be able to scrap car factory attribute information through EPC-encoded query and track the use of scrap auto parts full information. Thus scrapped cars can be classified automatically based on certain preliminary classification criteria, for example, according to age, species and other classified manufacturer; At the same time, no recovery value items can be early identified, saving on unnecessary waste transportation costs.

5.2 The optimization of the parts of the sorting process

Scrapped auto parts automobile recycling sorting process is an important part, is a next step after the dismantling of car parts, by sorting components are divided into suitable for re-manufacturing parts and not suitable for remanufactured parts. Traditional sorting process is more complicated and requires a lot of manpower, material and financial resources, the use of intelligent Internet of Things technology enables the sorting operation scrap auto parts: After parts to disassemble and clean, first experienced workers visually eliminate obvious defects and excessive deformation of the parts, then sorting department set up EPC tag reader to read parts, accessing to parts of the model, materials, work environment, working conditions, use the repair information, through which information and certain criteria parts are divided into no longer manufacture of parts, the manufacture of parts and need no longer be manufactured in several pieces, then use a conveyor belt parts sent to the appropriate next step.

5.3 The optimization of parts detection process

When before the demolition or removal to the quality of automotive components tested to determine whether the parts can be recycled or re-manufacturing, which is the traditional life vehicle recycling when necessary step; However, since the detection tool to select the detection method used improperly or incorrectly components is likely to cause secondary damage and the waste of resources; in addition, unnecessary testing will occur sometimes. In the inspection department also set the reader to read parts of EPC labels, direct access to repair damaged parts of all kinds of information, can save the use of non-destructive testing method or apparatus for the detection of defective parts, to avoid secondary damage and improve zero utilization components.

5.4 The optimization of spare parts inventory

In actual junk car reverse logistics, since the number of repossessions and reuse of parts will have great uncertainty, the inventory is an indispensable part in the supply chain and logistics. Traditional inventory management is not always the best, use of Internet of Things technology for scrapped cars can accurately locate the position, and thus the number of cars scrapped each region to estimate, a reasonable set of used spare parts storage center, can effectively resolve the zero logistics and parts distribution problems. Further, FRID radio frequency identification technology as the foundation, with the Internet of Things of software systems and hardware devices, automated inventory management for auto parts, and can improve the efficiency of inbound and outbound data updating and processing libraries.

6 Conclusion

With the progress of science and technology and people's living standards improved, more and more people to pursue high quality of life, which accelerates replacement rate to the car. In order to alleviate the harm to the environment by scrapped automobiles, the reverse logistics arises at the historic moment. However, China's current scrap cars reverse logistics has not yet formed a relatively complete system, optimizing scrap cars reverse logistics system is imminent.

This paper analyzes the main characteristics and development status scrap automobile reverse logistics and Internet of Things, and then discuss the specific optimization of things based on reverse logistics system scrapped automobiles from auto parts recycling, testing, sorting, and optimize these areas measures. Innovation of this paper is as follows:

Firstly, Internet of Things is extended to the forward logistics in order to achieve information sharing. Secondly, Internet of things will apply to sorting, inspection, inventory location and other recycling processes, which can avoid secondary damage and improve zero utilization components, thus optimizing the traditional recovery process.

Concerning Government Positive Role in the Development of the Gen Space

Yang JunJian

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: yjjprc@qq.com)

Abstract: This paper mainly discuss is the development of the "positive as the link between the space and the Chinese government. It puts forward the space is comply with the public entrepreneurship network times, and all the new trend of innovation, using the Internet to a wide range of integrated innovation of thinking innovation service resources, the existing innovation service system to improve and improve. It thinks that "The space" contains the service main body, content, carrier and so on three aspects. The gen space should give full play to the decisive role of market resources allocation, should also actively as the government level. It concluded that the Chinese government's functions should be changed to build the good environment for the development of the space. It includes the thread resources integration, and to strengthen the gen space classification guidance, increasing financial investment, extensive media publicity, widespread entrepreneurial culture.

Key words: Development; The gen space; Government; Positive role

On January 28, 2015, the state council executive meeting of China to determine the policies and measures to support the development of the "space, build a new platform for entrepreneurial innovation. On March 5, China's prime minister Li Keqiang pointed out in the government work report in 2015, to build the public entrepreneurship, innovation and increasing public products and public service "twin-engine", promote the development of speed is not because of better quality, quantity, realize the Chinese economy to increase quality upgrade. On March 11, issued by the general office of the state council "about the development of the business and promote the innovation in the public space of the guidance", puts forward the focus of eight aspects, promote the entrepreneurship, peoples innovation comprehensive deployment. According to the voice of China "epicenter wide news" report, in the aspect of the job, this year the national employment for network will be more than ten million people, is one of the most important areas of public entrepreneurship, peoples innovation. Popular entrepreneurship and innovation strategy is put forward, with the new trend, new requirements of economic and social development, shows that its "a lot of social problems also has strong rational" can be cured(Yu keping,2000)^[1]. It to adapt to the new technology revolution and industrial revolution of the world's new situation, to lead the economic development of the new normal, release and arouse folk entrepreneurial creativity and innovation in the whole society to build innovative entrepreneurial culture has important practical significance.

1 Introduction

Understanding and the understanding of all the space .At present, for the space, there is no unified in China, clear definition. Tsinghua university relevant scholars in 2014 produced a similar GIS (group innovation space) theory, defines the GIS as is characterized by loose groups to participate in the activities of innovation, to provide from idea to achieve the required materials, equipment and facilities and have the social function of physical space. Under the state council general office on the development of the guidance of the business and promote the innovation in the public space "will be the space expression for the low cost, convenience, total factor, open new innovation service platform. Ministry of science and technology put forward the "four modernizations" and space (i.e., marketization, specialization, integration and network), and "series" (that is, innovation and entrepreneurship, as well as the combination of online and offline, hatch and investment), "four space" (that is, the working space, the network space, social space, resources sharing space).

Reference of related theory research results, according to the national related documents of China, you can see, the space is different from the traditional incubator, university of science and technology park innovation such as business services, professional institution and training guidance, investment and financing, is to keep up with the new Internet age masses entrepreneurship, peoples innovation trend, using the Internet to a wide range of integrated innovation of thinking innovation service resources, the existing service system to improve and promote innovative undertaking and is the innovation of the traditional business service

agencies “upgrade”, its core characteristics is open, the exchange and sharing, is put forward by China's prime minister Li Keqiang, in his government work report “Internet +” strategy. “Freedom as the final goal, and finally the individual for the social entity”(Milton Friedman, 1988) [2]. From the literal meaning analysis, “the space” contains the service main body, content, carrier and so on three elements, namely: “all” is the main body: face all innovative entrepreneurial teams and individuals to provide services, promote innovation entrepreneurship from the elites to the masses, to promote all kinds of creative main body participation, mutual help, through all kinds of subjects, resources “aggregation” produce “fusion” effect. “A” is the content: provide service for all the innovative entrepreneurial activity, both service business, service innovation, trying to form innovation to stimulate entrepreneurship, entrepreneurship leading the innovation of the benign interaction, promote the coordinated development of innovative undertaking. “Space” is the carrier of: both in the workplace, operation sites, such as physical space, including resources docking platform based on Internet, study and communication platform, collaborative work platform, the virtual space of network community. The virtual space is an extension of the physical space, in a sense is more important than physical space.

2 An Example

There are “five kinds of ability of the gen space”. One is the entrepreneurial capacity. Entrepreneurial capacity refers to undertake innovative entrepreneurial teams, individuals, in space, facilities, equipment, etc, for the team, the individual’s ability to provide hardware support to carry out the innovative entrepreneurial activity, is the gen space should have the basic ability. Innovative entrepreneurial activity needs both outer soft environment support such as market, policy, service, also cannot leave the working space, the operation sites, common instruments and equipment and other hardware support. The space have a certain entrepreneurial capacity, is all the more conditions to provide support for innovative entrepreneurial activity, can better realize “nesting on a”. Create entrepreneurial capacity, need to pay attention to revitalize the stock resources, reasonable layout of the venue, facilities, equipment, and constantly adapt to innovative entrepreneurial teams and individual demand for hardware service.

The second is the support service ability. Support services ability both in the basis of the property and business service ability, also including the industrial and commercial registration agents, agent of financial accounting, tax returns, intellectual property rights to apply for the auxiliary services of ability, is the ability of the gen space should actively expand. Innovative entrepreneurial teams and individual demand has the characteristics of individuality, diversity and differentiation, but the universal demand for basic services, auxiliary service urgently. The gen space support capability, and can effectively solve the trouble back at home of innovative entrepreneurial teams, personal, let them into creative work. Build support service ability, need to have a thorough understanding of innovative entrepreneurial teams and individual needs, in such aspects as basic services and ancillary services in human, material and financial resources and realizing a complete coverage of support services, no dead Angle.

The third is the ability of organization. Activity organization ability refers to innovative entrepreneurial teams, personal organization to carry out all kinds of internal communication activities, build communication platform, lead team develop extensive exchanges and cooperation, personal ability, is the gen space should improve its ability. Innovation entrepreneurship is a difficult process, is also a lonely search process, need more community support, the gen space activities has certain ability of organization, will be a group of similar age, similar goals and aspirations of the same together, innovative entrepreneurs build up play each other, inspire each other, encourage each other “community” innovative entrepreneurial atmosphere. Ability of organization, building activities with strong charisma and cohesion, is good at using new media platform, guide the innovative entrepreneurial teams, personal work closely, collaborative innovation.

The fourth is the resource integration ability. Refers to across regions, regional resource integration ability, extensive use training guidance, investment and financing, such as external innovation service resources, to provide innovative entrepreneurial teams and individual total factor the ability of integrated services, is the core of the gen space should have ability. Innovative entrepreneurial activity dependence on external service resource support, in today's degree according to market rules constantly improves, resources has break through geographical restrictions, present the distinct features of liquidity. The gen space resource integration capability, and is able to allocate resources in a wider organization, for the innovative entrepreneurial teams, personal “go”. Makes the resources integration ability, it is necessary to firmly establish a “not for all, but for the” concept, is good at using the Internet, such as thinking, strengthen the innovation of the integration of innovation service resource configuration.

Fifth, radiation ability. Radiation impetus ability is to point to in promoting scientific and technological innovation, promote industrial development and cultivate the innovation culture of the area surrounding the demonstration drive ability, is the gen space should focus on enhancing the ability. At present, as the Internet, mobile Internet, cloud computing, big data, etc. The development and popularization of technology, innovative entrepreneurial threshold is reduced, the space as the cradle of the innovative undertaking, is becoming a emerging enterprises, technology, industry, business model, and the birthplace of the culture of innovation and the radiation source. The radiating and driving ability to create, it is necessary to accurately grasp the trend of new technology revolution and industry revolution, vigorously the introduction of technology, the original pattern, strengthen the interaction of technology innovation and business model innovation, cultivate a geek, a guest, such as innovative culture, in technology innovation, business model innovation and culture innovation always ahead, fast people a beat.

3 Data, Problems and Methodology

3.1 Data

At present, the professional development and space has just beginning. Such as the jade chamber of commerce, Peking University of China on the use of university or alumni resources, focus on providing the tutoring business entrepreneurship training, 36 kr, entrepreneurs, such as focus took advantage of the media, to provide online and offline services for innovative entrepreneurs, garage coffee, innovation works, angel sinks, dedicated to provide innovative undertaking investment and financing services such as a guest focus provides industrial chain upstream and downstream industry chain services such as cooperation and exchange, firewood space, the new focus of workshop, onion capsule, and the guest room, with 3 d printing, open source hardware services, etc. 36 kr, for example, at the beginning of its founding positioning for reporting the latest Internet technology news and one of the most potential Internet start-up technology press, with the development of the business and the grasp of the demand for innovation entrepreneurship, venture investment service, its started in 2011 to help entrepreneurs and investors have financing demand docking, explore to professional service transformation. In 2013, the open innovation service platform “36 kr +”, integrate all aspects of resources, through the combination of online and offline form, for entrepreneurs to provide investment and financing and so on various aspects of business services, currently has more than 400 investors, provide service for more than 7000 startups, successfully hatched a batch of start-up companies. Executives resigned from the company "stove" copy of a company and successfully listed, the scene is frequent in the capital markets. Such as The company's top executives of Vanke, Mao Daqing departure entrepreneurship, who was a former senior executive collective in the Internet. Public business, rely on the wisdom to create wealth, to market forces shaping the new national spirit, show that the transformation of Chinese society values.

3.2 Problems

Better giving play to the role of government of China and accelerating the development and space, It needs to be known the gen space problems of innovative undertaking. Public undertaking and have innovation, all the “grassroots entrepreneurship”. Relative to the institutions of higher learning, large and medium-sized enterprises innovation such as “national team” and “army” of entrepreneurship, innovation public entrepreneurship has a congenital disadvantage, such as lack of venue, equipment, capital and other resources, for the acquisition of ability and the innovation elements operation ability is insufficient; Tend to focus on the business model or technology itself, market channels such as impeded; Risk prevention consciousness, and are less able to take risks, etc., innovative entrepreneurs themselves alone, to overcome the difficulties of innovative undertaking and risk. If the related service and support is not in place in time, innovative business will face a greater risk of failure. As innovative entrepreneurial resource integration, service providers and business guidance, the gen space should always be for the purpose of service innovation entrepreneurship, on the one hand, to provide innovative entrepreneurs entrepreneurship required venues, equipment and other hardware conditions, on the other hand to provide innovative entrepreneurs from training courses, teaching entrepreneurship matched, exchange of experience to the investment and financing, technical consultation, scheme of diagnosis, the full range of marketing services, improve the innovative entrepreneurial success.

3.3 Methodology

At present, the space in the country has formed the tendency of “a single spark can start a prairie fire”. In Beijing the firewood and the guest room and guest room, shenzhen, Shanghai, Hangzhou of China new workshop onion capsule and innovation works, such as the garage coffee a batch of new innovation service organization to flourish, is leading a wave of the national innovation entrepreneurship,

innovation business has entered the “golden age”. The next step, the development of the space is to give full play to the decisive role of market resources, should also actively as the government level.

3.2.1 Seize resources integration, and a space as an important part of regional innovation system of science and technology

All construction creates the space is innovation service resources, revitalize the whole society innovation to strengthen the construction of innovative undertaking ecological environment, promoting the public entrepreneurship, has important way of innovation, is to stimulate the creativity of hundreds of millions of people, promote independent innovation ability, cultivating innovative enterprise and the emerging superiority industry, adapt and lead the new normal economic development, to build a new engine for the economic development of important choice. Borrow bourdieu's field theory(Pierre bourdieu,1998)^[3],The gen space should be as an important part of regional innovation system of science and technology of China, the more prominent position, and regional scientific and technological innovation work synchronous deployment, coordination, give full play to the government on strategic planning, policies and regulations, standards and the role of the supervision and other aspects, for the development of the "space. At present in China, as the public entrepreneurship, united innovative heating up, across the country have gradually into the gen space construction start a prairie fire. To encourage bold exploration, innovation actively the gen space model of development, at the same time also pay attention to the possible problem, such as through the line and space in the name of, the reality of the real estate development, regardless of the local actual situation, one-sided pursuit of scale, cause the waste of resources, etc., it has violated the original intention of promoting the development and space, does not mass innovative entrepreneurial activity of healthy and sustainable development. The development of the space, the key is to help promote the innovation of entrepreneurship, to the construction of regional innovation system as the development of the criteria and space. Only in this way, give full play to the space key support role in promote the innovative undertaking.

3.2.2 The development of the space, can't just focus on physical space, hardware facilities, the key is to adhere to the concept of service first, around the resource integration

Resource integration capability is the gen space should have the basic ability, as well as the gen space should strive to create core competitiveness. Innovation entrepreneurship is a complicated system engineering, from ideas to verify, development, popularization and application, such as the stages, is inseparable from the information, capital, management, market resources and elements such as input. Decided to innovative entrepreneurial success is the outcome of combined action of many factors, lead to innovative entrepreneurial failure may simply be due to the lack of a link resources and elements. The space as a creative services, constantly filling up the “short board” of the entrepreneurial innovation, both to improve hardware supporting ability, makes the service innovation entrepreneurship “hard power”, more to improve resources integration ability, provide innovative entrepreneurs with low cost, wide coverage, easy acquisition of service resources, perfecting the innovation entrepreneurship “soft environment”. The need to constantly strengthen the space resources integration ability, make full use of pricing, market incentives, competition mechanism and the decisive role of market resources allocation, break through its own development limited, a wide range of integrated innovation entrepreneurship resources, better to meet the needs of differentiation of innovative entrepreneurs. Especially with the development of Internet technology and business models evolve, broke the shackles of physical space and resources integration across the region, regional and industry field for the integration of online resources, greatly improve the efficiency of integrated utilization of resources. The space as a product of the Internet to promote the development of, more should actively embrace the Internet, according to the country about the implementation of the strategy of “Internet +” deployment, make full use of Internet technology and Internet, thinking of the depth of the resource integration and operation mode of deep refactoring, let all creative resources to flow, demonstrating the powerful vitality.

Considering the characteristics of mass innovation, all business all the gen space should integrate the resources mainly include the following aspects. One is money, mainly is the angel investment, risk investment and various government supportive funds, crack innovative undertaking facing financial difficulties; Second, market, docking downstream users, to provide innovative entrepreneurial strong driving force; 3 it is technology, integration of various technical resources, minimizing technology risk; Four is the talent, establish extensive contacts, to help entrepreneurs to introduce suitable talents, form a complementary structure entrepreneurial teams; Five is to manage, mentors, for innovation entrepreneurship walk fast, go too steady make recommendations.

4 Results

Attaches great importance to the professional development, and to strengthen the gen space classification guide. To give priority to construction of marketization of social forces to the gen space. The traditional incubator, university science parks, such as innovative business services, guides the use of the Internet thought, optimize and improve the operating mechanism and business patterns and realize the transformation and upgrading, make “incubator” 2.0. Counselling, venture investment and so on specialized institutions for training, industry leaders, and angel investors, successful entrepreneurs and other social organization, support to revitalize the existing idle factories, equipment and other resources, or in connection with the innovation of the traditional innovation service agencies to participate in the construction of a space. Actively create conditions and provide convenience for all social capital investment and space construction.

With the continuous development of socialized production, the social division of labor is more and more fine, specialization become inevitable trend. Look from the science and technology business incubator development course of about twenty years, from the early government-led innovation service center, to the comprehensive incubator, to focus on a particular industry, is good at providing a service in the field of professional incubator. It is professional development, science and technology business incubator by basic services, such as emphasis on property to pay attention to the resources integration, to provide professional services, achieved a perfect leap to the gen space. The gen space adhere to professional development, and will be able to concentrate more focus and attention to the area, the resources and services more concentrated in the field of need, so that they can intensively farmed in the field of a certain form features, realize the differentiation development.

The space as a new thing, is in beginning stage of development. On the one hand, should actively create conditions to guide the social capital into the space construction, growing innovation innovation service team; On the other hand, we should always adhere to the professional development direction, the space continuously outstanding professional characteristics, improve their professional skills, “one-size-fits-all” go in for grandiose projects, can be avoided.

5 Conclusion

Change of government functions, build the good environment for the development of the space. Increasing financial investment, supports the gen space in information consultation, business communication, training, coaching, investment and financing services such as docking, to move into the space rent of venture enterprises, broadband access, public software, development tools such as cost of appropriate subsidies. Give play to the role of multi-level capital market, provide innovative companies with comprehensive financial services. Implementation of centralized office registration system, in view of the characteristics of the space of the gen office, simplify the residence registration and provide convenience for startups industrial and commercial registration. In zhongguancun business street of China business services such as relatively dense area promoting the construction of the spatial agglomeration region, form the agglomeration effects and scale advantage. Support for entrepreneurial salon, entrepreneurship lecture hall, entrepreneurship training camp, innovative entrepreneurship contest and other activities, training professional career coaches and innovative entrepreneurial talent, excellent entrepreneurial projects and team. To strengthen the statistics of the gen space monitoring, timely grasp the industry development situation, completes the guidance for the development of the industry. Extensive media propaganda, introduce the typical patterns, the innovation and space characters and typical advanced deeds, widespread entrepreneurial culture, the masses entrepreneurship, has become more common in the whole society. This model is based on trust, is “to support China's new social stability is the most important and the most subtle is also the most key pillars.”(John naisbitt,Doris naisbitt,2009)^[4].

(E-mail: whutzhoutao@whut.edu.cn, lsx@whut.edu.cn)

Abstract: With the rapid development of China's economy, the logistics industry has been rapidly developed, but the gap between China and the developed countries is obvious. The development of emerging technologies like cloud platform make the new problems emerge in the logistics industry, such as multi-distribution center vehicle scheduling problem, and studying all kinds of these problems makes China's logistics industry exceed developed countries' possible. On the basis of the study of some vehicle scheduling algorithms, cloud platform and the analysis of the cloud platform integrated enterprise resource advantages in optimizing their aspects, I proposed a vehicle scheduling system based on cloud platform, the system helps logistics business to optimize vehicle scheduling and assets configuration, balance demand and capacity contradictory, but it has difficulties to schedule the entire region cluster enterprises' vehicles to maximize social benefits, its future development will be clustered vehicle scheduling, flexible dynamic, practical.

Key words: Cloud platform; Scheduling algorithms; Logistics industry; Vehicle scheduling

1 Introduction

1.1 Background

With the China's economic development and adjustment of economic structure, the industrial logistics industry, as a basis of the tertiary industry, has been rapidly developing, and feedbacks and supports the development of secondary industry and primary industry, and gradually develops into a pillar of the national economy industry. The degree of development of the logistics industry is widely used to measure a country's level of industrialization, the health of the economy and national strength [1]. However, there is still a big gap between the China's logistics industry and the developed countries', especially China's logistics industry concentration is not high. For example, the current top 20 China road transport companies' market share is less than 2%. The top five US LTL road transport companies account for 60 percent of the US transportation market share. This shows that China road transport companies cannot form a large-scale competition, most of the industries and enterprises are repeating inefficient market competition. This is bad for the development of modernization, informationization and intellectualization of the industry. With the rapid growth of China's logistics transportation enterprises, the initial formation of a national logistics network and the emergence of new logistics needs, there is the appearance of new logistics and transport problems in logistics and transport industry. For example, with the social and economic rapid development, Internet and communications technologies become more sophisticated, networking, big data, cloud platform emerged together which birth the new vehicle scheduling, such as joint vehicle scheduling, dynamic vehicle scheduling, inter-regional, large-scale and multi-distribution vehicle scheduling [2], while the traditional logistics vehicle scheduling mode is ineffective in dealing with this type of new vehicle scheduling requirements. With the increasing maturity of the Internet and communications technology and the emergence of new technologies, especially the development of cloud platform technology enables manage transportation vehicle scheduling and try new vehicle scheduling mode based on cloud platform possible. So studying the role of cloud platform technology in terms of the logistics industry has immeasurable benefits to improve the level of information, lever of intelligence and core competitiveness of China's logistics industry. This makes China's logistics industry catch and surpass developed countries' possible.

1.2 Vehicle scheduling algorithms

Vehicle scheduling problem is a hot topic in the logistics industry, since it was first proposed in 1959 by German scientists Dantzig and Ramser, lots of solutions for vehicle scheduling algorithms have been produced, which are divided into exact algorithms and heuristics algorithms.

Exact algorithms mainly have tabular method, branch and bound methods, cutting plane, dynamic programming and graph theory [4].

On the one hand, heuristics algorithm was found that people inspired by the nature laws governing the operation, on the other hand, heuristic algorithm was resulted from the previous work experience by

* This paper is supported by "the Fundamental Research Funds for the Central Universities"

people drawn from a summary. Firstly proposed heuristics algorithms are greedy algorithm and local search algorithm, but the algorithms solved the problems with poor quality results and cannot solve the problem of large-scale defects which caused a slow heuristic algorithm development, and with the rapid development of computer technology, the NP problems (Non-Deterministic Polynomial) and the genetic algorithm were proposed which ushered heuristics algorithms' development in a boom, scientists have proposed and developed a simulated annealing algorithm, artificial neural networks, taboo search algorithm, evolutionary algorithm, ant colony algorithm, physical algorithm and quantum algorithm.

Genetic algorithm, simulated annealing, taboo search and ant colony algorithm are applied more in vehicle scheduling, and their basic principle is starting from a random initial solution, adopting the optimal solution iterative improvement strategy and then gradually approaching the issue.

Genetic algorithm is use groups search technology, start from local search to improve the survival of the fittest law [5], simulate evolution gene on chromosome selection, crossover and mutation algorithms obtained.

Simulated annealing is annealing crystallization process simulation statistical physics of solid substances. In the simulation process, if you search for the good solution is accepted, otherwise, with a certain probability to accept a bad solution.

Taboo search is simulating the human experience through history and memory of the most recent search, contraindications some solution, so as to achieve the purpose of avoiding local search.

ACO is to simulate the behavior of ants foraging, ants will discharge its path through a pheromone as a marker, and the amount of emissions is based on the path length and the food rating decisions [5].

Currently single algorithm operation results may not be satisfactory, we may require a combination of several algorithms to optimize the current, and then it will come to a better solution, such as genetic algorithm search speed is slow and search ability is poor. As the cloud model's capability in transforming an uncertain relationship between qualitative and quantitative can well improve genetic algorithm[6], then people propose the quantum genetic algorithm, improved genetic algorithm and adaptive genetic algorithm based on cloud platform. With the development of intelligent computer, Hyper-Heuristic Algorithm has been developing based on these heuristic algorithms.

2 Vehicle Scheduling Based on Cloud Platform

2.1 Cloud computing platform

Cloud platform is a service platform which is built on the basis of cloud computing, it is to provide Internet-based hardware and software services, such as data storage services. Nowadays there has no universally accepted definition, the current high acceptance is defined by the US National Institute of Standards and Technology: Cloud computing is a pay-per-use model that provide a usable, convenient and network access on-demand into a shared pool of configurable computing resources, and these resources can be provided quickly, simply put minimal management effort or service provider with very little interaction. Cloud computing platform has a service resource pooling, safety and reliability [7], the use of processing power and billing features. Because cloud platforms can integrate logistics enterprise's internal capacity resources, advanced technology and advanced systems, so that the logistics enterprises can coordinate demand and transport capacity and build a vehicle scheduling system based on cloud platform [8].

2.2 Vehicle scheduling based on cloud platform

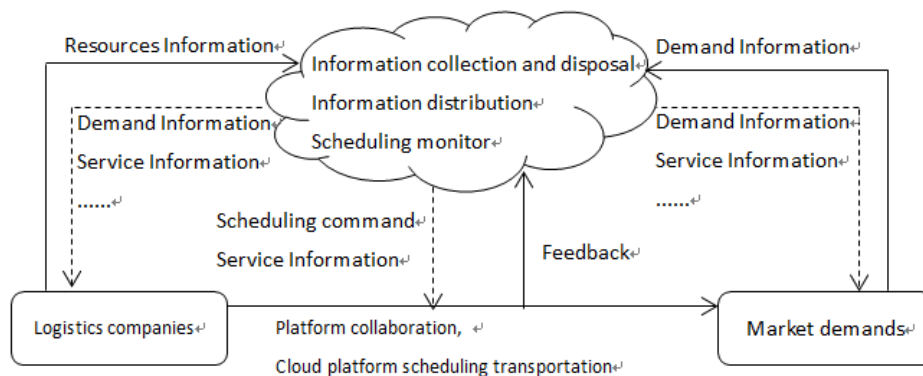

Figure 1 Vehicle Scheduling Based on Cloud Platform Principle Schematic

Cloud platform is equivalent to virtual brain in the entire transportation process. Cloud platform involves in the operation management of the entire process, gathers preliminary information and data generated during transportation, uses the algorithm to help the transport companies develop vehicles scheduling. Logistics companies will leverage cloud platform to complete vehicle scheduling, and cloud platform will communicate with logistics companies closely through communication information systems in order to manage and control the whole logistics process^[9]. This can significantly reduce the cost of logistics enterprises and the fixed assets of internal control risk and increase the professionalism, the core competitiveness and market responsiveness of enterprises. American Robinson transport company is only be a “transportation coordinator” between market businesses and transport companies, its core competitiveness is its ability to build a service platform for the global transportation business and the needs of enterprises and monitor the logistics chain^[10]. As a virtual brain of the chain, Robinson is the information collection point and service center of transportation and distribution chain. Its strong computing power and abundant data produced in platform will strongly support Robinson to do vehicle scheduling. So cloud platform has a huge advantage to deal with multi-distribution center vehicle scheduling relying on its powerful information collection and processing capabilities, computing capacity and reliability features.

2.3 Vehicle scheduling based on cloud platform advantages

2.3.1 Information collection and processing

The cloud platform can collect policy information, market business needs information, resources information and business operations logistics companies’ real-time information and so on, such as enterprise resource idle vehicles, the number of business needs, traffic conditions and insurance of the standardization services information^[2]. Cloud platform could classify information processing and distribute enterprises need information.

Using preliminary information provided by the cloud platform, logistics companies can manage their business preferably with better vehicle scheduling, do real-time scheduling adjustments based on feedback information. Logistics companies can also use the processing power of cloud computing platform to optimize their vehicle scheduling.

Demand enterprise can fully compare logistics companies to make a good choice, combining with their demand conditions and logistics enterprises references given by cloud platform.

2.3.2 Demand management

Demand management includes demand consolidation, demand regulation and demand forecast.

According to the needs of SMEs in China dispersion problem, cloud platform can integrate fragmented needs of SMEs, simplify the relationship between the responsible parties, and thus logistics industry will develop to scale and intensification.

Actual demand includes fixed demand and variable demand. As variable demand is randomness and unpredictability, it is difficult for transportation companies to do the whole vehicle scheduling. Cloud platform can monitor market demand fluctuation, then dynamically balance the fluctuated demand, transport enterprises can cooperate with demand enterprises to establish a similar "futures" modes of transport, demand enterprise will use recording information based on cloud platform, combining with market demand, to forecast and update the demand in real time, transport companies use the demand information released by demand enterprises to do vehicle consolidation scheduling, assignee peak demand to the off-season. With this Option Contract transport mode, transport enterprises can balance the capacity and demand contradiction of busy season and off-season, ease the contradiction between the waste and overuse of transport vehicles, reduce maintenance and acquisition costs of transport vehicles and develop the lever of vehicle scheduling optimization and asset allocation. This option contract form needs build related facilities and the related enterprises’ close collaboration.

With the development of communication technology and the Internet, the demand is no longer a passive pre-production, the system itself can also generate demand. On the process the system will continuously produce information^[3] which will generate a lot of variable demand. Cloud platform will simulate variable demand generated laws, enterprises can take advantage of the stimulated laws to schedule idle vehicles or require other companies or individuals to schedule free vehicles to complete variable demand, such as empty driving vehicles and return vehicles^[11], thus control the variable demand in the range of transport capability and gradually optimize transportation scheduling.

2.3.3 Monitoring and regulation

Cloud platform can help enterprises release scheduling plan and require other enterprises to assist when they fail to deliver. Cloud platform can monitor vehicle operating conditions in the logistics and transport process and collect real-time information along the road, then notice related service agencies to

take preventive preparation where vehicles and drivers may have possible accidents to reduce logistics risks. This enables dynamically schedule vehicles, query real-time scheduling information which will improve the lever of information management^[11] and services quality of logistic during transport.

Cloud platform can collect data while monitoring transport process to support government departments and industry associations to forecast, design and make macro-control legislation and regulation^[2]. These pave the way for the development of the logistics industry in the top-level design.

2.4 Vehicle scheduling based on cloud platform flaws

Transport enterprises will go through the process of enterprise developing alone and developing in regional industrial clusters syndication, so there has a contradiction when cloud platform does a single enterprise scheduling and the scheduling of the logistics industry as a whole. Cloud platform cannot manage other business enterprise resources well, thus cannot maximize social benefits while it does individual enterprises Scheduling; while it does scheduling management of logistics industry as a whole, there exists the game's stakeholders, hindering its integration of resources and coordination.

Cloud platform development in terms of the pre-information collection and dispatch is maturing, but now the information is generated randomly, so it will have difficulties in collecting early useful information, so vehicle scheduling parameter settings are not optimal and thus feasible solution is not optimal.

Cloud platform lacks humane factor, most current research is focusing on early information gathering and resources scheduling, the research on how logistics enterprises, drivers, customers and society to participate and exert influence in the logistics process is still a lack.

The current vehicle scheduling algorithms also cannot simulate actual conditions and realities very well to form the optimal solution, such as GA's control variables set unreasonable may cause local optimal solution, which cannot achieve maximum benefits.

3 Conclusion

Vehicle scheduling system based on cloud platform will promote the development of China's logistics industry in a certain extent, but there are still lots of problems to be solved. As technology advances, these problems will gradually be resolved. With the development of networking and urban industrial clusters, vehicle scheduling based on cloud platform will gradually develop vehicle scheduling from a single enterprise vehicle scheduling to regional cluster enterprise vehicle scheduling coordination, which will greatly release the transport capacity of logistics enterprises and help logistics enterprises integrate industry chain resources, optimize the operational efficiency of the industrial chain, increase value chain, improve profit chain and expand and extend the industrial chain of integrated supply chain management^[12].

Logistics and transport situations are complicated, this makes a very high demand for real-time monitoring capability of the vehicle and emergency service dispatcher, and the rapid development of car networking and intelligent transportation system make it possible to collect in-real-time vehicle scheduling operation information, thus cloud platform will establish a more flexible dynamic vehicle scheduling system.

Future vehicle scheduling algorithm will be more concise, parameter setting more realistic scheduling program quality greatly enhanced the level of participation in the system will be more and more, participation will be more extensive.

Making a Compatibility Match Between Supply Chain Type with Product Type and Product Life Cycle Stage

Md Afzalul Aftab

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: afzalulaftab@yahoo.co.uk)

Abstract: This paper describes a typology for designing supply chains that work in harmony to design, produce, and deliver products with different characteristics and customer expectations. This review discusses supply chain types that are necessary for success across three types of products: standard, innovative, and hybrid. It develops a framework for categorizing the supply chain types according to product characteristics and stage of the product life cycle. The key success factor for a product change as the product moves through its life cycle, and this may require different supply chain characteristics and capabilities. The paper blends literature and theory development to create the typology and develop a set of research questions for further investigation.

Key words: Agile manufacturing; Lean manufacturing; Supply chain management; Supplier selection

1 Introduction

Competition is shifting from firm versus firm to supply chain versus supply chain. Supply chain management integrates suppliers, manufacturers, distributors, and customers through the use of information technology to meet customer expectations efficiently and effectively. As a result, groups of companies can respond quickly and in a unified manner with high-quality, differentiated products demanded by fastidious final consumers while achieving system-wide advantages in cost, time, and quality.

This paper discusses strategies and methodologies for designing supply chains that meet specific customer expectations. Supply chain design should be, in part, a function of the product characteristics and expectations of the final customer (Fisher, 1997)^[4]. The goal of this paper is to provide insights to organizations that are designing supply chains to manufacture discrete parts. The paper defines the product characteristics of standard, innovative, and hybrid products, provides a framework for understanding lean, agile, and hybrid supply chains, and relates the adoption of these supply chains to the characteristics of the products and the needs of the customers.

2 Supply Chain Types

Supply chain type is to a large extent a function of product characteristics and customer expectations (Fisher, 1997)^[4]. The product is the soul of the supply chain; there is no justification for adopting a particular supply chain type unless it conforms to the needs of the product and its customers.

2.1 Lean supply chain

A lean supply chain (LSC) employs continuous improvement efforts that focus on eliminating waste or non-value steps along the chain. It is supported by efforts to achieve internal manufacturing efficiencies and setup time reduction, which enable the economic production of small quantities and enhance cost reduction, profitability, and manufacturing flexibility to some degree. The short setup times provide internal flexibility, but a lean supply chain may lack external responsiveness to customer demands, which can require flexibility in product design, planning and scheduling, and distribution in addition to manufacturing (Booth, 1996)^[1].

2.2 Agile supply chain

An Agile Supply Chain focuses on responding to unpredictable market changes and capitalizing on them through fast delivery and lead-time flexibility. Successful implementation involves responding to rapidly changing and continually fragmenting global markets by being dynamic, context-specific, growth-oriented, flexible across the organization, and driven by customer. An ASC focuses on responding to unpredictable market changes and capitalizing on them through fast delivery and lead-time flexibility. It deploys new technologies, methods, tools, and techniques to solve unexpected problems. It utilizes information systems and technologies as well as electronic data interchange capabilities to move information faster and make better decisions. It places more emphasis on organizational issues and people (knowledge systems and empowered employees), so decision making can be pushed down the organization. It is a systemic approach that integrates the business, enhances

innovations across the company, and forms virtual organizations (VOs) and production entities based on customer needs.

2.3 Hybrid supply chain

A hybrid supply chain generally involves “assemble to order” products whose demand can be forecasted with a relative accuracy. The chain helps to achieve mass customization by postponing product differentiation until final assembly. The lean or agile supply chain techniques are utilized for component production with different characteristics. For example, air bags would most likely be produced with a LSC while engine electronics might require the innovation found in an ASC. In addition, the agility is needed to establish a company–market interface to understand and satisfy customer requirements by being responsive, adaptable, and innovative.(Vonderembse et al. 2002)^[7].

3 Identify Product Types

Understanding the characteristics of the product is essential to design a supply chain that meets customer expectations (Vonderembse, 2002)^[7]. This section describes three product types (standard, innovative, and hybrid), relates these product types to the product life cycle, and discusses the factors that are critical for designing effective supply chains.

3.1 Standard product

The market for standard products tends to be stable, and demand can be forecasted accurately. Standard products tend to have long life cycles where designs characteristics change incrementally or slowly over time. This ensures well-defined and predictable processes for product design and manufacturing. Manufacturer may find it useful to establish a long-term relationship with its suppliers for high quality materials, just-in-time delivery, and quantity discounts. These products are usually in the latter part of the growth segment of their product life cycle or beyond. With predictable demand patterns and consistent processes, cost minimization can be pursued very effectively, especially in the mature phase of the product life cycle. The characteristics of the Lean supply chain fit the needs of the standard product well.

3.2 Innovative product

Innovative products are new or derivative products that often represent a breakthrough in product concept and design. They often satisfy emerging customer needs and in some cases needs that customers have yet to articulate. Innovative product requires sophisticated design and/or manufacturing capabilities. These are designed to be adaptable to changing customer requirements. As such their product designs may be unstable and require close and continuous customer contact and have uncertain demand (Fisher, 1997^[4]; Mason-Jones et al., 2000^[5]).

Innovative products usually command a premium price, which has the potential to increase profits. Once introduced and found to be successful, competitors quickly emulate innovative products because they command premium prices. As demand grows and competitors emerge, innovative product can become standard product where cost and quality are dominate characteristics. This forces the original manufacturer to constantly interact with customers to generate new ideas that drive a steady stream of new and improved product types.

Innovative products generally have a shorter product life cycle than standard products. Innovative products are usually in the introduction and growth stages of the product life cycle. However it can also be derivative or differentiated products that re-ignite the growth potential of a product in the mature phase of the product life cycle.

3.3 Hybrid product

The hybrid product is a complex product that includes a mix of standard and innovative components. To respond, lean supply chain and agile supply chain are combined to provide the components needed in final assembly. Hybrid products tend to have a long product life cycle with a certain degree of improvement or innovation offered periodically. These innovations most frequently occur at the module or component level.

4 Supply Chains Design and the Product Life Cycle

This section describes the product life cycle and discusses a set of observations that relates product type and supply chain type. Table 1 summarizes the supply chain classification based on product type and product life cycle.

4.1 Product life cycle

The product life cycle illustrates unit sales for a product category over time. It is divided into four

discrete stages: introduction, growth, maturity, and decline. The shape of the sales curve reflects the notion that a product’s sales begin slowly during the introductory stage, then grow rapidly often reaching a peak relatively early in a product’s life. During the saturation or maturity phase, demand may grow slowly for a long period of time before it begins to decrease.

The introduction stage involves the satisfaction of either a new or an existing need. A new need tends to involve the introduction of an incrementally innovative product, whereas an existing need often involves a standard product. If the product is new, generally the competition comes from different products. New products may have defects, but these are dealt with as quickly as possible in order to prevent the premature death of the product.

The growth stage involves the product’s market acceptance and an increase in the organization’s market share. Demand begins to accelerate and the size of the total market expands rapidly.

In the maturation stage, competition increases with other organizations trying to emulate the generic product with low cost products. Demand is often determined by the replacement or wearing out of the product and new family-formation rate. Products enter the decline stage as they lose consumer appeal and sales drift downward. Product obsolescence causes sales to decline, and new products (innovations) replace existing products.

Table 1 Supply Chain Classification Based on Product Type and Product Life Cycle

Product life Cycle \ Product Type	Standard	Innovative	Hybrid
Introduction	Lean Supply Chain	Agile Supply Chain	Hybrid Supply Chain
Growth		Hybrid/Lean Supply chain	
Maturity			
Decline			

4.2 Relating supply chains and product type

Lean supply chain focus on reducing lead-time, increasing efficiency, expanding manufacturing flexibility, and cutting cost. A LSC approach attempts to build a level schedule across the supply chain, and it uses pull production to respond to customer demand. While striving for these goals, the LSC focuses on incremental improvements (kaizen). It tries to improve the product and the associated processes, by balancing the supply chain.

The long product life cycle of standard product provides a stable design over many years. Being a low cost item, globally manufactured, with highly predictable demand patterns, profitability can be achieved by minimizing cost and employing a level schedule over the entire supply chain and over all the products life cycle stages (Mason-Jones et al., 2000)^[5]. This justifies the usage of a LSC for standard products. In addition to providing cost minimization, the LSC is efficient and flexible, and it brings about incremental improvements, permitting firms to constantly improve the quality of their products and keep their customers satisfied.

Proposition 1:To have the highest internal performance and customer satisfaction, standard products should be designed and produced by Lean Supply Chains through all stages of the Product Life Cycle.

In order for innovative products to succeed, they should be producible in any volume, as per customer requirements. The first two stages of the product life cycle, introduction and growth, are the testing grounds to ensure that organizations are achieving customization and market adaptability. For this, one of the strategic tools provided by Agile supply chain is a virtual organization (VO). VO integrate complementary resources existing in a number of cooperating companies to produce that particular innovative product(s) as long as it is economically justifiable to do so. This dynamic alliance provides access to a wide range of world class competences, enabling organizations to overcome the customization/responsiveness squeeze. This supports the usage of an Agile supply chain for the first two stages in the life of an innovative product. By providing concurrency of operations among the members of the VO, the agile company can rapidly deliver its innovative products in small quantities, as per customer requirements.

Proposition 2a:To have the highest internal performance and customer satisfaction, Innovative Products should be designed and produced by Agile Supply Chains in the Introduction and Growth stages of the Product Life Cycle.

Once the product has been firmly established, it transitions into the third stage of its life cycle, maturity. By this stage, the innovative product begins to take on the characteristics of a standard product. Price competition becomes very important. Production becomes more routine and is part of the organizations daily schedule, which already follows the LSC concept. In order to maximize their profits,

organizations still need to deal with their customers and provide them not only the support that they need, but also introduce new, improved versions of the existing product, thus maintaining their customer base. From the maturity level onwards, organization may employ LSC to meet the needs of this product.

Proposition 2b: To have the highest internal performance and customer satisfaction, innovative products should be designed and produced by Lean Supply Chains in the Maturity and Decline stages of the Product Life Cycle.

Hybrid products, which are complex, require the organization to bring together a set of suppliers with a wide range of capabilities (Choi and Hong, 2002)^[2]. This implies innovative and standard products as well as strategic partnerships. While it may be true that hybrid products that are near the end of their life cycle may use fewer innovation components than a product that is at the beginning, there is always the opportunity to introduce innovation into the hybrid product. As a result, hybrid products require HSC throughout their product life cycles.

Proposition 3: To have the highest internal performance and customer satisfaction, Hybrid Products should be designed and produced by Hybrid Supply Chains throughout the Product Life Cycle.

5 Conclusion

Standard products, which tend to be simple products with limited amounts of differentiation, should be produced by lean supply chains, which focus on simplicity, cost reduction, quality and limited amounts of flexibility. Early in their product life cycle, innovative products, which may employ new and complex technology, require agile supply chain. As the product enters the maturity and decline phases of the product life cycle, a lean supply chain could be more appropriate. Hybrid products, which are complex, have many components some of which may be components while others are new and innovative calls for a hybrid supply chain.

Abstract: At present, agriculture is the main portion of economic structure in remote mountain areas. Agriculture products are the main income sources for local peasants. However, Abundant agriculture products are not utilized enough, due to serious lag of logistics systems. According to the status quo of agriculture logistics in Fangxian county in Hubei province, this paper discusses the construction of agriculture logistics on the basis of modern theory of logistics. Through the analysis of advantages and disadvantages for developing the agriculture logistics in Fangxian, the agriculture logistics system is put forward centering on the processing enterprises of agriculture products .

Key words: Agriculture products; Logistics system; Fangxian; Mountain areas

1 Introduction

As a branch of logistics industry, logistics for agricultural products refers to the physical flow of material substances of agricultural products and relevant information from producers to consumers in order to satisfy the demand of the latter, including a series of links like agricultural products production, procurement, transportation, storage, handling, carriage, packaging, delivery, distribution processing, distribution and information activities, etc. Located in the deep mountains of western Hubei Province, Fangxian County has constructed an appropriate logistics system for agricultural products by combining national policy support and local special advantages of agricultural products, thus bringing along rapid development of agriculture and significantly uplifting the income level of the locals.

2 Overseas and Domestic Research Status on Logistics System for Agricultural Products

2.1 Overseas research progress in logistics system for agricultural products

The earliest overseas research of logistics for agricultural products starts with the Report of Agricultural Products Circulation Industry Committee made by John Crowell in 1901, which has expounded on various factors that may influence the costs of delivering agricultural products, thus raising the curtain on the researches of logistics for agricultural products. Later on, an increasing number of researches have arisen, and the researches related to the logistics system for agricultural products are mainly concentrated on two aspects. Including optimization researches on logistics links^[1], Informationization researches on logistics system^[2]. Due to the advanced information technology of agriculture in developed countries, the informationization of logistics system for agricultural products has been an important research direction.

2.2 Domestic research progress in logistics system for agricultural products

From the scope of research perspectives, domestic researches on constructing logistics system for agricultural products can be divided into macroscopic and microscopic levels. Macroscopic researches are mainly targeted at national or specific regions or specific objects^[3]. Microscopic researches are centered on the logistics system itself. Researches on the governance of logistics system^[4]. Application researches of new technologies^[5].

Based on the above, coordination researches of logistics system for agricultural products will remain an important direction for future. Fangxian County can construct a logistics system suitable for the realities of mountainous areas by starting from the overall coordination of the logistics system and giving play to the leading role of processing enterprises.

3 Development Status of Logistics for Agricultural Products in Fangxian County

3.1 Advantages of developing logistics for agricultural products in fangxian county

(1) Abundant natural resources

Located at the southeastern part of northwestern Hubei Province and the north subtropical monsoon climate zone. In 2014, three industries involving walnuts, goats and traditional Chinese medicine have ranked the first in the annual assessment of *sibaiwan*(four million) project in Shiyan City. By 2015, the black fungus, mushrooms, cold-water red rice, as well as bupleurum Chinese have been awarded the title of national product of geographical indication in succession.

(2)Improvement of infrastructure like transportation

The major transport lines within Fangxian County are S-N No. 209 national highway and E-W No. 305 provincial highway. In recent years, the transportation condition in Fangxian County has witnessed great improvement: (a) it has basically completed the building of village-to-village roads with enhanced hardening level. (b) the original roads have been optimized. (c) Two highways have been built, namely, the E-W Xiantian Highway running through the County and the S-N Shifang Highway connecting the counties and cities.

(3)Policy guidance and support

Under the support of national policies, Fangxian County has stepped up its efforts of offering capital subsidies to the cultivation of characteristic agriculture, including subsidies for fine breed and aquaculture to motivate farmers. Meanwhile, it has also guided the centralized and scale development of agriculture, Fangxian County has built standard production gardens of edible fungi. In the central belt of the County town, trade markets have been constructed to promote issuance and circulation of the information about agricultural products.

3.2 Unfavorable factors to the development of logistics for agricultural products in fangxian county

(1)Government policy misplays

In selecting agricultural products, a small misplay of agricultural departments can cause huge economic losses. Due to inaccurate grasp of the value principle of commodities, Fangxian County had once vigorously encouraged the cultivation of yellow ginger. Given the large-scale plantation in the local areas already, its market price went through a sharp decline, not only wasting large amounts of land resources but also bringing economic losses to farmers. The list of cases like these goes on; as a result, the farmers 'enthusiasm is harmed and it becomes difficult for them to accept the agricultural policies from government. In a word, reasonable decision-making mode weighs a lot.

(2)Dilemma of self-production and self-marketing

"Hard to sell" has always remained a core difficulty in the commercialization of agricultural products in mountainous areas. The sales are scattered, farming households based on the unit of families take advantage of available transportation equipment and seek for the buyer's market. Consequently, (a) most farming households choose to sell the products in places nearby. (b) It is unfavorable to expand external market and seek maximum benefits. (c) Limited enthusiasm of farmers for production will lead to decreased scale or quitting, harming sustainable development of agriculture.

(3)Extensive operation mode

Take the cultivation of traditional Chinese medicinal materials for an example. Due to the lack of scientific cultivation standard and guidance, farmers usually succumb to extensive management and use large amounts of pesticides in the growing period of materials, finally leading to non-conformity of products for limit-exceeding pesticide residues. It can be seen that traditional extensive operation mode can hardly adapt to the needs of modern commercialization of agricultural products. So improving scientific input and cultivating new-type farmers remain the only ways out for agricultural development.

4 Construction of Logistics System for Agricultural Products in Mountainous Areas

4.1 Reasonable positioning the subject role of logistics for agricultural products

The subjects of modern agricultural logistics refer to the organizers and participants who can provide agricultural logistics services and plan, execute, manage and control the operation process of modern agricultural logistics, including government agencies, producers of agricultural products, processing enterprises of agricultural products, selling enterprises of agricultural products and logistics enterprises, etc.. Many problems in the commercialization of agricultural products in mountainous areas are closely linked with subjects of logistics, and positioning the role of participants in logistics reasonably, optimizing their functions and reshaping the logistics system can effectively solve these problems.

4.2 Reasonable planning of logistics function

(1)Labor division of current logistics subjects for agricultural products and its demerits

In the current logistics system for agricultural products, all logistics subjects focus on their own functions and ignore communication and coordination among themselves, so the effective flow of information is affected (figure 1).

Figure 1 Current Logistics System for Agricultural Products

Seen from the above, the labor division mode for the current logistics subjects of agricultural products hinders the efficiency of the whole logistics system for its own defects. The fundamental reasons lie in that close cooperation relationship is absent among the subjects and none of them can play the role of coordinating the whole logistics system. Therefore, exploring a new-type logistics model dominated by a certain subject serves as an effective way to cope with the commercialization of agricultural products in mountainous areas.

(2) Construction of vertically integrated logistics system centered on processing enterprises

Within the whole logistics system, processing enterprises, as a value-adding link for agricultural products, can obviously uplift their market value. Hence, in agriculture-dominated mountainous areas of China, processing enterprises have always been supported and attached great importance to by local governments. Processing enterprises, positioning in the middle link of the logistics system, can effectively coordinate the relationship between upstream and downstream logistics subjects. In sum, the vertically integrated logistics model centered on processing enterprises is feasible.

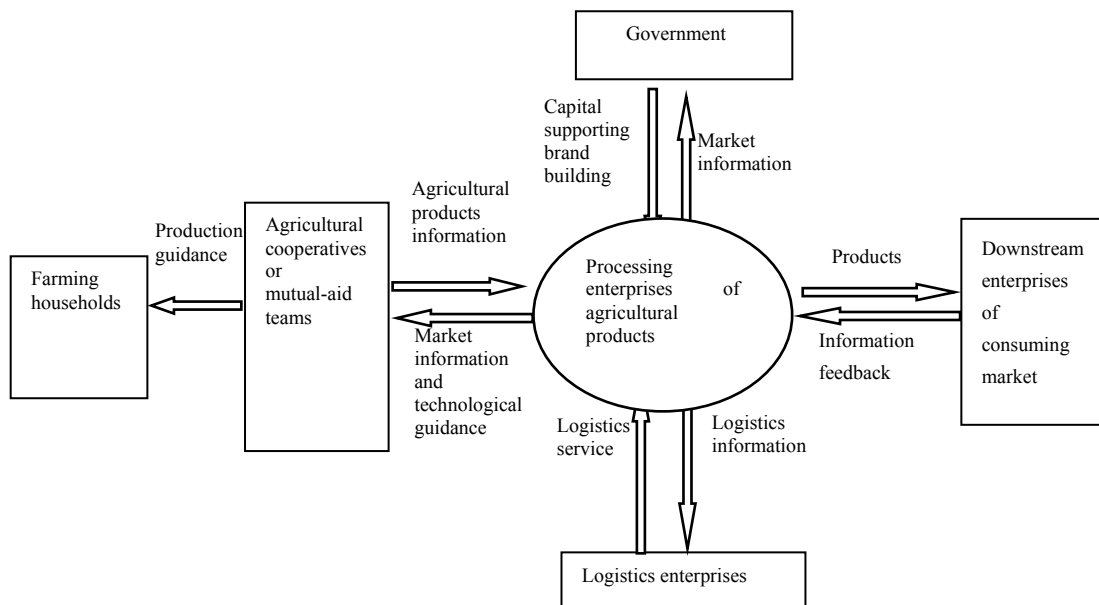

Figure 2 Logistics System for Agricultural Products Centered on Processing Enterprises

In the vertically integrated logistics system centered on processing enterprises, logistics subjects can realize mutually coordinated operation by centering on the processing enterprises of agricultural products and basing on the information so as to optimize the whole system.

(3) Construction of logistics system centered on processing enterprises at fangxian county

Take the edible fungi industry in Fangxian County for example. Processing enterprises should be established at the center of the three townships to reduce transportation cost and uplift the efficiency of

processing. Processing enterprise can choose to establish their own logistics system or cooperate with a third party according to the product features.

As the investment subject, the government should increase its capital support to processing enterprises of edible fungi, and improve the popularity of products with available publicity media like agriculture information website, newspaper and television. Processing enterprises of edible fungi can share the information with government decision-making departments so as to timely adjust the production scale and refine the breed of edible fungi.

To enhance the communication with producers, processing enterprises of edible fungi can foster agricultural cooperatives or mutual-aid teams into a bridge to reach for farming households. The production of edible fungi places relatively high requirement upon the temperature as well as humidity. It also demands necessary equipment. Therefore, processing enterprises can send technical staff to provide technical guidance to household and offer production tools. This agricultural practice, in which the government provides capital and processing enterprises offer assistance, has changed the situation of low efficiency for the government's insufficient energy to directly manage agriculture. Agricultural cooperative organizations should provide the production information of edible fungi to processing enterprises so as to make advance preparations for production, transportation and market planning, etc.

Given the advantages in capital, talents, location, logistics and network, processing enterprises should actively set up B2C and B2B e-business platforms to enlarge the selling channels of products. In order to grasp the information of all upstream and downstream links, processing enterprises of edible fungi should set up a platform for information collection, storage, analysis and decision-making, and through information sharing satisfy the interest of all logistics subjects. Information tracing mechanism can also guard against agricultural risks that might arise and promote the standardization of the production technologies of agricultural products and functions of logistics.

5 Conclusion

By analyzing the disadvantages of logistics for agricultural products at Fangxian County, this paper constructs a logistics system for agricultural products centered on processing enterprises through function integration. Nevertheless, the real conditions of mountainous areas in China are varied and the factors considered to have an impact upon logistics for agricultural products are not all-covering, so the research results are not free from limits and remain to be tested and improved in practice.

(E-mail:48899293@qq.com)

Abstract: Based on illustrating the relationship between TCM Five-Elements System and the objectives of the enterprise benefit system, the essay aims to interpret the consequences of the enterprises medicine reverse logistics management system due to lack of target economic from the perspective of the reinforce of the five elements. Besides, the Five Elements Balance Theory is explored to discuss how to enhance economic benefits of the drug supply chain enterprises, reduce excessive intervention in the market and increase the safety of drugs in the logistics environment in order to balance the objectives system of corporate and to promote society reverse logistics management efficiently.

Key words: TCM Five elements theory; Medicine reverse logistics; Management by objectives; Economic benefit

1 Literature Review

1.1 Review of the theory of traditional chinese medicine and chinese management research

Chinese culture is profound, it embodies the Chinese management speculative culture. In recent years, an increasing number of scholars apply the traditional Chinese culture, especially some Chinese medicine theory to management among local enterprises management.

Through the thoughts of Chinese traditional culture and Chinese philosophy, as well as the study of the practice, Cheng^[1] put forward Chinese-style management “C theory.” The “C” contains change, culture, centrality, creativity and concerning, then analysis the corresponding “Five Elements Theory”. Li^[2] analyzed the organization in Hong Kong and Singapore, divided strategy of organizational change mode into “Yin” and “Yang” strategy. The characteristics of the strategy of “Yin” is to ease, participation, not mandatory. “Yang strategy” for the characteristics is of rapid, the participation and mandatory. They think that the effectiveness of the organization strategy depends the balance of two opposing and complementary forces——Yin and Yang.

Xu^[3] divides the capital into “physical capital”, “human capital” and “intellectual capital” from the aspect of economic philosophy. He thought the modern enterprise capital includes entity capital “Yang capital” (physical capital) and the virtual capital “Yin capital” (human capital and intellectual capital), then used model analyzes the boundary of the two types of capital and the transformation problem. Li^[4] proposed that there is certain coupling between the whole concept of TCM culture, treatment based on syndrome differentiation, Yin and Yang and modern human resource management, through the in-depth study of traditional Chinese medicine, it can presented many references to the Chinese human resource management.

Lin^[5] engaged in applying the theory of Yin and Yang, five elements and hexagrams(from the “book of changes”)into economic management field, and has obtained certain research results: To confirm all business activities in enterprise profit and loss account qualitative from the new perspective of the Confucian concept of Yin and Yang, and established the business variables causal chain based on four images: real image, illusion, just like, from the new Confucianism related theory. Using one-way causal loop five lines of logical inference, and connecting with the five elements in the successful application of economic and business cycle activities, pointed out that the enterprise can not only use five lines to regulate anything one-directional human society, but also can have the effect of organization, guidance, and systematic quickly.

Chen^[6] applies the eight tri-grams causal chain into resolving the value of industry performance

* This paper is supported by the fund “The general program of HBTCM development research center: Research on Reverse Logistics Management Mode Based on the Theory of Traditional Chinese Medicine Five Elements.” (ZX2013Y2)

evaluation, the bottleneck of diagnosis, bench-marking and the key chain on the basis of studying the Lin, defined positive correlation “inter-promotion”, negative correlation “inter-restriction”, and using t-test analyze, concluded that the reason why big enterprise run smoothly lies in the “inter-restriction” in management chain is not strong.

1.2 Review of theory about five elements and organization management

Wen^[2] systematically expounds the connotation of analogism in TCM, and established the analogy model of enterprise on the basis of the five categories and five function system of human, then using the fuzzy evaluation method to diagnostic the enterprise's health. Ding^[7] put forward the enterprise could grasp the overall relationship of the basic modern enterprise organization in the multitude of complex giant system as long as hold the cultural, political, ecological, economic, social, five lines of benefits in management.

Dong^[8] considers that six functions in enterprise: budget-busting transfers, strategy, operations, constraints, and innovation corresponds to the fire elements: fire, wood, earth, metal and water, and put forward five kinds of TCM thinking research method inter-promotion, inter-restrict, dialectical, principle and process.

Yan^[9], on the basis of Wen, improves the five elements of enterprise management, and does some empirical research about one pharmacy industry, while fuzzy synthetical judgment diagnosis methods is applied to financial analysis, then put forward incentive mechanism (water restricts fire) under the diagnosis. Meng^[10] also uses a lot of mathematical analysis to study the mechanism of dynamic balance of five elements.

To sum up, the related theory of TCM, especially the five elements theory solving the problem of enterprise management, has gained more and more theoretical proofs. However, because there are many branch of traditional Chinese medicine theory, research scholars lay particular stress on one of them, and most of them are appearances research, seldom takes the theory guiding enterprise real practice.

Reverse logistics management researches are always on western thinking mode^[11], pay much attention to the application of mathematical model, ignoring the actual national conditions. The government's policy to reverse logistics management is idealized, finally causes the phenomenon "big thunder, little rain" (The government promotes the policy, but the enterprise implements slowly, the citizens don't correspond actively or in a correct way).

2 Introduction

In the light of China's “Drug Administration Law”, “Adverse Drug Reaction Reporting and Monitoring Management Approach” (Ministry of health, order No. 81) and the drug administration principle that “who produce, who is responsible”, the responsibility main body of the medicine reverse logistics in China is a production enterprise, and the government plays a role as the administrative supervisor. Since drugs are closely related to people's life safety, the effective implementation of the enterprise reverse logistics is an important means of social economic sustainable development. According to the tracking survey made by the professional medical logistics management and consultancy study construction, Shanghai Mdt InfoTech Ltd flux, the current medicine reverse logistics in China is almost out of control: Except the storage and transportation requirements made by most pharmaceutical enterprises themselves, the national level almost has no special specifications on the medicine reverse logistics management; In practice, the hospitals often ask no reasons to return goods, such as cold medicine. As it's known, this type of drug demands special temperature and humidity which can be completely lost in the return process. While Medicines Co can do nothing but only receive, and transfer the drugs to the new sales process; Pharmaceutical enterprises are prone to be more casual in reverse logistics management, such as the general cargo operation treatment drugs return process and the low rate of the reverse logistics facilities. The essay tries to explain the reason why the pharmaceutical enterprises are usually dynamic fatigue in the management of reverse logistics and what means the society and the government can adopt to promote the pharmaceutical enterprises on the supply chain management of medicine reverse logistics.

3 Analysis on Economic Benefits of the Medicine Reverse Logistics

The main objective of enterprise management is to obtain economic benefits. The enterprise can continue to operate when the income is more than the cost. In the drug supply chain, how much do these pharmaceutical enterprises, as the responsibility main body of the medicine reverse logistics, obtain economic benefits? On the basis of the theories of drug economics, economic effect can be divided into

direct and indirect economic benefits. Reverse logistics is different from the forward logistics enterprises, since there is no output and no direct economic benefit in the management^[11-14]. However, due to the obedience with the national policies and the promotion of public benefit measures, the indirect economic benefit is the gained reputation that produces the social benefit which is very difficult to be reflected in the income statement in short term. In contrast, during the management of reverse logistics process, on the one hand pharmaceutical enterprises need to invest a large amount of cost in hardware facilities (such as the construction of logistics center, the increase of reverse logistics function zone, and the purchase of special vehicle) and in the management cost; on the other hand, they should undertake the recovery of drug loss. And what's more obviously, the cost of the pharmaceutical enterprises reverse logistics is much greater than the benefits^[15].

Because of the negative effect that the medicine reverse logistics will bring to the overall economic efficiency of enterprises, the pharmaceutical enterprises' enthusiasm to the reverse logistics management is much low so that the government promotes the importance of reverse logistics actively and the social response is positive, while pharmaceutical enterprises, the real subject, can't be adhere to the long-term and effective implementation of reverse logistics management activities.

4 The Relationship Between Benefit Objectives Management Theory and TCM Five Elements Theory

Generally, the business has five main goals: political benefit, economic benefit, culture benefit, social benefit, as well as ecological benefit, these of which influence each other mutually. Only through combining these factors into a symbiosis system can the companies get the evergreen future possible^[16].

The nature of the objectives benefits is closely similar to the Chinese Five Elements, that is, "wood, fire, earth, metal, water". The first mention of the "five elements" theory is in "Shangshu: Hongfan"^[17]. The properties of the Five Elements are described in the book as follows,

"Wood characterized by bending and straightening". Those which the nature and role of things and phenomena extended to growth, transfer, are attributed to wood. In correspondence, culture benefit in the enterprise benefit should be Wood; culture is the source of enterprise management philosophy, and the starting point of all actions.

"Fire characterized by heating and ascending". Those which the nature and role of things and phenomena are warm and rise can be attributed to the fire. In the enterprise benefit, it should be political effect correspondently, which is the key environmental factors that promotes the growth of enterprises.

"Earth characterized by sowing and reaping". Those which the nature and role of the things and phenomenon are biochemical, carrying, storage belong to the earth. In the enterprise benefit should be the ecological benefit correspondently. This is the survival environmental factor of business, which is regarded as the most neglected business goal but the most fundamental one in the development of enterprises.

"Metal characterized by conforming and changing". Those which the things and phenomena are described as settlement and convergence, belong to the gold. In the enterprise benefit, it should be economic benefits. Enterprises gain money by business, and exchange the means of production, which is the main target of the enterprise market.

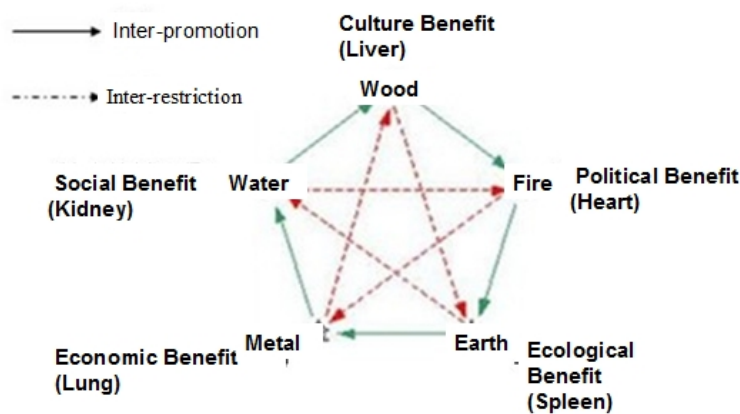

Figure 1 The Analogy Relations Between Five Elements Of TCM and Enterprise Benefit System^[17-18]

“Water characterized by moistening and descending”. Those which the things and phenomena are moisturizing, down, closed reservoir properties, belong to water. In the enterprise benefit should be social benefits. By obtaining social reputation and consumer trust, enterprises achieve sales and long-term market share, the effective communication among staff, managers and the society which makes the enterprise ecological function runs smoothly.

5 The Effect on the Medicine Reverse Logistics Management Due to the Weak Goal “Gold”(Economic Negative Effect)

In the Five Elements, "Metal" corresponding to the enterprises economic benefit. In the relationship of Five Elements, the normal relationship between gold and the other four factors writes as follows: earth generates metal, metal engenders water, fire restricts metal, and metal restrains wood. In Five Elements Theory, five elements reinforce each other to achieve a balanced system. Once some factors' functions are excessively hyperactive or too weak, there will be “over-restriction or counter-restriction” (reverse restraint), that is, once the original balance is broken, the system function will be in disorder. The Five Elements of TCM theory holds that the human body viscera system (five zang-fu organs) corresponds to the five elements, once the balance of five zang-fu organs is broken, human health problems will occur [17]. Applying the analogical thinking principles of Chinese medicine in the enterprise system, the same thing happens in business system. Once some benefits of the enterprise in the operation are poor, benefit system can't keep balanced so that it is also difficult to carry out this operation mode.

Only the balanced five elements can make a dynamic balance. When the metal is too weak, there will be a restriction where fire over restricts metal, and wood counter restricts metal. And in terms of the “mother-organ disorder involving its child-organ”, if metal, as the mother-organ, is too little, it is hard to condensate water, and the earth can't escape too.

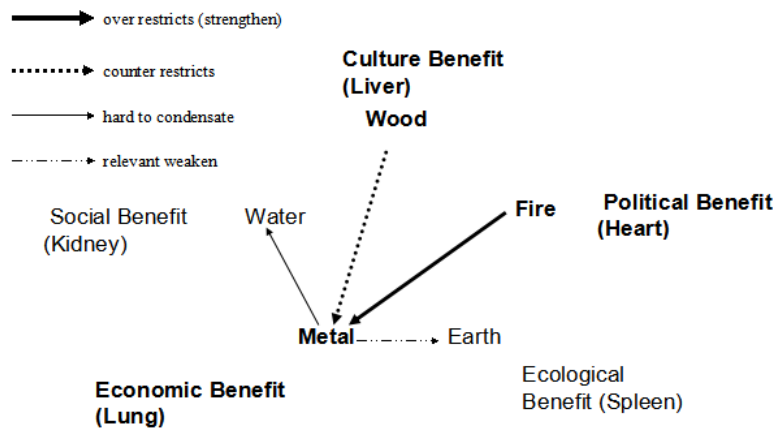

Figure 2 The Effects of the System as If the Metal Is Weaken

Reflected in the five elements of TCM, the point of view is that lung (metal) qi deficiency can cause liver (wood) yang hyperthyroidism, heart (fire)qi blazing (over-restriction), kidney (water) not steady, spleen (earth)qi weak. The negative effect of economic benefit will make the pharmaceutical enterprises lack of motivation when implement government policy. Besides, the introduction of a large number of policy and management made by government will remain on the surface (fire restricts metal), then social benefits will be weakened (metal is too little to condensate water), all of which can make the enterprise ignore or even abandon the management of reverse logistics, and finally make the ecological crisis (the mother organ “promotion element” are also effected by water.).

In 2009, my team conducted an investigation about the residents' attitude towards the abandoned drug, based on the 290 valid questionnaires analysis of Wuchang District in Wuhan City, Hubei Province [11]. We find that residents hold a absolutely high awareness that waste drugs should not be casually discarded due to the government propaganda and the influence of “environmental consciousness” [11]. But the actual environmental processing waste drug reaching rate is not high; what's worse, the measures on the recovery of abandoned drugs made by government are still in dispute, and the

cooperation between government and pharmaceutical enterprises is not smooth. The reason lies that not only the ecological benefit (society) benefits is greater than the economic benefits in medicine reverse logistics, but also the enterprises, as the recycle subject is short of any inducement. Even if the government has issued various instructions and promoted the benefits of reverse logistics vigorously, the implementation is still " Much said but little done ".

6 The Recovery of Balance by Applying TCM Concept “Syndrome Differentiation”

According to the theory of TCM diagnosis, if the deficiency of lung qi exists, the direct way is to enhance the lung qi, and the other way is to make the mother organ (spleen) strong, that is, to enhance the function of the spleen, reinforcing earth to generate metal^[17]. Reflected in the benefit system, it is that to strengthen ecological benefit (earth) research, restrain excessive regulation (fire), at the same time, the most important thing is to promote the achievement of the enterprise economic benefits (enhanced metal element function). Specifically, in order to make the social reverse logistics management effectively, it is necessary to enable the pharmaceutical enterprises gain economic benefits in reverse logistics management first. At the same time, great attention should be paid to the achievement of the five aspects of enterprise's benefit goals. Based on the above analysis, the author put forward the following opinions.

6.1 To enhance the “metal” function, in Chinese medicine, it means to notify lung qi. The government should focus on how to make the whole enterprises in reverse logistics supply chain get the economic benefits.

Economic benefit is the source for enterprise behavior. Economic benefits of enterprise are not obviously high when the enterprise constructs their private reverse logistics system^[11], the author holds the view that reverse medicine logistics in medicine supply chain should be escrowed by those qualified logistics enterprises approved by the government. These enterprises can make profits as the form of the collection of agency fees by taking advantages of scale economy effectively, and meanwhile, they will make the production enterprise free from the unfamiliar business and make a better use of corporate resources to generate more economic benefit.

As the largest pharmaceutical wholesaler in U.S.A, McKesson outsources its drug recovery to the MedTurn (CLS)^[18], which served as the third party medicine reverse logistics operators. Customers return drugs to McKesson distribution center, and then FedEx or UPS experience which has the experience of dealing with drug will transport them to CLS, which produces the most cost. In order to reduce the cost further, McKesson signs a supplier agreement with CLS that customers return drugs to the CLS processing center which is nearest to McKesson directly. The inspection and the management are implemented by the rapid response team that consisted of both sides. The SAP information management system and RFID (RF) are employed in tracking reverse medicine and identifying counterfeit drugs. McKesson has signed return agreement with the downstream customers, so that returning drugs on time is not charged^[18]. According to statistics, through the reverse logistics management, it can reduce 10% logistics cost^[18], which itself has took advantage of a "profit leverage" effect. McKesson plays a “chain master” role in the drug supply chain as a wholesaler: through the integration of drug supply chain resources, the drug supply chain cost is reduced and the efficiency is enhanced, which make the supply chain members liberated from the reverse logistics business.

6.2 To restraint “fire” function, in TCM it means eliminating excessive internal heat. The government should refrain from over publicizing and interfering reverse logistics market.

The government can continue to educate the public treat drug recycling scientifically, promote the development of the third party logistics industry, regulate medical logistics market vigorously, and promote the implementation of the access system. At the same time, the government should avoid the excessive administrative intervention to the market of drug logistics, and prevent some pharmaceutical production enterprise selling products by the government's promotion, all of which prompt consumers to buy and store excessive drug, it will create new waste.

6.3 To enhance the “earth” function, in TCM it means the supplement of the “spleen”. To enhance the study on drug safety influence factors in reverse logistics and harmfulness of environment that the improper treatment of drug recovery brings to.

A lot of data shows that pharmaceutical properties and efficacy changes may occur during transportation because of environmental factors, which may cause drug toxicity or decreased efficacy; discarding drugs is probably to cause environmental pollution^[19]. But these are not studied in depth. With the continuous extension of the pharmaceutical supply chain, the unknown changes of the

pharmaceutical drug efficacy in the logistics will be more and more. Therefore, to know these changes exactly, to control the factors that influence the efficacy and effect of the drugs in logistics, and govern the effect to human beings and the environment, will promote enterprises to manage the reverse logistics to conduct effectively. It has been widely acknowledged in the pharmaceutical industry that drugs need cold chain logistics system to be transported and stored. But the cold chain logistics of reverse logistics has not been given due attention. Since the returned drugs after being inspected and qualified will return to the normal sales channels, these drugs also need cold chain logistics^[20].

7 Conclusion

Medicine reverse logistics management involves many aspects such as enterprises, government, society and etc. In this grand system, the execution process of medicine reverse logistics management by medicine enterprises are more directly affected by their own target benefits. Therefore, there is still a long way to go on how to promote the effective implementation of medicine reverse logistics and to guarantee the people's medicine safety.

(E-mail: chenzhenhua@whut.edu.cn)

Abstract: Technological innovation is key power for enterprises to product upgrade and efficiency promotion, which is also fundamental safeguard for an economy in economic structure adjustment, optimizing and development sustainability. According to Schumpeter's theory of technological innovation, this paper has analyzed the model of technological innovation and implementing conditions, explored the power and hindrance factors of technological innovation in China's enterprises under transitional economy, and has also expounded the reasons why China's enterprises are in technological innovation low ebb is on seeking system rents path dependence. Finally, it has put forwards some technological innovation suggestions such as implementing country's innovation strategic planning, industry-policy guiding, cleaning out impediment in economic development and cutting down system rents, and improving market competitive mechanism, enhancing enterprise crisis awareness, intensifying technological innovation management tactics, building division and cooperation atmosphere, making each enterprise exert itself superiority.

Key words: Technological innovation; Innovational mode; Dilemma analysis; policy suggestion

1 Introduction

Logistics, as part of the supply chain process, is the forward and backward control process implementing in order to meet customer demand for goods, services and related information from origin to consumption efficiently, effectively. In today's competitive market economy environment, enterprise logistics is a key link in enterprise production and sales with increasingly highlights its important position and role. Low in specialization, networked and socialization, old in equipment and bad in service, poor in marketing and lack of guidance and industry coordination mechanism, low in informationization and market concentration, small in enterprise scale, inefficient in management and technology, all of which lead to poor competitiveness. This article analyzes the different enterprise innovation path, conditions and confused with the purpose to gain some enlightenments.

1.1 The connotation of technological innovation

According to different links of technological innovation, schumpeter (J.A.S chumpeter, 1912) in the *Economic Development Theory* defined it as the new combination of technological innovation, including five types: new products or services, new methods of production, new markets, new sources of materials and new organization.^[1]

Technological innovation, coming from a new idea, can make new product or service, production method or process, new materials, developing new market and constructing a new organization, especially stressing the guidance of new ideas. Myers and D.G. Marquis (1969) put forward the technological innovation is a complex process, the new ideas, new concepts, by constantly solving problems; end up with an economically-valued and socially-valued new projects.^[2] This concept connotation is narrow, particularly emphasizing the innovation of new ideas.

2 Implementing Condition of Different Technological Innovation New Mode

For a specific enterprise, innovation may be characterized by one or more aspects of the comprehensive implementation. To simplify the analysis, this article, based on innovation main body and the power, discusses the path and conditions of the different technological innovation.

In economic analysis, some scholars believe that demand for change is the main driving force of technological innovation. Through the measure of the investment and invention activities analysis, they found that changes in demand lead to innovation.^[3] enterprise technological innovation follows certain orbit, that is to say by starting market tested the product or service innovation can be achieved. Once the innovation design is appropriate, innovation will leads the enterprise to the development of the unit cost

reducing and production boosting.^[4] But tensile strength of the market demand is necessary and cannot be a sufficient condition of the success of technological innovation. There are still many unsatisfied demand market. Innovation complex scientific knowledge and take in a specific enterprise and time formed by the combination of technological innovation.^[5] With the view that, combining with an efficient market demand and development of science and technology create successful innovation. This article only involves in all kinds of technological innovation subjects, innovation-supported information collection and study, in order to show different path dependence on the pattern of technological innovation.

In the product or service innovation, the product or service innovation success is absolutely significant innovation, which involves the enterprise management in the market competition, customer information collection, sorting and analyzing. knowledge reserves and technology research and development in a product or service innovation, repeatedly market test process In the research and development of a product or service, test the necessary manpower and material resources, funding and necessary preparation technology of huge investment , *etc.* in information support, technology research and development and.

Production method or process innovation is a kind of technological innovation, reducing costs and improving efficiency in the implementation process. The enterprise conducts production technology or technological innovation or improvement. Absolute production method or technique innovation requires totally new thought and scientific knowledge accumulation. Through trial, technical research and development obtain success at last. The most important is to have new ideas and technology research and development personnel reserve, or at least other unit technology for joint research.

Innovation of raw material supply source, invention and production of new materials with certain features, functions to replace the existing material, which are significant innovation. For significant innovations for material source, it needs complete and long development process, and may consume more resources, involved in decision making, information, technology research and development, financial support and many other departments. Also have to amend the existing materials innovation or exploit new supply channels, existing materials to prevent the shortage of material supply and costs rose sharply, and this needs to be associated with technical department, Marketing Department, relatively speaking, cost will less manpower, financial and technical strength.

Significant market innovation is clearly a part of significant product or service innovation. The difficulty of market innovation lies in how to capture the market potential consumer demand information, to form the enterprise feasible new business unit, in order to meet the potential demand of the consumers. It requires acute and long-term vision carefully thinking, higher requirements for market research personnel. The enterprise existing products or services sold to there is no other competition market, the market can only exist in a certain amount of time and space. There is more and more enterprise existing product or service into the competitor's market, occupying the market by comprehensively use of the price and marketing strategy. This requires the enterprise market staff's enthusiasm and efforts to search for information, to analyze the consumer and to find and exploit this opportunity.

The realization of the new organization innovation path depends on the organization of the main leaders' clear strategic thinking. They can carry on the comprehensive and systematic analysis according to the content and characteristics of enterprise business objectives and requirements, advantages and disadvantages of existing organization, and mobilizes all members of the organization to the organization structure, rules, and other fields around the goal of enterprise management. In addition, it calls for junior staff, consistently cooperating actively. It brings bigger impact to the each department of the organization's members. It takes a long time, consumes more resources, and need to formulate reasonable steps to complete innovation gradually.

Therefore, an enterprise must have a positive innovation, technological innovation from the leadership to the staff and have diligently enterprising spirit. The implementation of different innovation must have the manpower, financial and technical basis for guarantee, forming a union between various enterprise departments. Enterprise innovation must capture information such as market, economy development and the policy environment. And it should take the advantage and avoid the negative impact of the environment as far as possible. Last, it should shorten the innovation time and reduce the cost of resources, in order to successfully implement innovation.

3 China's Enterprises Technological Innovation Difficulties

Enterprise technological innovation needs to have certain conditions, such as economy, talent and technology foundation, with fully grasping the role of market, economy and policy environment. Two attributes according to the ownership and scale, the enterprise can be divided into state-owned large enterprises, three types of large private enterprises, small and medium enterprises.

Being large scale, large state-owned enterprises is the dominant force in the national economy stable development, and is the main force of technological progress and the national main tax source, accumulated a lot of technical personnel and management personnel. Because of its large scale, well-funded, sufficient technical personnel, state-owned enterprises have strong economic strength and technical strength to support technological innovation.

Large state-owned enterprise in tax, employment bear the heavy mission. When implementing a great innovation, it need strategic planning and invests a lot of manpower, financial resources, and take a long time which limit its decision-making. And the decision tends to be short, frequent and fast innovation mode, such as the introducing of foreign eliminated but at home temporarily or feasible technology and equipment, enlarging the sales market of existing products, introducing other enterprise or industry product, service, overly diversified management, or five types of innovation in some spots of minor improvements.

Large and medium-sized private enterprises inject vitality of China's economic development and system reform and contribute greatly in the employment and tax revenue to society. Large and medium-sized private enterprises can provide good condition for technological innovation in the economic scale, talent pool and technology basis. Innovative entrepreneurs can make significant innovation positively. This is the only way for private enterprises from small to large and the fundamental guarantee.

Small and medium-sized private enterprises made a significant contribution in the economic and social development to promote the economic growth, convenient people's life and increase the employment. It is an indispensable economic subject in the process of economic development in our country. Private flexible management style, various forms of financing for small businesses, the operation time, such as free and low operating cost has obvious advantages, can capture the market supply and demand information in time, and adapt to the market mechanism of economic subject. These are the advantages of technological innovation in private businesses.

But whether state-owned enterprises or private enterprises, although they are different in their technological innovation conditions, they share some common disadvantages exist in the aspect of technological innovation, embodied in: weak in innovation strategy consciousness, the main management contenting with the status, underpowered progress; Innovation enthusiasm is not high; market competition effect is not strong; the pressure on technological innovation and timing, not to the poor economic situation, suffered persecution, only as a last resort for technical innovation and structural adjustment; Innovation investment dynamics is insufficient, infatuated with eyes have special rights and privileges, seeking rent "system"; Enterprises "internal market" is not sound; the innovative mechanism is not perfect, and not motivate innovation power.

4 Conclusion and Suggestions on China's Enterprises Technological Innovation

Technological innovation is critical factor of the country's economic structure adjustment and industry technology upgrades. Aiming at the advantages and disadvantages of all kinds enterprise innovation conditions, giving suggestions from the level of national and enterprise level respectively.

Firstly, enterprise should strengthen information collection and technology research, develop direction of technological innovation and strategic planning, improve the guidance and the preferential support on technological innovation. In today's information economy society, technology changes rapidly. It is the struggling target for domestic enterprises and research institutions that Studying on the technical gap with developed countries in all walks of life, narrowing the gap and catching up with developed countries. Executing a competitive incentive, the selecting number of fund units, timely to supervise and to give additional support, in order to narrow the gap between our country and the technology of developed countries. Furthermore, it should strive to gradually master the core technology in all walks of life, improve the added value of national economic development in the technology.

Secondly, enterprises should formulate the reasonable policy of industrial upgrading and technological innovation, use administrative, fiscal, taxation and financial means; arouse the enthusiasm of technology innovation of large state-owned and private enterprises. Large state-owned enterprises should bear the mission of technical innovation, but large state-owned enterprises in the innovation

strategy thought on passive, at risk for innovation action concerns. SASAC and other government management department should adjust the management criteria of state-owned enterprises according to the need, increase pressure on large state-owned enterprises in technological innovation, avoid rely solely on policy given the dominance of state-owned enterprises, only by increasing sales and occupying the market low level competition, promote the technical level, product quality, high level competition. By implementing the method of fair, open, cherry-picking technological innovation support, government assists by means of fiscal, tax, financial and other support for breakthrough. It should prize the core technology innovation. the national in respect innovation, positive innovation, and create the atmosphere of respecting innovation.

Thirdly, enterprises should implement the strategy of technological innovation management, maintaining a long-term innovative ideas, strengthen crisis consciousness of in time of peace prepare for war. Our country enterprise excessively pay attention to short-term interests and crowded in a small production, product management. In economic boom period, enterprises usually takes to increase production, expand sales, occupy the market as much as possible to increase short-term sales, maximize profits, ignoring economic boom after the excess must be existing excess production capacity, product, facing the plight of technology, product upgrading. In better-off business period, enterprises do not order the manpower and money for research and development in advance. When the time the poor economic conditions comes, the enterprise capital operation have difficulties in technology innovation, just on economic recovery. In fact, the economy develops more sophisticated rather than simply repeat high - low – high mode, but in terms of technology, product has a lot of improvement on the basis of a Renaissance. Therefore, the enterprises should prepared for the technology innovation in order to win the next opportunity better. When running smoothly, the enterprise shall have the ability to invest more technical innovation, to greet the arrival of the next economic boom.

Fourthly, enterprises should make reasonable allocation policy, people-oriented, weaken the capital owner has too big distribution of privileges, wipe out the system of technology innovation, reduce economic rent system obstacle. Technological innovation to strengthen the role of human capital may weaken the allocation of capital owners. This creates a block the main factors of technology innovation in today's society. Like the late feudal society, the landlord class land ownership is the factors hindering the research on the social progress. "This privilege corrosion will maintain this privileged social vitality"^[6], in a society, enterprise and individual pursuit of pouring system rental hindered the pace of technological innovation forward.

Fifthly, to promote division of labor cooperation between large and medium-sized and small enterprises and technological innovation synergy is by strengthening the construction of standardization of technology products, the realization of technology system decomposition. According to product standardization for technology and function decomposition, many large and medium-sized and small enterprises technological innovation needs the close collaboration between each other. It is advantageous for the industry chain to realize the reasonable division of labor, associated body so as to give full play to the large and medium-sized enterprise research and development power of technology, talent and capital, also transferring the small business vitality.

Abstract: With the nearly ten years in the development of manufacturing industry in the national economy increasingly prominent position, manufacturing technology innovation related problems are highly noticeable around the world. Based on the domestic and foreign scholars research achievements in the field of technological innovation we have an in-depth study and research, analyzing of the DEA method for manufacturing the applicability of the technology innovation efficiency evaluation. Then we put forward the four technical innovation output indicators and six technology innovation investment index of Wuhan manufacturing industry technological innovation efficiency evaluation system. What's more, we apply the Win4DEAP software to 26 Wuhan manufacturing industry enterprises in 2013 the relevant data for processing of using the method of data envelopment analysis (DEA) to its technological innovation efficiency is evaluated, to explore Wuhan manufacturing industry technological innovation efficiency solutions to problems.

Key words: Wuhan manufacturing; Technological innovation; Efficiency evaluation; Data envelopment analysis (DEA)

1 Introduction

As the national economy material foundation and main industry, manufacturing is developing rapidly in the nearly ten years and plays an increasingly prominent role in the development of national economy. The total output value of Wuhan manufacturing industry enterprises in 2004 was 149.617 billion yuan, in 2013 reached 1.024287 trillion yuan, year-on-year growth rate of 123.83%; And manufacturing industries output value proportion of the total output value of industrial enterprises has increased from 79.71% in 2004 to 98.44% in 2013 [1]. Ruan chengfa in Wuhan in the 12th party congress pointed out that "manufacturing is the cornerstone industry in Wuhan, of china we should attach great importance to the development of the real economy, unswervingly implement the strategy of industrial powerful city, to promote" industrial doubling plan ", to build our city into a national advanced manufacturing center to lay a solid foundation. As for the increasing contribution of Wuhan manufacturing industry in the Wuhan economic and social development, various problems in the development of Wuhan manufacturing, especially the technology innovation problems are more and more noticeable.

2 Literature Review

Abroad, Joseph Schumpeter (J. A. Schumpeter) firstly began to theoretical research on technological innovation, in 1912 he published A book of economic development theory and put forward the concept of technological innovation, for the first time in the book points out that the innovation is entrepreneurs to obtain profit potential and the factors of production new combination [2]. After the theory, represented by Solow, and other scholars believe that the nature of the technology is the same with labor and capital and also an important factor of economic growth. But technological innovation is the endogenous variable [3]. Since the 1950s, many foreign scholars have done a lot of empirical research on technology innovation, in which Mr Brown (1957) published "the innovation of the machine tool industry" in the journal of economics and the university of Sussex in England set up science policy research in this respect is a typical representative.

At home, many scholars from different angles, using different methods to do a lot of research on technological innovation, early Hai Shan Wang (1993) analyzed the UK, Canada, Italy and other foreign technology innovation index, and summarized the research situation analysis, based on the proposed by

* This paper is supported by Wuhan city circle manufacturing industry development research center, 2014 tender subject "comparative study in Wuhan and Guangzhou manufacturing innovation ability" (NO.WZ2014Y14)

the input index and output index and process indicators of three kinds of index of state (or region) and enterprises (or sector) evaluation index system of technology innovation in terms of comprehensive strength and level of^[4]. Tang Yanzhao, Zou Shangang (1999) on the basis of gray evaluation theory and by comparison method, puts forward the multi-level gray evaluation method of enterprise technology innovation ability, for the objective evaluation, timely adjustment of enterprise technology innovation strategy provides a reliable basis for^[5]. ChaZhiMin, durso double et al. (2004) to build the enterprise technological innovation ability evaluation index evaluation system, by using the theory of analytic hierarchy process (ahp) to China's 2001 large and medium-sized industrial enterprises technical innovation comprehensive ability evaluation^[6]. Yun-fei shao, Justin tan (2006), the formation mechanism of regional technology innovation ability has been discussed in detail the definition, and the connotation of regional technology innovation ability and system structure for the theoretical basis, the forming mechanism of regional technology innovation ability model, the fuzzy mathematical method has carried on the empirical analysis^[7]. Ma Xiandi, ZhuangYu et al. (2007) using DEA method with preference enterprise technological innovation ability to establish a evaluation model, and a case of five representative enterprises, draw a preference model of DEA method which can scientifically evaluate the enterprise's technological innovation status and reasons for diagnosis, conducive to enterprise to make the technical innovation strategy, such as high-level conclusion^[8]. Guo Lei, zhi-ying liu zhi-xiang zhou (2011) innovation in the cross efficiency model of data envelopment analysis is used to the evaluation of regional technical efficiency, and analytic hierarchy clustering method is introduced into clustering similar size of technology innovation investment provinces to study^[9]. NiuZeDong, Zhang Qianxiao (2012), using related industry panel data in 1997-2010 as samples, adopts the output distance function based stochastic frontier analysis method to calculate the technical efficiency of the equipment manufacturing industry in China innovation production activities, and the scale efficiency of it is concluded that by improving the ownership structure. With the conclusion of improve enterprise scale can effectively promote China's equipment manufacturing industry technological innovation efficiency improvement and so on^[10].

Academic circles at home and abroad using a variety of methods in different areas and different fields do a lot of theory and empirical research on technological innovation, is study of Wuhan manufacturing industry technological innovation efficiency, however, very few. This article will combine the current situation of Wuhan manufacturing, selection of Wuhan manufacturing technology innovation of the original indicators, using DEA method of efficiency evaluation, aiming to find the existing problems in the development of technology innovation.

3 The DEA Method to Evaluate the Applicability of the Wuhan Manufacturing Industry Technological Innovation Efficiency

Fuzzy mathematics and analytic hierarchy process (ahp), grey prediction methods of pre-assessment for multi-objective evaluation, because of large amount of calculation, the determination of evaluation index weight with strong characteristics of subjectivity, makes the evaluation result is impartiality. Due to the relatively strict hypothesis test of factor analysis leading to frequent index adjustment, and makes the index classification method and index of economics to explain too far-fetched, the analysis results are often unsatisfactory.

Wuhan manufacturing industry technological innovation efficiency evaluation, need to consider multiple input and multiple output indicators, most of which index formula and the weight is difficult to set up the production in advance. DEA model of evaluation is similar as a frame of reference for comparative analysis, no preset production function and weight, for input and output of technology innovation activity has good applicability, objectivity; Finally, the DEA model of data processing, can not restricted by the input and output indicators dimension selection, without prior to correlation analysis of indicators, making data processing is simple and feasible. In view of the above reasons, this article choose DEA method to evaluate the Wuhan manufacturing industry technological innovation efficiency.

4 Wuhan Manufacturing Industry Technological Innovation Efficiency Evaluation System

For scholars of the selection of the index system of technology innovation are diversified, such as hai-shan wang (1993) to put forward by the input index output index and process indicators of three kinds of index of state (or region) and enterprises (or sector) evaluation index system of technology

innovation in terms of comprehensive strength and level of ^[4]. By the innovation of system, Chen Yufang (2006) design output performance and the performance of the two aspects of innovation process is given priority to with product innovation performance evaluation index system of enterprise technology innovation ^[11]; De-yuan zhang, Zhang Jiexi (2013) built by the environment of technology innovation, technology innovation and technology innovation input-output three categories of agricultural technology innovation capability evaluation index system ^[12]. Follow the scientific nature of the index selection, consistency, and comparability principle, together with the present situation of the development of the manufacturing industry in Wuhan, this article selects six five input index of technological innovation and technological innovation output indicator of constructing Wuhan manufacturing industry technological innovation efficiency evaluation system (as shown in table 1).

Table 1 Wuhan Manufacturing Industry Technological Innovation Efficiency Evaluation System

	Category	index	Calculation method
Technology innovation investment	Science and technology input	R&D spending	R&D Intramural Expenditure(\$one thousand)
		R&D personal input	total staff
		R&D institution input	R&D activities of companies
		Science and technology projects	Number of projects
		Technical renovation expenses	The technical reconstruction spending
	New products input	New products input	New products development spending
Technology innovation output	S&T output	Invention patent output	Effective number of invention patents (items)
	Profit output	Profit output	Total profit(\$one thousand)
	New Product Output	New product sales output	Sales of new products(\$one thousand)
		The output value of new products	New product output(\$one thousand)

5 Wuhan Manufacturing Industry Technological Innovation Efficiency Evaluation

According to table 1 of Wuhan manufacturing industry technological innovation efficiency evaluation system, this article selects the 31 Wuhan manufacturing industry in 2013 as the research object is analyzed. Based on the principle of comparability index study, considering the leather rushes down and its manufacturing, oil processing and coking and nuclear fuel processing industry, chemical fiber industry, non-ferrous metal Smelting and rolling processing industry, resource waste and old materials recycling industry five industries in multiple aspects of technological innovation input and output index of zero, so will the five industries, only for the rest of the 26 industry using DEA analysis software.

Using 26 Win4DEAP software of Wuhan manufacturing industry technological innovation input and output of 10 2013 index to calculate. Selection of investment orientation, scale reward variable DEA (1 - stage) model to calculate and get the analysis results of table 2. According to the calculated data of table 2 for the purpose of intuitive, also made entirely of Wuhan manufacturing industry technical efficiency (as shown in figure 1).

From the above chart shows, the Wuhan manufacturing industry technological innovation rate exist the following problems:

The table 2 and figure 1 shows that in the analysis of the 26 Wuhan manufacturing industry, the comprehensive technical efficiency index of average of 0.852; 16 industry technology innovation efficiency index is 1.00, is in a state of technical efficiency effectively; Technological innovation efficiency index in 0.5 ~ 1 industry has six; But agricultural food processing industry, fabricated metal products, railway, shipbuilding, aerospace and other transportation equipment manufacturing, handicrafts and other four manufacturing industry technological innovation efficiency values are below 0.5, low efficiency of technological innovation, the input and output adjustment needs.

Table 2 Win4DEAP Software Evaluation Results 1

Trade	The comprehensive technical efficiency	Pure technical efficiency	The scale efficiency	The size of the returns
Food manufacturing	1.000	1.000	1.000	The same
Beverage manufacturing	1.000	1.000	1.000	The same
The tobacco industry	1.000	1.000	1.000	The same
Wood processing and wood, bamboo, cane, palm, grass products	1.000	1.000	1.000	The same
Furniture manufacturing	1.000	1.000	1.000	The same
Paper and paper industry	1.000	1.000	1.000	The same
Printing and recording media copy	1.000	1.000	1.000	The same
Cultural and educational sporting goods manufacturing industry	1.000	1.000	1.000	The same
Chemical raw materials and chemical products manufacturing	1.000	1.000	1.000	The same
Pharmaceutical manufacturing	1.000	1.000	1.000	The same
Rubber and plastic products	1.000	1.000	1.000	The same
Non-metallic mineral products	1.000	1.000	1.000	The same
Black metal smelting and rolling processing industry	1.000	1.000	1.000	The same
General equipment manufacturing industry	1.000	1.000	1.000	The same
Car manufacturing	1.000	1.000	1.000	The same
Communication equipment, computers and other electronic devices	1.000	1.000	1.000	The same
Instrumentation and cultural office machinery manufacturing	0.970	1.000	0.970	diminishing
Special equipment manufacturing	0.949	1.000	0.949	diminishing
Electrical machinery and equipment manufacturing	0.802	1.000	0.802	diminishing
Metal products, machinery and equipment repair	0.702	0.702	1.000	The same
Textile industry	0.697	1.000	0.697	increasing
Textile and garment, shoes and hats manufacturing	0.632	0.760	0.832	diminishing
Railway, shipbuilding, aerospace and other transportation equipment manufacturing industry	0.481	0.485	0.993	increasing
Agricultural and sideline products processing industry	0.472	1.000	0.472	diminishing
Fabricated metal products	0.370	0.413	0.898	diminishing
Arts and crafts, and other manufacturing industries	0.072	0.399	0.180	increasing
The mean	0.852	0.914	0.915

Table 3 Win4DEAP Software Evaluation Results – 2

Output slack variable values				
trade	Effective number of invention patents (item)	New product sales (\$one thousand)	New products output (\$one thousand)	Profit (\$one thousand)
Textile and garment, shoes and hats manufacturing	0.000	0.000	13193.965	0.000
Fabricated metal products	0.000	0.000	54606.617	0.000
Other transportation equipment manufacturing industry	0.000	0.000	558641.314	0.000
Arts and crafts, and other manufacturing industries	0.000	9693.774	11661.659	115701.263
Metal products, machinery and equipment repair	0.000	11451.526	14211.579	134791.211

Table 4 Win4DEAP Software Evaluation Results

Input redundancy variable values						
trade	R&D spending (\$one thousand)	R&D staffl (a)	R&D Activities companies (unit)	R&D numbers (item)	New product development (\$one thousand)	The technical reconstruction spending (\$one thousand)
Textile and garment, shoes and hats manufacturing	27967.600	180.231	0.835	0.000	12285.750	25490.582
Fabricated metal products	17716.503	371.574	0.000	4.103	0.000	0.000
Other transportation equipment manufacturing industry	24492.186	1418.717	0.000	0.000	0.000	25938.085
Arts and crafts, and other manufacturing industries	5343.947	12.982	0.000	0.000	0.000	0.000
Metal products, machinery and equipment repair	26993.684	124.070	0.281	0.000	20968.509	0.000
Input redundancy variable values	R&D spending (\$one thousand)	R&D staffl (a)	R&D Activities companies (unit)	R&D numbers (item)	New product development (\$one thousand)	The technical reconstruction spending (\$one thousand)

1) technological innovation efficiency of effective industry scale reward have increased

In 10 comprehensive technical efficiency value is less than 1.0 in the industry, textile industry, railway, shipbuilding, aerospace, and other transportation equipment manufacturing, crafts and other three manufacturing industry scale reward, the investment evaluation system in the corresponding input indicators, will be good for the industry to promote the efficiency of technology; Instrumentation and cultural office machinery manufacturing industry, special equipment manufacturing, electrical machinery and equipment manufacturing, textile and garment and shoes manufacturing, agricultural food processing industry, fabricated metal products and other six industry presents the diminishing returns of scale, the need to reduce the corresponding indicators into the indicator system of the inputs to improve the efficiency of technology.

2) the technical efficiency is low industry is faced with the problem of insufficient input redundancy and capacity

The table 3 and table 4 shows that textile and garment, shoes and hats, fabricated metal products manufacturing, railway, shipbuilding, aerospace and other transport equipment manufacturing, handicrafts and other manufacturing, metal products, machinery and equipment

repair 5 low technical efficiency industry are faced with input redundancy and the problem of insufficient capacity, should be listed in the table refer to adjust resource, to improve the efficiency of technology innovation of the five industries.

Literature Review on the Service Quality in Higher Education for International Students in China Based on Services Marketing

Dai Fang¹, Song Ruoyu², Yuan Guohua²

1 Wuhan Int Trade Univ, Sch Management, Wuhan, P.R China, 430205

2 Wuhan University of Technology, Wuhan, P. R China, 430070

(E-mail: whicudaifang@126.com, yuanguohua@whut.edu.cn)

Abstract: With the rapid development of the international education in China, the quality of education service for international students is drawing great attention for all the parties. By researching related literatures about the current situation of education service for international students in China, quality evaluation models both at home and abroad, and the promotion strategies for the service quality in China, this paper lays a foundation for further research of the quality of international student educational service, from the angle of services marketing.

Key words: Services marketing; International students in China; Quality of higher education service

1 Introduction

In recent years, service management, marketing and other advanced theory of management have been gradually leading the new trend of higher education research. Services marketing theories are frequently applied to higher education research by foreign scholars. How to use the concept and the model of services marketing to carry on the service quality in higher education research has been the focus of attention of the scholars. Under the macro background of the internationalization of higher education, the education for international students has developed rapidly; however, the service quality has not been taken seriously in the process. Although the domestic scholars have done an in-depth research, most of the researches focus more on management and few are about feasible and applied researches in improving the quality. Therefore, the necessity of this research area is determined by the particularity of higher education for international students in China and shortcomings in the current research. Based on services marketing theory, this paper summarizes and analyzes the present situation of the service quality of higher education for international students in China in recent years; meanwhile, it sums up and sorts out the evaluation model of the service quality in higher education overseas and in China. Furthermore, it puts forward some strategies on how to improve the service quality in higher education for international students in China. In this way, it can provide references and enlightenment for future academic study and educational practice.

2 The Present Situation of the Service quality in higher education for International Students in China

2.1 The number of international students increases rapidly, but the origin of student and colleges distribute unevenly

In recent years, the number of international students has been increased more than 20% per year. According to the China Education Yearbook for 2012, the total number of international students studying in China exceeds 290,000 in 2011 for the first time. Compared with 2010, the total number of international students in China increased by 27521, an increase of 10.38% and it has set a new high since the founding of New China. Although the number of international students increases rapidly, but over half of them come from Asia, very few from European and American areas. Therefore, the origin of student distribute unevenly. As shown in Table 1.

Table 1 2009-2011 The Number and Proportion of the Origin of International Students in China

Continent	2009		2010		2011	
	Number	Proportion	Number	Proportion	Number	Proportion
Asia	161,965	68%	175,805	66.32%	187,871	64.21%
Europe	35,728	15%	41,881	15.8%	47,271	16.15%
America	25,486	10.7%	27,228	10.27%	32,333	11.05%
Africa	11,909	5%	16,403	6.19%	20,744	7.09%
Oceania	2,620	1.1%	3,773	1.42%	4,392	1.50%

In addition, there are 544 colleges that are qualified for enroll international students, and there are 76 colleges in Beijing alone. Under the effect of the famous schools, more and more foreign students prefer to choose prestigious universities. As a result, a short supply of students plagues some general universities, even distinctive colleges.

2.2 The whole education level maintains a healthy rate of growth, but the high-level curricula education develops slowly

International students are divided into two categories: degree students and non-degree students. The former includes doctor degree students, master degree students, undergraduates and junior college students; the latter includes senior scholar students, general visiting students and short-term international students. According to the China Education Yearbook, the total number of international students who attend degree courses in China is 118,837, accounting for 40.61% of the total number, a rise of 11,405 compared with 2010 and an increase of 10.62%. The total number of doctor degree students and master degree students is up to 30,376, an increase of 25.57% over 2010, and there are 23,453 master degree students and 6,923 doctor degree students. Thus it can be seen that the whole education level maintains a healthy rate of growth, but the high-level curricula education develops slowly. As shown in the Table 2, The increase in international students mainly results from the growth of students without degrees; furthermore, the growth of students with degree is mainly due to the increase in undergraduates. Therefore, the number of students still remains in a lower-level expansionary phase.

Table 2 Year 2009-2011 The Education level of International Students in China

Level	Year Number	Non-degree Students	Degree Students		
			In Total	Including	
				Undergraduates and Junior College Students	Master and Doctor Degree students
2009		144,734	93,450	74,472	18,978
2010		157,658	107,432	82,566	24,866
2011		173,774	118,837	88,461	30,376

(Source of Processing of Data: China Education Yearbook)

2.3 The management of international students has been gradually improved, but the awareness of quality management remains undeveloped at large.

In recent years, China has kept reformed and innovated administrative system for international students and meanwhile, universities, as the subject of managing international students, have more autonomy increasingly. The management of international students involves many factors, mainly including enrollment, entry and exit procedure settlement, and status management, teaching management, ideological education and daily life management when they study abroad. Although education management models for international students vary from one university to another in China, and both the government and universities have built the corresponding mechanism and management systems to make sure the management of international students to go on smoothly.

Meanwhile, in spite of the increase in the numbers of international students, the difference of the qualification of administrative staff and teachers and management methods, the management of international students in each school is still very mechanical. In addition, quality management is not included in the process of management, so the administrative staff lacks a sense of service and quality.

3 International marketing of Higher Education Services

Considering the current situation of the higher education service for international students, it's urgent to enhance awareness of international marketing of higher education services, built its international brand and improve the market competitiveness.

International higher education service, which is also a typical product, has the same basic features of service products--the invisibility, inseparability, perishability and heterogeneity of production and consumption^[1]. These characteristics put forward some special requirements on the international marketing of higher education. Therefore, firstly, build international brand awareness of higher education services, establish schools' international fame and brand image and pay attention to value-added products of higher education services; secondly, give full play to its price advantages and make scientific pricing on the basis of cost accounting; finally, expand new ways of international marketing of higher education service, for example, how to build teaching projects abroad through

strategic alliance and how to implement transnational distance education by technological medium.

4 Literature Review of Empirical Research on Evaluation Models for the Service Quality in Higher Education

There are mainly two kinds of evaluation models for the service quality in higher education by scholars overseas and in China: one is the SERVQUAL model. This model first was proposed by three academics Parasuraman, Zeithaml and Berry, and its theoretical core is 'service quality gap model' which means the service quality depends on the difference between the service level customers perceived and the service level they expected^[2]; The second is SERVPERF model. This model research shows that it is sufficient to measure directly service quality customers perceived without having to measure expected quality when we measure the higher education service quality, and service quality customers perceived can be measured directly by service performance^[3]. In addition, other scholars have put forward or developed some new evaluation models, such as Brady's perception quality model. The model suggests that service quality is a kind of perception in essence, which is decided by the comparison between customer's service expectation and the actual service. Among the evaluation models of the higher education service quality, the SERVQUAL model and its evolution models are most often used^[4]. Scholars like Kay pointed out that the reason is that the SERVQUAL model has strong practicability and sensitivity in collecting and analyzing education service information of students' perception^[5].

In the empirical study of higher education service quality, the researches of domestic and foreign scholars mainly focus on higher education quality evaluation of Chinese students, but the studies of college students' education service quality evaluation are relatively rare. This paper summarizes empirical study of higher education service quality evaluation model by some scholars both overseas and in China in recent years, as shown in table 3.

Table 3 Empirical Research on Evaluation Models for the Service Quality in Higher Education Overseas and in China

Category	Researchers and Time	Sample	Model	Dimensionalities of the Model	Scale Design
Overseas	Gary Don Schwantz (1996) ^[6]	92 fresh graduates and 116 on job students from the Texas Tech University in America	SERVQUAL Model	5 Dimensionalities: Tangibility, Reliability, Responsiveness, Assurance and Empathy	39 Questions
	Owlia and Aspinwall (1998) ^[7]	205 Students and 40 Teachers from the University of Birmingham in England.	Revised SERVQUAL Model	4 Dimensionalities: Academic Resource, Capability, Attitude and Content	19 Questions
	Martin A. O'Neill and Adrian Palmer (2004) ^[8]	368 Students from a State University in Western Australia	Revised SERVPERF Model	3 Dimensionalities: Procedural, Empathy and Tangibility	22 Questions
	Robert J. Angell (2008) ^[9]	170 Postgraduates from the Faculty of Social Science and Economics at the University of Plymouth in England	Revised SERVQUAL Model	4 Dimensionalities: Study, Relaxation, Employment and cost	20 Questions
In China	Zhu Guofeng, Lan Xingfang (2003) ^[10]	345 Students from Zhejiang Institution of Communication	SERVQUAL Model	5 Dimensionalities: Tangibility, Reliability, responsiveness, Assurance, Empathy	22 Questions
	Luo Changfu (2005) ^[11]	146 Students from the School of Graduate of Chinese Academy of Agriculture Science	Revised SERVQUAL Model	6 Dimensionalities: Tangibility, Reliability, Responsiveness, Assurance, Empathy and Overall Perception Quality	40 Questions
	Gu Jiafeng (2006) ^[12]	288 Students from Peking University	Revised SERVQUAL Model	6 Dimensionalities: Interactivity, Reliability, Value, Assurance, Caring and Appearance	24 Questions
	Hu Zixiang (2006) ^[13]	239 Students from a university	Perception Quality Model	9 Dimensionalities: Brand Image, Employment Service, Curriculum, Emotion, Teaching Process, Reliability, Talent Cultivation, Teaching Conditions and Service for Life	35 Questions
International Students	Tomkovicck Chuck and Al-Khatai Jamal (1996) ^[14]	282 International Students from a S	SERVQUAL Model	5 Dimensionalities: Tangibility, Reliability, Responsiveness, Assurance, Empathy	20 Questions
	Mao Lunhua (2006) ^[15]	61 Students from Shanghai Institution of Physical Education	SERVQUAL Model	6 Dimensionalities: Inputs Quality, Core Service, Ancillary Service, Teacher-Student Interaction, Students Interaction, Outcome Quality	35 Questions
	Rodney Arambewela and John Hall (2006) ^[16]	573 International Students in Victoria, Australia	SERVQUAL Model	5 Dimensionalities: Tangibility, Reliability, Responsiveness, Assurance, Empathy	36 Questions
	Bradley R. Barnes (2007) ^[17]	102 Students from China in a University in England	SERVQUAL Model	5 Dimensionalities: Tangibility, Reliability, Responsiveness, Assurance, Empathy	19 Questions

Through the researches by the scholars overseas and in China on the evaluation model for the

service quality in higher education for local and international students, it can be concluded that both of them adopted SERVQUAL evaluation model that is more widely used, or revised and developed them on the basis of this model. However, the cultural differences, communication and environmental adaptation and other factors were taken into account when designing the model dimensionalities and the items of the questionnaire of evaluation for the service quality in higher education for international students.

5 Literature Review of Ensuring the Service Quality in Higher Education for International Students

5.1 Adhering to the customer-oriented marketing philosophy

Customer-oriented higher education means that the whole staff and relevant personnel of universities should regard customer orientation as the principle and put students at the center of the service, meanwhile, all staff are required to have motivations and skills of serving students, furthermore, they have to improve the service level according to the needs of students. Customers markets of higher education are characterized by customer diversity, exchange network, lifelong customer value, the diversity of student role, and the complexity of the consumer decisions^[18]. Universities in China must change service concept, adhere to the customer-oriented marketing philosophy, and apply the advanced marketing theories and methods to improve the overall quality of the foreign student education service.

5.2 Improving each education service products

From the perspective of students, higher education service products is a relatively broad concept, mainly including the level of teachers, management service awareness, hardware facilities, logistic services and other aspects. For teaching management, universities should integrate teaching resources, attach great weight to the training of teachers for international students' education, and improve the level of English teaching; on the other hand, universities should increase the teaching management, adjust and improve the teaching plans and course arrangement according to the ideological difference of Chinese and foreign education; in addition, universities should be supposed to further deepen the educational reform of the international students, raise the overall level of education and increase its appeal overseas. For infrastructure investment, universities should add the investment on the hardware facilities, improve the learning and living environments for students, especially speed up the utilization and research on multimedia and network teaching through a variety of channels.

5.3 Formulating diversified pricing strategies

Targeted at different kinds of origin of student, pricing of universities mainly formulate the corresponding strategies in terms of tuition fee, scholarships and allowances for learning. The universities in China can formulate appropriate financial aid and scholarship systems by drawing common practices from foreign universities. In the admission process, universities should reward foreign students with good examination results or remarkably comprehensive quality by tuition-fees exemption and providing them with entrance scholarships. Universities should give work-study posts to international students with poor economic conditions according to their personal skills and characteristics.

5.4 Making an all-around marketing promotion

The overseas promotion of universities intends to strengthen international students 'recognition of China and Chinese universities' brand and enhance the reputation of China and Chinese universities, thus making international students customer resources. On the one hand, universities should 'go global' to expand its influence by means of the international education exhibition and the international public welfare activities; try to get more subject authentications by international authorities; try to offer publicity on the media such as broadcasting stations abroad and newspapers; On the other hand, universities realize the transformation of their own resources by "bringing in" strategies, such as making use of alumni effect, keeping in touch with overseas alumni and returned students at regular intervals, or holding a variety of alumni gatherings. In this way, overseas students can be attracted with the help of their positive impact in the industry.

5.5 Expanding diversified enrollment channels

Traditional channels in universities is generally a "admission dicing" model, but as the years went by, delivery channels of higher education service have moved forward in the direction of diversity, networking and internationalization. Overseas recruitment channels can adopt the diversified model, including internal channel, external channel and network. For internal channel, it sends teachers to recruit students abroad and to attract overseas students by using its own advantages; for external channel,

the scale of enrollment is expanded by cooperating with intermediary institutions overseas and in China visiting foreign universities. Network channel means strengthening the website construction of English or other languages at universities, promoting and introducing the history, achievements and characteristics of universities as well as publishing the regulations on admission on the Internet, thus realizing the enrollment online.

6 Conclusion

To sum up, scholars overseas and in China made a detailed research in the higher education service, but the research on the service quality in higher education for international students mainly focused on the marketing theory and education management, and the researches related to service quality are less, not to mention about the research on evaluation for services quality higher education for international students. Based on the limitations of current research, the paper proposes the following suggestions for further research:

1. Increasing the proportion of the service marketing theory in researches on higher education for international students in China. Nowadays, there is little research on the service quality in education for international students overseas and in China; however, with the speeding up of the internationalization of higher education, the service level and the awareness of students have been the focus of universities. Therefore, it is scientific and practicable to introduce the theory of service marketing as well as to evaluate and research the service quality education for international students in China from the perspective of customer perception.

2. Strengthening the empirical research on the evaluation for service quality in higher education for international students in China. Currently, most researches in the field have remained at the theoretical level, so we should make some empirical researches based on the specific circumstances of universities in China, thereby building the evaluation models for the service quality in higher education which are more suitable for the situation of our country.

Study on Information Security Incidents Management in Automobile Manufacturing Enterprise*

Wu Xiaoyan¹, Wang Bei¹

¹ School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wxy111@whut.edu.cn, 997552657@qq.com)

Abstract: At present, information security incidents in automobile manufacturing enterprise occurs frequently and brings severe consequence. This paper aimed to discuss the reasons and consequences of information security incidents, and build up a synthetic management model of information security incidents in automobile manufacturing enterprise. Firstly, this paper defined and analyzed the definition, classification and grading of information security incidents in automobile manufacturing enterprise. Then, this paper putted forward a set of comprehensive management method, and constructed a synthetic management model of information security incidents in automobile manufacturing enterprise based on the analysis on the reasons and consequences of information security incidents.

Key words: Automobile manufacturing enterprise; Information security incidents; A synthetic management model

1 Introduction

Nowadays, under the background of the increasingly fierce competition in the automotive industry and network security facing serious challenges, the factors which lead to information security incidents in automobile manufacturing enterprise not only include computer management deficiency or network attack, but also include secrets-divulging to unrelated people or even competitors intentionally or accidentally in the process of communication. As long as these anomalies degenerated into information security incidents, they would damage enterprise's business and even influence its existence and development to some degree. Moreover, big automobile manufacturing enterprise often has complicated organization structure, frequent transfer of internal and external personnel, a large amount of rapidly flowing information, and so on. All of these are increasing the difficulty to prevent or control information security events effectively. This paper aimed to achieve efficient and effective management of information security incidents in automobile manufacturing enterprise.

2 Classification and Grading of Information Security Incidents in Automobile Manufacturing Enterprise

2.1 Definition of information security incidents in automobile manufacturing enterprise

Combining with the characteristics of automobile manufacturing enterprises, the definition of information security incidents of automobile manufacturing enterprise can be defined as: the events that would cause damage to the enterprise or have negative impact on society when secret information is leaked, exposed, or stolen for natural, man-made factors or the defect and failure of software and hardware, which would destroy the integrity and confidentiality of the enterprise's information assets.

The form of the information security incidents of automobile manufacturing enterprise is varied, but mainly includes: ①The exposure of product planning information; ②The exposure of product technical information; ③The exposure of product defect information; ④The resale of technical drawings by suppliers; ⑤The diffusion of internal information by employees; ⑥Computer virus and network attack; ⑦The damage of network communication equipment.

2.2 Classification of information security incidents in automobile manufacturing enterprise

Combined with information security incidents that automobile manufacturers' often happen, automobile manufacturing enterprise's information security incidents can be mainly classified into four categories: Information Destroy Security Incidents, Information Content Security Incidents, Information Technology Security Incidents, and Information Facilities Security Incidents (See Table 1)

* This paper is supported by the Wuhan Soft Science Research Founding, and the project is "Research on Key Technologies of new energy and new energy automotive industry in Wuhan".

Table 1 The Classification of Information Security Incidents in Automobile Manufacturing Enterprise

Number	Type	Description
1	Information Destroy Security Incidents	It refers to the information security incidents that resulting in the information of system has been tampered, counterfeited, leaked, Intercepted, etc. through a network or other technical means.
2	Information Content Security Incidents	It refers to using information networks to publish, transmit the information which endangering national security, social stability and public interests.
3	Information Technology Security Incidents	It refers to harmful program incidents and network attacks incidents. For example, harmful program incidents destroy the system data, or external person use configuration defects, protocol defects, bugs or violent of information systems to attack information systems.
4	Information Facilities Security Incidents	It refers to that the own fault of information systems or the fault of perimeter protection facilities due to natural disasters or the artificial maintenance, so that the integrity and confidentiality of information are destroyed.

2.3 Grading of information security incidents in automobile manufacturing enterprise

In addition to category management, automobile manufacturing enterprises should do grading management for the information security incidents. According to the National Standard GB / Z20986-2007, and combining with the specific circumstances of automobile manufacturing enterprise by considering these three factors (namely the importance of information assets, losses caused by information security incidents and social impact Comprehensively), the information security incidents of automobile manufacturing enterprise can be classified into four grades: special significant events (grade I), grave events (grade II), larger events (grade III) and general events (grade IV).

3 Constructing of the synthetic Management Model for Information Security Incidents in Automobile Manufacturing Enterprise

3.1 Causation of information security incidents in automobile manufacturing enterprise

Generally speaking, the reasons of information security events in automobile manufacturing enterprise are loopholes in management and technology. This paper found that the information in different stages would face different threats by studying various stages of the information after the information generated.

Figure 1 show that information is evoked by management and technical loopholes in different stages, triggering a series of information security incidents in the role of the variables α .

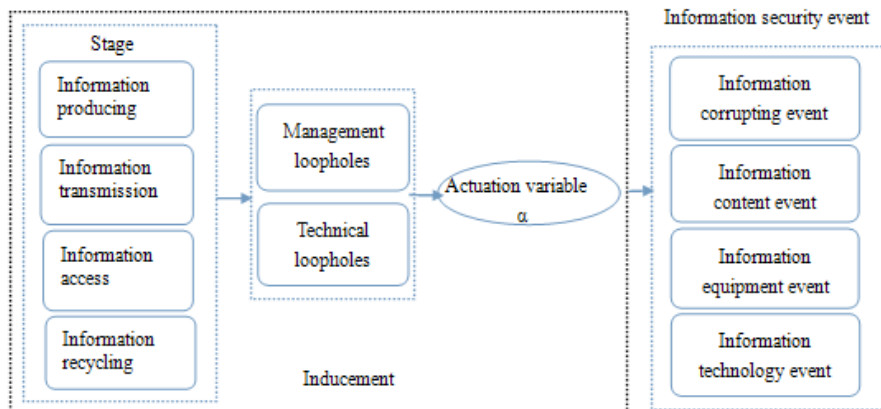

Figure 1 Generating Process of Information Security Events

3.2 Consequences of information security incidents in automobile manufacturing enterprise

Information security events do not cause direct harm to business generally, but may have different effects on the survival and development of enterprises through other ways.

Figure 2 shows how does the enterprise information security event affect corporate image, core competitiveness and profitability through the Intermediate action variable β indirectly. $\beta = \{ \text{Competitors} \}$

to obtain benefits, Negative news and so on } . “Competitors to obtain benefits” refers to competitors get automotive components drawings, key production technical information, product planning and deployment of the company's development of information and so on by various means. “Negative news” refers to the product quality problems and other unhealthy image of corporate and product information content or other similar information out of enterprise’s control.

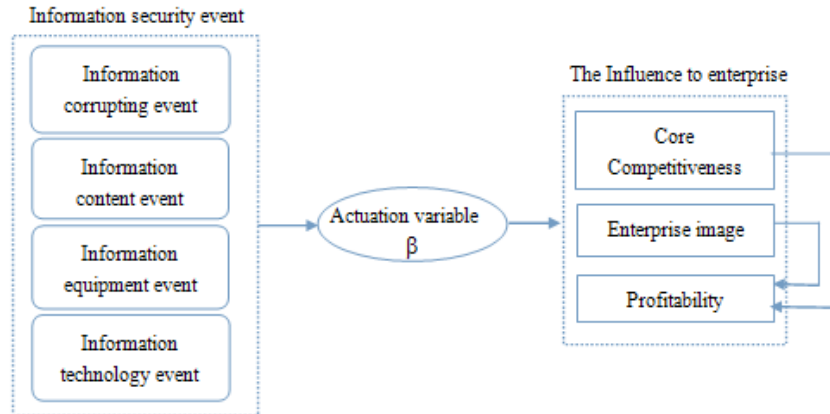

Figure 2 Action Process of the Influence to Enterprise

3.3 Comprehensive management of information security incident in automobile manufacturing enterprise

Based on the analysis of the influence and the causation of the information security incident in automobile manufacturing enterprise. This paper putted forward a set of management mechanism to manage the information security incident in whole Process. That is the total management which contains pre-incident management, in-incident management and after-incident management. Only by this method can the enterprise prevent the happening of the information security incident in earlier stage, control the information security incident effectively to decrease the harmful effects when it happens, analyze, summarize and feedback the merits and demerits of the management scheme to improve and perfect the management.

3.3.1 Pre-incident management

As the earlier stage work, what the enterprise should do firstly is setting up a special organization, for example the Information Security Management Committee to be responsible for the Classification and Grading of information security incidents in automobile manufacturing enterprise; secondly, the organization should Make corresponding information security awareness training plan to improve the security awareness of Secret Related Personnel; thirdly, formulating corresponding classification standard of information security events as a basis for determine how much energy should be paid on it is necessary.

3.3.2 In-incident management

In daily business, the information security incident management personnel should abide by the responsibility according to the arrangement of the information security management agency in the earlier time. Once the information security incident in automobile manufacturing enterprise happened, what the detecting personnel of information security incident should do firstly is collecting the data completely and report to the information security management agency at the first time. Then the management agency should evaluate its levels and categories as soon as possible, and control it with corresponding material, personnel and financial resources.

3.3.3 After-incident management

After the treatment of one information security incident, it's necessary for the information security management agency to analyze every data deeply to find out the source of the information security incident, then feedback to the corresponding department; meanwhile, rethinking about the management mechanism of information security incident management, redesigning the management technology to improve the management technology and perfect the management mechanism; and what could not be ignored is the appropriate rewards and punishments measures to the personnel involved into the information security incident.

3.4 Comprehensive management model of information security incident in automobile manufacturing enterprise

The model used the “IPO” analysis structure that is “Input-Process-Output”.

$O=f_2(P, \beta) = f(I, \alpha, \beta)$, $P=f_1(I, \alpha)$, $I= \{ \text{management-faults, Tech-leak} \}$,
 $\alpha = \{ \text{info-management, personnel management, equipment management, technical support, incident management mechanism} \}$,
 $\beta = \{ \text{obtainen by competitors, negative influenceetc.} \}$,
 $P= \{ \text{enterprise image, core competence, profitability} \}$.

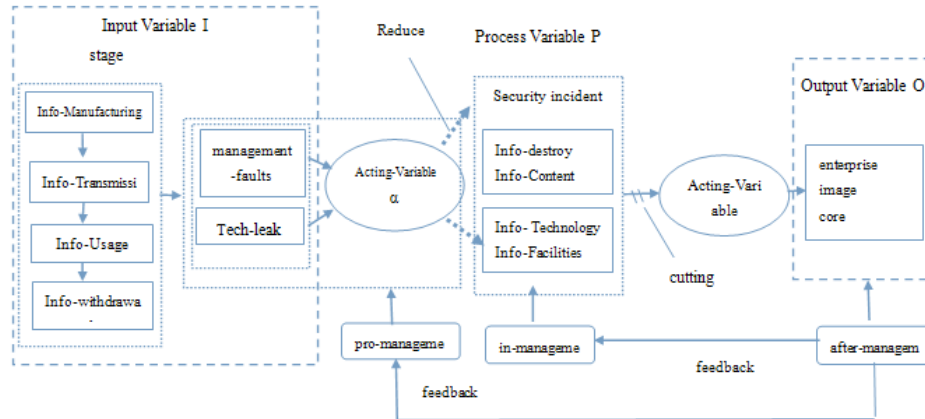

Figure 3 Comprehensive Management Model

The model showed the process that management and technical loopholes induce a series of action variables and threat enterprise throughout the corporation information assets’ life cycle, which eventually lead to information security incidents and damage corporate interests.

4 Conclusion

Aiming to discuss the reasons and consequences of information security incidents, this paper defined and analyzed the definition and classification & grading of information security incidents in automobile manufacturing enterprise. Then, this paper putted forward a set of comprehensive management method, and built up a synthetic management model of information security incidents in automobile manufacturing enterprise based on the analysis on the reasons and consequences of information security incidents.

Abstract: As global risks are transcending national boundaries, business, governments or civil society alone do not have the tools and the authority to tackle the increasingly interconnected set of risks and actions to build resilience. Nine core drivers comprise the FM Global Resilience Index and are grouped into three categories: economic, risk quality and supply chain factors. The purpose of this article is to analyze the relationship among components of resilience and impacts in relation to global risks in 132 countries. Data was analyzed with factor analysis and multiple linear regression techniques using MINITAB 16 software. The study seems to indicate that regardless of how effective public policies may be in reducing risks, inherent crisis will continue to take place with potentially serious consequences. There however hope that studies on resilience may foster collaboration between the public and private sectors and academia to strengthen joint risk management frameworks that empower communities to build their own resilience to a range of local and global risks.

Key words: Resilience; Economic risk quality; Supply chain factors; Global risks

1 Introduction

Recent fast growing of cities in developing countries and emerging economies represent a great challenge to local authorities that are not able to cope with the infrastructure needed with the influx of so many people in such a short time. This leads to question which measures are suitable at national and international level to raise the resilience of cities towards natural hazards and the impacts of climate change under this fast population dynamics changes.

The resilience of a country is measured by many factors. These include the quality of the government, and governance in general; the strength of its institutions, especially the economic and financial policymaking institutions in the country; the soundness of its banking sector—and the financial sector more broadly; the structure of the economy—including such things as its export dependency and diversity, its openness to global financial markets, and other such factors; and its policy-making space at any given time, particularly in the areas of fiscal, monetary, and reserves policy.

Actually informal settlers in developing countries have taken adaptive measures to respond to threats posed by natural hazards. They are attempting to have budgets provided by the municipal authorities for this purpose. Unfortunately, again and again their proposals are ignored by the authorities. At the same time, there is a need for examples and concepts of how cities may enhance their resilience – in cooperation with the inhabitants.

This study aims to analyze the relationship among economic, risk quality and supply chain factors, to determine the resilience of an economy, and its ability to give policy makers a more clearer insight into the sources of their country's resilience and the specific areas where further strengthening is needed.

2 Theoretical Reference

Preparing and building resilience against global risks is long and complex, something often recognized in theory but difficult in practice.

2.1 Resilience

Resilience is a concept that has been used to explain phenomena that overcome or transcended unfavorable situations. It is an issue of extreme importance, because it implies greater knowledge of how we can strengthen the capacity of resistance of society and nature, learning to deal with the tensions caused by the climate change and other environmental impacts. Cities or countries resilient are those that are prepared to recover quickly from the impact of natural disasters or economic conditions and effects in social unfavorable or external situations such as riots or wars, or extreme events related to unforeseeable situations (black swans).

The concept refers to a set of cognitive competencies and behavioral strategies that may be used to deal with the demands of stressful situations. Adaptive capacity, on the other hand, is understood as a

long-term process that includes structural changes. Moreover, adaptation focuses more on measures and strategies that deal with the negative impacts of natural hazards and climate change in the future.

The 2015 FM Global Resilience Index defines resilience as a combination of the vulnerability of a country to supply chain disruption and the country's ability to recover from such disruption. The index identifies nine key drivers of resilience including, for example, political risk, the quality of infrastructure, exposure to natural hazard and commitment to risk management. These drivers are aggregated into three broad factors – economic, risk quality and supply chain – which, in turn, combine to form the index.

2.2 Economic, risk quality and supply chain

Economic represents political and macroeconomic influences on resilience. Combining to form the economic factor are three drivers: productivity (GDP per capita), political risk and oil intensity. Political risk reflects perceptions of the likelihood that the government will be destabilized or overthrown by unconstitutional or violent means, including politically-motivated violence and terrorism. Oil intensity captures the vulnerability that a country has to an oil shock, – oil shortage, disruption or sudden price hike.

The Risk quality attribute of the index is the ability to draw upon the wealth of data gathered over many years by FM Global's team of property risk engineers who visit and assess over 100,000 locations annually across the world. The data, located in the FM Global's proprietary RiskMark database, has the advantage of being applied consistently across all industry sectors and regions. The factor, risk

Quality, comprises three drivers drawn from the RiskMark database: exposure to natural hazard, quality of natural hazard risk management and quality of fire risk management.

Exposure to natural hazard is the percentage of locations in the country that are exposed to at least one natural hazard: earthquake, wind or flood. Quality of natural hazard risk management is the level of natural hazard risk improvement achieved given the inherent natural hazard risks in a country. Quality of fire risk management is the level of fire risk improvement achieved given the inherent fire risks in a country.

The Supply chain relates to the supply chain itself and comprises three drivers: control of corruption, infrastructure and the quality of local suppliers. The process of identifying for an index a set of core drivers with significant impact on resilience to supply chain disruption is partly heuristic, partly statistical and partly practical. Research into the causes of supply chain disruption highlights common triggers of disruption to global supply chains.

Control of corruption reflects perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as capture of the state by elites and private interests. Infrastructure reflects perceptions of general infrastructure: transport, telephony and energy. Local supplier quality reflects perceptions of the quality of local suppliers

The index offers business executives an additional resource to help in prioritizing supply chain risk management and guiding strategy in four key areas: 1. Selecting suppliers based on the supply chain risk/resilience of the countries in which they are located; 2. Deciding where to locate facilities; 3. Evaluating the resilience of the countries hosting existing facilities; and 4. Assessing the resilience of the countries where customers' facilities are based.

In summary, the index provides a robust, composite view of business resilience to supply chain disruption around the world. Independently constructed, annually updated, and facilitating deeper analysis of the key drivers of resilience, the index aims to offer a fresh perspective to strategic dialogue and informed decision making.

3 Result Analysis and Discussion

For our purpose we'll be dealing with 132 countries divided into 3 Regions that are of our special interest to be compared regarding Resilience levels: the Iberoamerican AIBER (21 countries), the Advanced Economies AVECO (28 countries) and the rest of the 132 countries OTHERS (84 countries). Table 1 shows the means for each one of the 3 Regions (3R) of Synthetic Indicators such as Social Progress Index (SPI), Human Development Index (IDH), and Governance (GOV), as well as the ones concerning Analytic Indicators related to Vulnerability (IVULN), Lack of Coping Capacities (CAPAFRSIT) in difficult situations and lack of Adaptive Capacities (CAPADAP), Resilience Index (RESIND), Economic factor (RESECON), risk quality factor (RESR) and supply chain factor (RESSCH); as well as the Fs of the corresponding ANOVAS.

Table 1 Means and F's for Rescaled (0–100) and positized Variables (the higher the better)

3R	SPI	IDH	GOV	IVULN	CAPAFRSIT	CAPADAP	RESIND	RESECO	RESR	RESSCH
AIBER	64.41	65.62	42.48	58.17	71.56	61.67	34.65	35.72	45.88	35.43
AVECO	90.3	87.36	83.25	86.26	90.51	85.35	73.84	69.03	58.66	75.01
OTHERS	42.63	46.74	33.36	42.56	57.69	42.9	32.15	32.56	50.7	31.57
FANOVA	83.97	43.45	97.02	57.93	97.08	58.52	91.07	99.07	3.98	95.41

The correlation analysis showed a strong, positive and statistically significant relationship between the variables. As it was to be expected Advanced Economies AVECO countries as a whole are doing better than the AIBER countries and these ones doing better than the OTHERS countries.

Figure 1 Comparing the 3 Regions Regarding the Basic Indicators

Generally speaking and as indicated by Figure1 AVECO countries have the largest averages in all variables, and in some more that in others. Economics vary among countries due to various factors such as GDP per capita driver, political risk driver and oil intensity driver. The result of such an institutional and historical progress means different structures and different rates at which they can impact social progress. The top-ranking countries are Norway with 85%, New Zealand with 100% and Chad with 100%, respectively.

Actually Norway achieves consistently high scores across the three core factors: economic, risk quality and supply chain and ranks in the top 10 in the world for economic productivity, control of corruption, political risk and oil intensity (a driver that reflects vulnerability to an oil shock). Norway's high score for risk quality depends strongly on minimal natural hazard exposure and excellent management of natural hazard risk at exposed locations. But even in this case it has a chance to improve in absolute terms, especially in the management of fire risk. Switzerland scores very highly on the economic and supply chain factors (where the country leads), and scores best in the world for an extensive and efficient infrastructure.

The highest supply chain factor is seen in control of corruption driver (Denmark 100%), infrastructure (Switzerland 100%) and local supplier quality driver (Japan 100%). There is growing awareness among business executives of the importance of effective supply chain risk management. Common threats to the supply chain often have a territorial aspect and involve the concentration of resources and activities in vulnerable locations, combined with insufficient redundancy and spare capacity.

The countries with the greatest lack of risk quality factor are seen in exposure to natural hazard driver (Ireland 100%), quality of natural hazard risk management driver (Czech Republic 100%), and quality of fire risk management driver (Costa Rica 100%).

Venezuela on the other hand is the worst in the 2015 index, and is the victim of a challenging mix of an unstable macroeconomic environment, high inflation and public debt, and malfunctioning markets. Beyond economic factors, the country scores poorly in terms of risk quality and supply chain factors – little changed in those respects from 2014.

There is nothing one can do about a country's geophysical position and characteristics. However, there are many opportunities for both regulators and business executives to improve a country's resilience through greater awareness of where the exposures lie, and well-targeted investments in improved risk

management activities. Moreover as globalization accelerates, businesses are increasingly moved in

a borderless interconnected and almost invisible way, leading to a potential loss of strategic control. This emphasizes the need for a much more tangible, strategic and proactive approach to supply chain risk management. It is here that the FM Global Resilience Index may make its most powerful contribution.

4 Conclusions

Resilient cities and countries prepare to react to external events or great adversity in an organized manner, reducing damage and loss of life as well as acting synergistically proactive and address the global mega trends and unpredictable events. City leaders from government, civil society and the private sector are ideally positioned to plan rapid urbanization and must act to sustain metropolitan growth.

In many countries, infrastructure has not been taken care well enough to withstand the kinds of catastrophes that could spark such cascading effects. This is often the result of procrastination, the perception that the risk is so small that it is not worth considering overcome by other priorities, and the fact that investing in being prepared for extreme events is rarely immediately rewarded in the electoral process.

With adequate land-use planning and in coordination with the private sector, cities may develop infrastructure in more sustainable, low-carbon ways – but this requires governance, technical, financial and institutional capacities that are often lacking in developing countries. Leadership within local governments is at the heart of both urban mitigation of and adaptation to climate change, but this requires redefining priorities. Well-governed cities with universal appropriate conditions on infrastructure and services have better chances of building resilience to climate change if processes of planning, design and allocation of human capital and material resources are available to take care of emerging climate risks.

To increase investment in infrastructure, a coordinated, global, long-term and multi stakeholder approach is required particularly when dealing with middle and long range strategic planning. Upgrading infrastructure is essential, and may become the backbone of a competitive economy.

Risk Management of Assets Dependency Based on Copulas Function

Cheng Lei, Chen Xiaofang

School of Management, Wuhan University of Technology, Wuhan P.R. China, 430070
(E-mail: chenglei_cl@126.com, cxf2010611@163.com)

Abstract: Under the hypothesis of normal distribution, the analysis and calculation of portfolio is more different from the actual situation, often underestimates the financial risks; And if only using extreme value theory to study the financial risks, this way will often leads to overestimation of the risk. Copulas-GARCH-t model reflects the correlation of portfolio return, describes the time-varying and independent feature under the state of financial assets yield distribution. Therefore, the model describes time-varying and state-independent for return distribution of financial assets, and solves the portfolio selection problem in risk investment management. And by the empirical study of Baoli and Wanke Real Estate, we can draw a conclusion that Copula-GARCH-t model is the ideal model.

Key words: Portfolio; Correlation analysis; Copulas function; Risk management

1 Introduction

Economic globalization and financial integration greatly enhanced the interdependence between the global economy and financial markets; The synergy of prices in financial markets made local fluctuations of any areas have an influence on other financial markets, triggered the financial crisis. During the Asian financial crisis in 1997, Hengsheng index in Hong Kong dropped from the top of the nearly 16000 point to less than 8000 points. And during the global financial crisis in 2007, the subprime crisis originated in America spread to the global market. A-share index fell from 6200 to 2000, at the same time, Hengsheng index also fell from 30000 to 12000, indicating a strong following up. So the study of the dependent features and risk factors among the assets structure is an ongoing process in the financial risk analysis.

For foreign references^[1,2,4], Frees, Valdez and Embrechts studied simulation and estimation of individual asset dependency structure between among time series, without studying multiple assets dependency structure. Nelsen introduced the Copulas function into the finance, and discussed the limitation of using the linear correlation index to measure the dependency in the financial markets. Furthermore he suggested to estimate the joint distribution with Copulas theory among the random variables. Domestic study of Copulas connection theory started late^[9,10,11]. Zhang Yaoting (2002) theoretically discussed the feasibility of the application of Copulas function in the financial industry, and pointed out that using Copulas technology to analyze the correlation structure between the variables can be more reliable between the variables. Wei YanHua and Zhang Shiyong (2004) applied the Copulas to GARCH model to measure the autocorrelation structure of financial time series.

The above research either concerns with a single portfolio risk, or the static study of portfolio. In order to study the relationship of portfolios, these research has been neither conducted from the perspective of dynamic effect, nor considered assets as additive and independent. This paper will introduce Copulas function to study dependency structure of multiple assets, to measure the correlation between each other, and to verify the correlation with the empirical analysis. Therefore, not only the effective analysis of assets dependency will be achieved, but also the purpose of forecast and control of the financial risk will be attained.

2 The Tail Correlation and Copulas Function

Financial market is full of risk, but Markowitz creatively put forward that diversified investment can reduce risk level under a certain range. In general, investors will choose assets of small correlation to reduce investment risk. So correlation analysis of assets portfolio has great influence on the returns, which needs further interpretation.

Copulas function does not contain any information about marginal distribution, but contains relevant information between marginal distribution. This correlation is often non-linear. Generally we use Kendall's or Spearman's correlation coefficient to measure the correlation of marginal distribution. Because correlation coefficient has a strong robustness, and is strongly resistant to the impact of abnormal data. Therefore it has been used to measure the correlation. T is defined as the difference of two random variables between the same direction and the reverse direction.

Definition: if $(x_1, y_1), (x_2, y_2)$ is the vector of independent and identically distributed,

$$x_1, x_2 \in x, y_1, y_2 \in y, \tau = P\{(x_2 - x_1)(y_2 - y_1) > 0\} - P\{(x_2 - x_1)(y_2 - y_1) < 0\} \tag{1}$$

then τ measures the consistency of the variability of x and y , which proves

$$\tau = 2P\{(x_2 - x_1)(y_2 - y_1) > 0\} - 1, \tau \in [-1, 1] \tag{2}$$

According to research and deduction of Kendall's rank correlation coefficient, we can get the following conclusion: τ changes reflect the extent of consistency of the variability of x and y .

Table 1 shows two Copulas functions with only one parameter, and if the estimated value of τ is calculated, the whole nature of Copulas function is sure to know.

Table 1 The Copula Function Parameters and the Correlation Coefficient

Type	Copula distribution	θ - Range	τ - Parameter
Gumbel	$\exp\{-[(-\ln u)^{\theta} + (-\ln v)^{\theta}]^{\frac{1}{\theta}}\}$	$[1, \infty)$	$\frac{\theta}{\theta + 2}$
Clayton	$(u^{-\theta} + v^{-\theta} - 1)^{-\frac{1}{\theta}}$	$[-1, 0) \cup (0, \infty)$	$\frac{\theta}{\theta - 2}$

3 Single Asset Yield Model(GARCH –T)

When we use Copulas technology to build the model, we can separate correlation structure between marginal distribution and random variable. This will help us to analysis and understand a lot of financial problems; At the same time, for conditional heteroscedasticity and tailing characteristics of the financial time series, the following research will analyze financial time series model of single variable distribution---- building of marginal function.

Traditional fluctuation model believes that exogenous variables, such as the exchange rate or interest rate, can cause yield heteroscedasticity (volatility). But conditions mean and variance may change by time, leading to the change of the variance. So Engel (1982) [2] proposed conditional heteroscedasticity (ARCH) model to describe the time series with the conditions of the second order moment in nature, and describe fluctuations of time-varying and aggregation through the change of conditional heteroscedasticity. In the ARCH model, Engel points out that the mean ϵ_t interference condition do not change by time. But in the ARCH model, variance(γ_2) depends on the time series of past observations. So according to the description of the ARCH model, under the condition of known information, y_t obey normal distribution where $\epsilon_t = 0, h_t$. Thus the ARCH model can be used to describe the condition of variable marginal distribution.

Because in practical application the ARCH model takes a lot of order, leading to deficiency in calculation, Bollerslev (1986) proposed the Generalized regressive conditional heteroscedasticity (GARCH) model, which is an important extension of the ARCH model. The model has faster lagged convergence than the ARCH model, and the similar structure with the ARMA model.

GARCH (p, q) - T model is defined as follows

$$\begin{cases} r_t | I_{t-1} \sim t_v \\ h_t = \partial_0 + \sum_{i=1}^q \partial_i \epsilon_{t-i}^2 + \sum_{i=1}^p \beta_i h_{t-i} \\ r_t = h_t^{1/2} v_t \end{cases} \tag{3}$$

Where, r_t is the series of return, $p \geq 0, q > 0; \partial_0 > 0,$

$\partial_i \geq 0, i = 1, \dots, q; \beta_i \geq 0, i = 1, \dots, p.$ IF $p=0$, GARCH process becomes ARCH(q) process. So you can consider ARCH process as a special case of GARCH process.

4 Multi-Asset Portfolio Model and Parameter Estimation

4.1 Construction of multi-asset portfolio model

Supposing, portfolio have n kind of financial assets, $i(i = 1, 2, \dots, n)$, and build model directly by

using GARCH - t model, according to the latest m phase of the historical data

N for return on assets, $(R_{i,t-1}, \dots, R_{i,t-m})$, the rate for return time series is $r_t = (r_{1t}, r_{2t}, \dots, r_{nt})$, if the prior information set before t moment shows

$I_{t-1} = \{r_{t-1}, h_{t-1}, r_{t-2}, h_{t-2}, \dots\} = \bigcup_{i=1}^n I_{i,t-1}$, $I_{i,t-1} = \{r_{i,t-1}, h_{i,t-1}, r_{i,t-2}, h_{i,t-2}, \dots\}$, h_{it} is conditional volatility for the information set $(I_{i,t-1})$ of singular asset (r_{it}) , $C(\cdot|I_{t-1})$ shows Copulas function for n, $F_i(r_{i,t}|I_{i,t-1})$ is the conditional distribution of i-th component.

Many empirical studies have shown that asset return sequence obeyed the GARCH (1, 1) model. Bollerslev (1987) point out that t-student distribution can reflect more characteristics for financial time series than the normal distribution can do, such as the peak of time series and thick tail. Here we also assumes that r_{it} satisfy the model. After filtered the fluctuation of time-varying about a single series, we propose a time-varying model ---Copulas- GARCH (1, 1) - t (shorthand for Copulas- GARCH - t). The term used to describe the time-varying dependence structure of n assets, and the model is as follow :

$$\begin{cases} r_{i,t} = u + \varepsilon_{i,t}; \\ \varepsilon_{i,t} = \sqrt{h_{i,t}} \cdot v_{i,t}; \\ h_{i,t} = \alpha_0 + \alpha_1 \varepsilon_{i,t-1}^2 + \beta_1 h_{i,t-1} \\ F(v_i|I_{t-1}) = C_{\Sigma} [F_1(v_{1,t}|I_{1,t-1}), F_2(v_{2,t}|I_{2,t-1}), \dots, F_n(v_{n,t}|I_{n,t-1})|I_{t-1}] \end{cases} \quad (4)$$

where, r_{it} is the series for return, u is the average return rate for singular asset,

$p \geq 0, q > 0; \alpha_i \geq 0, \beta_i \geq 0$; $F(v_t|I_{t-1})$ is the joint distribution portfolio on the moment of T, C_{Σ} is Copula function. $\alpha_0, \alpha_1, \beta_1, v$ and Σ are parameters to be estimated.

4. 2 Parameter estimation of Copulas - GARCH function

Parameter estimation of function model includes parameter estimation and non-parameter estimation. Parameter estimation method generally adopts maximum likelihood estimation (MLE) and the torque estimation. The maximum likelihood estimation is the most commonly and most effective method of Copulas function model. Parameters $\alpha_0, \alpha_1, \beta_1$ to be estimated in the model for single asset are obtained through the Eview software, and the parameters of the portfolio will be obtained by maximum likelihood estimation.

If we set random variables x_1, \dots, x_N in the Copula function as $C(\cdot, \dots, \cdot)$, density distribution is $c(\cdot, \dots, \cdot)$, the marginal distribution $F_n(\cdot, \cdot)$, the edge density function $f_n(\cdot, \cdot), n=1, \dots, N$, then the parameters $\theta = (\theta_1, \dots, \theta_N; \theta_c)$ of the logarithm likelihood function is:

$$\ln L(x_1, \dots, x_N; \theta) = \sum_{t=1}^T \left[\ln c(F_1(x_1; \theta_1), \dots, F_N(x_N; \theta_N), \theta_c) + \sum_{n=1}^N \ln f_n(x_{n,t}, \theta_n) \right] \quad (5)$$

We can directly use the maximum likelihood estimation for parameter estimation. But from the logarithmic likelihood function we can find that the marginal distribution density and the density of Copulas likelihood function is separate. Therefore, we can first estimate the edge parameter, then the Copulas function parameter. The estimation of parameter is divided into two phases.

The first phase: $\hat{\theta}_n = \arg \max \sum_{t=1}^T \ln f_n(x_{n,t}, \theta_n), n=1, \dots, N$ (6)

The second phase: $\hat{\Sigma}_c = \arg \max \sum_{t=1}^T \ln c(F_1(x_{1,t}; \hat{\theta}_1), \dots, F_N(x_N; \hat{\theta}_N), \theta_c)$ (7)

First estimate the parameter in the marginal distribution $\theta_n, n = 1, \dots, N$, and then put the estimated value $\hat{\theta}_n$ into Copula function of different kinds, thus estimate the parameter of Copula function $\hat{\Sigma}_c$.

4.3 The empirical analysis

Here we only analyze two stock market index of daily closing price: Baoli Real Estate and Wanke Real Estate; the data range from July 31, 2006 to May 9, 2013. It is important to note that because there may be one day when two stocks are not trading at the same time, in order to accurately describe the correlation of the two stocks, we consider data observed as the data for that day when only one stock has dealings (t stands for trading day). After pretreatment, valid data of observation samples reach 1372, namely $T = 1372$. Secondly, the daily closing price is selected as poor stock index, logarithmic LPR, defined as $LPR = \log(pr) - \log(pr(1))$.

(1) The figure of the return rate of the two stocks, in which bp stands for Baoli Real Estate's daily yield rate, wp stands for Wanke Real Estate closing price.

Figure 1 The Daily Yield Rate of the Two Stocks

(2) Descriptive statistics of the two stocks

Table 2 Descriptive Statistics of the Two Stocks

	Mean	Median	Maxi	Min	Std. Dev	Skewness	Kurtosis	J-Bera	Prob
BP	25.715	19.055	96.23	8.52	19.52	1.605	4.654	745.244	0
WP	12.632	9.3	39.5	4.93	7.60	1.578	4.511	699.837	0

From the table, we can draw the following analysis. During the sample period, the mean of bp stands at 25.7, standard deviation 19.5 with 1.6 of skewness, and 4.7 kurtosis. Compared with the normal distribution, bp has the tendency to slide right with rush thick tail phenomenon. JB normality test also confirmed this, with $JB=745.2$, $P=0$, and refused null hypothesis. These show that under the confidence level $\delta=0.05$, Baoli Real Estate significantly differs from those of normal distribution. Similarly, Wanke Real Estate also has the tendency to slide right with rush peak phenomenon and significantly differs from those of normal distribution.

(3) Parameter estimation

Table 3 Two Property Parameter Estimation

	u	$\hat{\sigma}_0$	α_1	β_1	ν	Σ_c
lbp	1.000002 (2525.385)	0.0000134 (3.499094)	0.004938 (2.740976)	0.983879 (239.6179)	3.872199 (12.86543)	[1,0.078442] [0.078442,1]
lwp	0.999609 (1946.871)	0.001052 (9.165047)	0.103511 (2.179955)	-0.00604 (-0.18711)	3.433089 (12.11436)	

From the above table, we know that α_1 and β_1 in logarithm return rate (LBP) is respectively equal to 0.004938 and 0.983879 in the conditional variance equation, and they are significantly different. It shows that the return series has significant volatility cluster. Secondly, in Baoli Real Estate's LBP, the sum of ARCH and GARCH coefficients equals to 1, so the GARCH (1,1) process is stable, that is, the effects of fluctuations in the past on the future is gradually fading. Similarly, we can get logarithm yield values of the parameters for Wanke Real Estate.

(4) Equation residual test

Autocorrelation	Partial Correlation	AC	PAC	Q-Stat	Prob	
		1	-0.000	-0.000	0.0003	0.987
		2	0.004	0.004	0.0221	0.989
		3	-0.002	-0.002	0.0266	0.999
		4	-0.030	-0.030	1.2946	0.862
		5	-0.024	-0.024	2.0710	0.839
		6	-0.002	-0.002	2.0791	0.912
		7	-0.030	-0.030	3.3004	0.856
		8	-0.009	-0.010	3.4130	0.906
		9	0.001	-0.000	3.4140	0.946
		10	-0.020	-0.021	3.9806	0.948

Figure 2 Baoli Real Estate Autocorrelation

The residual test of equation shows Q statistic of the logarithm return rate on Baoli Real Estate, at k=10, p=0.948. It rejects the original hypothesis, namely the residual sequence is independent from each other, which meets the requirements.

Autocorrelation	Partial Correlation	AC	PAC	Q-Stat	Prob	
		1	-0.001	-0.001	0.0006	0.980
		2	-0.031	-0.031	1.3540	0.508
		3	0.011	0.011	1.5218	0.677
		4	0.008	0.007	1.6148	0.806
		5	-0.010	-0.010	1.7591	0.881
		6	0.006	0.006	1.8056	0.937
		7	-0.019	-0.020	2.2974	0.942
		8	0.016	0.017	2.6506	0.954
		9	0.001	-0.000	2.6516	0.977
		10	-0.009	-0.007	2.7562	0.987

Figure 3 Wanke Real Estate Autocorrelation

The residual test of equation shows Q statistic of the logarithm return rate on Wanke Real Estate, at k=10, p=0.987. It rejects the original hypothesis, namely the residual sequence is independent from each other, which meets the requirements.

5 Conclusion

Based on the conditional heteroscedasticity GARCH-t model for portfolio, this thesis attempts to simulate spike and thick tail characteristics, and describes the characteristics of time-varying and state independence of the distribution on financial assets, and solves the problem proposed in the beginning; By using Copulas function, the asset correlation is reflected, and the portfolio selection problem is solved in the risk management. And from an empirical analysis of the Baoli Real Estate and Wanke Real Estate, the following conclusion can be drawn:

Conclusion 1: There are significant GARCH effects in two stocks, namely the conditional heteroscedasticity. Positive risk premium of Baoli is higher than that of Wanke, which reflects the Baoli stock investors are more risk-averse than Wanke investors.

Conclusion 2: There is obvious leverage in two stocks, which the effect of bad news on the stock market will cause more volatility than that of the good news. For example, in 2008, after increasing the stamp duty, there was a sharp decline in stock market. There was two-way spillover effect between the two stocks, which indicates that a stock fluctuations can cause the fluctuation of the other stock.

(E-mail: gzhouq@163.com, chenylq0227@163.com)

Abstract: This paper provides a study of internal audit which is applied in engineering project from the viewpoint of risk identification and risk evaluation. On the basis of introducing the general theory and basic framework of risk-oriented internal audit, the thesis systematically analyzes project risk within Changjiang Maritime Safety Administration. In order to facilitate the distribution of audit resources and minimize losses, the author adopts quantitative methods to weigh risks and rank risks from high to low. Therefore, in light of risk ranking, recommendations are proposed to improve internal audit technology and strengthen project risk management.

Key words: Engineering project; Risk-oriented; Internal audit

1 Introduction

Risk-based audit was proposed by four international accounting firms as a new audit methodology in late 1990s, which configures audit resources priority to vulnerable areas. Consequently, risk evaluation in financial statements is more comprehensive, proper, and more effective to achieve the audit objectives. In 2004, COSO formally released "the Enterprise Risk Management Frame", which prompted internal control, as a conventional object of internal audit, to enter the stage of comprehensive risk management. In addition, many western multinational companies active in risk-oriented internal audit practice. For example, the Oracle ranks risks before establish the internal audit plan, and then allocates audit resources by a certain percentage based on the importance of risk exposure. Therefore, it will be a tendency to apply risk-oriented internal audit in various areas.

Engineering project is a high-risk area with fraud and corruption in that it involves a huge amount of investment, long construction period and numerous links with a wide range. Besides, more and more complex technology and imperfect regulatory system make it worse. Chinese scholars have conducted a lot of researches of internal audit in this area. Liu Guoyong (2012) pointed out that many problems also exist when strengthen supervisor function of audit in engineering construction. For instance, the management system within construction project is not perfect, some aspects of audit cannot operate effectively, and irregularities often occur during the process. Deng Xiong (2013) believed that internal audit, which is focus on the reasonable control to calculation and budget, affects project quality. As a result, auditors ought to pay attention to both scientificity and availability in auditing methods.

Moreover, the Communist Party and government also concern about this area's internal audit. In July 2009, the central government issued an edict---"Opinions about the special governance work in engineering construction field of outstanding issues", clearly putting forward that audit departments should give full play to project audit with their professional advantages in punishing corruption and enhancing honest political construction.

Considering the strict supervision of public expenditure and a very complicated modern project environment, it is meaningful to apply risk-oriented internal audit into projects. Because this will help internal audit fully perform re-controlling function in internal control and re-managing function in risk management, as well as improve the efficiency and quality, and it is of great significance to guard against risks and deepen the special governance in outstanding problems.

2 Theoretical Framework of Risk-Oriented Internal Audit

2.1 Modern risk-oriented audit mode

Accountability relationship caused by a series of principal-agent is the essential prerequisite for the emergence and development of audit. With the changes of audit environment, auditing mode has experienced the historical evolution from transaction-based auditing, system-based auditing to risk-oriented auditing.

Since 1990s, audit risks have been affected by enterprise inherent risks, internal control risks and the potential risks that a CPA failed to identify material misstatement, thus the international accounting

firm began to conduct a comprehensive study on audit mode with academia. On December 15, 2004, the US Auditing Standards required auditors applying a new audit mode, namely:

$$\text{Audit risk} = \text{material misstatement risk} \times \text{detection risk} \quad (1)$$

This mode, which carries out organizational audit from strategic perspective and is guided by operation risk of the audited entity, is described as the modern risk-oriented audit mode.

Modern risk-oriented audit evaluates the audited entity's internal control and risk point on the basis of operation, market and policy. It focuses the limited time and energy in high-risk areas and controls these areas' risks via a more detailed transaction-based auditing. Meanwhile, by simplifying audit tests in low-risk field, the mode can improve audit efficiency.

2.2 Connotation and characteristics of risk-oriented internal audit

To ensure the security and development of the organization, supreme management authorities generally demand that the internal audit institution can reveal the real risk and the potential risk, as well as offer proposals to prevent or control these risks. In this way, the risk-oriented audit theory also has been applied and developed in internal audit. In a word, the advent of modern risk-oriented audit mode has significant impact on the theory and practice of internal audit and pushes it to a new stage of development.

(1) Connotation of risk-oriented internal audit

Internal audit, according to the Institute of Internal Auditors (IIA) in 2001, is regarded as an independent, objective assurance and consulting activity designed to add value and improve operation, whose purpose is to evaluate, improve the effectiveness of an organization's risk management, control, and governance process by systematic and standardized approaches. Besides, On August 23, 2013, the Internal Audit Association of China issued a newly revised "Chinese Internal Auditing Standards" which also ordains that internal audit is an independent, objective assurance and consulting activity. It examines and appraises adequacy and effectiveness of an organization's operation, internal control and risk management through systematic, normative approaches, so that the organization can improve governance, add value and realize target. In summary, internal audit must pay attention to risks and guide by risks when implement auditing to achieve goals.

Therefore, this paper defines risk-oriented internal audit as a new concept of audit and audit techniques. It starts from risk identification, aims at reducing risks and allocates audit resources after a full risk assessment. Through its identifying and counseling activities, an organization's value is increased and objectives are accomplished.

(2) Characteristics of the risk-oriented internal audit

Risk-oriented internal audit has the following basic characteristics:

1) Focus on the risk. Risk-oriented internal audit not only concerns about audit risk but extends to a variety of risks that an organization cannot achieve its goals during operation process. Based on these risks, audit resources are allocated reasonably.

2) Aim at increasing the organization's value. Internal audit, while not participating in production and sales activities, can add the organization's value via protecting assets, reducing risks, lowering own audit costs, putting forward valuable suggestions as well as increasing profit opportunities and so on.

3) Add function in countermeasure suggestions. Discovering problems is always what internal audit good at. Traditionally, internal audit finished its job merely by delivering those problems to corresponding departments. However, Risk-oriented internal audit is different. When perform audit, it allocates more audit resources in these issues so that proper audit conclusion and feasible countermeasure suggestions can be made on the basis of confirming and evaluating relevant information.

3 Application of Risk-Oriented Internal Audit in Changjiang Maritime Safety Administration Engineering Projects

3.1 Application framework of risk-oriented internal audit in Changjiang Maritime Safety Administration Engineering Projects

To introduce risk-oriented audit mode in Changjiang Maritime Safety Administration projects. Firstly, there must be a process of adjustment in accordance with the purpose and characteristics of internal audit. Secondly, the depth and the breadth of expansion of the audit function in project risk management and the utilization of risk-oriented internal audit techniques, depending on the level of the administration's project risk management and audit resources.

According to the weak situation of project risk management and audit resources, the application of

risk-oriented internal audit in the administration mainly concentrates on the following two aspects (Figure 1):

1) Application in project management. The mode, firstly, identifies and evaluates risks during project management processes, utilizing the result of risk assessment to improve the efficiency of internal audit. Secondly, through cross-sectoral cooperation and participation during the risk assessment process, the mode provides risk warnings to management department. Finally, with the diffusion and feedback of audit reports between related project management sectors, responsible departments are urged to develop and perfect emergency countermeasures in high-risk points.

2) Application in project governance. Many uncontrollable factors are involved in external governance and environmental management. Therefore, the application of risk-oriented internal audit in project external governance is mainly to recognize the risk of selecting participants, while in internal governance, it chiefly about risk evaluation of internal control in engineering projects.

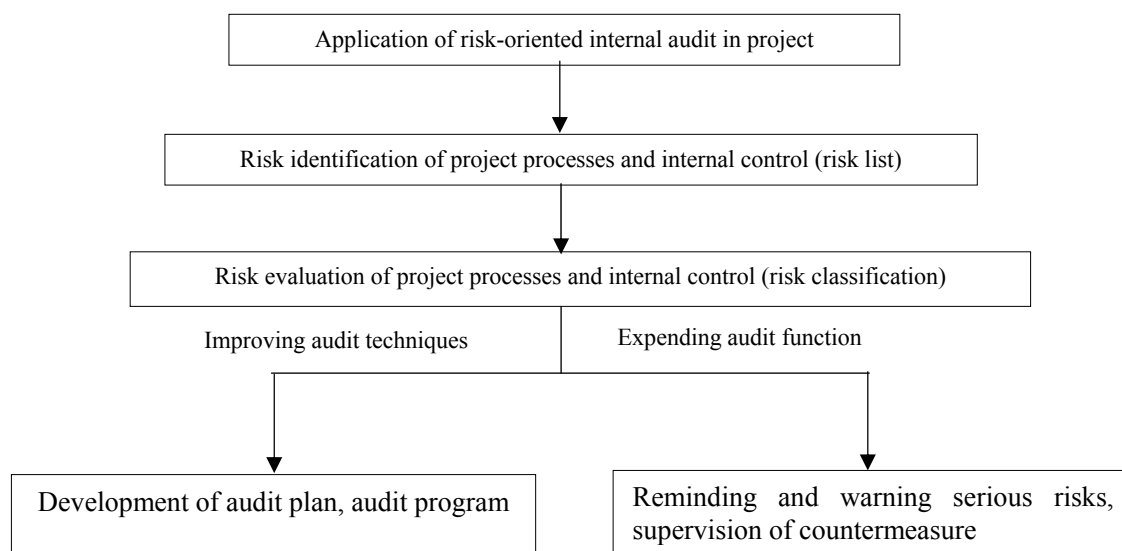

Figure 1 Application of Risk-oriented Internal Audit in Changjiang Maritime Safety Administration Engineering Projects

3.2 Risk identification within project processes

Due to the similar procedures and methods in risk identification and risk assessment, when compared project processes with internal control in project, this paper only discusses risk identification and risk assessment of project processes in detail.

A large number of stakeholders are involved during project construction and operation, for example, project sponsors, construction enterprises (proprietors), investors, consulting companies, designing entities, and construction units (contractors), material suppliers, operators, government, public, etc. In order to discern risks from different stakeholders at different stage of the engineering-cycle, the research undertaken primarily from the following two aspects:

1) Confirm processes of the administration projects. After reviewing a great deal of literature and doing spot investigation, processes of the administration project can be divided into decision-making phase, preparation phase, construction phase, completion and delivery phase.

2) Identify risks from various stakeholders and external environment to form a risk list fit the administration. Initially, 140 risk factors are listed according to literature. After interviewing and enquiring relevant experts, only 94 risk factors which cater the organization's reality are remained.

3.3 Risk evaluation and classification of projects

(1) Risk evaluation of each project phase

Expert advice and risk recording methods are used to assess all risks due to the absence of historical data in Changjiang Maritime Safety Administration project risk management. With questionnaire survey, experts are required to grade each listed risk factor in "large, medium or small". Meanwhile, they have to consider the possibility and influence of these risks in actual working environment.

(2) Risk classification of each project phase

21 valid questionnaires are fed back, these samples are processed as follows:

1) Distribute weight. The risk factor which is graded to "large, medium or small" respectively given "5, 3, 1" weights.

2) Calculate risk expectation.

Expectation of each risk factor = \sum the proportion of each grade risk factor in total copies recovered
× each grade weight (2)

3) Rank the risk. Ranking each risk factor according to expected value calculated above.

4) Classify risk level. Dividing the risk according to Pareto taxonomy and DuPont "boiling pot" model. Namely, calculating the percentage of the expected value of every risk factor accounts for the total risk expected value. The risk level is divided into A, B, C, or D, where accumulated risk value is less than 10%, between 10% to 40%, from 40% to 80%, and among 80% to 100%, separately.

3.4 Application of project risk evaluation

(1) Formulate audit procedure based on risk evaluation

Process of developing audit program according to risk classification:

1) Pre-audit survey. First, auditors investigate risk changes of certain project based on the organization's former risk classification, then, adjustment about the project risk level are made so that a suitable risk classification can be formed.

2) Develop audit program. Confirm the emphases of the auditing field, so reasonable arrangements for the audit team and audit time can be made, which means auditors can work out an economical and effective audit scheme.

3) Adjust audit program. When carry out auditing, auditors should assess risks on audit progress and significant discovery. If the risk is higher and has greater effect on the project according to assessment result, auditors should consider the recommendations to make proper adjustments of the program.

(2) Consultative advice based on risk level classification

1) Suggestions to the project commissioned audit agency

When the project commissioned audit agency is doing follow-up auditing, it should determine the focus of audit to allocate audit resources reasonably and confirm audit mode correctly in light of risk classification of every stage. For instance, to risks grade A, it should implement on-site audit.

Commissioned audit agency should perfect its internal management mechanism, and take hierarchical management strategies to handle different risk factors grade A, B, C, D. For example, A-level risk factors should strengthen audit review in management procedures.

2) Recommendations to the administration's project internal control

Different intensity control should be executed in light of risk ranking and classification of internal control. For A-level risk, high costs and multiple (multi-link, multi-sectoral, multi-level) measures are needed. For B-level risk, measures are slightly lighter than A-level risk. While C-level risk and D-level risk only need implement general risk control measures. In this way, control effect, management efficiency and control costs can be comprehensive taken into account.

Besides, considering complicated interest groups, different categories of control ought to be carried out. The administration should develop countermeasures and form a system if the risk factor belongs to itself. However, when risk elements pertain to relevant interests, the administration should assess and evaluate these entities' risk control measures and control system, and select the appropriate party to participate in the project based on the evaluation result.

In order to make it clear, the paper take A-level risk factors as an example to illustrate how to make specific control suggestions. In A-level risk factors, both design management, tender and bid activities have four factors, project decision-making mechanisms have two factors while quality supervision and material management have one A-level risk factor separately, the rest belongs to the administration itself. Depending on the content of each risk factor, suggestions are as follows:

Establish a sound management system of design units. Apart from considering the design unit's qualification, competence and credibility, more emphasis should be placed on the quality control system in design when choosing a design unit. Such as evaluate the system's integrity and effectiveness of execution, what's more, rewards and punishments as well as major design errors compensation items should be stated in the contract.

Establish and perfect tender management system. To some vital fields, control must be enhanced. For instance, whether procurement of major equipment and bulk materials in accordance with the provisions, whether choosing the appropriate way of tender, whether sign other agreements which against the substantive clause in the contract with the winning bidder, whether procedures of tendering

are legitimate.

Establish and improve decision-making mechanisms and systems. Attention should be put on ascertaining the responsibility for mistaken project decision-making and the security system of effective project feasibility study.

Establish a sound management system for construction supervision. Evaluating the soundness and effectiveness of the quality-management system of the construction supervisor, and utilizing the evaluation result as the standard to select construction supervisor institution. At the meantime, the Engineering Project Office of the administration should also supervise the construction supervisors' capability, work attitude, and vigor contributed at ordinary times.

Implement procedures of infrastructure project management strictly. The formal construction cannot be carried out before obtain legal permission of construction land, urban planning, environment protection, security and other aspects.

4 Conclusion

This paper discusses the basic framework of risk-oriented internal audit, sorts out risk factors and develops a risk list and risk classification according to project processes. Based on this, advice is proposed to strengthen project risk management, which will help to make full use of internal audit in project risk management as well as improve audit efficiency and give full play to the role of the internal audit function.

As a new audit concept, risk-oriented internal audit applied to engineering projects, is still in the stage of exploration. Due to the absence of historical date on project risk management, only qualitative approach of risk assessment used. With the accumulation of data, quantitative evaluation methods will be well applied to enhance the accuracy of project risk assessment.

Inequality Aversion, Risk and Incentive in Teamwork*

Tu Jing

School of Management, Wuhan University of Science and Technology, Wuhan, PR China, 430081

(E-mail: tujing100@163.com)

Abstract: A standard HM model is built on the basic assumptions that agents have no inequality aversion. We introduce inequality into this principal-agent model to study the interaction of inequality aversion, risk and incentive, then compare with the conclusions of the standard HM model. The results of the study are followed. Inequality aversion and the risk of agent's individual task is positively related. High-risk tasks should be assigned to the team and low-risk tasks should be assigned to individuals to reduce the agency costs of incentive. Compared with the conclusions of the HM model, inequality aversion increases agency costs, reduces the incentive for individual performance and has no impact on the incentive for team performance.

Key words: Inequality aversion; Risk; Incentive; Teamwork

1 Introduction

Teams have become increasingly important in work settings in recent years (Che and Yoo, 2001). The growing popularity of teams is driven partly by the increasing complexity of work tasks in a knowledge-driven environment. This increasing complexity means that tasks require the input of many different complementary skills, thus leading to a greater use of teams with some form of output sharing. Equity considerations are likely to play an important role when agents work together in teams. Team members will often be able to observe the performance of other team members. Accordingly, if individual contributions to the team output vary across team members, rewarding team members with an unequal share of the team output may cause feelings of intra organizational inequity (Lawler and Jenkins, 1992).

The inequality aversion is supplement to rational preference of economic agent. Guth(1982) has researched the ultimatum game experiments which showed that agent make decision on the inequality aversion concept, not just to maximize the benefits. A series of related economics experiments have been done in the following decades, the results of experiments can be successfully interpreted by inequality aversion preferences (Charness and Rabin, 2002; Engelmann and Strobel, 2004). Models of inequality aversion have had substantial success in rationalizing experimental data. Both in Fehr and Schmidt (1999) and Bolton and Ockenfels (2000) the agents' utility increases in own profit but decreases if they are better or worse off than others. While in Fehr and Schmidt (1999) agents compare own payoffs to everybody else's payoff, in Bolton and Ockenfels (2000) they compare themselves only to the average in the reference group. Abeler et al. (2010) show that when norms of equity are violated because harder working agents are paid the same as those who exert less effort, the harder working agents start to withdraw effort, even though it would be in their interest to continue to work hard. Bartling(2012) shows that team production incentives can then be muted below the level that results from noisy measurement and risk aversion alone—even though team production does not cause wage inequality. Grill and Stone(2015) show that it's painful for team members to find receive less than their perceived entitlement, while receiving more may induce pleasure or pain depending on whether their preferences exhibit desert elation or desert guilt.

Effects of inequality aversion on incentive have received the focus of research. Risk aversion is the basic preference assumption in incentive theory, but there are few studies on the interaction between the two kinds of preferences. Moreover, the study of inequality aversion is carried out under the background of the agents with single task.

We introduce inequity aversion into a HM (Holmstrom and Milgrom,1987,1991) setting where a principal hires two agent who, by his choice of effort, determines the probability distribution of profit. The existing multi-tasking literature analyzes the impact of differential measurement precision on optimal incentives. We focus on the mutual influence among the inequality aversion, risk and incentive in the team work.

* This paper is supported by 2015 Hubei provincial education department project (15Y024).

2 Model Setup

Assumption 1. Agent i has two kinds of tasks: individual task and team task. Individual task is incented by individual performance. Team task is incented by team performance.

Assumption 2. The output of agent i is linear function $x_i = \alpha_i + \theta_i$, where α_i is the efforts of agent i on his individual task, θ_i is the exogenous uncertain of individual task production, $\theta_i \sim N(0, \sigma^2)$.

Assumption 3. The output of team is linear function $g = g_1 + g_2 + \varepsilon$, where g_i is the efforts of agent i on the team task, ε is the exogenous uncertain of team task production, $\varepsilon \sim N(0, \sigma_g^2)$.

Assumption 4. The cost function of agent i is $C(\alpha_i, g_i)$, the cost coefficient of effort is 1, α_i and g_i are independent of each other, then $C(\alpha_i, g_i) = (\alpha_i^2 + g_i^2) / 2$

Assumption 5. The utility function of principal is linear function $V(x_1, x_2, g) = x_1 + x_2 + g$.

Assumption 6. The incentive contract is linear function $W_i(x_i, g) = x_i + \gamma_i x_i + \gamma_g g$.

Assumption 7. The principal is risk neutral and the agents are risk averse. The absolute risk aversion rate of agent i is ρ , ρ is invariable, thus the utility function of agent is $-e^{-\rho W_i}$.

Assumption 8. The agents are inequality averse towards other agents. The negative utility function of agent i is $u_i(\gamma_1 x_1, \gamma_2 x_2)$, which shows that the agent is not only incited by the income, but also impacted by the overall income distribution. Economic agent will compare his own income with other agents one by one to determine whether income distribution is fair. According to the assumption above, the utility function of principal and agent i are

$$\pi_p = V(x_1, x_2, g) - W_1(x_1, g) - W_2(x_2, g) \tag{1}$$

$$\pi_i = W(w_i, g) - C(\alpha_i, g_i) - u_i(\gamma_1 x_1, \gamma_2 x_2) - \rho \gamma_i^2 \sigma^2 / 2 \tag{2}$$

3 Model Analysis

By solving and analyzing the model, we draw four propositions about the interaction of inequality aversion, risk and incentives.

Proposition 1. The negative utility of inequality aversion is positively related to the risk of individual tasks in which the agents are engaged.

Proof. Since the agents are symmetric, $\gamma = \gamma_1 = \gamma_2$. Let $t = x_2 - x_1$, we get $E(t) = 0$,

$D(t) = 2\sigma^2$, $t \sim N(0, 2\sigma^2)$ from the distribution function of x_1 and x_2 . The negative utility of inequality aversion is draw from FS model. Fehr and Schmid (1999) reckon inequality aversion is composed of envy and guilty. Envy is the utility lost from that other's payoff is higher than his own, while guilty is the utility lost from that his own payoff is higher than others. We use α as envy parameter and β as guilt parameter, satisfying $\alpha \geq \beta$ and $1 > \beta \geq 0$. $\alpha \geq \beta$ shows the agent is far more aversive to the disadvantageous inequality than advantage ous inequality. $1 > \beta \geq 0$ shows even the agent owns advantageous inequality, he won't reduce his payoff to be equal to others. According to the symmetry of the agents, the negative utility of agents is obtained

$$U_1(\gamma_2 x_2, \gamma_1 x_1) = U_2(\gamma_2 x_2, \gamma_1 x_1) = \alpha \max(\gamma_2 x_2 - \gamma_1 x_1, 0) + \beta \max(\gamma_1 x_1 - \gamma_2 x_2, 0) \tag{3}$$

$$= \gamma \alpha (x_2 - x_1) \text{prob}(x_2 - x_1 \geq 0) + \gamma \beta (x_1 - x_2) \text{prob}(x_1 - x_2 \geq 0)$$

$$= (\alpha + \beta) 2\gamma \sigma_i / \sqrt{\pi}$$

Thus, $\frac{\partial u_i}{\partial \sigma} = \frac{2\gamma(\alpha + \beta)}{\sqrt{\pi}} > 0$. Proof of Proposition 1 is completed.

Proposition 2. Compared with incentives of standard HM model, the optimal strategy of principal is to cut incentive on individual performance and keep incentive on team performance unchanged.

Proof. According the first order constraint condition of agents, $\partial \pi_i / \partial \alpha_i = 0$ and $\partial \pi_i / \partial g_i = 0$. We get

$$\gamma_i = \partial C / \partial \alpha_i \tag{4}$$

$$\gamma_i = \partial C / \partial \alpha_i \tag{5}$$

The equivalent payoff of agents and principal is summed as

$$TCE = V(x_1, x_2, g) - C(\alpha_i, g_i) - u_i(\gamma_1 x_1, \gamma_2 x_2) - \rho \gamma_1^2 \sigma^2 / 2 - u_1(\gamma_1 x_1, \gamma_2 x_2) - u_2(\gamma_1 x_1, \gamma_2 x_2) \quad (6)$$

The optimal incentive strategy of principal is $\max_{\gamma_1, \gamma_2, \gamma_g} TCE$. Putting equation (3), (4), (5) into equation (6), according to the first order condition $\partial TCE / \partial \gamma_i = 0$ and $\partial TCE / \partial \gamma_g = 0$,

$$\gamma = \frac{1 - 2(\alpha + \beta)\sigma / \sqrt{\pi}}{1 + \rho\sigma^2} \quad (7)$$

$$\gamma_g = \frac{1}{1 + \rho\sigma_g^2} \quad (8)$$

Since $\alpha \geq \beta$ and $1 > \beta \geq 0$, we get that individual incentive $\gamma < 1 / (1 + \rho\sigma^2)$, team incentive is independent of risk. Proof of Proposition 2 is completed.

Proposition 3. Compared with standard HM model, inequality aversion among agents increases the agency costs of contract.

Proof. The agency costs are composed of four parts: the risk cost of agent, the inequality aversion cost of agent, the efforts cutting of agent and the expected income cutting of the principal.

The risk cost of agent is

$$\Delta RC = \rho\gamma\sigma^2 + \rho\gamma_g^2 + \sigma_g^2 \quad (9)$$

The inequality aversion cost of agent is

$$\Delta u = u_1 + u_2 = 4\gamma\sigma(\alpha + \beta) / \sqrt{\pi} \quad (10)$$

The effort cutting of agent is

$$\begin{aligned} \Delta C &= \Delta c_1 + \Delta c_2 + \Delta g_1 + \Delta g_2 \\ &= 2\left(\frac{1}{2} - \frac{1}{2}\gamma^2 + \frac{1}{2} - \frac{1}{2}\gamma_g^2\right) \end{aligned} \quad (11)$$

The expected income cutting of the principal is

$$\begin{aligned} \Delta \pi_p &= \Delta \alpha_1 + \Delta \alpha_2 + \Delta g_1 + \Delta g_2 \\ &= 2(1 - \gamma + 1 - \gamma_g) \end{aligned} \quad (12)$$

Then, the agency costs are

$$\begin{aligned} \Delta C &= \Delta RC + \Delta U + \Delta \pi_p - \Delta C \\ &= \rho\gamma^2\sigma^2 + (\alpha + \beta)\frac{4\gamma\sigma}{\sqrt{\pi}} + 2(1 - \gamma) - (1 - \gamma^2) \\ &\quad + \rho\gamma_g^2\sigma_g^2 + 2(1 - \gamma_g) - (1 - \gamma_g^2) \end{aligned} \quad (13)$$

In equation (13), the first four are the agency cost of individual task, the latter three are the agency costs of team task. The agency costs of team task don't include α and β , so it has no relationship with inequality aversion and keeps unchanged.

Putting equation (7) and (8) into equation (13), we get

$$AC = \frac{\rho\sigma^2}{1 + \rho\sigma^2} + (\alpha + \beta)\frac{4\gamma\sigma}{\sqrt{\pi}} + \frac{\rho\sigma_g^2}{1 + \rho\sigma_g^2} \quad (14)$$

The quality aversion increase the agency cost of individual task, so the total agency cost is increased. Proof of Proposition 3 is completed.

Proposition 4. To reduce agency cost where exists inequality aversion, tasks with high risk should be assigned to the team, while tasks with lower risk should be assigned to the individual

Proof. Suppose two tasks, one's variance is σ_l , the other's variance is σ_h , satisfying $\sigma_h > \sigma_l$. $AC_{\sigma=\sigma_l, \sigma_g=\sigma_h}$ represents that task with variance σ_l is assigned to the individual and task with variance σ_h is assigned to the team. $AC_{\sigma=\sigma_h, \sigma_g=\sigma_l}$ represents the converse.

$$AC_{\sigma=\sigma_l, \sigma_g=\sigma_h} = \frac{\rho\sigma_l^2}{1+\rho\sigma_l^2} + (\alpha+\beta) \frac{4\gamma\sigma_l}{\sqrt{\pi}} + \frac{\rho\sigma_h^2}{1+\rho\sigma_h^2} \quad (15)$$

$$AC_{\sigma=\sigma_h, \sigma_g=\sigma_l} = \frac{\rho\sigma_h^2}{1+\rho\sigma_h^2} + (\alpha+\beta) \frac{4\gamma\sigma_h}{\sqrt{\pi}} + \frac{\rho\sigma_l^2}{1+\rho\sigma_l^2} \quad (16)$$

Thus, $AC_{\sigma=\sigma_l, \sigma_g=\sigma_h} - AC_{\sigma=\sigma_h, \sigma_g=\sigma_l} = (\alpha+\beta) \frac{4\gamma(\sigma_l - \sigma_h)}{\sqrt{\pi}} < 0$. Proof of Proposition 4 is completed.

4 Conclusion

To establish a fair and efficient system of income distribution is the major issues to be solved in the current economic development of China. Exploring the inequality aversion preference and its resulting behavior influence has important practical significance. In this paper, we study the mutual influence among inequality aversion, risk and incentive in the team work using the principal-agent model. The relationship between inequality aversion and risk is that inequality aversion is positively related to the risk of individual tasks. The relationship between inequality aversion and incentive is that inequality aversion increases the agency costs of incentive. Based on the two relationships, we draw the following difference of the optimal incentive strategy between standard HM model and HM model with inequality aversion. Tasks of higher risk being assigned to the team and tasks of lower risk being assigned to the person can reduce agency costs and improve the efficiency of team work. The incentive to individual performance should decrease with the increase in inequality aversion among the agents. The incentive to team performance is not subject to the effect of inequality aversion.

An Analysis of Risk and Supervision of China's Shadow Banking

Wu Yuejuan

School of Economics, Shanghai University, Shanghai, P.R.China, 200444
(E-mail: wuyuejuan1991@163.com)

Abstract: Through studying the numerous reports and literature, using the method of comparative analysis, we give a detailed and comprehensive analysis of the development, behavior, risk and regulatory progress of China's shadow banks respectively. It was found that, in 2013, the size of the shadow banking has reached 27 trillion yuan, accounting for about one-fifth of all the assets of the banking, however, due to the low degree of financial innovation in China, the development of China's shadow banking is still in the initial stage, and there is still great room for development. Secondly, China's shadow banking behavior is mainly asset securitization and part of the repurchase agreement or other, in which risk is mainly the former. Finally, according to the supervision of shadow banking which has been strengthened by Chinese government in recent years, we propose for specific types of shadow banking entities shall formulate specific regulatory strategy to promote the healthy development of the shadow banking system.

Key words: Shadow Banking; Securitization; Repo; Risk; Supervision

1 Introduction

Shadow banking was born in the course of the financial markets. When the profitability of traditional business reached a bottleneck, commercial banks will develop high-risk, high-yield business in some areas lack of supervision to seek new profit point and to ease the pressure of downward profitability. In the continuous development, driven by the interests, various non-bank financial institutions have joined to form the shadow banking system. Compared with the traditional commercial banks, shadow banks can adapt to international development, and the assets they hold gradually increase. However, the shadow banking is getting well known in the financial crisis. In 2007, the US subprime mortgage crisis happened and gradually spread to other countries through the global linkage of financial markets, and now even some countries did not recover from it. And people found that shadow banks played a key role in the financial crisis in the process of exploring the causes of the financial crisis. After two or three years, the European debt crisis occur in Greece, Spain and other countries, where the shadow banking affect the stability of the financial system. In China, until 2011, the Wenzhou private lending crisis broke out, people realized shadow banking's risk has begun to have an impact on the country's financial stability.

For the shadow banking risks and financial stability, the domestic and foreign scholars have carried out extensive research. David Longworth (2012) studied the potential risk of shadow banking system and found that the lack of financial regulation and information opaque are two important reason that shadow banking system leads to financial instability. Elias Bengtsson (2013) took the European money market funds for example, studied the relationship between the shadow banking and financial stability, and found that money market funds had greater impact on financial stability and shadow banking supervision should be strengthened. Among the studies of Chinese scholars on this problem, which are more representative are as follows: Ba Shusong(2009) studied the performance of the shadow banking in financial crisis and proposed shadow banking accumulated considerable financial risk, which had the negative effect on the 2008 financial crisis. Wang Zhenggang et al. (2013) analyzed from the perspective of the financial audit of the analysis, raised that the shadow banks have liquidity risk, credit default risk and legal risk, and government should strengthen supervision of shadow banking.

At present, although there is a popular belief that the shadow banking system is infectious, the research on the shadow banking is still limited to the traditional banking risk levels and lack of research on the conduct and risk prevention of the shadow banking in the non-bank system. To understand China's shadow banking, we should not only base on the status quo of China's financial market development, but also need an international perspective, comparing with the shadow banking system of mature Western markets, to clear difference between the two, and thus be able to better grasp the future trends of the shadow banking and take appropriate regulatory measures. Therefore, this paper is based on the comparison of the different features of shadow banks in China and the US, grasp the difference; then analyzes the risk of China's shadow banking from three shadow banking behavior aspect——monetary market fund, asset securitization and repo; finally state the regulation and control

measures which are necessary in the future with China's shadow banking development.

2 The Current Development of the China's Shadow Banking

In 2011, the Financial Stability Board define the broad and narrow shadow banking respectively from the perspective of financial functions: broad shadow banking refers involving credit intermediation activities and institutions outside the traditional banking system, narrow shadow banks means non-bank credit intermediaries which may cause systemic risk and regulatory arbitrage. And later added: Shadow banking has many characteristics such as maturity mismatch, liquidity transformation, leverage operation and credit conversion. Considering the characteristics of China's financial market development, China's shadow banks should belong to the broad definition. The specific definition of China's shadow banking type refer to "Notice on Numerous Issues of the Strengthening Shadow Banking", which include: The first category is those credit intermediaries which has no financial license and totally unregulated, including the new online financial companies, third-party financial institutions; The second category is credit agencies which has no financial license and insufficient regulatory, including the financing guarantee companies, micro-loan companies; the third category is the financial institutions hold a license, but there is inadequate supervision or circumvent regulatory business, including money market funds, asset securitization, financial services and others.

"China's Financial Supervision Report (2014)"¹ pointed out that the size of China's broad shadow banking system was about 27 trillion yuan, accounting for about 19% of all the banking assets. FSB (2014)² shows that in 2013, China's other financial intermediaries' assets increase more than 37 percent, nearly \$ 3.1 trillion, accounting for 4% of the size of the world, and compared with 1% in 2007, China's shadow banking developed rapidly. However, compared with the United States and the European Union respectively accounted for 33%, 34% of the world's shadow banking scale, China's size is still smaller. In addition, the size of the US shadow banking in 2008 has exceeded the size of commercial bank assets, European shadow banks scale is also close to the scale of commercial banks, while China's accounts for only a fifth. The above is a horizontal comparison, and longitudinal comparison is in Table 1: RMB loans as a percent of social financing scale fell, while the entrusted and trust loans have increased significantly, indicating that the share of shadow banking in the credit markets increase gradually and developed rapidly. Overall, China's shadow banks have a lot of room for development.

Table 1 Social Financing Scale Structure (Unit: %)

Year	RMB loans	Foreign currency loans	entrusted loans	trust loans	others
2002	91.86	3.63	0.87		1.48
2003	81.06	1.76	8.99		6.7
2004	79.20	4.82	10.89		2.97
2005	78.46	4.72	6.53		7.91
2006	73.83	3.42	6.31	1.93	12.52
2007	60.88	6.48	5.65	2.85	22.32
2008	70.26	2.79	6.11	4.5	14.19
2009	68.97	6.66	4.87	3.14	14.61
2010	56.67	3.46	6.24	2.76	28.67
2011	58.24	4.45	10.1	1.59	22.07
2012	52.04	5.81	8.14	8.15	22.56
2013	51.35	3.38	14.71	10.63	17.22

Note: The above calculated according to "China Statistical Yearbook 2014"; "Others" include undiscounted Banks' Acceptance Bill, Corporate Debt and domestic Equity Financing of non-financial businesses; The Total Social Financing Scale is 100%.

3 The Shadow Banking Behavior and Risk

¹ Quoted from "the report said the scale of China's shadow banking system is about 27 trillion yuan," China News. <http://www.chinanews.com/gn/2014/05-09/6154444.shtml>, May 9, 2014

² Financial Stability Board (FSB): Global Shadow Banking Monitoring Reporting 2014. http://www.financialstabilityboard.org/wp-content/uploads/r_141030.pdf, October 30, 2014

The shadow banking behavior is that a financial institution regulated attempt to achieve profit by the related activities (such as financial innovation). Shadow banking behaviors include money market mutual funds, securitization and repos.

3.1 Money market mutual funds

Money Market Mutual Funds is a fund which invest solely in money market instruments. Money market instruments generally have good liquidity and short term. Compared with general funds, money market funds have two characteristics: First, money market mutual funds provide a restricted deposit account; second, there is less regulations on money market mutual funds.

Risk of Money Market Mutual Funds mainly comes from the fund holders and where the funds invest into. Before the financial crisis, US money market mutual fund raised money from individual or institutional investors and most of capital are flowing into shadow institutions like structured investment vehicles and investment banking. Money market mutual funds has been the “blood donor” of shadow banking system. Once these institutions investment banking appeared crisis, money market mutual funds would inevitably be affected. When fund holders perceived crisis, they would be upset and worry about money market mutual funds difficult to fulfill the implicit promise of the net assets. Then run occurred and financial institutions would sell assets in order to avoid potential losses, in the end, causing panic throughout the financial system. Bengtsson (2013) found that during the subprime crisis, the US and European money market mutual funds suffered a massive fall in asset prices and investor redemptions, which transmitted to the banking system and caused turmoil in the financial system.

China’s Money Market Fund launch constructed in 2003, then experiencing ups and downs, until the regulator canceled the money market fund investment deposit agreement shall not be higher than the prescribed 30% ceiling in 2011, and meanwhile it’s under the background of cross-integration of Internet and finance, money market funds have a new era of development. Among them, a typical example is the ‘Yuebao.’ Money Market Fund still have great potential for growth and innovation. Although the role of China's money market funds in the shadow banking system is not very critical, the awareness of its risk is also very important.

3.2 Asset securitization

Chinese Asset-Backed Securitization began in 2005, but stopped in 2008, and did not resume until 2012. Its development is full of twists and turns. Figure 1 presents the development of assets securitization from 2005 to 2014 and data comes from the Central Securities Depository and Clearing Corporation Limited. 2005 - 2008, the annual issuing size of asset-backed securities was 4.2, 11.6, 17.8 and 30.2 billion yuan respectively, 2013, 10.9 billion yuan, while in 2014, this scale soared to 255.1 billion yuan. Visibly, since 2014, domestic credit asset securitization entered its prime time for development. As issuer continuously enriches, asset securitization in China has gradually reached the stage of normalization development.

Figure 1 The Size of Asset Securitization (Unit: Billion RMB)

The differences between China’s asset securitization and US’ are as follows: on the one hand, the product structure is relatively simple and transparent. Compared with the United States securitized products such as CDO, China's securitized products belong to a one-time derivative, not repeated, therefore, the information asymmetry is not serious and the risk is not quite high; on the other hand, asset securitization secondary market is not active, the mobility of the products is small, two thirds of that are held by domestic commercial banks. Securitized products was originally used to spread risk, but if it has

been held in the hands of by the banks, systemic risk cannot be dispersed. Above all, China's Asset Securitization may need to build up a vibrant secondary market. Although the history of asset securitization market is relatively short, especially after three successful pilot, there has been initially forming a relatively complete system of regulatory system.

3.3 Repurchase agreements

Repurchase agreement is a contract in which the seller of securities, such as Treasury Bills, agrees to buy them back at a specified time and price. It also called repo or buyback. It's the instrument that finances the short-term fund. Essentially, it is the mortgage agreement and is also the media that transfer to between cash and other complex financial instrument. Currently, the world's largest repo market is the US repo market. We can say that in the United States, the repo has become an important short-term financing tool. Its major participants is mutual funds that have many short-term funds. Moreover, as long as the funds provider agrees, any asset can engage in repurchase transactions. But in China, influenced by the degree of interest rates liberalization and financial innovation, repurchase agreements are strictly limited to Treasury bond, the repo market is still in a primitive stage.

Risk of repurchase agreements mainly come from the quality of its collateral. Due to the spotty quality of collateral, it will produce information asymmetry. As mentioned in Batchvarov (2013), the quality of collateral repo transactions determines good or bad trading results rather than repurchase agreement itself. In a depression, poor quality of collateral defaults may cause large-scale "run", under financial leverage, it will soon spread to the entire repo market, eventually causing the financial crisis. Although the quality of collateral in repo market is excellent and the possibility of causing systemic risk is small, reviewing the development of the US repo market, the market seems to be difficult to flourish if too cautious, so how to develop the repo market is well worth thinking.

According to the analysis of the development in the shadow banking and shadow banking behaviors, China's shadow banking system has the following characteristics: First, China's shadow banking system is dominated by commercial banks. For example, bank financing business, interbank business and entrusted loans are all directly associated with the commercial banks and others like trust companies and other financial companies is also related with the bank in the business process. Second, the major China's shadow banking behavior is securitization. Limited to the extent of securitization, products operated by China's shadow banking is still debt instruments or very junior asset securitization products. Third, China's shadow banking mainly service residents or corporate clients, which is also called retail customer.

The characteristics of mature markets abroad shadow banking are as follows: First, the shadow banks usually are dominated by non-bank financial institutions, especially no commercial banks. Second, the main business of the shadow banking is securitization activity. Third, it is of high leverage. Fourth, shadow banking is wholesale funding (for example, by issuing ABCP), and the major investors who bought the shadow banking products are institutional investors.

Comparison of the two, the current China's shadow banks do not fully "copy" the West Shadow Banks. China's shadow banking changes a lot in a particular environment, even some of the China's shadow banking characteristics are different from the international convention and common criteria. But China, after all, is different, it needs cautious thinking. Strictly speaking, China's shadow banking is different, we cannot simply imitate the development of Western shadow banking.

4 The Regulation Progress of the Shadow Banking

After the financial crisis, the shadow banking supervision has become a consensus of countries in the world. However, according to the features described above, China's shadow banking supervision strategy is required different with other countries. The Assessment of Chinese Economics released by IMF in July 2013¹ gave warnings about the risk of excessive expansion of the "non-traditional financial sector," and stated that shadow banks risk may evolve into Chinese financial systemic, so the shadow banking activities must implement more strict prudential supervision. China's shadow banking initially features regulatory arbitrage, but the leverage is not high, unlike United States, European Union and other economies, therefore the focus of regulation is standardization.

At present, the supervision of the shadow banking has an overall rule, published in 2013 called "Notice on Numerous Issues of the Strengthening Shadow Banking." It establishes the principle of "who approved the establishment of institutions also is responsible for risk management" and implements

¹Cited from "IMF Takes" Pulse "of China's Economy, Warning Shadow Banking Becomes Financial Systemic Risk", CNFOL, July 18, 2013

centralized management. Viewed from design of regulator, the pattern of “horizontal regulatory coordination + two-level supervision” has been formed progressively. The former refers to full regulatory of the “one bank and three commissions”¹, eliminating regulatory vacuum and avoiding regulatory overlap; the latter refers to the central and local supervision.

But with regards to the newly established or slow-glowing shadow banking institutions, our government issues trial measurement for administration. Summarized in Table 2.

Table 2 The Shadow Banking Regulatory Summary

Agency or Business	Regulatory
Whole	“Notice on Numerous Issues of the Strengthening Shadow Banking”
Banking Financial Services	“Notice on Regulating the Assignment of Credit Assets and Credit Assets Financial Business,” “Regulation on Financial Cooperation between Trust and Bank,” “Notice on Regulating Investment Operations of Commercial Bank Financial Services ” “Guidance on Banking Financial Services Supervision 2014” and “Notice on Commercial Bank Financial Products Enter the Interbank Bond Market ”
Trust	“the PRC Trust Law,” “Administrative Rule of Trust Company”, “Regulations for Trust Plan of Assembled Funds”, “Guidance on Supervision of Trust Risk”
Non-bank financial institutions engaged in specific business	“Regulations on Group Finance Companies”, “Regulations on Auto Finance Companies”, “Regulations on Consumer Finance Companies”
Interbank business	“Notice on Regulating Financial Institutions Interbank Business”
Non-bank financial institutions service specific objects	“Guidance on the Small-Loan Company Pilot”, “Regulations on Pawn Shops”, “Temporary Schemes of Financing Guarantee Company”
Asset securitization	“Notice on Managing Credit Asset Securitization Pilot”, “Asset-backed Securities Information Disclosure Rules,” “Accounting Rules of Credit Assets Securitization Pilot,” “Measurement Supervision and Administration of Pilot Securitization of Credit Assets”

Throughout the China’s shadow banking supervision, there is still some shortcomings. For example, some financial institution is regulated by the local, others is regulated by the central, causing problems that the same organization may face different regulation in different regions, coupled with lack of cooperation and coordination among regulators, finally creating regulatory arbitrage. Therefore, China needs to form a complete shadow banking regulatory system, which supervisory duties implemented by only some agencies, with coordination of other departments, forming management practices and special rules of various types of shadow banking.

5 Conclusion

In general, although the size of China's shadow banking now is small, it should be regulated. The major direction of supervision is that while it service the real economy to avoid just transferring risks within the financial system rather than reduce risk, strengthen macro and micro prudential supervision to achieve financial stability. However, financial innovation and financial supervision have the dialectical relations which promotes and restrict mutually. Kane, the supporter of Circumventive Innovation Theorem, thinks that financial innovation will be generated when of that when seeking to avoid a variety of financial controls and regulations while external market forces combined with internal needs. When the financial innovation endanger financial stability and the government's monetary policy cannot achieve the intended goal, it will produce strengthening financial regulatory requirements. And under more stringent financial regulation, people will try to circumvent the new regulations, thereby promoting financial innovation. To some extent, financial innovation and financial supervision are constantly challenged each other and move forward during this challenge. And supervision of shadow banking is an ageless topic. It needs subsequent study to cope with new problem occurring in the later development.

Discussion about Influence Factors of the Investment and Management Risks of Japanese Companies in Jiangxi Province

Katsuhiko Nakajima, Luo Fan, Tang Xinxin

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: kcband@outlook.jp, sailluof@126.com, castle_kb24@163.com)

Abstract: This paper presents why, when, and where Japanese companies advance into Jiangxi Province based on the related information provided by Jiangxi Province Commerce Agency and interviews with the companies operating in the Jiangxi Province. The paper investigates the relation between the investment decision and each local city's economic data. The result shows that some economic indexes such as total population at year end have relationship with the number of Japanese company advancing. By comparing the risks which are behind for the corporate overseas activity, and risks which are related to the location to advance, we verify the management risks of Japanese companies operating overseas. It provides some guidance for Japanese companies to invest in Jiangxi Province.

Key words: Jiangxi province; Japanese company advancement; Relation analysis; Influence Factors; Corporate management risk

1 Introduction

At the end of Y1970's the Chinese government started to implement the FDI (Foreign Direct Investment), and in Y1992 it employed Socialist Market Economic System. In the past, for the FDI amount to China, Japan is ranked top or second after the overseas Chinese. On the other hand, due to the rapid Chinese economic growth, the investment environment in China for foreign companies has changed in recent years. This paper focused on influence factors of the investment, the plant location strategy and the management risks of Japanese companies in Jiangxi province during Y1990 to Y2014.

In the past several years, in order to look for the advantages such as labor, human resources, and materials etc., the worldwide borderless corporation's plant localization activity increased year by year. However the overseas advancement is one of the corporate activities in which sometimes management risk is involved. According to Dunning, an England international economist, Ownership-specific advantage(O), Internalization-incentive advantage(I), and Location-specific advantage(L) are three major advantages for foreign company's FDI^[1]. In the theory of Horizontal FDI and Vertical FDI by Shatz and Venables, Helpman and Elhanan, the motivation of FDI by company are the locally competitive advantageous^[2], and the necessity management implementation (labor, raw material, land cost etc.) for low cost operation^[3,4]. Baldwin and Okubo conducted Networked FDI with a focus on new movement of industrial organization such as Global Value Chain^[5]. Johanson and Vahlne, Noisi J. stated that the multinational corporation's globalism has developed from nearest country to farer country, by the standpoint of language, culture, and social system to avoid the risk of unsureness and limitation of information^[6,7]. Wheeler and Mody^[8], Head and Reis indicated that multinational corporations are concentrated in some specific areas^[9,10]. Usually the company selects the plant location at the area where the overseas corporations are gathered. Regarding the Japanese corporation's trend of FDI, Tai Nihyou analyzed the relation between Japanese company's investments in China and economic data^[11]. However, the report on the relation between the Japanese company's investment in China and the Chinese local area economy has not been found. Therefore, this point is discussed here to verify influence factors of the investment and the management risks of Japanese companies operating overseas. It provides some guidance for Japanese companies to invest in Jiangxi Province in the future.

2 The Purpose and Time of Japanese Companies Investment in Jiangxi

Jiangxi Province is located at the south of lower Yangtze River. To the northeast of them is the Yangtze River Delta economic zone which includes Shanghai, of china and to the south there is the Pearl River Delta Economic Zone which includes Guangzhou. Previously Jiangxi Province had many processing type industries using rich resources, but in recent years, with the development of transportation and infrastructure, with the geographic superiority close to the coastal areas and the low cost labor force, their advantage has been reviewed better by business circle.

After the collapse of Lehman Brothers (08), the foreign company preferred further to advance into Jiangxi Province to establish the second plant to complement the production of the coastal areas.

According to the Japanese companies list obtained from Jiangxi Commerce Agency, only 62 Japanese companies have a presence in Jiangxi Province of China.

(1) The investment situation and the timing of advancement of Japanese companies.

We checked the number of Japanese companies advancing into Jiangxi Province, and found the advancement of them converged on the period from Y2006 through Y2010, when exchange was the trend of advancement to the yen in the context of the dollar yen exchange (Figure1).

Figure 1 The Number of Japanese Company Advance in Jiangxi Every Five Year

Before Y2000, Japanese companies advanced to utilize the Jiangxi's rich natural resources, but the number was small. From Y2000 through Y2010, Full-scale industrial transfer from the coastal areas. After Y2011, the number of Japanese company advancing is on the decline

(2) Advance location and investment form

They mainly advanced into the area of Nanchang and Ganzhou followed by Jian, Jingdezhen, Jiujiang, and Yichun. From the data, they initially started operating in Nanchang and Jingdezhen, then expanded to Ganzhou and Jian. In particular, by the effect of the tax reform since 2008, it can be seen that the plant location in Jiangxi (especially Ganzhou) has increased.

(3) Investment Corporate Form

In Table 1 the industries and investment form (Wholly owned or not) are summarized. There are many wholly owned companies for the light industries, such as Food, toys, pottery, and sewing cloth. On the other hand, for chemical, rare metals, and environmental industries, the number of wholly owned company is extremely few. It can be said here, Japanese companies may prefer wholly owned company other than joint venture. It can be seen that they choose the joint venture only when it is necessary.

Table 1 Japanese Company Number by Industry

type of industry	Number of Japanese companies	Example	Wholly owned company	
			number	Ratio%
Food	3	Boiled eeel, Shallot pickle	3	100.0
Toy	2	Toy, Lantern Mfg.	2	100.0
Pottery	6	Pottery, Exterior Mfg.	6	100.0
Sewing,Clothing	5	Sewing,Clothing	4	80.0
BuildingMaterial, Furnitur	7	Bamboo work, Buddhist altar, Building material	5	71.4
Metal Processing	6	Plating, Coil, Copper pipe, Metal press	4	66.7
Manufacturing	10	Transformer, Digital camera lens, Air conditioner, Electric parts, Display, Lighter, Toner, Small motor	6	60.0
Auto, Auto Parts	8	Auto, Wire harness, Auto coil	4	50.0
Service	4	Hotel, Trading, Construction design/Auto parts design consultant	2	50.0
Chemical	3	Fluorine Chemical, Medicine	1	33.3
Metal Materials	6	Rare metal, Hard alloy	0	0.0
Environment	2	Sewage & water treatment, Household appliance recycling	0	0.0
Sum	62		37	59.7

(Reference:Author made based on jiangxi Province Data)

3 Influence Factors of the Investment of Japanese Companies in Jiangxi

During November 2014 through January 2015, we had visited 11 Japanese companies in five districts of Jiangxi (Nanchang, Jiujiang, Yingtan, Jingdezhen, and Yichun) for the research. Influence factors of the investment of Japanese companies in Jiangxi are as follows.

(1) Influence factors of the investment of Japanese companies in the past years

Based on this research, the reasons that they have entered Jiangxi Province are as follows.

- ① the availability of material: 5 companies (chemical company 1, wood processing company 1, pottery manufacturer 2, food company 1)
- ② the location of business partner: 1 company (environment company1)
- ③ the good logistics: 1 company (toner manufacturing company1)
- ④ The location of customer: 1 company (gilding company1)
- ⑤ The low cost of labor: 1 company (sewing company1)
- ⑥ Development Zone personal enthusiasm: 2 companies (food chemistry company1, small size motor manufacturing company1)

Regarding overseas destination of Japanese companies, it is said in generally that except the basic infrastructure of electricity, gas, water, transportation, and labor, key factors are ①close to the raw materials or market, which are both ends of production and sales, ② regional income level (cost), ③ the number of Japanese company (or foreign companies) in this area, ④ distance between Japan and the location.

In Jiangxi, the factors of ③ and ④ are not so important as that in other areas, but the factors of ① and ② are more important reasons and more attractive for investment. In our opinion, they selected Jiangxi area due to key factors ① and ②.

(2) Influence factors of the investment of Japanese companies in the future

They expanded their business in China based on two strategies. One is export-oriented type (overseas markets, particularly Japan-oriented) using Chinese inexpensive intermediate input elements while the other one is local market-oriented type aiming China's growth market. Most companies we visited were export-oriented one (eight companies out of 11th).

On the other hand, if you look at the timing of investment, in 90s only one company a year invested, in 2000s and 2010s five companies invested respectively. From 2009 to 2013, when dollar yen exchange advanced less than 100Yen, it came up to six companies out of 11th to make investment. It can be assumed, when Japanese Yen appreciated, Japanese companies established plant in Jiangxi, where the income level is rather low, and preceded the business model to export to Japan.

However, due to recent depreciation of Yen, appreciation of Yuan and the increase of labor cost, the profit of the Japanese export-oriented companies has been down rapidly. There were some companies which have begun to examine the restructuring, including the withdrawal.

Even in this situation, some export oriented companies have made efforts to improve profitability by diversification of sales destinations. In a few years, the difference of the self-help efforts or the business strategy of the company will bring the huge different results for the company direction.

In the meantime, the labor problems have occurred in the four companies out of 11 companies we interviewed. Two companies faced member's strike, one company was sued by the labor arbitration committee for overtime while one company had issue regarding secret information. All of them are Japanese wholly owned companies.

In joint ventures, Chinese management, who had not been interviewed by us, is responsible for personnel and labor generally. So some related problems have not been reviewed. It can be seen the Japanese advance companies are struggling with labor problems.

4 Relation Analyses Between Advancing Timing and Economic Index

On the above we reviewed Japanese companies how and why they have advanced to the Jiangxi. In this section, we further consider about the relation between the Japanese companies advancing and the number of economic indicators of Jiangxi each city. First, we attempt a correlation coefficient analysis as quantitative evaluation, then attempted qualitative analysis. Based on the list of Japanese companies in Jiangxi provided by Jiangxi Province Commerce Agency, the presence of Japanese companies were confirmed by the China nationwide corporate credit information public announcement system (<http://gsxt.jxaic.gov.cn/ECPS/index.jsp>). (Table 2).

Table 2 Economic Indicators of Each City

Year	Total	Nanchang	Ganzhou	Jian	Jingdezhen	Jiujiang	Yichun	Yingtan	Fuzhou	Shangrao	Others
1992	1	1	0	0	0	0	0	0	0	0	0
1993	1	1	0	0	0	0	0	0	0	0	0
1994	0	0	0	0	0	0	0	0	0	0	0
1995	2	1	0	0	1	0	0	0	0	0	0
1996	1	0	0	0	0	0	0	0	0	0	1
1997	0	0	0	0	0	0	0	0	0	0	0
1998	2	0	1	1	0	0	0	0	0	0	0
1999	0	0	0	0	0	0	0	0	0	0	0
2000	3	1	0	0	1	0	1	0	0	0	0
2001	2	1	1	0	0	0	0	0	0	0	0
2002	1	1	0	0	0	0	0	0	0	0	0
2003	5	2	1	2	0	0	0	0	0	0	0
2004	3	2	0	0	0	0	1	0	0	0	0
2005	4	1	0	0	1	0	0	0	1	1	0
2006	8	2	3	0	1	1	0	0	1	0	0
2007	4	2	0	0	0	1	0	0	0	0	1
2008	1	1	0	0	0	0	0	0	0	0	0
2009	4	0	0	0	1	0	0	2	0	0	1
2010	8	2	1	2	1	0	2	0	0	0	0
2011	8	0	2	1	0	2	1	1	0	1	0
2012	2	0	1	0	0	1	0	0	0	0	0
2013	2	1	0	0	0	0	0	0	1	0	0
Total	62	19	10	6	6	5	5	3	3	2	3

(Reference: Author made based on Jiangxi Province Data)

Economic indicators of each city were collected from Y1992 to Y2013 from Jiangxi Statistical Yearbook of Y1993 to Y2014. However in the previous data in 2000, the items are insufficient. Therefore we use the data from Y2000 to Y2013 for the continuity.

(1) Quantitative analysis (correlation analysis)

We used the program “SPSS Statistic19” to do the correlation analysis.

① Regression Equation

This paper reviews the relation between “the number of Japanese company FDI” and “Jiangxi province area’s economic index” using the following regression equation:

$$N(it) = A_0 + A_1 * POP(it) + A_2 * D2P(it) + A_3 * GRP(it) + A_4 * GRC(it) + A_5 * GRG(it) + A_6 * IDN(it) + A_7 * FIN(it) + A_8 * ITP(it) + A_9 * FIT(it) + A_{10} * FIU(it) + A_{11} * HSN(it) + A_{12} * PRS(it) + A_{13} * TR(it) + PP(it) \tag{1}$$

Each parameter in regression equation is showed in Table 3.

Table 3 Correlations Analysis Parameter

Number	Parameter	Variable
1	Total population at year end	POP(it)
2	secondary industry population at the year end	D2P(it)
3	GRP	GRP(it)
4	GRP per capita	GRC(it)
5	GRP growing ratio	GRG(it)
6	Industrial company number	IDN(it)
7	FDI corporate number	FIN(it)
8	Industrial total production	ITP(it)
9	Yearly FDI total	FIT(it)
10	yearly actual FDI amount	FIU(it)
11	High school student number	HSN(it)
12	City people disposable income	PRS(it)
13	Tax incentive policy	TR(it)
14	China-Japan political problem	PP(it)

In addition, the sub-index are “i: the timing (year)” and “t: each city”.

② The actual steps of the correlation coefficient analysis

The actual steps are explained as follows using the Nanchang City as example.

First, we examined the correlation between each year FDI company number and each parameter. It is shown as below. (Table 4)

Table 4 Correlation Analysis Sig. & Company Number

	POP(it)	D2P(it)	GRP(it)	GRC(it)	GRG(it)	IDN(it)	FIN(it)	ITP(it)	FIU(it)	HSN(it)	PRS(it)	TR(it)	PP(it)
Sig.(2-tailed)	0.041	0.045	0.063	0.183	0.038	0.079	0.239	0.074	0.084	0.497	0.137	0.036	0.224

Here, the parameters, which the standard deviation is greater than 0.1 (the upper limit for the existence of the correlation), are removed (GRC, FIN, HSN, PRS, and PP). As a result, the remained eight parameters are considered as analysis (Total population at the year end, secondary industry employees at the year end, GRP, GRP growing ratio, Industrial company number, Industrial total production, Yearly actual FDI amount, and tax incentive policy), and we calculate the correlation coefficient in the equation 1.

② Analysis result

As a result, if adopt the Standardized Coefficients (the constant is zero), the relationship between “the companies advancing number each year” and “each parameter in Nanchang City” became as follows.

$$N(it) = 0 - 2.417 * POP(it) + 0.849 * D2P(it) + 2.592 * GRP(it) + 0.852 * GRG(it) - 0.114 * IDN(it) - 0.879 * ITP(it) - 0.459 * FIT(it) - 0.291 * TR(it) \quad (2)$$

For other cities, the number of data is too small, therefore unfortunately it was not possible to obtain a correlation expression. For even Nanchang city, there is stronger correlation with GRP, GRP growing rate, and the secondary industry employee population at the year end. It was the result of the inverse correlation with other parameters. Data number of Nanchang City is only 19, to apply a correlation analysis, it is considered the number of data is too small, therefore it's the result of credit also seems to be low.

(2) Qualitative analysis

Regarding the results of the above quantity analysis, the reliability is seems low due to the small number of data. If you look at the data as qualitatively,

① In the entire Jiangxi, as described in Chapter 5, the influence of "New Enterprise Income Tax Law" in January 2008 and the foreign exchange rate enacted largely.

② Japanese FDI was gathered in Nanchang City, which is the provincial capital, and Ganzhou located nearby Guangdong, which tax benefits was continued. And it was spread over to other cities regardless of the economic indicators. In other words there is a tendency for them to advance in the place where many Japanese companies gathered

(3) The key factors based on relation analyses

From the above, we can say as follows regarding Japanese company FDI in Jiangxi of China.

① Their main business type is export to Japan using the resources of the abundant resources (mineral resources, agricultural resources) and the low cost labor in this area. Especially when the yen exchange rate became stronger, this trend became clearly.

② They were affected by the Exchange rate, the Tax regulation, and the cost difference with the coastal areas.

③ Since Y2000 the advancement has been accelerated, and peaked in 2011, after that, its number was greatly reduced under the influence of the Japan-China relationship.

④ They prefer single advancement (wholly owned corporation) unless they need other corporate model.

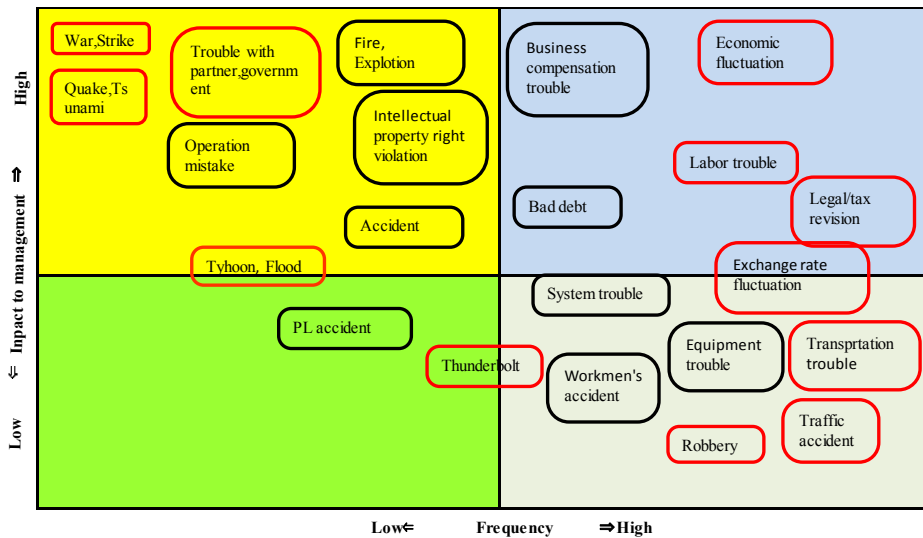

⑤ We attempted the correlation analysis to determine where and when they decided to advance, however the result is not satisfied due to small number of samples. By the qualitatively view, its tendency is to invest in the place where many Japanese companies gathered.

⑥ In order to focus on the pursuit of cost reduction, labor risk measures would be neglected, and caused labor problem for them. There is a tendency that their labor risk measures are insufficient.

⑦ Recently the exchange rate of yen becomes weak. This gave the big impact to Japanese companies' profitability of Jiangxi.

6 Management Risks of the FDI Corporation in Jiangxi

Some management risks are involved in the foreign company investment in Jiangxi. They may face many management risks. To minimize these management risks, the foreign companies consider well when and where they should make investment. The Figure 2 shows the general management risks by impact and frequency. In this map, red squared risks are related to the location they choose and timing they enter in Jiangxi.

(Reference: Tokio Marine Nichido)

Figure 2 General Management Risk Map

7 Conclusion

The result of this paper shows that some economic indexes such as total population at year end are influence factors of the investment and can effect on the number of Japanese company advancing in Jiangxi Province. The changes of these indexes not only affect the number of Japanese company in Jiangxi Province, but also provide some advices to the Japanese companies' investment and development in Jiangxi Province. From the investigation of this paper, it is clear the purpose of many Japanese companies advancing Jiangxi Province were to obtain the low cost labor and raw materials. However, the reversal of the currency exchange trends makes their management more difficult or severe. In addition, their cost oriented management has the weakness of the labor risk management. For Japanese companies it is necessary to prepare to control the corresponding risks. In this regard, we will further advance the investigation.

Abstract: The constant exposure of P2P lending platform running off with investors' capital has aroused great concern from the public and Chinese government. This paper argued that the moral hazard of P2P lending platform is what investors and Chinese government should give priority to especially when P2P lending is still in its infancy in China. Fraud is also a kind of moral hazard, based on the fraud triangle theory, this paper analyzed the reasons for moral hazard of P2P lending platform from the perspective of pressures, opportunities and rationalized excuses and then put forward some corresponding suggestions for Chinese government to prevent and control the moral hazard of P2P lending platform by inhibiting its incentives, reducing its opportunities and weakening its excuses.

Key words: P2P lending platform; Moral hazard; The fraud triangle theory; Run off with capital

1 Introduction

P2P lending platform has been frequently reported to run off with investors' capital in China, causing great losses to investors. P2P lending refers to lending and borrowing between unrelated individuals or peers without going through the bank or other traditional financial institutions. Platform that facilitates such transactions is called P2P lending platform. Investors, borrowers and P2P lending platform are the main participants of P2P lending. Among them, P2P lending platform serves as an information intermediary to connect investors and borrowers, matching transaction amount, period and interest for them, making it the core of P2P lending. P2P lending has been experiencing robust growth in China since 2013 for it satisfies the great unmet financial demands of small and medium-sized enterprises and personal consumer as a result of the long-term financial regulation of Chinese government. However, behind its booming development, the news of P2P lending platforms running off with investors' capital is also frequently seen on the Chinese newspaper and media. According to data from Wangdaizhijia, the first web portal tracking the P2P lending industry in China, the number of P2P lending platforms which vanished without a notice in the first five months of 2015 is 24, 24, 32, 27 and 33, respectively, accounting for 34.78%, 41.38%, 51.74%, 51.92% and 58.93% of the newly exposed P2P lending platforms with problems in the same month, respectively. The increasingly serious moral hazard of P2P lending platform has greatly undermined investor confidence and jeopardized the healthy development of P2P lending. The moral hazard of P2P lending platform refers to egoistic behaviors that P2P lending platform conducts to maximize its own interests by harming the benefits of investors and borrowers, which is usually involved in misleading propaganda, unimaginably high returns, false profiles, bogus borrowers and forged financing projects as well as fake use and flow of funds.

Professor, Roger Melson, the Nobel Prize winner in economics, once pointed out that moral hazard is the risk that all countries, particularly developing countries need most to keep vigilant in the process of economic development. Though the past two years have witnessed its leaping development, P2P lending is still in its infancy in China. The moral hazard of P2P lending platform is extremely difficult to discover in advance for it can hide well. Meanwhile, once it breaks out, investors are usually unable to get any of their principal and interest back, leaving them out of pocket. Therefore, the risk that investors and Chinese government desperately need to guard against is also the moral hazard of P2P lending platform. Many scholars have done researches on the moral hazard of P2P lending. Yum et al. (2012) indicated that P2P lending has the problem of adverse selection and moral hazard because of information asymmetry. Chaffee and Rapp (2012) pointed out that P2P lending has higher level of moral hazard in comparison with traditional lending for it lacks family, cultural or group tie to enforce borrowers to pay back and the lending transactions are not made face to face. Xie Ping, the father of the concept of internet finance in China, indicated in the "report on Chinese internet finance in 2014" that P2P lending platform has the fraud risk in order to increase trade volume. Xu Rong et al. (2014) argued

* This paper is supported by the subject "study on risk transmitting mechanism of private lending in Wenzhou"

that moral hazard exists in P2P lending because of incomplete social credit system and defective operation mechanism. Lin Liping (2014) suggested that rational man hypothesis and information asymmetry act as the internal cause and external cause for moral hazard of P2P lending, respectively. The current studies nearly all focused on the moral hazard of borrowers. There is almost no paper specializing in the moral hazard of P2P lending platforms. Studies on moral hazard of P2P lending platforms are few and superficial. The fraud triangle theory, aimed at finding out the causes of enterprise fraud, is widely used to instruct fraud auditing. Fraud is a kind of moral hazard; therefore, the fraud triangle theory can also be applied to the study on the moral hazard of P2P lending platforms. This paper made further study on the moral hazard of P2P lending platforms in hope of making up for the insufficiency of this research field and contributing to Chinese government's prevention and control of the increasingly serious moral hazard of P2P lending platform and thus promoting the long-term healthy development of P2P lending.

2 The Reasons for Moral Hazard of P2P Lending Platform Based on the Fraud Triangle Theory

The fraud triangle theory articulates that pressure, opportunity and rationalization, together, lead to fraud. Without any one of these three elements, fraud won't occur. Pressure, the incentive of fraud, is what motivates the fraudulent acts. Personal or professional financial obligations, greed and alcohol addiction can all serve as pressure. Opportunity refers to the chance to commit the fraudulent acts without being caught. Typical opportunities for fraud include information asymmetry, insufficient supervision and lack of legal restriction. Rationalization, last but not least, is the excuse fraudsters find to justify their dishonest actions.

2.1 Pressures for moral hazard of P2P lending platform

1) Finance for affiliated enterprises or their own projects. One of the major reasons for the prosperity of P2P lending platform in China lies in its unlimited financing capacity. Many people established a P2P lending platform with the purpose of solving financing difficulty whether for their affiliated enterprises or their own projects, which significantly motivates them to defraud investors by means of forging borrowers, fabricating financing projects and falsifying funds use and flow in order to transfer investors' capital. Typical P2P lending platforms of this kind like "Dongfangchuangtou" and "Wangyinzaixian" which both cheated investors of more than one hundred million RMB ended up with running off with investors' capital. Investors usually take greater risks and are more likely to suffer from huge losses if they invest on this kind of P2P lending platforms.

2) Encircle investors' capital and then ran away. There are many fraudulent P2P lending platforms in China. Money encirclement is their initial and final goal. To circle money, fraudulent P2P lending platforms tend to attract investors by promising unbelievably high returns, releasing false or misleading propaganda, issuing day mark and second mark to perpetrate Ponzi scheme. After encircling enough capital, they just disappeared. It is nearly impossible for investors to retrieve their capital.

2.2 Opportunities for moral hazard of P2P lending platform

Introduced to China in 2007, P2P lending is still immature in this country, which provides P2P lending platforms with plenty of opportunities to conduct fraudulent acts. Opportunities for moral hazard of P2P lending platform are shown in Figure 1.

1) Extremely low entry threshold. P2P lending platform basically has no entry threshold in China since its introduction. A P2P lending platform can be registered with little investment in human and material resources. Compared with the low initial investment, the funds it can attract from investors are exponentially magnified. The fraudulent P2P lending platform named "Youqiandai" only invested 60 RMB for its establishment, but defrauded nearly 50 million RMB and then disappeared. P2P lending, in essence, is a kind of finance. Considering its industry particularity, there should be some restrictions on the entry threshold to screen out those disqualified. Too low entry threshold gives those who want to get something from nothing opportunities to enter P2P lending industry to seek personal gains through improper means.

2) Non-standardized third-party funds trusteeship. There are huge amount of precipitation funds on the P2P lending platforms. Although China Banking Regulatory Commission clearly demanded that P2P lending platform should implement third-party funds trusteeship, yet how and who to trustee, the scope of funds needed to trustee and the qualification of trustee agency are still not be determined. Lacking detailed rules results in non-standardized third-party funds trusteeship. Some P2P lending platforms trustee the precipitation funds to their own or affiliated financial institutions, and some only trustee risk

reserve funds, and some even just don't trustee the precipitation funds. The form of third-party funds trusteeship is over its substance, which enables P2P lending platforms to form huge capital pools that can be withdrawn and disposed freely by them. Capital pools make it easier for P2P lending platforms to illegal transfer and embezzle investors' capital. Lin Caiyi, chief economist for Guotai Junan Securities, pointed out that more than 95% of the exposed fraudulent P2P lending platforms are involved in capital pool. It can be said that capital pool is the hotbed of moral hazard of P2P lending platform.

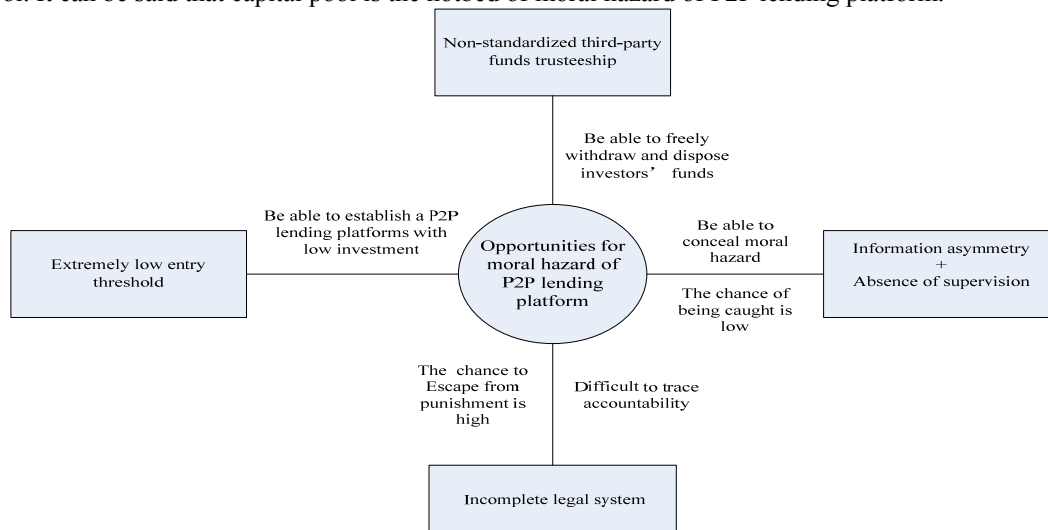

Figure 1 Opportunities for Moral Hazard of P2P Lending Platform

3) Information asymmetry. Investors and supervision departments are at information disadvantage in P2P lending for they rely on P2P lending platforms to get information about their operations, investment projects, credit standing of borrowers and funds flow. Because of lack of compulsory and detailed industrial standard of information disclosure for P2P lending, information disclosure of P2P lending platform is self-disciplined for the purpose of attracting investors, which means that they have great liberty to determine what, how, when and where to disclose. They are able to selectively disclose favorable information, insufficiently disclose or not disclose or even falsely disclose unfavorable information to conceal moral hazard and deceive investors. Meanwhile, there are no audit institutions to authenticate the disclosed information. Investors and supervision departments are unable to gain a comprehensive and correct idea of key information such as funds flow, financing projects, etc, which makes investors unable to prevent moral hazard and supervision departments incapable of supervising timely and effectively. The moral hazard of P2P lending platform has a slim chance of being discovered. Information asymmetry is the primary cause of moral hazard of P2P lending platform.

4) Absence of supervision. As it can be seen from the Figure 2, the supervision of P2P lending in China is blank until April, 2014. Though China Banking Regulatory and People's Bank of China have issued concerning documents to supervise P2P lending, however, from the four "red lines" to "six principles" to "ten principles" to new "seven principles", the supervision of P2P lending is all about official principles which don't possess the power of laws and rules. What's more, the official principles are just too general, no specific and detailed regulations have been made, leading to the absence of government supervision. The regulation of P2P lending largely relies on industrial self-discipline supervision which can only impose limited restraint on the behaviors of P2P lending platforms. Insufficient supervision significantly decreases the likelihood of moral hazard of P2P lending platforms being caught and leads to time lag of moral hazard of P2P lending platforms being discovered, which allows P2P lending platforms to conduct fraudulent acts without worrying about being caught since they have great chance to get away with the monitoring of relevant supervision departments.

CBRC issued four “red lines” on what P2P lending platforms can do or cannot do	CBRC issued five orientations for supervision of P2P lending	CBRC introduced ten principles for supervision of P2P lending	CBRC put forward new “seven principles” for supervision of P2P lending	CBRC established a department named “universal benefits” to supervise P2P lending
April,2014	July,2014	August,2014	September,2014	November,2014
	PBOC released “guidance to promote the healthy development of Internet finance”	Executives of CBRC put forward six principles for the development of P2P lending		PBOC released the five ideas on supervision of Internet finance

Remarks:CBRC stands for China Banking Regulatory Commission and PBOC stands for People’s Bank of China

Figure 2 The Course of Supervision of Chinese P2P lending

5) Incomplete legal system. There are no laws and regulations targeting P2P lending platform in China. Only contract law, property law, etc can place little constraints on P2P lending platform. A great many P2P lending platforms hold the view that anything laws don’t prohibit is legal and can be done. P2P lending platforms taking advantage of legal loophole to engage in business in gray areas is common in Chinese P2P lending industry, some of which can greatly harm the benefits of investors. Furthermore, incomplete legal system makes it hard to trace accountability for there are some difficulties in determining legal characterization of moral hazard of P2P lending platform and gathering evidences, making case filing difficult. According to statistics of Wangdaizhijia, there are nearly 300 fraudulent P2P lending platforms by the end of May, 2015, but less than one third of the cases have been placed on file and less than one tenth of cases have proceeded to the trial phase. The moral hazard of P2P lending platform has a high chance of escaping from punishments due to the incomplete legal system.

2.3 Rationalized excuses for moral hazard of P2P lending platform

Chinese P2P lending industry is at a mess at the present. News about disappearance of P2P lending platform is reported every few days. It seems that P2P lending platforms running off with investors’ capital has become a common phenomenon in China. P2P lending platforms involved in financing for affiliated enterprise or their own projects often find excuses like this: “I’m doing this out of frustration”, “I’m doing this for the company’s sake”, “I will pay back the money once I get through” to rationalize their fraudulent acts. The excuses fraudulent P2P lending platforms find are often like this: “I’m just doing what most people have been doing, if I don’t do as they do, I’m kind of losing money”. An industry environment prevalent with moral hazard of P2P lending platform and a social environment lacking professional ethics are the best excuses to rationalize P2P lending platforms’ dishonest practices.

3 Suggestions to Prevent and Control Moral Hazard of P2P Lending Platform Based on the Fraud Triangle Theory

3.1 Inhibit the incentives of moral hazard of P2P lending platform

Whether the moral hazard of P2P lending platform will occur or not depends on the evaluation of its costs and benefits. Only when the benefits outweigh the costs will P2P lending platforms conduct dishonest behaviors. The reason P2P lending platforms degenerated into a tool to finance for affiliated enterprise or encircle money lies in its low entry threshold and unlimited leverage. No restriction on the leverage ratio of P2P lending platform makes the benefits of moral hazard way too much more than its costs. Therefore, inhibition of the incentives of moral hazard of P2P lending platform can be achieved by setting an appropriate maximum leverage ratio to limit its benefits or raising the entry threshold and imposing stiff penalties to increase its cost.

3.2 Reduce the opportunities of moral hazard of P2P lending platform

1) Set an entry threshold for P2P lending industry. As an integral part of Internet finance, P2P lending has degenerated into a free-for-all because of its low entry threshold. More emphasis should be attached on its qualification approval. Government should set threshold for registered capital especially contributed capital, founding team’s credit standing and professional background, places of business, qualification of business, organizational structure and the security of information system to screen out speculators and those with poor credit record, controlling its moral hazard from the first beginning.

2) Standardize third-party funds trusteeship to completely eradicate capital pool. Considering the serious damages capital pool can do to the benefits of investors, it is urgent for government to come up with feasible concrete rules to standardize third-party funds trusteeship, defining trustee agencies, way of trusteeship, and qualification, scope and duties of trusteeship. It should be required that both investors

and borrowers must open an account in the same independent third-party trustee agencies with trusteeship qualification like banks, respectively. The capital goes directly to opposite account rather than account of P2P lending platforms when doing transactions. In this way, P2P lending platforms are deprived of free access to investors' capital, which makes it more difficult for them to transfer and embezzle investors' capital.

3) Reduce information asymmetry to prevent and control moral hazard of P2P lending platform. The inadequate and false information disclosure largely accounts for the information asymmetry among investors, supervision departments and P2P lending platforms. The key to preventing and controlling moral hazard of P2P lending platform is to monitor the funds flow and guarantee the authenticity of financing projects. Therefore, to reduce information asymmetry for the purpose of preventing and controlling moral hazard of P2P lending platform, just as is shown in the Figure 3, Chinese government, on the one hand, is suggested to establish compulsory and standardized information disclosure system to make sure that the information P2P lending platforms disclosed is sufficient and reasonable, on the other hand, it is also expected to discover and correct false information disclosure timely by developing monitoring platforms using big data, improving complaints mechanism for financial consumers, establishing third-party information sharing platform, implementing registration system for P2P lending products and introducing third-party audit institution and rating agency.

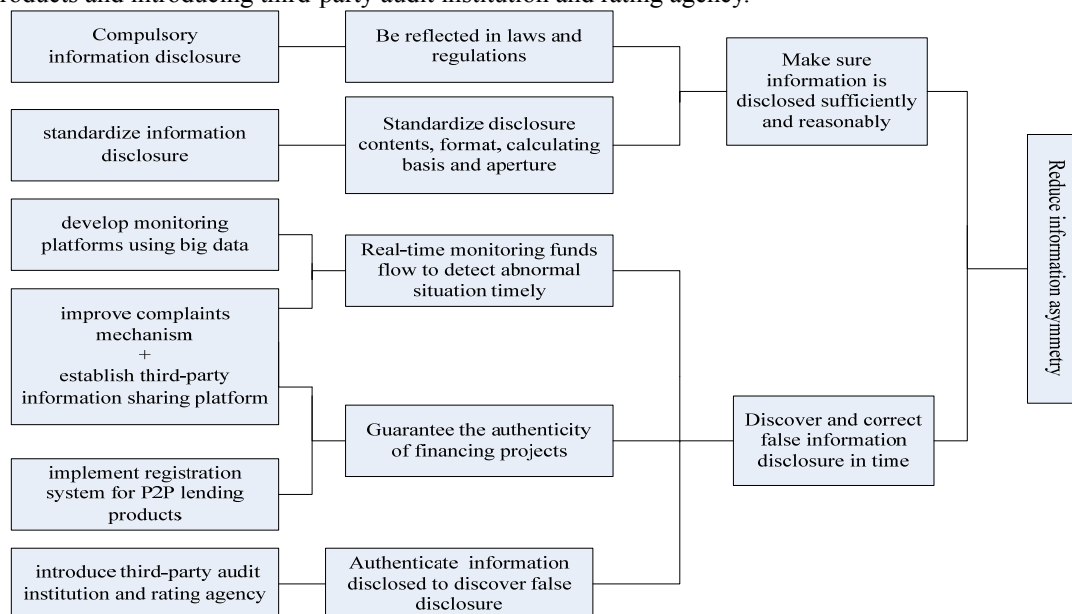

Figure 3 Ways to Reduce Information Asymmetry Regarding Moral Hazard of P2P Lending Platform

4) Develop and perfect supervising system to strengthen supervision for P2P lending. One important reason why P2P lending develops rapidly yet still orderly without the phenomenon of P2P lending platforms vanishing with investors' capital in America lies in that American supervision departments take P2P lending seriously and step in timely to formulate industrial supervising standards. Chinese government should issue relevant supervising policies and concrete rules as soon as possible to strengthen government supervision, identifying supervisory duties and scope and prohibiting related-party transaction, false propaganda and forgery of financing projects and funds flow; promote the establishment of industry associations, self-regulatory organizations and self-discipline standards to reinforce the industrial functions of guidance and regulation; introduce third-party audit and rating institutions to give full play of market supervision. More efforts should be made to supervise intermediate fund accounts, funds flow, related transactions and information disclosure.

5) Improve legal system to impose legal restraint on P2P lending platforms. Chinese legislature needs to enact laws aimed at P2P lending platform to identify its legal characterization, business scope and responsibilities, making case filing and trial legally well-founded. A special court can also be set up to accelerate the settlement of fraud cases of P2P lending platforms.

3.3 Weaken the excuses of moral hazard of P2P lending platform

To weaken the excuses of moral hazard of P2P lending platform, on the one hand, Chinese government is expected to strengthen professional ethics education, honesty education and social

responsibility education for P2P lending practitioners to enhance their moral levels and increase moral self-restraint, making them less willing to find excuses. On the other hand, it also needs to create a healthy and positive industrial environment to make P2P lending platforms shamed of their dishonest behaviors and guide P2P lending platforms to the right direction.

4 Conclusion

The moral hazard of P2P lending platform has become a serious problem hindering the development of P2P lending in China. Low entry threshold, non-standardized third-party funds trusteeship, information asymmetry, absence of supervision, incomplete legal system and an industrial environment prevalent with dishonest acts largely account for the moral hazard of P2P lending platform. To prevent and control the moral hazard of P2P lending platform, Chinese government can adopt leverage management to inhibit its incentives; set an entry threshold, standardize third-party funds trusteeship, reduce information asymmetry, develop and perfect supervising system and improve legal system to reduce its opportunities; strengthen professional ethics education, honesty education and social responsibility education and create a healthy and positive industrial environment to weaken its excuses.

Research on Risk Analysis and Countermeasure of Vertical Integration Strategy of Enterprise

Zhang Jianming

Huaxia College, Wuhan University of Technology, Wuhan, P.R. China, 430223

(E-mail: huozhetree@163.com)

Abstract: According to the phenomenon of some domestic enterprises actively “opening up the industrial chain”, this paper analyzes the risk of vertical integration strategy of enterprise, and on this basis, two measures are proposed: the first is properly handling the relationship of industrial chain extension and management standards, the relationship of corporate capital and investment-financing capacity, and the relationship of core business and supporting business; the second is forming the critical resources advantage of high concentration, the competitive advantage of core competitiveness transferring cross-industry, the industrial chain cost advantage under industrial policy conditions, and the market advantage of coordination and linkage of upstream and downstream of the industrial chain; hoping to provide reference for the strategic decisions of some enterprises.

Key words: Enterprise strategy; Industrial chain; Integration; Strategic risks

1 Introduction

The whole industry chain model first proposed by COFCO is sought after by domestic enterprises^[1], and theorists have given it a great deal of attention. Feng Changli, Lan Ying, and Zhou Jian (2012), on the basis of theories of industrial chain and value chain, with COFCO Corporation as case study object, systematically and logically demonstrated the development process of "whole industrial chain" strategy, and mainly analyzed the close relationship between the creation of enterprise's own value and public value and strategic activities^[2]. Xu Zhenyu, Li Bingqian, and Yue (2014), on the basis of "whole industry chain" theoretical analysis, with COFCO as example, sorted out the construction and implementation process of its "whole industrial chain", mainly analyzed the implementation effect of the strategy, and draw relevant conclusions^[3]. Liu Shan (2005) put forward that under the conditions of relatively stable market environment, companies' using vertical integration strategy can bring many benefits. But as the market becomes increasingly competitive and market's dynamics and uncertainty are particularly conspicuous, the negative effects of enterprise's vertical integration business model can not be ignored^[4]. Teng Binsheng(2010) made it clear that the "whole industrial chain" is not omnipotent^[5].

The whole industrial chain strategy, also called enterprise integration strategy or vertical integration strategy is type of organization in which enterprise breaks the industry division and industrial chain division, while involving in a number of links in the upstream and downstream of the industrial chain and forming a certain internal supply-demand relationship. This strategy puts production, marketing or other activities with different techniques under control of the same ownership, and resists uncertainty of external market by means of internal administration.

Recently, some companies have been changing the development model according to the needs of development. Among them, many enterprises actively "open up the industrial chain", and form the corporate function of "whole industrial chain", in order to control risks and achieve rapid development. However, is there no risk in the vertical integration strategy?

2 Risk Analysis of Vertical Integration Strategy

While the implementation of integration strategy can optimize the enterprise's industrial structure, expand the scale of the enterprise's market, stable enterprise's resource supply, reduce enterprise's transaction costs, control the price of enterprise's transactions, enhance enterprise's market position, and form the enterprise's core strengths, but there are also certain risks.

(1) Capacity risk. Since the ability distribution of the links in the enterprise's industrial chain is not balanced and professional collaboration is inconsistent, in the implementation process of vertical integration strategy, it may lead to problems of insufficient business professional and fragmentation of enterprise's core competence. Moreover, the higher the degree of vertical integration, the more enterprise's internal special assets, and the weaker external flexibility will be. The loss of this kind of flexibility will reduce the ability of enterprise to cope with external change.

(2) Competitive risk. Generally speaking, the supplier should not become a competitor of its customers. In the implementation of vertical integration strategy, enterprise is bound to go into other links of the industrial chain, squeezing the market share of upstream or downstream enterprises in the industrial chain, which will intensify competition. Whether the enterprise has the competitive advantage of industrial chain, namely whether the enterprise has core competencies of industrial chain has become the key competitiveness of enterprise.

(3) Information Risk. In the enterprises implementing vertical integration, market demand information is likely to be misinterpreted in the process of passing along the supply chain, which will lead to information asymmetry among enterprises and among departments in the enterprise. This is the “bullwhip effect” led by information transformation. Bullwhip effect is a variation and amplification phenomenon of supply chain demand. When the information flow passes from the client in the downstream to the supplier in the upstream, if the information cannot be effectively shared, information distortion will be stepwise larger. This amplification in the graphics is much like a swinging bullwhip, so it is aptly called the bullwhip effect. Thus, the risk of vertical integration comes from the ability of enterprise to cope with external shocks, and also increases the risk of enterprise’s internal collaboration and linkage.

The industrial chain integration involves many elements inside and outside the enterprise. Besides the above risk, enterprise may also be subject to customer risk, financial risks, policy risks, personnel risks, technical risks, economic environmental risk and so on, which comes from the different stages of development. They are interrelated and interact on each other.

3 Internal Control Strategy for Preventing the Risk of Vertical Integration Strategy

In the implementation process of enterprise integration strategy, according to the above possible capacity risks, competitive risks and information risks, in order to prevent risks, enterprises should handle the following three relationships in the internal control strategy.

3.1 Relationship between core business and supporting business

In the implementation process of integration strategy, many enterprises tend to extend the industrial chain as much as possible, master and control related resources in the upstream and downstream of the chain, in order to prevent instability of the supply of resources caused by market volatility, thus leading to the production fluctuations of enterprise. Therefore, many companies become large or small all-round enterprises. Although in the case of market imperfections, this approach is normal, but it is clearly inefficient. Therefore, how to deal with core business and supporting business is also a very important issue in the implementation process of the integration strategy.

3.2 Relationship between industrial chain extension and management level

With the extension of the integrated industrial chain, the type of company's available resources continues to grow, allocation of resources changes from the original external market regulation into enterprise’s internal management, which is bound to increase the difficulty of business management and raises higher demand in management level. Expansion of enterprise’s scale increases the difficulty of monitoring employees. As the enterprise levels and the number of sectors increase and business range extends, the smoothness of channels of internal coordination and information communication is bound to decline, which will reduce enterprise’s sensitivity to the market response, and timely business decisions will also not be properly guaranteed. All of these require enterprise to pay attention to raising the level of management and changing the management style in the implement process of integration strategy.

3.3 Relationship between enterprise capital and investment-financing capacity

The expansion of enterprise’s business scale and continuous extending boundary need strong capital support, so there must be a considerable investment and financing capacity for guarantee. Once there is a shortage of funds, it will affect the normal operation of the industrial chain, and even break it.

Strategic value is the result of many factors. When enterprises are value-oriented, they should take full account of the relationship of the various aspects, the establishment of risk early warning mechanism, to ensure the enterprises’ sustainable value in the expansion.

4 Advantageous Conditions for Controlling the Risk of Vertical Integration Strategy

The successful implementation of vertical integration strategy, in addition to prevention of risks, but also needs to meet specific conditions, including industrial policy, industrial characteristics and transferability of the enterprise’s core competence in the value chain, etc.^[6].

4.1 Forming cost advantage of industrial chain under conditions of industrial policy

The formation and development of the industrial chain will inevitably be affected by the relevant state industrial policies. How to make use of industrial policy to build a scientific and rational industrial chain, or to transform existing industrial chain, and form unique advantages, is the project that vertically integrated enterprise should study. Our country's coal-electricity-aluminum industrial chain developed mainly due to the adjustment of national industrial policy and complying with the social environment of recycling economy and ecological economy. Such as East New Hope, its business includes bauxite, coal, feed and dairy farming and other seemingly unrelated businesses, investing in the construction of pit power plants, aluminum plants, bio-engineering company, and contacting the company's business with a line. By shaping alumina, aluminum, power generation, lysine, feed and other products chain in upstream and downstream, enterprise integrates the industrial chain, reduces procurement costs in all links, avoids price controls and activates the synergy between the various business^[7].

4.2 Forming critical resources advantage of high industry concentration

Enterprise with an industrial chain of high industry concentration has the ability to negotiate pricing. In the building process of industrial chain integration, based on the principles of critical resources, on the basis of analyzing the advantages and disadvantages of the whole industrial chain, by means of self-support, self-building, self-development, annexing, and purchasing, etc., enterprise raises the industry concentration and form core competitiveness in core business. Meanwhile, in the supporting business link of the industrial chain, by means of procurement outsourcing, financial shares, strategic cooperation and cross-shareholdings, etc., enterprise improves the industrial chain structure, bind together business interests from beginning to the end of the industrial chain to reduce industrial risks due to the scarcity of resources in upstream and downstream. For example, Japan's Mitsui group intervenes in the whole process from mining resources in Brazil, to the port, to ocean transportation, then to steelmaking and profile production in the industry's downstream and until the final consumer products manufacturing. Iron ore mining adopts the way of financial shares, ocean shipping uses Mitsui merchant ships and vessels, steel production are in the charge of Nippon Steel, and final consumer products are produced by Toyota, Sony and other top brands. The advantage of critical resources in the whole industrial chain is highlighted, and industry risks of all sectors in the enterprise brought by resource scarcity are relatively low^[8].

4.3 Forming competitive advantage of core competitiveness transferring cross-industry

To some extent, the market competition has evolved into the competition between industrial chains. The so-called core competencies transferring cross-industry, is that the unique technology, product or service capabilities in a certain link in the upstream or midstream of a certain chain, can transfer to some links of the downstream of the industrial chain, forming unique competitiveness in the market. For example, Tyson Foods Inc. integrates the feed, feeding and the production, and revolutionizes the management structure of the poultry industry. Tyson's own production of chicken feed with a unique formula helps the chicken flesh become tender. This feed becomes Tyson's unique competitiveness, and passes to the downstream links. Good feed coupled with efficient farming and processing, Tyson produces chicken with higher quality than competitors, and achieves higher prices and margins.

4.4 Forming market advantage of synergies and linkage of upstream and downstream of the industrial chain

Business in an industrial chain can be divided into the core business, supporting business and derivative business, where the derivative business is a parasitic business form on the core business and supporting business. This is the business linkage effect in the industrial chain. Industrial chain combines and makes supporting business compatible relying on core business, which is business synergies effect in industrial chain. Disney's industrial chain model is the one relying on television and film business and theme park business to support further development of derivative business. Film and television production is Disney's core business, which is boosting the consumption of Disneyland, clothing, toys and other derivatives. Its links of industrial chain include book publishing, animation, television and film issue, theme park resorts, toys, home furnishing and other consumer goods. This model promotes the development of other business with film and television, achieving the synergies and linkage effects in industrial chain^[9].

5 Conclusion

Industrial chain integration requires a balanced development of all links of the industrial chain; otherwise it is difficult to form synergies. Extension of industrial chain is bound to increase risk of the

business system. This risk exists in two levels, one is whether it is able to become a holistic enterprise, i.e. whether integration is to bring "synergies"; the other is whether the ability of resisting external risks of the integrated enterprise is to reduce. To reduce the strategic risk of enterprise integration, in addition to the countermeasures in management level, investment-financing capacity and the core business, etc., there should be efforts to create conditions for enterprises as much as possible, to form resource advantage, cost advantage, competitive advantage and market advantage, enabling enterprise groups with integration strategy in industrial achieve more and more success.

Study on Relations and Differences Between Internal Control and Risk Management

Gao Tiantian

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 2932223895@qq.com)

Abstract: This paper proposes the comparison between the Chinese and foreign theory and practice in the internal control and risk management with literature research and descriptive analysis. Through the analysis of the development process and characteristics of both, the conclusion is the internal control and risk management reach an agreement on the ultimate goal, but there are differences in the application environment etc. It builds the model of historical development process of internal control and risk management respectively. In order to make better development of enterprise, we must build enterprise internal control system combined with risk management based on the risk management of enterprise internal control system.

Key words: Internal control; Risk management; Relationship; Similarities and differences

1 Introduction

In recent years, cases that enterprise got failed because of failure on internal control occur frequently, then the traditional internal check and internal accounting control has far cannot satisfy the needs of the enterprise risk control. Therefore, it has been a problem that domestic and foreign enterprise needs to solve which is how to strengthen the construction of enterprise internal control, to build a comprehensive risk management as the core of risk management system, to improve the level of comprehensive risk management. And it is also the trend of the times for the change of enterprise management. This article attempts to expound the related concepts, sorting results, analysis and summaries of internal control and risk management from the current situation of the development of internal control and risk management of our country,

2 Literature Review

In September 2004, the American COSO committee widely absorbed the research of theory and practice, and then it published<Enterprise Risk Management-Integrated Framework>to guide the comprehensive risk management activities of the enterprises. Internal control of Chinese practice and theoretical research started relatively late. In 1986, the ministry of finance issued the<Guidelines for Fundamental Accounting Work>which made specific provision to the internal control system for the first time. In June 2008, the ministry of finance issued<Enterprise Internal Control Basic Norms>to emphasize the basic methods for the enterprise to implement risk assessment. The researches of internal control based on the risk management are more. The relationship between the two, how to make the mutual fusion and promoting enterprise development are the key to the researches. But in the development of the research process, the differences between theory and practice are often neglected, which is the basis.

Today internal control and risk management are no longer within the enterprise, while it is the corporate governance behavior with high transparency under the government's supervision and the investing public's widespread attention. It has become the important guarantee for the enterprise to prevent risks and develop. Although there is a certain distance between the domestic and overseas in the risk management system, from the gradual encroachment of experts and scholars' attention to this aspect, the improvement of the system is just around the corner.

3 Development History

Table 1 Internal Control Development Process

Period	Stage	Represent events	Concern point	Technology method	Aim	Factors
Forming stage	Internal contain Rules	Parallel recording system	Account	Division of duties, interactive tests	Accounting fraud	Account system
Formative period	Internal control rules	Robinson company case	Accounts, entity, management activity	Organizational structure, responsibilities, personnel condition, business processing procedures, inspection standards and Hard control of internal audit, etc	Financial objective, management objective	Account system, control activities
Evolution period	Internal control structure	Watergate affair	Management and administration activity	Hard control, focus on senior managers Want to morality construction	Financial objective, management objective	Controlled environment, account system, control activities
Mature period	Internal control integrated framework	COSO report	Resources and activities	Add soft control based on hard control	Working efficiency goals, financial reports standard, law-abiding goals	Control environment, risk assessment, control activities, information and communication, supervise
Elongating stage	Risk management framework	Enron event	Risk factor	Add soft control based on hard control	Strategic goals, working target, financial results goals, law-abiding goals	Internal environment, setting goals, events recognition, risk assessment, risk response, information and communication, supervision

Table 2 Risk Management Development Course List

Year	Big event	Stage division
1705	Bemoulli build Law of Large Numbers	Traditional risk management stage
1720	The world's first insurance company was founded in the UK	
1921	Kinght published < Risk, Uncertainty and Profit >	
1952	Marlowitz published "portfolio selection" theory	
1956	Snider put forward the concept of "risk management"	
1962	The first book about risk management published	
1973	Risk management, association of insurance combined with economy was established in Geneva	
1979	IBM established	
1980	SRA established	
1986	Financial derivatives trading for the first time in the world	
1987	The U.S. stock market suffered "black Friday"	
1993	Title of CRO was used in the U.S. for the first time	
1995	Bahrain bank closes down, the world's first enterprise risk management standards came on	
1996	The first global risk management association (GARP) established	
1998	LTCM, long term capital management in financial derivatives trading lost \$4 billion	
1999	The new capital accord revised (BasselO)	
2000	The concept of "comprehensive risk management" has been widely accepted	Comprehensive risk management stage
2001	9. 11 terrorist attacks	
2002	Collapse of Enron	
2004	The COSO issued < Enterprise Risk Management - Integrated Framework >	

4 The Relationship Between Internal Control and Risk Management

The relationship between internal control and risk management refers to the internal control and risk management. Combining with the international authoritative definition of internal control and risk management, there are the following three kinds of representative opinions on the relationship between the internal control and risk management. They are risk management includes internal control, the internal control includes risk management, the internal control is just the risk management.

Among them, the first idea that comprehensive risk management is the extension and expansion of the internal control framework gets more consensus. For example, “the enterprise risk management - integrated framework” made clear that risk management includes internal control. The content of the internal control structure includes three aspects: control environment, accounting system and control program. Risk management, in addition to these three goals, adds strategic goals. Eight elements of risk management include not only the three elements of goal setting, event identification and risk countermeasure, but also the five elements of the internal environment: internal control, risk assessment, control activities, information and communication, internal supervision. Obviously, the risk management’s concept has wider extensions.

5 Similarities Between the Internal Control and the Risk Management

5.1 The ultimate goal is consistent

Though there are differences of primary goal between the internal control and the risk management on establishment and implementing, the internal control and the risk management are consistent on the final goal of preventing enterprises’ interests from damage and promoting the enterprise’s value creation.

5.2 The main body of implementation is consistent

Both in the internal control and risk management need the staff in the enterprise to cooperate and join in actively. It’s not the preserve or exclusive content of a certain level. If you can't mobilize the staff in the enterprise to participate in internal control and risk management fully, the implementing effect of the plan will be discounted.

5.3 Risk management is the developing direction of the internal control

The COSO risk management framework is built on the basis of the original internal control framework, and it is an extension and segmentation of the original internal control framework. In the new complex environment of market economy, enterprises face enormous internal and external all kinds of risks. The internal control management model that risk management oriented will be more conducive to the development of the enterprise. Enterprises need to bring more proactive risk management in enterprise internal control account, and change passive to active.

6 Differences Between the Internal Control and the Risk Management

6.1 The difference of the goal in a narrow purpose

Internal control is just a function of management, reach their goals only through control in process and afterwards. Its purpose is to provide reasonable assurance for the legitimacy and compliance of the enterprise management, the security of asset, the authenticity and integrity of financial accounting information relying on the systematic and standardize operation process so that they can promote the enterprise’s business efficiency and performance and facilitate the enterprise to go forward in an established development strategy direction.

Risk management is throughout all aspects of the management process. The means of control is not only reflected in inwards and afterwards control, what’s more, when setting goals in advance, it gives full consideration to the existence of risk. Its purpose is to prevent the risk, control risk at the source or forecast the incidence of the risk and try to make it to the lowest, even benefit from risk management.

6.2 The difference in application environment

Formulation and implementation of internal control is mainly in an internal environment. According to the different characters, different characteristics and different development stages of enterprises, managers set different internal control systems and apply it in the daily operation of enterprises. Internal control is not responsible for the specific establishment of enterprise management goal, but simply to evaluate target formulation process, especially on the target and the strategic planning of risk assessment. And risk management needs comprehensive consideration on the risk in the internal and external environments. Furthermore, it integrates the risk management requirements into enterprises' management and business processes.

6.3 The difference of the constituent elements

According to the COSO report, internal control mainly includes five elements: internal environment, risk assessment, control activities, information communication and supervision. While risk management newly increases three elements: goal setting, matter identification and risk response on this basis. And the elements of the same also have different connotations. Elements of its overall risk management have more extensive connotation, increasing the measurement and inspection for the risk.

7 Conclusion

Based on the review of related theory and practice in Chinese and foreign enterprise internal control and risk management on the basis of the historical development process, we explore the relationship between internal control and risk management, which has important theoretical and realistic significance. Specifically, the main research results include:

1) By straightening out the developing process of internal control, we find that it roughly experienced internal control rules, internal control structure, internal control integrated framework, risk management framework as a whole and comprehensive risk management six stages.

2) Borrowing the COSO <Enterprise Risk Management - the Intergrated Framework>, it thinks the comprehensive risk management is the extension and expansion of the internal control framework. The internal control and risk management have distinction and connection. They supplement each other and are indispensable. The goals of risk management and internal control are consistent. In order to protect the interests of investors more effectively, under the condition of new technology and the market, we need to develop more active and comprehensive risk management on the basis of the internal control.

The main contribution of this paper is to establish an internal control system for the enterprise and provides a new train of thought: combining the internal control system and risk management. Based on risk management of enterprise internal control system, it can reflect the requirement of risk management to the enterprise internal control better. Hope this article can provide certain reference for our country's enterprises to establish scientific internal control system in accordance with own needs.

Risks and Evading Measures of Overseas Mergers and Acquisitions of Chinese Financial Institutions

Zhao Jun

College of International Business and Economics, Wuhan Textile University, Wuhan, P.R.China, 430070
(E-mail: 282762010@qq.com)

Abstract: By the method of literature research and case analysis, this paper firstly did cases retrospect regarding overseas merger and acquisition of domestic commercial banks, insurance companies, security companies and sovereign wealth fund. Afterwards, the risks of overseas merger and acquisition, which China's financial institutions are facing, are concluded by qualitative analysis, including strategic choice risk, timing of M&A choice risk, political risk and legal risk at pre period, financing risk and anti-M&A risk at while period, possible operational risk and integrating risk at post period. Last, some measures about risk evading are proposed based on the level of both China's financial institutions and government, including formulating suitable oversea M&A strategy, valuing the impact of financial period and economic and financial environment home and abroad, strengthening the power of financial institutions, emphasizing the integration of strategy, culture, staff, administration after M&A, formulating relative national strategies and implementing supervision mechanism.

Key words: Financial institutions; Overseas mergers and acquisitions; Risks; Evasion

1 Introduction

Researches done by scholars home and abroad concerning financial institutions cross-border M&A risk mainly includes:

Through the research on bank's cross-border M&A risk and profit, the risks are classified as general risk and system risk. Researchers found that there is neither increase nor decrease on general risk and system risk, compared with acquirer's domestic market M&A. Although the abnormal returns of acquireris negative, it could be increased by slightly raisingbuyer's risk. Yakov Amihud, DeLong, Anthony Saunders(2002).

By collecting bank's mixed merge and international activity in the past hundred years, expansion risk and system risk were found in the process of bank M&A. After further research on financial data of famous international banks M&A from 1991 to 2002, it was found that the risk tendency of bigger bank was not lower than smaller one's, especially after the year of 2000. It was also found that the potential system risk of a more concentrated bank would be higher than a less concentrated one. Gianni De Nico, Philip Bartholomew, Jahanara Zaman and Mary Zephirin(2003).

In practice, the key to bank merging is a suitable balance between the speed of institutions integrating and the speed of concept combining. Researches done by domestic scholars concerning financial institutions cross-border M&A risk are mainly based on international researches and combined with China's national conditions as supplements. The practical policy formulation is still under exploration, however, a great theoretical breakthrough can be seen regarding China's financial system reform. Haspeslagh(2005).

2 Previous Cases of Overseas Mergers and Acquisitions of Chinese Financial Institutions

Recent years, especially since financial crisis in 2008, witnessed the trend of steady growth in overall size of Chinese enterprises in overseas mergers and acquisitions, and the fields it involves are not just limited to resources.

In order to serve overseas expansion of Chinese enterprises better, and break through the bottleneck of market share to gain target company and technology with underestimated value, financial institutions in China accelerated their pace of overseas mergers and acquisitions. According to Dealogic, the overseas mergers and acquisitions of Chinese financial institutions reached 30 cases with a total amount of \$ 4.8 billion in 2014. Although the amount is less than \$ 5.1 billion of 2013, the number almost doubled compared with that of 2013, and overseas acquisitions are more inclined to acquire the controlling stake. Nowadays, commercial banks, insurance companies and sovereign funds are the major acquiring firms in overseas mergers and acquisitions of Chinese financial institutions. Commercial banks and insurance companies, take their core business as orientation, mainly focus on equity acquisition of institutions like foreign banks; while sovereign funds have a wide range of

merging objects, including not only equity of foreign funds, but also that of investment bank.

2.1 Overseas mergers and acquisitions of commercial banks

Take Industrial & Commercial Bank of China (ICBC) for example, it kept itself ahead of other Chinese banks among overseas mergers and acquisitions. When did overseas mergers and acquisitions, a cautious strategy has been adopted by Industrial & Commercial Bank of China and the construction of overseas branches were taken as its primary goal.

On August 29, 2007, ICBC paid \$ 46.83 million patacas to purchase totally 119,900 shares of common stock of Seng Heng Bank, which accounted for 79.93% of its issued capital. After the transaction, ICBC became the largest shareholder of Seng Heng Bank.

Then on October 26 of the same year, ICBC purchased shares from existing common shareholders of Standard Bank of South Africa at the price of 136 Rand per share, and those have been purchased is equal to 11% of the existing issued common stocks. At the same time, ICBC subscribed common stocks at the price of 104.58 Rand, with which the number is also 11% of issued capital before transaction. Immediately after the mentioned transaction, ICBC again bought 20% equity held by Standard Bank at the average price of 120.29 Rand per share, becoming its largest shareholder.

On June 4, 2009, ICBC and BEA (Bank of East Asia) established an agreement on equity transaction between Canada Branches of BEA and ICBC-BEA Financial Holding Co., Ltd. According to relevant agreement signed by the two parties, ICBC paid BEA C\$ 80.25 million to purchase 70% equity of Canada Branches of BEA. One year after the transaction, ICBC possessed call option which can make its stake increased to 80%, while BEA held put option which can make its remaining shares transferred to ICBC. Meanwhile, ICBC sold 75% equity of ICBC-BEA Financial Holding Co., Ltd to BEA with an amount of HK\$ 372 million. These two transactions are mutually premise. Upon completion of the two transactions, ICBC and BEA conducted joint operation and management for Canada Branches of BEA, while ICBC-BEA Financial Holding Co., Ltd will become a wholly-owned affiliated company of BEA.

The day of April 21, 2010 witnessed the completion of ICBC's voluntary tender offer for Thailand ACL Bank Public Company Limited, and both parties completed the delivery of shares and funds on the following day. ICBC collected about 97.24% shares of ACL Bank through this kind of voluntary tender offer. ACL Bank was subsequently delisted by ICBC on the basis of reasonable procedures.

2.2 Overseas mergers and acquisitions of insurance companies

When it comes to this topic, Anbang Insurance, as a good example, was intended to obtain a full financial license and set up financial holding groups in overseas mergers and acquisitions. It has accelerated its overseas mergers and acquisitions since the fourth quarter of 2014. On October 13th, Anbang Insurance acquired the Belgian Insurance Company--FIDEA with a history of almost one hundred years, which cost more than 220.9 million euros, namely RMB 1.7 billion yuan. On December 16th of the same year, it spent 219 million euros to purchase 100% equity of the Delta Lloyd's Bank in Belgian. Anbang Insurance also acquired VIVAT, a Holland insurance and asset management company which has operated for more than 100 years on February 16, 2015. The next day, it announced the acquisition of Korea Tong Yang Life Insurance and the maintaining of its listing status. In May, Anbang Insurance was negotiating with bankrupted Germany Mortgage Bank Hypo Real Estate AG for the acquisition of its large real estate subsidiaries. If this deal of 1 billion euros can be made successfully, the asset purchase scale of Anbang Insurance in global will see great expansion.

2.3 Overseas mergers and acquisitions of security companies

In December 2014, Haitong Securities spent 379 million euros to purchase investment banking business of Banco Espirito Santo which is the largest investment bank with a history of 144 years in Portugal. Taking Europe as its home market, Banco Espirito Santo established branches in London, New York and Hong Kong. And its operating profits reached 76 million euros in 2013 with an net profits of 7 million euros. However, the parent company of Banco Espirito Santo, the Santo financial group, was reported to have financial crisis in July 2014, which lead to the slump of share prices. Haitong Securities' acquisition of Banco Espirito Santo suggested that it has internationalized layout and also has the intention to develop into a company with comprehensive and mixed operation.

2.4 Overseas mergers and acquisitions of sovereign funds

Take China Investment Corp. (referred to as CIC), the Sovereign Fund as an example, it paid The Blackstone Group ---the largest private equity firm in the world---\$ 3 billion to subscribe 9.9% shares of the Group in the initial public offering in June 2007, but up to October 2008 since its listing in June 2007, the share price of The Blackstone Group has dropped nearly 70%. In October 2008, CIC has increased its stake from the original 9.9% to 12.5%, which cost \$ 250 million.

In order to improve long-term earnings of foreign exchange investment, CIC has established a deal agreement with U.S Morgan Stanley on December 19, 2007. In line with this agreement, CIC paid about \$ 5 billion to purchase a kind of Convertible equity units issued by Morgan Stanley and shall be converted to common stock after the expiration. The share price of Morgan Stanley was \$ 48 at that time, in that way, the corresponding shares that \$ 5 billion bought in were 9.8%, while according to terms of the deal, the conversion price at expiration shall not exceed 120% of the reference price. Before the investment converted into common stock in 2010, an annual ROI of 9% ---5% higher than the cost of financing---can be guaranteed for CIC. CIC indicated that this investment was just for the long-term financial investments, not involved in daily management of Morgan Stanley.

3 Risks of Overseas Mergers and Acquisitions Faced by Chinese Financial Institutions

Take sustainable development of commerce into consideration, Chinese financial institutions can expand the business scale of overseas mergers and acquisitions, increase points of profit, improve its management and competitiveness, but we should not ignore the fact that there existed many failed cases of acquisition in the past few years. Risks which should be noticed in overseas mergers and acquisitions are as follows.

3.1 Risks before overseas mergers and acquisitions

3.1.1 Risks faced when choosing a strategy

To make a successful strategy, most of the buyers inclined to choose those merger targets who are highly related with itself and take notice of the control of transaction exposure in overseas mergers and acquisitions. Taking main business as the subject of acquisition, on one hand, can consolidate traditional advantages and enhance global competitiveness, on the other hand, can make it easier to control risks due to familiarity for the business. However, the failure of many overseas mergers and acquisitions is directly related to the lack of clear strategic objectives, some of them have nothing to do with the improvement of these companies' core competitiveness.

3.1.2 Risks caused by time of mergers and acquisitions

Experiences have shown that great chances of success for overseas mergers and acquisitions can be seen in financial downturn, while in the period of financial boom, institutions faced with high barriers to entry and the valuation of asset is also relatively high. In financial downturn, the regulatory authorities will generally relax overseas investment restrictions due to the need for external capital inflows generated by the liquidity contraction of the capital, thus providing convenience for overseas mergers and acquisitions. In addition, the downturn period see the decrease of asset valuation, pessimistic expectations covered with the original shareholders, it is the right time that the acquirer can effectively reduce the cost of mergers and acquisitions. For example, in early 2008, it cost China's Ping An insurance company \$ 2.15 billion to purchase 50% equity of Fortis Asset Management Company, but until October 2 of the same year, Ping An's investment has a deficit of RMB 15.7 billion yuan, with its net profit of the year decreased by 95.6% when compared with that of 2007, because the financial crisis in 2008 made Fortis Group suffered from heavy pressure of capital liquidity, making its share price plunged.

3.1.3 Political and legal risk

Usually, Chinese financial institutions suffered political risks from the host country during overseas mergers and acquisitions, including political unrest, policy adjustment and political boycott. Due to the acquisition in financial industry has bearing on the financial stability of host country and affected its economic artery, so the policy constraint is the most strict. Many countries formulated strict approval procedure for cross-border mergers and sharing equity of financial institutions, making the cost and difficulty of acquisition increased.

Chinese financial institutions will also inevitably suffered legal risk in overseas mergers and acquisitions, such as the restriction of the host country's Securities Law, Antitrust Law and Foreign Investment Law. Take the Securities Law as an example, in terms of information disclosure, the Securities Laws of the United States, Japan and Australia are specified, when shares of the target company an investor holds reached or exceeded 5%, it should be disclosed, even every change of 1% shares is included in the disclosure. When it comes to principle of purchase for listed companies, just as Williams Act specified, if the acquisition company launched a one-time acquisition of a listed company by providing a tender offer, the relevant forms must be submitted to the U.S Securities and Exchange Commission for filing, the target company and the Stock Exchange that the stock listed should be informed at the same time. The acquisition company should send the tender offer to all the shareholders

of the target company, and the purchasing price should be higher than the stock price before the announcement of the offer, in addition, the tender offer should effectively last for no less than 20 payday. After shareholders of the target company made a commitment to the offer of the acquisition company, they have the rights to withdraw its commitment within 15 days after the start of the offer.

As finance has something to do with national security, the 873(a) paragraph of U.S. National Defense Authorization Act for the Fiscal Year of 1993 even specified that buyers should be controlled by government of foreign countries, or should be investigated when they carried out activities on behalf of foreign government.

3.2 Risks during overseas mergers and acquisitions

3.2.1 Risks of financing

Financing risks of financial institutions in overseas mergers and acquisitions include the risk of raising funds, the debt risk of overseas target financial institution and the risk of increasing price during the acquisition competition. Usually, it will cost a huge amount of money for financial institutions to conduct overseas mergers and acquisitions. For instance, ICBC paid \$ 5.6 billion to purchase Standard Bank of South Africa. It also cost CIC \$ 3 billion to acquire common stocks of The Blackstone Group in 2007. The use of the financial institutions' own funds in overseas mergers and acquisitions will take up the cash flow and increase the risk of investment. If conducted high leverage by borrowing, it will suffer from the risk of exchange rate under the fluctuation of it, especially in the current appreciation cycle of U.S. Dollars, these highly leveraged financing will bring huge debt pressure to the financial institutions.

3.2.2 Risks of anti-mergers & acquisitions

When conducted mergers and acquisitions for overseas financial institutions, Chinese financial institutions generally enter into management of the target financial institution in the host country and gain its control rights. Sometimes, the original management make endeavor to fight against mergers and acquisitions for the sake of its own interests and for resisting foreign culture. They may lobby the antitrust division to stop the acquisition, collect evidences which is possibly in violation of Company Law, Securities Law, Antitrust Law and other relevant laws and regulations to file a suit to the court or increase the potential cost of acquisition and send the tender offer at higher price, intentionally increasing the difficulties of acquisition. Moreover, finance is the lifeblood of the modern economy, if overseas mergers and acquisitions of Chinese financial institutions posed a threat to the control rights of financial lifeline in the host country, it will result in psychological resistance of the host country, raising the transaction cost and integration difficulty in later times.

3.3 Risks after overseas mergers and acquisitions

3.3.1 Operating risks

If the overseas mergers and acquisitions of Chinese financial institutions can not bring about operating, financial and management synergy effects as well as market share effects, it is difficult to achieve economies of scale and complementary advantages, or it can not create economies of scale due to large span of management and fail to reach the expected acquisition goal, all these can give rise to operating risk.

3.3.2 Integration risks

Most of Chinese financial institutions have a relatively short history of carrying out overseas business, they also had little chance to cooperate with foreign financial institutions in the past, unfamiliar with their management style and pattern. The core brain drain caused by poor integration after mergers and acquisitions actually means the failure of financial institutions' overseas mergers and acquisitions, because the core talent is the core competitiveness of financial institutions. For example, after China Citic Bank's acquisition of CLSA, the quit of the best investment manager in CLSA made the once favored acquisition greatly reduced. Some insiders even directly said: "the investment manager is the most valuable asset of CLSA, but the acquisition led to the loss of the most valuable asset."

4 Conclusion

Facing the above risks, Chinese financial institutions can take the following measures to evade them.

4.1 Develop appropriate strategy for overseas mergers and acquisitions

Firstly, in terms of the choice of location for the acquisition, areas deeply affected by crisis and which have development potential should be given priority, while focus should be given to those Chinese financial institutions who have strong strength of acquisition, such as overseas financial non-performing assets and banks. Secondly, from the point of view of specific acquisition targets, full

investigation and analysis should be made before the acquisition. One of the most complex aspects in the process of enterprise acquisition is valuation and pricing. Only through investigation of the target company can the valuation be more accurate, not resulting in the exorbitant valuation.

4.2 Attach great importance to the influence of financial cycle and the economic & financial environment at home and abroad

First of all, we should maintain the stability of domestic economy and financial environment to create a good internal environment for overseas mergers and acquisitions of financial institutions. The corresponding financial supervision also should be improved to avoid excessive overseas expansion of the financial institutions in the bubble expansion period and the excessive contraction of the financial institutions in overseas financial markets after the bubble rupture. Then financial institutions should pay attention to the use of the international financial cycle. After the subprime crisis, the U.S. Economy recovered through quantitative easing policy, while the European economy was stuck in the quagmire of debt crisis. Chinese financial institutions can take advantage of the international financial cycle, and choose target financial institutions in those areas with a relatively low cost, conducting overseas financial mergers and acquisitions.

4.3 Strengthen financial institutions themselves

At present, traditional interest income is still the main source of income for banks of our country, there are less than 30% banks take non-interest income as their main source of income, the proportion of non-interest income in a considerable number of commercial banks is lower than 10%. Recently, non-interest income in large international banks accounted for more than 50% of the total income, some banks even reached 80%. It suggests that Chinese commercial banks which have not strong enough overall strength and relatively low level of financial innovation, with serious homogeneity and low-tech, carried out more absorbing and imitative innovation, less independent innovation. Before overseas mergers and acquisitions, Chinese financial institutions should firstly enhance their own strength and continuously make financial innovation.

In addition, our financial institutions must introduce or cultivate a group of compound professionals with high-quality for overseas mergers and acquisitions who can reasonably judge the market trends, asset pricing and the level of risks.

4.4 Pay attention to the integration after mergers and acquisitions

Several aspects are included in integration, such as the integration of strategy, culture, people and management. As we all know, overseas mergers and acquisitions involve different countries, each of them has different national and enterprise culture. Due to this kind of cultural differences, it's easy to generate disagreements and obstacles during the communication of both parties. So our financial institutions should fully understand history, style and reputation of the target company before mergers and acquisitions, giving priority to choose those who have similar cultural backgrounds and goals with themselves. Communication and exchanges between two parties should be strengthened and special attention should be paid to internal control and moral hazard issues existed in foreign financial institutions.

4.5 Corresponding support policies from government

Firstly, the government should develop and implement national strategies for overseas mergers and acquisitions of domestic financial institutions as soon as possible. Strategy should include the strategic objectives, strategic focus, embodiments and assessment indicators.

Secondly, the government should be good at supervising several departments of overseas mergers and acquisitions and establishing a regulatory mechanism for the whole dynamic process to ensure interests of state-owned assets. Meanwhile, the government also should optimize relevant environment of overseas mergers and acquisitions, promoting foreign investment and acquisition legislation to make clear the investment access, the forms of mergers and acquisitions, the supervision and management as well as allocation of revenue.

Finally, the government should further develop strategies to support overseas mergers and acquisitions of domestic financial institutions. By introducing relevant rules and regulations to simplify relevant approval procedures, and reducing some taxes and fees, it can serve for overseas mergers and acquisitions of domestic financial institutions. Additionally, the transaction costs and uncertainty of acquisition can be lessened through supportive policies and administrative service of multi-sectors.

Abstract: At present, enterprise's innovation model is transforming from the closed innovation to the open innovation. In the process of open innovation there are four kinds of risk which caused by the uncertainty. They are the risk of capability, the risk of technology, the risk of project and the risk of market, and each kind of risk displays for certain aspects. Based on the innovation risk evaluation system of Japanese industrial research institute, this paper proposed a better risk evaluation system of open innovation.

Key words: Open innovation; Uncertainty; Risk evaluation; Risk management

1 Introduction

At present, enterprises only rely on internal innovation cannot respond to increasing pressure from suppliers consumers and competitors. So enterprise's innovation model is transforming from the closed innovation to the open innovation, and the competitive advantage comes from the more efficient use of other people's innovation. Open innovation is an innovation model that consciously uses the inflow and outflow of knowledge to accelerate the enterprise internal innovation, and take advantage of external innovation to expand market. This innovation model assumes that when enterprises want to improve technology, they can and should use the internal and external ideas, and through the internal and external two paths to move towards the market (Chesbrough, 2003, 2006). Open innovation helps to overcome the professor Clayton Christensen proposed "innovation dilemma", that is in the closed innovation model, enterprises will be difficult to survive if without innovation; but if innovation, it will face the huge risk, even in trouble (Christensen, 1997).

However, any innovation models have some defects just as we open the doors and windows will also enter the fresh air and annoying flies. Four remarkable features of open innovation (open innovation environment, open innovation subject, open innovation resources and open creative development) and the imperfection of internal and external environment determines many risks in the process of open innovation (Gassmann, 2006; Rigby & Zook, 2002). If those risks cannot be well controlled and resolved, they will give enterprises a deadly blow. Because of open innovation implementing late in China, researching on open innovation and risk management have important theoretical and practical significance of some aspects, for example, effectively carry out innovation activities and successfully commercialize innovation knowledge.

2 The Source and Performance of Open Innovation Risk

Since the 1980s, many changes have taken place in the internal and external environment. Innovation resources and capability from centralized to decentralized, so that everyone can innovation, everywhere can innovation, and anytime innovation; the mobility of human resources is more and more frequent, so the innovation resource distribution changes more and more rapidly. "Small and specialized" enterprises increasing, and "dogs economics" gradually beat "zebra economics". There are more and more integrated innovation, and the proportion of breakthrough innovation is becoming smaller. Innovation is not worthless, and we cannot find the opportunity to achieve innovation but meet the increasing opportunity of innovation to achieve value. Consumer and supplier business era is gradually coming. The life cycle of technology and product becomes shorter, thus the request of the innovation speed is more strict than that of the innovation quality. Business model itself is more important than technology and products, how to sell is more important than to sell what. All these changes make enterprises meet many risks of open innovation, that is the basic risks (market risk, technical risk and management risk) and the specific risks (process control risk, internal creative outflow risk, project assessment risk, knowledge sharing control risk, strategic partner selection risk and so on).

This article argues that the risk of open innovation (short for ROI) is due to various uncertain factors (Lichtenthaler & Ernst, 2009). Overall, the defect of open innovation model and the imperfection

* This paper is supported by NSFC (71372201), soft sciences research project of Hubei province (2013BDF033).

of enterprise's internal and external environment will lead to innovation risk. Specifically, the following uncertainty factors that lead to many risks of open innovation.

2.1 Capability uncertainty leads to the risk of capability (short for RC)

The first is the complementary ability to innovation participants, and the uncertainty of balanced situation, which includes whether the capacity of partners just what innovators need, whether the innovation ability of the participants will appear shortage or waste (the shortage is essentially synonymous with waste, the shortage of innovators' capacity necessarily mean the waste of partners' ability, and vice versa. The most ideal situation is the ability of innovation participants with the change of internal and external environment at the same time, increase or decrease in proportion). The second is the uncertain ability of innovation coordinator, which includes business leaders' powers of foresight (whether they can find the development trend of innovation), ability of insights (whether they can grasp the essence and the difficult points of innovation), capacity of management (whether they can make organization members agree with and involved in the innovative behavior; whether they can prevent brain drain and loss of creativity; whether they can manage the entire chain from idea generation to product sales; whether they can influence innovation networks and industrial environment in favor of their own direction of development), innovation capacity (whether they can flexible change the traditional management ideas and methods; whether they can conduct business model innovation) and coordination capacity of innovation network coordinator (whether they can promote innovation participants' knowledge sharing; avoid opportunism; balance the investment and return of the participants; and guide the healthy development of innovation networks). The third is the uncertain ability of enterprises to collect a wide range of innovation resources, which previously means to find useful resources in a limited capacity of innovation resources, and now mainly refers to identify useful resources in excess capacity of innovative resources. Finally is the uncertain ability of commercialization of innovation resources. The seller dominated market mainly refers to the ability of successful manufacturing product, and the buyer dominated market mainly refers to the ability of selling products and making a profit, also include the ability of selling their useless innovation resources to earn profit.

2.2 Technology uncertainty leads to the risk of technology (short for RT)

The first is the uncertain leading technology degree (West & Gallagher, 2006). Firstly, enterprises are not familiar with competitors' leading technology degree; secondly, enterprises are not familiar with leading technology degree of the new technology which emerges in the same period of time (mainly referring to different technical standards); thirdly, it is not easy to grasp the leading technology degree when a new technology launches. Enterprises should not only consider the new technology that can profit as soon as possible, but also consider new technology that can continue to profit. A backward technology is difficult to profit; also an excessively leading technology may become an obstacle to sustainable development of enterprises. The second is the uncertainty of the complexity of the technology, one characteristic of the new economic era is the continuous integration of the science and technology. Now many technologies are integrated high-tech, enterprises may lack the ability to understand technical mechanism. The third is the uncertain speed of technical replacement. It's difficult to grasp rivals' speed of the upgrading of technology (passive update), it's also difficult to grasp their time on technology upgrading (active update). We can learn experience "marginal revenue is equal to marginal cost, that initiative update chip technology when profit maximization is achieved" from Intel. Finally is the uncertain development situation of complementary technology and alternative technology. If complementary technology development falls behind, it will lead to the development of new technologies is very difficult to expand the scale (for example, the development of mobile phone battery technology will limit the pace of development of mobile phone technology, and one main reason for the rapid development of the netbook is the rapid development of a large-capacity battery invention which make laptop battery greatly extend a period of time), and if alternative technology is developing rapidly, it is difficult for enterprise to recoup advanced R&D investment and make a profit.

2.3 Project uncertainty leads to the risk of project (short for RP)

The main point is the uncertainty of value of the project, including short-term commercial value (the project can bring much benefit to the enterprise, which is not determined by the individual enterprises, but also consider the profitability of competitors), the mid-term industrial value (it is difficult to assess how much benefits the project can bring to the industry, some projects can make the whole industry profit, some projects can make individual enterprise monopoly profits, and some projects make the whole industry more difficult to profit), and long-term social value (it is more difficult to assess how much benefit the project can bring to society. For example, "Ractopamine" has been

vigorously promoted as a new technology initially, but research shows that it's too toxic and has been banned 20 years later. DDT has been initially applied to agriculture due to the effect of magic pest control, but it is prohibited because of harming the entire ecosystem 30 years later). So the commercial value, the industrial value and the social value can be taken into account in rare cases, in most cases three are conflicting.

2.4 Market uncertainty leads to the risk of market (short for RM)

The first is the uncertainty of market positioning, whether it relates to consumers who can quickly recognize the value of innovative products. The second is the uncertainty of the early customer and the later customer who can accept the innovation product, and enterprises are likely to sell a good product to an inappropriate customer. The third is the uncertainty of the important customer, and enterprises may spend a large amount of human, material, and financial resources in maintaining the unimportant customers, so we can use Customer Lifetime Value to evaluate the importance of customer. Finally is the uncertainty of our market capacity. It's not only difficult to assess the overall capacity of the market, but also the market share of an enterprise in the overall capacity of the market. For example, the failure of "Iridium plan" in Motorola company is unable to form a stable customer base.

These uncertainties appear single or together, both will fail to achieve the expectation aim in innovation activities, so it will bring a lot of risk in the innovation process.

3 The Risk Evaluation Management of Open Innovation

3.1 The innovation risk evaluation system of Japanese industrial research institute

Japanese industrial research institute proposed a set of open innovation risk evaluation system in 2003 (Gerybadze, 2004):

1) Inflows of external innovation resources. In the past several years, what is the percentage of sales revenue which adopt external patent technology to produce product or service that accounted for total sales revenue of enterprises? The percentage is increasing or decreasing? If the percentage changes abnormally, it may represent higher uncertainty of enterprises' ability that control the external innovation resources.

2) Outflows of internal innovation resources. In the past several years, what is the percentage of net revenue which licensed to other enterprise patent royalties that accounted for total revenue? The percentage is increasing or decreasing? If the percentage changes abnormally, it may represent higher uncertainty of enterprises' ability that sell the internal innovation resources.

3) The ability of enterprises which makes internal innovation transfer inward. How long does it take to transform the enterprise's interior patent creativity into products or services? In the past several years, what has changed during this time interval? Which direction? If this time interval changes abnormally, it may represent higher uncertainty of enterprises' ability that commercialize the innovation resources.

4) The ability of enterprises which makes internal innovation transfer outward. What percentage is produced by the internal creative in those provide external enterprise patent technology? How long does it take from patent creative to external patent? If the percentage and this time interval changes abnormally, it may represent higher uncertainty of enterprises' ability that provide the outside need innovation resources.

5) The ability of managing innovation project. How many projects have been broken off over the past several years? How many stopped projects have been revisited? And how many stopped projects have been provided to the external organization for a further provided to the external organization? If these abilities are not regular, it may represent higher uncertainty of enterprises' ability that manage innovation project.

6) The ability of enterprise management "false negative" project (it refers to the projects which look worthless early but have developing value in fact, and it missed R&D and profitable business opportunities because of the poor evaluation or no prospects that the project is difficult to adapt to the enterprise business model. In addition, some projects achieve their value in new markets rather than in traditional market, or even achieve double values because they can cooperate with other projects, and combine with technology) (Rothwell, 1994). Referring to the fifth point of the project, are there any projects to develop fast in the technology, or grow more rapidly in the market than expected? Are there any projects to raise external funds for further development? What are the main customers they have signed the agreement? The ability of a project to raise external funds or to sign important customers should be considered as a strong signal that may produce "false negative". If the quantity of "false

negative” project changes abnormally, it may represent higher uncertainty of enterprises’ ability that identify innovation resources.

3.2 The risk evaluation system of open innovation

It is not difficult to find that the innovation risk evaluation system of Japanese industrial research institute in fact is mainly capability risk of open innovation. Based on the innovation risk evaluation system of Japanese industrial research institute, this paper proposed a better risk evaluation system of open innovation (See Table 1).

Table 1 The Risk Evaluation System of Open Innovation

Risk of Open Innovation (ROI)	Risk of Capability (RC) (Weight r1)	RC1: Uncertainty of innovation participants’ complementary ability (Weight r11)
		RC2: Uncertainty of innovation participants’ balanced ability (Weight r12)
		RC3: Uncertainty of enterprise leader’s ability (Weight r13)
		RC4: Uncertainty of network coordinator’s coordination ability (Weight r14)
		RC5: Uncertainty of innovation resources’ collection ability (Weight r15)
		RC6: Uncertainty of innovation resources’ commercial ability (Weight r16)
	Risk of Technology (RT) (Weight r2)	RT1: Uncertainty of technology’s leading degree (Weight r21)
		RT2: Uncertainty of technology’s complex degree (Weight r22)
		RT3: Uncertainty of technology’s upgrading speed (Weight r23)
		RT4: Uncertainty of complementary technology’s development (Weight r24)
		RT5: Uncertainty of alternative technology’s development (Weight r25)
	Risk of Project (RP) (Weight r3)	RP1: Uncertainty of short-term commercial value (Weight r31)
		RP2: Uncertainty of mid-term industrial value (Weight r32)
		RP3: Uncertainty of long-term social value (Weight r33)
		RP4: The conflict degree of three kinds of value (Weight r34)
	Risk of Market (RM) (Weight r4)	RM1: Uncertainty of market positioning (Weight r41)
		RM2: Uncertainty of the earlier customers (Weight r42)
		RM3: Uncertainty of the later customers (Weight r43)
		RM4: Uncertainty of the customers’ importance (Weight r44)
RM5: Uncertainty of market volume (Weight r45)		

The risk of capability (RC) in open innovation expression as follows:

$$RC=RC1 \times r11 + RC2 \times r12 + RC3 \times r13 + RC4 \times r14 + RC5 \times r15 + RC6 \times r16 = \sum_{i=1}^6 RCi \times r1i \quad (1)$$

In equation (1), $\sum_{i=1}^6 r1i = 1, 0 \leq r1i \leq 1$.

The risk of technology (RT) in open innovation expression as follows:

$$RT=RT1 \times r21 + RT2 \times r22 + RT3 \times r23 + RT4 \times r24 + RT5 \times r25 = \sum_{i=1}^5 RTi \times r2i \quad (2)$$

In equation (2), $\sum_{i=1}^5 r2i = 1, 0 \leq r2i \leq 1$.

The risk of project (RP) in open innovation expression as follows:

$$RP=RP1 \times r31 + RP2 \times r32 + RP3 \times r33 + RP4 \times r34 = \sum_{i=1}^4 RPi \times r3i \quad (3)$$

In equation (3), $\sum_{i=1}^4 r3i = 1, 0 \leq r3i \leq 1$.

The risk of market (RM) in open innovation expression as follows:

$$RM=RM1 \times r41 + RM2 \times r42 + RM3 \times r43 + RM4 \times r44 + RM5 \times r45 = \sum_{i=1}^5 RMi \times r4i \quad (4)$$

In equation (4), $\sum_{i=1}^5 r4i = 1$, $0 \leq r4i \leq 1$.

Synthesize equation (1) (2) (3) (4), the risk of open innovation (ROI) expression as follows:

$$ROI = RC \times r1 + RT \times r2 + RP \times r3 + RM \times r4 = \sum_{i=1}^6 RCi \times rli + \sum_{i=1}^5 RTi \times r2i + \sum_{i=1}^4 RPi \times r3i + \sum_{i=1}^5 RMi \times r4i \quad (5)$$

In equation (5), $\sum_{i=1}^4 ri = 1$, $0 < ri < 1$.

4 Conclusion

Since the 1980s, open innovation as the main model of innovation, is not only widely used in high-tech industries (for example, Intel often adopt “take-ism” strategy of external technology internalization), but also be well welcomed in the traditional industry (for example, since the implementation of open innovation, the efficiency of R&D has increased nearly 60% in P&G, and the innovation rate has increased more than two times, and the innovation costs has decreased 20%. Although P&G is a traditional company, it ranked the sixth in 2007 the world’s most innovation enterprises). Open innovation has been applied to our enterprises relatively late, but has been rapidly expanded in China. For example, the Midea company began to implement open innovation model called “national innovation” from 2004. On the basis of “national innovation”, the Midea company launched more than 20 fan products with special health functions, and has won many favors in the eyes of consumers especially high-level consumers. In the annual domestic sales of nearly 10000000 units of products, those new products accounted for 30%. For the weak innovation capability of Chinese enterprises, it is necessary for them to grasp the essence of open innovation as soon as possible, and master their risk assessment and method of control, which is an effective way to shorten the gap between Chinese enterprises and international advanced enterprises.

Study on Early Warning of University Mass Emergency Evolution Based on SIR

Li Chaoxin, Cai Chun

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 38198802@qq.com, 21770646@qq.com)

Abstract: Currently, complex social environment pushes great impact into universities. Meanwhile, the universities also reflects the social problems. Maintaining stable and harmonious environment in universities is a time request. To prevent and identify the occurrence and evolution of the university mass emergency, the paper uses SIR model, combines with double field drive structure of the university mass emergency, constructs a university mass emergency early warning method, gets university mass emergency evolution parameter relational tables, helps to identify development trend and form a quick reaction mechanism in university.

Key words: University mass emergency; Early warning; SIR; Simulation

1 Introduction

In recent years, with the changes of social life and the deepening of higher education reforms, the outer world that universities are confronted with becomes more complicated. Many social problems thereupon reflecting universities caused the views on world, life and values of some university students to be impacted at some extent. The 2013 Blue Paper released by the Chinese Academy of Social Sciences said that the unstable and uncertain factors in international economic and social environment remain pronounced. China still faces many problems and challenges in many aspects including the employment, labor relation, income distribution and social management, etcetera. For the past few years, occurrences of mass disturbance over all kinds of social contradictions are up to tens of thousands and even more than a hundred thousand^[1]. The body of universities is special. They are mostly young people, concern a lot about the social focal issues, highly sensitive about the demands of justice, passionate as well as impulsive. Under the guidance of the existing emergency management mechanism in university, problems such as separation of departments, lack of coordinated command and poor overall correlation are likely to emerge^[2], thereby seriously affecting the response capacity of emergency management, raising more uncertainties to universities in the transition during development. What's more, with all kinds of crises triggered by social environment, rates of occurrences of university mass emergency will be greatly raised.

The university mass emergency management is mostly based on the theory of public crisis management. The early studies of public crisis management are confined to military and diplomatic matters. As the years went by, they gradually extend into enterprises and social organization fields. Despite its late start, emergency management and public crisis management enter the stage of rapid development after the SARS in 2003. Thereinto, public crisis management in university is becoming a locus. With the development of society, the potential risk of university students' community crisis has a tendency to further expand^[3]. To effectively control the university mass emergency, scholars have studied the prevention of university crisis or emergency from multiple perspectives. Some of them tried to probe into university mass emergency early warning in new perspectives. Scholars have approached from qualitative analysis angle such as association rule^[4], sensitive nodes^[5], prevention mechanism^[6], causes and countermeasures^[7], psychological crisis^[8] and government management^[9]. However, most of these studies are summaries of past experiences, with no quantitative analysis as a base of decision reference as well as lacking of dynamic analysis and simulation modeling studies of influencing factors. In this article, I proceeded with university mass emergency early warning, based on double field drive structure, utilizing SIR, to construct a university mass emergency early warning method a quantitative analysis method, which can provide us a basis for emergency decision-making.

2 Double Field Drive Structure of University Mass Emergency

The university should adhere to the principle of "Put Teachers and Students First, construct a harmonious campus" and build a university mass emergency early warning method during the process of the construction of a harmonious campus. When public incident happens, it endows the university with the capacity of unified command, rapid deployment, rapid response and makes the early warning

mechanism functions of detection, prediction and defense to play a positive leading role in dealing with emergencies. To implement the early warning of emergency, data acquisition is a essential basic requirement. Because the information covers a wide range of subjects, it's conducive to emergency dealing unless the information collected are valuable. Using the value measure of information as the starting point, under the influence of propagation characteristic, the time, the content and the form of information will have a significant impact on its quality. Therefore it is necessary to measure the information in accordance with there dimensions including time, content and form in order to determine its value. Information's value can be determined according to three dimensions including time, content and form^[10,11,12,13], though in terms of mass emergency, it is even more complicated to determine the value of information because the evolution of university mass emergency is influenced by group emotion. In the process of university mass emergency, the group emotion will go through three stages: cognition-emotion-behavior^[14]. Thereinto, public cognition includes cognition of the trigger event, the impact of the trigger event to the group they belong to and responsive thoughts of the trigger event; the cognition of the impact of the trigger event to the group they belong to will emerge emotional thinking and be affected by the cognition of the trigger event, thus breeds group emotion; responsive thoughts of the trigger event are formed under cognition of the trigger event and group emotion. In the new era, the development of group emotion is influenced by physical and information field in the process of university mass emergency.

(1) the Physical Field

Physical field refers to under the influence of some trigger events, a certain number of people gathered in a relatively short time in a same physical space. It is the basis of university mass emergency. When mass crowd emerges in a same physical space, persons present will feel the “group pressure” of “going with the flow and avoiding isolation”, easy to be affected by the “opinion leader”, and finally lead to mood expansion.

(2) the Information Field

Information field mainly refers to public opinion, which is the emotional cognition and political attitude that populace as the subject hold toward social manager or event organizer as the object in a certain social space and also the beliefs, attitudes, opinions and emotions that most people express about all kinds of social phenomena and problems.

3 SIR Model of University Mass Emergency

Nowadays, it is hard to explain the law of evolution of many social economic phenomena through traditional linear or differential dynamical system. Zhao Lei(2011)^[15] illustrated the mechanism of “The Butterfly Effect” in mass emergency. In epidemic dynamics, the mainly used mathematical model is so called “the warehouse” model which is based on the two classic models developed by Kermac and Mckendrick ---- SIR and SIS. Scholars have developed many epidemic models closer to real problems based on them^[16,17]. With the coming of information era, the occurrence of university mass emergency is no longer only the on-the-spot mass emergency, but also the emergency on the net. And two kinds of emergency are likely to jointly push the evolution of the event in their combination. Given this, this paper discusses the university mass emergency and its evolution under double fields.

(1) Assuming that when a certain trigger event outbreaks, there are two groups of people that are respectively gathering in the campus and the net, the respective numbers of people are N1 and N2. In the process of event evolution, these two groups of people are not independent from each other, but competing with and affecting each other, and the competition intensity coefficients are m and n. Hence with the interaction of the physical field and virtual field, the evolution law of these two groups of people are shown in Equation 1.

$$\begin{cases} \frac{dN_1}{dt} = \left[r_1 \left(1 - \frac{N_1}{K_1} \right) - mN_2 \right] N_1 \\ \frac{dN_2}{dt} = \left[r_2 \left(1 - \frac{N_2}{K_2} \right) - nN_1 \right] N_2 \end{cases} \quad (1)$$

(2) In physical field, the quantity of susceptible people on the spot is S_1 ; the quantity of affected people on the spot is I_1 ; the quantity of (emotionally) freed people on the spot is R_1 ; the rate of (emotionally) freed people on the spot is γ_1 ; the rate of (emotionally) freed people on the spot

reentering susceptible people on the spot is δ_1 ; the rate of susceptible people on the spot turning into affected people on the spot is β_{11} ; the wastage rate of people on the spot is $d_1 + (1 - \alpha_1) \frac{r_1 N_1}{K_1}$; People in physical field are not only affected by the emotion on the spot, but also affected by the emotion on the net. Assuming that the rate of people affected by the emotion on the net is β_{12} , therefore the process of the emotion evolution of people in physical field is shown in Equation 2.

$$\begin{cases} \frac{dI_1}{dt} = (N_1 - I_1 - R_1)(\beta_{11}I_1 + \beta_{12}I_2) - \gamma_1 I_1 - \left[d_1 + (1 - \alpha_1) \frac{r_1 N_1}{K_1} \right] I_1 - mN_2 I_1 \\ \frac{dR_1}{dt} = \gamma_1 I_1 - \left[d_1 + (1 - \alpha_1) \frac{r_1 N_1}{K_1} \right] R_1 - \delta_1 R_1 - mN_2 R_1 \\ \frac{dN_1}{dt} = \left[r_1 \left(1 - \frac{N_1}{K_1} \right) - mN_2 \right] N_1 \\ N_1 \geq I_1 + R_1; r_1 = b_1 - d_1 > 0; 0 \leq \alpha_1 \leq 1 \end{cases} \quad (2)$$

(3) In information field, the quantity of susceptible people on the net is S_2 ; the quantity of affected people on the net is I_2 ; the quantity of (emotionally) freed people on the net is R_2 ; the rate of (emotionally) freed people on the net is γ_2 ; the rate of (emotionally) freed people on the net reentering susceptible people on the net is δ_2 ; the rate of susceptible people on the net turning into affected people on the net is β_{22} ; the wastage rate of people on the net is $d_2 + (1 - \alpha_2) \frac{r_2 N_2}{K_2}$; People in net field are not only affected by the emotion on the net, but also affected by the emotion on the spot. Assume that the rate of people affected by the emotion on the spot is β_{21} , therefore the process of the emotion evolution of people in information field is shown in Equation 3.

$$\begin{cases} \frac{dI_2}{dt} = (N_2 - I_2 - R_2)(\beta_{21}I_1 + \beta_{22}I_2) - \gamma_2 I_2 - \left[d_2 + (1 - \alpha_2) \frac{r_2 N_2}{K_2} \right] I_2 - nN_1 I_2 \\ \frac{dR_2}{dt} = \gamma_2 I_2 - \left[d_2 + (1 - \alpha_2) \frac{r_2 N_2}{K_2} \right] R_2 - \delta_2 R_2 - nN_1 R_2 \\ \frac{dN_2}{dt} = \left[r_2 \left(1 - \frac{N_2}{K_2} \right) - nN_1 \right] N_2 \\ N_2 \geq I_2 + R_2; r_2 = b_2 - d_2 > 0; 0 \leq \alpha_2 \leq 1 \end{cases} \quad (3)$$

Synthesizing the impact of net field and physical field as well as the competitive relation of the groups, the evolution of university mass emergency is shown in Equation 4^[18].

$$\begin{cases}
 \frac{dI_1}{dt} = (N_1 - I_1 - R_1)(\beta_{11}I_1 + \beta_{12}I_2) - \gamma_1 I_1 - \left[d_1 + (1 - \alpha_1) \frac{r_1 N_1}{K_1} \right] I_1 - m N_2 I_1 \\
 \frac{dR_1}{dt} = \gamma_1 I_1 - \left[d_1 + (1 - \alpha_1) \frac{r_1 N_1}{K_1} \right] R_1 - \delta_1 R_1 - m N_2 R_1 \\
 \frac{dN_1}{dt} = \left[r_1 \left(1 - \frac{N_1}{K_1} \right) - m N_2 \right] N_1 \\
 \frac{dI_2}{dt} = (N_2 - I_2 - R_2)(\beta_{21}I_1 + \beta_{22}I_2) - \gamma_2 I_2 - \left[d_2 + (1 - \alpha_2) \frac{r_2 N_2}{K_2} \right] I_2 - n N_1 I_2 \\
 \frac{dR_2}{dt} = \gamma_2 I_2 - \left[d_2 + (1 - \alpha_2) \frac{r_2 N_2}{K_2} \right] R_2 - \delta_2 R_2 - n N_1 R_2 \\
 \frac{dN_2}{dt} = \left[r_2 \left(1 - \frac{N_2}{K_2} \right) - n N_1 \right] N_2 \\
 N_i \geq I_i + R_i, r_i = b_i - d_i > 0, 0 \leq \alpha_i \leq 1, (i=1,2)
 \end{cases} \tag{4}$$

In equation 4, N_i is the total number of people in field i ; S_i is the quantity of susceptible people in the field i ; I_i is the quantity of affected people in the field i ; R_i is the quantity of (emotionally) freed people in the field i ; m and n are the respective competition coefficients of the people in two fields. β_{ii} is the internal emotional contagion rate in two fields; $\beta_{ij} (i \neq j)$ is the mutual emotional contagion rate in two fields; γ_i is the ratio of (emotionally) freed people in the field i ; δ_i is the ratio of (emotionally) freed people turning into susceptible people in the field i .

4 The Evolution Simulation of University Mass Emergency

Computer simulation methods were adopted to demonstrate the nonlinear mechanism of the university mass emergency early warning method ---- SIR model and to seek the possible laws in it and accordingly providing some technical references for the prevention of university mass emergency. Given that a university mass emergency happened, and due to that, the initial quantity of people gathering on the net is $N_1(0) = 400$; the initial quantity of people gathering on the spot is $N_2(0) = 500$. Thereinto, the respective quantity of susceptible people are $I_1(0) = 120$ and $I_2(0) = 100$; the respective quantity of (emotionally) freed people are $R_1(0) = 40$ and $R_2(0) = 60$; the relevant parameter of the natural wastage of crowds are $\alpha_1 = 0.91$ 、 $\alpha_2 = 0.91$ 、 $K_1 = 400$ 、 $K_2 = 500$ 、 $r_1 = 0.08$ 、 $r_2 = 0.05$ 、 $d_1 = 0.0001$ 、 $d_2 = 0.0001$; the competition intensity of people in two fields are $m = 0.001112$ and $n = 0.001261$; the mutual emotional contagion rate in two fields are $\beta_{12} = 0.003$ and $\beta_{21} = 0.003$; the internal emotional contagion rate in two fields are $\beta_{11} = 0.004$ and $\beta_{22} = 0.004$; the ratio of (emotionally) freed people are $\gamma_1 = 0.18$ and $\gamma_2 = 0.15$; the ratio of (emotionally) freed people turning into susceptible people are $\delta_1 = 0.01$ and $\delta_2 = 0.01$. Based on the above parameters, this emergency can be stimulated and the result is shown in Figure 1.

Figure 1 The Evolution of University Mass Emergency

Figure 1 shows that in the evolution of university mass emergency, there is a complex transaction between on-the-spot emotion and network emotion. They jointly influence the development of university mass emergency and have similar development trend. The event will settle down as time go by, but there are differences between the waves and span of the evolution curves. Stimulation correlation were adopted item by item to the parameters of university mass emergency evolution model SIR suggested in this article, which is shown in Table 1.

Table 1 The Parameter Correlation Stimulation of University Mass Emergency Evolution

Parameters	Evolutionary Path	Evolution Trend
The rate of (emotionally) freed people on the spot γ_1	0.16→0.18→0.2	When γ_1 increases, the quantity of affected people on the spot I_1 and the quantity of affected people on the net I_2 decrease; meanwhile, the quantity of (emotionally) freed people on the spot R_1 and the quantity of (emotionally) freed people on the net R_2 also decrease.
The rate of internal emotional contagion on the spot β_{11}	0.0038→0.039→0.004	When β_{11} increases, the quantity of affected people on the spot I_1 and the quantity of affected people on the net I_2 decrease; meanwhile, the quantity of (emotionally) freed people on the spot R_1 and the quantity of (emotionally) freed people on the net R_2 also decrease.
The ratio of (emotionally) freed people turning into susceptible people on the spot δ_1	0.02→0.06→0.1	When δ_1 increases, the quantity of (emotionally) freed people on the spot R_1 decreases, the quantity of (emotionally) freed people on the net R_2 increases; meanwhile, the quantity of affected people on the spot I_1 and the quantity of affected people on the net I_2 increase.
The rate of (emotionally) freed people on the net γ_2	0.14→0.15→0.16	When γ_2 increases, the quantity of affected people on the spot I_1 and the quantity of affected people on the net I_2 decrease; meanwhile, the quantity of (emotionally) freed people on the spot R_1 and the quantity of (emotionally) freed people on the net R_2 also decrease.
The rate of internal emotional contagion on the net β_{22}	0.0038→0.039→0.04	When β_{22} increases, the quantity of affected people on the spot I_1 and the quantity of affected people on the net I_2 decrease; meanwhile, the quantity of (emotionally) freed people on the spot R_1 and the quantity of (emotionally) freed people on the net R_2 also decrease.

The ratio of (emotionally) freed people turning into susceptible people on the net δ_1	0.02→0.06→0.1	When δ_1 increases, the quantity of (emotionally) freed people on the spot R_1 and the quantity of (emotionally) freed people on the net R_2 decrease; meanwhile, the quantity of affected people on the spot I_1 and the quantity of affected people on the net I_2 increase.
When the competition intensity coefficient of spot to net m	0.00111→0.001112→0.001115	When m increases, the quantity of (emotionally) freed people on the spot R_1 、the quantity of affected people on the spot I_1 、the number of people on the spot N_1 decrease; the quantity of (emotionally) freed people on the net R_2 、the quantity of affected people on the net I_2 、the number of people on the net N_2 increase.
When the competition intensity coefficient of net to spot n	0.00125→0.001261→0.00127	When n increases, the quantity of (emotionally) freed people on the spot R_1 、the quantity of affected people on the spot I_1 、the number of people on the spot N_1 increase; the quantity of (emotionally) freed people on the net R_2 、the quantity of affected people on the net I_2 、the number of people on the net N_2 decrease.
When the rate of people on the spot affected by people on the net β_{21}	0.0028→0.003→0.0031	When β_{21} increases, the quantity of (emotionally) freed people on the spot R_1 and the quantity of affected people on the spot I_1 decrease; the quantity of (emotionally) freed people on the net R_2 and the quantity of affected people on the net I_2 decrease.
When the rate of people on the net affected by people on the spot β_{12}	0.0026→0.0028→0.0033	When β_{12} increases, the quantity of (emotionally) freed people on the spot R_1 and the quantity of affected people on the spot I_1 decrease; the quantity of (emotionally) freed people on the net R_2 and the quantity of affected people on the net I_2 decrease.

After refining by Table 1, we obtain the parameter relationship map of university mass emergency evolution, which can contribute to fast query in practical application.

Table 2 The Parameter Relationship Map

Parameters	I_1	I_2	R_1	R_2	N_1	N_2	Relation
$\gamma_1 \nearrow$	\searrow	\searrow	\searrow	\searrow	--	--	full inverse
$\beta_{11} \nearrow$	\searrow	\searrow	\searrow	\searrow	--	--	full inverse
$\delta_1 \nearrow$	\nearrow	\nearrow	\searrow	\nearrow	--	--	R_1 inverse
$\gamma_2 \nearrow$	\searrow	\searrow	\searrow	\searrow	--	--	full inverse
$\beta_{22} \nearrow$	\searrow	\searrow	\searrow	\searrow	--	--	full inverse
$\delta_1 \nearrow$	\nearrow	\nearrow	\searrow	\searrow	--	--	R_1, R_2 inverse
m \nearrow	\searrow	\nearrow	\searrow	\nearrow	\searrow	\nearrow	I_1, R_1, N_1 inverse
n \nearrow	\nearrow	\searrow	\nearrow	\searrow	\nearrow	\searrow	I_2, R_2, N_2 inverse
$\beta_{21} \nearrow$	\searrow	\searrow	\searrow	\searrow	--	--	full inverse
$\beta_{12} \nearrow$	\searrow	\searrow	\searrow	\searrow	--	--	full inverse

Note: "--" in the table means the relationship is unknown.

There are many evolution maps, but the space is limited. So, we only show the process of how the rate of (emotionally) freed people on the spot influences the university mass emergency (Figure 2).

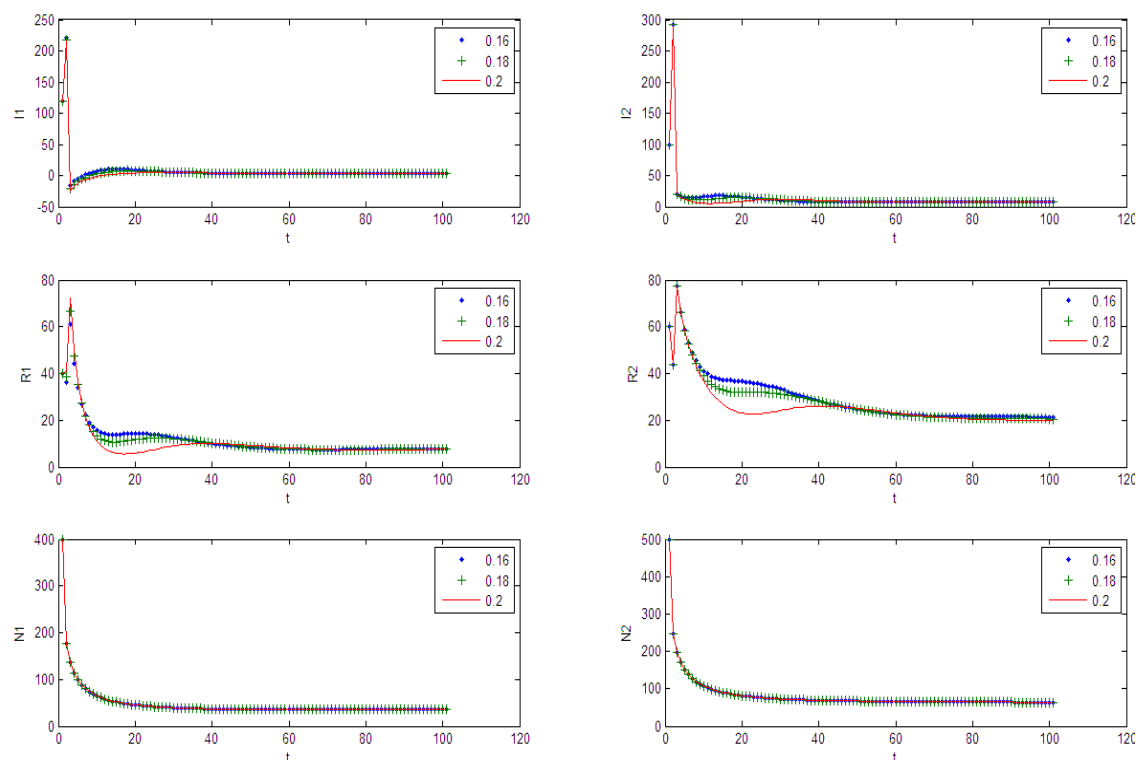

Figure 2 the Evolution of Emotion Affected by the Rate of Freed People on the Spot

Through simulations above, I probed into the relationship between university mass emergency and alarming index, including the emotional contagion rate of people present, the rate of emotionally freed people present, the ratio of emotionally freed people present turning into susceptible people present, the emotional contagion rate of people on the net, the rate of emotionally freed people on the net and the competition intensity between people of two fields.

To build an emergency early warning platform, a warning analysis system should be included, the general setups of which are mainly alarming index and threshold value. Alarming index is used to measure the change target in social operation and the threshold value is a critical point of alarming index in order to draw lines to tell all kinds of risk ranks apart. Once the alarming index surpasses a certain threshold value, the warning system should send a signal of a certain level. The specificity of university mass emergency is shown in the combination of its burstiness and group character, whereas with time lag, the index of burstiness are not always subsequent. Through evolution stimulation in this study, we can deal with the highlighted index in advance and estimate the subsequent evolution trend.

5 Conclusion

Mass emergency early warning can be used to refine huge amount of data bits, judge criteria basing on index system, predict the event in time and confirm its rank and severity, which can provide decision information for relative departments and be better targeted, therefore guaranteeing the accuracy and effectiveness in dealing with events. An university mass emergency early warning method is built based on SIR, which can be applied to the university mass emergency management. And also, a parameter relationship map is proposed through the calculation and simulation for facilitating identifying development trend, which can help form a quick reaction mechanism in university.

(E-mail: fanghaining@whut.edu.cn, 52518755@qq.com)

Abstract: At present, WeChat has become the important channel to communicate voice opinions and accept information for teachers and students in universities, but also makes new challenges to universities coping with emergencies. This paper introduces the categories and characteristics of universities emergencies, studies WeChat's development situation and the characteristics of information dissemination, considers universities in the environment of WeChat facing the challenges that strong interpersonal relationship easy to cause public attention, information transmission quickly and difficult to grasp, difficult to clarify rumors and unequal information dissemination. According to Stephen Fink's stage analysis theory of crisis event and the characteristics of WeChat information dissemination, the paper constructs response strategy of university emergencies in the view of WeChat.

Key words: University emergencies; WeChat; Information dissemination; Response mechanism

1 Introduction

The definition of emergencies in *Emergency Response Law of People's Republic of China* is as follows: Happened suddenly, causing heavy casualties and property losses, environmental damage and serious social harm, endangering public safety emergencies. Synthesized many scholars' opinions, according to *Emergency Response Law of People's Republic of China*, the paper defines university emergencies as follows: Happened suddenly, causing casualties of college teachers and students, significant damage to property, impact on the order of university, impact and harm the image and stability of the universities.

China Internet Public Opinion Analysis Report 2014 shows that WeChat, replaced MicroBlog, has become the premier public information channels and social networking platforms in the current economically developed regions. Teachers and students in universities are often at the forefront of technological development, have strong ability to accept new things and active thought. It is likely to become more complicated and more difficult because of the spread of WeChat in the stages of prodromal, breakout, chronic and resolution of university emergencies. Therefore, it is a new topic for universities managers that research on information dissemination and response strategy of university emergencies in the View of WeChat.

Scholars studied public opinion dissemination (*Shi Minfeng, 2012*), warning mechanism (*Feng Hongqi, Wang Juanlin, Liu Yumeng, 2013*) and management mechanism (*Zhou Qiang, Chen Shaoping, 2013*) of university emergencies under network environment, but there is no research on university emergencies in the view of WeChat.

2 The Categories and Characteristics of University Emergencies

2.1 The categories of university emergencies

Similar to emergencies, university emergencies can be divided into four categories according to procedure occurred, character and mechanism:

a. Natural disasters, mainly caused by earthquakes, typhoons, floods, fires, storms and other natural disasters, which posed a serious threat to the life and property of university teachers and students.

b. Security incidents, including the safety and security emergencies and students psychological crisis, are currently the most common and multiple emergencies in the universities.

c. Public health events, including infectious diseases and food safety, are seriously affecting the health and safety of university teachers and students.

d. Political security and stability events, often caused by conflicting national interests, international political crisis, domestic social conflicts, ethnic and religious issues, etc.. In addition, if the vital interests of the students are directly affected when universities provide management and service, emergencies is likely to break out.

2.2 The characteristics of university emergencies

Due to the special nature of participants and space, compared with the social common emergencies, university emergencies have significant features.

(1)High concern. The participants in university emergencies are teachers and students. Even in a local university, the emergencies also affect thousands of families all over the country so that university emergencies once occurred, it will inevitably lead to a high degree of concern.

(2)Great harm. University emergencies can cause varying degrees of harm to universities' property and reputation as well as personal and property security of the teachers and students, and do great damage to normal order of work, study and lives. Meanwhile, because students stay at the stage of being-educated whose life, values, world view is not mature, the improper management of university emergencies can easily affect the students from forming the correct ideals and beliefs, moral character and life goals, even affect the development of student's whole life.

(3)Fast spread. University students live together in the dormitory and have more consistent daily routine, in addition, university teachers and students belong to new media groups that spread information fast and diversely, so university emergencies spread rapidly, and tend to spread among different universities.

(4)Periodicity. All the works in university have a significant cyclical characteristics, which makes university emergencies, particularly safety accidents own cyclical characteristics.

3 The Characteristics of WeChat Developments and Information Dissemination

WeChat is launched by Tencent in early 2011, which can sent a graphic information, voice and video information, support multi-user voice intercom and other functions. Users also can share life with real-time in Moments. As of the end of March 2015, WeChat monthly active users have reached 549 million, covering more than 90% of the Smartphone. WeChat has not only an innovative features of mobile application, but also become the representative of Chinese electronic revolution, known as indispensable for daily use tools in humans life.

WeChat, under the background of mobile internet, is a kind of We Media, whose earliest aim is to build a new type of interpersonal communication tool. But after continuous development, a variety of services and function are added to WeChat, such as People Nearby, Moments, Public ID, payments, games, etc., which make its propagation properties become more diversified (*Jing Ming, Zhou Yan, Ma Danchen, 2014*). Compared with MicroBlog, Blogs and other media forms, the information dissemination of WeChat has the following features:

(1)Strong interpersonal and community-based

The start point of WeChat is a kind of IM, whose main function is communication between acquaintances, including friends in mobile phone address book, QQ friends, etc. WeChat Moments integrate QQ instant messaging, mobile phone address book and "People Nearby", to some extent, which has realized the effective combination of the network virtual community and realistic community. In WeChat Moments, only the distributors and mutual friends can see comments and "Praise", which enhance the authenticity of the virtual community.

(2)Immediacy and Weak traceability.

WeChat is a kind of instant communication, when users posting messages, the others can receive information instantly. Because of WeChat only used on Smartphone, the limitation of the screen size determines communication content easy to be covered by real-time information. In addition, a great part of information is voice, information is difficult to search and trace.

(3)Point-to-point transmission, low openness and high credibility.

WeChat includes 3 kinds of transmission, which are transmission between friends, Moments, and information push. When receiving information, users can share to Moments and friends; the contents in Moments can be simply discussed and "Praise", but not transmitted; WeChat Public ID also only push information to who have focused on, therefore, information transmission way of WeChat is point to point. Transmission patterns of point to point, limiting number of groups and limiting information transmission frequency of Public ID greatly reduce openness of the information transmission, increase privacy and credibility.

4 The Challenge of University Emergencies under WeChat Environment

China New Media Development Report No.6 (2015) points out that the WeChat platform has less source of fake news, only about 7% in new media fake news. However, it is difficult to address rumors as the closed WeChat communication environment with weak self-correcting capability. Unlike the

hedge between different information in MicroBlog square, human relationship and keeping face has built a strong relation-chain in WeChat platform. For example, though the fake news of “Hebei province will be split after APEC” is first appeared in 2011 and afterwards netizens and mainstream media clarify the rumors, it appears again in WeChat with obvious periodicity in 2014 as the fake news communicators comprehends the public psychology.

University is a relatively closed environment and higher attention compared with the society, but teachers and students have more active thinking. WeChat has become a standardized mean for exchanging information and ideas in daily life, as 45.4% users are in the age of 18 to 25 and 19.7% users are students according to WeChat User Data Report published in 2015. The present situation results in great challenges when dealing with university emergencies. The main challenges can be summarized into four aspects, listed as follows.

(1)The strong interpersonal relationships lead to more public concern. When the university emergencies occurred, undergraduates become the first reporter to spread the event. Possibly, they released the information to Moments to draw attention of WeChat friends. More important, those friends include parents, schoolmates and colleagues in different areas, their secondary transmission further enhanced the public awareness, which increased the pressure for universities to manage unexpected events. Moreover, most colleges have known little of the world with more radical thinking, once the emergency is handled improperly, it is easily to enlarge or distort the influences of event.

(2)The closed communication environment leads to a difficult grasp of information propagation. Communications among acquaintances are sealed and fast spread from online to offline. Nevertheless, the relatively closed university environment has intensified this situation. WeChat is a widely used chat software with images, text and voice in interactive group, searching and tracking information is more difficult outside the group.

(3)The higher believability among interactive group members leads to more difficult in clarifying the rumors. As WeChat is built with quasi-real-name mechanism, the believability among WeChat friends is higher than any other online commutations. When a rumor is spread out among friends in WeChat, the rumor is more durable, and of even more trusty (*Liu Gaoying, 2015*).

(4)The unequal information exchanging leads to resolve emergency with more efforts. When the emergency occurred, the university director should be issued the progress and solutions timely in order to eliminate adverse effects. Different from MicroBlog, the efficiency of information dissemination for universities WeChat Public ID is much lower than Moments of teachers and students, which results in unequal information exchanging between official and private and more passive to deal with the university emergencies.

5 Response Strategy of University Emergencies under WeChat Environment

According to Stephen Fink’s stage analysis theory of crisis event (*Rcarn Banks K, 1996*), university emergencies can also be divided into four stages, namely, prodromal, breakout, chronic and resolution. It should be carrying out the corresponding work in accordance with the four stages that coping with university emergencies under WeChat Environment, as shown in Figure 1.

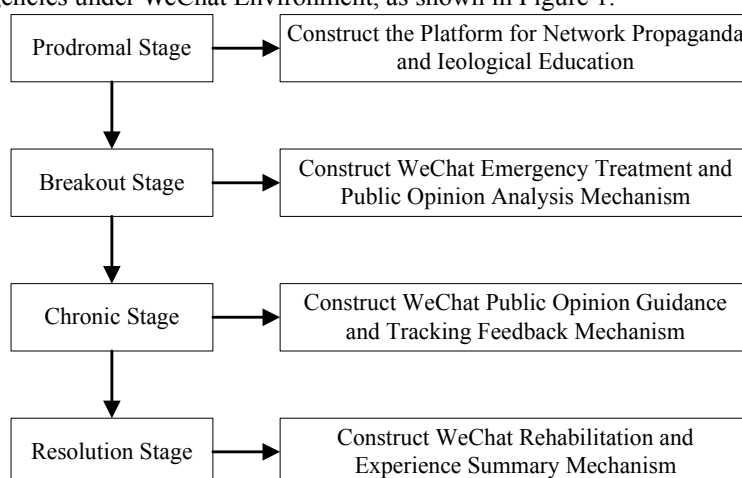

Figure 1 Response Strategy of University Emergencies under WeChat Environment

(1) Prodrimal Stage-construct the platform for network propaganda and ideological education.

In prodromal stage of university emergencies, it should be to put WeChat under the platform of network propaganda and ideological education, and do a good job to prevention. It can work from the following four aspects to construct platform:

1) Build the network platform of multi-sectoral coordination and daily propaganda education, set up network publicity leadership team including propaganda, student affairs, security, academic, regularly research network propaganda theme and public opinion direction, let the teachers and students find effective solutions when they have problems, eliminate the contradiction in infancy.

2) Develop a network education elite team, including party and government cadres, teachers, counselors and student cadre. Through training and exercise, the team has high political theory accomplishment and network using ability, able to shoulder the daily network propaganda and ideological education, and emergency management ability during university emergencies.

3) Cultivate network opinion leaders, which should be online and offline. They can be respected teachers, can be campus "influential person" who has many fans, also can be counselors familiar with students' situation. Improving their media literacy, moral level and discernment ability, can guide positive network public opinion.

4) Set up network messengers, strengthen public opinion monitoring. In accord with "university-school-grade-class" realistic organization structure, university should be set up network messengers of corresponding levels, strengthening public opinion monitoring.

(2) Breakout Stage - construct WeChat emergency treatment and public opinion analysis mechanism.

In breakout stage, WeChat is the important channel of information dissemination. Public opinion crisis once erupted, it must immediately start WeChat emergency treatment and public opinion analysis mechanism, strengthen information openness, analysis the trend of public opinion.

In the process of public opinion occurrence and development in emergencies, opening information actively and fast can effectively control the formation of negative public opinion. According to British crisis public relations specialist Michael Regester's 3T principle, which is "tell your own tale", "tell it fast" and "tell it all", university should constantly released comprehensive and real information as soon as possible, firmly grasp information release initiative when crisis breakout (*Michael Regester, Judy Larkin, 2001*).

(3) Chronic Stage - construct WeChat public opinion guidance and tracking feedback mechanism.

When rumors spread, university WeChat public number must response as soon as possible, stabilize students emotion in time, and guide public opinion quickly. At the same time, WeChat should steadily track and roundly report emergencies, and construct benign interaction with traditional media to guide public opinion direction persistently. After comprehensively analyzing WeChat public opinion information, clear the key of public opinion, to provide decision basis for university.

(4) Resolution Stage- construct WeChat rehabilitation and experience summary mechanism.

In resolution stage, university must overcome psychological paralysis, consolidate stability situation in time, continue to track WeChat public opinion, to prevent emergencies come back. University WeChat public ID should take full advantage, publish university emergencies as cases for discussion, which can make students to learn and grow in the emergencies, and guide university managers to reflect emergencies prevention, treatment and rehabilitation.

6 Conclusion

WeChat provides convenient for teachers and students to communicate, voice opinions and accept information, but also gives a transmission platform for rumors and bad information, which makes challenges for university to cope with emergencies. According to Stephen Fink's stage analysis theory of crisis event and the characteristics of WeChat information dissemination, the paper constructs coping strategy of university emergencies in the view of WeChat, so as to provide some references for university to cope with emergencies. As the new media form appear constantly, universities should keep pace with the times, capture the position of network propaganda actively, play the positive role of network public opinion direction, and promote sustained, coordinated and healthy development of the universities.

A Conceptual Model for Children's Websites Using E-CRM

Mahmoud Akbarieh Yazdi

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: Mahmoud_akbarieh@yahoo.com)

Abstract: In this research it is aimed to provide a conceptual model for designing and administrating children's website. In this research we extracted factors that are important for designing a successful websites by analyzing the content of 50 websites that have good ranking among children websites. We applied qualitative content analysis. We designed a conceptual model by classifying factor into three levels: awareness, expansion and commitment. The main factors of awareness stage are: brand, communication and community. In expansion stage; design, responsibility and technical issues are main factors. Format of content, customization and complementary services are the main factors of commitment stage.

Key words: Children's website; E-CRM; Awareness level; Expansion level; Commitment level

1 Introduction

Designing a successful website has been a key issue over years and a good literature has been evolved but children websites are different. This difference rooted in the online behavior of children and their threads. Online behavior of children is different from adults. According Kaiser family foundation study, children react to different stimuli in other way ^[1]. Children like big font and prefer voice and animation. They have some physical limitation like typing slowly. Children use the internet more for game and chat ^[2]. The first reason is the age of audience. The threads for children are different from adults. The most important thread for adults is virus but children face different threads: Almost 50 percent of the children have had a negative experience on the internet ^[3]. Children most frequently reported encountering pornography, followed by violence, computer viruses and/or their computers crashing. Approximately 80 percent told someone else about their negative experience, and, although it might be expected that this was a parent or a teacher, 45 percent of the children shared their experience with a friend. So they are more fragile and for designing a successful website, we need a different model. In this research we are going to designing this model.

2 Methodology

In this research we used qualitative content analysis. We selected 50 children's websites that according Alexa.com have good ranking among children website. We analyzed these websites and extracted about 78 items and labeled them to 9 factors. Then we classified these 9 factors to three levels. These factors are resulted through analyzing the web sites:

Table 1 Extracted Items and Categories

Design	vocal and pictorial navigation, animism, presence of animals, attractive design, context music, happy mood, kindly characters, promotional animations, contriving a character as main character, bright and attractive colors, larger site and fonthan usual, using imaginarybeings, bookmark feasibility, using adventure in games, having site map, having site tour, feasibility of translating into different languages, print and download feasibility of content, simple design, chat room
Responsibility	without non-moral issues, classified games, having instruction for parents, introducing the site to the users, FAQs, explain about site security, securing the information of users, having privacy statement, having user care officer, without violent, content for parent
Communication	IMC, having banners, introduced and linked by other sites, giving the award, presentation feasibility to user's friends via email, links to other sites, designing a network of sites, having chat room, blogging feasibility, collaborating with other sites
Technical issues	Site technical support, fast navigating, using backup sites, high speed download
Personalization feasibility	feasibility of signing in as a member, automatic personalization, categorizing plays and other content based on age, feasibility of writing the story, feasibility of sharing the content, feasibility of composing music
Brand	Proper logo for children, easily remembered name, the name fits with the children, short and simple name, the name fits with the content, positive connotations, meaningful name, easy to pronounce
Complementary options	Sale of educational products, providing the products online, educational materials for parents,
Community	Users' community
Format of content:	Play, painting, animation, video, music, story, puzzle, photo, essay, pastime, poem

3 Discussion:

Relation between the website and audience has four stages: awareness, expansion, commitment and dissolution [4]. In the awareness stage the audience would get inform from the existence of the website. At the next stage, expansion, check the website and the content. At the third stage, the audience would make decision that continues the relation or not. We categorize extracted factors based on these stages.

Brand, communication and community have the most important role in attracting and informing audiences. is not just ID and name of site but in the beginning ID is more attended. ID or the name of site is very important and some criteria are important for name selection. These criteria are: short and simple, easy to pronounce, positive connotations to potential users, easy to recognize and remember, memorable, fit with content and potential users. Community is a space that sites devote to their users. They can deal with each other through this space. They can ask and answer question and share their experiences. Users who get familiar with site via community are more possible that refer to site because users trust in other users easily. Communication in children website is a little different by common websites. Important communicational tools used in children's site are:

- Link: lot of sites of schools, libraries, cities and states have a part that introduce and make link to safe sites for children. Introduction of these sites is a strong advertisement tool. Content of the site is very important for introducing and making link. For instance schools make the link to educational sites. "starfall.com" is a good example that has been made link by a lot of sites.
- Integrated marketing channel (IMC): some sites use various channels for awareness. Most famous of these sites are which collaborate with TV channels for instance "pbskids.org" or "torahtot.com" that put their recorded live performance on sites.
- Presentation feasibility to user's friends via email (viral marketing): viral marketing is a valid tool in commercial sites as well as children's sites. This is a very important tool because the site is introduced to another person by a user who is more reliable.
- Designing a network of sites: It's through designing a network of sites or a site as mother and others as its subsidiaries. They can be designed all for a specific or various age groups.
- Collaborating with other sites: collaboration with websites that have similar activities and have same target group is one tactic to attract more new audience.
- Giving award: it can be in various forms: Electronic present, permission to play, a piece of music after winning, etc.

At the second stage, expansion, design, responsibility and technical issues play important role. Design of children's sites is completely different from design of adult's sites. Some differences that extracted from analyzing the sites are:

- Vocal and pictorial navigation: since children aren't able to read and pictures are more attractive for them and they notice them more, children site's navigation shouldn't be through text.
- Presence of animals: all sites utilize the animals to attract more users.
- Animism: one of the children's psychological traits is animism. So they will communicate better if there are some animated objects in the site.
- Context music: listening to music while navigating site can increase the site attractiveness.
- Happy mood: animals and objects with happy posture are tools for making a site mood happy.
- Kindly characters: presence of animals and animated objects is a trait of children's site. Presenting these animals and objects as a kind and nice character is another tool sites utilize.
- Promotional animations: some sites contrive promotional animation on homepage. In addition to attractiveness, promotional animations increase potential user's awareness.
- Contriving a character as main character: some sites are designed based on a main character. For instance starfall.com that has used turkey for educating "t". It's because of children's psychological traits. As previously explained children animate objects and animals and communicate with them so contriving a character cause better communication.
- Larger size and font than usual: the size of icons and the font of texts in children's site are larger than adults one.
- Print and download feasibility of content: the content of site should be printable and downloadable.
- Simple design: the navigation of adult's sites is through text and they are full of text and essays. But children's sites are very simple.

- Site map: site map is the outline of the site that helps users to assess the site easily and find what they want.
- Search engine: help users to seek their favorites in the site.
- Imaginary objects: based on children's psychological traits imaginary objects are interesting and attractive for them.
- Site tour: touring in the site is an option that some sites have made through putting animation on the homepage.
- Feasibility of translating into different languages: translating to different languages can make the site more attractive.
- Bookmark feasibility: children don't choose the sites by themselves. Their parents evaluate and select the sites, and then they bookmark the sites for their children so bookmark feasibility is very important in children's sites.
- Using adventure in games: adventure will make the plays and other hobbies more lovable for children.
- Blogging feasibility: site devotes a space to users and they can design it by themselves.
- Responsibility shows commitment of site to its users. If the site has commitment, it will communicate to its users and understand their needs and answer their requests and preserve children from negative experience such as pornography, virus, etc. herein we mention some items:
 - Instruction for parents and teachers: young children can't navigate sites by themselves so their parents or teacher do that. Presenting an instruction help them to use the site better and communicate easily. Being aware of capabilities of site and its content is another instruction advantage.
 - Without non-moral issues and violent: pornography, violent and other non-moral issues have adverse effects on children so responsible sites preserve children from these negative experiences.
 - Introducing the site to the users and FAQs: answering users question distinctly and giving information about designers of site and its sponsor can make users to put their trust in site.
 - Insuring the security of site: security of site, preserving users' information and protecting against virus are security issues that are important for every user. Insuring users, therefore, is a very important factor for attracting users' trust

Technical issue is third important factor in expansion stage. Site technical support, fast navigating, high speed download are considerable elements that should be mentioned. Online behavior of children is different from adults. For example they are looking for quick satisfaction and don't wait a lot for loading the website. So technical issue is very important in this stage.

Format of content, personalization feasibility and complementary options have significant role in commitment stage. Designing and all activities to launch a site are for presenting the content. Content presentation can be done in many formats: Play, painting, animation, video, music, story, puzzle, photo, essay, pastime, and poem. Personalization takes place through customizing content, format or both of them. It means they change according to user's favorites or traits. Personalization can increase user's loyalty to site. Personalization can be provided through:

- Membership
- Automatically via classifying the content based on age, nationality, language, etc.
- Enabling the user to make his/her favorite content such as story, music, etc.

Complementary options are serving services and products suitable for children. Depending on strength of relation and trust in site, complementary options will be more important. Presenting content for parents is one of these services. Putting some material for parents about children and children's psychology is a service that is served by a lot of sites.

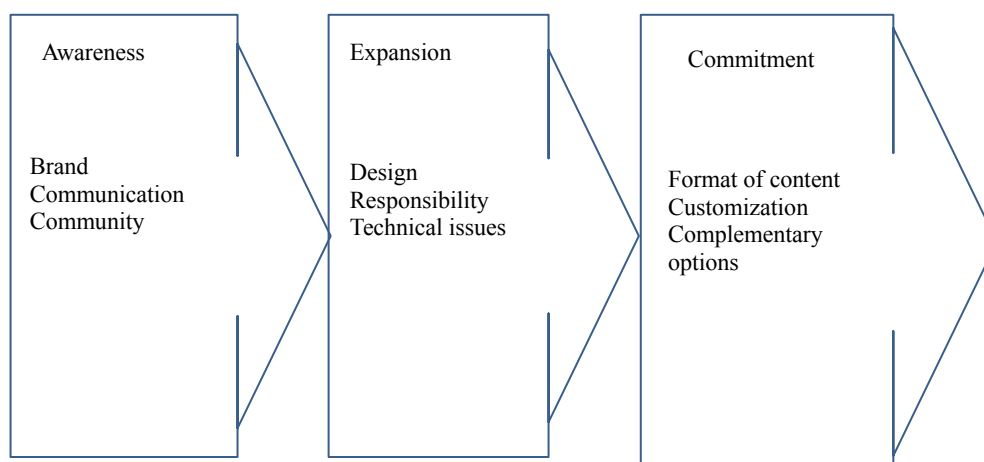

Figure 1 Conceptual Model for Children's Website Using E-CRM

4 Conclusion

We focus on children's website in this research. We provided a conceptual model for designing and managing website by using e-CRM. In this research we apply qualitative content analysis and after extracting items and categorizing, classified them in three stages that audience would pass them to feel commitment to a website. These stages are: awareness, expansion and commitment. In awareness stage the audience gets inform from the existence of the website. In expansion stage the audience checks and make decision that continues his/her relation or not. In the commitment stage, the audience create a continues relationship with website and use the content frequently. The criterion for a successful website is the number of committed clients. Brand, communication and community are the most important factor for awareness stage. In expansion stage; design, responsibility and technical issues are main factors. Format of content, customization and complementary services are the main factors of commitment stage.

Process Analysis and Implication of 2014 Shanghai Stampede Incident

Cao Qing, Liu Zimei, Xie Kefan, Yu Jintian

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: caoqing13@foxmail.com, 814198410@qq.com, xiekefan@163.com, Yu Jintian@whut.edu.cn)

Abstract: This paper exams the timeline and causes of the deadly stampede which occurred on December 31, 2014 in Shanghai, near Chen Yi Square on the bund. The study find out that people must have good safety awareness of the public, try to avoid exposure to the crisis, learn to self-help and mutual aid at the same time. The relevant departments also need to cultivate good safety awareness of the public, to avoid the lack of preparation which can lead the incident happen.

Key words: 2014 Shanghai stampede; Process analysis; Implication; Crowd stampede

1 Introduction

Public activities, which are rapid growing in the number and expanding in the scale at the same time, its public safety risk issues are also increasingly prominent. Security incidents showed in a high frequency with public activities and one of the most serious incidents are Crowd Stampede. It is becoming formidable challenges of the modern urban governance to avoid crowd stampede from public activities because crowd stampede occurred due to the population congregated and the characteristics of public activities is a lot people gathered in a place.

At present, many domestic and foreign researchers studied the causes and the countermeasures of crowd stampede. For example, R. S. C. Lee(2005) and R. L. Hughes first proposed the formation mechanism of crowd stampede. Helbing(2000) studied group behavior during irrational panic in emergency escaping and proposed a “social power” model. Zhang Qingsong(2007) backed a crowd stampede forming conditions and established a crowded microscopic simulation model. There are a large number of studies and theories and these theories play an important role in guiding Crowd Stampede warning pre-control.

Based on these theories, this paper reviews the deadly stampede which occurred on December 31, 2014 in Shanghai, near Chen Yi Square on the bund, and tries to get some revelation of it.

2 Process Analysis of 2014 Shanghai Stampede Incident

2.1 The timeline of 2014 shanghai stampede incident

Shanghai Stampede can be divided into three stages: Pre-Event Stage, In-Events Stage and Post-Event Stage.

2.1.1 Pre-event stage

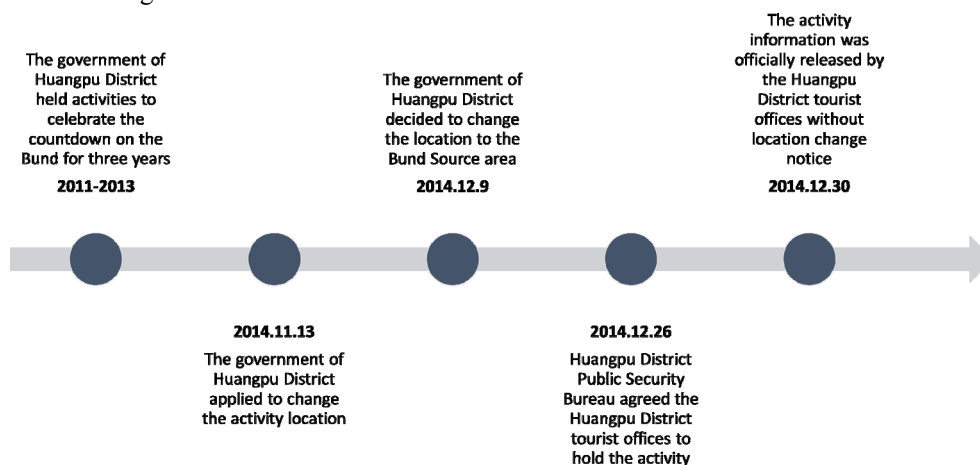

Figure 1 Pre-Event Stage of 2014 Shanghai Stampede

Huangpu District Government has held New Year's countdown event for three years since 2011, and it becomes a routine for the local people to celebrate the New Year. However, in 2014, for some reason, the district government applies for location changing with themunicipal government on November 13. On December 9, the Huangpu District government decided to change the location to

“Bund Source” area from “Bund” area. December 26, Huangpu District Public Security Bureau agreed the Huangpu District tourist offices to hold the activity. On December 30, Huangpu District Tourism Bureau officially released in the New Year countdown event information without special alerts and publicities for the distinction between “Bund” and the “Bund source”.

2.1.2 In-event stage

In the evening of 31 December 2014, tens of thousands people gathered in Shanghai Bund, full of joy waiting for activity. They don't know the activity has been moved to another place. Since 20:00, the attendance of the Bund was rising. At 22:37, a large number of tourists rush into the viewing platform of Chen Yi Square after perimeter was broken. From 23:23 to 23:33, the downflow of people who wish to exit the viewing platform met the upflow of people who want to see the 5D lights, they stalemated in the middle of the stairs and finally formed a “surge”. At 23:35, someone who are in the bottom of the staircase was unbalanced fall, causing many other people fall and resulting in crowded stampede.

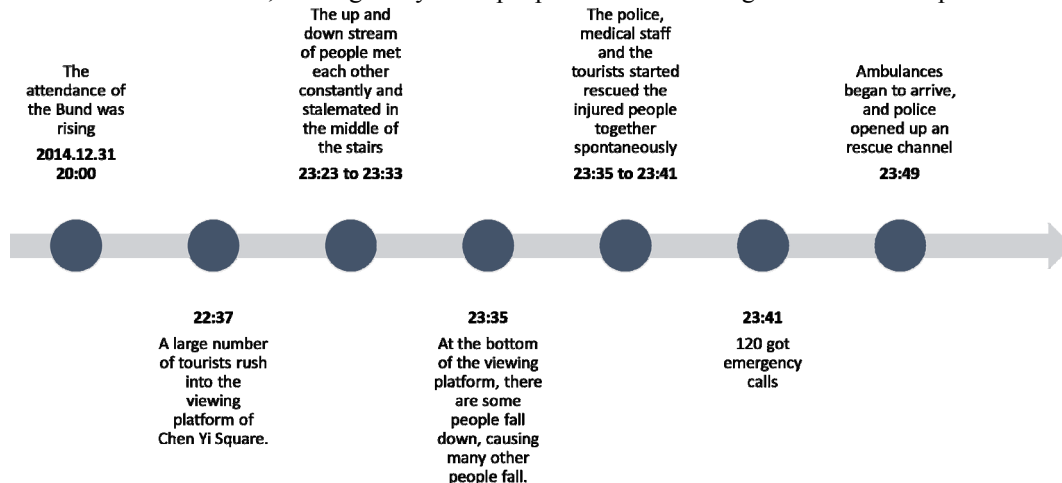

Figure 2 During-Event Stage of 2014 Shanghai Stampede

Police at the scene immediately tried to maintain order and medical staff and tourists tried to rescue the injured people together spontaneously. At 23:41 Shanghai “120” Emergency center began to receive emergency calls. Since 23:49, there have been 19 ambulance arrived Chen Yi Square. Shanghai and Huangpu Public Security Bureau quickly opened up an emergency channel for rescue.

2.1.3 Post-event stage

Figure 3 Post-Event Stage of 2014 Shanghai Stampede

At 0:31 on January 1, 2015, the official weibo of the Shanghai Public Security Bureau released the information. Police arrived in time to guide the visitor exit. At 4:01 in the same day, Shanghai Municipal Government Information Office official weibo confirmed the stampede, causing a total of 35 people

were killed and 42 others injured. In the same day's morning, the municipal government held a meeting to deploy the aftermath and security work after the accident. January 20th, 46 of 49 injured people left hospital after treatment. January 21, Shanghai publish the report of the 2014 Shanghai stampede, which is identified as a public security incident.

2.2 Cause analysis of 2014 Shanghai stampede

By analyzing the timeline of 2014 Shanghai stampede, we can see five factors that causes the accident:

(1) No risk assessment for the changing of New Year's countdown event

New Year countdown event has been held for three years in the bund scenic area and a large number of public visitors thought it will be last in 2014 without notice. Huangpu District government hasn't assessed the security risk of place-changing for the event. It leded resulting in a series misjudgments..

(2) Inadequate information publicity for the changing of New Year's countdown event

After the change of New Year's countdown event, the organizers should notice the public in advance. However, until December 30, Huangpu District Tourism Bureau was officially released the information that New Year countdown event will take place in the "Bund" instead of the "Bund source". It turned out that a large part of the tourists do not know the activity has changed Location.

(3) Lack of preparation for prevention

During New Year's Eve events in previous years, there are nearly 6,000 police near the Bund area. Police will maintain order at the scene and also conducted road blockade to limit the number of people. But at New Year's Eve 2015, there were only about 600 police officers. With the significantly reduce of police, the Bund area is free to enter without control. The crowd can easily aggregate and format stampede.

(4) No warning when Personnel flow changes be monitored

Since 20:00 to the time when the incident happened, the Bund scenic personnel flow rise. Faced with the gradual increase of the flow, site security department did not promptly report situation, but also failed to take effective measures to warning the public.

(5) Improper dealing with the accident

According to the increasing flow of tourists, with insufficient police force on site, Huangpu Public Security Bureau was only deployed few people as the adjustment. There is no effective measure, nor safety assessment.

3 Implications of 2014 Shanghai Stampede Incident

Public activities such as major cultural and sports activities, holiday gatherings are hard to assess the event risk, neither to ensure public safety. It is a worldwide problem. 2014 Shanghai stampede exposed the lack of domestic public safety governance. On the other hand, the incident also gave many revelations for domestic public safety governance in the future.

1) Develop an emergency plan for the event

A feasible emergency plan can ensure the preparedness and monitoring and early warning work go well. Additionally, when risk factors begin to accumulate or incident happens, emergency plan can also ensure the emergency treatment can be done.

2) Do risk assessment

Risk assessment is an important basic work to prevent the occurrence of unexpected events. At each stage of activities, risk monitoring and evaluation help us notice the potential risk factors in the activity scene.

3) Limit the participant

Stampede most likely to occur in crowded public places. Therefore, the event organizers must put enough manpower and material resources to limit the participant to strictly control the density of personnel within the grid area.

4) Monitoring the personnel flow and early-warning

Crowd stampede foundation is the large population density. To prevent the stampede, we should start from the crowd control. It based on personnel flow monitoring. When the monitoring data show that the flow of people will exceed the safety capacity of the site, we should take measures and warning the participant.

5) Effective information release

Government should notice public the exact location, time, and other relevant information of every

mass activities in advance via major media and make sure that there was no misunderstanding. If something is easily to get wrong, like “Bund” and “Bund Source” area, government should be more careful.

6) Enhancing the capacity of the police at the scene

Police at the scene is the most important power of emergency power. They should be sensitive for any risk factor and warning the public to get away from potential danger. When there is a chance to erupt a crowd stampede, police should have the ability to block the dangerous zone and evacuate crowd safely.

7) Improving public safety awareness and capacity

People's awareness of public safety, is not only knowing how to self-help when incident happen but also be sensitive to the potential risk. The most basic method of prevention of stampede is to avoid crowded places. When exposure to the crowded crowd and hear the sound of the alert, be calm and do not push others is the basic thing you need to do.

8) Strengthen coordination

Public security is responsible for easing and controlling the incident filed, rescue the wounded and medical personnel was responsible for treating the wounded. These works in the wide area are not difficult. But in the case of Crowd Stamped, rescue is often very difficult. Every department can only save life efficiently when they can be in an effective coordination.

4 Conclusion

Strengthening public safety management of urban public activities, constructing efficient preventive preparation, monitoring and early-warning and emergency rescue mechanism can ensure the safely urbanization of China. We can learn from the Shanghai Stampede that people must have good safety awareness of the public, try to avoid exposure to the crisis, learn to self-help and mutual aid at the same time. The relevant departments also need to cultivate good safety awareness of the public, to avoid the lack of preparation which can lead the incident happen. The increase number of the urban public activities should not be the reason for increasing number of Crowd Stampede. To make the city safe and the life better, government should continue to improve and strengthen the urban public security and social order governance. In that case, tragedy may become a revelation for a new start point of progress.

The Research about the Emergency Management Thought of the Fourth Generation of Central Collective Leadership of the Party and State: By the Response to Major Public Health Emergencies as Example*

Zhu Jiangbin, Xu Pengfei, Wang Ting

School of Politics and Administration, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: jiangbinzhu@gmail.com, xupengfei911_@126.com, 826862074@qq.com)

Abstract: The emergency management thought of the fourth generation of collective leadership of the party and state has been mature gradually through response to major public health emergencies like SARS, Sanlu milk powder event and A (H1N1). This paper takes crisis management thought of the fourth generation of central collective leadership response to major public health emergency as example. Adopting case study method. Inducing and summarizing the emergency management thought and main content that include emergency preparedness thought with the emphasis on normalized crisis preparation, emergency early warning thought with the emphasis on information transparency, emergency rescue thought with the emphasis on the people-oriented concept, and post-emergency rehabilitation thought with the emphasis on restoring social order. And then putting forward the perfecting policy suggestions for major public health emergency management, so that provide ideological reference and theoretical reference for the new generation of collective leadership responding to major public health emergencies.

Key words: The fourth generation of central collective leadership; Major public health emergencies; Thought of emergency management

1 Introduction

When comrade Hu Jintao as the core of the communist party of china(CPC) and the state of the fourth generation of central collective leadership(FGCCL) was in power, many major public health emergencies has happened, such as SARS, Sanlu milk powder event(SMP), A (H1N1). Under the management of the CPC central committee's collective leadership, the response to all these events has made great victory, and the thoughts on how to response to the major crisis event has been more mature day by day.

Academics for the FGCCL thought of emergency management research mainly concentrated in the field of thought, thought content, thought subject these three aspects. In the field of thought, the thought with Hu Jintao as general secretary of the CPC central committee of natural disaster emergency management system of the construction always be discussed (Wang Yongbin, 2009; Hu Huan, 2013; Dai Gangshu, 2011). In terms of thought content, such feature of the FGCCL emergency management thought that summarized like Humanization, Scientization, Legislation, Internationalization, and Transparency(Qu Ting, 2012; Hu Huan, 2012; Huang Jiansheng, 2011).In the meantime, the three remarkable characteristic should be embodied in emergency management thoughts, which is time characteristic, national conditions characteristic, and system characteristic (Yang Lixin,2011).In terms of thinking subject, academic circles more is discussed in Hu Jintao's crisis management thought, who is the core comrade of FGCCL (Huang Xiaolin, 2008; Wang Qing, 2011; Wang Lingyun, 2012).To sum up, the academia for the FGCCL crisis management thought more focus in the field of natural disasters, while relatively few studies in the field of public health, in addition the research from overall the FGCCL of on its crisis management thoughts also does not see more.

So, following by the major public health emergencies as example to do some research on the main content of the thought of emergency management formed during the fourth generation leadership was in power, which is of important experience for the public health security work of Xi Jinping as general secretary of the CPC central committee leadership and our country's current public health emergency

* This paper is supported by Natural Science Foundation of China "Measurement Evaluation System and Empirical Study on Government Response Capacity of Major Public Health Emergencies" (71003079), the Fundamental Research Funds for the Central Universities "Research on the Mode of Dynamic Collaborative Governance Based on the Evolution Characteristics of the Financial Crisis"(2015V1009) and "Thought of Four Generations of Leaders of the Management of National Public Health Emergency Response to Major Crisis" (2013-ZZ-A2-04)

management.

2 Methodology

For the research on the fourth generation leadership crisis management thought, this paper adopts case study method. According to the level characteristics of major public health emergencies, we choose five typical cases, that is SARS, Fuyang inferior milk powder incident (FIMP), H5N1, SMP, and A(H1N1). All five cases are spread so fast, harm greatly, and influence wide. Besides, all they are particularly important or special major public health emergencies, which are typical cases concentrated reflect the emergency management wisdom of fourth generation of leadership. According to the disaster cycle theory (Mileti, 1999) and emergency management work requirements of the *Emergency Response Law of the People's Republic of China*(ERL), this paper shall adopt to such analysis framework of emergency management process as Emergency Preparedness, Emergency Early Warning, Emergency Rescue and Post-emergency Rehabilitation for the five cases. From the early stages of the fourth generation of leadership to response to SARS to their ruling late response to A (H1N1), for the fourth generation leadership case evidence of each phase of emergency management thought, this article is based on time sequence to show the development of his thought,by this way we induce and summary the crisis management thought and main content.

3 The Emergency Management Thought Content of the Fourth Generation Leadership

3.1 Emergency preparedness thought with the emphasis on normalized crisis preparation

In the emergency management practice of the FGCCCL, the thought which emphasized the normalized crisis preparation about emergency preparedness has been formed. Before the outbreak of A (H1N1), our country has established two sets of relatively perfect crisis management mechanism, that is command coordination mechanism and the legal safeguard mechanism. Since the SARS outbreak in 2003, six years had passed, we had formed command coordination mechanism from central to local. The ministry of health had established the national public health emergency expert advisory committee. Specialized emergency department had been set up at provincial and ministerial levels, and health emergency office had been founded in local grassroots. Top-down by the central government unified leadership and coordinated command. During the six years, China has promulgated *Regulations on Preparedness for and Response to Emergent Public Health Hazards*, *Master State Plan for Rapid to Public Emergencies*, *Emergency Response Law of the People's Republic of China*, *Regulations of the people's Republic of China on Government Information Disclosure*, etc. A set of comparatively complete legal emergency safeguard mechanism had been set up. On the principle of high attention, active response, joint prevention and control, statutable and scientific treatment. China actively carry flu prevention and control work, when the A (H1N1) raging abroad. Making plans to prepare, improving emergency supplies production and reserves, strengthening human A (H1N1) control techniques propagation mode and vaccine development, rapid diagnosis, clinical treatment methods to enhance the ability and level of scientific control. Since the establishment of the normal management of crisis management mechanism, the CPC and the government in response to A (H1N1) in stride.

3.2 Emergency early warning thought with the emphasis on information transparency

In the emergency management practice of the FGCCCL, the thought which emphasized the information transparency about emergency early warning has been formed. The social impact of SARS is so wide, a very important reason is that opaque epidemic information. Due to official conceals information, making social rumors, greatly hindered the epidemic control, Meanwhile that China has also suffered strongly condemned by the international community because of withholding information. Since then, the FGCCCL attaches particular importance to the communication of information in response to the crisis. According to *Regulations of the people's Republic of China on Government Information Disclosure*, China's epidemic information to establish a communication mechanism, including that establishing an international information exchange mechanism, establishing a national epidemic information release mechanism, and establishing local governments at all levels to perfect the epidemic detailed information disclosure system (Zhang Wenli, 2010). Information exchange mechanism plays an important role in the A (H1N1) outbreak control, at the same time, delivering transparent information Chinese government has won wide acclaim from the international community. Disaster information work will be throughout the entire process of crises, among this should paying special attention to information which high transparency in the alert stage. So as to provide a practical basis for the development of emergency management every step of the work.

3.3 Emergency rescue thought with the emphasis on the people-oriented concept

Comrade Hu Jintao at the 17th national congress of the CPC proposed the concept of scientific development is based on people-oriented as the core. And in the emergency management practice of the FGCCCL, the thought which emphasized the people-oriented concept about emergency rescue has been formed. Wen Jiabao made three important instructions in response to FIMP, which is incident investigation, the accident responsible to punish and rectifying the market order to ensure food security and people's health (People.cn, Apr. 22th, 2004). "For the people in charge of" requirements for responding to SMP was powerful. On the one hand, the Central People's Government of the People's Republic of China asked the children suffered calculus a free, timely treatment. On the other hand, Government requirements for the country's infant milk powder production enterprises to carry out comprehensive quality testing, and to implement for recalling system, rectifying the dairy industry. Universal vaccination of A (H1N1) effectively improve people's ability to resist disease. State Council executive meeting Sep. 7th, 2009 the emphasis on strengthening vaccine and antiviral stockpiles, actively and steadily good vaccination. Sep. 15th, 2009, People's Republic of China Ministry of Health issued *Guidance on the prevention of influenza A (H1N1) influenza vaccine in the fall and winter of 2009*. In the face of a catastrophic disaster for the people requires time to time, to maximize the reduction of people's losses, which is the people-oriented concept connotations.

3.4 Post-emergency rehabilitation thought with the emphasis on restoring social order

In the emergency management practice of the FGCCCL, the thought which emphasized the restoring social order about post-emergency rehabilitation has been formed. An important guarantee to restore social order is to continuously improve the social system, which the legislation is one of an important way. After SARS, China's established emergency response legalization construction direction. Premier Wen Jiabao speech that, for the effective prevention and timely control and eliminate hazards to public health emergencies, and China is an urgent need to establish a unified, efficient and authoritative public health emergencies emergency response mechanism, perfect relevant laws and regulations, which in the "Implementation of the *Regulations on Preparedness for and Response to Emergent Public Health Hazards* forum" (People's Daily, May. 16th, 2003). China in the post-emergency rehabilitation stage of SARS successively promulgated the *Regulations on Preparedness for and Response to Emergent Public Health Hazards* and *Management Method for the Prevention and Treatment of Infectious Atypical Pneumonia*. Then the SMP also contributed to revise and perfect the food safety legislation. Another important way to restore social order is to recover industry production. The source of infection of H5N1 from poultry, therefore, the poultry industry suffers major blow, then the production of the poultry industry recover to get the attention of the FGCCCL. For poultry production and market recovery, Hui Liangyu made important instructions that, intensify policy support to maintain the health of poultry and its products normal circulation order, to actively promote the breeding pattern change, and promote the sustained and healthy development of the poultry industry (People's Daily, Nov. 7th, 2005).

4 Conclusion and Discussion

Through the analysis of five typical cases, clarify the connotation of the fourth generation leadership of crisis management thought that include emergency preparedness thought with the emphasis on normalized crisis preparation, emergency early warning thought with the emphasis on information transparency, emergency rescue thought with the emphasis on the people-oriented concept, and post-emergency rehabilitation thought with the emphasis on restoring social order, which is of great experience to our country current emergency management policy-making, and help to further promote the government emergency management ability.

4.1 Perfect the normalized construction of emergency preparedness

The emphasis of emergency preparedness work is through the rational allocation of people, goods, content as well as the scientific and reasonable analysis of system, technology, information so that full and deadly preparations are made for the next crisis management. One Case and Three Systems (OCTS) as the core of emergency management system has been fully improved the emergency preparedness capacity in our country. But there are still many problems of it, including the legal construction, which has always been the weak item in the system. Perfecting emergency legal system developments is extremely urgent and necessary, and the perfection of legal system cannot leave with summarizing experience and lessons of each public crisis response. Perfecting OCTS as the core of emergency management system is necessarily to be a long-term and arduous task, and which also helps to perfect the normalized emergency preparedness.

4.2 Enhance information transparent awareness in emergency early warning

The key emphasis in work of emergency early warning stage is the disaster information, besides, promptly collecting, sorting and analysis of disaster information are important. So improving leaders' information high transparent warning awareness is very necessary. On the one hand, leaders need to improve awareness of emergency. The government leaders must identify crisis in development from vague, ambiguous and contradictory signals. They must have an accurate assessment to the threat of disaster and find out what kind of crisis to limit the crisis may lead to harm (Arjen Boin & Paul Thart & Eric Stem & Beng Sundelius, 2010). On the other hand, we need good information communication mechanism. Such relationships as the Domestic and the Abroad, the Central and the Local, the Government and the Nongovernment, in the communication of information are required to deal with. The media information must achieve industry self-discipline as well as government supervision so that rumors caused by the error message which will increase the difficulty that crisis management work can be avoided.

4.3 Highlight the people-oriented concept in emergency rescue

Emergency rescue work should be first to control the losses of people and objects in time. The next step is to gradually control the expansion trend of disaster until eliminating crisis. From Marxist theory to Mao Zedong thought and a series of theory which belongs to the sinicization of Marxist theory, and then to the FGCC of the concept of scientific development, to today's China Dream, people-oriented has always been the foundation of CPC ruling. In the whole stages of crisis especially pay special attention in emergency rescue phase, getting rid of the crisis must be put in priority position, the interests of the people must be placed in the front. Emergency rescue must closely around the interests of the people, must be responsible to the people, which is the core principle to all emergency response measures and emergency response actions.

4.4 Guide the restore social order in post-emergency rehabilitation

Post-emergency rehabilitation priority is to reach people and materials as well as the order recovery, and the restore of social order is extremely difficult. In order to reach the recovery of the social order, we should guide the boost of the social confidence, including the boost of confidence in personal life as well as in the government and the market after a disaster. Timely and effectively recovery also helps to boost social confidence. The concrete actions are to actively guide the recovery of industry production through policy support, industry itself, the recovery of industry consolidation and other means. By the meantime, we should summarize the experience of responding the disaster and dealing with the rest problems to actively guide the revise of social system.

Exploring Investment Risks for Chinese Manufacturing Industry in Bangladesh

A.B.M. Munibur Rahman, Zhang Yutang

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: munib_30@yahoo.com, zyt@whut.edu.cn)

Abstract: The explanatory power of institutional and macroeconomic variables for capital stock accumulation and related risks in Bangladesh is investigated. In addition, the risks of foreign investment in Bangladesh have been explored for Chinese manufacturing companies those are going to invest in Bangladesh or developing country. Hypotheses are tested by means of pooled least squares regressions to support the logic of associated risks for investment. The results found that the institutional variables such as political risk and macroeconomic variables are strongly relating the risks for investing in Bangladesh. To invest in developing country like Bangladesh, inflation risk, operational risk, and appreciation of host country's currency, and lower inflation rate stimulate the investment risk for manufacturing company. It is well established that foreign investment company must conform to mitigate strategically those risks in the host country in order to remain competitive.

Key words: Investment risk; Manufacturing investment; Country risk; Developing country

1 Introduction

Investing in any country, there have risks associated with return of the firm's investment. Countries differ on a wide range of attributes which may influence firm performance. Investment flows to developing countries dramatically increased; Bangladesh is not also beyond of that part of risks. Recently, China's direct investment in Bangladesh has also grown significantly in the recent years where Bangladesh is increased by 24.42% to USD 1.13 billion in FY 2012. Investment inflows into Bangladesh by Chinese investors are 53% in Textile and Wearing; 31% in manufacturing (Source: Statistics Department of Bangladesh Bank). So textile and manufacturing industry is the thrust sector for Chinese investors' investment.

The advantages for multinational corporations investing in foreign countries have been explained by theories such as stages in the product life-cycle, location-specific advantages, and strategic rivalry, the shortcomings of other entry modes such as exporting and licensing (Knickerbocker, 1973; Vernon, 1966: 211-226; Dunning, 1988). This study is going to analyze of the factors that drive direct investment to Bangladesh and associated risk factors. Multinational companies are entering foreign markets to adapt their overall strategies to environmental conditions in host countries. Faria and Mauro (2004) concludes that a variety of factors stimulate foreign investment in developing and emerging markets, sound macroeconomics, natural resources, institutional quality and educational levels.

Empirical research on investment using the institutional approach has mostly emphasized the impact of incremental risk, e.g. political risk (Bailey & Chung, 1995), bilateral investment treaties (Heinrich & Konan, 2001), corruption (Jain, 2001), trade regulations, capital market. Events like the end of the Cold War and developments like globalization have led to broad institutional changes in political economies, including market and economic liberation and democratization. The first reduced barriers to international trade and investment; the latter created a business environment attractive to FDI inflows owing to higher levels of transparency, continuity and predictability. If episodic changes address opportunity, then incremental changes, or even the lack thereof, refer to threats or risk. Slow changes to political instability (macro-political risk) and intrusive market regulation (micro-political risk) remain at the heart of the risk profiles of host countries (Howell & Chaddick, 1994: 70-91; Root, 1972: 345-365; Fatehi & Safizadeh, 1994: 65-73; Kobrin, 1976: 29-42).

The rationale for this paper is threefold: first, the analytical focus will be on developing countries, then determining the risk factors for Chinese manufacturing company in Bangladesh. Finally, this paper implies to investigate the risk and mitigate the risks for foreign investment development in Bangladesh.

2 Literature Review

The liberalization of trade and the spread of the free market philosophy have created business opportunities; it led to firm activities like acquisitions, mergers, and green field investment in host country investment markets. The spread of representative and accountable to political governance in

developing countries has lowered instability and strengthened investment confidence in the emergence of more transparent business environments (Rafael, Luiz & Flávio, 2011). Moreover different types of risks effect on the investment of any country. Chinese investment in Bangladesh is concerning in risk factors and country institutions policy. In literature review, we have discussed in terms of the different types of risk and factors of risk those are associated with the investment of Chinese company in Bangladesh and constitute the hypothesis for this research paper.

Political risk not only constitutes a threat for multinational enterprises but can also be a source of opportunities. For foreign investors, the primary concern about political risk (PR) in host countries is the adverse impact it may have on a firm's profitability. Exposure to and accumulated experience dealing with political risk allows firms to better implement a wide set of political actions such as negotiation of entry conditions, lobbying, litigation, campaign contributions and coalition formation, leading to preferential conditions, reduced environmental uncertainty, reduced transaction costs and increased long-term sustainability to the firm (Alfredo, Isabel, Diana, 2014). These advantages facilitate investments in countries with higher and more diverse levels of risk and make political risk to be positively associated with the firm's scope of internationalization. The literature indicates that PR is an impediment to investment and those foreign companies are more likely to avoid host countries with a high political risk profile (Erramilli & Rao, 1993) and higher transaction costs (Nigh, 1985; Schollhammer & Nigh, 1984). Grosse and Trevino (1996) and Bailey and Chung (1995) attribute this to the inability of host countries to reduce political risk as well as their failure to alleviate investors' uncertainty about unanticipated costs and reduced ROI associated with long-term capital investments.

Razin (2003: 415-428) argued that direct investment in more risky countries provides firms with direct control over operations rather than relying on indirect control, e.g. licensing or exports. Pan (2003) and Pan and Li (2000) show that investment inflows into China, despite the country's high political risk profile, is driven by long-term strategic advantage rather than short-term risk exposure. Companies those are investing in developing country face a range of operations risks (OR). operations risks is common in countries that have no clear, accurate, easily discernible and widely-accepted practices governing the relationships among firms, investors, governments and courts. This refers to micro political risk, i.e. government policies aimed at market restriction (Balasubramanyam & Mahambare, 2002). According to Kurtzman, Yago and Phumiwasana (2004), operations risks is largely informed by opacity, i.e. insidious and incremental small-scale risks like fraudulent transactions, bribery, legal and regulatory inefficiencies, unenforceable contracts and negative attitudes towards foreign investors, rather than dramatic risk events (macro political risk) like revolutions, major acts of terrorism, interferes with commerce, adds costs and interfere the growth and hampers prediction about the future. The developing world characterized by fragile democracies and markets, there is macroeconomic instability. Risks include instability of prices, interest rates, exchange rates, and economic output, as well as unemployment. Inflation is caused by excessive growth in the money supply. Companies invested less in developing countries like Bangladesh with high inflation rates (Schneider & Frey, 1985). Grosse and Trevino (2005) found that inflation did not add significantly to the explanation of FDI flows into the CEE countries.

Currency valuation may impact on MNE's decision to invest in developing country in various ways. Currency depreciation introduces uncertainty in long-term planning and exposes long-term investment to increased risk. Erdal and Tatoglu (2002) found, in a study of locational factors on the level of FDI flows to Turkey, that the lack of exchange rate stability hindered Turkey's efforts to attract a much higher volume of investment. Esuola and Adeleke (2006: 219-224) found that exchange rate is the strongest macroeconomic driver of capital inflows in Nigeria. The impact of capital investment on DCs' balance of payment (BOP) is an important policy issue for most host governments. Reinvesting in local manufacturing facilities may also improve the competitiveness of local producers and boost a host nation's exports, thereby improving its BOP position (Wild, Wild & Han, 2006).

3 Methodology

The dynamic nature of foreign direct investment or Chinese company's investment in Bangladesh activities lends itself to time-series analysis as a robust way of capturing trends in multinational enterprises investment choices. To capture a sufficient number of observations, we choose Chinese investment in manufacturing sector in Bangladesh of last nine years (2005-2014) investment panel dataset. We have observed 127 companies for our sample data set most of the companies are textile and lite machineries. To examine the causes of Foreign Direct Investment (FDI), we postulate the following:

FDI = f(Market size, Rate of Growth of GDP, Inflation Rate, Current Account Balance, Exchange Rate, Political Risk, Operational Risk, Economic Freedom)

Based on our initial estimation results, we decided to use the log-linear functional form to estimate the causes of FDI. Finally, we have used our formula to find the risk factors results as below:

Log(Investment of Chinese firm)=constant + alog(G05 or PCG14) + blog(GDP) + clog(CPI) + dlog(CB) + eelog(ExR) + flog(PRISK) + glog(OPRISK) + hlog(EF) + error term

Where, Exchange rate denotes as Local currency per US\$: ExR; Political Risk as PRISK; Operational Risk as OPRISK; Economic Freedom as EF; Inflation Rate as CPI and Current Account Balance coded as Export of Goods and Services /Imports of Goods and Services: CB

The advantage of using log formulation is that it enables easy interpretation of the data as coefficients associated with independent variables or parameter estimates measure respective elasticities.

4 Result Analysis

As stated in the introduction, the objective of this analysis is to examine whether the level of capital investment inflows into a panel of developing country may be attributed to institutional and macroeconomic variables and to explore the risk variables for Chinese manufacturing companies those are investing in Bangladesh. To determine the presence of multicollinearity, correlation was run with the independent risk variables and autocorrelation is tested for testing the hypothesis of risks variables.

As outlined in correlation analysis, we found that two independent variables are indeed strongly correlated. PRISK is strongly correlated with another institutional variable, OPRISK. OPRISK was therefore omitted from our analysis. We also found a positive correlation between ExR and CPI. Hence, we have one or the other in our estimation. However, Commercial political and operational risk assessments differ in their prowess to predict risk (Howell & Xie, 1996). So, for Chinese manufacturing firm, those risks are strongly correlated for investing in Bangladesh. As outlined in correlation analysis, we found that two independent variables are indeed strongly correlated. PRISK is strongly correlated with another institutional variable, OPRISK. OPRISK was therefore omitted from our analysis. We also found a positive correlation between ExR and CPI. Hence, we have one or the other in our estimation. However, Commercial political and operational risk assessments differ in their prowess to predict risk (Howell & Xie, 1996). So, for Chinese manufacturing firm, those risks are strongly correlated for investing in Bangladesh.

In Table 1, we present the best estimation results. We used pooled least squares and, to take care of the problem of autocorrelation of first degree, we added AR (1) term to our model and finding the significance of risk variables for Chinese Investment Company. A number of important results were obtained.

First, market size, measured as per capita GDP, in the base year 2005 leads to higher inward investment. The coefficient is significant at 5 per cent level. The findings indicate that the initial size of

the market is more important than the rate of GDP growth.

Second, higher ExR leads to lower inward FDI. In other words, depreciation of the local currency (host country) or appreciation of US\$ (as measure of home country currency) leads to lower inward FDI. As indicated above, high collinearity between ExR and CPI led us to estimate only one of the two independent variables at a time. Collinearity between ExR and CPI is to be expected, as *ceterisparibus* higher inflation rate should lead to the depreciation of its currency. When CPI was used in place of ExR, a higher percentage growth in CPI or higher inflation leads to a lower inward investment. The coefficients for both ExR and CPI were significant at 5 per cent level. Higher inflation rates in host countries will lead to lower investment in Bangladesh from any country.

Finally, the findings also confirm that a deficit on the current account of the Balance or payment of host countries will have a negative impact on capital inflows. However, the correlations were not measured at a significant level. Because of its high collinearity with PRISK, institutional change, on the macro political, bureaucratic and economic levels, points to the strengthening of the investment climate investment country. This finding is consistent with previous studies related to the market disequilibrium in DCs (Grosse & Trevino, 1996; Klein & Rosengren, 1994). It is also in line with location theories of FDI that weaker currencies in host countries lower the costs of investment factors like capital, taxes and operations (e.g. labour, facilities) (Dunning, 1988).

5 Conclusion

The findings provide some support to assessment of risk related to investment in Bangladesh. It implies that such related risks would need to be cared when Chinese manufacturing companies invested in Bangladesh. They also imply that country-level efforts to attract capital investment will favor governments in Bangladesh with strong institutions, i.e. sound monetary policy, liberalization of institutions that reduce uncertainty and foreign direct investment-related transaction costs for foreign investors, as well as a level playing field for both foreign and domestic investors. Also that commercial political and operational risk assessment differs in their prowess to predict risk (Howell & Xie, 1996). Others have pointed to the limitations of the qualitative or subjected indices of political risk assessment (Cosset & Roy, 1991; Oetzel, Bettis & Zenner, 2001). At the end, managers should develop an integrative risk management strategy based upon various sources, whether outsourced or developed in-house. Risk assessment should involve managers from both the parent and subsidiary levels of the firm.

Abstract: New music movement launched by the Communist Party of China (CPC) is very important in the history of music in modern and contemporary China. The art to eulogize the country developed slowly in KMT-ruled area at 1940s, the time of Stalemate stage. Guiling has become the important area to develop the new music. This paper based on the literature and used the method of historiography, and this paper discussed the contribution made by the Tianhan. According to the reference of CPC, Tianhan leads the career of promoting the new music, assists to develop Guiling new music, and takes part into compose the new music.

Key words: Tianhan; Guilin; New music; New music group

1 Introduction

New music movement launched by the Communist Party of China (CPC) is very important in the history of music in modern and contemporary China. The art to eulogize the country developed slowly in KMT-ruled area at 1940s, the time of Stalemate stage. Guiling has become an important area in the new music development. Dramatist Tian Han related deeply to the new music movement; is the sponsor and the leader of the music group “Friends Of the Soviet Union” and the Left-wing Dramatists Association, and the tutor of Nie’er and Zhangshu, the delegate musician of new music movement. After the outbreak of the Anti-Japanese War, Under the leadership of Zhou Enlai and Guo Moruo, he “trained out artist soldier of three thousand”¹ in Wuhan. He is a forerunner to concern the development of new music in the time of the anti-Japanese war. Tian Han frequented in Guiling 3 times after the outbreak of the anti-Japanese war, during the periods respectively from Apr. 20. 1939 to Sep. 21. 1939; between the Feb. and the Mar. 1940; and from Aug. 23. 1941 to Sep. 1944 (*Xiang-gui retreat*)⁴^[1], his words and behavior has a deep significance to the development of Guiling anti-war music. There are lots of research on the Left-wing Union and Guiling anti-war art, and on Tian Han together with Guiling anti-war drama. However, much attention was not seen in the researches about Tianhan and Guiling anti-war music which have effect on the Guiling “New music movement”. In my opinion, During the Anti-Japanese War, Guilin is an important fortress in the “New Music Movement” led by CPC, and Tian Han played an important role in that development.

2 Guilin is the Place of Strategic Importance on the “New Music Movement” During the Anti-war.

Before we talk about the relationship between Tianhan and “New music” in Guilin, I think I should reiterate that Guilin is the place of strategic importance on the “New music movement” launched by the Communist Party of China in KMT-ruled area during the anti-war.

After Wuhan was occupied by the enemy, Zhou Enlai arrived in Guilin three times during Dec. 1938 to May. 1939, and he implements the party's united front policy, makes the reports to insider and outside the party, and meets and encourages the people of literary and art circles, he also take part to organize anti-war cultural movement. He points out the orientation. The Communist Party of China has led consistently the art career in Guilin. The Office of the Eighth Route Army in Guilin has been established, which leads the business of New Cultural in about 2 years until the Jan. *National salvation daily* Founded in Jan.10 1939, and it acted an important publication in this time with powerful promotion. After the Southern Anhui Incident, The Office of the Eighth Route Army and *National salvation Daily* retreated one after another. The united front committee lead the business of revolutionary art work in Guilin, and the association of literary and art circles to resist the enemy Guilin branch is an organization in Guilin art circle launched by the Communist Party of China, and it is the

¹ excerpted in the poetry written by Tao Xingzhi, Comes from Wuhan, living on Wuhan, trained three thousand artists, Tianhan is a good man, drink up the last drop wine, stick to the last minutes; toast three wine at the mid-autumn festival, and celebrate the exciting news.

core of the literature and art organization in Guilin and the sign of the foundation of the united front in Guilin art circle.

The Deployment of the new music movement is the screws of the machine of revolutionary work in this background. The national government military commission the political department of the third hall retreat to Guilin to reorganize in Guilin. at the same time, many artists were reserved at Guilin. In addition, the third hall included in art group is also the important place, and these groups are also the part of *new music movement* launched by the Communist Party of China. When we talk about *the New Music Associations*, *New Music Monthly* is inevitably to be talked. However, the foundation, development of the association and the publication, the prosperity of the paper relate to the Guilin. *New Music Monthly* was published in Jan.1940, there are Vol.5, Phase 29 during the anti-war, which is hosted by Lilin and Published in Guilin. Stop publication happened in Aug. 1943. This newspaper provides many songs, and it became the base to carry out the discussion of music theory, which issued about Thirty thousand. It has the most huge Volume of sales and the most influence. *The New Music Associations* established by Lilin, which aims to associate all people, to set up branch and to improve the New Music Movement.^[2]So, *the New Music Associations*, *New Music Monthly* provide the support to develop *New Music Movement* during in the anti-war.

In conclusion, Guilin is the place of strategic importance on the “New music movement” launched by the Communist Party of China in KMT-ruled area during the anti-war.

3 Tianhan and his Activity of Anti-war Singing Song in Guilin

Frequented three times in Guilin during the Anti-Japanese War, Tuian Han, focused his attention mostly on drama. Though the things are like that, his music activities during this period are not to be ignored by our music theory field. The following fact is not to be neglected. That is, he also mostly possibly participated in the Anti-Japanese Song-sing activities in Guiklin and is a sticker and leader at that difficult time.

On May.7.1939,Tian Han presented the award presentation ceremony of anti-war song-singing held in Guangxi province and wrote the article *Drama, Opera and others*, which praised enthusiastically the achievement in Guiling Anti-Japanese War Song-singing and the musician Wu Bochao. The article reads: “Today people as well as army need very much music. They like very much music. These popular songs ,and the children songs-singing movement in peculiar, due to the many musicians and instructors like Wu Chaobo especially those kinds of anti-war art. These activity hold by musicians like Wu Bochao, has achieved a very considerable achievement.”^[3] And then, cooperated with Wu,wrote *‘July 7’ to memorize two-year anniversary tribute song*; for the commemoration of 2-year Anniversary of “July 7” Song-sing Meeting, calling the people “to devote ourselves for the victory of tomorrow!” and he also co-operated with Anti-Japanese Union and composed *new solider songs*.

The most successful activity which Tian organized is Southwest Drama Show. 1944, the seventh year of Anti-Japanese War,the hardest period, Tian Han, together with other artists like Ouyang Yuqian successfully held the Southwest Drama Show at Guilin. During 90 days,this activity has viewed roundly thedrama, opera and music since the outbreak of the anti-war, at the same time, which leads the climax of anti-war art in KMT-ruled area! This activity has a great significance onto the drama-circle, and it is the same to the music-circle. The festival opens in a warm atmosphere and lasted till to the May, Tian Han wrote for the festival and acted as the judge. In June, he initiated in establishing The Propaganda Committee of Guilin Cultural Circles for Expanding Anti-Japanese War Mobilization to set up the propaganda week of Defend the south-west (June 14-20), he also set up music day: and the sound of the patriotic was spread on the street, tea bar, radio station, music hall in Guilin. Guo Moruo said Flag was extended everywhere, as like heavy rain in the three days, and Shouchang is the Pioneer both in the theatre and in the cultural circles.^[4]

4 Tianhan and the New Music Associations, New Music Monthly

When we talk about *the new music movement*, we must refer *the New Music Associations* and *New Music Monthly*. So the young and inexperienced Liling started to establish the publication from Yanan to Chongqing, and sought advice from Tian Han to learn how to establish a publication, and organized song-singing movement around the country; the first issue of *New Music Monthly* was published in 1941, Tian Han, Huang Luofeng, Liling were present, and they invited the musicians in Chongqing like Zhang Hongdao, Jiang dinxian, Miu Tianrui, Li Baocheng, Chen Tianhe, Li Yuanqin, Fan Jiseng, Liu Xuean to take part in the meeting, Tian Han made a speech to call upon everyone to unify; thereafter, Tian Han

always provided help to Liling in *the New Music Associations* and *New Music Monthly*. For example, he agreed with Liling to set up *the music school communication*, which was a help to develop the art skill. He also argued that “we should choose some people from our team, and send them into school to learn and to develop their art literacy”, as the result, the conductor Yan Liangkun, the composer Wang Zhengya, the singer Huang lie, Xu wei, Zhang yun were all sent into Chongqing Qianmuguan National Conservatory.^[5]

Furthermore, Tian Han led lots of musicians who endorsed the new music to memorize Nie'er and Zhang Shu. The death anniversary of Nie'er in Jul.7.1942; *the Wild Festival* to memorize three years death anniversary of Zhang Shu in Dec.12.1942; *the Rally Commemorate* to souvenir eight years death anniversary of Nie'er in Jul.1943 and so on. These commemorate activities are to interpret Nie'er and Zhang shu's paths, and to interpret the thought and the significance of new music movement.

5 Tianhan's Songs Composing in Guilin

The Guilin period was the high time of Tian Han's creative activities. One of the features in his drama writing is the adding of the new music into his dramas. Tian Han also composed lots of dramas which are related to the historical background and historical circumstances, such as the modern opera *Jianghan fisherman's song*, the drama *Ode to the Autumn Sound*, *Roar! Guilin* and so on.

In the dramas Tian Han paid much attention to the combination between melody and plot. The melody has become the systematic part of the whole drama, and it is the confessions of the character. Like the songs *Lijiang chantey*, *Shoeshine song*, *The Song of the Fallen Leaves*, *Xiaoxiang Nocturne*, and *Ying Heqiu's Sonata*, these are all excerpted from the drama *Ode to the Autumn Sound*. And the theme song like *Welcome back! Hong Kong, always stand together are all speared within Guilin even in the KMT-ruled area* intellectual, which also lead the singer Yaomu¹ going into the road of song-writing. In addition, Tian Han also concentration on the drama *Roar! Guilin*, which includes six songs, they are *wake up! rear areas*, *Contributions song*, *Lakeside month*, *the flower song*, *song for the second front*, and *Roar! Guilin*, written by Tian Han, An'e and composed by Feike, Wang Tiandong. The lyrics are very Passionate and epic. The release of the drama mobilize the messes, it was called “*A bomb thrown into the citizen in Guilin!*”^[6] These compositions combine the music with the plot instead of drama adding singing, and they enhance the cultural meaning of the song as well as rich the drama itself.

6 Conclusion
