Hengyang was lost at Jun. 27. 1944, and two days later, Tian Han organized *Guilin Cultural Anti-war Working Association* to follow the method used by Shanghai at the early period of anti-Japanese War to set up a propaganda. Beside above, Tian Han was the last one to retreat until the government announce the last evacuation order, which could be called the last artist. At the third time Tian Han arrived in Guilin, there happened the Southern Anhui Incident. Also that time was also his Guilin cultural and art career turn into bottom. It makes people to ponder about, that Tian Han, which was called the democratic personages by KMT, would come to Guilin. And the influence he brought about also let us to research seriously. Although Tian's activities in Guilin are less than Wuhan in the early years of anti-Japanese War, they have the same significance. This kind of significant influence is both to Guilin cultural and to the new music movement. He grasped fully the united front policy set by party during the anti-Japanese War. He played the key function to maintain the Party's rule, he protected the Party's art troops, and he reached a climax of Guilin anti-Japanese War art movement again and again during the hard time. In composing, he combined the current situation with art to interpret the enthusiasm and confidence of winning the war which people have, this king of anti-Japanese War musical thoughts is just the goal the “new music movement” seeks.

The Coupling Mechanism and Decoupling Strategies of Safety Risk in Airport Flight Area *

Luo Fan, Yang Xiaoyu, Zhang Chao, Yang Xiao

School of management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: sailluof@126.com, 970026957@qq.com, tide1974@21cn.com, y_xiao0206@163.com)

Abstract: The main factors of safety risk in airport flight area include personnel factors, equipment factors, environment factors and management factors. Using system dynamics model, the coupling mechanism of multiple risk factors, especially the coupling path between the airport flight safety risk factors, is discussed. Combined with the actual situation in the airport flight area management, the decoupling strategies for airport flight area safety risk are put forward, so as to enhance the level of airport security management, effectively protect the security of civil aviation.

Key words: Airport flight area; Safety risk; Coupling model; System dynamics; Decoupling strategy

1 Introduction

Airport flight area is the special field for airplanes takeoff, landing, taxiing and parking, including runway, lifting belt, runway end safety area, taxiway, apron and area around airport with limited obstacles. With the development of air traffic, the pressure of the safety management of civil aviation airport in our country is increasing, and the safety risk management is urgently needed to be strengthened. In practical work, the occurrences of airport flight area security risks are not caused by a single factor, but one factor often inextricably linked with others, which leads to the coupling mechanism between these risk factors.

The domestic and foreign scholars have carried out researches about airport safety risk management, designed the risk assessment index^[1-2], and discussed the methods of risk evaluation^[3]. The research team in Wuhan University of Technology chose four representative airports in central-southern China, conducted questionnaire to 208 airport personnel. Main safety risk factors of airport flight area were extracted through exploratory factor analysis and confirmatory factor analysis, including human factors, equipment and facilities factors, environment factors and management factors^[4]. There are few domestic and foreign scholars researching on aviation safety risk coupling mechanism, Liu Tangqing analyzed constitution and coupling relationship of air traffic safety risk^[5], but none of the research results is about airport security risk coupling mechanism. As to decoupling control strategy, Yang C designed an intelligent controller based on expert rules and fuzzy control to realize the compensation decoupling between coke oven^[6]; Hunt J K designed multivariable decoupling control scheme, combining PID neural network with RBF fuzzy neural network^[7]. However, these studies were not involved in decoupling control strategy of the security risk coupling. In this paper, the safety risk factors of airport flight area are selected as the research object, the coupling mechanism between the main factors is discussed and the decoupling strategies are put forward.

2 Connotation of Flight Area Safety Risk Coupling

The security of airport flight area is affected by both internal and external environment, especially by the impact of growing traffic flow leading to great uncertainty, which makes it faced with the complex and changeable risk. In the safety management system of flight area, the security risks of various subsystems are constantly evolving, conducting, or spreading, the mutual influence and interaction between subsystems has a combined effect, changing the flow and characteristics of safety risk, and this combination effect is called the coupling effect. The forms of coupling interaction are not the same, the matching degree between the risk factors and the correlation degree of the system function nodes are different, thus there are different coupling states resulting in different influence to the flight area safety risk. From a macro point of view, coupling of airport flight area safety risk is in a dynamic evolution in the civil aviation safety management system, having a direct impact on the security level of airport. From the meso and micro perspective, the coupling of risks exists in the internal system of the flight area, such as the coupling of management factor and human factor and etc.

* This study is supported by National Nature Science Fund of China: "Research on the Evolution Mechanism and Early warning Simulation System of Safety Risks in the Flight Area of an Airport" (authorized number: 71271163).

3 Flight Area Safety Risk Coupling Mechanism Based on System Dynamics

Influenced by the nonlinear complex factors, the security risk management system of the airport flight area is dynamic, which is suitable for the study of system dynamics. The system dynamics model decomposes the system according to the internal characteristics, which is divided into several interrelated subsystems. Using system dynamics to study the main risk factors affecting the safety of airport flight area, each risk factor is divided into several sub systems, mutual relationship between the main risk factors and between each subsystem was set up, the causal loop diagram of interaction was depicted, and on the basis of reasonable inference, a SD model of safety risk management in flight area was constructed. According to the coupling situation, the security risk of the flight area is divided into the coupling of two risk factors and the coupling of multiple risk factors; this paper mainly analyzes the latter one.

Multiple risk factors coupling refers to the risk caused by coupling of any three or more than three in four factors of security risks in airport flight area, that is, human risk, equipment risk, environment risk and management risk. The human- equipment- environment risk coupling, for example, one path is: the change of social environment → ineffective team cooperation → human factor risk → low work performance → lack of professional ability → lack of risk identification → management factor risk → ineffective risk control → security risks in the equipment → equipment factor risk. See Figure 1.

Multiple risk factors coupling includes human- environment- management risk factors coupling, human- equipment- environment risk factors coupling, human- equipment- management risk factors coupling, equipment- environment- management risk factors coupling, human- equipment- environment- management risk factors coupling, as shown in Table 1.

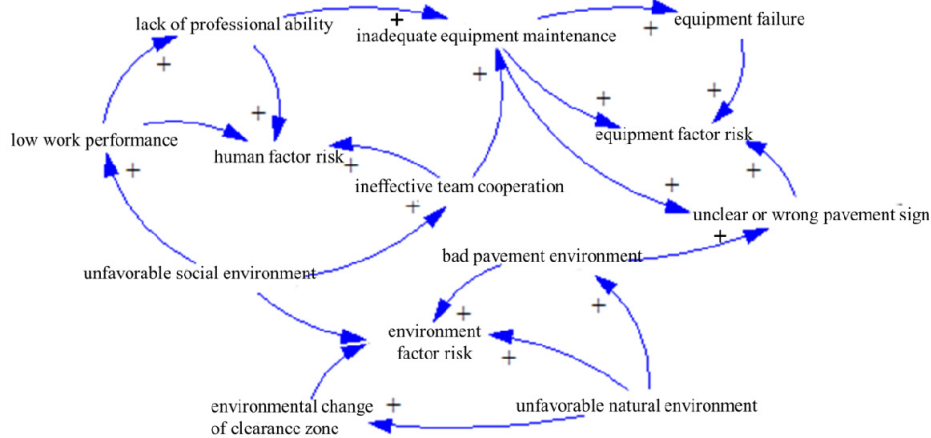

Figure 1 The Coupling Relationship Between Human Factor Risk, Equipment Risk and Environment Risk

Table 1 The Coupling Relationship of Multi Risk Factor of Field Service

Coupling factor	Risk coupling path
Human-equipment-environment coupling risk	Unfavorable natural environment → bad pavement environment → unclear or wrong pavement sign → equipment factor risk; unfavorable social environment → ineffective team cooperation → human factor risk
Human-equipment-management coupling risk	Management factor risk → lack of risk identification → insufficient risk assessment → ineffective risk control → unclear or wrong pavement sign → equipment factor risk; incomplete institutional construction → low work performance → human factor risk → lack of professional ability → insufficient risk monitoring → inadequate equipment maintenance → equipment failure → equipment factor risk
Human-environment-management coupling risk	Change of natural environment → change of social environment → ineffective team cooperation → human factor risk → low work performance → lack of professional ability → lack of risk identification → management factor risk
Equipment-environment-management coupling risk	Unfavorable natural environment → ineffective risk control → management factor risk → insufficient risk monitoring → flight area system failure → equipment factor risk
Human—equipment—environment—management coupling risk	Change of social environment → ineffective team cooperation → human factor risk → low work performance → lack of professional ability → lack of risk identification → management factor risk → ineffective risk control → security risks in the equipment → equipment factor risk

4 Decoupling Strategies of Security Risk in Airport Flight Area

In contrast with coupling, decoupling is to deal with the problems by using some methods to separate the coupled motion form or system, and the tight coupling relationship can be transformed into a loose coupling relationship to reduce the relative density of the related system. Scholars have discussed the methods of inertia decoupling, elastic decoupling and excitation decoupling. Inertial decoupling essentially belongs to the pre control decoupling principle, the decoupling term is added in the process of risk coupling to reduce the strength and speed of risk coupling, or the risk coupling chain is blocked by decoupling term, thus coupling and spreading of risk is effectively controlled. For example, two kinds of risk factors are coupling, one of which meets the decoupling item when flowing in the risk chain and the decoupling item will block the risk flow. If the risk is within the scope of the decoupling control, it will disappear; if not, the risk will be weakened. When both of the risks are decoupled from the intervention, the possibility of risk coupling is reduced. Just like that, when multi risk factors coupling encountered decoupling, it will happen, so that the risk can be reduced or even avoided. Based on the principle of decoupling, decoupling strategies can be taken that maintain normal state of the various safety subsystems of the airport flight area, change the risk tolerance limit of safety system and change the risk flow rate, which inhibit and delay risk flows from static to dynamic to finally burst, stop the coupling process and before affecting the safety of flight area, the risk will be resolved, or the effects caused by the risk will be delay.

4.1 Establish a grid information system of flight area safety risk

A grid system is formed with storage information and processing capability on the network of the security risk information system integrated in a scientific and reasonable way. The risk chain can be cut off by the grid, thus effectively reducing the risk. The key to grid safety risk information system in flight area is to master enough information to identify the risk, and the system should be constructed by the joint efforts of three parts: firstly, at the level of process and institution, staff of flight area must be in accordance with the provisions of the procedures for reporting unsafe information, to provide relevant information for safety management; secondly, at system check level, management staff in the flight area should promptly inform all kinds of implicit or explicit problems found in safety inspection, so that other people could know the information and try to correct their own behavior; the third is the personal level, staff in the flight area report the work of the security information and recommendations in a conscious way. Taking the human- equipment- environment risk coupling factor as an example, the grid information system of security risk can separate the mutual relationship between the three factors. Before the coupling of human factor and equipment factor, if training process is added here, team spirit and professional ability can be strengthened, and then forces of all parties can be used in the process of maintenance, which will reduce the possibility of equipment risk factors; and if equipment procurement standards are improved before the risk coupling of equipment factors and environmental factors, the possibility of equipment failure in bad environment can be reduced.

4.2 Maintain internal stability of flight security subsystem

Only when the stability of internal state of the subsystem is ensured, can subsystem hidden risks be limited in the control range, so that external risk can be resisted. First is to establish a grid risk management organization system, which is complementary to the current flight operation pattern, reflecting in the three levels of setting up the risk supervision center, risk command center and risk acceptance center. In airport flight area safety management process, after collecting information corresponding center will identify the risks and inform to its supervisor about the risks. Risk disposal plan will be set and followed, after getting result feedback and paper verification, it can be closed. Second is to attach importance to staff in airport flight area, to achieve people-oriented. As the main part of the risk control, staff should be cared in the grid risk management program. Decoupling of human risk factors, for example, staff with lower work performance should be given guidance timely, in case of mistake, missing and forgetting, as well as phenomenon that equipment are not inspected and maintained in time. The guidance will help the staff to adjust work load to the appropriate level and to carry out their career planning, improving their working enthusiasm, which is most important part of risk control in airport flight safety area.

4.3 Block the external risk into the internal security system

There are risk source in both external environment and internal environment of flight area. In the process of movement, they are stimulated by other risk events, flowing, spreading and coupling with the dynamic changes in the safety chain of flight area. External factors are the key factors, to delay or even inhibit the release and the risk flow, it should be stopped outside the security door of the flight area.

Decoupling of human factors and environment factors as an example, combined with the coupling path of harsh environment→ pavement freezing or ponding→ environmental risk factors→ incomplete institutional construction→ insufficient risk assessment→ ineffective risk control→ management risk factors, first, the competent authorities of the flight area should strengthen the supervision of the safety, such as security checks, internal audit, security, etc., reduce the environmental risks to acceptable level; The second is to strengthen monitoring dynamic changes in the external environment, set up a monitoring system aiming at the political and legal environment, economic environment, social environment, technology environment and other aspects, and equipped with specialized staff analyzing favorable and unfavorable environmental factors, identifying and evaluating external risks and take effective measures to meet the challenge of external environment.

5 Conclusion

Based on the research team in Wuhan University of Technology, the main factors of safety risk in airport flight area include personnel factors, equipment factors, environment factors and management factors. Using system dynamics model, the coupling mechanism of multiple risk factors is probed into, and next step should be case study in the actual situation in the airport flight area management. The decoupling strategies for airport flight area safety risk are put forward, but effectiveness will be tested and verified in the future.

(E-mail: yuanlingli001@163.com, guiping518@163.com)

Abstract: Based on the principle of early warning management system and “man—machine—environment—management” ship navigation systems, this paper constructs safety early warning management system of ship navigation. Through those steps of acquiring ship navigation warning information, constructing the evaluation index system for early warning, taking effective pre - control measures, optimizing emergency rescue plans, shortening recovery time, ensure the implementation of early warning and pre-control management, in order to reduce or stop the ship navigation accidents and improve the safety of ship navigation.

Key words: Ship navigation; Safety early warning management; Ship navigation system; Water transport

1 Introduction

Chinese Orient Star sank is the highest mortality in large passenger ship wreck under the non-war situation in the history, and capsizing and wrecking the fastest large ships sailing disasters. Its harm great and impact profound. To some degree, this calls on the community to strengthen the focus on navigation safety. Meanwhile, with the development of international and domestic shipping industry and the progress of shipping technology, the requirements of navigation safety are increasing, and the establishment of safety early warning management system of ship navigation is imminent.

1.1 Study on early warning of transportation

In the 1960s, American scholars formally presented the early warning management on the basis of crisis management and risk management, and expanded it into each microscopic fields.

In the transport area, the early warning mainly focus on freeway disaster warning, aviation disaster warning, railroad disaster warning and water transport disaster warning and so on. In comparison, research on waterway transport sector are especially inadequate. Todor BAČKALIĆ*, Marinko MASLARIĆ (2012) indicated risks in water transport are perhaps an under researched area and proposed a structured framework for characterizing risk in inland water transport chains. Wang Chao, She Lian (2004) proposed the concept of water transportation disasters, and constructed the destructive mechanism of water transport disasters based on the four elements of human, ship, environment and management, and proposed the early warning management measures of water transportation disasters. Xu Kaijin (2005) used the theory of crisis management to explore and describe the basic contents of water safety early warning management. Wang Chao, Fan Hongye (2005) built maritime accidents safety early warning system combining the analysis of Yangtze River water traffic accidents.

1.2 Safety early warning management

The theoretical foundation of study on early warning management include system of non-optimal theory in the system theory, system control theory and safety science. The purpose of the safety early warning management is to relieve the system from “non-priority” as soon as possible, to make it into “good” condition, so that it can make an evaluation system in detail to reflect the system “of non-optimal” state, and through early warning management tools makes the system from “non-priority” status back to “good” condition, shorten the time of the system in “non-priority” states and reduce the probability of accidents. Safety early warning management mainly involves early warning analysis and pre-control measures. Scholars have basically reached the consensus on the content of safety warning management, mainly related to early warning analysis and pre-control measure.

Overall, the studies of early warning management have made abundant achievements, but the development in the transport sector is imperfect. In the field of water transport, the discussion on waterway safety early warning only conduct preliminary study from the angle of the channel depth, the interdisciplinary research of water traffic safety and early warning management is also in its infancy, and the systematic studies of theory and method of water safety early warning management are also lack of systematicness.

2 Principle of Safety Early Warning Management System of Ship Navigation

Principle of safety early warning management system of ship navigation applies safety warning management theory to the process of ship navigation. By building the evaluation index system for early warning can implement real-time monitoring, diagnosis and pre-control for various factors in the ship navigation process, and correctly determine safe state and unsafe condition, and prevent, deter and correct unsafe behavior in the system, so that the ship navigation is always in the safe and controllable state. As is shown in figure 1, the contents of safety early warning management system of ship navigation include early warning analysis and pre-control measures.

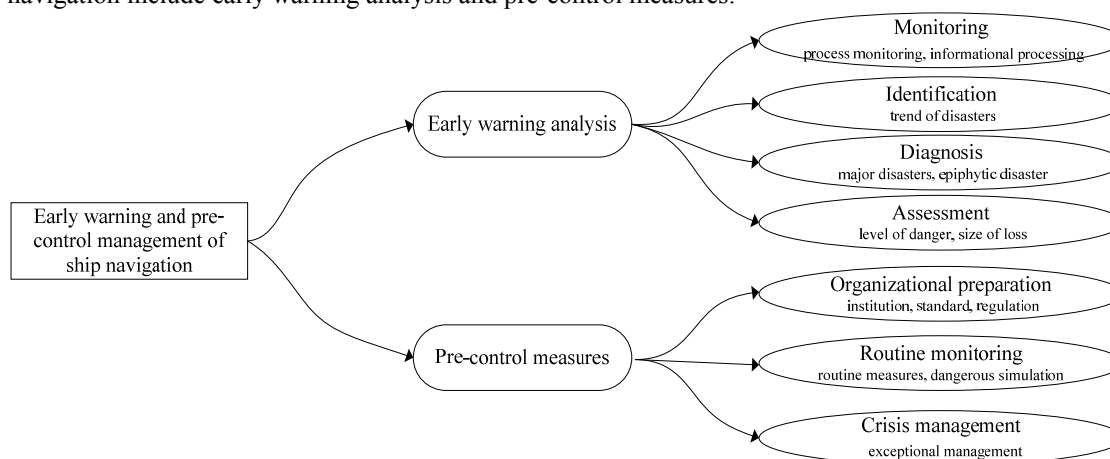

Figure 1 The Contents of Safety Early Warning Management System of Ship Navigation

2.1 Early warning analysis of ship navigation

The early warning analysis of safety early warning of ship navigation includes four states, referring to monitoring, identification, diagnosis and assessment.

(1) Monitoring

Monitoring is the basis of early warning activities of ship navigation, and the premise of the entire early warning system operation. The first step of implementing monitoring is to determine the monitoring objects, and the second is monitoring the whole process, and the third is processing the obtained information that may be stored in information archives.

(2) Identification

Through the comparison of the processed information and the evaluation index system for ship navigation safety warning identifies the factors that have impacts on ship navigation safety. Meanwhile, it is determined whether there will occur mutation and chain reaction in the management activities of ship navigation.

(3) Diagnosis

Diagnosis is a comprehensive analysis of the identified risk factors and identify major risk factors. It require in-depth analysis of risk factors, and find the reasons for its occurrence, to timely formulate corrective and preventive measures.

(4) Assessment

Assessment is to estimate the identified risk factors, confirm the danger rating and size of loss of hazardous occurrence. Accurate assessment is the basis of pre-control measures proposed and implemented.

2.2 Pre-control measures of ship navigation

The pre-control Measures of ship navigation safty warning include organizational preparation, routine monitoring, emergency management.

(1) Organizational preparation

Organizational preparation is the organizational support activities for conducting the safety warning activities of ship navigation, and its destination is to provide good environment for the early warning management activities. Organizational preparation includes regulations, institution and development and implementation of specific measures about early warning activities.

(2) Routine monitoring

The main task of routine monitoring is to track and monitor risk factors, including routine measures and dangerous simulation. Routine measures is the measures that deal to the safety problems in the ship

sailing process. And its aim is to restore the ship sailing to a normal state. Dangerous simulation is to assume and simulate the possible dangerous situations and propose appropriate measures.

(3) Crisis management

Crisis management is a particular emergency management that was conducted after the accidents. Its function is used to complete the crisis tasks beyond the control of routine monitoring. If ship navigation can back to the controllable state after emergency management, routine monitoring will continue to implement pre-control task.

3 Safety Early Warning Management System of Ship Navigation

The establishment of safety early warning management system of ship navigation, is based on existing technology of ship navigation and safety management system of ship navigation. As is shown in figure 2, safety early warning management system of ship navigation mainly includes the following aspects.

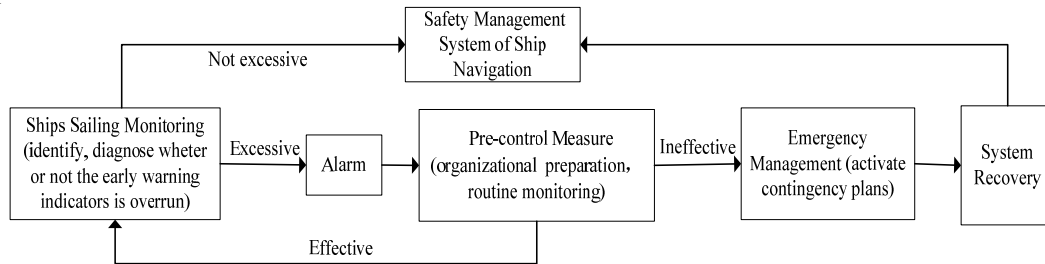

Figure 2 Safety Early Warning Management System of Ship Navigation

3.1 Acquiring ship navigation warning information

The accurate acquiring of ship sailing information is the basic premise of ship navigation safety warning. As is shown in figure 3, ship navigation system is a system composed of four areas "man - machine - environment - management"(Liu Wen yuan, 2010). Therefore, the entrance of acquiring relevant information about ship sailing is focused on the four aspects. The human factors are when people complete a specific task, their behaviors produce the adverse effects on the proper function or successful performance of this system. At this time, human factors are mainly emphasized crew factors, primarily involving the crew of professional skills, education level, physiological state. Environmental factors include three aspects, natural conditions, navigable waters, traffic conditions. Machine factors refer to the ship and equipment factors, including the ship's structure, ship's equipment, ship's performance and ship's age and other aspects. Management factors mainly involve ship management companies and maritime regulators that bear the responsibilities for safe navigation of ships' supervision. This mainly relates to the supervision of seaworthiness, safety inspection, the comprehension degree of the trade area of information, manning check and the monitoring tracking of maritime regulators.

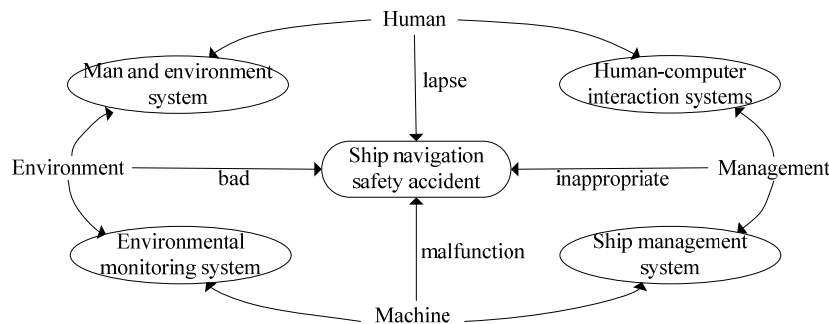

Figure 3 Ship Navigation Systems Made of Man—Machine—Environment—Management

3.2 Constructing the evaluation index system for early warning

The evaluation index system for safety early warning of ship navigation is the standards of these activities of monitoring, identification, diagnosis and evaluation. The construction of early warning indicator system is based on the four aspects of ship navigation systems, each indicator given different weights, as seen in table 1.

Table 1 The Evaluation Index System for Safety Early Warning of Ship Navigation

Primary index	Secondary index	Tertiary index
Human factor	professional skill	the rate of illegal operations, the number of turnovers ship safety inspection, the number of inappropriate emergency treatment
	education level	the proportion of college education
	Physiological status	continuous ship time
Machine factor	ship itself	the failure rate of the ship and equipment, maneuverability, vessel size, ship age
	ship management	the error rate of ship and equipment maintenance, the nonattainment rate of ship and equipment maintenance quality, the oversight rate of technical standards
Environment factor	natural Environment	the severity of weather during ship navigation, the mutational number of weather during ship navigation, the risk index of routes
	social environment	the rate of meteorological false alarm rate, the failure rate of maritime command device, the turnovers of navigation command
Management factor	ship management company	distortion of information communication, the frequency and intensity of inter-group conflict, the reasonableness of the organizational structure, the oversight rate of management standards, the inspection of the ship manning, the supervision of seaworthiness, the level of understanding of navigation area information
	maritime regulatory management	the technology of coverage

The construction of evaluation index system for safety early warning of ship navigation not only be able to achieve real-time monitoring of the security status of navigation itself, but also to achieve the monitoring of human and management factors that may lead to the safe navigation accidents. By the evaluation index system for early warning conducting single factor and comprehensive evaluation, we can get the security status of the ship navigation. Then according to the related information on the existence of hidden dangers in the process of ship sailing goes on governance or rectification, in order to achieve the prevention of ship safe navigation.

3.3 Taking effective pre - control measures

Pre-control measures are the management activities that correct and control the early signs of the major security crisis in the process of ship sailing. We can proceed ship navigation safety prevention and pre-control from the following.

(1) the establishment of ship navigation information management system. Establishing an information management system that government as the leader, and transport, maritime, port, ship inspection, ocean, VMS, border, news and other units as the participants. These units through the communication of needed information on ship sailing develop the early warning force, in order to build safe ship navigation.

(2) to strengthen the construction of training mechanism for ships sailing practitioners. With the worsening of navigation system's environment, ship navigation safety ask its employees to enhance their ability. Continually elevated training mechanism should be based on the different positions and quality requirements to go on focused training, and ultimately enhance the safety awareness of relevant staff.

(3) to strengthen the safety system of ship navigation. Ship management company and ship navigation safety regulators should establish close contact. The aim of monitoring the whole process of ship sailing by safety system is to handle navigation safety accidents in the first time. In order to ensure the effective operation of the security system, ship management authority may establish incident reporting system and ombudsman system, to ensure safe navigation of ships carried out.

3.4 Optimizing emergency rescue plans

Emergency rescue plan which aims to reduce accidents and reduce the impact of disasters, is an important part of the safety early warning management system of ship navigation. This requires ship management authorities to develop on-site rescue plans according to different situations, to establish the systematic level plans, to define the implementation path of action programs, as well as to periodically evaluate and improve plans. At the same time, the flexibility of rescue needed resources must be guaranteed. Moreover, we should pay attention to different levels and scope of practical exercises, definite each departments' and everyone's responsibility, to improve the real rescue capability and ensure the accidental scene rescue work quickly and efficiently.

3.5 Shortening recovery time

After the handling of ships sailing security accidents, what measures can be taken quickly and

effectively to restore ship navigation safety warning management system remains an important task. The length of the recovery time of the ship navigation system will become an important indicator that measures the resilience of safety early warning management system of ship navigation. In order to strengthen the anti-risk property of early warning system of ship navigation, this requires ship management authorities to summarize ship navigation safety incidents, and continue to make up for the defect of warning management system and the inadequate of early warning indicator system, to continuously improve the safety early warning management system of ship navigation.

4 Conclusion

This paper studies on the present constructional situation of the safety early warning of ship navigation, and constructs safety early warning management system of ship navigation based on the principle of early warning management system and ship navigation systems. The system can be summarized as five areas, the acquisition of ship navigation warning information, the construction of evaluation index system of early warning, the adoption of effective pre-control measures, the optimization of emergency management plans, the shortening of recovery time. It has some practical value. Given the imperfection of the current basic theories and methods of safety early warning management of ship navigation, the system still exists a lot of shortcomings, such as the evaluation index system of early warning management and the connection among the system's all sectors need to be further improved, further work to be done to improve the system in the future.

Abstract: Cost reduction efforts in the product system have not been supporting innovation. This contradiction becomes a great challenge for any type of industry in order to improve the competitive level and this was solved using the Theory of Inventive Problem Solving (TRIZ) that was integrated into the Design to Cost Innovation framework. This research focused on the application of TRIZ tools on reducing cost for patented parts. From the case study, the results show that the magnitude of cost improvement and innovation achieved is substantial. These change the limitation of mindset in cost reduction without compromise or trade-off, and open up new possibility of research for reducing cost in processes and services for various industries.

Key words: TRIZ; Automotive; Design to cost; Patent circumvention

1 Introduction

Competition in industry, particularly in automotive industries focuses critically on product cost and technology advancement. The biggest challenge is the contradiction to achieve a win-win situation for both the product manufacturer and the customer. The conventional approach to balance between the new technology for customer and the incurred cost from the manufacturer is known as “trade-off”. TRIZ methodology is proposed to bring higher value to the customer by eliminating trade-off or compromise. TRIZ methodology has been adopted in the automotive industry in various areas such as product design [1], product performance [2] and technology management [3]. However, every industry will always relate improvement activity with cost impact in business processes. In parallel, many companies recognize that a well-crafted patent portfolio may be used for a variety of objectives, including winning market position, protecting R&D efforts, generating revenue such as from licensing agreements [4]. Using Design-To-Cost (DTC) framework integrated with TRIZ [5], the industry could achieve higher improvement in driving cost down.

This research presents patent circumvention in DTC case study, applying TRIZ methodology to generate innovative solutions. The common four phases of the DTC program are ‘Prioritization Phase’, ‘Idea Generation Phase’, ‘Idea Evaluation Phase’ and ‘Implementation Phase’. Each of the DTC phase requires a systematic approach to ensure that innovation in the product design can be executed and simultaneously achieving cost reduction. An implementation framework (DTCI) where TRIZ methodology as a systematic innovation is integrated with DTC framework is adopted as shown in Fig.

2 An Example

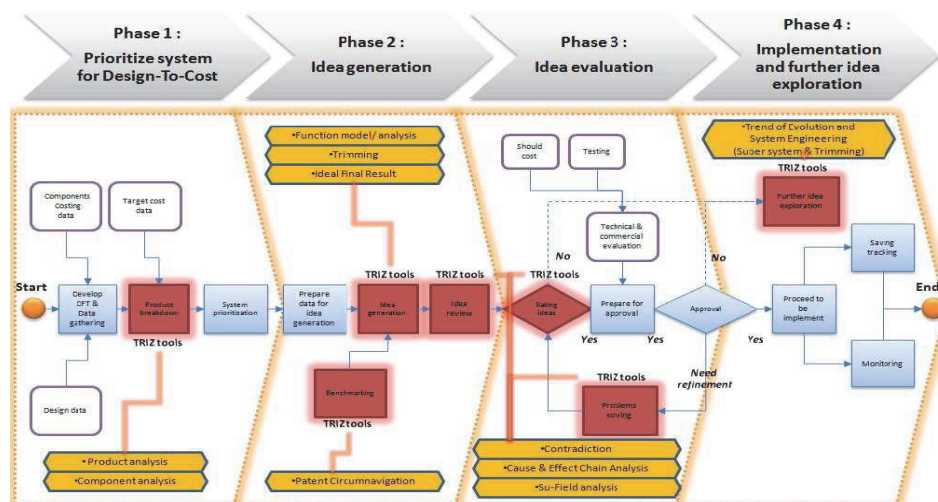

Figure 1 Design-To-Cost-Innovation (DTCI) Framework [5]

3 Case Project for the DTCI Framework Using TRIZ

The implementation of the proposed framework has been executed upon several breakthrough cases in the automotive industry. Previously, there was a research on complexity planning for automotive components through this framework^[6]. In this study, a case project that explored new tool from TRIZ known as ‘Patent Circumvention’ is presented. In the automotive industry, patent plays a critical role in securing new findings and discovery that bring high impact to product competitiveness^[7]. It aims to create an opportunity to develop own patent, alongside cost reduction on the benchmarked systems.

The case project in adopting the integrated framework DTCI was conducted in an automotive OEM. The company was selected because of their capability in conducting a full cycle product design process. The duration of the case study was around 3 months to be completed at the conceptual level, and further 6 to 12 months to actually implement the concept into the product for market. The cost improvement results were recorded after the case implementation was completed.

4 Patent Development with Cost Reduction Methodology

Patent triggers a new level of competitiveness, especially in the automotive industry. Innovative Benchmarking may open up a new possibility to create another innovation. This can be achieved using Patent Circumvention. There were several tools used that were based on TRIZ theory that opened up new possibility to bring innovation from the competitive patent without issues of infringement^[8]. This tool is used in creating several possible new patents to avoid any infringement issue. Within the patent circumvention process, there are trimming activities. Therefore, it gives opportunities for the patented system to reduce the numbers of components or change the function of the system radically^[9]. However, in the real situation, things may be more difficult when cost reduction is also a part of the target, which people normally compromises for the long-term goal. DTCI was used to explore this situation and to demonstrate how sound results can be achieved, and later a comparison was made to the normal patent development process.

A team that specialized in the automotive powertrain and transmission was selected and explored the patent on a cylinder deactivation system. The research target of this study is to develop new cylinder deactivation system.

4.1 What is cylinder deactivation system?

- 1) Deactivation of internal combustion activity in the specific cylinder.
- 2) Both valves are shut off after the combustion is completed (the piston at the lowest position).
- 3) Keep the exhaust gas trapped inside the cylinder.
- 4) The trapped gas works as air spring during the engine operation.

4.2 Technical contradiction in conventional engine:

If more cylinders are active, then engine power increase, but fuel consumption and CO₂ emission also increase.

4.3 The Physical contradictions:

4.3.1 Solution of physical contradiction

1) High load and variable speed: cylinder activates – engine power increases, fuel consumption increases.

2) Low load and constant speed: cylinder deactivates – engine efficiency increases, fuel consumption reduces.

4.3.2 Separation in Time: cylinder deactivation engine

Cylinder deactivation of the engine is controlled at each power demand conditions. Several mechanisms of cylinder deactivation system are as follows;

- 1) Cam shaft mechanism (solenoid locked rocker arm)
- 2) Pushed rod mechanism (solenoid locked pushed rod)
- 3) Valve collapsed mechanism
- 4) Cam shifted / slide mechanism
- 5) Piston deactivation mechanism

Three steps are recommended for executing this task. The first step was to identify the problem that was within the system itself. The Cylinder Deactivation Engine System considered as a contradiction “separation in time”. Through benchmarking, the potential patents of cylinder deactivation engine systems by several companies were selected to further analysis. Using the Independent claims from the

patent, a function model was created in order to visualize the components and their function in the system.

The second step was the problem solving process. With the establishment of function model based on independent claims, the “Trimming” process was required to take out potential components and managed the function within the system. The trimming rules were used to help manage the functions after the selected components were discarded from the system. Furthermore, the effect from trimming process gave secondary problem that might affect the performance of the system. Several TRIZ tools were used, including a few Inventive Principles, to solve the problem.

The third step was the “concept substantiation” process. With the achievement of solving contradiction and having fewer components compared to the previous system, this new proposed system is ready for patent filing process. It also includes the prototyping process that was needed to develop and validate the new system and its performance. Figure 2 showed the process flow for this assignment.

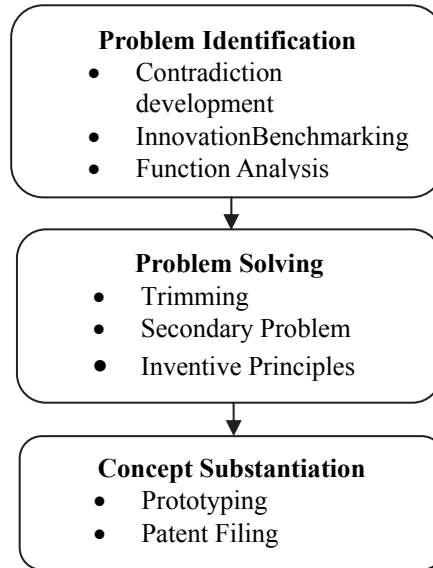

Figure 2 Guidelines for Patent Circumvention on Developing Engine System.

Four types on patents related to cylinder deactivation system were benchmarked by the team, which included patents filed by Bentley, Audi (cylinder on demand), Bosch and Volkswagen. The activity requires a strong teamwork between the group of designers and the group from the legal unit, from the very beginning of the project.

Using the detail description provide by the patent selected, the DTC-TRIZ team starts to develop function model for analysis.

Function analysis is an analytical tool that identifies functions, their characteristics, and the cost of system and ‘supersystem’ components. Function analysis is significantly more powerful than a component focused approach. It opens many innovation possibilities by developing a function model of the system. This leads to multiple design options that significantly increase the ability to improve the system.

4.4 Results and Discussions

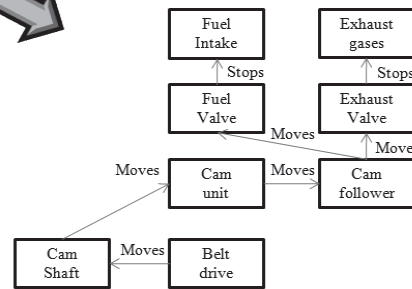

Based on the mechanism of the selected system, the patent circumvention process used was trimming, and the secondary problem was solved using Technical Contradiction. Figure 3 shows the process of TRIZ application for patent circumvention.

• Function analysis current system

*Trimmed double actuator, pin, switching gate, splint cam unit, valve lift system.

• Function analysis new system

*Cylinder head is taken out from the function analysis because there is no direct function provide to the system.

Figure 3 Trimming Process on the Current Patented Engine

Trimming is based on improving a system by reducing the number of components and simplifying the system. Eliminating components, thereby reducing costs and preserving or improving overall functionality increases system value. Trimming offers multiple options for eliminating the same component. These options represent a spectrum of possible innovations - from incremental to more radical and fundamental design.

Figure 4 Deactivation Mechanism Developed

Using the feasible concept generated, a new system of cylinder deactivation was developed as shown in Figure 4. However, the concepts need to be further refined in terms of technical ground and

also legal perspective. This creates a patentable solution that is different from others competing patents.

The result from the case project shows that the application of TRIZ methodology in the DTC generates a significant impact towards cost reduction (in the region of RM 18 million) in the automotive engine components together enhances the innovation level of the existing system [10]. TRIZ methods change the thinking process to extract more innovative ideas and expand new inventions that produce a significant impact on cost reduction. In the same financial year (2011/2012), the OEM company demonstrates significant results in cost reduction performance. Continually adopting the proposed framework further cost reduction achieved in the following financial year.

5 Conclusion

The case project explains the central importance of the DTCI framework that adopted TRIZ to enhance the result of cost improvement through innovation. The present study was designed to determine the effect of adopting TRIZ in cost strategy and compared to any existing available method. One of the more significant findings that emerge from this study is that contradiction in reducing cost at the product design level can be solved using the DTCI. The result of this research supports the idea that the cost reduction achievement can be better enhanced using the TRIZ method^[10]. The findings of this study have a number of important implications for future practice beyond product design, for example, process design or service design in cost reduction initiatives.

Policy Value Chain of Making Regulation in ICH S7B/E14*

Yuko Hayashi¹, Kano Shingo²

1 Graduate School of Innovation and Technology Management, Yamaguchi University, Yamaguchi, Japan, 755-8611

2 Graduate School of Frontier Sciences, University of Tokyo, Chiba, Tokyo, Japan, 277-8564
(E-mail: hayashiy@yamaguchi-u.ac.jp, kano@k.u-tokyo.ac.jp)

Abstract: This paper explores rule making process in ICH S7B and E14 by boundary organization (BO) framework to find essential factors for making rules between regulators(regulatory agency) and innovators(scientists and engineers). There is few research analyzing a rule making process from boundary organization point of view which mediate different communities. The research shows ILSI Health and Environmental Science Institute(HESI) from US and QT Interval Prolongation: Project for Database Construction Team (QT PRODACT) from Japan worked as boundary organization and played important role in making regulations but there are some difference in works between two. Important factors are specialty and continuity of BO. Specialty helps providing scientific data to endorse possibility of technology and making a strategic decision. Continuity cultivates network and reliability among stake holders.

Key words: Innovation; Regulation; Boundary organization; Policy value chain

1 Introduction

A market of new pharmaceuticals and medical devices cover whole world. Especially, in order to spread them in OECD countries, rules should be revised to have enough safety and effectiveness or new guidelines should be drafted as quickly as possible under an international harmonization. Taking initiative in the making of the international rule affects application of technologies, development of products, and creation of new markets. This paper explores the case study of International Conference for Harmonization (ICH) among Japan, the US, and EU related to ICH S7B, the Non-clinical Pharmaceuticals, and ICH E14, the Clinical Evaluation of QT/QTc Interval Prolongation and Proarrhythmic Potential for Non-Antiarrhythmic Drugs using the analytical frame work of boundary organization.

2 Precedence Research and Methods

2.1 Objectives

The international market of pharmaceutical products and the medical equipment is large. However, in the international rule composition, Japan seldom takes initiative and tend to adapt the guidelines that have been approved by Europe and the U.S. The Japan's trade deficit of the pharmaceutical products is approximately 19,640 million dollar in 2012, and imported from EU countries most followed the US. Since Pharmaceutical and Medical Device Act (PMD Act) to support the development of a new medicine and the new medical technology was enacted in November 2014, development environment of pharmaceuticals and medical devices have been improved. The strategic and quick global rule formation is essential to create a new market for an emerging new products. Therefore, this study examines initiative of the international rule composition using the boundary organization framework.

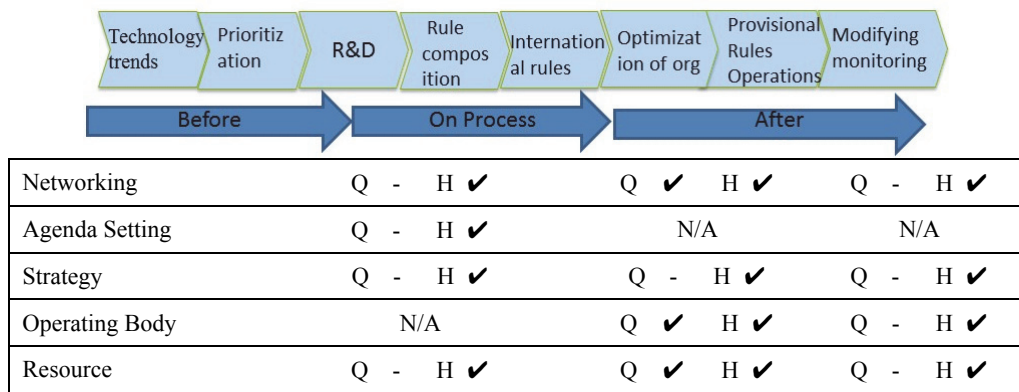

2.2 Analysis method - policy value chain and boundary organization

We have proposed policy value chain (PVC) with eight phases in a rule composition process of medical field^[1]. A rule making proceeds through these eight phases, "prediction of technology trends", "prioritization and recognition of issues on rule", "research and development for the rule", "rule composition", "international rules setting", "optimization of organization for operating rules", "provisional rules operations" and "modify monitoring of rules operating condition". It proceeds sequentially, sometimes non sequentially and sometimes occurs simultaneously. Furthermore, we divided eight phases into three parts "before", "on process", "after" like the "PDCA cycle". "On process" means that rule making is on process. The stage of "before" is preparing and planning for "On process". The stage of "after" is checking and correcting stage. The result of checking and correcting causes a revision of an existing rule or a new rule making.

* This research is funded by RISTEX of JST "Scenario planning for making regulatory policies and technological standards in advanced medicine".

We use boundary organization framework to observe the PVC of rule composition. When a new technology or concept comes out, boundary organization is formed around/between different organizations and communities to mediate them. A boundary organization is the organization which takes responsibility for both different communities and mediate them. It has a role to stabilize relations of organizations/communities by absorbing temporary works and ambiguous jobs^{[2][3][4]}. We found important functions of a boundary organization to mediate different communities and adapted the functions to rule making process. Main functions are these five; Networking, Setting Agenda, Organizing a operating body, Securing research resources, and Setting strategy. In addition, a boundary organization is categorized two types, One of which is a multitask organization and the other is a single task organization. Multitask ones, such as Science councils and think tanks, are conducting several researches on various fields while single task ones, such as working groups for certain issue, are doing a research on very restricted field. We explore works of boundary organization in each stage of PVC and try to find missing functions. In the United States, ILSI HESI mediated as a boundary organization. HESI was established in 1983 aiming at identifying and solving health and environmental issues to link researchers and scientists in academia, government, industry, other research institutes and NGOs^[5]. In Japan, QT PRODACT project team of JPMA constituted a member of EWG and worked as a boundary organization (BO). So, both of BOs in Japan and the US will be compared to be found mediate functions in a process of the making S7B/E14.

3 Result of Case Study on ICH

*HESI: H QT PRODACT: Q

Figure 1 Result of Analyzing PVC

3.1 Before

In the late 1980s, fatal arrhythmia caused by QT interval prolongation with the drug except antiarrhythmic such as terfenadine became the problem after marketing. It was revealed that the drug which caused QT interval prolongation controlled the rapidly activating delayed rectifier potassium current, IKr, and it became the urgent business to establish an evaluation method about QT interval prolongation^[6].

Japanese researchers made a presentation on this risk in Japan Pharmacological Society in 1996, but, in Japan, the arrhythmia caused by pharmaceuticals was not recognized as a critical issue.

On the other hand, in 1997, Committee for Proprietary Medical Products (CPMP) of the European Agency for the Evaluation of Medicinal Products (EMA), located in London, indicated these problems on non-clinical and clinical trials as Points to Consider^[7]. ICH S7A, Safety Pharmacology Studies for Human Pharmaceuticals, was agreed in November 2000^[8], but the details were entrusted to S7B, because there was not an international unification standard on methodology about the evaluations of electrocardiogram data and others. HESI establishes a task force to investigate QT interval prolongation by scientific evidences. Scientists in HESI put the high priority on safety of cardiovascular, so HESI organized a working group on cardiovascular safety committee and convene the first working group among industries, academics and government to establish a scientific method and collect data for safety. This WG made it possible to share information of difference of the data on plasticity and stability of the hERG assay in each laboratory^[9]. S7B started to be discussed in STEP1 in May 2001, and E14 in February 2003.

3.2 On Process

In August 2001, a committee meeting was held in the ILSI headquarters of Washington D. C. In the latter half of 2001, HESI started a experiment program of the non-clinical model about the potential possibility of QT interval prolongation.

Japan, the United States and EU formed Expert Working Group (EWG). From Japan, Medical Devices Agency (PMDA) and Japan Pharmaceutical Manufacturers Association (JPMA), and NIH joined the EWG. In 2001, QT PRODACT project team was established among JPMA and more than 60 companies joined and 18 companies joined from JACL. There was no support from government, so that companies supported fund and personnel.

Data collected systematically for rule making by HESI ,QT PRODACT, FDA and Georgetown university and the collected data was provided with ICH ^[1]. These data endorsed the importance of preclinical researches which were related to clinical researches so that a joint meeting with S7B and E14 was held for integrating both data in 2003. In May 2005, Japan, EU and the US signed an agreed document on S7B and E14^[10]. Although participated in ICH, Japan decided to introduce E14 and S7B when the compulsion right was exercised in October 2009. Japan introduced them as domestic rules in November 2010, five years later than EU and the US.

3.3 After

In 2008, after integrating various cardiac committees, HESI establish multifocal cardiac safety technical committee with 21 companies and 23 academic and government institutes of US, EU and Asia from various cross sectional fields including clinical medicine, pathology, imaging, safe pharmacology, physiology, toxicology and bioinformatics. HESI established a joint think tank on the troponin as a translational biomarker in 2008 and introduced HESI/FDA combination database in 2009. The committee provided workshops, many scientific publications, presentation, and meetings. 257 compounds were reviewed and 150 was included in a database of HESI/ FDA^[9]. The Committee discussed safety of new technologies considering the possibility that new technologies such as in-silico and pluripotent stem cells might be introduced to a preclinical researches and clinical researches.

The workshop of pluripotent stem cells was formed in HESI in 2013, and as technological possibility has increased, a revision plan of S7B in 2015 and an abolition plan of E14 in 2016 were proposed by the CSRC-HESI-FDA Meeting in July, 2013. This critical change was proposed just three years after Japan was accepted E14/S7B as a domestic regulation.

In Japan, QT PRODACT team was dissolved after S7B and E14 finished and did not join the stage of “After”.

4 Conclusions and Implications

Both HESI and QT PRODACT worked as boundary organization, but there are some different features between two. Through the observation, two factors are very important; Specialty and Continuity of BO.

Specialty: As HESI’s work suggested, specialty of BO helped providing scientific data to endorse possibility of technology and making a strategic decision. HESI secured specialty by networking specialists in industry, academia and government. Data HESI provided help making rules endorsed by scientific evidence in ICH.

Continuity: HESI is a multitask organization and work continuously to intermediate industries and government. HESI could joined the very beginning “before” stage through “after” stage and could help strategic decision making. Continuity cultivates network and reliability among stake holders including regulators and enable to make it easier to secure research resources and organize operating body. As QT PRODACT was temporally formed, it joined only “on process” stage and in “before” and “after” stages, there was no boundary organization to mediate regulators(regulatory agency) and innovators(scientists and engineers).

The Application of Stag Hunt Game to Business Cooperation of Industrial Complexes in Japan

Kazuya Inaba

Graduate School of Innovation & Technology Management, Yamaguchi University, Japan

(E-mail: inaba@yamaguchi-u.ac.jp)

Abstract: In my proceeding, I analyze the application of “Stag hunt game” to business cooperation of industrial complexes in Japan, and declare the meaning of the framework. Stag hunt game is one of models in game approach and was named by a topic of “Discours sur l'origine et les fondements de l'inégalité parmi les hommes”, written by Jean-Jacques Rousseau. The framework of this game approach clarifies the case that persons do not collaborate when cooperative works are clearly advantageous. This model's application is based on historical examples of business cooperation in Japanese petrochemical complexes. Furthermore, I practically replace this model with more realistic one with regard to differences of big or small extent of their scale and profits. And I exhibit a model of stag hunt game added the balance of transfer gains. Then I explain that a third party organization coordinate both interests to establish business cooperation in industrial complex. The third party is in a neutral position and make arguments and adjustments as a mediator. And it proposes a compromised transfer gain after serious consideration of their gains of business cooperation.

Key words: Industrial complex; Oil and petrochemical industry; Group operation; Business cooperation; Game approach; Stag hunt game

1 Introduction

I will utilize the framework of "Stag hunt game" to explain business cooperation of companies with different capital¹. Stag hunt game is one of models in game approach and was named on the basis of the story that early human being was distracted by the prospect of immediate gain, which was explained in "Discours sur l'origine et les fondements de l'inégalité parmi les hommes", written by Jean-Jacques Rousseau.

There are two hunters (A, B) at first. Each hunter can choose either in two. The one is "to catch a stag in cooperation with each other (gain of 2 points)". The other is "to catch a rabbit alone (gain of 1 point)". However, they cannot catch a stag only in one. If they independently try to capture a stag, his gain becomes 0 point. These are stories of the game.

In this game, hunter A and B will choose which one in two in this game: (a rabbit, a rabbit) is (1, 1), or (a stag, a stag) is (2, 2). This result is Nash equilibrium.

When the one hunter is more likely to choose a stag, the other hunter may choose a stag, too. Two hunters want to aim at a stag. However, it doesn't necessarily happen. His gain of the one becomes 0 point if the other chooses a rabbit. Then, two hunters will choose a rabbit safely because they strongly want to avert a risk². The framework of this game approach clarifies the case that persons do not collaborate though cooperative works are clearly advantageous.

Table 1 The Basic Framework of Stag Hunt Game

		B	
		a rabbit	a stag
A	a rabbit	1, 1	1, 0
	a stag	0, 1	2, 2

2 Application of Stag Hunt Game to Business Cooperation of Petrochemical Complexes

I can apply framework of stag hunt game to business cooperation with some companies of different

¹ The application of “Stag hunt game” to business cooperation is an idea of Nguyen H. Phuc and Y. Matsuura (Yamaguchi university). See Nguyen H. P., Y. Matsuura, M. Kubo, “Efficient Exploitation Of Waste Heat: Coordination Management for a Waste Heat Utilization Project from Economic Perspectives”; IAEE 2009 PROCEEDINGS, refereed, page: 420, Austria, 2009.

² On the premise of this framework, it is important to design the case of aiming a stag together to promote business cooperation.

capitals in petrochemical complexes. On the premise, company A and B can get gains more than conventional operations when they cooperate each other and execute group operations. But company A or B get a conventional gain when they do not have a collaborative relationship and continue independent business operations. Suppose that company A or B take an action alone for business cooperation and one company does not perform any cooperation. Then the one gets a conventional gain, and the other who took a cooperative action loses a gain.

We can apply the previous framework of stag hunt game to logic of business cooperation. For example, there is the case that both companies are going to replace independent and old electric power generation plants with the latest facilities. When the efficiency of generation is proportional to the scale of generator, it is clearly more effective for them to purchase joint facilities than to rearrange it alone. However, they often invest in independent plants in practice¹.

In following table 2, I replace this case with more realistic model with regard to differences of big or small extent of their scale and profits.

Table 2 The More Realistic Stag Hunt Game in Business Cooperation

		B	
		independent business	business cooperation
A	independent business	3, 2	3, 0
	business cooperation	0, 2	8, 3

I suppose that company A and company B have any differences of their gains when they conventionally operate businesses alone in industrial complexes. And their gains are not equal, even if both companies collaborate group operations. In the case of independent business, (company A, company B) is (3, 2). In the case of business cooperation, (company A, company B) is (8, 3). When company A or company B aims at business cooperation alone and the other company continues conventional independent business, the company, which adopts business cooperation without cooperation of the partner, gets gain of 0 point.

I expect the result of game approach of this case. When business cooperation is carried out, company A largely gets more gains than those of independent business. It is desirable for him to implement business cooperation with company B. But company B doesn't increase gains of independent business so much in this case. He worries about uncertainty of partner's cooperation and the cost of investment. And company B does not positively have a motive to push forward business cooperation. It is less likely for company A to obtain business cooperation, unless company B adopt group operation. If company A execute it alone, he will lose all the gains. Therefore, company A will hesitate to advance to group operation. As a result, company A and company B get conventional gains and continue to implement their businesses alone. After all, business cooperation is not performed and ordinary activities are still continued. Nothing happens in this situation. They will keep preservation of the status quo.

But there is a method to change the situation. A historical resolution is observed in Japanese petrochemical complexes. In this case, a third party organization, which coordinate interests between company A and B, is necessary to establish business cooperation in industrial complex. It is in a neutral position and make arguments and adjustments as a mediator. The third party calculate and propose a compromised transfer gain after serious consideration of their gains of business cooperation. I show an example of stag hunt game added the balance of transfer gain on next table 3.

Table 3 The Adjusted Stag Hunt Game in Business Cooperation

		B	
		independent business	business cooperation
A	independent business	3, 2	3, 0
	business cooperation	0, 2	8-1, 3+1

I suppose that company B won't advance cooperation positively. This is why he worry about big risks such as heavy investment, noncooperation and small increase of gains after group operation. In this situation, introducing a system of a third-party organization to adjust interests is effective for them. They

¹ This decision is a selection of intermediate organization between market transaction and internal market. The form has been analyzed by transactions cost economies. We can examine it totally to adopt the framework of stag hunt game.

may justify the means economically in order to promote business cooperation. The third-party is likely to integrate the whole gains and transfer suitable gains to implement cooperative activities. Then, it have to increase gains of company B from those of company A by negotiation. In this example, it subtract 1 point from 8 of gains of company A and add 1 point to 3 of gains of company B.

3 Conclusion

I point out an example of business cooperation in compromised interests. However, the result of 7 points and 4 points in this case is one of adjustments. Neither big nor small number of gains is so meaningful to business cooperation. Cases of petrochemical complexes in Japan prove that it is important for business partners to establish a relationship of trust. If differences between conventional gains in dependent business and total gains in cooperation business are so small, historical examples demonstrate that a third-party organization play more tremendous role. It is more essential to calculate accurate transfer gains to promote business cooperation than quantity of profits.

Assessment of Services in Higher Education Courses in Brazil

Alexandre Luzzi Las Casas, Arnaldo de Hoyos Guevara
Pontifical Catholic University of Sao Paulo, Brazil
(E-mail: alascasas@terra.com.br, arnoldodehoyos@yahoo.com.br)

Abstract: The need to assess quality of services in the area of education has been increasing not only because of the need for continuous improvement, but also because of more competition and a relative market saturation; moreover, due to huge proliferation of graduate *latus sensu* courses in general; hence it's becoming clear the need for more research to improve ways to assess the quality of these courses in order to find out to what extent possible targets of improvement have being met. One important reason for this kind of research is that the time students of these different courses spend is relatively short in relation to normal *strictus sensu* graduate courses; so there is a need to measure the benefits of such programs to see to what extent they are actually suitable. This work actually represents an additional contribution to research related to quality of service evaluation, analyzing the relationships between expectations and perceptions of students and their profiles; and may serve as guide in terms of a strategic plan for the improvement of educational services. Results show some of the benefits for the students, and indicate that multivariate statistical tools may be useful for achieving the proposed objectives, even though may have certain limitations.

Key words: Higher education; Quality of services; Assessment

1 Introduction

Brazilian higher education courses have shown an increasing demand in recent years. Higher education recorded 6,4 million of enrollments in 2009, almost the triple of those 2,3 million recorded ten years ago. (LEITE, 2011). It is estimated that in the last ten years the number of graduating students has tripled in the country. There are several programs in the Brazilian market and with the increase on the demand at the undergraduate level is leading to a natural increase on all kinds of graduate courses, as students look for deeper knowledge and professional improvement on specific fields : "The data on Brazilian graduate courses indicate that all areas of knowledge show significant growth over the years with some oscillations and that the trend is clearly positive." (PNPG, 2010).

Due to the proliferation of graduate courses by different institutions, there is a need for assessing the quality of these courses to verify whether improvement goals are being achieved since: "*There is low frequency to the courses, low learning assessment and low quality of education.*" (NISKIER, 1997, apud CANOPF et al, 2005).

The Brazilian Education Federal Council 977/65 report mentions two types of graduate courses: *latus sensu* and *stricto sensu*. The first ones are about graduate courses focused on technical training and professional development, directed to those that search update and practical knowledge for their activities; whereas *stricto sensu* are also graduate courses focused on graduating professors and researchers (Masters and PhD's).

Typically courses to graduate professors and researchers have demanded strict control, they are regulated by very specific legislation, whereas *lato sensu* courses lack guidance and direction for managing or development. The University Reform Law number 5540/68 has provided an improvement in terms of broadening the possibilities of offers of differentiated courses, as the case of the Top of the Market EAESP/FGV that segmented graduate students and developed an alternate program specifically focused on the student who works for companies. (BANDEIRA et. al. 1998; OLIVEIRA, 1996).

Because of the strict control that extended over undergraduate courses, in the nineties Brazil went through several types of assessments. The Brazilian University Institutional Assessment (PAIUB) assessed qualitative and quantitative experiences on the institutions. In 1995 it was implemented the Brazilian exam of courses with institutional and offer assessments. Undergraduate education and training also went through several assessment processes among which CAPES has been in place for over 30 years.

Especially for that reason and by the strong influence and pressure over educational institutions, some researchers have studied the institution in terms of the assessment process. One of the topics of interest is related to opinions of those professionals involved in the process and one of these studies showed a trend to identify the opinion of the faculty over the assessment practiced by Central Educational Agency CAPES at Brazilian universities. It was concluded that the institution's assessment

criteria was considered as higher quality by those interviewed, however three principles would be necessary to improve results: veracity, coherence and justice. The latter one was recommended due to risks in relation to the assessed programs.

Other studies aimed at collecting the opinion of program coordinators, and one of them was conducted by Targino (1999). A different and more broaden study tried to check both the opinion of consultants from MEC (Brazilian Education Ministry) and program coordinators who underwent the assessment process. In that case, it was recommended that the institution should have a more friendly and lighter criteria resulting into a more open and participative CAPES (SPAGNOLO; SOUZA, 2004). In the study, however, the authors did not clarify what more friendly and lighter criteria should be enhanced.

Horta and Moraes study (2006) also considered the opinion of program coordinators from graduate courses on the assessment criteria. Some of them criticized the process's quantitative assessment as well as the length of the course, the number of scientific articles produced etc. The suggestion was that the institution should be more concerned about qualitatively assessing the course and its results. Several coordinators show difficulties in dealing with the strict criteria to which they are submitted. The authors inquired if those involved in the assessment process had heard the opinions of professors and program coordinators as a critique to their one sided acting. By reviewing the data from the assessment of the graduate courses it was noticed a concerning about the re-assessment of the criteria to which the institutions are submitted, and the recommendation is that other evaluators are included in the process both professors and students, similarly to what is made in the undergraduate courses.

In this line of research but extending the context, some researchers attempted to assess the impact these courses may have over the society. One study from education has historically assessed the actions from CAPES, and all the adjustments the institution has made to reach the current book assessment process within the criteria of scientific production. One of the conclusions that the authors reached was that social impact of programs is not being contemplated in the assessment criteria from CAPES. Considering a strong trend to use quantitative methods to assess the scientific production, the suggestion made was the use of both criteria, subjective and quantitative for a more appropriate assessment (HORTA; MORAES, 2005).

As Villardi and Vergara (2011) have observed in the *stricto sensu* graduate course, it is expected that within 24 months master's degree students have developed the capability of research and abstraction of studied concepts, however the complexity of the learning process does not seem to have been considered in the teaching methods or research and not even by pedagogical projects that are based on positivist epistemology that traditionally guide Business master's degree courses.

Whereas there are studies focusing *stricto sensu* graduate programs, a large amount of scientific publications have dealt with assessment of programs for *latu sensu* graduate courses. One of these studies seek to assess the effects of the business administration course at MBA level on the alumni from the Accounting and Actuarial Science schools mainly regarding to competences acquired and professional improvement in their career. In this case it was observed that 58% of the interviewed alumni from the program demonstrated progress in their career and approximately 70% provided a positive assessment on the impacts from the course on their career. These data helped to notice that the institution obtained positive results however other results in the same study also showed that there is room for improvement towards the learning of these professionals that are more concerned with the job market. Similar research by several other authors have studied professors and students at this level of education (FREZATTI ; KASSAI, 2003).

Regarding graduation from higher education, Godoy, Santos and Moura observed that the studies over quality assessment are fundamentally centered on incoming and outcome data from the system (GODOY et al. 2001). Regarding incoming data there are usually analyses on the social economical profile of inbound students whereas the outcome data refer to the verification of success of the process education/learning mainly concerning the acquisition and application of knowledge and basic skills of those graduating from the course. In the assessment data for higher education courses both incoming and outcome data have been the focus of academic studies.

In addition a review of some of these studies basically replicated the methodologies that demonstrated to be adequate on a specific research. It is believed that this is a very positive way of assessing as it allows validating the method and testing on several situations providing it with more credibility and opportunities to make it deeper.

In Syntheses we notice that higher education assessments, both for undergraduate and graduate, shows a trend to students opinions in the process, as well as the use of qualitative assessments and not

only quantitative as observed in some cases, besides the concern on analyzing the social impact and knowledge transfer for the job market.

Moreover several criteria may be used by institutions to assess their programs allowing more freedom for marketing actions and students' preparation. The interest in graduate courses at the level of specialization also resulted into a great proliferation of offers all around the country. Besides, the participation of researchers as professors in such courses also pointed out certain needs because of the observation method used in these interactions. In addition including the point of view the customers of an institution and other stakeholders may help to prepare more suitable strategies for educational marketing, and the method to be presented in this paper may be used as a tool so that these institutions are able to improve their results.

The purpose of this work is then the developing and application of an statistical assessment method for a higher education graduate course. The questions that guided this research were: How a methodology addressing the identified pre-requisites may be applied to *Latu Sensu* graduate courses, and what relevant information may be obtained as signs of contributions of a graduate course? The choice was the replication and adaptation of a pilot study because of the benefits mentioned before, and for the additional reasons that the criteria used addresses the requirements pointed in the studies in the references, such as the participation of students and other extra-class evaluators as for example, as well as the social impact of their activities. Initially, a theoretical development was performed around the theme and then the students' responses were analyzed from a certain institution and finally we presented the educational conclusions.

2 Theoretical and Methodological Aspects

2.1 Educational service assessment: a marketing vision

In a Marketing study performed by Shostack, in 1977, products which were predominantly tangible were plotted on the top of the scale and those products which were predominantly intangible were placed at the bottom. Shostack then observed the more the services were away from goods, more differentiated would be the marketing of such commercial offers. In this *continuum*, educational services were placed in the extreme end and considered professional services in which predominantly intangible offers were traded. In this case, the efforts of making offers tangible and evident have become a fundamental guidance for the trading of these types of services. As a consequence, the quality and the image turned into major aspects for the building up of values for customers of a certain target-public (CRONIN; TAYLOR, 1994).

As observed by Aaker, in the last decade a significant progress was made to measure degree of satisfaction, partly because of pressure from the total quality movement. This trend led to the development of several dimensions of satisfaction which differ among goods and services and from industry to industry (AAKER, 1996).

Many studies now adapted to Brazilian reality also supplied important contributions. One author checked the application of a simplified scale that produced good results in the assessment of bars and restaurants with the possibility of being extended to other sectors. In the proposed methodology, the assessment of the perception and expectation is considered before the interaction with the supplier what eliminates the bias of later responses. In addition, the assessment form is built from a specific customer need, and due to its simplicity it is very easy to adapt. In the longitudinal study it was verified that the tool serves as thermometer (indicator) of the assessment rates (LAS CASAS, 2008).

Several other authors have proposed assessment methodologies for the quality of services (PARASURAMAN et al, 1988; BROWN et al., 1993). In general, a customer measure of satisfaction may be done through direct and indirect methods (BATESON; HOFFMAN, 2001). An institution uses indirect measures when assessing the rate of satisfaction through monitoring of data from sales, profits and customer complaints. On the other hand, the direct measures of data collecting are not standardized among evaluators. Bateson e Hoffman (2001) observed that the scales used to collect data may vary in different aspects, such as questions made to the respondents, the method to collect data vary from personal interviews to data collection without the interference of third parties. According to these authors, the information system about satisfaction may be determined as a current process of research which supplies data to make decisions. The guidance is that an information system should be used along with other measures of satisfaction at different times to assess the overall performance of an institution. Such concerning has spread to different parts of the service sector, and education is one of them. Viegas e Titanegro (2008) commented that at education institutions the standard of quality of services should be

assessed from several factors such as market, institution, challenges and customers.

Some authors state that the identification of the most important attributes for the perception of quality may start up and push processes that focus on the improvement (LOURENÇO; KNOP, 2011).

Lourenço and Knop (2011) assessed the perception of quality in higher education courses of Business Administration applying the scale of SERVQUAL. As a conclusion the authors recognized some limitations in the scale and proposed that the empiric effort should be improved by new researches that inquire the relevancy of the proposed variables as per the dimension of the scale.

Educational services have been assessed in a broadly manner as well as their impact varied on institutions, pedagogical projects faculty and alumni. The need of assessing the customer/students has led the assessments in the educational sector to further developments. (BANDEIRA et al., 1998; MAINARDES, DOMINGUES, 2009; FIEBIG, 2006).

2.2 Assessment of lato sensu graduate courses

The growth in the demand for graduate courses had several causes. One of them that favored the demand for lato sensu graduate courses in Brazil was the failure of undergraduate education to follow social changes and the requirements for professional qualification of for an up-graded job market and technological advances. (BANDEIRA et al., 1998).

Oliveira (1996) apud BANDEIRA et al. (1998) state that the role of graduate courses is fundamental in the context of changes, and its role should grow even more due to the requirements from companies for these courses with a modern professional background.

Graduate courses have a minimum length of 360 hours and should be offered to students who completed their undergraduate courses and their extra-class studies should not be included as well as the time needed to prepare their background paper. They usually have a specific proposal that is technical-professional and do not cover the whole field of knowledge in which it is inserted. The operational procedures that rule the course assessments, programs and individual performance of Higher Education Institutions (IES) are set by Brazilian Decrees number 2406/97, 3860/01, 302/98, 972/97 and 2297/98 (SOARES 2002, p. 49).

Several operational changes took place at this level of courses and most recently, the resolution dated June 8 2007 re-states that such courses offered by the accredited institutions are not dependent on prior authorization when offered by accredited institutions. The second article of the referred standard sets that at the moment of renewal of the accreditation the institution will be subject to the assessment performed by proper and competent bodies (MINISTÉRIO DA EDUCAÇÃO, 2007).

Higher education courses may have different parameters for assessment such as analysis, appreciation, diagnosis, control, among others. The assessment functionality allows us to improve the methods and techniques or even the material used by the professor as well as ensuring students are properly assessed, in order to contribute with the growth of the learning process. Similarly, upon assessment results, institutions may improve their practice of educational marketing, addressing the needs of customers and others involved in providing the service. However, for the assessment process to be effective it should emphasize not only the final result but also the process as a whole in order to reach the target. (OLIVEIRA; SANTOS 2005).

Not only the assessment process is important for the practice of marketing, but it is also important for an adequate service and so this is the main focus of this study. Taking into account the assessment of graduate courses as a whole and in accordance with what has been proposed by Oliveira and Santos (2005), these would be distant from the entrepreneurial issues and not addressing the targets of managerial background partly because of the complexity in the business environment. Despite the fact that some institutions have been searching to develop more modern methods, such as simulations and lab classes, they are still far from developing the needed competences. *“There is an issue in the process of knowledge transfer and adaptation of results in the background, in the work environment, by the participants of such courses.”* (ANTONELLO; RUAS, 2005)

A very old discussion about this subject refers to the need of adapting Higher Education Institution to the conditions and requirements of the market and therefore we have the proliferation of different approaches. (TOMASSINI et al., 2008).

As mentioned before, many researches have been led to assess lato sensu graduate courses. One of them had as target to develop a tool to assess quality of graduate courses using as a base the analyses of three higher education institutions in the Brazilian city of Belo Horizonte. The scale is based on the idea of quality of service as well as in the knowledge of those professionals involved with graduate course teaching (BANDEIRA et al., 1998).

Another study sought to analyze the quality of the course by building up a hybrid tool targeting at

education and teaching at accounting graduate courses. The format was based on a research document by CAPES; with information regarding the surveyed institution, open questionnaire and semi-structured interviews. According to researchers the hybrid model was able to integrate internal and external perceptions taking into account a valid and legitimate model, among other benefits. (IGARASHI et al., 2007).

Godoy et al. (2001) adopted in their replica the study performed by Kuh (1997). Kuh observed that the university environment and culture may either favor or harm the development of students both inside and outside of the classroom. Once the research with 12 institutions and 149 scripts was done and factor analysis was applied, there was a reduction to the following five main factors that may be followed along the time: personal competence, cognitive complexity, knowledge and academic skills, practical competence, altruism and cultural appreciation.

The choice for this paper was the tool developed by these authors as it was more complete to analyze factors that interfered with the students' development. The questionnaires were adapted to the graduate courses, master's degree level and doctorate by other authors (BEZERRA. In: CORRAR et al., 2007). However, it was observed the absence of the application of the tool for lato sensu graduate courses. The final version of the assessment tool with new adaptations was applied in the present study.

2.3 Methodological procedures

This work was based on Kuh's approach tested by Godoy et al. (2001) in undergraduate courses in order to assess graduate courses and called Assessment Questionnaire for Graduation Effects – QUEG. The questionnaire was tested initially on a sample of 58 students attending their last (senior) year of an Accounting and Business undergraduate course at a private college in the city of Sao Paulo in the year of 2000.

QUEG consist of three parts: the first one describes the respondents profile in terms of gender, age and undergraduate course; the second one consists on five open questions, two of them being aimed at identifying the reasons why students chose a certain school and undergraduate course. The third one refers to identify the respondent.

On this paper there were some changes involved; so now the first part consists on three open questions aiming at identifying the reasons to enroll in the course, strengths and weaknesses and improvement suggestions.

In addition to the open questions, the second part of the questionnaire included 16 items in a Likert type scale indicating the relative importance of each of the mentioned items.

The third part of the assessment tool is the identification of respondents. The base for building up the tool was the 14 categories of learning and personal development recommended in the research made by Kuh (1997 apud GODOY et al., 2001).

The adapted questionnaire then was applied in the nonprobability sampling of 227 graduate students at a Higher Educational Institution in the city of Sao Paulo in April 2010. The questionnaires were distributed in different rooms by the interviewers to be filled out and delivered at the location. The institution coordinates its offers in an integrated manner allowing extending the analysis in other disciplines besides those directly related to Business courses since it aims at testing the assessment tool and the courses benefits of a graduate course from the perception of students. In this way it may be even possible a comparison between the results and along with a multidisciplinary view will allow us to have a better assessment on the adequacy of the tool used.

3 Descriptive Analysis

3.1 Students' profile

The data shows that the students are proportionally distributed into three groups of age up to 40 years of age and the most sought areas are finances (25%) and law (22%), as shown in Table 1.

Table 1 General Profile of Students

SEX (0 = F, 1 = M), AGE (1 < 26 YRS OLD; 2 of 26-30; 3 of 31-40; 4 > 40), TERM (1 = 1; 2 = 2; 3 = OTHERS), MSC (Most Sought Courses : C1 = Finances; C2 = Law; C3= MBA Entrepreneurial Management; C4 = People Management)							
SEX	%	AGE	%	MSC	%	TERM	%
0	65,33	1	29.33	C1	24.67	1	8.44
1	34,67	2	24.89	C2	21.59	2	25.33
		3	33.33	C3	14.10	3	66.22
		4	12.44	C4	11.45		

The focus of this analysis was on the benefits acquired in the courses that were filled in the

questionnaire with closed questions. For the purpose of this study and because of the great variety of items, we only considered the answers with a percentage higher or equal to 10 %.

The first part of the questionnaire consisted of open questions trying to identify specific aspects regarding a Higher Education Institution (HEI) that included the reasons why the university had been chosen, strengths and weaknesses; as well as recommendations for improvement.

3.1.1 Motivations

Table 2 refers to the answers about the main drives shown by students regarding their search for professional background organized from higher to lower.

Table 2 Motivation Ranked as Most Important
(0 = NO; 1 = YES)

MT1=Improve the career; MT2= Acquire Knowledge ; MT3=Update;
MT4=Professional Growth ; MT5 = Deepening in the area

Motivation	% YES
MT1	40.97
MT2	38.33
MT3	25.55
MT4	15.86
MT5	10.57

3.1.2 Strengths

Table 3 shows students opinion regarding major strengths ranked as most important.

Table 3 Major Strengths
(0 = NO; 1 = YES)

PF1=Professors; PF2=Updated Content; PF3=Learning

Strengths	% YES
PF1	47.14
PF2	25.11
PF3	11.45

3.1.3 Weaknesses

Table 4 shows students' opinion regarding major weakness detected and ranked as most important. It is relevant to observe that the percentages referring to major strengths are considerably higher than major weaknesses what may represent a good result.

Table 4 Major Weaknesses
(0 = NO; 1 = YES)

f1= Low load of hours; f2=Teaching techniques of some professors;
f3=Infrastructure

Weaknesses	% YES
f1	22.03
f2	14.10
f3	13.22

3.1.4 Recommendations for Improvement

Table 5 shows the main suggestions and recommendations for improvement ranked as most important. It is interesting to observe that the percentages related to suggestions of "improvements" are not high. Therefore, if the institution targeted at applying the results for implementing operational improvements, best policy would be to reinforce the better assessed strengths and also improve some of the weaknesses.

Table 5 Suggestions for Improvement
(0 = NO; 1 = YES)

ML1 = Review hour load; ML2 = Improve Infrastructure; ML3 =
Dynamic/Practical Classes

Improvements	% YES
ML1	14.98
ML2	11.98
ML3	11.45

3.1.5 Questions

The Variables were coded for statistical and graphical purposes:

ANSWERS (R) and QUESTIONS (QI, QII,QXVI):

RQI – Acquired responsibility regarding my own learning.

RQII- Started to attend other cultural locations such as exhibits, museums and theaters.

RQIII- Learned to manage my time sharing it into leisure activities, work and study.

RQIV- Acquired posture, behavior and skills needed to perform the career I have chosen.

RQV- Became a critic person with capabilities to analyze and confront different points of view and opinions.

RQVI- Started to understand and deal with management and bureaucratic systems.

RQVII- Started to read more books about general subjects.

RQVIII- Started to read more books about subjects related to the course I have chosen.

RQIX- Learn to examine and summarize several types of information and experiences.

RQX- Started to attend libraries and bookstores.

RQXI- Developed a capability of relating with other people and work in teams.

RQXII – Started to apply in my practical life the things I learned in the classroom

RQXIII- Became a more independent person with my own thinking.

RQXIV- Broadened my knowledge about the subjects taught.

RQXV- Developed skills of speaking and verbal fluency that make my communication easier with others.

RQXVI – Learned to study and research in an independent manner.

Regarding these 16 items, table 6 shows a relative influence on habits according to area of the graduate course; and Table 7, which is a comparative frame for the Variance Analysis regarding these relative impacts shows us for instance that in average students are feeling the impact (influence) significantly higher in relation to certain items like QI, QIV, QV, QVIII and QXIV as compared to QII which is the question about attending cultural places and events, that is, the respondents stated that they did not start to attend museums and theaters as an outcome from the graduate course.

Table 6 Results for Background Influence Regarding Questions

(Absolute numbers out of a total of 227)

	Strong	Average	Little	None
RQI	94	73	42	18
RQII	19	45	70	93
RQIII	66	63	59	39
RQV	73	101	33	20
RQVI	37	75	65	50
RQVII	45	75	65	42
RQVIII	105	78	31	13
RQIX	61	104	40	22
RQX	25	56	88	58
RQXI	47	64	68	48
RQXII	64	86	51	26
RQXIII	48	57	55	67
RQIV	121	80	18	8
RQXV	51	69	65	42
RQXVI	64	69	55	39

Figure 1 Correspondence Analysis

Note. Clearly the horizontal axis is related to the degree of influence.

In order to present a general map based on tables 6 and 7, it was used Correspondence Analysis as shown in Figure 1 that shows how answers RQI, RQIV, RQVII e RQXIV are very close among each other and are located closed to the category of strong influence (F). Answers to questions RQV, RQVII and RQIX form another group that are also close to category F (Strong Influence). Group RQV, RQVII and RQIX is close to category M (Average Influence). Questions RQVII, RQXI and RQXV build a group and are close to category P (Little Influence); and finally RQII and RQX are more loose and a little to the left where category N (No Influence) is found. In fact, Figure 1 confirms Table 7 for the Comparative Analysis made by ANOVA.

4 Relationships Between Profile Variables and Questions

In order to proceed with the analysis of relationships between the variables related to profile and its possible impact, the following variables were grouped:

RQI to RQXVI (Question Approval: Strong Impact = 3, Average = 2, Little = 1, Others = 0)

AGE (0 = up to 30 Yrs. of age, 1 = Higher than 30yrs of age).

CMP (Most sought courses: C1 = fin, C2 = law, C3 = mba, C4 = gpes).

A chi square test was used based on contingencies tables in order to analyze the differences regarding the respondents' profile. The values of relative significances that are shown in Table 8 demonstrate that basically to a higher or lower degree (a lower "p" value means a stronger relationship) there are differences. As may be seen most responses have a relationship which are statistically significant with several features from the students' profile except for gender (SEX) which makes no significant difference in any of the cases except for RQVIII, RQXII E RQXIV.

Table 8 Relationships Between Responses and the Features Listed in the Students' Profile
(p-values for a chi-square test; the lower the higher relationships)

	SEX	AGE	CMP	TERM
RQI	0.141	0.075	0.020	0.005
RQII	0.595	0.009	0.331	0.065
RQIII	0.311	0.095	0.000	0.030
RQIV	0.391	0.037	0.001	0.010
RQV	0.244	0.019	0.021	0.044
RQVI	0.670	0.108	0.013	0.027
RQVII	0.019	0.911	0.738	0.049
RQVIII	0.057	0.379	0.129	0.892
RQIX	0.297	0.166	0.294	0.009
RQX	0.425	0.425	0.428	0.093
RQXI	0.093	0.056	0.000	0.124
RQXII	0.070	0.426	0.002	0.525
RQXIII	0.804	0.139	0.034	0.109
RQXIV	0.022	0.832	0.068	0.609
RQXV	0.732	0.048	0.185	0.320
RQXVI	0.458	0.231	0.010	0.213

Note. In the case of RQXIV there were cells regarding CMP and TERM with a number of events lower than 1, we modified them joining responses 0 and 1 of RQIV, to be able in a way to find chi-square.

More specifically in the first question, RQI, the feature that makes the most significant difference is the term in which the student is in TERM (p = 0,005), that is, as the student progresses he/she has more reasons to approve QI, that means, he/she becomes more responsible for their own learning. The second feature that makes some difference is the course CMP (p = 0,020) that presents a higher approval by students from Finances than from Law – and the age ID (p=0,075) with younger students approving QI more often.

In the case of RQII it was observed that the age makes the most significant difference ID (p = 0,009), however, curiously in the opposite way to RQI; that is, older ones are those who approve QII more often. The term is the second aspect with higher influence TERM (P=0,065) and then again the opposite of what happens in QI, that is, as time passes less students approve of QII.

Regarding RQIII, Table 8 shows us a more significant difference regarding courses CMP (p = 0,000) and this may happen due to the fact that only half of the students from finances approve of QIII. In

continuation, the approval will depend on the Term TERM ($p = 0,030$) – however, curiously here the approval increases in the second term and then drops again. With age something similar happens in the case of QI, in the sense that QIII has more approvals among the younger ones ID ($p = 0,095$).

For RQIV it is observed a similar behavior to that found in the prior case of RQIII in the sense that the most significant difference shows in regarding to courses CMP ($p = 0,001$), however the continuation in this case appears in age and then again the younger ones are those mostly satisfied with this new item ID ($p = 0,010$); and then right after Term TERM ($p = 0,037$) revealing a good approval from the second term on.

In regards to questions that were best assessed we observed some similarity between RQI and RQV, what may occur because of the proximity of the questions. Regarding RQVIII, just the item sex had a significant difference GEN ($p=0,057$) – women were most strongly influenced regarding to reading the subjects specific texts.

In a similar manner, in question RQXIV, sex is what makes the biggest difference GEN ($p = 0,022$) – women who demonstrated to be significantly more optimistic; followed by CMP ($p = 0,068$) – apparently because of the low valuing given by students from finances regarding the acquired knowledge.

5 Conclusion

The purpose of this work was mainly adapting, improving and testing an assessment method for Quality Service of a graduate course. Due to the need of assessing results from undergraduate and graduate higher education courses, several studies have been developed in order to improve the assessment system. Some methodologies have been tested at different levels. For instance, an institution may assess using a methodology in undergraduate courses and then later use the same methodology in graduate courses. The advantage of this procedure is that it makes possible to assess the method in different situations enhancing the credibility of results. In this work the replication and adaptation of a methodology tested in the undergraduate course, and then later adjusted to *stricto sensu* and *lato sensu* graduate courses.

What was noticed in the application of this assessment tool is that it was adequate to measure the effect of courses in the behavior and the results obtained by the students. Besides being a useful tool to identify the strengths and weaknesses, recommendation for improvement as well as drives for the establishment of a course at this level, it also reveals the perception students have over the acquired benefits. Therefore, the first part of the questionnaire allows us to assess and improve the quality of education as any other course assessment tool, as it may become a common practice in this type of graduate course. Moreover, the second part of the questionnaire, with questions prepared in a more broadly manner covers most of the suggestions provided by the data.

One of the benefits from this assessment was to allow emphasizing the process as a whole (OLIVEIRA; SANTOS, 2005). The tool assesses the benefits acquired in their personal, professional and social areas. Among the acquired benefits in the course, from a professional standpoint, we observed a strong influence in item RQIV that means, in the acquisition of a posture, behavior and needed skills to perform the job. However, the response to question 12, about the application of learning into the practical life demonstrated influence which was just about average. This means that a graduate course is developing positive demeanor towards work, but is not meeting the requirements from the market at the level of knowledge. Nevertheless, the statement that there are issues in the knowledge transfer process and results adaptation in building up a work environment (ANTONELLO; RUAS, 2005), the results show that in spite of the limitations in knowledge transfer, courses are helping for the development of behavioral competences what may be considered as an important contribution.

In addition, it was noticed that by the scope of topics, the tool meets the most broaden requirements being used as an assessment criteria (GODOY et al., 2001). However, as in this study the assessment was focused in the assessment tool; in order to obtain more reliable results we would need also to assess professors, considerations about the pedagogical projects, results at companies or aspects either more broaden or more hybrid. (IGARASHI et al., 2008). Direct and indirect assessment methods as suggested by Bateson e Hoffman (2001) would certainly be a great contribution for the assessment of results (sales data, profits and customers complaints).

The questions seem to be adequate, despite interpretation problems, with certain caution on assessment within a given context. One of them for instance, approached the influence over the specific aspect of book reading, a habit that may be considered as positive. The result was a strong influence,

that is, there was a positive effect on several students. However, the result may have been a consequence from the course own requirement which demands the preparation of background papers forcing students to research specific subject on the fields they have chosen, that may not mean the acquisition of the habit of reading after the conclusion of the course. A suggestion would be to replicate the questionnaire after a determined period of time to check if revealed habit and knowledge remained.

Therefore it is possible to conclude that the selected assessment method may bring many benefits to the evaluation of *Lato sensu* graduate courses. It meets some requirements mentioned by other researchers on changes of behavior and knowledge and social and educational aspects among others mentioned in the 16 questions of the assessment tools. However, as it was mentioned before, a more reliable response may be obtained if other ways of assessment are also included (SPAGNOLO, SOUZA, 2004; HORTA, MORAES, 2006; HORTA, MORAES, 2005; FREZATTI, KASSAI, 2003).

Other suggestion is that questions may be adapted to every type of course. Questions about sustainability and social responsibility that have not been included in this questionnaire should be added because of the importance for education and learning in any area or field nowadays.

As to the methodology used for the data analysis, the study of Godoy et al. (2001) used Factor Analysis. The attempt here was to add techniques for data analysis such as Correspondence Analysis, ANOVA, and chi-square tests to find and test relationships.

All techniques used showed to be adequate and very profitable; and allowed the analysis of other aspects as needed. The results allowed statistical comparisons (ANOVA), regarding the impact or relative influence of the 16 items in the questionnaire about the benefits perceived in the students' background as well as the possible differences by gender, age, course term and course type; showing these differences and general relationships in a map based on a Correspondence Analysis. Hence it could very well be used in a strategic development plan by area as in the case of Villardi and Vergara (2011); and also to help preparing indicators that may allow to monitor the relative improvements in this major sector of services related to higher education an area so vital for the development of the country.

Abstract: Longevity is becoming an issue of increasing relevance almost everywhere. This paper presents a study regarding the conditions faced by a majority of retired Brazilian in the context of increasing life span and governmental social policies which affect, directly or indirectly, this growing number of the population. Begins by presenting the emergence of programs for the retired people and people about to get retired, considering the Projects of Preparation for Retirement - PPRs, showing the economic, social and current policies experienced in Brazil and the impacts on the topic studied here. It shows the profile of interest and risk, taken along 2,066 civil servants, men and women, regardless of marital status, academic level, or professional position, surveyed through a questionnaire composed of 20 questions answered on a scale from 1 to 4, focusing on: the financial aspects, changes in interpersonal relationships, physical and mental health and various interests. The results of the analysis indicate that the flattening of the amount paid in pensions and retirement may drive a large number of retired people to a state of survival, close to the conditions of social, financial and cultural poverty, which proves the urgent need for the various actors of the process to look at a country - Brazil that is getting old with the elderly population doomed to general impoverishment, and consequent need to generate sustainable policies for the millions of beneficiaries, who may increase dependence on the state, families and the community.

Key words: Retirement policies; Retirement future; Increasing impoverishment; Insecurity in Post-retirement

1 Introduction

1.1 The emergence of programs for retired people or people about to get retired in Brazil

Programs for civil servants were applied in Brazil the 80s for the municipal, state and federal levels in different states of Brazil. For 35 years now, these programs have been following the format, which was defined for an economic and political environment in crisis, when the Brazilian people were under the impact of military dictatorship. In the 80s, there was the civic movement "Direct Elections Now", which involved various strata of society. Some expressive political parties were founded, as PT, PMDB and the PSDB, which claimed for democracy. A civil president was elected, Tancredo Neves, who did not actually take over, by health problems which lead him to death. The transition to democracy was then led by his deputy, José Sarney, who was appointed president.

We had inherited the high debt ratios from periods of previous development plans, with great difficulties to rollover debt from creditor institutions. From orthodox economic policies - which means cutting government costs and increasing revenue - with Sarney's mandate government starting in 1985, policies started to become heterodox, different from those advocated by the International Monetary Fund IMF.

High inflation rates and economic stagnation of the period generated a very troubled context, with attempts to make a monetary reform and adoption of various plans – Cruzado, under Bresser's mandate and Summer, which showed insufficient economic results. For these reasons, the 80s became known as the lost decade from an economic point of view, considering growth and development, which ended with hyperinflation.

In the political sphere, the 1988 Constitution was promulgated, materializing the end of dictatorship. Conditions were created for increased civic participation of elections, which brought to power Fernando Collor de Melo in the first direct election after the military regime, with the Salvationist speech against the 'Marajás', nickname by which civil servants were appointed, for their had high wages and pensions. All the expectations placed on him were frustrated in his government that ended with impeachment.

By the late 80s, neither Brazil nor the world were the same. With the end of the Cold War took shape the neoliberal model of governance around the world took shape, leveraging the economic globalization process. And Brazil, a rich country, but still very poor in social welfare, encouraged civil servants to discontinue their work by offering huge amounts of money for retirement,

Through a Plan of Voluntary Dismiss, or Early Retirement Plans. There was a strong movement

offering privileges to the younger, considering that the older people over the loyalty value of older, consisted a category people considered 'disposable', because of their undesirable high wages, that 'burdened businesses and the public purse'.

1.2 Favorable context for the projects preparing retirement - PPR

Accelerated in the first PT government, which pressed for new positions and jobs to be filled by young people and recent graduates, at the expense of the elderly, privileges changed hands: from the elderly to the younger, resulting in greater intergenerational competitiveness, currently with three generations in fierce and unequal struggle in the labor market.

With new technologies, the governmental and private companies, not being allowed by law to press and encourage older employees to discontinue their jobs, they coined the expressions: "no profile". Until the beginning of this century, in the Brazilian context, dismissals, as well as voluntary and involuntary dismissals took place with the appeal of conducting the 'surplus and older undesirable' to leisure practices and to a retirement organized for the idleness to fill with pleasure and meaning the 'free time conquered'. Now most of them try to survive on less than half the pension provided in a technological world by which they were not absorbed and for which they have not been prepared to enter. In addition, being subject to bullying, from which few really recover later, so painful are the moral and psychological wounds that shake their confidence in life, their personal and family security, and their overall health, when inadequately addressed by authorities unprepared to bring them back to the life 'out there'.

The PPRs were devised in critical times, 35 years ago. Now, in 2015, crises are even more virulent. A political opening was expected to take away the evil rulers of power and place the elderly into the universe of the global economy. Nowadays, after some lost decades in terms of education, public health, greater investment in infrastructure, housing and public transport, with the air being more polluted and the climate going through a devastating change, with a recession crushing the acquisition power, the PPRs have to cope with a social - financial education, which collides with previous decades stimulus to reckless consumption without guaranteed savings and no decent future vision.

2 Changes in Retirement Conditions in a Country with Economic and Political Crisis

In the past, there was a dream of a peaceful and desired retirement. Nowadays is the nightmare of survival and hopelessness of a country which did not know how to generate prosperity. A country whose unemployment rates grow at an alarming rate and whose entire population is already under pressure from population aging, even not coping with policies for children and youth people which, when formulated, are very poorly implemented.

It is rather staggering to know about the pension funds of public and private companies had the money deviated in amounts which certainly surpass what is still being raised and quantified in the 'Petrolão' corruption process. All this is caused by mismanagement of public money and the deviation of funds due to corruption. The private pension system is about to collapse under the supervision of politicians who are not committed to public policies for sustainable growth and development.

This panorama of huge amounts of money being deviated from the original purpose, leave taxpayers unassisted, who besides the disappointment for the poor results obtained, will add to big groups of people in poverty, as a result of corrupt governments. There is a growing number of Brazilians in the process of impoverishment largely orchestrated by excesses of insensitive rulers to the needs of retirees and pensioners.

The number of public and private companies that currently maintain the PPRs in their official agenda do it under three conditions: outdated working model, lack of vision of future and dignified social insertion, in addition to closed market for the elderly who wishing and / or need to undertake some working activity. Still, without being preparing for the changes that follow after dismissals, elderly people are offered insufficient programs, as a great rite of dismissal, which at times may be honorable, but in most cases is painful.

3 A Response to the Questions and Perplexities of the Working Population about to Retire

The PPRs was started with the presentation of their content and working conditions for those who accepted the invitation to join; and as a result of our experience in the field in a great extent of the country, having communicated with over 10,000 people in seminars and workshops that we have been

offering in the past 30 years of work to retired people or people about to retire, we list some key issues and interests they raised and discussed. A full document shows us a series of reflections and decisions about the personal and professional future.

4 Number and Profile of the Population Covered by the Data Mapping below

This paper presents a profile of interests and risk, taken along with 2,066 civil servants, men and women, regardless of marital status, academic level or professional position. Respondents were addressed in auditoriums before the beginning the presentations of content through a questionnaire consisting of twenty (20). The questions should be answered on a scale of 1 to 4, showing: 1.) high preparation / readiness to retire in good conditions. 4.) little preparation to retire well - in case they will leave the company in a short time - from 01 to 3 years .

A common characteristic is the fact that they are civil servants, working for at least ten (10) years as civil servants, on the dates the survey was conducted.

All received the same instructions and had the freedom to respond spontaneously, even taking some questions in plenary. The groups were formed with 40-260 people, from those present in the same auditorium, during the morning or afternoon.

Data was obtained in the period 2002-2012, with the: Chamber of Deputies in Brasilia; House of Representatives from Salvador, BA; Ministry of Labor and Employment - MTE in Brasilia, DF; Regional Electoral Court – TRT, in Brasilia and Aracaju-Re; Court of Justice - TJ, in Belo Horizonte-MG, Aracaju-RE and Manaus-AM; Council of São Luiz, MA; Council of Joinville, SC; State Departments of Labor and Social Welfare - SETAS, in Cuiabá-MT and Aracaju-SE; Secretary of Social Development and Fight against Poverty - Headquarters in Salvador-BA, and Department of Public Safety, with the prison system of São Paulo, in several of its units.

5 Mapping the Risks to Which the Newly Retired People are Exposed

The questions posed at the beginning of the program we implemented in connection with the civil servants were related to their vision of the future: 5 years prior to their dismissal to five years after their dismissal, an estimated range of 10 years, during which people have performed adjustments to the new conditions, as well as to their lifestyle.

This data has as an immediate effect the following:

- Introduce the program as a whole and its main objectives;
- Get a critical and conscious adherence from the civil servants to its preparation;
- Start a broader reflection regarding the positive and / or negative-impacts on their lifestyle;
- Adjust our arguments and knowledge to the interests and needs of each particular group;
- Map their realistic prospects, or not, related to the 20 topics, namely:
 - (1) Changes that occur after leaving the company'
 - (2) Conscious preparation or lack of preparation in relation to the future in a short time and future time, a projection of up to 05 years after retirement, be it voluntary or compulsory
 - (3) Possible conversations on issues that directly affect their decisions on that
 - (4) State of the current financial situation
 - (5) State of the expected income for post-retirement
 - (6) Current savings / bond conquered
 - (7) Current profession and future professional occupation
 - (8) Projected changes and desired changes in family relationships after leaving company
 - (9) Changes in the relationship with the spouse / partner
 - (10) Quality of sex life expectancy for a period of 10 to 15 years
 - (11) Entertainment, activities kept and / or learned for post-retirement
 - (12) Specific cultural activities and / or comprehensive
 - (13) Interest in politics, participation as a citizen
 - (14) Changes in social life
 - (15) Update of general and / or specific knowledge
 - (16) Practice, interest and development of spirituality
 - (17) Physical health
 - (18) Mental health
 - (19) Stress resulting from adaptation and management of the quality of free time
 - (20) Venture plans for the future

6 Interpretation and Analysis of the Results

The frequency of responses was compiled as notes, among the individuals surveyed, with option for multiple choices options.

Data was divided into five broad categories:

- (1) Expectations regarding the discontinuation of work in the company
- (2) Financial aspects
- (3) Changes in interpersonal relationships
- (4) Various interests
- (5) Physical and mental health

Regarding the discontinuation of work in the company, it can be said that more than half of the answers given by the public researched points to the fact that they were not prepared to leave the company; they did not stop to design their plans for the future and believed that the changes would not be very significant; in addition, they do not consider themselves well informed about what would happen with them in the short run - within a few months up to five years.

As for the financial aspects, the vast majority was satisfied with what they had and, as long as nothing unexpected happens in their lives, they consider they had enough. But for the future, they would still need to capitalize. Considering that the country is getting older, it transfers to the individual and families the responsibility to provide for general care, health, education, and housing for all four generations: the old-old, the own, the children and grandchildren. The government has flattened the top limit amount for retirement - from ten to less than seven minimum wages along the past three decades, and has encouraged the use of pensions as a warranty to pay loans, thus, running the risk to become hostage of the retired people's growing debts, which will never be paid with their work.

As for the changes in interpersonal relationships established in the governmental company / public agency environment, less than half of the answers express a tendency to retain contact with the few friends made at work, as there is feeling of low social network identification and belonging. With regards to the family environment, expectations are not very optimistic, with about 60% of the answer expecting that the quality of marital relationship to get worse.

With regards to Various Interests, almost 40% say they do not want or have expectations of great achievements while working in the company. Leisure, entertainment and some cultural activities seem to be their personal fulfillment, denoting a demotivating framework and lack of interest in keeping high productivity and engagement in work projects, while they remain in the job. Similarly, they show low engagement and interest with regards to politics and only half of the number of people researched stated they would seek for new knowledge, to keep up to date in ways. Spirituality was a subject that does not mobilize even half of the number of people taking part of the research.

On the issue of physical and mental health, expectation is quite optimistic, with almost 83% believing they would preserve their active sexuality, depending much more on the willingness of individuals than the physical aging and affective relationships. About 40% of the answers reveal that they do not take as much care as they would in the future. Nearly in half of the answers, their mental health was considered to improve, according to the activities engaged in the future. Sixty percent of the answers show there is a wish or desire regard to improve their emotional aspect of life: to be more balanced, and have more self-control and patience, for example.

Thus, there is a large number of people unprepared for the future, which are not updated from the standpoint of education, general interests and plans for the future, not the professional point of view. They did not cultivate great expectations on personal fulfillment during the time they keep working, while they believed that your health would improve after they stopped working, and they were aware they might not have enough money to face emergencies and contingencies with negative impact. They did not know how much there would get when retired, neither when. Their journeys follows without security, nor information and knowledge to face "the outside world", which is in crises of all social institutions, making their plan for long, dignified and healthy life seem more dismal.

7 Longevity and Related Conditions Around the Globe

As mentioned before similar conditions as the ones in Brazil may be going on all around the world particularly on developing countries like the Latin or Iberoamerican ones. For this reason, it's interesting to have a picture of how are we doing on this Region in relation to the rest of the world; so using data from Knoema we'll be dealing with 132 countries divided into 3 Regions that are of our special interest to be compared regarding Longevity: the Iberoamerican AIBER (21 countries), the Advanced

Economies AVECO (28 countries) and the rest of the 132 countries OTHERS (84 countries). Table 1 shows the means for each one of the 3 Regions (3R) of Synthetic Indicators such as Social Progress Index (SPI), Human Development Index (IDH), Governance (GOV), Corruption (CORR), Longevity (LONG) and Age Watch Index (AWI); as well as the ones concerning Analytic Indicators such as Survival of Females to more than 65yrs.(SURF65) and Survival of Men to more than 65 yrs. (SURVM65), as well as the Fs of the corresponding Analyses of Variance ANOVAS.

Table 1 ANOVAS Comparing Means and F's Were all Variables Were Rescaled (0–100) and Positized Variables (the higher the better)

3R	SPI	HDI	GOV	CORR	LONG	AWI	SURF65	SURVM65
AIBER	64.41	65.92	42.48	37.21	68.75	52.94	84.81	75.25
AVECO	90.3	87.36	83.25	74.94	91.09	73.15	91.33	83.53
OTHER	42.63	46.74	33.36	30.7	44.43	44.49	71.19	61.73
F	83.97	43.45	97.02	81.65	62.34	54.18	29.33	40.67

No doubt, as its clearly shown in Figure 1, we at the Iberoamerican Region (AIBER) are still a long way to go in relation to the Advanced Economies Countries (AVECO) particularly in critical issues like Governance (GOV) and Corruption (CORR) that, as mentioned before, end up having an impact on retirement conditions; and moreover this may be even more critical at the OTHERS countries. So this work may help as a warning signal for the purpose of strategically planning and developing more humanly concerned sustainable development policies all around the world.

Figure 1 Comparing the 3 Regions Regarding the Basic Indicators

8 Conclusion

The Flattening of the amount of pensions going on in Brazil will leave retired people in a critical state of survival, and almost social, financial and cultural poverty. The lack of preparation to face the intergenerational competition is already a fact. Pension funds, institutions that have managed to keep to the present, are under interventions to expose corruption due to promiscuity with the physiological, governmental powers. It is time we look to a country - Brazil – that is getting old and leaving the population to general impoverishment, and in great need to develop sustainable policies for more than 31 million people, that otherwise will depend on the families and the good will of neighbors. The situation in this country is similar to other developing countries that are not yet quite aware and be well-prepared to the challenge of Increasing Longevity and Decreasing Birth Rates simultaneously going already along the last decades.

Abstract: The scope of this study is to understand the teaching strategies used by professors of Brazilian colleges, as well as the reasons for these choices. The research aims to collect answers from professors through a questionnaire offering open questions, closed questions and open / closed questions on the teaching methods used in colleges. The answers are checked against the UNESCO Report by Jacques Delors for Education for the twenty - first century, which is based on the four pillars: learning to be, learning to do, learning to know and learning to interact - Education as the *Treasure Within*. As far as the teaching and learning processes are concerned, it is necessary to take into account both the content and the human relations which are established. Becoming conscious of the choices teachers make for the class planning, that is, the strategies used in the classroom, makes them important agents for the development of the learning process when defining the type of class that focuses on the transmission / reception of scientific knowledge or participation / interaction of students. Interdisciplinarity which takes into consideration the ontological, praxiological and epistemological aspects of education seems to bridge the transition process of education from mere knowledge transmission towards Education, as a *Treasure Within*.

Key words: Educational strategies; Interdisciplinarity; The treasure within

1 Introduction

Studies involving the identification of teaching strategies have aimed to make learning more meaningful and relevant to meet the needs of students as well as professors.

Owing to the specificity of the subjects offered in further education, teachers most often tend to be more attentive to knowledge than to students. However, according to the social historical theory by Vygotsky (1984), the human beings are essentially social and it is through the relations that they are constituted as subjects.

Throughout history, many theories have addressed the education issue and how it should occur. Based on these theories, it is possible to identify two basic opposite trends. One stating that knowledge is acquired from without, transmitted from one individual to another, whereas another proposes that knowledge occurs from inside out. From these conceptions several proposals are developed.

It can be noticed in the literature that many authors approach the teaching methods aimed at adults, demonstrating the positive and negative aspects and how to use them. Nowadays, we wonder how the Brazilian professors conduct their current academic practice. What are the most commonly used teaching strategies and why are they chosen?

2 Development

Education, particularly adult education, is a practice which is as old as human history: Confucius and Lao Tse in China; Aristotle, Socrates and Plato in ancient Greece and Cicero in ancient Rome, were all adult educators. The perception of these great thinkers concerning learning was that it was an active process of question making, not passive, full of content. But even such an old practice, has only recently been the object of scientific research. So with roots in Pedagogy, Andragogy emerged.

In his book *The Adult Learner: a Neglected Species*, Malcolm Knowles (1990) attempts to formulate the Adult Learning Theory in 1950. Later in 1960, for the first time, he had contact with the word Andragogy through a Yugoslav educator who attended a summer workshop at Boston University.

It was then that the meaning of the word was adopted as the most suitable to express the “art and science of helping adults to learn”.

Education involves the integral development of the learner, so this issue becomes complex and involves, besides knowledge, the one who learns and the one who teaches.

In addition, it is necessary to consider the three main epistemological learning models: empiricism, apriorism and constructivism (Becker, 2001), as below:

Empiricism is centered in teacher transmission of information and student reproduction of it. Therefore, the pedagogy is directive, not offering the opportunity for the learner’s creativity and autonomy. The student is regarded as someone devoid of knowledge, as a *tabula rasa*.

Apriorism assumes that intelligence is innate, inherited. The teacher is just a facilitator of the learning process to awaken the knowledge that exists in it.

Another epistemology that guides the pedagogical practice is constructivism, manifested through a relational pedagogy. In this model, the teacher leads the student to problem making. Learning is regarded as a result of the interaction between the learner and the social environment.

The Psychodramatic Pedagogy by Romaña (2004), practice of one of the researchers, is a constructivist educational approach which is based on the social historical theory by Vygotsky, using the ethics of the Autonomy Pedagogy of Freire and Sociopsychodramatic didactics by Moreno. It seeks to link the knowledge acquired formally, to the cultural and affective learning through experiences. It starts with the idea that the learning process initially takes place in the social contact to become an individual expression, *a posteriori*. This proposal incorporates the learning process to the life experience of the learners- learning in action, as well as he use of a democratic and participatory teaching methodology.

Thus, these three thinkers' conceptions are below.

3 Main Concepts by Freire, Vygotsky and Moreno

The focus of the theory by Freire (1990) is the possibility of education to produce the evolution of the learner awareness, through development, in three levels: the magical consciousness in which the learner can not understand the environment and regards him / herself as inferior to others – usually in relation to those with dominant interests – submitting to their opinions; the naive consciousness, in which the student regards him / herself as superior to the others, considering he / she fully understands the facts and that all his / her opinions are correct; the reflective or critical consciousness, in which the student is able to recognize the facts, however he / she questions reality, makes research and takes risk in making forecasting. This level of awareness enables a relationship between reflection and action. Once motivated, he / she starts to reflect on him / herself and recreates prior knowledge and new knowledge, in such a way that he/ she is moved to action, seeking to transform reality. The dialogue is the main tool used in this educational process.

The social historical psychology by Vygotsky (1984) is centered around three main points: the psychological functions which have a biological basis, as they are products of brain activities; the social relations which are the ground for the psychological functioning, and are developed in a historical process; the symbolic systems which are the mediators in the relationship between the human beings and the world.

According to Vygotsky (1984), learning is made possible by the contact of the human being with the cultural environment, which allows for the awakening of the inner processes of development.

The levels of development according to this author can be divided in the following ways: real development, with regards to learning that is already consolidated in the child, indicating mental processes already established; and potential developments, that corresponds to what the child is able to accomplish with the help of another person. The distance between the real and potential levels of development constitutes the zone of proximal development, which defines the functions that are still in the maturation process.

The main concepts by Moreno (2003) are: spontaneity / creativity and tele. He considers four expressions of spontaneity: creativity, which can be related to the creation of new masterpieces, or new social environments, to human beings birth and development, as well as to inventions; dramatic quality which makes repetitions new and full of life; originality which is related to the free flow of expressions, as variations of “*conserva cultural*”; answer adequacy to new situations, showing flexibility of the self.

As for tele – a factor of communication of Psychodrama, the relationship between I and You is a two way relationship, where the intentions of both are shown and grasped.

The three thinkers – Freire, Vygotsky and Moreno – regard the human being as a social being, in a

relationship, who largely depend on the interactions in which they are involved.

These pedagogical concepts can be references to guide the understanding of the answers of the teachers practice, and the reason for the choice of the teaching strategies. The dimension of the being can be detected in the answers through these references.

4 Jacques Delors UNESCO Report

Considering the UNESCO Report by Jacques Delors for the Education for the twenty-first century, four pillars are mentioned: learning to be, learning to do, learning to learn and learning to interact.

Delors proposal had to cope with three challenges in the world: tensions to be overcome, designing and building our common future, and learning throughout life: the heartbeat of society.

Education for Jacques Delors is regarded as “the principal means available to foster a deeper and more harmonious form of human development, and thereby, to reduce poverty, exclusion, ignorance, oppression and war.”.. “for a world which is a better place to live in”.

When seeking for a title for the report, he used the parable by Le Fontaine: *The ploughman and his children*, in which Work was the Treasure Within. Delors used this metaphor to say that Education is the *Treasure Within*.

For such achievement, that is, becoming conscious of meaning in being, doing, knowing and interacting, to be able to take decisions with the challenges and uncertainties presented in the twenty-first century, the vision and approach of interdisciplinary education seems to have an important role to play.

5 The Role of the Interdisciplinary Vision and Approach in Education

Interdisciplinarity is an attitude to knowledge, regarding the human being in his / her plenitude, taking into account the ontological, praxiological and epistemological aspects of education, according to Ivani Fazenda (2002).

It is 40 years since the researches in Interdisciplinarity were started, and it does not have one single definition. It provides opportunities for the following encounters to happen: one with oneself, one with the others, and one with the environment, in the learning process. It also encourages integration of different fields of knowledge.

In an environment of mutual trust, the individual perceptions emerge, and are perceived with the attitude of ‘epoché’ – suspension of judgement to better understand the own Ethics and Aesthetics. Meaning guides the construction of the proposals. It is the organizing factor that brings coherence of thoughts, actions, expression and feelings, along a maturation period, with respect, loving attitude, humility and lack of attachment which allow for constant calibration of the process, while theory and practice are articulated, in permanent reorganizing flow. Both, teachers and student become aware of themselves as they articulate knowledge.

Paulo Freire (1990) insisted on the famous point that it was necessary to ‘make people conscious before literacy’. In this concern, Espirito Santo (2007) emphasizes that developing consciousness is related to the sense of knowledge as a whole, together with deep awareness of the self, without which, education remains in the level Freire called ‘banking education’, implying there is no space for self-knowledge.

Could Interdisciplinarity bridge the transition processes of Education regarded as mere transmission of knowledge to the Education for the twenty – first century, as the *Treasure Within*? As a matter of fact this seems to be a way to wisdom such as its being proposed by advanced, experienced and visionary thinkers like Claudio Naranjo and Ricardo Semler.

6 Methodology

This is a descriptive exploratory study, which organizes the information obtained in data collection, according to the kind of educational strategy used by the professor. The research is based on the information and narratives by the professors. Approximately 50 Brazilian professors, chosen at random, answer the questionnaire. Governmental and private university professors are included, involving courses in humanities from the five regions of Brazil – North, Northeast, Midwest, Southeast and South. Teachers are included regardless of the subjects they teach, their age and sex.

7 Procedures

The research is conducted through a questionnaire, as it is one of the most important techniques

available to obtain data in social research through e-mails, inviting professors to answer the questionnaire, in various cities of the Brazilian regions.

The questionnaire was pre tested, in order to assure consistency. This procedure aims to check aspects regarding the clarity and precision of the terms; the organization of questions and the understanding of the introductory text.

Along with the questionnaire, the professors receive an introductory text informing about the research, its importance, the fact that neither the professor's identity, nor the institution where he works are shown.

The questions are presented as open, closed, and open / closed. Open questions meet the needs of exploratory studies, for allowing the use of the own words, without restrictions, while closed questions only allow for answers of the yes / no type, or multiple choice. As for the open / closed questions, after a first question which can be open or closed, a second question follows: "why?"

The different kinds of questions included in the questionnaire provide data for a qualitative and quantitative study; and open-ended questions encourage personal and spontaneous responses that enable a qualitative analysis of the data, while closed questions provide answers that are quantified.

8 Other Similar Studies

Along the research, it was identified that the use of particular educational strategies are encouraged by some authors. Games, dramatization, group dynamics, role playing are chosen because they enable greater involvement of students with the object of study, leading to better learning (Romaña, 1985; Capellini; Bellido, 2008).

Studies by Cyrino and Toralles-Pereira (2004) discuss two important ways of focusing educational strategies in health care: problem-based learning (PBL) and problematization. PBL focuses on the cognitive aspects of the construction process of concepts and appropriation of basic mechanisms of science and questioning the construction of knowledge in the context of critical development. Both "break the traditional way of teaching and learning, encouraging the participatory management of the experience protagonists, reorganizing the relationship between theory / practice".

In the studies by De Domenico and Ide (2005), aiming to identify the teaching strategies adopted by professors to build skills in graduation students on nursing at a governmental university in São Paulo, it was identified that there is a trend of "adopting a constructivist approach and the intention of promoting pedagogical changes seeking for a different educational development by levels of complexity".

Still in a nursing graduation course, in the State of Piauí, in the northeastern Brazil, Moura and Mesquita (2010) evaluated the perception of the students facing the experienced educational strategies and concluded that "the success of an educational strategy will depend on the integration of factors related to both the teacher and the student," and that "the involvement of this process results in the development for higher education, in a meaningful exchange of knowledge where the teacher is learner and can also enable the learner to be a teacher in a valuable role reversal."

Furthermore, in others studies by Moura and Mesquita (2010), it was noticed that the role of the teacher "goes beyond mere transmission of the message, allowing the assimilation of the curriculum and raising critical awareness on the part of the student that will help face the different situations, through creative and transforming attitudes," practicing less traditional forms of strategies in their classes towards the implementation of innovative teaching strategies for the development of nurses.

In his research, Quadros (2009) found that the professors of the Chemistry Department at the Federal University of Minas Gerais, southeastern Brazil, chose interactive lessons seeking to engage students by creating a favorable environment for the intellectual development. In this case, "the attention of the professor is directed to the students, as he / she values their speeches and questions, letting them express their ideas and build their arguments."

On the other hand, recent studies by Mazzioni (2013), conducted in southern Brazil in the graduation course of Accounting Science, concluded that the class in a lecture style is the most widely used teaching strategy. About 40% of the students consider problem solving the most effective kind of lesson.

9 Conclusion

It has been observed so far, based on the similar researches performed, that the use of strategies including knowledge transmission, together with personal interaction outcome strategies focused only in

knowledge transmission.

The kind of subject matter taught has some influence in the choice of educational strategies used by the professor. It was the case of Accountancy, where the focus was the content.

But in many different places, there seems to be a reversal from the focus on the object to the focus on the subject. That allows for a professor to be a constant learner, along the process of teaching, even in reversal roles with the student.

It is, hopefully, this reversal that may lead Education of the twenty-first century to the *Treasure Within*, encompassing the ontological, praxiological and epistemological aspects, that is learning to be, learning to do, learning to know, learning to interact. As a matter of fact; and as mentioned before slowly an Educational Grassroots Revolution is under way that may transform schools opening doors to innovation and creativity (ROBINSON, 2015). Education then will be able to bring a significant contribution to human beings and nature, for each one may be able to bring his / her own talents on service as a contribution to the world, through Better Visions, Higher Values and Wiser Decision Processes.

Abstract: This work aims to analyze the relationship between security and peace and their present conditions in Latin America, based on the research of these issues in international publications in various media and data collection indicators available in studies with statistical reliability. There is also the goal of obtaining a set of indicators in the light of existing jobs and new contributions that may show the “state” of present Security and Peace conditions in Latin America and infer about the future of such conditions, with a view to proposing actions between and within countries of the region. The Security-Peace binomial presents us with a fundamental question regarding the relationship of cause and effect - the safety results from the peace or peace is a consequence of security? Independent-minded succeed or not answer this question we have to consider that the two factors have impacts on the wellness of the human being. Equal opportunities and valuing life are fundamental principles that pave the road to full citizenship in Latin America, and without which it won't make sense any attempt to try to achieve security and peace. The Security Commission Hemispheric of the Organization of American States Permanent Council emphasizes in a recent meeting (March 2000) that among the premises for reformulation of the hemisphere's security concept are “the need to recognize the close links between security, development and consolidation of democracy as well as the historical relationship between peace and democracy”. We are hence at a very special moment of our historical trajectory, where notorious disrespect for human rights are frequent threat to populations of Latin American countries. Drug traffic brings devastating consequences for the internal security of many countries in the Region and gives rise to a climate of war that challenges public policies and exposes the populations and governments to immense costs, affecting resource and areas that should be prioritized for further progress of our countries, all levels of society. While most developed nations discuss issues relating to the use of social achievements, we are still involved in the fighting against child prostitution, abandonment of children and adolescents, food insecurity, neglect and violence against the elderly, among other sad examples. This immense concern frame extends also to relations with the environment, with enormous consequences for future generations of Latin America. The construction of new prisons does not track the growth of the prison population and the inhumane conditions to which prisoners are subjected act as catalysts of crime, generating a vicious and terrifying cycle. The example of the Dominican Republic with the implementation of “zero laziness” in prison is a path to be followed by all the nations of Latin America. Initiatives to education, focusing on children and youth, with heavy use of art and science, may make all the difference and create today a future of peace and security, based on fraternity among all peoples.

Key words: Peace; Security; Sustainability; Happiness; Latin America

1 Introduction

What benefit could bring all the wealth of a human being if it lacks peace and security? Catherine Salles, in her book *In Underworlds of Antiquity* comments about life in the slums of Rome in the beginning of the II century B.C.: “Crowded in unsound and unhealthy housing, the inhabitants of the slums are exposed to all the dangers that nature or society does not cease to generate”.

After all this time we could see that this reality of the ancient world is still present today in the big cities of Latin America, where fear is present in all social classes.

Income inequality, as overwhelming as determining, establishes who has and who does not have the right to have security mechanisms without, however, ensure that this security is real and to ensure a minimum of everyday peace, whoever.

Although we are already historically distant from the beginning of civilization of mankind, we are forced to recognize that we are still far from a world turned to the happiness of man. We did not achieve democracy as a form of general government and suffer from the glaring inequality between

opportunities for rich and poor, so crucial to the insecurity and violence.

We witnessed a major paradigm shift, fundamental to the study of this topic - the threats to security and peace in the states before being mainly due to factors and external aggressions, are nowadays more an endogenous result, of primarily, social and multiple problems in underdeveloped countries. According to CHEYRE (2015): "However, in the 70's begins what we can characterize as a gradual expansion of the traditional concepts of security and defense that arises when we identify in the world and also in Latin America, threats to the security in a large scale than those who so far have been facing. While some come and linked to the military, then an increasingly wide range of topics and issues related to political, social, environmental and economic issues that subsequently drug-related phenomena joined was recognized, crime and now more recently minorities linked to refloat aspects of identity and nationalism, with a full agenda of various themes which fit issues of energy, climate, resources, ecology, demography, transnational movements, migration issues and other matters.(...)"

Problems such as social exclusion, drug trafficking expansion, deaths caused by road accidents, low quality education and truancy, increased crime among adolescents, mortality of the youth, mainly among the male gender, poor sanitation and health services, among other social dramas form a framework to increased insecurity and violence. The consequences are similar to a war of considerable proportions and sad.

Other forms of insecurity, so ancient, go back to extend their shadows on the societies within this new century: food insecurity, water, housing and many other. However, actions to fight the causes and effects of insecurity and violence are felt, often by the third sector initiatives and even by government actions. The complexity of the problems require integrated solutions, as we can see in the case of the reconstruction of Medellin, Colombia, as mentioned by BRAND(2001).

At the core of all the evils that could see the lack of security and peace is linked to lack of democracy, combined with growth of corruption. It was proven in "Peace and Corruption 2015" from "Institute for Economics & Peace" that these three factors are correlated. Among the regions that have experienced an increase in the level of corruption, is Latin America, including the Caribbean countries, also considered one of the most violent regions of the world; and as its mentioned in the Psalms since the old times Peace goes hand in hand with the so much needed (Social) Justice: *Love and faithfulness meet together; righteousness and Peace kiss each other* (PSalm85).

Latin American needs to face the fact that become in evidence through the Global Peace Index 2015 of the Institute for Economics & Peace studies indicating that: "Latin America remained the world's most violent region in terms of societal safety and security, as highlighted by its poor results in most related categories. This is particularly the case for Central America and the Caribbean, the lowest ranked region and where many of the world's highest homicide rates can be found."

This follows - among other factors - the fragile conditions of democracy, governance disability and power of corruption, aggravation of economic crisis, the immense social inequalities and increased drug trafficking in many countries in the region. Those where populist governments subverted the democratic logic in favor of the state power projects has worsened and violence has become frightening. The imperfections of weak democracies in Latin America favor the corruption that, in turn, feeds impunity, causing internal insecurity and violence.

Corruption in the police and judicial system feeds a vicious cycle, as described in the document "Peace and Corruption": "Increases in police and judicial corruption directly undermine the rule of law, thereby increasing political instability and can lead to the collapse of those institutions which were designed to prevent violence and conflict. This occurs in many fragile and low capacity contexts whereby once corruption reaches a certain point, police forces no longer perform a useful function in controlling crime, but rather become part of the problem."

2 Peace and Security - Citizenship and Happiness

2.1 The evolution of security concepts and peace

The end of the Cold War led to the review of security and peace concepts. The concept of security is now centered on the human person and concerning their lives and the degree of freedom that make their choices (SVETLANA, 2004). The concept of "positive and negative peace" invites us to reflect on social issues and how they affect the binomial security and peace. Obviously, this is fully applicable to Latin America, as defined by GALTUNG (1969):

"With the distinction between personal and structural violence basic violence becomes two-sided, and so does peace conceived of as the absence of violence. An extended concept of violence leads to an

extended concept of peace. Just as a coin has two sides, one side alone being only one aspect of the coin, not the complete coin, peace also has two sides: absence of personal violence, and absence of structural violence. We shall refer to them as negative peace and positive peace respectively. For brevity the formulations 'absence of violence' and 'social justice' may perhaps be preferred, using one negative and one positive formulation. The reason for the use of the terms 'negative' and 'positive' is easily seen: the absence of personal violence does not lead to a positively defined condition, whereas the absence of structural violence is what we have referred to as social justice, which is a positively defined condition (egalitarian distribution of power and resources). Thus, peace conceived this way is not only a matter of control and reduction of the overt use of violence, but of hate we have elsewhere referred to as 'vertical development'. And this means that peace theory is intimately connected not only with conflict theory, but equally with development theory."

These new concepts bring opportunities and challenges that we know well. As a matter of fact it takes political will, and citizenship development to confront endogenous problems without the temptation (and even the facility) to point out external factors for the problems in Latin America.

A struggle for peace and security will need to overcome centuries of passivity in the face of problems and causes with which, simply, we got used to leave along in Latin America.

2.2 Peace and security, democracy and populism in latin america

The costs of insecurity and violence are worrying worldwide, but Latin America, particularly South America, needs a special attention to this aspect, considering the Global Peace Index 2015 statement: "South America is the largest contributor to homicide rates by region and represents an expenditure of US\$250 billion". In South America this comes mostly from Colombia and Brazil. Moreover even though in recent years economic development has progressed significantly in both countries, crime rates have not experienced a corresponding decrease (which would be seen with such increases in wealth and development). One of the main observations regarding these two countries is that while the overall size of their respective economies has increased, the levels of progress in Positive Peace has not yet follow this trend. In particular, both Colombia and Brazil still hold high levels of inequities and corruption"; although Colombia is somewhat improving lately.

In Latin American countries (as in other parts of the world) there is a feeling that the police are highly corrupted, especially in Mexico (90% of the population), Jamaica (86%) and Venezuela (83%). These countries also boast high rates of homicides and violent crimes, according to the study quoted above, "Peace and Corruption 2015" this points the fact that the populations of fragile democracies and authoritarian regimes lead to greater police corruption. Moreover the conditions for "Positive Peace" are very rare or incipient in most Latin American countries. Chile and Uruguay have the best positions in the rankings of the Global Peace Index in the Region while the rest have a long way to go to improve peace conditions.

In addition weakening of democratic institutions in the Latin American states with populist governments, end up having an impact on the governance of such countries and fostering systemic corruption, which leads to a decrease in security and peace. Hence, the need to find ways to overcome populism and inefficiency of hypertrophied states that results from that lack of democracy condition. The illusion of the state as the sole provider of wealth has only made increasing inequality, poverty and corruption in a vicious circle that generates insecurity and violence - unnecessary, irrational and incompatible with the Latin Soul of the region. The achievement of security and peace in Latin America depends on the improvement of governance, which according to the World Bank Governance Indicators (WGI) includes five dimensions: "Voice and Accountability, Political Stability, Regulatory Quality, Rule of Law and Control of Corruption". Good governance is a consequence of democracy and leads to sustainable progress. The World Bank is actually keeping a record of many years regarding this 6 dimensions that show in general very little if any improvements in most of the countries of the region.

2.3 The relationship between security, peace and happiness in latin america

As indicated by Maslow's hierarchy of needs, Peace and Security are basic for Human wellbeing and becoming essential for happiness and an Harmonic Society as mentioned by IP PO-KEUNG(2014): "In view of the broad and substantive overlaps between harmony and happiness, it seems a society that exhibits signifying overlaps would have certain identifying features. In the Societal domain, safety, peace, stability, democracy, the rule of law, mutual respect, relatively wealthy, social health, freedom, social fairness, solidarity, friendship, sharing, balanced social interests, and environmental sustainability are the common components."

As a matter of fact Happier Societies are peaceful and enjoy security over multiple prisms. However following further up in the Maslow Pyramid there is also need for economic security, as

pre-supposed for a sense of peace and tranquility; however and as indicated by FERRAZA et al (2007), after overcoming the subsistence line, including access to water, food, housing and sanitation, financial conditions are not so critical for an increased sense of happiness, as shown Kahneman *et al.* (2006). Such finding shows that there is a "window of opportunity" for Latin America (and the world), where the pursuit of sustainability, beyond mere economic and financial progress provides us more harmonious societies and consequently happier ones.

Research by ARRGGLE(1987); MYERS and DIENER(1995); MOREIRA-ALMEIDA et al.(2006), people who claim to have faith, religion and / or spirituality are more likely to be happy and these condition is widespread among the peoples in Latin America.

3 Methodological Procedures

For the purpose of an statistical analyses data from 132 countries were considered divided in three regions:

- the Iberia American – AIBER – 21 countries;
- the advanced economies – AVECO – 28 countries;
- the remaining 132 countries – OTHERS – 84 countries.

Table 1 shows the means for each one of the 3 Regions (3R) of Synthetic Indicators such as Social Progress Index (SPI); Human Development Index (HDI); Governance (GOV); Corruption Perceived Index (CORR) and Environmental Performance Index (EPI); as well as some Analytic Indicators such as Discrimination and Violence Against Minorities (DISCVIOL); Community Safety (COMSAFETY); Traffic Deaths (TRAFICDEATH).

Table 1 ANOVAs Comparing Means and F's for Rescaled (0–100) and Positivized Variables (The higher the better)

3R	SPI	HDI	GOV	CORR	EPI	DISCVIOL	COMSAFET	TRAFICDEATH
AIBER	64.41	65.92	42.48	37.21	52.7	48.96	81.3	60.73
AVECO	90.3	87.36	83.25	74.94	81.39	67.1	89.43	90.01
OTHER	42.63	46.74	33.36	30.7	37.95	36.45	65.13	57.4
F	83.97	43.45	97.02	81.65	69.68	27.61	28.77	39.26

Source: Produced by authors

As shown more clearly in Figure 1 Latin America is in an intermediate situation between AVECO and OTHER regions, but it's still far from those of more developed nations, which indicates the need for improvements particularly regarding Governance and Corruption; and moreover is particularly close to OTHERS regarding Traffic Deaths !

Figure 1 Comparing the 3 Regions Regarding the Basic Indicators

The Dendrogram in Figure 2 indicates that the highest correlation among these variables is the one between Governance and Corruption, that means that Bad Governance impacts High Corruption and the no doubt the other way around too. This will in turn, increases insecurity and violence; and therefore affecting the level of Peace.

Figure 2 Dendrogram of Synthetic and Analytic Indicators

The averages presented in Table 1 show that the highest difference between AIBER and AVECO countries is regarding Governance (83.25 to $42.48 = 40.77$). Moreover the three countries with better governance in Latin America are, respectively, Chile (83.61), Uruguay (73.23) and Costa Rica (69.96); so only Chile got to the point of attaining the average Governance of the AVECO countries. go. Something very similar happens with Corruption Levels. Hence there is still a long way to go.

4 Conclusion

As shown above as a whole Latin America is in an intermediate situation between the group of developed countries and the least developed. It's like a teenager region, between childhood and maturity, where most countries are still suffering internal crises that results from high deficiencies in governance levels; moreover there is no happiness in the absence of security and peace and there is no peace and security in the absence of a "culture for peace"

Problems regarding security and peace in Latin America are now well known and quantified, including in terms of its causes. Solutions are being implemented, but despite the merit of these efforts, the problem of insecurity and violence seems far from eradication. The question is when or how will a Culture of Peace be developed in Latin America?

According to FREIRE(2009): "the United Nations defines the culture of peace as a set of values, attitudes, ways of behavior and ways of life that reject violence and to avoid when dealing with the causes that you are at the root to solve problems through dialogue and negotiation between individuals, groups and nations".

The challenge, of developing and sustaining Peace in Latin America will require coping with serious social problems and the lack of appropriate standards of governance in most countries of the region. Improving governance would allow greater control of corruption that may fosters Trust that would be essential to give some hope to the people of many Latin American countries.

Improving the educational system would no doubt contribute to a more equitable distribution of opportunities and therefore would increase social justice, without which it will be hard to think that one day the region may attain adequate levels of Peace and Security. Also art could help be as a catalyst of these changes, complementing education as well as preserving rich traditional cultures on the Region.

As a matter of fact the region has a great heritage of faith and spirituality; that may help to increase resilience and opens a predisposition to improve human, social and environmental conditions as recently pointed out by Pope Francis on his *Evangelii Gaudium* that is actually a warning as well as a moving call to worldwide Walk the Path towards a more Caring and Sharing Society

Today in many places we hear a call for greater security, but until exclusion and inequality in society and between peoples are reversed, it will be impossible to eliminate violence (EG59).

Schools Management in the Complex Thinking Perspective

Ana Maria Di Grado Hessel, Ivani Catarina Arantes Fazenda, Arnaldo José de Hoyos Guevara
Pontifical Catholic University of Sao Paulo, SP, Brazil
(E-mail: digrado@uol.com.br, jfazenda@uol.com.br, arnoldodehoyos@yahoo.com.br)

Abstract: The scope of this Paper is to clarify the unfolding of Complex Thinking concerning the role of management, as a result of a research carried out in some Brazilian Governmental Schools, where the dialogical movements were understood in the whole context in which the linear and systemic aspects coexisted. The studies of the theory of Complexity are the bases of the reflections on the management action, enabling articulation toward the self-organization of the group. It is observed by many researchers that the action of the manager usually encompasses the role of a planner of the work, with rational use of the resources and articulation of the means to reach the targets of the institution, in addition to the role of coordination and control of people's work. That has shown not to be enough to meet the challenges of the world nowadays. The processes of management may get different meanings: under a technicist conception, management is often centralized, decisions come from the top without participation of the other levels; under a more democratic conception, the process is more participative, and decision is collective. In this view, the manager is expected to promote collective work, encourage the participation of the different subjects of the team and institution community, establish co-responsibility and assure the construction and implementation of a proposal – a set of intentions – a collective agreement. To be able to do so, the manager should be prepared to perceive the team as a living system, able of self-organization, as well as the linear and systemic aspects in permanent balance.

Key words: Complex thinking; School management; Self-organization; Sustainability

1 Introduction

The strengthening of democratization represents a change in the net of power relations at the institution. The vertical flow of centralized command is replaced by more flexible horizontal relations. Power is not crystalized in hierarchical levels, but it is distributed among the teams of work which take responsibility for thinking and doing. Decision and action becomes complementary in the alive dynamics of the balance of polarities – not opposites as in the hierarchical pyramid. The dichotomy between planning and executing does not exist as mutually excluded. Instead, protagonism of those who share the same ideals for change increases, and they agree in taking a common task defined by negotiation of objectives. Success or failure of results are not attributed to a leader of command, but are the result of collective work. Control is much more related to follow up and evaluation of the process aiming at helping the subjects in their construction of responsible action. Plans of work are not imposed top/down nor outside/inside, but rather built, implemented and evaluated by the teams. Models make no sense, as the solutions come from the context, resources and degree of need and effort on the part of the people involved. This view of management actions expands as we reflected with the help of the Complex Thinking approach of Edgar Morin preparing managers to take decisions for sustainable development. Moreover knowledge and complexity and socially networked cultures are already an essential characteristic of progress in most developed countries as indicated by Hidalgo and Hausman from the MIT Media Lab; and that may now be even measured by the Economic Complexity Index (ECI).

2 From Administration to Management

In the last two decades, the expression 'school management' was introduced in the Brazilian educational context, replacing 'school administration', with the aim of encompassing new skills of the school principal, in the process of democratization of the governmental school. In this sense, school management is understood today, at least legally, as a collective and participatory process, which governs the way the school works, involving decision-making, planning, implementation, monitoring and evaluation of an educational policy.

In this context, the school principal is in charge of the implementation of the collective decisions of school boards, as well as the coordination of the operations of the school unit. The manager is expected to encourage the participation of the members of the team and the school community, define responsibilities and ensure the construction and implementation of a pedagogical proposal, ie a body of intentions, a collective pact. The democratic management concepts are closely interwoven with the

principles of citizenship, autonomy and emancipation, being a way to develop people for sustainability. Democratic management in school, in essence, is not a practice that can simply be instituted because it is a self-organizing process, coordinated by the manager, through participatory experience. This process is not mechanical, as social reality is extremely complex, the educational field is not neutral and the human being cannot be regarded as an instrument of production, distant from the natural world. Thus, the discussion on school management will be expanded below from the perspective of the complex thinking by Morin (2005a, 2005b, 2005c), covering the dialogical movement between linear thinking and systemic thinking.

3 Linear Thinking in Management: Hierarchical Control and Bureaucracy

Linear thinking, a hallmark of our times, tends to simplify reality, fragmenting it so it can be understood and controlled. It is appropriate for the treatment of mechanical and functional problems, but ineffective when dealing with issues that require a systemic view. Reason is overused, through rationalization, which perceives only the immediate answer, simplifying and reducing everything to simple causality.

The traditional model of school management, which expresses the linear, Cartesian and mechanist logic, has its recent origins in the Classical Theory of Administration, whose leading exponents according to Chiavenato (2000) are: the American Frederick Winslow Taylor and his studies on Scientific Management; the European Henry Fayol and the Classical Theory; the German Max Weber and the Theory of Bureaucracy.

One of the criticisms of the administrative models of Taylor, Fayol and Weber is the logical and deterministic approach of the organization, in which fragmentation and the mechanist division of labor prevail. Critical theorists of the twentieth century, guided by the Marxist conceptions, played an important role in denouncing the alienation in production processes and social relations of such administrative models. As a result of this alienation, human being were perversely prevailed from understanding the nature and product of their work, as well as perceive themselves as human beings, part of a systemic nature where they are encompassed. The human dimension in its entirety was eclipsed by the excessive importance given to a fragment of a human being's capability: labor force.

The model and practice of school management, based on the classical management theory, served the purpose of the mass formation of a skilled labor for mechanical work. The structural model of the industry was reproduced in school by maintaining organizational efficiency, centralization of power and instrumental use of communication at the service of control of the production machine.

The ideals of discipline and obedience, plausible in the context of productivity optimization, have become the linear communication standards, desirable in the school environment in which subjectivities are hidden and unrecognized.

Even nowadays, schools are characterized by pyramidal power structure and the fragmentation of school work. In what concerns school organization, the division of labor in technical-administrative and pedagogical tasks is due to the value of specialization at work. The roles and responsibilities are defined through regulations, to maximize efficiency and to assure hierarchical control.

4 Systemic Thinking in Management: A Living Organization

While the linear thinking is effective for the analysis of the parts of a whole, systemic thinking is important for the understanding of the interdependence of parts.

Systemic thinking can be represented by the web of life, as this is its very essence. It is a contextual thinking in the concept of Capra (1997, p. 46): "systemic science shows that living systems cannot be understood by analysis. The properties of the parts are not intrinsic properties but can only be understood within the context of the larger whole."

A system is a set of components that are related to each other. It keeps an organization and a structure. The organization defines the system's identity and expresses its configuration through the essential features of its parts. The structure is defined by how the parts are related. The structure of the system changes during its existence, in permanent exchange of energy with the environment. It is an autopoietic system in continuous regeneration.

In the systemic thinking, the labor organizations are conceived as dynamic, not linear networks, as the mechanist paradigm is not enough to explain them. For Capra (2002), human organizations resemble living systems. They cannot be controlled like machines, through instructions, because they react to the impositions.

Regarding the organization as a living being, there is awareness that the system is able to get self-organized, to learn, to change and evolve naturally, because its intrinsic feature is self-production. It is in constant circular retroactive movement, of own creation, seeking for sustainability in the balance of two paradoxical forces: autonomy and dependence.

The notion of human autonomy is complex and is directly related to the idea of dependence. According to Morin (2001), the subject depends on the environment in which he or she lives, learning a language to communicate, in order to acquire knowledge and generate new knowledge. These are fundamental perceptions to build an attitude towards sustainability.

The sustainable management of democratic school is based on the experience of the dialogic principle of autonomy / dependence, through the strategic coordination of actions and mediation of interpersonal relations. The living organization, in this case, is a self-eco-organizing system with relative autonomy, as it constantly interacts with exterior, and is able to create its own determinations and purposes.

Systemic thinking is necessary for the manager, as it allows him to view school life beyond the bureaucratic routine and formal / functional relations. School dynamics may be understood as a living being, a culture in permanent construction.

Democratic management can fit in this conception, for autonomy and dependence, in dialogical movement, are complementary polarities that characterize the emancipatory process.

An articulation action can be unveiled by the manager when understanding that the own power can be used to stimulate shared decision-making, in which he takes the coordinator position. Thus, he / she can create opportunities for him / her and his / her team to experience new relations and for the educators isolation scenario to assume new settings.

Systemic thinking is opposed to linear thinking, but both are embraced by complex thinking, so that reality is understood.

5 Complex Thinking in Management: Dialogic Relationship Between Linear Thinking and Systemic Thinking

Morin (. 2005a, p 151) explains that all organizational relationship produces antagonism with complementarity, ie, "[...] the complementarities that are organized between the parties secrete antagonism, virtual or otherwise; . dual and complementary identities coexisting in each part is itself virtually antagonistic "As in the TAO, a figure of complexity, the female principle yin contains within it the yang masculine principle, antagonistic and dormant; in opposite relationship, the male yang principle contains latency in the female principle yin. When a polarity reaches its peak, it reveals within it the seed of its opposite.

Linear thinking which is expressed in the bureaucratic matrix and systemic thinking characterized by the vision of the whole oppose dialogically, that is, are complementary opposites, according to the interpretation of complex thinking (Morin, 2005a, 2005b, 2005c). The linear thinking and systemic thinking are always present in the same reality. The prevalence of one over the other may represent a simplistic attitude in the interpretation of reality, if they exceed, for example, in the particularization or generalization. Mariotti (. 2007, p 82) explains: "The holistic view is as reductionist as the Cartesian. One reduces to aggregation, while the other reduces by fragmentation."

The school organization reflects in its domain all the social complexity as it is a part of this. It is a cell of the social hologram, therefore it reflects inside the dynamics of the whole of which it is part. As society, it is also a living organism that is able to get self-organized. Metabolically (Moraes, 2004) it is in permanent reorganization or regeneration, in response to all processes of disintegration. Inside, the relations are ambiguous, appearing as complementary and antagonistic. Beside the movements of change, there are conservative forces, collaboration and resistance are forces which coexist, as well as order and disorder. A force is always in operation in response to the simplifying character of the opposite force.

Morin (2005a, p. 151) explains that all organizational relationship produces antagonism with complementarity, that is, "[...] the complementarities that are organized between the parts segregate antagonism, virtual or otherwise; the dual and complementary identity coexisting in each part is itself virtually antagonistic" As in the TAO, a symbol of complexity, the female principle yin contains within it the yang masculine principle, antagonistic and dormant; in opposite relationship, the male principle yang contains in it, in latent form, the female principle yin. When a polarity reaches its peak, it reveals within it the seed of its opposite.

With the vision of complexity on the school organization, it is possible to deal with the paradoxes that are perceived in everyday reality, which is predictable and at the same time unstable and uncertain. The school culture is ambiguous and has a contradictory character, because it has elements that stimulate innovation, as well as elements which contribute for conservation. Routine and emergent situations alternate; formal and informal relationships flow in parallel; ambiguities are natural in the game of convergence and divergence.

Understanding reality from the perspective of complexity is to realize that there is a creative tension between the polarities depending on contradictions. The opposites are fed by this contradiction and the dialogic relationship is maintained, while new properties emerge that feed, as a recursive ring, the balance game of polarities.

The school is a place of conflict, of dialogic encounters that generate creativity. The subjects have different interests and values from each other that can be negotiated through dialogue. The dialectic can be helpful in finding a consensus whenever possible. A dialogics is necessary in situations where tensions remain, and also in what concerns diversity. The words by Mariotti (2007, p. 154) complement the idea: "Being able to distinguish when employing dialectics and dialogics is a highly strategic skill."

Conflicting situations are not only found in schools, but are part of the social fabric. They are the result of confrontation of ideas, in all social issues, especially of political nature. In fact, it is they that are reflected in the school. An example of this is the paradox in which managers are in the task of mobilizing educators for participatory and co-responsible building of a political-pedagogical project.

Thus, the management action faces a conflicting reality, explicated by De Rossi (2006), whose interests and values emanate from two distinct and contradictory forms of reasoning: the regulatory one and the emancipatory one. The linear reasoning of regulations is at the service of public policies that are governed by the market economy and are extremely concerned with quick results, while the emancipatory reasoning regards the socio-political citizenship construction as a process.

A major challenge for the school manager is to encompass the coordination of bureaucratic and educational activities in such a way they express a relationship of interdependence. In practice, there is a division of activities due to the technicist culture still prevailing in governmental schools. The educational activities tend to be under the supervision and full responsibility of the coordinators, while bureaucratic activities monopolize all the time of the school manager. This split is due to a fragmented and reductionist vision of school teams who base their actions only in the list of regulations drawn up by school assignments. They lack a vision of the whole, a perception of the systemic reality.

Educational and bureaucratic doings are imbricated in the democratic and complex dimension. The bureaucratic tasks, called 'the means', are necessary to give support to the school routine, to the maintenance of the infrastructure, the implementation of the projects, in short, to give life to the intentionality of the formative educational process. Otherwise, if they are valued as 'core activities' they will assume a linear and instrumental character. On the other hand, the educational activities are made viable through the bureaucratic structure and legal boundaries.

Bureaucracy is also ambivalent. It has an operational and rational characteristic, as it encompasses working methods and applies impersonal rules to ensure the good work of the organization. However, this same bureaucracy can be manipulated by rationalization, running the risk of becoming an administrative blockage, to the extent that the real purpose is distorted.

Besides the bureaucratic and routine activities, there are planned actions. The former are predictable and resemble rigidity, the latter are focused on uncertainty and emerging elements. Planning is a more strategic action, as it works in the field of unpredictability and flexibility, in opposition to the program through which everything is done by automation (MORIN, 2000, 2001).

In addition, planning, in the complex and democratic dimension, is an activity resulting from collaborative movements inherent to participatory spaces. They emerge and are consolidated as leaders and their teams do not arise as mutually exclusive opposites. In this case, management is not exercised with authoritarianism, but gains recognition and legitimacy when there is respect and value of individuality and diversity. The balance between the polarities is maintained because the focus of the changes remains on the interests and meanings. Significant disturbances act naturally in organizations, perceived as self-organizing systems, without having to undertake a mechanical effort to put them in motion.

These impulses may trigger structural, unforeseen changes. Under these conditions, intuition, according to Motta (2001) shall be valued in the action of an officer, beside the analytical rationality, as it produces the global vision required to cope with ambiguities and uncertainties which are present in the emerging situations at work. What is desired is a balance between order and chaos, logical and illogical elements, rational and intuitive ones.

In modern organizations, communication of inter-subjective nature emerges at the heart of management practices, concomitant with the reduction of both, relations of subordination and use of communication only to transmit orders and guidelines.

In contemporary management, the concept of authentic communication arises in professional activity. According to Zarifian (2001, p. 165), it is “a process by which reciprocal understanding is established which leads to a shared meaning, resulting in further understanding of the actions that those involved take together or in a convergent manner.” This meaning is transformed in the course of this communication according to the viewpoint exchanges and explicitation of common needs. From the reflective dimension of meaning, that is, the subjective and practical redesign, the subject directs his / her thoughts and actions, undertakes the own change in face of the events or problems that have made a pre-existing situation lose stability. The expression of that individual dimension is the mark of freedom of the subject, an attribute of civility in modern society.

However, authentic communication is related to expressiveness, that is, in the right to freely express the personal meaning that is contained in the thinking and action, in relation to the partners of communication, as well as the power to express this sense in the initiatives concerning ideas and the doing with autonomous responsibility. Thus, the individual assumes the causality of the own actions.

In line with this, there is a dialogical relationship in the management action, that is: to assert an idea or action in terms of the management skills to direct and control, and at the same time, use authentic communication as a source of reflection on the challenges of the company and the subjective engagement of the individuals who compose it.

Thus, the interpersonal relationship based on the authoritarian model of obedience, and control gains a new meaning by the collaborative model, which values friendship, cooperation, fellowship and consensus. While the first model exemplifies the patriarchal culture and is based on distrust and desire for domain, the second is related to the matristic culture, recognize trust as the principle of interpersonal relationships.

Mariotti (2000) summarizes the essence of these two matrixes according to their characteristics. The patriarchal culture is described as an expression of linear thinking, which, in turn, is guided by the need to control nature, to encourage competitiveness, to use deterministic discourses of exclusion, based on immediacy and dichotomies such as good / bad, friend / enemy, and others.

The matristic culture, representative of complex thinking, is distinguished by understanding the human being in tune with nature, by the participation, solidarity, inclusion, as well as acceptance of reflection on paradoxes and differences.

6 Conclusion

The articulating action of School Managers is a complex undertaking, but not complicated. It turns around the key words, like: democratic management, participation, autonomy, emancipation, and others of the kind. The change is systemic, but it requires the manager's attention to the context and at the same time, the value of educators. Looking at the whole and the parts, without losing sight of the intersubjective plot. In other words, taking care of the atmosphere of the school is crucial for the members of a work team to find pleasure and meaning in their work on a self-sustaining movement, helping students develops attitudes of a sustainable world.

Research on Development Trend of Cultural Industry Structure in China Based on ARIMA Model

Liu Bingfeng, Yan Ningning

School of Business Administration, JingDeZhen Ceramic Institute, Jingdezhen, P.R.China, 333403

(E-mail: txcf2000@163.com)

Abstract: The paper according to the proportion data of the cultural industry output value from 1952 to 2008 accounted for the GDP, ARIMA time series model and time series model based on delay dependent variable auto-regressive are established through the concrete data using comprehensive analysis. Through model analysis, the conclusion is that since 1952, the fluctuations of the proportion of the cultural industry output value account for GDP is larger. In a period around 1978, the proportion of culture industry reached trough; but after 1984 the situation improved and the proportion is increasing year by year, this is consistent with the rapid development of China's cultural industry economy after the reform and opening policy implementation; and in recent years the proportion of the cultural industry in gross national products in the stable. And according to the change trend of cultural industry production value proportion and analysis the proportion of cultural industries output value, understand that our country's culture industry structure should be optimized, to vigorously develop the cultural industry at the same time, should pay attention to the adjustment of industrial structure, and promote cultural industry better and faster development.

Key words: Cultural industry; Cultural structure; ARIMA model; Proportion; Empirical study

1 Introduction

At present, China's per capita GDP exceeded 2000 dollars, city gasification rate reached 47%, is in the industrialization accelerating to in the late stage, from the international experience, the stage of culture industry driven collaborative economic growth strengthens day by day, and gradually become the main body of the modern industrial system. However, from the overall supply of culture industry, the total amount is obviously insufficient, the service level is low, competition ability is not strong; from the internal structure of cultural industry, the traditional service industry is developed, the modern service industry, the emerging service industry, logistics industry lags far behind; in last few years development in the same state, the cultural industry output value proportion to be improved. In 2007 March, the State Council issued "several opinions on accelerating the development of service industry" put forward clearly, to 2010, and strive to make the service industry added value accounted for the proportion of GDP than in 2005 increased by 3 percentage points; the industrial structure based on service economy form conditional and medium-sized city^[1]. In this context, to speed up the development of service industry becomes our country faces a major and a long-term strategic task, which has significant and profound realistic significance^[2]. In particular, for many years China's economy has sustained rapid growth, however, the unreasonable industrial structure, the extensive mode of economic development, resources and environmental constraints exacerbate such problems still exist, these are must study seriously and need to be addressed effectively. So the research on the development of the cultural industry production value proportion is very necessary^[3].

In the prediction of the development trend of the research on data and data problems on time series model is a better model, and compared before papers in cultural industry proportion predicted this aspect mostly choose a model, but a single model has limitations, so in the specific to the identified delay variable auto-regressive non stable time series model based on the ARIMA model, and then, according to the empirical data in China, what kind of model is better is our research direction, but also to the analysis of the data before breakthrough^[4]. At the same time, we will culture industry production value proportion and relative growth speed in the same picture visual comparison, further illustrates the current situation of cultural industry structure is not reasonable^[5-6].

2 Preparation on Model Construction

2.1 Certain assumptions

We make the following assumptions from the nature of the economic development trend in recent years as well as the data itself: The 1 development trend of China's cultural industry output value proportion can be used ARMA (P, q) or ARIMA (P, D, q) model to fit, may the better, but can not

explain the economic significance. The decomposition of theorem 2 can use time series: decomposition and Wold decomposition theorem or Cramer decomposition theorem of the calendar year of cultural industry output value proportion data uncertainty and random effects. And autocorrelation test in order to test the effect of extract of random uncertainty whether full effect. In the following analysis, modelling, we separately these two assumptions on the cultural industry output value proportion data, proposed in 1973 by Japanese statistician Akaike AIC criterion and the Schwartz in 1978 according to the Bayes theory put forward by SBC criterion to evaluate the obtained fitting and the merits of the model, using the AIC criterion and SBC criterion, can effectively make up for according to the autocorrelation and partial autocorrelation graph diagram to determine the order of the subjectivity, in all through the tests of the model makes the AIC or SBC function reaches the minimum model for the relative optimal model. At the same time, assisted with the rationality of model fitting effect diagram and the prediction results to evaluate the merits of the model.

2.2 Theoretical basis of model building

1) has the following structure model called autoregressive integrated moving average model, called ARIMA (P, D, q) model:

$$\begin{cases} \phi(B)\nabla^d x_t = \Theta(B)\varepsilon_t \\ E(\varepsilon_t) = 0, Var(\varepsilon_t) = \sigma_\varepsilon^2, E(\varepsilon_t \varepsilon_s) = 0, s \neq t \\ E x_s \varepsilon_t = 0, \forall s < t \end{cases} \tag{1}$$

Type in $\phi(B) = 1 - \phi_1 B - \dots - \phi_p B^p$ as stationary reversible ARMA (P, q) autoregressive coefficient polynomial model; $\Theta(B) = 1 - \theta_1 B - \dots - \theta_q B^q$ is ARMA (P, q) mobile smoothing coefficient polynomial model.

2) auto-regressive model construction thought is the first information to identify the main decomposition method to extract the sequence by uncertainty factors:

$$x_t = T_t + S_t + \varepsilon_t \tag{2}$$

T_t is the trend effect fitting, S_t fitting for the seasonal effect. While the extraction factor decomposition method for uncertainty information may not be sufficient, the need for further testing autocorrelation of residuals of the $\{\varepsilon_t\}$ sequence. If the inspection result shows no significant autocorrelation, the deterministic regression model to illustrate the extraction of information more fully, can stop the analysis. Extracting enough, consider the establishment of the residual sequence fitting autoregressive model:

$$\begin{cases} x_t = T_t + S_t + \varepsilon_t \\ \varepsilon_t = \phi_1 \varepsilon_{t-1} + \dots + \phi_p \varepsilon_{t-p} + a_t \\ E(a_t) = 0, Var(a_t) = \sigma^2, Cov(a_t, a_{t-i}) = 0, \forall i \geq 1 \end{cases} \tag{3}$$

The following two kinds of commonly used trend fitting model of the effect of practice:

3) auto-regressive model, the power function as the independent variable of time t

$$T_t = \beta_0 + \beta_1 t + \dots + \beta_k t^k + \varepsilon_t \tag{4}$$

4) auto-regressive model, the independent variables to observe the value of $\{x_{t-1}, x_{t-2}, \dots, x_{t-k}\}$ for the history

$$T_t = \beta_0 + \beta_1 x_{t-1} + \dots + \beta_k x_{t-k} + \varepsilon_t \tag{5}$$

3 Construction of ARIMA Model

3.1 Sequence diagram

First of all, to our country since 1952, culture industry output value accounted for the proportion of gross domestic product to draw a sequence diagram, as shown in figure 1.

Figure 1 Cultural Industries Accounted for the Proportion of the Total Output Value of the Timing Diagram

3.2 Differential operation and pure random inspection

By the sequence diagram can be seen, the series is non-stationary, therefore cannot use ARMA (P, q) model. And it can be seen that the sequence contains a significant trend curve, we can use the low order (2 or 3 order differential effects) to extract the curve trend, to realize the sequence trend stationary, in actual operation, the two order differential ideal, get the timing diagram of two order difference such as shown in Figure 2.

Figure 2 Cultural Industries Accounted for the Proportion of the Total Output Value of the Timing Diagram

Sequence of smooth, we have to do the pure random testing on the sequence, the test results are shown in table 1. We took a significant level of 0.05, due to the 6 order, 12 order delay of P value is less than 0.0075 and 0.0233 respectively, less than the level of significance, can reject the sequence as the original hypothesis of randomness, i.e. the time sequence is non-random, that data continue to study is meaningful.

Table 1 White Noise Test Results

To	Chi-Square	DF	Pr>	ChiSq	-----Autocorrelations-----				
6	17.52	6	0.0075	-0.242	-0.312	-0.002	0.257	-0.204	-0.163
12	23.57	12	0.0233	0.115	0.196	0.025	-0.160	-0.074	0.073

3.3 Difference model structure

Partial correlation diagram showing sequence has obvious tailing. The integrated autocorrelation and partial autocorrelation properties, for fitting the model order is MA (2) model, namely, the original time series ARIMA (0,2,2) model.

3.4 Significant test

Table 2 Conditional Least Squares Estimation

Parameter	Estimate	Standard Error	t Value	Approx. Pr > t	Lag
MU	-0.01958	0.04663	-0.42	0.6763	0
MA1,1	0.48242	0.13320	3.62	0.0007	1
MA1,2	0.28748	0.13338	2.16	0.0358	2

Results show that the constant p value is 0.6765 larger than the significant level (0.5), that is, MU is not significant, other parameter p values were less than the level of significance (0.5), which were significantly. The removal of the constant term, again carries on the parameter estimation. Test of significant model parameters need to be estimated and the parameters determined after SAS operation, the obtained results are shown in table 2. Obviously, the two parameter p value is very small, two parameters were significantly. Significant test for the whole model. We can see that the delay of each order LB statistics for P values significantly greater than 0.05, so the fitting model significant vertical.

3.5 Specific form fitting model

The specific form fitting model for:

Factor 1: $1 - 0.47993B - 0.28603B^2$

That is,
$$\nabla^2 x_t = \frac{\varepsilon_t}{1 - 0.47993B - 0.28603B^2}$$

Or the equivalent in mind for: $x_t = 2.47993x_{t-1} - 1.67383x_{t-2} - 0.09213x_{t-3} + 0.28603x_{t-4} + \varepsilon_t$

Using the fitting model to predict the sequence of x_t , as shown in table 3.

Table 3 Predicted ARIMA Model

Obs	Forecast	Std Error	95% Confidence	
58	40.0642	1.3885	37.3428	42.78
59	40.2244	2.5264	35.2728	45.1760
60	40.3846	3.5092	33.5066	47.262
61	40.5447	4.4649	31.7937	49.2958
62	40.7049	5.4273	30.0676	51.3423

We can see that in the next five years, the cultural industry output value accounted for the proportion of GDP does not have too big change.

4 Conclusion

At present, China is in the middle stage of industrialization, the development of the social economy rapidly into the city, the market, the internationalization of the track. Accelerate the development of cultural industries, improve the proportion of the cultural industry in the three industry structure, is an important way to promote the adjustment of industrial structure, a fundamental change of the mode of economic growth; is the overall enhancement of comprehensive competitiveness, improve the overall quality of the national economy and the residents quality of life in an effective way; is the inevitable choice to promote economic health, coordination, sustainable development; is the effective guarantee to promote sound and rapid development of the national economy.

Research on the Status Quo of Implementation of Science and Technology Insurance in China*

Liu Zimei, Cao Qing, Xie Kefan

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 814198410@qq.com, caoqing13@Foxmail.com, xiekefan@163.com)

Abstract: Science and technology (S&T) insurance is a new institutional arrangement aiming at transferring scientific and technological risk and promoting enterprise technological innovation. S&T insurance in China developed rapidly through the gradual pilot work. This paper introduces the basic theory of scientific and technological risks and S&T insurance, to take an overall understanding of S&T insurance, then analyzes and evaluates implementation status of S&T insurance pilot cities, and points out the problems and difficulties in implementation process of S&T Insurance. Finally, the paper proposes relevant countermeasures for the government, high-tech enterprises and insurance companies respectively, to provide a reference for the healthy development of China's S&T insurance.

Key words: S&T insurance; Technological innovation; Scientific and technological risk; Pilot cities

1 Introduction

S&T insurance is a novel concept born in China. Xie Kefan and Ni Shuguang (1995) first proposed the concept of S&T insurance and defined the scope of S&T insurance, highlighted that S&T insurance is the tool to transfer the risk of failure and termination in the research and development process of high-tech enterprises. With the development of S&T insurance in China, Scholars such as Shao Xueqing (2009), Xie Kefan (2010), Zhao Shi (2012), Xue Weixian (2014), Li Hongkun (2015) studied the connotation, the function, innovation of new types and operation mode of S&T insurance. Some scholars discussed S&T insurance in more specific way, and concluded some mature theories on high-tech enterprises protecting and transferring scientific and technological risk. Tiller and Bedigian (2001) studied on technology insurance in intellectual property field. Luigi Buzzacchi and Giuseppe Scellato (2008) tended to studied technology insurance of patents. Scott J. Shackelford (2012) focuses on network risk insurance.

Since 2007, China has initiated S&T insurance in Beijing, Wuhan, Chengdu, Shanghai and other 12 pilot cities (regions), this act has a huge impact on transferring scientific and technological risk and promoting innovation activities in high-tech enterprises. Most of China's S&T insurance pilot areas are still at an initial stage, and have the urgent need to get more promotion and development. This paper examines the implementation status of S&T insurance, and summarizes relevant experience of typical pilot areas, analyzes the existing problems, and then puts forward relevant countermeasures.

2 Scientific and Technological Risks in High-Tech Enterprises and S&T Insurance

High-tech enterprises are both the mainstay of technological innovation to bear the main benefits and risk of technological innovation. Scientific and technological risks include technical risks, financial risks, talent risks, market risks. Technical risks mainly are: 1) product development failure, 2) delay in production of new products, 3) product quality defects, and etc. Financial risks mainly include: 1) lack of R&D funds, 2) problems on export business loan recovery, and etc. Talent risks mainly are: 1) high-tech brain drain, 2) high-tech talent health problems, and etc. Market risks mainly include: 1) new products have not achieved the desired effect, 2) new products lack of competitiveness, and etc.

High profit is the driving force of high-tech enterprises to conduct technological innovation, however all kinds of risks become the obstacle for enterprises engaged in technological innovation. The S&T insurance combines science and technology with insurance, becomes a particular tool to transfer scientific and technological risk of high-tech enterprises. According to the business security object classification, the existing 15 S&T insurance types of China can be divided into four categories, as shown in Table 1. At present, the types of S&T insurance are less, still can not fully meet the high-tech enterprises needs to avoid and transfer scientific and technological risks.

* The paper is supported by the national soft science research project (project number 2010GXS5D241)

Table 1 Types and Categories of S&T Insurance

Categories	Types of S&T insurance
High-tech enterprises R&D achievements category	product development liability insurance, product liability insurance, product quality guarantee insurance
High-tech enterprises business environment category	key research and development equipment insurance, research and development business interruption insurance, high-tech enterprise property insurance, investment loss insurance, patent insurance
High-tech enterprises employee security category	senior management and core R&D staff accident insurance and health insurance, board of directors and the supervisory senior management professional liability insurance, employer's liability insurance
High-tech enterprises social responsibility category	export credit insurance, environmental pollution liability insurance, microfinance guarantee insurance

3 Status Quo of Implementation of S&T Insurance Pilot Cities

Beijing, Chongqing and other five cities of China are the first group S&T insurance pilot cities. After years of promotion, S&T insurance has steadily sustainable development. The relevant S&T insurance statistical data of these pilot cities was collected with a representative, as shown in Table 2 and Figure 1.

Table 2 The Relevant S&T Insurance Statistical Data of Six Pilot Cities up to 2012¹

Items	Beijing	Wuhan	Chongqing	Suzhou	Shenzhen	Tianjin
Guaranteed high-tech enterprises	427	400	106	45	40	55
Insured amount	520	500	188	208	183	187
Premiums paid	5886	6500	1225	1884	675	1517
Financial subsidies	3100	1000	393	204.3	1000	440
Payment amount	2953	2785	4569	366	1000	1153
Financial subsidies to premiums paid	53%	15%	32%	11%	148%	29%
Payout Amount to premiums paid	50%	43%	373%	19%	148%	76%

To analyze the numbers of guaranteed high-tech enterprises, Beijing, Wuhan each has more than 400 guaranteed high-tech enterprises, to pay premiums about 60 million yuan, and the insurance amount is more than 50 billion yuan, reflecting the high-tech enterprises are of high enthusiasm to be insured. Chongqing has 106 insured enterprises, the number of insured enterprises in Suzhou, Shenzhen, Tianjin were around 50, and the premiums paid and insured amount are relatively small, showing high-tech enterprises in these four pilot cities are of less awareness of S&T insurance, the development of S&T insurance in pilot cities is uneven.

To examine the situation of financial support, Shenzhen provides subsidies nearly 1.5 times the premium to guaranteed high-tech enterprises, whereas Beijing subsidies for guaranteed enterprises is more than half of the premiums paid. Followed by Chongqing, Tianjin, Wuhan, Suzhou, government financial support for guaranteed enterprises is relatively low.

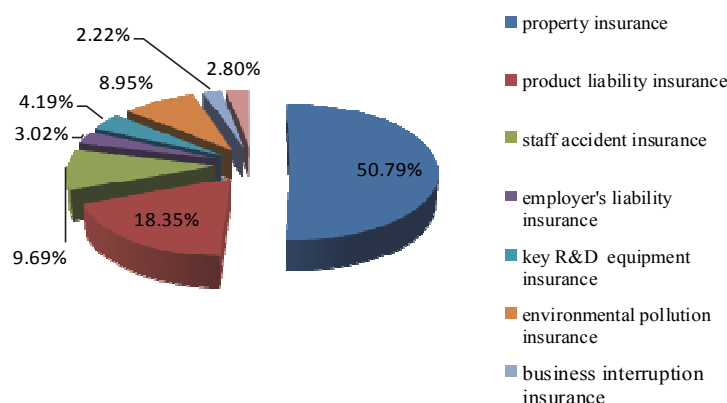

Figure 1 S&T Insurance Premium Distribution of Wuhan in 2011²

To detail the situation of payment for guaranteed high-tech enterprises, guaranteed enterprises in Chongqing get about 45 million payment amount, 3.7 times the amount of the premium paid, guaranteed

¹ (Source: local Science and Technology Bureau)

² (Source: Wuhan Science and Technology Bureau)

enterprises in Beijing, Wuhan each get payment amount of nearly 30 million yuan, showing that pay scale in these three pilot cities are relatively large. Guaranteed enterprises in Suzhou, Shenzhen and Tianjin receive relatively smaller amount of S&T insurance payment.

To discuss the situation of S&T insurance premium distribution, property insurance has the highest premium income accounted for 50.79 percent of all types of insurance, product liability insurance accounts for 18.35 percent, followed by staff accident insurance and environmental liability insurance, the rest of S&T insurance premium share are very low, indicating a serious imbalance in the distribution of S&T insurance.

In general, the development of S&T insurance in China has made a breakthrough, but there are three prominent problems: First, some local government financial subsidies for S&T insurance is not in place, incurs a negative effect on the insurance initiative of high-tech enterprises to a certain extent. Second, the type of S&T insurance is not rich, the existing insurance structure can not meet the comprehensive needs of high-tech enterprises, and some technology venture can not be guaranteed. Third, S&T insurance coverage has an uneven development, and high-tech enterprises prefer the continuation or extended of traditional insurance coverage.

4 Recommendations for Further Development of S&T Insurance

In order to further promote the development of S&T insurance, the main measures proposed are:

4.1 Recommendation for local government

Local government should put emphasis on the financial subsidy policies of S&T insurance, and combine financial subsidy policies with other incentives policies to support technological innovation. The policy mix of tax incentives policy, venture capital policy and S&T credit policy could grant the high-tech enterprises a full range of support and protection to conduct technological innovation.

The government should encourage insurance companies to create new types of S&T insurance, and use the patent policy to protect their innovation of new S&T insurance types. For instance, the insurance company has a patent right for the new type of S&T insurance they created, while other insurance companies have no right to participate in the related businesses of the new S&T insurance, and the new S&T insurance services will be available to all insurance companies and the market until the government buy the patent from the insurance company.

4.2 Recommendation for insurance companies

Insurance companies should strengthen the awareness of innovation of new S&T insurance types, to provide professional, high-quality insurance services to high-tech enterprises. Insurance companies could classify the risk from the aspects of innovation activity and from the different involved bodies, and then create new S&T insurance types accordingly. For the demand of high-tech enterprises, insurance companies can focus on the development of independent innovation first (set) products insurance, high-tech enterprises financing insurance and scientific and technical personnel security insurance.

Insurance companies could cooperate with insurance intermediaries and banks to innovate insurance services model. Insurance intermediaries and banks have the information superiority insurance companies do not, the cooperation can solve asymmetric information, risk identification, risk assessment and other issues in S&T insurance business, to provide a personalized risk management strategy to high-tech enterprise, and also give support for insurance companies to determine premium rate, and make it more profitable.

4.3 Recommendation for high-tech enterprises

High-tech enterprises should seriously study the knowledge of risk management, and gradually build enterprise risk management system, and according to the feature and the level of risk to choose the proper type of S&T insurance to transfer risk and develop innovation activities. Moreover, high-tech enterprises should strengthen communication with government departments, to reflect the business demands. When preferential policies for enterprises may not be implemented, the enterprises and trade unions could complain or suggest to relevant departments to actively protect their own interests.

5 Conclusion

S&T insurance greatly promotes the cooperation between science and technology and insurance, is an important measure with a strong strategic significance to implement education strategy and promote independent innovation. Through tripartite collaboration of government, high-tech enterprises, insurance companies, S&T insurance of China will get a good and orderly development. With the support of the

government policy and the promote of S&T insurance, there will be better risk diversification and protection of corporate innovation activities, so that more enterprises will participate in technological innovation, and ultimately accelerates the construction of innovative country of China.

Research in Universities' Patents Transformation in China

Li Ming, Yu Zongru

School of Arts and Law, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: liming@whut.edu.cn, 1548863795@qq.com)

Abstract: The 21st century is the era of knowledge economy, the quality of patent transformation is an important measure of the national scientific and technological level. But it is also an important criterion of reflecting a national scientific and technological innovation capacity and economic competitiveness. This paper argues that Chinese universities out of the market application of patent applications, and the insufficient management of intellectual property and protection transformation in patents transformation. The shortage of financial support for research funding is a major problem in Chinese universities, which should be solved in the transformation of patent. By strengthening enterprise's project docking and co-development, and actively guiding the development of small and pilot scale, and improving the possibilities of conversion, focusing on the economical practical value in research project, strengthening the measures, such as technology transfer center career capabilities can effectively improve patent conversion rate.

Key words: Knowledge economy era; College patent; Patent transformation; Patent transformation system

1 Introduction

1.1 Research presentation of foreign situation

Intellectual property originated in western countries, domestic research on intellectual property rights than China much earlier. They did a more in-depth research in the current situation of patent transformed, problem and cause of it. They put forward a number of practical recommendations. On the one hand, universities rely on government investment to improve the economic interests of the patent. On the other hand, universities can manage their own patents which generate economic benefits. In research of this area is relatively mature, they has formed a sound management system patents, patent applications as well as supporting policies and institutions, and also set up specialized agencies responsible for it particularly. They adjust the strategy through intellectual property, the growing number of patent, and patent quality will be improved, thus it contributes to the transformation of the implementation of the patent. For example, establishment and development of patent system is ahead of other countries in the US, which have been earlier patent specification in the mid-17th century. The US patent system in the production practice through constant changes and additions, and gradually formed a relatively complete system of patent management and protection.^[1] Due to these factors, universities in Western countries have got enormous social and economic benefits by patent management, and it has become a very successful business activities.

1.2 Research presentation of Chinese situation

Compared with the United States, the rise of Chinese intellectual property is still relatively late. Situation research focuses on issues about the college transformation of science and technology, in the study of science and technology achievements transformation of universities. The main needle transforming scientific and technological achievements from mode, operation mechanism, factors, problems and countermeasures of universities to improve scientific and technological achievements study recommendations. But the researchers said the study of university patent Transformation, mainly from theoretical analysis, which is lack of empirical data to support appropriate research and specific situations. We summary that the Chinese college patent Transformation: First, Chinese universities patent transnational research started late and develop slowly. Second, it lacks of systematic transformation at the present stage of Chinese college patent. Third, Chinese domestic research with respect to foreign, there is an apparent gap between still less research of economic transformation of university patents.^[2]

2 General Situation of Patent Transformation of Chinese University

Because gathering talent people, excellent research conditions and strong scientific and technological innovation with Universities, which gather more attention from the world economy and it is also the main science and technology investment direction of government. In recent years, countries around the world develop strategies to promote university patent industrialization. Especially in the United States

and Japan, which have done a lot of work for the university patent, and also achieved good results. Compared to the United States and Japan, China attaches great importance degree in university patents should be improved, and we also should provide a reliable theoretical basis. In order to accelerate the study of university patents, patent strategy improve the quality of colleges and universities to improve the patent, the effective promotion of patents. To research universities' patents, their status is real basic research, from the phenomenon to the nature of the issue, and they put forward effective countermeasures to improve the situation, whose purpose is to improve the international competitiveness of high-tech.

According to the Science and Technology Universities Compile Statistics, which shows there is only one supreme science and technology award in Chinese universities in 2013. National natural science Award 33, including there are 4 of the first prize, 29 of second prize. STIA is total 64, including three first prize, 61 of second prize. National Science and Technology Progress Award 192, two of grand prize, 10 of first prize, 180 of second prize. The various departments of the State Council of Science and Technology progress Award 1173. Under the Science and Technology Progress Award of provinces and autonomous regions and municipalities 3821. In 2013, a total of 3821 university patent awards have been applied. In 2013, the applications of patent total 106714, authorized 68,971. Turnover 2357, accounting for only 3.4 percent of whole patents. Universities and research institutions patented technology conversion rate is far lower than the full rate patent transformation. According to an empirical analysis suggests that Chinese college patent transformation. In 2014, top ten universities patents schools of China, there are four patent universities whose conversion rate of more than 50 percent of institutions, 30 percent to 40 percent of institutions have six, patent conversion rate is generally low. Patent lowest conversion rate of only 37 per cent only. From 2006 to 2013, the total patent applications in China reached 10.355 million, but the amount of invention is granted patent 5.9 million authorized rate is 57.5 percent. Total number of patent applications for invention is 3.455 million, while the amount of invention patents 1.08 million authorized rate of only 31 percent.

Secondly, the situation of the international patents application. According to Chinese patents will be published statistics. Chinese international patent applications 21516 in 2013, which accounted for 10.5 percent in global applications. While the US global patent applications 57 239, which accounted only 37.5 percent in the U.S. Analyzing of China awards and international patent applications universities and technological achievements, which illustrates the quality of Chinese university patent is not high. It also don't match the quality of patents and patent applications.

3 Problems of Chinese Universities Patent System's Transformation and the Reasons Analyzing for It

3.1 Problems existing in the Chinese universities patent transformation

In recent years, applications and granted patents in universities has shown rapid growth, but also there are many problems in Chinese universities patent transformation. For example, most colleges and universities patent conversion is low, the quality of patent transformation is not high, and the conversion of the patent system management has its drawbacks. All of these make a gap between China's colleges and universities in the development and management of patent and the western countries. Also in research and development activities in colleges and universities is not really to combine closely with market applications, which has also led to a drop in the quality of patents and patent application. And in contrary to that, And foreign professional patent investment company, using scientific research resources of colleges and universities, put forward a targeted market research and development project, through the study commissioned or patent acquisition "refresh" patent layout, which pose a potential threat to China's industrial development. An application for a patent for the existing main problems are from the market, colleges and universities patent conversion rate is low, and the lack of management and protection of intellectual property rights, the patent into the money shortage, etc^[3]. In order to promote the ability of China's colleges and universities patent creation, utilization, protection and management. It is necessary to get a further study in the present situation of our college patent technology transformation work and problems, to put forward relevant suggestions and countermeasures, provide reference and recommendation for Chinese college patent technology transformation work.

3.2 Analysis of the problems existing in the transformation of Chinese universities patent

3.2.1 Colleges and universities patent application is out of the application of the market

Because the patent technology transformation work of our country college has been away from the market application and so result in college patent technology transformation dynamics is insufficient.

The quality of patents and patent technology conversion has showed a trend of decline, not conducive to the transformation of scientific and technological achievements in colleges and universities. On the one hand, the scientific researchers are accustomed to the pursuit of technical level, emphasizes the technical achievements to attain the international and domestic advanced level, and ignored the market orientation and the reality of economic value, scientific and technological achievements and patent technology transformation of consciousness is not strong.^[4] On the other hand, evaluation system in colleges and universities are more dependent on important journals such as the publications and patent application number, evaluation of quality of patents, patent technology transformation and reward mechanism is insufficient, resulting in a large number of teachers in colleges and universities attaches great importance to the research. The application of basic research and despise attaches great importance to the patent application and despise patent technology transformation.

3.2.2 Shortage of college patent transformation in the management and protection of intellectual property rights

Management and protection of intellectual property rights has gradually integrated into the college of science and technology development agenda. Many colleges and universities have issued the regulations on the protection of intellectual property. In 1999 formulated the Tsinghua university provisions about promoting transformation of scientific and technological achievements, reward for successful transformation of scientific and technological achievements of science and technology personnel, allow individuals to implement transformation and so on have made that clear.^[5]

However, from the overall, the transformation of colleges and universities in the patent protection of intellectual property rights and management still exists many problems. Firstly, the patent protection consciousness is too weak, although has strong scientific and technological innovation capacity in university, but because of the patent law the propaganda work of knowledge and to strengthen the patent protection for not doing enough. Secondly, Chinese most of the protection in universities' intellectual property work lack of unified leadership. Intellectual property management system is not perfect enough. Thirdly, Chinese most universities patent work by the school hosting of scientific research management departments, most colleges and universities has not yet set up a special intellectual property management, the lack of perfect patent system.

3.2.3 Research funding shortage

In recent years, due to the lack of scientific research base in universities and the lack of funding, which can't make patents realize industrialization quickly. Though the university scientific research funds has been a relatively greatly increased, but the amount is limited, relative to the colleges and universities is still insufficient demand, difficult to obtain significant results. University of science and technology enterprise is little investment in the country or in a few cases, the accumulation relying on their own rolling development. Few colleges and universities can get government or agency technology achievement transformation fund or risk fund, one can, lack of necessary capital input, college patent technology transformation will lack the necessary material base, again good, have market prospect of patent results also are unable to commercialization. State Intellectual Property Office on Universities Patent Investigation. Analysis shows that Chinese universities lack the funding of Patents accounts for 86% of the total survey.^[6] The data also reflecting the capital factor is also the important reason of the process are some patents. Patent transformation is a complicated process, the realization of the process, requires a lot of manpower and material resources and financial resources. In the process of transformation of the patent with particular emphasis on these links, patent transformation of inadequate investment, especially the lack of money, make some risk is bigger, in the short term is difficult to effective patent is difficult to convert.

4 Suggestions to Conversion of Chinese Colleges and Universities' Patent

Nowadays, China has been deepening reform and further opening to work hard to build the Socialist Market Economy. Under this new circumstance, the colleges and universities should take their own advantages and contribute to economy construction all the time. To build and develop the Socialist Market Economy, we should make more contributions, such as paying more attention to and promote enterprises' technical transformation, converting and popularizing our inventions, introducing and absorbing foreign new outstanding technology. There are several suggestions to the conversion of colleges and universities' patent.

First, it should be sticking to strengthen co-operations with enterprises, which is the most effective way to increase the rate of conversion. According to needs of enterprises, colleges and universities can

take advantages of knowledge and experimental equipment to develop research and devise activities, which have specific market objects. The intellectual properties acquired in this way, can be put into practice quickly, create social and economic values.^[7] Based on provisions of trust agreement, these intellectual properties usually belong to both sides, but enterprises have rights to apply them into practice. It is also possible for enterprises or colleges and universities to own whole intellectual properties. However, ownership of the achievements of further researches should belong to person who invent them.

Second, guiding the development of small-scale and pilot is important to increase possibilities of conversions. Under the current policy, scientific research administrations in colleges and universities should encourage teachers to invent by those measures such as adjusting the systems of testing, reward and propaganda. Before applying for a patent, pilot scale test or small scale test is essential. Using samples to apply for patents should be a standard of test for patent. After pilot scale test or small scale test, achievements are basically mature, which have more advantages on practicability and have specific market targets. It's relatively accurate to estimate investments and profits. At the same time, the inventions through pilot scale test can decrease the risks, increase the confidence to enterprises when being converted. It can also decrease period of negotiation.

Third, changing researchers' minds, that is, patents created by researchers should bring economic values.^[8] Scientific administrations in colleges and universities should strengthen management, especially when researches apply for patents that are same or similar. Number of patents is not the point, on the contrary, quality and effect are the keys to patents. Researchers should be good at combining scientific researches with technological innovations, balancing the relationship between them. Only through technological innovation can scientific research achievements create economic values to realize the social values.

Finally, strengthening the professional function of technological transfer center in colleges and universities. Technological transfer center in colleges and universities is a successful mode to transfer or convert intellectual properties in United States and Japan. Currently, because of a large amount of patents and management affairs, some of comprehensive universities in our country establish technological transfer center to deal with issues about intellectual property. The main function of this organization which belong to colleges or universities, is applying for a patent, paying fees to maintain a patent, contacting to convert and deliver relative market information. At the same time, it also take on some management work of science and technology department. According to our researches, in a college or university who has many authorized patents, if a person is in charge of applying for patents and paying fees very well, there is no enough time to marketing to enterprises. Marketing to enterprises is mainly relied on intermediary technological agent. It reflects that the operation of technological transfer center in colleges or universities don't meet requirements of market or enterprises. Therefore, it's high time to strengthen construction of technological transfer center, making it independent to science and technology department. To improve ability of technology transfer, it should strengthen professional personnel allocation, which make itself reach the professional standards as market intermediary technological agent and operate in the market way.^[9]

5 Conclusions

According to the researches about problems of conversion of patent in colleges and universities in our country, the number of applying for patents and authorizing patents show the importance of universities' innovation in patent. However, the quality of patent and social economic values is also important to colleges or universities. From the construction of patent system in Chinese colleges and universities to the development of patent conversion, many universities show their advantages of technological innovation. But there are many problems in patent conversion. Compared to western countries, our colleges and universities have a huge gap in rate of patent conversion. To solve these problems, we should establish reasonable patent conversion system, make proper policy which is beneficial to the development of patent. In the aspect of marketing, we should strengthen the cooperation between universities and enterprises to make patent bring economic values. At the same time, researchers should change their old minds. Number and quality are both important to express huge advantages of scientific and technological innovation.

Enlarging the propagation and education to all society, improving the whole society's mentality of intellectual property, enlarging administrative enforcement and building a better marketing circumstance intellectual property are important tasks in a near future. The work of intellectual property should be

market-oriented, enhance the cooperation between universities and enterprises and adopt the industry-university-research cooperation. Meanwhile, we should make reasonable test measures based on technology conversion to encourage researches to select project from market, to test in enterprises. Only in this way, it can solve the problems enterprises have and patents in colleges and universities can convert fast. Finally, universities, enterprises and market can form a sound relationship of interaction and cooperation.

Study on the Dynamic Relationship Between Foreign Trade, FDI and the Economic Growth in the New Normal

Wang Rong

College of Jincheng, Nanjing University of Aeronautics and Astronautics, Nanjing, P.R.China 211156
(E-mail: wxr920@163.com)

Abstract: Recently, our economy has developed rapidly. The foreign trade and FDI grows continually. In the new normal, that whether foreign trade, FDI and the economic growth has a relationship or not has become a hot issue in the academia. This essay, on the basis of the VAR model analysis methods, makes a study on the relationship between foreign trade, FDI and economic growth from 1994 to 2014. And the results show that there is a cointegration relation between the foreign trade, FDI and the economic growth. And this essay will figure out some actions to sustain the economic growth in the new normal on the basis of the empirical analysis.

Key words: Foreign trade; FDI; Economic growth; The new normal

1 Introduction

Recently, our economy has developed rapidly. The foreign trade also has a rapid growth. Since the end of 1994, the foreign trade has reached 2 trillion RMB and been on a rapid development track. Up to the December, 2014, the foreign trade volume reached 26,433.5 billion RMB, which surpasses the USA to be the first. The foreign trade has made a great contribution to the economic growth, meanwhile, China's resources and investment environment has greatly attracted foreign businessmen. The bring-in of FDI has provided funds for economic growth and introduced advanced technologies. That whether there is a relationship between foreign trade, FDI and economic growth or not has been very popular. There are large numbers of studies on the influence of FDI to a country; these studies have focused on FDI to the country economic growth, foreign trade, technological progress, industrial structure and employment, etc. On FDI and economic growth, Jordan Shan (2002) using VAR method research the relationship between FDI and economic growth in China, Finding there is bidirectional causality between FDI and economic growth, but on the influence of FDI to economic growth is greater than the influence of FDI on economic growth. Domestic Sang Xiu Guo (2002) study positively correlated relationship between FDI and economic growth, FDI has a promoting effect on economic growth, but it is not the main cause of China's economic growth. China's economic growth is the cause of the FDI growth. Wei jiang liu (2002) study shows that FDI to China's foreign trade volume expansion has played a great role in promoting, both from foreign and import, FDI in our country are showed significant trade creation effect. While Shi Xiaolong (2004) research has shown that FDI to our country foreign trade has a significant role in promoting.

Throughout domestic academia for FDI research, we found that more studies are on relationship between export, import and the economic growth, the relationship between FDI and economic growth. Few studies are on the relationship between these three. Besides, China's economy faces the new normal. And China's economy is endowed with new meanings and new characteristics. So this essay plans to analyze the dynamic relationship between the foreign trade, FDI and the economic growth and aims to provide suggestions to promote the development of the economy.

2 Data and Methodology

2.1 The data sources

In this essay, the sample chooses the data between 1994 and 2014. The data come from the *China Statistical Yearbook*. In order to deprive of the influences of price, the GDP deflator is used with 1994 as the base period. The data of FDI come from the *China Statistical Yearbook*. Every year's FDI multiplies the annual average exchange rate. Meanwhile, in order to the reduce the influences of price, the FDI variables are translated with the GDP deflator with the 1994 as the base period. The GDP is measured with RMB. And the import and the export are measured with US dollars. So firstly, the unit of account of the import and export has to be translated in RMB. Besides, this essay also uses the CPI to deflate the data and then calculate the logarithm of these data and get $\ln(EX)$, $\ln(IM)$, $\ln(FDI)$ and $\ln(GDP)$.

2.2 The methodology selection

In order to explore the dynamic relationship between foreign trade, FDI and the economic growth,

this essay chooses to establish VAR models of 4 variables including imports(IM), exports(EX), FDI and GDP. VAR is set up on the basis of the characteristics of the data. In the economies, the variable will be influenced by its own hysteresis value and other variables' hysteresis value. So the single variable in the autoregressive model needs to be changed to C, which is the VAR model. The expression of the model VAR should be :

$$y_t = A_1 y_{t-1} + A_2 y_{t-2} + \dots + A_p y_{t-p} + Bx_t + \varepsilon_t \tag{1}$$

(t=1, 2, L, T)

In the equation, y_t is the endogenous variable with the K - dimensional vector. T is the number of the samples. P is the order of the lagged variables. x_t is the endogenous variable with the D-dimensional vector. The K×k matrix A_1, \dots, A_p and the k×d matrix B are the coefficient matrix. ε_t is the variable influenced by the K-dimension. In the model VAR, in order to reflect the dynamic characteristics of the models, p and r have to be very big. However, if p is overly large, the degree of freedom in the model will be reduced. So we must establish a balance between these three. This balance can be made by AIC principle and SC principles.

3 Results

3.1 The stationary tests of the variable time series

According to the Econometric Theory, if the time series are non-stationary series, spurious regression is easy to get, which makes that traditional models can not reflect the relationship between the explanatory variable and the explained variable. In order to avoid the spurious regression, this essay will use the ADF method to make a Unit Root Test on various tests. The results are as follows:

Table 1 The Unit Root Test of Ln (EX), Ln (IM), Ln (FDI) and Ln (GDP)

Variable	ADF	5%	Terms of inspection (c, t, k)	Result
Ln (GDP)	-2.0253	-3.4629	(C, T, 1)	Not smooth
Ln (IM)	-2.3359	-3.4629	(C, T, 1)	Not smooth
Ln (EX)	-1.2987	-3.4629	(C, T, 1)	Not smooth
Ln (FDI)	-2.3256	-3.4629	(C, T, 1)	Not smooth
ΔLn (GDP)	-3.3963	-3.0001	(C, 0, 3)	smooth
ΔLn (IM)	-3.5526	-3.1200	(C, 0, 0)	smooth
ΔLn (EX)	-3.9961	-3.0314	(C, T, 1)	smooth
ΔLn (FDI)	-4.214	-3.1212	(C, 0, 3)	smooth

Note: in the test, c, t represent the constant term and trend term. K represents the Lag Intervals for Endogenous. Δ represents the first order difference.

From this, we can see that Ln (EX), Ln (IM), Ln (FDI) and Ln (GDP) are non-stationary. But these four are all first order stationary. Therefore, we need to further test it.

3.2 Cointegration test

In order to make sure that whether Ln (EX), Ln (IM), Ln (FDI) and Ln (GDP) have a stable and long-term relationship, this essay will adopt Johanson's method of maximum likelihood to test the cointegration relationship between Ln (EX), Ln (IM), Ln (FDI) and Ln (GDP) . The selection of optimal Lag Intervals for Endogenous of Johanson test is determined by the p. The test results are as follow:

Table 2 The Cointegration Test Results

Variable	Eigen value	The trace statistic	Results	Cointegration equation
Ln (GDP)	0.3612	8.2311 (10.40)	1	Ln (GDP)=0.221Ln (EX) +0.05 Ln(IM)+ 0.136Ln (FDI)+ 5.3056 (0.006) LR: 59.31
Ln (EX)	0.1158	3.6018 (5.79)		
Ln(IM)	0.0996	3.2589 (4.65)		
Ln (FDI)	0.2263	7.2356 (11.20)		

The Cointegration test results show that the Cointegration test statistic receives the hypothesis that the Cointegrate vector is "1". Therefore, we can think that these 4 time series has a long-term stable

relationship. From the Cointegration Equation, we can see that FDI and import and export have a positive influence on the economic growth. When FDI increases by 1%, the economy will increase 0.136%, which means that FDI and GDP are positively correlated. When import increases by 1%, the economy will increase 0.05%. and when the export increase 1%, the economy will increase 0.221%.

3.3 VAR model and granger causality test

The Cointegration test shows that there is a long-term and stable cointegration relationship between these three. However, whether this kind of relationship is causal relation still needs to be proved. This essay will use the Granger Causality Test to test whether there is a causal relation between variables. The test results are as follow:

Table 3 The Results of the Granger Causality Test

The null hypothesis	F Statistic	P Values	Results
Ln(FDI) is not the cause of Ln(GDP)	6.2621	0.0108	reject
Ln(GDP) is not the cause of Ln(FDI)	3.0503	0.0231	reject
Ln(FDI) is not the cause of Ln(EX)	5.7122	0.0121	reject
Ln(EX) is not the cause of Ln(FDI)	1.6339	0.9625	accept
Ln(FDI) is not the cause of Ln(IM)	1.1252	0.3358	accept
Ln(IM) is not the cause of Ln(FDI)	1.4689	0.5045	accept

The results show that firstly, when the significance level is 5%, Ln (FDI) and Ln (GDP) influence each other. On one hand, the rapid development of China’s economy attracts much foreign direct investment. The increase of FDI leads to a great growth of the foreign exchange reserve. The growth of FDI causes the increase of the monetary base, which finally increase the money supply and then stipulate the economy. On the other hand, the flow of the FDI promotes the domestic investment in related fields and then provides more jobs and pushes the economy forward. Facts prove that when FDI increases by 1%, the economy will increase by 0.136%. On the other hand, with the rapid development of economy, China’s resources and environment become more attractive, which can prove that FDI and economic growth can influence each other? Secondly, when the significance level is 5%, Ln (FDI) causes Ln(EX) . The mass inflow of FDI increases the domestic investment and then provides more jobs. The growth in domestic production will increase the export. The Ln (EX) is not the reason of Ln (FDI) which shows that FDI can promote the export growth and the export growth cannot attract investment. This is mainly because the structure of exporting goods. For many years, the energy intensive, highly polluting and resources products occupy a large part in the exporting goods, which is not good for attracting foreign capital. Thirdly, when the significance level is 5%, Ln(FDI) cannot influence Ln(IM), which can prove that the growth in import is the reason of the increasing domestic demand. The import is not the reason for the inflow of FDI. The inflow of FDI is mainly determined by that whether the domestic economy can attract the foreign capital or not.

3.4 Error correction model

The Cointegration Test shows that there is a long-term and stable relationship between Ln(GDP)、Ln(IM) 、 Ln(EX) and Ln (FDI) . However, the stable relationship cannot put up with the outside influences or the balance will be broken out. So the short-term dynamic model should be built.

Error correction model can prove the stable relationship between Ln(IM) 、 Ln(EX)、 Ln (FDI) and Ln(GDP) and correct the short term balance. This essay will establish the error correction model to explore the short term fluctuation. The error correction model’s results are as follows:

$$\Delta^2LnGDP=0.0023+0.1024\Delta^2LnEX+ 0.0015Ln(IM) +0.131Ln (FDI) -0.245e_{t-2}$$

$$R^2=0.9901 \quad DW=1.9722$$

We can find that degree of fitting of the model is high. In a long term, the cointegration has a huge power, which can change the imbalance to the balance. The coefficient of correction can show the adjustment degree of the imbalance. If the short term data deprives of the long term data, the model will change the model with the adjustment degree as 0.245. And the ratio for error modification is negative, which can reflect the negative setting of the repair mechanism.

4 Conclusions

From the results of the positive analysis, we can conclude that: Firstly, there is an obvious cointegration relationship between FDI and the economic growth. Although their own growth is unstable, the relationship is stable. Secondly, through the Granger casual relationship test, we can find that: ①Ln

(FDI) and Ln (GDP) can influence each other. ②LnFDI can have an influence on LnEX. And LnEX cannot influence LnFDI. ③Ln(FDI) is independent on the Ln(IM) and the Ln(IM) is also independent on the Ln(FDI). ④all these can prove that FDI is an important reason of the economy growth. Thirdly, the Error correction model can show that in a short term, there is a dynamic adjustment system between the foreign trade, FDI and economy growth. In the long term, the adjustment degree of the imbalance is about 24.5%.

4.1 Improving the export structure and attracting the inflow of the foreign capital

This essay proves that the export can exert a huge influence on the domestic economic growth. Therefore, we need to improve the structure of the export, guarantee the export of the labor intensive products, expand the export of the Electromechanical products and hi-tech products, develop the service industry and service outsourcing, build our brands and the marketing networks, control the export of the energy intensive or highly polluting products to attract the inflow of the foreign capital.

4.2 Adjusting the export strategies

The empirical analysis proves that the import exerts a huge influence on the economic growth. Adjusting the import strategies can promote the economic growth. We should encourage importing the advanced technologies, equipment, innovative results and resources and raw materials, controlling the import of the low-technology goods to form an intensive economic growth pattern, improve the productivity and the core competence of the exporting enterprises. This can prompt the import to increase the economic growth and then promote the export growth.

4.3 Creating a market full of fierce competition

To promote foreign enterprises to bring in more advanced technologies and take part in more research activities, it is important to maintain the competition in the market. The international enterprises are easy to form the monopoly in the regional market dependent on the funds, technologies and governments' favorable policies. Therefore, only by creating a competent environment can foreign enterprises produce more new technologies and products. Domestic enterprises and foreign enterprises all need a competent environment. The institutional barriers should be removed to let enterprises become the major role in the market. In addition, some industries have advanced technologies and fund barriers. Domestic enterprises cannot have a high competence in a short term. In this situation, at least 2 enterprises should be introduced in to form a competition among them. Foreign enterprises will bring in more advance technologies and services to get more market shares. And then domestic enterprises can get more information and technologies.

4.4 Improving the innovation ability of the domestic enterprises

On one hand, enterprises should put more investment in the research and development to improve their own innovation ability, especially the ability to make use of the foreign funds and the ability to take in the technologies. On the other hand, government should encourage enterprises to make innovations. For instance, To promote enterprises to cooperate with research and institutions, to promote enterprises to share technologies and to promote more investment in the new technologies. Besides, we should make use of the opportunity of the international division of labor and International Industrial Restructuring to improve the quality of foreign capital and technology content. And then we should take advantage of the technology spillover effects to foster their own innovation ability.

4.5 Strengthen policy coordination, promote the balanced development

Foreign investors should be encouraged High technology industries and advanced manufacturing. China's current capital is relatively abundant, Foreign exchange reserve is adequate, the international trade balance surplus slightly every year, construction funds Gap is not big, in this case, the investment focus should shift to high technology And advanced management, encourage foreign companies in China promotes the research and development ability, belt Dynamic domestic industrial upgrading; Speed up the process of open services, encourage foreign investment to the knowledge Modern services flow; Im actively introduce advanced agricultural industry in the developed countries Production management technology, the development of green ecological agriculture emphatically, so as to optimize foreign investment Industrial structure, promote industrial upgrading in China.

Research on the Relationship Between Differentiation Strategy, Heterogeneous Resources and Performance of HTSME

Qi Shuyang

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: qishuyang93@163.com)

Abstract: This article studies the relationship between differentiation strategy, heterogeneous resources and firm performance of high-tech small and micro enterprises. Firstly, the article will do a literature review about the effect differentiation strategy and heterogeneous resources on firm performance, then building a model about the above three, proposed assumptions that differentiation strategy and heterogeneous resources have a positive impact on firm performance, and obtain data through investigation and research, using SPSS19.0 for data analysis and processing, obtained conclusion that both differentiation strategy and heterogeneous resources has a positive impact on firm performance, but compared with differentiation strategy, the heterogeneous resources has less impact.

Key words: Differentiation strategy; Heterogeneous resources; Enterprise performance; HTSME

1 Introduction

HTSME (High-tech Small and Micro Enterprises) play an important role in China's national economy and social development, promoting the development of small and micro enterprises also promotes national economy steady and rapid development. But the HTSME themselves faced with various difficulties and challenges, their late development results in HTSME have been appeared some problems that include not enough emphasis, risk resilience is not enough, and the burden of financing, lack of market demand and so on. Since the financial crisis, China's HTSME are facing many problems. By studying heterogeneous resources and differentiation strategy of HTSME, and analysing the impact of differences strategy and heterogeneous resources on enterprise performance, and thus draw conclusions in favor of the development of HTSME.

Researching the effects of heterogeneous resources and differentiation strategy on performance can not only help HTSME to solve their own development in the presence of problems, but also provide reference for HTSME on how to use heterogeneous resources, differentiation strategy to improve performance. Not only promoting the development of HTSME faster and better, but also conducive to China's economic development. How does heterogeneous resources and differentiation strategy impact on performance? What is the impact mechanism? Thus, this article do literature review on the basis of previous studies, model assumption, examples of verification and data analysis to get the final conclusion and summary.

2 Literature Review

The primary basis of differentiation strategy is heterogeneous resources, so study the impact of differentiation strategy and heterogeneous resources on the business performance is significant. Especially for HTSME in China, the difficulties encountered in the early days, how should they use heterogeneous resources for differentiation strategy to improve business performance, and how they handle the relationship between differentiation strategy, heterogeneous resources and enterprise performance?

The so-called differentiation, refers to the elements of the enterprise in the form of the business entities to provide products, or various conditions in providing products in the process, compared with other enterprises which provide similar products or service, causing particularity enough to lure buyers, so buyers will differentiate it with other companies operating similar products, and differentiate enables different companies within the same industry products or services reduce substitutability, which means that the strengthen of product market monopoly elements. Differentiation strategy can be many ways: design or brand image, technical characteristics, appearance characteristics, distribution network and uniqueness of other aspects. It should be stressed that the differentiation strategy does not mean that companies can ignore the cost, but now the cost is not the company's primary strategic objectives. Mintzberg (1978) thought that the Porter's differentiation strategy can be broken down into five cases which conclude market image differentiation, product design differentiation, quality and differentiation, support differentiated and undifferentiated, which are emphasized the role of advertising, R&D and

product development, reliability and performance, products and imitation. Philip Kotler (2002) pointed out that whether a difference is worth establishing, it should see if it can meet the following characteristics: Importance, Exclusivity, Superiority, Perceptual, Preemption, Affordability, Profitability. Even so, when the company introduced a new product or service to the market, even if do a little minor improvements for an existing product or service, to distinguish their products or services with other, it will attract consumer concerns, and produce new feeling. Therefore, all the elements that can make their products or services different from other products or services can be attributed to differentiation. But just a certain point to seize market share is not enough, but more importantly, to make their own products or services are unique, significantly different from the other, and to attract consumers. Above we mention that the primary basis for the implementation of the differentiation strategy is heterogeneous resources, then what is heterogeneous resources?

RBV theory think that, if the resources of the enterprise meet the characteristics of valuable, difficult to imitate, can not copy and the scarcity, then the resource of competitive advantage is persistent, and will improve the enterprise long-term performance. Then competitive advantages that the resource generating has persistent, and will enhance long-term performance. Accordingly, RBV scholars proposed conclusion that heterogeneous resources is the root of differences between Competitive Advantage and Corporate Performance.

What is "Valuable", Barney (1991) made a clear explanation and definition. In his view, the valuable of resource is able to make business with a lower cost than competitors to get the same profit, or the same cost to get more profit, then we can bring a competitive advantage for enterprises; and, when such resources are scarce or are irreplaceable, then the resource brings competitive advantage is persistent. For the scarcity of resources, scholar Hitt (2002) gives a straightforward exposition. He noted that the scarcity of resources means that this particular resource is only possession and control by the industry's few companies. For difficult to imitate and not copy characteristics of resources, Hitt and other scholars to be the same definition and analysis. In their view, not copy means that competitors can not replicate through technical means, while difficult to imitate refers to the high cost of the same resources to imitate. In sum, the RBV theory think that the root of the discrepancy between the different companies lies in the different of nature of the firm constitute resources. Differences in resources has led to the different both competitive advantage and the length of time to maintain competitive advantage. If the companies are trying to gain a competitive advantage in the fierce competition in the market, it makes necessary to have a valuable nature resource companies; if trying to maintain long-term competitive advantage, it necessary to make this valuable resource to meet the scarcity and difficult to imitate characteristics.

3 Research Model and Hypothesis

3.1 Effect of differentiation strategy on enterprise performance

Dess and Davis (1984) analysed and summed up the 21 kinds of driving factors, designed a scale to measure competitive strategy type, to be followed seven strategic management scholars seminars, 19 corporate CEO survey, found that companies do exist several types of competitive strategy through factor analysis and cluster analysis, and performance indicators which is measured by return on assets and sales growth positively correlated with differentiation strategy. Based on this, this study presents the following hypothesis and verification:

Hypothesis1: differentiation strategy has a direct positive impact on business performance.

3.2 Effect of heterogeneous resources on enterprise performance

HTSME engage in innovation through the integration of existing enterprise resources, based on the existing capacity of enterprises, including technology companies and management capacity, and foster or form new private or heterogeneous resources of enterprises. Private resources or heterogeneous resources bring the excess returns to the enterprise under the protection of isolation mechanisms to enable enterprises to gain competitive advantage. Based on this, this study presents the following hypothesis and verification:

Hypothesis2: heterogeneous resources has a direct positive impact on business performance.

3.3 Hypothetical model

Based on the above hypothesis, this study proposes relationship conceptual model about the differentiation strategy, heterogeneous resources and firm performance, as shown in Figure1.

Figure 1 Relationship Model about the Differentiation Strategy, Heterogeneous Resources and Firm Performance

4 Data Analysis

On the operational definition and measure of differentiation strategy, heterogeneous resources and corporate performance, as far as possible using scales the existing domestic and international literature has been used. Dess and Davis designed scale to measure type of competitive strategy .Subsequent studies, most of indicators are based on that Dess and Davis set 21 methods of competition and make appropriate adjustments according to the characteristics of the study, the article is mainly based on Dess and Davis designed scales to be modified, then selected three metrics: Attention to product brand, Attention to R & D and innovation, Attention to marketing techniques. For heterogeneous resources, the current difficulties faced by high-tech small and micro businesses is focused on technological innovation, financing ability, talent aggregation, etc., so for combine the status quo of the current HTSME, we could measure from technical innovation, financing ability, talent gathered three aspects .Kaplan and Boston (1996) think that it should be from the customer satisfaction, staff development and learning, internal processes and management and financial performance to reflect the business performance and competitive advantage the overall balance, scholars called the Balanced Score Card. Therefore, according to description that Kaplan and Boston discussed on the Balanced Score Card, which selected our research needed indicators, and combined with the need our study ,concluded financial, internal processes and management, employee learning and growth, customer satisfaction this four changes of circumstances. All these questions use Likert scale measure 7, 1--7, respectively, "not" --- "complete." Table 1 variables and metrics can be drawn from the above scale.

Table 1 Variables and Metrics

Variables	Variable name	Metrics	Metric name
Differentiation strategies	X1	Attention to product brand	x1
		Attention to R & D and innovation	x2
		Attention to marketing techniques	x3
Heterogeneous resources	X2	Technical innovation	x4
		Financing ability	x5
		Talent gathered	x6
Enterprise performances	Y	Customer satisfaction	y1
		Staff development and learning	y2
		Internal processes and management	y3
		Financial performance	y4

After forming the questionnaire, questionnaires are distributed and collected mainly by Wuhan High-Tech Development Zone, and Wuhan High-tech Development Zone assist the distribution and recovery in the above business park. Select the payment approach, on the one hand there is a good group with these institutions and cooperative relations, on the other hand can ensure the integrity and reliability of survey data. T test has been used on returned questionnaires which at different times, and found no significant difference. Thus, the recovery of the sample is statistically representative of the population, and finally selected a sample of 20 questionnaires to analyze. Finally, using SPSS19.0 software for data analysis:

a. Dependent variable: y4

5 Analysis and Conclusions

As is shown from SPSS19.0 analysis data, x2 for y1 regression coefficients significance test t value is $-0.410(p=0.687>0.05)$, x2 for y4 regression coefficients significance test t value is $-0.114(p=0<0.05)$, x4 for y2 regression coefficients significance test t value is $-0.726(p=0.726>0.05)$, x4 for y4 regression coefficients significance test t value is $-1.727(p=0.103>0.05)$, x5 for y3 significance of $p = 0.057 > 0.05$, x6 to y4 significance of $p = 0.062 > 0.05$. In addition, the remaining variables on the dependent variable of the regression coefficient significance test t values are positive, p less than 0.05, indicating that the dependent variable has a positive impact relationship.

x2 for y1 on the t is negative, but significant test was greater than 0.05, indicating negative for y1 to x2 is not great, but the x2 for y4 indeed has a significant negative effect; Similarly, x4 for y4 has not obvious negative effect, x5 on y4 has not obvious positive effect, x6 of y4 has not obvious positive effect. x1, x2, x3 represent differentiation strategy, x4, x5, x6 represent heterogeneous resources, thus we can conclude: both differentiation strategy and heterogeneous resources has a positive impact on firm performance, but compared with differentiation strategy, the heterogeneous resources has less impact. Therefore, the foregoing hypothesis 1, hypothesis 2 have been verified.

The Role of Foreign Direct Investment on Economic Growth

Antonio Goncalves de Andrade, Yang Qing

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(Email: antoniocv@live.com, yangq@whut.edu.cn)

Abstract The present work attempts to explore economic growth problematic by studying which factors can affect the economic growth. A time serial data from 1986 till 2012 was used and the ordinary least squares regression method was applied to analyze the relationship between gross domestic product set as a dependent variable and foreign direct investment, export, import and inflation rate as a independent variable. We emphasize the theories of economic growth, some empirical studies related to relationship of foreign direct investment with economic growth and empirical result of this study. The results show that foreign direct investment and import are positively associated with economic growth and they are very significant variables to explain economic growth in Cabo Verde while export and inflation rate has no significant impact on economic growth. This study brings new insights of gross domestic product relationship with foreign direct investment and provides empirical evidence of exceptional case of Cabo Verde.

Key words: Gross domestic product; Foreign direct investment; Export; Import and economy growth

1 Introduction

Every country in order to achieve the international competitive advantage, to provide opportunities to his people and accomplish sustainable development, needs to face one of the most crucial issues in macroeconomics, economic growth. The government jointly with private institutions must produce in order to increase its market value. Thus, economic growth should be the increase in the market value of the goods and services produced by this country over time. Economic Growth is one of the five ways for a society to reduce scarcity. To achieve this goals government should invest in education, health and technological innovation. This last is usually associated with economic growth. The U.S. economy large growth serves as an example during the introduction of the Internet and the technology that it brought to United States industry as a whole. An increase in productive capacity and an improvement in the quality of life to the people of that economy are two main important aspects to be thought on this growth of an economy.

Many empirical studies have been carried out in attempt to provide variables that can affect the economic growth and has been confirmed and many researches has supported the assumption that there are many factors that can affect economic growth. Some variables or factors such as inflation rate, expending on education, expending on health, import, export, foreign direct investment, increase on population etc. are some of the important factors that are assumed to affect the economic growth.

Although some research has provided evidence to support the existence of relationship between these variables with economic growth others research has failed to do so. In this research we will try to provide some empirical evidences that can support these hypothesis.

This present paper is structured as following: Section 2 we give some highlights of economic growth and its theoretical framework. In the section 3 we present our methodology and data, section 4 we present our results and last section we conclude our study.

2 Theoretical Framework

Economic growth has arisen the interest of many researchers for many decades. Their concerns about economic growth have created some theories and models of economic growth. Thus we will emphasize some theories and models created by notorious researchers in this matter.

2.1 Theories of economic growth

The classical growth theory was developed by David Ricardo, Thomas Malthus, Adam Smith, and James Mill which the first, also developed one of his most important legacy, the theory of comparative advantage, which suggests that a nation should concentrate its resources solely in industries where it is most internationally competitive and with other countries to obtain products no longer produced nationally. The classical growth theory also called the theory of production and the theory of growth, based on the theory or law of variable proportions, which states that increasing both of factors productions (labor or capital), whereas holding the other constant and assuming that there is no technological change, will increase output, but at a diminishing rate that eventually will approach zero.

This theory has received some criticism because technology is known as one of the most important factors in economic growth is assumed to be constant.

A very important model was developed by Robert Solow and Trevor Swan. This model assumes that there are diminishing returns to capital and labor. Capital accumulates out of saving but its level per worker decreases due to depreciation and population growth. As a result of diminishing returns to capital economies eventually reach a point where, absent technological progress, capital per workers remains constant and economic growth ceases.

Another theory of economic growth is endogenous growth theory developed by Paul Romer and Robert Lucas, Jr. in the late 1980s and early 1990s. They developed the endogenous growth theory that includes a mathematical explanation of technological advancement. This model also included a new concept of human capital, the skills and knowledge that make workers productive.

There are some others theories well know such us: Unified growth theory that was developed by Oded Galor and his co-authors to address the inability of endogenous growth theory to explain key empirical regularities in the growth processes of individual economies and the world economy as a whole, The big push revived and formulated rigorously, in the late 1980s by Kevin Murphy, Andrei Schleifer and Robert Vishny, Schumpeterian growth, the approach explains growth as a consequence of innovation. The economic theory was named after the 20th-century Austrian economist Joseph Schumpeter. And finally three other theories: institutions and growth, human capital and growth, Energy consumption and efficiency theories.

2.2 The effect of foreign direct investment (hereafter FDI) in economic growth

There is a weak support for an exogenous positive effect of FDI on advantage of FDI externalities in the macro empirical literature and it might be limited by local conditions, such as the development of the local financial markets or the educational level of the country. Alfaro, Chanda, Kalemli-Ozcan and Sayek (2004), Durham (2004), and Hermes and Lensink (2003) provide evidence that only countries with well-developed financial markets gain significantly from FDI in terms of their growth rates. Borensztein, De Gregorio, and Lee (1998) and Xu (2000) show that FDI brings technology, which translates into higher growth only when the host country has a minimum threshold of stock of human capital.

Marta Bengoa and Blanca Sanchez-Robles (2003) found that economic freedom in the host country is a positive determinant of FDI inflows. Their results also suggest that foreign direct investment is positively correlated with economic growth in the host countries. However, the host country requires economic stability, adequate human capital and liberalized markets to benefit from long-term capital flows.

Nuzhat Falki (2009) examined the Impact of FDI 35 on Economic Growth of Pakistan. The data of FDI from the Handbook of Pakistan Economy-2005 published by the State of Pakistan and the World Bank Development indicators-2008 from 1980 to 2006 with variables of domestic capital, foreign owned capital and labor force. With the help of endogenous growth theory and applying the regression analysis she concluded that FDI has negative statically insignificant relationship between GDP and FDI inflows in Pakistan.

Anokye M. Adam & George Tweneboah (2009) examined the Foreign Direct Investment and Stock Market Development in Ghana's they collected the data of market capitalization as a proportion of GDP, Ghana cedi-Dollar exchange rate and Net FDI inflow quarterly - data from 1991 to 2006. They apply multivariate co integration analysis and Vector Error Correction Model (VECM) and concluded that FDI has significant influence in the development of Ghana stock market and also concluded that there is long-run relationship between FDI and nominal exchange rate and stock market in Ghana perspective.

3 Data and Methodology

3.1 Selection of the variables

3.1.1 Dependent variable

In this study we use Gross domestic product (hereafter GDP) growth as a dependent variable for measure of economic growth.

3.1.2 Independent variables

We use some independent variables in this study such us: FDI, import, export and inflation rate. The following table shows the independent variables, their description and their expected relationships with the firm's value.

Table 1 Summary of Independent Variables

Variable name	Variable definition	Hypothesis sign
FDI	Amount of investment of foreign assets into domestic structures, equipment, and organizations	+
Import	The amount of products shipped into a country	+
Export	The amount of products shipped outside a country	-
Inflation rate	The percentage increase in the price of goods and services annually.	-

3.2 Data and method

This study is a study case about Cape Verde Economy. The data used was obtained from World Bank and respective website of Central Bank of Cape Verde and Institute of National Statistics. The time series of each variables cover the period of 1995 to 2012. Most of data was transformed into their natural LOG with exception of inflation rate.

In this study we use time serial data, we assume that there is a linear relationship between the proxies chosen with GDP, thus we use the Ordinary Least Squares Regression (OLS).

4 Results and Discussion

The table shows the statistical summary of the variables included in this research. GDP have 20.332 for the mean and the Std. Deviation 0.678

Table 2 Statistical Summaries of Variables

	GDP	FDI	EXPORT	IMPORT	Inflation
Mean	20.332	16.201	18.824	19.771	2.279
Median	20.240	17.081	18.718	19.603	2.160
Maximum	21.346	19.167	20.190	20.840	19.848
Minimum	19.066	9.075	17.329	18.784	-9.383
Std. Dev.	0.678	2.541	0.963	0.673	6.287
Skewness	-0.012	-1.006	0.095	0.231	1.061
Kurtosis	2.020	3.445	1.569	1.686	4.611
Jarque-Bera	1.081	4.780	2.343	2.184	7.981
Probability	0.582	0.092	0.310	0.335	0.018
Sum	548.960	437.420	508.244	533.827	61.525
Sum Sq. Dev.	11.949	167.910	24.105	11.760	1027.674
Observations	27	27	27	27	27

The Jarque-Bera values of variables and the probability associated with them reflects that all the variables in this study follow normal distribution.

According to the OLS regression results presented in the table 4 we can see that these four variables jointly are significant to explain the changes in GDP. The model is very significant, adjusted R-squared is 0.982 which means that 98.2 % of changes in GDP are explained by these four variables. Durbin-Watson statistic is 1.131, F-Statistic and the probability associated is 0.000, which means that the data well fit in this model. The variables FDI and import has positive sign and there are significant which means that these two variables have positive significant relationship with GDP. Nevertheless export and inflation rate does not seems to affect economic growth.

FDI has a positive coefficient 0.038, which means that an increase in 1% on FDI leads an increase on 0.038 on economic growth. Thus FDI promotes economic growth. The probability associated with t-statistic is 0.038 and it is less than 5% meaning that this variable is very significant. This result is consistent with Anokye M. Adam & George Tweneboah (2009) and Marta Bengoa and Blanca Sanchez-Robles (2003).

Table 4 OLS Regression

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	1.300	1.300	1.000	0.328
FDI	0.038	0.017	2.202	**0.038
Export	-0.168	0.128	-1.307	0.205
Import	1.092	0.177	6.169	***0.000
Inflation	-0.005	0.004	-1.385	0.180
R-squared				0.985
Adjusted R-squared				0.982
S.E. of regression				0.092
Sum squared resid				0.185
Durbin-Watson stat				1.131
F-statistic				349.474
Prob. (F-statistic)				0.000

, * Corresponding to 5% and 1% level significance.

The variable imports has also positive coefficient 1.092 meaning that when the import increase in 1% the gross domestic product increase in 1.092%, there have a strong positive relationship between each other. The probability associated with t-statistic is 0.000, which is less than 5% meaning that import is very significant variable in this study.

The explanatory variable inflation rate has negative coefficient, meaning that gross domestic product has negative relationship with inflation rate and the same happens with variable export. However these two variables are not significant since their probability value associated with t-statistic is more than 5%.

We applied some residuals tests to examine the existence of any problems on the residuals. The Breusch-Godfrey Serial Correlation LM Test was applied to see if there is autocorrelation on the residuals, but the test prove no existence of serial correlation. The normality test also was applied to prove if the residuals are normally distributed. The results in table 5 show that Jarque-Bera is 0.473 and the probability associated with Jarque-Bera is 0.789 which is more than 5% leading as to accept null hypothesis meaning that the residuals are normally distributed. The following table presents the results about serial correlation and normality test.

Table 5

Breusch-Godfrey Serial Correlation LM Test:			
F-statistic	2.318	Prob. F (2,20)	0.124
Obs*R-squared	5.081	Prob. Chi-Square (2)	0.078
Normality test			
Jarque-Bera	0.473	Probability	0.789

5 Conclusion

This paper examines the relationship between Gross domestic product and foreign direct investment by using OLS regression method. After applying the important method to find out the relationship between the variables on this study, we conclude that there is a strong relationship between foreign direct investment and imports with gross domestic product and these two variables affect positively the economic growth of Cabo Verde. The results express the reality of Cabo Verde. The country import most of the products consumed internally. The others variables such as export and inflation rate do not seem to have any statistically significant relationship with gross domestic product.

(E-mail: 172357532@qq.com, acan71@msn.com)

Abstract: Knowledge has become the essential production factor in the era of knowledge-based economy. New high-tech enterprises tend to take knowledge as their most valuable strategic resources for development. Competitive edge comes from the knowledge resources owned by the enterprises. Enterprise configuration and the capability to protect knowledge resources are the profound sources of the competitive edge of new high-tech enterprises, and also the power to implement knowledge management. The knowledge management is the decisive channel to implement knowledge economy development strategy. Intellectual property is the vital means for enterprises to realize the economy development strategy. There are connections as well as differences between enterprise knowledge management and intellectual property protection. Only by dialectically dealing with mutual relations between enterprise knowledge management and intellectual property protection can the knowledge management smoothly carried out in high-tech enterprises.

Key words: Knowledge management; High-tech enterprises; Developing strategy; Intellectual property protection

1 Introduction

The core of knowledge-based economy is knowledge innovation. Intellectual property rights and knowledge management are the two significant means correlating with each other and also distinguishing from each other. As the power sources of enterprise innovation, the two have become the resources with the most distinctive values, the focuses of competition among new high-tech enterprises, as well as the power and sources of economic growth. "The high-tech enterprises with distinctive knowledge-intensive and technology-intensive features pay special attention to the knowledge acquisition, creation, sharing, integration, recording, storage and renewal with other business organizations as well as the implementation of innovation activities transversely and longitudinally, in order to continuously enhance their own knowledge reserves and scientific research and creative abilities, so as to form the core competitiveness and gain competitive edge." (Marco Grimm, Reiner Anderl, 2013) By promoting the variation of other factors, they promote the entire social progress and development. In development strategy of enterprises, knowledge management and intellectual property protection has become the vital dynamic mechanism to promote innovation and improve core competitiveness; therefore, to discuss about the correlations between knowledge management and intellectual property has vital theoretical significance and practical guidance value in promoting the development of knowledge-based economy.

2 Correlations Between Enterprise Knowledge Management and Intellectual Property Protection

Enterprise knowledge management is to coordinate and unify the different aspects of human resources as well as information technology, market analysis and enterprise management strategies. It is to jointly serve for the development of the enterprise, in order to generating the management effects that the whole is larger than the sum of the parts. Intellectual property rights are the rights of people to enjoy the spiritual wealth that they have created in the fields of science and technology, culture, arts and etc. The objects of protection are widened with the increasing and spreading of the human's intellectual property forms and the development of applied technologies; cover the copyrights, rights of invention, patent rights and trademark rights and etc. According to the definition there is no significant correlation between knowledge management and intellectual property protection; however, when they are analyzed in different aspects it can be specified that the two have correlations as well as differences.

2.1 Correlations between enterprise knowledge management and intellectual property protection

The ultimate goals of enterprise knowledge management and intellectual property protection are consistent and promote the innovation activities of the enterprise. On one hand, by effective utilization

and sharing of enterprise knowledge, the enterprise knowledge management stimulates the innovation and strains capacities of the enterprise as a collective, in order to developing more new products, new processes and new technologies, to make the enterprises own more intellectual property. On the other hand, the intellectual property protection renders the enterprise's knowledge achievements of deserved rights, to rationally used and popularized knowledge achievements, in order to largely encouraging the enthusiasm of the enterprise, scientific and technical personnel for innovation.

The protection of enterprise intellectual property shall be an essential aspect of enterprise knowledge management. The enterprise knowledge management includes: enterprise knowledge information management, to set up knowledge base in order to solidifying knowledge; enterprise knowledge application management, to apply the acquired knowledge to specific practice; management of enterprise knowledge exchange mechanism, to encourage knowledge creation and sharing; and enterprise knowledge property management, to establish effective enterprise intellectual property management mechanism. Obviously, as the essential form of intellectual property which needs to be effectively managed, intellectual property is the vital component of knowledge management.

2.2 Differences between enterprise knowledge management and intellectual property protection

The objects that enterprise knowledge management and intellectual property protection are involved with are different. What the enterprise knowledge management is involved with includes enterprise explicit knowledge, enterprise tacit knowledge and people. In particular, enterprise knowledge management emphasizes tacit knowledge management, which is expressed as the management of people. However, what the intellectual property protection is involved with mainly refers to the enterprise explicit knowledge, that is, the recordable coding knowledge; besides, it is hard to implement or protect the tacit knowledge in the mind of people.

The action mechanisms of enterprise knowledge management and intellectual property protection are different. Enterprise knowledge management mainly takes the means of effective utilization and sharing of knowledge, to improve the enterprise innovation and strain capacity. However, intellectual property is to take the means of knowledge protection, to let the enterprise and innovative personnel gain profit, in order to stimulating their enthusiasm for innovation and improving the innovation capacity of enterprise. Although the two have the same objective, that is, to promote the innovation activities of enterprises, the action mechanisms adopted by them are totally different and even contradictory to each other; because one is about knowledge sharing and the other is involved with knowledge protection.

The management technologies adopted by enterprise knowledge management and intellectual property protection are different. Enterprise knowledge management technologies mainly include the various kinds of information management technologies (such as document management technology, data mining technology, expert system technology, search engine technology, BBS technology and etc.) and various human resources management technologies (such as inspiring technology, communication technology, coordination technology and etc.). However, intellectual property management technologies mainly adopt legal measures to protect the intellectual property and apply management tools to implement intellectual property.

3 Dialectical Relationships Between Enterprise Knowledge Management and Intellectual Property Protection

Although there is a certain contradiction between enterprise knowledge management and intellectual property protection, their objectives are consistent, which are both to improve the innovation capacity of enterprise and promote the innovation activities of enterprise; therefore, while carrying out the enterprise knowledge management, the enterprise shall protect the intellectual property. On the premise of protecting the intellectual property, the enterprise knowledge management shall be carried out, to make enterprise knowledge management and intellectual property protection mutually promote each other, sequentially taking effects to jointly fulfill the unified objective.

3.1 Dialectical relationships of the two kinds of knowledge during conversion process

By analyzing it theoretically, enterprise knowledge management is the conversion process of the two kinds of knowledge, i.e. explicit knowledge and tacit knowledge. The conversion process is composed of four models: converting tacit knowledge into tacit knowledge, converting tacit knowledge into explicit knowledge; converting explicit knowledge into explicit knowledge; and converting explicit knowledge into tacit knowledge, that is, the SECI model put forward by Ikujiro Nonaka and Hirotaka Takeuchi. The four kinds of models are called socialization, externalization, combination and internalization in succession.

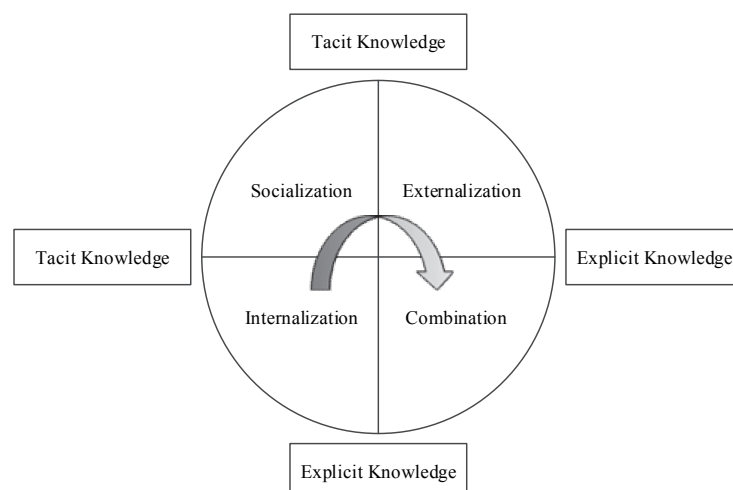

Figure 1 Process of SECI Self-Transcendence

By taking this model as reference, the relations between knowledge management and intellectual property during the dynamic process of knowledge creation are listed below,

(1) Model I (Socialization): while converting tacit knowledge into tacit knowledge, it needs the observation, experience, imitation and continuous practices among people, to gradually comprehend and master the tacit knowledge of the members in an organization, in order to converting it into their own tacit knowledge. In this model, the enterprise needs to pay attention to the issues of intellectual property including the tacit skills liketechniques, knacks and etc. Besides, the knowledge management shall be conducted, including carrying out on-the-job training, establishing learning organization, developing intellectual capitals and etc. While protecting business secrets, the principles of knowledge management shall be abided to fulfill the first kind of conversion model.

(2) Model II (Externalization): while converting tacit knowledge into explicit knowledge, it needs to apply the means including analogy, metaphor, hypothesis and etc., to express the tacit knowledge by the inheritable explicit knowledge which is easy to be spread. In this model, the enterprise shall pay attention to protecting the intellectual property including patents and copyrights towards the innovative products with explicit knowledge, consequently preventing the negative influence of the outflow effects of tacit knowledge. In addition, the method to assess and measure the values of knowledge shall also be implemented by taking the balance sheet for reference, to establish the knowledge model and conduct the knowledge management including coding and so on. While protecting the explicit intellectual property, it shall enhance the functions of knowledge management, to fulfill the second kind of conversion model.

(3) Model III (Combination): while converting explicit knowledge into explicit knowledge, it needs to adopt the tools including distributed documents management, data warehouse and etc. to further systematize the fragmented explicit knowledge and express it with professional language. In the model, the enterprise shall pay attention to protecting the intellectual property including patents, trademarks, copyrights and etc., which is recorded and spread in the explicit and available texts, in order to maintaining the image and reputation of the enterprise. In addition, it shall establish the enterprise internal and external network system, to establish, renew and expand the knowledge base, among which, the patents, trademarks and copyrights, as well as the technologies, methods and information of licenses of other enterprises are one part of the contents in knowledge base. While protecting the intellectual property towards the comprehensive explicit knowledge, the level of knowledge management shall be improved, to fulfill the third kind of conversion model.

(4) Model IV (Internalization): while converting explicit knowledge into tacit knowledge, it needs to adopt the means of training, to convert the explicit knowledge in textbooks into the tacit knowledge in the mind of people, and then reuse the knowledge by the innovation activities of people. In this model, the enterprise shall pay attention to protecting the intellectual property including skills, knacks and etc., to prevent the business secrets from being given away. In addition, the learning model of “learning by doing” shall be implemented, and the current knowledge resources shall be applied, to make the knowledge management of knowledge innovation and improvement. While protecting the intellectual property towards the tacit knowledge to stimulate innovation, the objective of knowledge management

shall be realized, to fulfill the fourth kind of conversion model.

3.2 Dialectical relationships among factors of enterprise knowledge management

Enterprise knowledge management is involved with many essential factors, including enterprise cultural factors, human resources factors, technological factors, organizational structure factors, system factors and etc.

Enterprise cultural factors are the most significant factors in knowledge management, because they manage the foremost tacit knowledge which is hardest to manage in enterprise knowledge. Whether they are good or not is concerned with the establishment, growth, explicitness and codification of enterprise tacit knowledge, in order to conducting a series of processes including creating new tacit knowledge. Besides, they are also the key factors concerning the success or not of the enterprise knowledge management. Enterprise culture includes three vital components, i.e. symbols, values and mental models. Symbols are to express the unified feeling of enterprise from the outside, including dressing, office environment layout, corporate logo slogan and so on. Values standardize the thoughts and codes of conduct of employees intangibly, which can make the behaviors of the employees and the objective of the enterprise consistent. Mental models are the deep corporate culture, which influence many assumptions, stereotypes or impressions on the way that people understand the world and take actions. They constitute a kind of force hidden in the people's heart and deciding people's behavioral patterns. To conduct the knowledge management, the enterprise must establish good values and mental models, deepen the understandings of employees towards knowledge, pay attention to knowledge learning accumulation, and create a kind of enterprise culture which not only respects intellectual property (tacit intellectual property) but also encourages knowledge sharing.

Human resources factors are a kind of essential factors in enterprise knowledge management, because tacit knowledge exists in people's mind; and in essence, the management of tacit knowledge is expressed as the management of people. As for the human resources management in knowledge management, firstly a Chief Knowledge Officer (CKO) shall be established, whose duties include understanding the knowledge demand and business environment of the enterprise; creating the environment to promote knowledge learning, knowledge accumulation, knowledge protection and knowledge contributions; and enhancing the processes of knowledge collection, integration, protection and sharing. Secondly, the evaluation of intellectual capitals shall be conducted. Intellectual capitals refer to the sum of the excellent human resources within the enterprise and the infrastructure supporting the good development of these human resources. Intellectual property evaluation is a decisive step for an enterprise to implement knowledge management, which can grasp the conditions of the knowledge resources within the enterprise, in order to protecting, applying and further exploring the knowledge resources. In addition, the communication mechanism among employees shall be established, due to that according to the statistics, the tacit knowledge accounts for 80% or so in an enterprise. To deeply explore the tacit knowledge, communication is an ineffective means. Nevertheless, because of various factors, the communication fails to go on smoothly, which requires the enterprise to establish some mechanisms to stimulate the employees to make communication, and grant awards to the employees making contributions to tacit knowledge. It is the confirmation of "tacit intellectual property".

Technological factors are the basis of knowledge management, and the means to realize the knowledge accumulation, storage and communication. On the premise of protecting intellectual property, the enterprise shall apply technological factors to make the enterprise knowledge management. Firstly, information technology shall be applied to establish the knowledge base of the enterprise, to accumulate, classify, process and extract the knowledge which was originally dispersed, thereby forming the systematic and continuously developing knowledge assets and sharing resources, to facilitate the application of the experience and achievements by other people. Secondly, the Intranet of an enterprise shall be established to provide the services including internal e-mails, file transfer, electronic bulletin, news, data query and etc., in order to realizing internal communication and collaboration via the Intranet; sharing the research reports, production technologies, scientific research methods and textual and graphic files. Besides, the enterprise external knowledge can be obtained by Internet, including social public knowledge and enterprise supply chain knowledge and etc. Besides, the knowledge alliance with colleges and universities, scientific research institutions and partner enterprises can be formed via the Internet. The organizational structure factors and system factors are also the chief factors in enterprise knowledge management. A flat organizational structure is favorable to the knowledge exchange and sharing, because there are no intermediate nodes. A set of reward system for examination and assessment with intellectual property protection and knowledge sharing consciousness, in a large degree, can better stimulate the innovation capacity of employees and promote the knowledge exchange and

sharing.

4 Knowledge Management and Knowledge Property Protection in Knowledge Value Chain

Professor Michael. E. Porter in American Harvard Business School holds the view that each enterprise is the aggregation conducting various activities during the processes of design, production, sales, sending and assistance of other products; all these activities can be expressed by a value chain .There is also such a value chain in the flow and renewal of the knowledge in an organization. The essence of knowledge management is the management of knowledge value chain, to increase the values of knowledge continuously in movement. The following is to analyze the Knowledge Value Chain (See Figure 2) by the value chain model of Michael. E. Porter, in order to further clarifying the relations between knowledge management and intellectual property in the various links of the value chain.

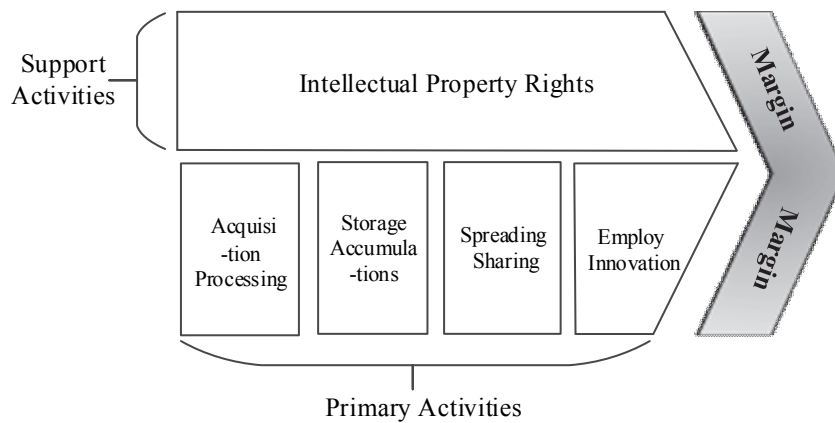

Figure 2 Knowledge Value Chain

The successful knowledge management can optimize the association among the various links in value chain, accelerate the flow of knowledge, and make it become the resource which will never dry up in the organization. Similarly, the improved intellectual property protection can also become the basic guarantee to increase the values of the various links in the value chain, and provide the basic route to realize the smooth cohesion of the various links. (G. Scott Erickson, Helen N. Rothberg, 2013)

In the phases to acquire and process knowledge, the enterprise can apply the computer network, to search the current information of patents, which can not only avoid repeated researches, but also provide the theoretical starting point for the researches. Knowledge management is started from acquiring knowledge. Acquiring knowledge is merely processing knowledge, in order to converting the dispersed and disorderly knowledge into orderly knowledge by classification, analysis, arrangement and extraction, so as to form the knowledge with proprietary intellectual property and the knowledge valuable for the enterprise, to guarantee the increase of values.

In the phases to save and accumulate knowledge, the knowledge which has been processed is depositing so that forming the knowledge base of the enterprise. In the process to form the knowledge base, the contents regarding the intellectual property like patents, trademarks and copyrights of the enterprise and other enterprises shall be searched and classified, to guarantee their security. The storage of knowledge shall be considered in the long run. The knowledge concerning the long-term interests of the enterprise shall be saved for a long period time, whereas the out-dated knowledge shall be eliminated timely, thus keeping on renewing the knowledge, so as to increase the values.

In the phases to spread and share knowledge, knowledge is not exclusive. Only on the basis of flowing and sharing, can the values of the knowledge in the enterprise be increased. However, the intellectual property has the monopoly property. During the process of knowledge distribution, attention shall be paid to distinguishing the knowledge which can be shared and spread from the knowledge which cannot be spread, as well as the knowledge which needs to be protected from the knowledge which does not need to be protected. Only in this way, can the positive effects brought by knowledge spreading and sharing be obtained; otherwise, if the enterprise merely enlarges the scope of knowledge sharing and reduces the costs of knowledge spreading by the simple and convenient way of information technology, but neglects the negative influence of the outflow effects of knowledge, it will bring

uncountable huge losses to the enterprise.

In the phase to use and innovate with knowledge, enterprises must establish Intranet, technology network and knowledge base, so as to continuously use, expand and create knowledge. Only in this way, can it realize the values of the knowledge and bring the increase in values. The process to use and innovate with knowledge is also the process that the intellectual property protection is given full play to. It is rightly due to the intellectual property protection that lays the foundation and paves the road for the usage and further innovation of knowledge, and stimulates the enthusiasm of the innovators, to make the employees keep on innovating and realize the value increase of knowledge during the process of usage and under the incentive of property rights. By the reorganization of enterprise business processes, the practice in knowledge management including the assessment regulations and etc., which can make knowledge generate benefits shall be established to make the knowledge resources form the unblocked knowledge flow in knowledge chain in a more rational manner and making the employees contribute the knowledge that they have acquired while using the knowledge.

5 Knowledge Management in Intellectual Property Strategy of Enterprise

Knowledge management provides the new management idea for the enterprise, and intellectual property has become the critical component of knowledge management. During the process of taking intellectual property protection as the core and establishing the intellectual property strategy, the knowledge management shall be improved, to achieve the huge values of knowledge capitals and enhance competitive edge of the enterprise by tacit knowledge, which is the vital route to promote the development of the enterprise. As for the knowledge management in intellectual property strategy, firstly, the objectives for the enterprise to produce, develop, apply and protect knowledge shall be formulated. Secondly, the market survey as well as research & development shall be enhanced, to organize the application, assessment and delimitation of property rights of the various kinds of knowledge products, improving the core competitiveness of the enterprise finally. To implement the intellectual property strategy, the enterprise shall not only pay attention to the intellectual property protection of the scientific and technological achievements, but also penetrate the work regarding the intellectual property into the various links of the enterprise including production, operation and value chain. The scientific and improved intellectual property management system shall be established in the enterprise, and the special management organization shall be set up to guarantee the orderly implementation of the intellectual property strategy in the enterprise.

Figure 3 Knowledge Management in Intellectual Property Strategy

5.1 Knowledge management in microcosmic intellectual property strategy

The so-called microcosmic intellectual property strategy is the enterprise intellectual property strategy. To implement the enterprise intellectual property strategy, it shall not only pay attention to the intellectual property protection in research and development center, but also implement the protection of intellectual property in the various departments in the management and production of the enterprise, the various links of the value chain, and the whole process of value creation. In the enterprise, the intellectual property management system shall be established, and the management personnel of intellectual property shall be selected and cultivated. When it is necessary, the special department shall be set up to handle the daily affairs of intellectual property management. At the same time, attention shall be paid to the research and formulation of enterprise intellectual property strategy, to provide sufficient fees for the intellectual property management, and be really aware of the relations among intellectual property management, enterprise technological innovation and enterprise economic benefits.

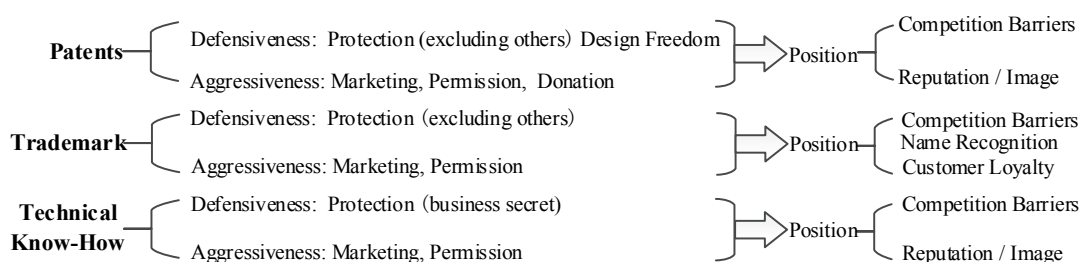

Figure 4 Functions of Intellectual Property in Enterprise

In the era of knowledge-based economy, management is developing in the direction of knowledge management, which is to meet the requirements of the survival, competition and development of the enterprise by a series of continuous management processes including acquirement, innovation, delivery, usage, protection and etc. of the various kinds of knowledge. Knowledge sharing is the biggest advantage to rationally develop intellectual resources, knowledge learning is the development tendency of knowledge integration, and knowledge protection is the dynamic mechanism of knowledge innovation; therefore to develop the knowledge management taking intellectual property protection as the core is the principal condition to promote innovation and enhance competitiveness.

Knowledge management in intellectual property strategy is the knowledge management taking intellectual property protection as the center, to turn the intellectual property protection from an organic component of knowledge management to an endogenous variable penetrating into the various aspects of knowledge management.

5.2 Knowledge management in macroscopic intellectual property strategy

The so-called macroscopic intellectual property strategy is the national intellectual property strategy. The above all set forth the relations between intellectual property and knowledge management in the angle of microscopic organizations; however, as a kind of brand-new management idea and management method, knowledge management will change the survival ways of the various organizations including the national government in the macroscopic level.

To implement the national intellectual property strategy is to make the government focus on the work of intellectual property protection of scientific and technological innovation achievements while enhancing the scientific and technological work and promoting the economic growth. Firstly, the government shall lift the intellectual property protection to the national strategic level.

Whether it is America or Japan, they all reexamine the significant role played by the intellectual property system, which appears along with the scientific and technological development, on the modern economy in the strategic angle. The “National Patent Strategy” by America grasps the core technologies of proprietary intellectual property in many key fields, in order to providing the powerful weapon for the technological innovation and activities of multinational firms in America as well as the behavior of market contest. By comparing Japan with America, it can be discovered that there are the shortcomings in the aspect of intellectual property protection. (It shall lift the intellectual property to the national level, set up the strategy of “building the nation on intellectual property”, and take it as the power to promote the scientific and technological advance, improve the competitiveness and revitalize the economy. The above two developed countries show the emphasis degree of the governments on intellectual property. It is exactly this kind of forward-looking strategic insight that makes the quantity of patent applications maintain comparatively fast growth in America and Japan.(Riikka Kulmala, Juha Kettunen, 2014)

Therefore, while taking the successful points of foreign enterprises for reference, special attention shall be paid to being combined with the practical national conditions in China, the policy supporting conditions of the government as well as the strategic targets and actual requirements of the enterprise, to match and effectively integrate intellectual property protection with knowledge management, thereby realizing the win-win situation between the enterprise and the employees. On the basis of effective and reasonable protection of intellectual property, the potential of the employees and enterprise in innovation shall be stimulated, enhancing the core competitiveness of the enterprise and even the nation in international arena.(Lina Wang, 2004)

6 Conclusion

In the perspective based on the development strategy of new high-tech enterprises in the paper, as

for the research on enterprise knowledge management and intellectual property protection, the main following conclusions are obtained:

Knowledge management is the major subject of business management in the 21st century. Due to that the economic changes and technological changes are increasingly intensifying, the necessity for high new-tech enterprises to adapt to and grasp changes becomes more and more critical. Knowledge management makes enterprises obtain competitive edge from learning continuously, to further improve work efficiency of the enterprises, so as to realize the sustainable development and innovation of the enterprises.

The role played by the enterprise intellectual property protection in enterprise and regional development becomes more and more significant day by day. In modern days driven by knowledge-based economy, intellectual property gradually turns into the major means for high-tech enterprises to research and develop science and technology, and explore market. It is the core strategic resource and crucial wealth for enterprise development, as well as the enterprises' strategic means in market competition.

In the paper, by exploring the close connections between knowledge management and intellectual property protection in high-tech enterprises, it has been discovered that the common goal of the two is to promote the knowledge innovation of enterprises, so as to arrive at the conclusion that the matching and integration between knowledge management and intellectual property protection in high-tech enterprises is the new trend for the future development of enterprises. Besides, evidences show that in the environment of knowledge-based economy, all the enterprises must adopt effective measures, input sufficient human resources, strengthen knowledge management and intellectual property activities, and enhance the competitive edge in knowledge innovation.

Abstract: In the current research related to the forecasting of the technology life cycle, the S-curve is fitted based on historical data for a particular technology, then the technology life cycle is forecast according to the fitting parameters. However, in the whole development process of a technology, it may contain multiple S-curves, only using a single S curve fitting is impossible to get the forecasting results accurately. In this study, the patent data of the hydraulic components of China and the other countries are compared, and the difference between the development stage of them is analyzed. From the analysis result of the other countries, it has been found that there may be appeared more than one S curve in the technology life cycle of hydraulic component, when the development of the technology is still in its early stage, only through the existing data is difficult to accurately predict the technology life cycle. Therefore, the comprehensive solution which combine with the development stage and the S curve inflection point analysis are presented in this paper, which can forecast the technology life cycle of Chinese hydraulic components accurately.

Key words: Patent analysis; Technical life cycle forecasting; Logistic model; S curve; Hydraulic component

1 Introduction

Hydraulic components are important parts of basic mechanical components, which are mainly responsible for transmission of power and control functions in mechanical equipment and are crucial component parts. Therefore, the technology forecasting of hydraulic components has great strategic significance for the development of China's equipment manufacturing industry.

Currently, the main method related to the forecasting of the technology life cycle is using Logistic model to determine the current stage based on the S-curve^[1,2]. But, after the comparison and analysis of the patent data of the key hydraulic components of China and the other countries, it has been found that if the logistic model were used to make predictions, it needs to be segmented. Meanwhile, because the development stages of China and the other countries are quite different, so it is difficult to get the accurate results if only use one S-curve to forecast the hydraulic components technology life cycle of China. Therefore, the comprehensive solution which combine with the development stage and the S curve inflection point analysis are presented in this paper, which can forecast more accurately.

2 The Methodology and Data Source

2.1 The forecasting method of S-curve of technology life cycle

Logistic growth curve was proposed by Verhulst in 1838^[3], namely that the path of technological progress is not random, but follow a specific track, the overall trend needs to go through infancy period, growth period, maturity period and recession period as human life cycle, so it is also called "growth curve", and its shape is approximately S, also known as S-curve. The life cycle forecasting method of S curve is to utilize the past development information of the forecast technology, combining with logistic regression model to find out the growth curve and estimate future. The using of S curve mainly includes two aspects: one is to predict the performance of a single technology to solve the problem, the other is to predict how and when to reach the upper limit. Currently, many scholars have achieved satisfactory results by using the S-curve to forecast technology life cycle. For instance, Frank utilized the logistic curve model to forecast the diffusion of wireless communications in Finland and to identify the factors affecting the diffusion process^[4]. Yu-Heng Chen et al proposed the technological S-curves that integrates the Bibliometric and patent analysis into the Logistic growth curve model for hydrogen energy and fuel cell technologies to forecast the life cycle of hydrogen generation and storage^[5]. Analytic results indicate

* This study was sponsored by the National Soft Science Research Program of the People's Republic of China 2014GXS4D131.

that the S curve is a very effective means of quantifying the technology forecasting.

2.2 Logistic model

The most common description of logistic growth curve model equation is:

$$p(t) = \frac{k}{1 + e^{-\frac{\ln(81)}{dt}(t-t_m)}} \tag{1}$$

Where, $P(t)$ is the cumulative number of the patent; k is the growing saturation level (saturation); dt is defined as the time interval length of $[k \times 10\%, k \times 90\%]$, i.e., the length of time from growth period to maturity period^[6].

2.3 Data resource

In this study, the cumulative application of patent was chosen as patent indicators, which was proposed by Ernst (1997), so the first task was to select the appropriate patent database to obtain reliable patent data. In this study, Wanfang patent database (<http://g.wanfangdata.com.cn/>) is chosen to conduct retrieval analysis for hydraulic components patents of Chinese and foreign. Due to the limit of paper length, the hydraulic cylinder was chosen as an example, the specific search logic of Chinese and foreign is shown in Table 1.

Table 1 The Search Logic of Patent

The search logic of patent	
Foreign	subject:("hydraulic cylinder")+subject:("oil cylinder") + subject:" hydraulic actuator"
Chinese	subject:(" hydraulic cylinder ") + subject:(" hydraulic oil cylinder ") + subject:("oil cylinder")

Meanwhile, because the patent data in 2014 is still not complete, so the retrieval time range to 2013.

In order to confirm whether the data obtained from Wanfang database were complete and reliable, a comparative analysis of different databases was needed. Firstly, the patent tool in Wanfang database was used, input “hydraulic cylinder” in the title, the total amount of hydraulic cylinder patents retrieved in database was 2803 from 1971 to 2013, and the number of U.S. patent was 377 in it. Secondly, input the same search logic in the United States Patent and Trademark Office patent database (<http://www.uspto.gov/>), the total number of hydraulic cylinder patent from 1971 to 2013 was 341. The results obtained from two database were substantially equal, the excess data in Wanfang database could be explained that it did not update the small part of failure patent. So, it indicated the data obtained from Wanfang database were reliable.

3 The Forecasting of Chinese Hydraulic Cylinder Patent Development

3.1 Foreign hydraulic cylinder patent technology development trend analysis

3.1.1 The development trends analysis

The number of foreign hydraulic cylinder patent is retrieved from the Wanfang database and imported into Microsoft Excel, the trend chart is shown in Figure 1.

Figure 1 The Number of Hydraulic Cylinder Patents in the Other Countries

From Figure 1, it can be seen that technology development of hydraulic cylinder in the other countries has experienced two S-curves from 1967 to 1974, the patent number of hydraulic cylinder grown very slow (patent number from 1 to 74); from 1975 to 1981, the patent number of hydraulic cylinder grown extremely fast (patent number from 441 to 3003). From 1982 to 1993, the growth rate

became significantly slower than before; from 1994 to 2000, the growth rate has accelerated again; after 2001, the number of foreign hydraulic cylinder patents has the negative growth trend, it decreased with time.

According to the theory of technology life cycle, it was easy to find that the number of hydraulic cylinder patents in the other countries has experienced the complete life cycle, including the infancy period, growth period, maturity period and recession period. From the development trend analysis of hydraulic cylinders patents, the growth rate of the number of hydraulic cylinders patents speed up from 1975 to 1981 and then slowed down from 1982 to 1993, then re-accelerated from 1994 to 2000, but slowed down again after 2001. For instance, from 1982 to 1993, the growth rate did not continue to grow in accordance with the previous stage.

3.1.2 Verification of logistic prediction model

From the analysis result of the development of the hydraulic cylinder patent technology in the other countries, it can be found that there are two S-curves, if the logistic model were used to make predictions, it needs to be segmented, and the selection of data segments plays a very key role in prediction accurately. Here, the first period of S curve (1967-1981) was chosen to import into Loglet 2 (Logistic fitting software developed by Rockefeller University, <http://phe.rockefeller.edu/Loglet Lab/2.0/>), the fitting result is shown in Figure 2, and parameters is shown in Table 2.

Figure 2 Fitting Curve of the First Stage of Hydraulic Cylinder Patents in the Other Countries

Table 2 The Fitting Result of S-curve of Foreign Hydraulic Cylinder Patents

Saturation	Midpoint	Growth time (dt)
2971.037	1977.208	4.882

From the fitting result, it can be seen that the saturation number of hydraulic cylinder patents was 2971, which corresponds to the time in 1981, and from the entire trend of foreign cylinder patents, the growth rate of the patent numbers flatten out in a stage after 1981, it can be considered the patent numbers tended to be “saturation” (it could be considered as local saturation) in short-term, it indicated that the forecasting by logistic model was feasible in the selected range. In addition, the midpoint can no longer be seen as a turning point between growth period and maturity period from the entire trend of foreign cylinder patents, it should be a turning point between infancy period and growth period in the whole development of the hydraulic cylinder patents. Namely, the hydraulic cylinder technology in the other countries entered into the fast-growing growth period.

3.2 The forecasting of Chinese hydraulic cylinder patents development

Similarly, retrieve the patent data of Chinese hydraulic cylinder in the WanFang database, and record it in the Microsoft Excel, the data is shown in Figure 3.

From the Figure 3, it can be seen that the number of Chinese hydraulic cylinder patents showed a rising trend since 1985, and increased exponentially after 2005, which was in line with the model of logistic growth curve. Compared with the trend of the other countries (as shown in Figure 4), it can be speculated that the hydraulic cylinder patent technology of China may also experience 2 or more S curves.

Figure 3 the Trend Chart of Chinese Hydraulic Cylinder Patent

Figure 4 Comparison Chart of Hydraulic Cylinder Patent between China and the Other Countries

But, if only use logistic growth curve fitting, it is impossible to forecast the life cycle of the hydraulic cylinder technology accurately, because the current historical data is not comprehensive. Therefore, the patent data from 1985 to 2013 was selected in this paper, and Loglet 2 was used to fit the growth curve of patent technology. The S-curve of the patents of hydraulic cylinder from 1985 to 2013 is shown in Figure 5.

Figure 5 The Logistic Fitting Curve of Hydraulic Cylinder Patent Technology in China

Table 3 Fitting Parameters in Loglet 2

Saturation	Midpoint	Growth time (dt)
43262.547	2014.222	13.587

In Figure 5, the discrete points are the number of hydraulic cylinder patent, the solid curve is the optimal S-curve fitted by Loglet 2 based on historical data. Compared with the whole development process, the local saturation point is 43263, namely, the limit number of hydraulic cylinders patent at this stage, and the inflection point (midpoint) is 2014. Compared with the development process of the technology of foreign hydraulic cylinder patents, it represents a turning point in the whole development process between infancy period and growth period, then it enter into the fast-growing growth period after 2014.

4 Conclusion

The life cycle analysis of the patent technology plays an important role in evaluating the development level of a technology and the enterprise strategy making. In order to forecast the technology life cycle accurately, the trend of same patent technology in China and the other countries should be considered comprehensively. In addition, for the S curve fitting in a certain stage, the corresponding fitting results should be given the reasonable meaning.

In this study, the life cycle of Chinese hydraulic technology is forecast by the S-curve growth model combining with the trend of foreign hydraulic cylinder patents. The forecasting result demonstrated the hydraulic cylinder technology development of China is still in the fast-growing growth period, R&D and patent applications in this area continued to thrive, which has important significance for the development strategies making of Chinese hydraulic components enterprises.

Abstract: System theory is a method theory about the recognition of universal connection of things, is a set of scientific theories and ideas which fully reveal the specific system exists, the laws and relationships among things. System theory is also the important theoretical basis to establish a rational reward system of science and technology. The Chinese reward system of science and technology (CRSST) is a complex system which contains three key factors of reward subject, reward object and reward intermediaries, as well as related contents such as objectives, principles, review standards, operation mechanism. Using system theory to optimize the CRSST, we should pay attention to three aspects: setting the right rewards in accordance with the social needs; seeking right programs to optimize system operation by using the feedback principles; the investigation and reasonable adjustment of the afterward effects.

Key words: Chinese reward system of science and technology; Social needs; Operation mechanism; Reward-after effects

1 Introduction

The system is universal, from inorganic to organic world, from natural science to social science, from people's thinking to whole society, every substance or everything is in a certain system, and in the system they exist, develop and form new system. Based on overall situation, system science method is a comprehensive analysis method in order to best analyze and solve the problems. System science method is universal significance and is an important theoretical basis to establish reasonable reward system of science and technology (S&T).

S&T reward is recognition for important S&T achievements, is material and spiritual rewards for the peoples those finished the S&T works. The important S&T achievements are the original achievements those produced huge economic values in national economical production. The Chinese reward of Science and technology (CRSST) has undergone the process from scratch to continuous development and improvement, from the release of "Provisional Regulations about Invention Right and Patent Protection" in August 1950, to the publication of "Regulations on National Rewards for Science and Technology" in May 1999. So far, the CRSST has formed and is in the process of improvement.

The Chinese S&T rewards should include another form of S&T rewards --- special talent rewards, in addition to a variety of traditional rewards. In 1994, the China Academy of Sciences launched "Hundred Talents Plan" to attract and train hundreds of outstanding young academic leaders from abroad. In 1998, the Ministry of Education set up the "Chang Jiang Scholars Award Plan" to improve the academic status of Chinese higher education. In 2008, China initiated the "Thousand Talents Plan" to bring in overseas top talents to China over the next five to ten years, and this plan called for strategic scientists or leading talents who can make breakthroughs in key technologies or can enhance China's high-tech industries and emerging disciplines. In 2012, the country implemented "Ten Thousand Talents Plan", in 10 years, to support the selection of about 10000 domestic high-level personnel, and maximize their activities of innovation and entrepreneurship. Meanwhile, all provincial governments also started the implementation of a variety of names of the talent introduction plans. Through the implementation of introduction and training plans of special talents, some special talents got spiritual and material rewards based on their S&T researches and experiences.

In the view of general system theory, the CRSST is a complex system consisting of three important elements, it is, reward subject, reward object and intermediary. The reward subject is the organizer and implementer of science and technology reward, it may be the government, social groups, enterprises or individuals. The reward object is the creators of S&T achievements that are included in the reward range and obtain the acceptance of evaluation criteria. The intermediary refers to the reward mechanism and implementation process by which the subject interacts with the object, including reward purposes, reward principles, review standards, reward services and other related contents.

Based on system science method, the studies for the CRSST demand ones grasp the structure and function of CRSST. It is well-known that, the subject of CRSST includes government institutions (state, province, city), industry associations, enterprises and seldom personal; the main functions of CRSST are to produce outstanding talents, to promote technological innovation and scientific development, as well as their applications in various fields of national economy. In this paper, using system science method, we have discussed the reward setting, review mechanism, investigations for reward-after effects and policy adjustments in order to put forward prospective suggestions for optimizing the operation of CRSST.

2 Set S&T Rewards According to Social Demands

S&T is a subsystem of the whole social system, its social status and its foundation of survival and development, are to meet social demands and promote social developments. As Engels said, “technology is largely dependent on science status, then science is more dependent on the status and needs of technology. Once society has the need for technology, the need can push science forward more than ten universities.”^[1] The social demands for S&T are in many aspects. The developments of new products, new material and new technology in industrial and agricultural productions need S&T to provide new knowledge accumulation; the improvements of the people's spiritual and cultural life need S&T to create new information carrier and communication means; the international military competitions need S&T to provide technical and intellectual supports. It can be said that the interaction between the social needs and the development of S&T is a two-way choice process.

According to the demands, the society adjust its economic inputs to various S&T resources (scientific research projects, research institutions, human resources), and review the benefits and values of S&T achievements according to evaluation standards, thus the subjective motivations of researchers are integrated into the social objective demands. The greater the demands of the society for some field of scientific research achievements is, the more funding is provided, to help scientists focus on this research field. Otherwise, the higher the degree of scientific research work meeting the social needs is, the greater the social support is. The two-way choice mechanism is conducive to the promotion of fair competition in the development of S&T, but also to ensure the limited social resources can be put into the study with best benefits. The Chinese government issued the “National high technology research and development program (863 Program)” in 1986, “Hundred Talents Plan” in 1994, “National key basic research and development program (973 Program)” in 1997, the “Chang Jiang Scholars Program” in 1998, “Thousand Talents Plan” in 2008 and “Ten thousand Talents Plan” in 2012. Meanwhile, all provincial governments also implemented a variety of names of talent introduction and training plans. All these are the embodiment of social demands for S&T.

The fundamental purpose of CRSST is to promote the growth of scientific knowledge and technological innovation, to strengthen the penetration of S&T to all economic and social fields. In the CRSST, the reward subjects formulated reward objectives, principles, review standards, operation mechanism, honor and treatment, so that the objects consciously accept the guidance of S&T rewards, and carry out scientific researches in the specified direction. Moreover, the reward subjects implement the motivations in order to obtain useful S&T achievements and enlarge own social influences. The objects accept the motivations and carry out scientific researches in the specified direction, they hope that their S&T achievements are recognized and themselves obtain spiritual satisfaction and material treatments. In the CRSST, to be recognized is original S&T achievements those produced significant economic benefits, but in fact, the most critical is the S&T talents who created those original S&T achievements. Therefore, all kinds of S&T rewards in the CRSST should be constructed on the basis of esteeming and motivating S&T talents.

In order to fully mobilize the enthusiasm of scientific researchers in all industries, in various subject fields and at all levels, the CRSST should show its characteristics of multi-species, multi-level and multi-form rewards, cover all creative S&T works and construct an all-round reward systems, moreover each kind of S&T reward should have its specific reward scope, area and object. The settings of the CRSST, not only offer the rewards for the minority of S&T elites, but also ensure that the contributions of most S&T workers are recognized; not only offer the rewards for the achievements those obtained significant economic and social benefits, also offer the rewards for the creative theory achievements; not only offer the rewards for the S&T personnel who engage in the basic, applied and development researches, also for the people who work in the management, popularization and education of S&T achievements.

3 Optimize the Operation Scheme of CRSST Using Feedback Principle

Feedback control method is one of basic methods of system theory. In order to make the CRSST run in good condition, it is necessary to use feedback principle to design and optimize the system operation based on the collection and analysis of all relevant information. Feedback refers to that the output information of a system, go back to input port of the system through certain channel, enable the system to maintain the information flow and play a good role of self control. According to the different results, feedbacks can be divided into positive feedback and negative feedback. If a feedback tends to resist the movement against target, makes the system run along the direction of target, and allows the system to achieve a dynamic equilibrium state, the feedback is a negative feedback; conversely, positive feedback. Figure1 shows the sketch of feedback controls of CRSST. The feedback controls of CRSST include three loops. Loop I consists of “Review and Arguments”, Loop II consists of “Objects, Applications, Reviews, Arguments, Reward results and Objects” and Loop III consists of “Subjects, Reward settings, Reviews, Arguments, Reward results and subjects”. To realize negative feedback controls of CRSST, the subjects should ensure the collection and accurate transmission of all kinds of feedback information in Loop III.

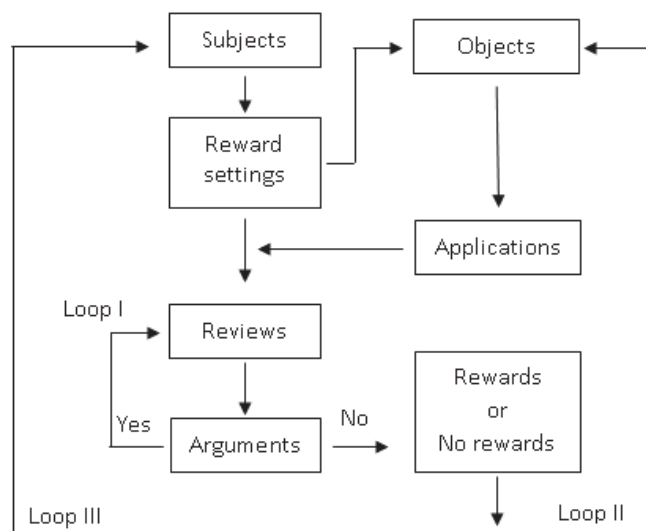

Figure 1 Sketch of Feedback Controls of CRSST

The deviant behaviors in S&T rewards is often seen, if not be controlled strictly, the universality, fairness principle, reputation and stability of CRSST will be damaged. To ensure the fairness and rationality of review process, the objection system was introduced into the CRSST. As shown in Loop I, the objection system is a reassessment system implemented by reward subject, for the arguments about the rewarded achievements and S&T personnel, raised by social sectors in the objection period. The objection system uses the feedback information to correct the deviation from reward targets and carry out the feedback controlling and adjustment, so it is a direct and effective method to prevent the deviant behaviors.

Normal objections are negative feedback information, it helps to improve the system robustness and stability. But there are few deviant objections to fight for power and money, and confuse right and wrong. The deviant objections are positive feedback information, will cause the system output distortion and disorder. Therefore, in the settings and actual operations of CRSST, the subjects should give full play to the positive roles of normal objections and avoid the negative influences of deviant objections. Moreover, it is necessary to broaden the objection channels and establish the supervision and control systems consisting of experts, scholars, public opinion and the discipline supervision departments to play the positive roles of objection systems.

Loop II shows the function of identification feedback of S&T workers for CRSST. The S&T rewards are open recognition of the governments, society and peers for the important S&T achievements and the S&T workers who finished the achievements, including spiritual and material rewards. Through the rewards, the S&T personnel got the recognition information for certain S&T achievements, these feedback information are beneficial to the S&T personnel adjust their future plans and behaviors of S&T. As authoritative social recognition, the S&T rewards can further stimulate the S&T personnel’s

enthusiasm for innovation, encourage them to create more achievements. This will form a negative feedback cycle.

4 Investigations of Reward-after Effects and Adjustments

Loop III shows that the subjects should strengthen the follow-up investigations for the reward results and make the analysis for feedback information to improve evaluation method and provide the suggestion for the reform of CRSST. By investigating the reasonableness of reward-after effects, the subjects may improve the system structure and implementation schemes of CRSST. The reward-after effects of CRSST mainly include accumulated advantage and Matthew effect.

The advantage accumulation refers to the phenomenon of the continuous accumulation of S&T rewards, resource allocation and superiority. When having made great achievement and obtained social recognition and reward, the scientist have better jobs, better environment and more research resources, these progressively leads to higher level research results and new rewards, and enter a virtuous cycle of “advantage — achievement — recognition — rewards — advantage”^[2]. Jerry Gaston pointed out, “the scientist made an achievement in a certain time point, the recognition for this achievement will affect his output at second time point.”^[3]

The advantage accumulation has positive influence on the different layers of S&T personnel. For outstanding scientists, the advantage accumulation can highlight their position and role in the S&T development, establish their prestige, strength the influence of their contribution on the society and even the whole human civilization. For general S&T workers, the advantage accumulation can urge they enter into the prestigious research institutions, study the scientific frontier, accelerate the output rate, in order to obtain further advantage in recognition and reward, and to become a member of elite scientists.

Matthew effect is an injustice phenomenon in science honors and resource allocation caused by S&T rewards. In the S&T rewards, honors and resources were often given to those applicants who are more famous and more prestigious, and less to those not well-known. In the CRSST, the rewards for cooperative achievements are more likely to the cooperator who has greater prestige; Among the independent achievements finished by different people, the achievements done by famous people was considered to be higher levels.

The negative influence of Matthew effect is great, the main performance is unfair distribution. After obtaining high level rewards, some elites enjoy repeatedly the reputation, honor, status and wealth in a long time or even a lifetime even though they hasn't new contribution or achievements, such award way of “a reward-winning, lifelong benefit” causes that some scientists rest on his laurels. Meanwhile, some common S&T personnel often do not get due reward, it will seriously dampen their research enthusiasm. Moreover, Matthew effect could hinder new S&T talents and new theory, since it is established on the basis of authoritarianism, people are prone to blind obedience to authority, not easy to accept new people in the scientific community and new ideas against popular theory.

5 Conclusion

The CRSST consists of reward subject, reward object and reward intermediaries. Based on system theory, we outline three feedback control loops in the CRSST. Loop I consists of “Review and Arguments”, Loop II consists of “Objects, Applications, Reviews, Arguments, Reward results and Objects” and Loop III consists of “Subjects, Reward settings, Reviews, Arguments, Reward results and subjects”. Using system theory to optimize the CRSST, we should pay attention to four aspects:

(1) The subjects set the rewards in accordance with social needs, and should adjust the reward setting based on the changing S&T situation.

(2) In Loop I, between the review and reward, the objection system should be introduced into the CRSST to ensure the fairness and rationality of review process.

(3) In Loop II, the recognition information for S&T achievement should be open to the society, that is beneficial to the S&T personnel adjust their future plans and behaviors.

(4) In Loop III, the subjects should investigate and study the reward results and reward-after effects to improve the system structure and implementation schemes, thereby play the positive influence of accumulated advantage and restrain the negative influence of Matthew effect.

Abstract: The most important person in college are students, the most important architectural in college is library. How to optimize and configure the resources of library better has been an issue to be considered by libraries. Through learning at KTH Royal Institute of Technology Library, we proposed some recommendations for libraries of internal colleges.

Key words: KTH royal institute of technology; Library; Services; College students

1 Introduction

Academic library is a symbol of the strength of the university, the heart of the university, and an important pillar of teaching and scientific research. The library is an academic fortress, an academic center, and a small university in the university^[1]. From the digital library, subject librarian system to the patent information service platform, to cloud computing, and then to applications of big data, academic library develops rapidly. But as common undergraduates, they pay more attention to the study environment and services of the library. University library should consider how to optimize the allocation of library resources based on the needs of students, and how to improve its position in the hearts of university students. And so university students put libraries on an indelible position in their memories of college life. Fortunately, we visited the KTH Royal Institute of Technology library for a while. Combined with local university libraries, we provided some advices on the reasonable sharing and use of available resources based on the needs of the students.

2 The Impression of the Library of KTH Royal Institute of Technology

KTH Royal Institute of technology was built in 1827. So far it has nearly 200 years of history. It is the Sweden's largest and oldest public institution of higher education in science and engineering. Its science and engineering has a high reputation in Europe and the world. An old laboratory building built in 1917 is the former site of its library in main campus. The library was renovated in 2000 and it is strongly artistic. The first floor of the library looks like an open book and you can go inside from the "opening" of the book. The atrium of library is the stack room and it is the center of the library. The atrium has high headroom and is littered with a variety of sofas and chairs, which could provide a comfortable environment to readers. Around the stack room there are lounges where people can discuss subjects, and also computer rooms where people can collect information over Internet. In the periphery of the lounges and computer rooms is the librarians' office and career guidance room. The book-keeping room which is full of Swedish books and periodicals reading room are on the second floor of the periphery. There are a lot of desks and chairs in the reading room, both of them are with different shapes. The lamps and power strips are matched with desks and the boxes where bags and clothes can be collected behind the chair. All of these make readers feel comfortable and intimate.

The library of KTH Royal Institute of technology specifically sets small places for students' life services. One can easily find the school map, school calendar and guide of the library there. Also the library sets some billboards where various lectures and activities information can be posted. At the entrance to the library, the works of the students in School of Architecture are exhibited, which decorate the library and also broaden students' horizons. Several ancient books are exhibited in the outmost periphery of the central stacks. Students could learn more about the process of books and also the library could increase some sense of history with these books.

Many students are attracted by the predominant environment and considerate services of the library of KTH Royal Institute of technology. Even on Friday afternoon the library is full of people. The library

* This work was supported by the National Natural Science Foundation of China (Grant No. 61203032), the Natural Science Foundation of Hubei Province (Grant No. 2012FFB05007), and the Fundamental Research Funds for the Library and Information Committee for Academic libraries of Hubei Province Grant No. 2013ZD08).

is the most satisfied place on campus.

Recently, the libraries of Peking University, Nanjing University and Wuhan University are ranked in the top ten beautiful libraries. The students in the universities show high expectations on the libraries. Therefore, we should pay more attentions to the construction of the library. Also the staffs in the library should provide considerate services to the students, and try our bests to make the library the most satisfying place. The students will be reluctant to leave library when they graduate. And the library will be in their memories when they leave school after several years. The library will gradually receive more donations from successful schoolfellow and it could reach a win-win situation between students and their university.

3 Building College Science Competition Service Platform

Many seminar rooms for different disciplines were set up outside of the stacks of the library of the KTH Royal Institute of technology. There are many professional books and journals, with small blackboards and chalks for group discussion. The seminar rooms are integrated with the stacks, insulated by the transparent glass wall. The research team can use it whenever, without reservation. Only few domestic university with seminar room^[2]. It is neither convenient nor popular, since the research team have to book them for use in advance.

Recently, our country has played more and more attention to college research training projects, such as National Undergraduate Electronic Design Contest and the National University student mechanical innovative design contest. Library can play a major role in the student competition with the advantage of Library Collections and subject librarians.

The implementation of subject librarian system was extremely difficult. Because subject librarians have limited professional knowledge of different discipline, it is difficult to obtain the trust of project leaders and make something for major research projects^[3]. However subject librarians can of course play an important role in college scientific contest with their retrieval skill. Chongqing University proposed a boot-service system for college research training, and obtained certain achievements^[4].

Therefore, this paper constructed a college science competition service platform, which is combined with discipline seminar rooms and subject librarian.

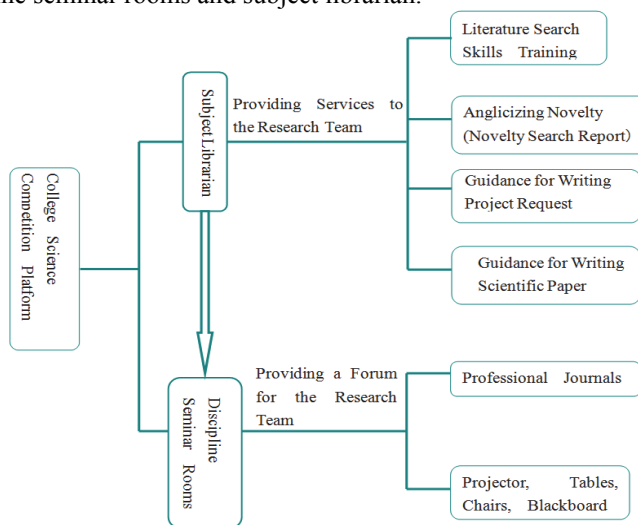

Figure 1 College Science Competition Platform

Subject librarians can be distributed among different subject seminar rooms, which should be booked by research teams in case of need. In addition, subject librarians have the right to participate the student competition and project research. Such corporation can strengthen the link between the librarians and students, enhance the position of the library, obtain the invaluable service experiences for research projects, and provide power to the development of subject librarian system. It guarantees a gradual development of the subject librarian system.

4 Play a Role in the Employment of Graduates

Providing career guidance and employment information service for the college students to is an

important responsibility of the library of the KTH Royal Institute of Technology. The library sets up Career coach (career guidance) office. When students have career confusion, they can get professional analysis and advice. Information shelf is set next to the office with materials such as how to write a resume, interview skills, how to write a cover letter and job information. College students can demand for free. Bulletin board is next to the information shelf. It contains the information of enterprises Campus Talk, lectures of career planning, job hunting, and many others. Campus network provides a more comprehensive employment information service platform, the same as the career centers of domestic colleges and universities.

Calls on the University Library to broaden its employment service have occurred constantly^[5-7]. Some perspective is based on subject librarian in the Library Employment Service^[5], and some suggest that library should establish an employment information service platform^[7]. But most domestic universities set the University Career Center, and therefore it's very difficult to promote university students' employment service in the library. But the University Career Center are "distant" from students. The university students will focus on this web site only in need of applying for jobs. Thus the library can cooperate with the University Career Center with its geographical and "likability" advantages. Only in this way can employment guidance be really popular in college students' lives.

4.1 Set up a special employment information office

The library should provide the books and newspapers about choosing jobs, employment, career planning, resume writing, interview skills. They can be placed centrally in the Employment Information Office that will offers enough space for students to read and discussed about job hunting. Additionally, the library should strengthen cooperation with the University Career Center, and specifically sets up information shelf and panels. The information about enterprise recruitment brochures and the instruction manuals of the web site for University Career Center can be both placed on the shelves. Notices of a variety of career-related lectures held by the University Career Center and Campus Talk will be post on information panels. Meanwhile, low-grade students can also be attracted, which means that college students can create awareness of career planning and employment earlier. It will be certain to increase the employment rate in an indirect manner.

4.2 Set up career counseling office

There are professional career counseling teachers in university career center that is the advantage of human resources. However low-grade students usually do not pay close attention to job websites and career counseling. Library can strengthen cooperation with Career Center of university, set up career counseling office next to the library stacks, and provide career planning guidance and employment counseling for students in need. The entire library student employment service platform are as follows:

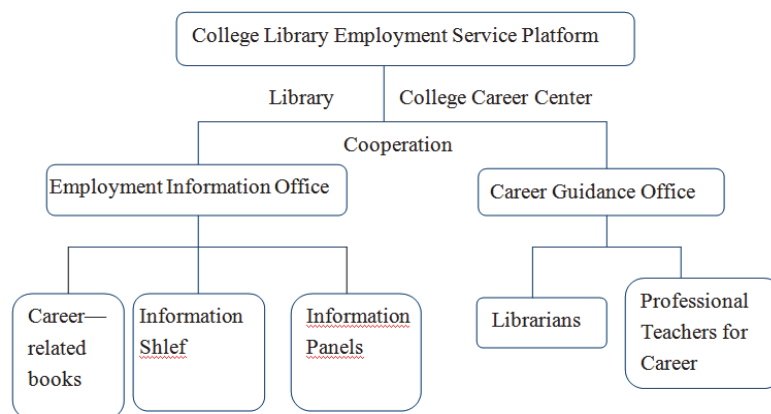

Figure 2 Students Library Employment Service Platform

5 Conclusions

It is very important to cultivate a sense of library identity for students, which can be achieved by improving the learning environments and service levels of libraries. Students will love and admire the university libraries, only if the libraries operate based on needs of college students and from a service-oriented point of view, via optimizing their functions and resources gradually.

Abstract: Student organizations in colleges and universities are vital to students' active participation in curricular and extracurricular activities, playing a significant role in enriching extracurricular activities, nurturing an on-campus culture and helping enhance their comprehensive abilities. Among all, student news association has a distinguished and irreplaceable role in broadcasting on-campus news, which could help publicize the philosophy, build an image and advance the culture of the university. Thus the urgent need to improve the news association and realize innovative development is compelling.

Key words: Colleges and universities; News association

Interest-based associations are building blocks of student organizations in colleges and universities. Students are drawn to them on account of their shared interest. Through engagement students' interests become entrenched and these associations serve as a platform to further their personal attainment. However, news association is differently and explicitly targeted to serve the campus. It is a crucial tool to broadcast on-campus news.

1 Major Responsibilities of the News Association

The main responsibility of the news association is news broadcasting. Members collect original news material, interview outstanding students, edit magazines for different departments and make posters and relative videos so as to cover the efforts university has done for students and successful stories of some excellent students themselves. News association is designed to differentiate from other interest-based associations.

2 Members of the News Association

2.1 Preferred abilities

Good writing, organizing and photographing abilities are preferred. The coverage is closely related to students themselves, such as freshmen welcoming at the railway stations or airports, sports events and literary activities. Besides, progress of academic research, the work of CPC organization and dean's office will be covered. As a result, the specific responsibility required includes news coverage and photographing. Sometimes trainings are offered as to enhance the efficiency of the work group.

In addition, excellent writing skills and students who have passion for literature are highly preferred to ensure the ongoing news writing, exclusive interview, relative compiling and publishing. The news association often assists some departments with editing documents of CPC, ideological and moral construction, editing and composing literary or political publications and making posters or videos. Therefore students with innovation spirit and wielding computer skills or others are welcomed to join the association.

Members of the news association are also required to have a sense of contribution and responsibility, because trivial and detailed work is time and energy consuming. Any mistake in the report or news coverage is not allowed. Members should take the their own obligations, be meticulous and passionate for the association.

2.2 Evaluation of members

Members of the news association shall be evaluated in the following aspects:

Ability: perfect accomplishment of a task, wielding several skills, independent thinking, innovation and leadership;

Attitude: a strong sense of responsibility for assignments, teamwork, a sense of contribution and aspiration to learn;

Efficiency: legitimate tools to accomplish a task, finishing each assignment and self-improvement

3 Dilemma

3.1 Shortage of funds

Funds are necessary to support the running of news association. There are three main sources of funds: social patronage, membership fee and funds from the university. As an association with actual working responsibilities, News Association needs to offer payments rather than collect membership fees. With inadequate funds from the university and limited social patronage, the association now faces real funding problems.

It depends on the members themselves to get over this hump. Generally speaking, more social patronage, more funds. There are separate teams in charge of gaining patronage, which requires skills and resilience to tackle problems within the process. Support from the university is also very helpful. While members from the news association do their best to serve the campus, the university needs to do their part to attach much importance to the association. They need ample funds to secure the healthy development.

3.2 Lack of legacy

Student organizations in universities and colleges see a new leaders team every year or even every semester. On this occasion, documents are not well maintained and inherited, and some of the feature activities have to be dropped. A legacy of culture is impossible without accumulation and reflection of previous experiences. New leaders teams have to learn by doing, given the fact that there is lack of documents inherited from the previous teams. Consequently, members and leaders team are repeating the work inefficiently and obtain slow improvement, further resulting in deficiency in unity and becoming less appealing.

A team should therefore be established to exclusively document the daily work, compile contributions from each member and leave this legacy to the following team next year.

3.3 Incompetence of leaders

In the news association, the assignment as leaders has a one-year term. Most of them didn't get involved in managerial roles until they are appointed as the leader. Ordinarily even outstanding members lack managerial abilities.

To solve the problem, continuous efforts can be made in two ways. On one hand, the incumbent leaders should create a favorable environment and engage more students into decision-making who could build their own decision-making and management abilities at an early stage. On the other hand, it is important to clarify different roles of leaders and members from different grades. For instance, outstanding seniors can serve as the president and vice president; sophomores are main contributors as leaders of each department; some vice heads of a department could be taken by freshmen that meanwhile are the majority of members.

3.4 Little sense of belonging

Many members cannot find a sense of belonging or achievement or even want to withdraw from the association due to lack of recognition for their hard work. This is partly attributable to less care from the leaders group and ineffective incentive policy.

Solutions can be multiple. Leaders group should feel responsible to motivate the members, for instance arrange more activities to interact with and give credit to them timely. A full-fledged incentive policy had better be in place including material awards, moral encouragement and evaluation system. Due respect and honor awards can help the members keep a sense of belonging and at the same time show more drive.

4 Suggestions

4.1 Create an environment where members feel like home

In comparison, student organizations in overseas universities are more institutionalized and standardized. There are strict proceedings in applying for, examining and approving a new association and all the organizations must abide by the Student Organization Management Rules. It is a different case in China where students join an association, complete tasks all out of their own free will. A group with rigid rules should give way to a home-like association.

Leaders group secures the daily work. They are leaders, such as president, vice president and heads of each department but equally importantly friends and partners. They are more like brothers and sisters, sharing experiences with lower-grade members, helping them settle problems and motivating them to be a better self. Even when the leaders retire, they will always be there and offer a helping hand if the association needs help. Home-like associations are more likely to produce better outcomes.

4.2 Engage more members into social practices

News broadcasting is the main responsibility of the news association but not the only one. Members shall be encouraged to step out of their comfort zones and explore more outside the campus. There could be numerous things worth trying. Students can gather successful stories related to their own universities that may be reported on the campus news; students can follow and document post-graduate work and study of outstanding graduates which is beneficial to the statistics as a reference for undergraduates especially at the point of choosing whether to pursue an academic or business career; students can interview folk artisans and appeal to better protection of falling customs or artworks... Apart from broadcasting on-campus news, the news association needs to cover current affairs as well. Therefore, they need to explore outside the campus and build a bridge between the university and the society.

Members of the news association can not only unleash their potential, get involved in lots of practices, improve networking ability, enrich extracurricular lives, build an information tunnel, guide others' mindset but also reach more friends or movers and shapers on campus and put their fingers on the pulse of research progress.

News associations in colleges and universities play a unique role in guiding a more healthy media environment. Relative management teams must look for innovative means to support their development, offer them with favorable policies and economic support and promote their healthy and orderly development.

Abstract: Traditional Chinese Medicine (TCM) owes long history in China. The development of TCM international trade plays an important role in improving human health and carrying forward traditional culture. This paper starts with the development situation of TCM international trade, and states the existing problems and the restrictive factors of TCM international trade development. In order to promote the rapid development of TCM international trade, the government should make feasible policies according to the actual situation of TCM development: strengthen quality control of TCM and improve product quality; optimize the industrial structure of TCM and improve the international competitiveness of TCM; reinforce support for TCM export and actively respond to trade barriers; enhance international communication and cooperation of TCM, and drive TCM development with Chinese medical treatment.

Key words: Traditional chinese medicine(TCM); International trade; Restrictive factors; Policy suggestions

1 Introduction

Traditional Chinese medicine (TCM) is the history treasure of the Chinese nation, and also the precious resources that benefit the world. The revitalization and development of TCM is the important strategy to realize the Chinese Dream. The deepening of economic globalization has brought opportunities of TCM international trade. In international trade, TCM plays a critical by its natural advantage of unique treatment theory, high security, and low side effects, however, a variety of restrictive factors have brought TCM international trade the adverse effect even huge losses. How to solve the problems relates to the way China's TCM industry goes to. To improve the international competitiveness of China's TCM industry, not only the force from micro level of TCM enterprise, but also the country's corresponding macro policies are needed.

2 The Current Situation of TCM International Trade Development in China

2.1 TCM total external trade continues to grow

In recent years, China's TCM trade continues to grow. The total exports of China's TCM rose from \$1.708468 billion in 2010 to \$3.592072 billion in 2014. The annual increase rate of TCM exports on the whole is about 20.7% in past 3 years. The total imports of China's TCM increase from \$554.1228 million in 2010 to \$1038.032 million in 2014. The average growth rate of TCM imports is as high as 17.5% annually(table 1). China has a long history and rich resource of TCM, but export volume growth is far lower than the import growth in international trade. The problem of unbalanced development exists.

Table 1 Import and Export Situation of TCM Products in China 1n 2010-2014

(unit: ten thousand dollars)

Year	2010	2011	2012	2013	2014
TCM products exports	170846.83	214820.94	230410.6	290324.6	294171.95
TCM products export growth rate	--	25.73%	7.25%	26.03%	23.73%
TCM products imports	55412.28	70640.23	85607.59	105353.81	91473.21
TCM products import growth rate	--	27.28%	21.18%	23.06%	-1.47%

Data sources: China chamber of commerce for import and export of medicine and health products, Jan 1, 2015.

* This paper is supported by humanities and social science research base of Hubei province college: The research center of TCM development.

2.2 TCM products export is typically extensive

TCM products can be divided into four categories: health care products, extract, proprietary Chinese medicine, Chinese herbal medicine and slices. From the perspective of TCM products export structure in recent five years (table 2), exports were mainly based on raw material products such as extract, Chinese herbal medicine and slices, which reached more than 80%. The export share of processed products, such as proprietary Chinese medicines and health products is significantly lower, even has a tendency to be less. Proprietary Chinese medicines and health products exports accounted for only 14.47% of the total amount in 2014, which hit fresh low in recent five years. All above show that China's TCM product export is typically extensive. It will make harm to the development of China's TCM industry in the long term.

Table 2 TCM Export Structure in China in 2010-2014

(unit: ten thousand dollars)

Name of commodity	2010	2011	2012	2013	2014
Total Traditional Chinese medicine	170846.83	214820.94	230410.6	290324.6	359207.24
Health care products	9589.33	14086.66	14980.14	17800.88	26983.7
extract	76770.99	104741.26	106252.7	125927.09	177724.02
Proprietary Chinese medicine	19371.34	20605.74	23718.14	25956.88	25006.31
Chinese herbal medicine and slices	65115.16	75387.27	85459.63	120639.75	129493.21

Data sources: China chamber of commerce for import and export of medicine and health products, Jan 1, 2015.

2.3 TCM exports account for a relatively small share in the world's natural medicine market

China owns rich TCM resources. TCM product has its unique advantages. However, the share of TCM products in the world's natural medicine market is not high. TCM export share in the international natural medicine market is about 3%-5%^[1]. The priority of export is Chinese herbal medicine and plant extracts. Proprietary Chinese medicine products' market share is even lower. In recent years, overseas natural medicine research and development is in a leading position. Export of TCM products represents a continuous low proportion which would create more pressure on TCM export in China.

2.4 TCM export market is focus on the asian market

Influenced by traditional culture and geographical location, export market of TCM is clearly biased, stable but excessively narrow. More than 80% of the export is based on Asian markets which is focus on Japan, South Korea and southeast Asian countries. Although the European and American market have wider demand, exports of TCM only account for about 20% which is focus on health food^[2]. The concentrated market results in limitations of TCM export and increased trade risk. At the same time, it also increases the entrance difficulty of proprietary Chinese medicine in international market.

2.5 External trade of proprietary Chinese medicine keeps continuous deficit

Proprietary Chinese medicine can embody the theory and culture of TCM. The trade situation of proprietary Chinese medicine reflects the trade level of TCM to a certain extent. Although China has superiority of history and resources of TCM, its proprietary Chinese medicine is occupying few market share in the international trade. China's proprietary Chinese medicine relies on import seriously. As to proprietary Chinese medicine in China, trade deficit existed and increased continuously from 2010 to 2014 (table 3).

Table 3 Present International Trade Situation of Proprietary Chinese Medicine in China in 2010-2014

(unit: ten thousand dollars)

Year	2010	2011	2012	2013	2014
Proprietary Chinese medicine export	19371.34	20605.74	23718.14	25956.88	25006.31
Proprietary Chinese medicine import	26822.68	29126.7	33076.29	35034.43	33718.77
Proprietary Chinese medicine trade deficit	7451.34	8520.96	9358.15	9077.55	8712.14

Data sources: China chamber of commerce for import and export of medicine and health products, Jan 1, 2015.

3 The Restrictive Factors of TCM International Trade in China

3.1 Low TCM products quality

The quality is the material foundation of TCM international trade. Although China has rich resources of TCM, TCM is often in a very passive position in international competition because of its low quality. TCM international standard work started relatively later in China, which made TCM lose good opportunities in the international competition. At present, TCM products export is restricted by international market barriers, and is often labeled low quality which does not accord with the specific standard in international trade. Quality control of TCM in cultivation, production and process is not ideal. TCM planting is mostly extensive management, which may lead to excessive heavy metals, remnant pesticide and excessive microbial. Developing TCM industry, low processing level of Chinese herbal pieces, and low innovative ability result in the slow development of TCM international trade.

3.2 Unreasonable TCM industry structure

TCM international trade in China has its own characteristics. The main export products are Chinese herbal medicine and extract, which has caused excessive competition of international trade. Proprietary Chinese medicine has few kinds. Proprietary Chinese medicine has 26 dosage forms and 10000 varieties. Its technical content is not high and life cycle is short. And it is lack of intellectual property rights protection^[3]. The unreasonable export product structure also reflects the limitations of manufacturing enterprises. In general, the size of the TCM manufacturing enterprises is small, and they have backward production technology and low efficiency. The lack of research and development capabilities makes TCM export depend on the raw material which has low added value. The trade pattern that creates over-consumption of natural medicine resources is unsustainable. If things continue in this way, there will be a vicious cycle and a serious threat to China's TCM international trade.

3.3 Numerous TCM trade barriers

With the development of TCM international trade, trade barriers also follow. In order to protect their own interests in TCM international trade, many countries set up new non-tariff barriers. These barriers mostly take the form of legal, technical rules, regulations, agreements, standards and certification, and are implemented in technical index system, such as science and technology, health, quarantine, security, environmental protection, product quality, authentication, etc. The barriers are used in international trade. They consist of flexible and various regulations. The common trade barriers include the technical bulwark and green barriers. These trade barriers have a huge influence on China's TCM entrance to the international main market. Sometimes, a clause can change the whole pattern of TCM trade. Due to the limitation of European plant drug approval and continuity of terms (the British has banned the sale of unregistered traditional medicine on May 1, 2014), China's TCM exports to the EU market are just more than 11 million dollars, and fell 5.85% in 2014. All of these make the internationalization of TCM increasingly difficult.

3.4 Different culture

Culture is the accumulation and inheritance of historical tradition. It will have an impact on the country's public behavior. Different cultural background leads to the general skepticism of the west to TCM. Compared with western medicine, TCM has complex composition, pays attention to syndrome differentiation and treatment, and dose not have quantitative analysis of pharmacological effect, which result to a lot of TCM promotion difficulty. Moreover, TCM concept records are all in Chinese. It is difficult to fully retain the theory essence in the process of translation^[4], which also affect the propagation of TCM concept in Western countries.

4 Policy Suggestions on the Development of TCM International Trade in China

To achieve rapid expansion of international trade, China's TCM industry requires not just the power of the enterprise but the government's energetic support. The government should formulate the corresponding macroeconomic policies and fundamentally solve the factors which restrict the development of TCM products international trade .

4.1 Strengthen the quality management of TCM products

The quality control and guarantee of TCM is the core problem in TCM modernization, industrialization and internationalization. The government should establish and perfect GAP, GMP, GLP, GCP, GSP etc., define the process of TCM research, development, production and circulation so as to promote comprehensive management, control and security of TCM^[5]. At the same time, these norms can accept recognition and beliefs of more countries and regions.

4.2 Optimize the structure of TCM industry

The government need to carry forward the optimization and upgrading of TCM industry, adjust the national industrial policies, make comprehensive study and deployment of the development direction of TCM industry, and give corresponding policies and financial support, such as credit, taxation, price, technical transformation etc. Further deepening reform is necessary. In order to enhance the international competitiveness of TCM products, and promote the transformation pattern to change from extensive development to intensive development, the government should develop the scale of TCM industry, improve industrial concentration, create a batch of famous international brand of TCM enterprises through assets operation and structural adjustment^[6].

4.3 Reinforce the support to TCM export

The government should formulate corresponding policies to encourage the export of TCM products, to enhance support to TCM products export, and to improve conditions of TCM enterprises in the international competition. At the same time, the government should strengthen the introduction of foreign advanced technology and equipment, improve the advanced standardized construction about science and technology of TCM, coordinate and protect intellectual property rights of TCM through the formulating and perfecting the laws and regulations, and make use of the multilateral agreements^[7]. In the face of abnormal trade barriers, the government needs to strengthen international dialogue, develop trade policies which are suitable for China's national condition, optimize the trade structure, deal with trade frictions, and promote promote the cancellation of non-tariff barriers through policies.

4.4 Enhance TCM international exchange and cooperation

In order to promote the development of TCM trade, the government should improve relevant policies and enhance exchange and cooperation, which can make the TCM trade connect with international standards further^[8]. It is important for TCM international trade to drive TCM development with medical treatment. Driving TCM development with medical treatment needs the government to perfect the relevant policies, to promote international exchange and cooperation of TCM industry, and to reinforce international medical academic communication. It is necessary for the government to promote international education of TCM. We should let more people especially foreign medical experts believe the scientific and the effect of TCM so as to improve the international status of TCM theory system and heighten the international understanding and trust of TCM.

5 Conclusion

Basing on the understanding of TCM international trade, we analyze the current situation of the development of TCM international trade in China, summarize the restrictive factors of TCM international trade, including the low TCM products quality, unreasonable TCM industry structure, numerous TCM trade barriers and different culture. Some policy measures should be taken, such as strengthen the quality management of TCM products, optimize the structure of TCM industry, reinforce the support to TCM export and enhance TCM international exchange and cooperation.

In the future, in terms of research on the development of TCM international trade in China, we should consummate the relevant policy and integrate the theory with practice; build perfect theory system to improve the development of TCM international trade in China.

The Construction of Subject Knowledge Platform Based on Knowledge Management: Empirical Research on Subject Knowledge Management of Library of Wuhan University of Technology*

Shao Rui, Fu Xianhua

Library, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: sorrny@whut.edu.cn, xhfu@whut.edu.cn)

Abstract: Through the survey on the needs of users in their scientific research, the library I work for began building subject knowledge service teams in 2014 to reform of the organizational structure of subject service, integrates the special database resources in the subject of information and communication engineering, carries out knowledge sorting, mining and search for the subject and builds up a subject knowledge platform of information and communication engineering for scientific research. The platform provides the teachers and students in the college with subject evaluation and value added services to satisfy the extensive demand of scientific research for information. With the building of platform for the subject of information and communication engineering, this paper will explore and practice the expansion and extension of subject service.

Key words: Subject knowledge; Scientific research; Practice of platform; Knowledge management; Subject service

1 Introduction

Knowledge management originates from the organization and service of knowledge^[1]. It refers to a process that a manager acquires, stores, transmits and applies the internal and external knowledge of organization to improve the organization's ability of value creation. Karl M Wiig proposed that the knowledge management of library has two meanings^[2]: one is the meaning of service-based knowledge management, i.e. extraction, organization, development, service and dispersion of numerous information resources in a library to directly satisfy the needs of users for knowledge; the two is the meaning of people-oriented knowledge management, i.e. conversion between implicit knowledge and explicit knowledge in a library to facilitate the innovations of library and improve the core competitiveness of library.

In 1998, Mr. Ren Junwei^[3], as the introducer of "knowledge service" into the library circle of China, opened the curtain to the research of knowledge service in this circle. In 2000, Mr. Zhang Xiaolin^[4] pointed out the new requirements for library and information science in the environment of knowledge economy and modern information and the focus of library and information institutions on knowledge service in their core competence, and thoroughly reviewed the connotation, service model and operational pattern of knowledge service, promoting an upsurge of the research on knowledge service in China. So far, scholars in China have studied knowledge service for more than ten years and published a great number of articles to present its connotations, features, contents and implementation measures from different approaches and put forward a great deal of constructive viewpoints and ideas. In other countries, some articles have introduced My Library and My Gateway, etc., but there are few researches on knowledge service of library^[5].

Under the information environment of digital scientific research, academic library assists scientific researchers in knowledge control, knowledge mining, knowledge sorting and knowledge search to facilitate the conversion from implicit knowledge to explicit knowledge, satisfying the requirements of scientific research for utilization of knowledge^[6]. Through the survey on the needs of users in their scientific research, the library I work for began building subject knowledge service teams in 2014 to reform of the organizational structure of subject service, integrates the special database resources in the subject of information and communication engineering, carries out knowledge sorting, mining and search for the subject and builds up a subject knowledge platform of information and communication engineering for scientific research. The platform provides the teachers and students in the college with subject evaluation and value added services to satisfy the extensive demand of scientific research for information. With the building of platform for the subject of information and communication

* This paper is supported by the topic of Library and Information Committee for Academic Libraries of Hubei Province (2014): Research on Service Exploration of Subject Service Platform. Project number is 2014ZD09.

engineering, this paper will explore and practice the expansion and extension of subject service.

2 Strategies for Construction of Subject Knowledge Platform Based on Knowledge Management

Now, subject knowledge service is one of the important tools utilized by academic library to provide knowledge service extensively, which introduces the idea of knowledge management into subject service. Under the guidance of knowledge management, scientific management methods are employed to integrate all kinds of distributed subject resources. Subject knowledge base is established based on the needs of users and the contents of service are presented through subject knowledge platform. On the other hand, scientific management methods can be utilized to manage the resources other than literature for subject service, e.g. organizational structure, organizational personnel and organizational system, etc.

The knowledge management of library^[7] can be roughly divided into three phases, i.e. knowledge acquisition, knowledge conversion and knowledge innovation, during which the value of library knowledge is gradually increased. Based on the roles of knowledge management in library and the current status of subject service, this paper sums up the strategies of knowledge management for construction of subject knowledge platform mainly in the following aspects: integration of subject resources and construction of subject knowledge base; understanding the needs of users in scientific research; building a subject service team; reform of organizational structure of subject service.

2.1 Integration of subject resources and construction of subject knowledge base

Integration of subject resources means to apply scientific organization methods to gather, sort out and store all kinds of resources inside and outside a library, and integrate all kinds of scattered knowledge into a knowledge system in terms of subject. This knowledge system is an important source for subject knowledge base, so as to provide a lot of knowledge resources for subject service.

Both integration of subject resources and construction of knowledge base entail the scientific methods of knowledge management. Considering the three phases of knowledge management, knowledge must be well gathered, processed, stored and dispersed first for academic library to provide better subject service. Then, a large number of disorderly and unrelated knowledge resources, electronic resources of the library and other explicit knowledge are acquired from the library together with the experience of librarians and other implicit knowledge, which are processed and delivered into subject knowledge base. The subject knowledge base with multiple carriers for various subjects appears in multiple forms to integrate library resources with internet resources and provides accurate subject resources for users on the subject knowledge platform, so as to extend knowledge service to end users.

With emerging technology, subject knowledge platform combines the explicit knowledge including library information resources with the implicit knowledge of subject librarians and users to facilitate the conversion of knowledge, realizes the accumulation and innovation of knowledge and expands the contents and service receivers of subject knowledge platform. At present, subject knowledge platform is established mainly by means of Web 2.0 or Lib 2.0 (e.g. LibGuides), blog and static web page for subject, etc. With its Web 2.0 features, subject knowledge platform satisfies the requirements for library's information service at a deeper level, realizes the transmission of subject knowledge and the function of knowledge sharing quickly, and provides the customized service for users in respect of different subjects and special topics. In 2010, Fulton surveyed 40 research libraries in the U.S., of which 28 libraries had used the content management system to provide service for scientific research users and 11 libraries were planning to use content research system. Subject knowledge platform performs the content management of subject resources, and guarantees the orderly and continuous storage of scientific research achievements, in order to facilitate the sustainable development of scientific research.

2.2 Understanding the needs of users in scientific research

Subject service for scientific research users has expanded from the traditional delivery of literature to the information service. However, the idea of subject service has upgraded the basic information service of library to the specialized service supporting teaching and research, and transformed from passive service to active service. Meanwhile, subject service has embraced the new model of service satisfying the needs of users in scientific research. Today, subject service requires subject librarians to frequently communicate with scientific research users in different departments of university and learn about their actual needs. On the other hand, subject librarians are required to often utilize emerging technology and get well involved in the virtuous space of scientific research users, in order to make users enjoy subject services at any place. Hence, embedded subject service under ubiquitous knowledge

environment has become a user-centered subject knowledge environment subject to special information demand, and been fully blended into the virtual space of users to provide extensive information service and form a knowledge service system featured by brand-new organization of resources, service functions and system structure.

In order to construct a brand-new knowledge service system, the subject service model of library must be combined with the subject knowledge platform, so as to facilitate the sharing of subject knowledge. The new subject knowledge platform of library should be driven by the needs of scientific research users, contain subject knowledge and comprehensively utilize the latest tools and technologies to jointly realize the creation of knowledge through the collaboration of subject teams. The subject librarians of new generation must get involved in the scientific research process of college users and understand the needs of users in scientific research to provide useful knowledge service for them.

2.3 Building a subject service team

In this context, knowledge staffs are subject librarians involved in the subject service of library. The management of staff with scientific management methods can guarantee the standardization of organization. Under the standardized management, knowledge staff can also improve their work efficiency. The process of knowledge management contains developing the rules on subject librarians, providing periodical training for librarians, arranging communication activities among librarians, making librarians share their knowledge and experience and cultivating the awareness of subject service team, etc. Some academic libraries have also started the construction of learning organization for adapting themselves to the changing knowledge environment.

In order to improve the quality of subject service and the satisfaction of users, the library I work for builds subject service teams to provide subject knowledge service with their wisdoms and strengths through mutual learning. Subject service team^[8] is a collaborative subject service unit. Through collaboration and cooperation among groups, a subject service team can provide the integrated subject service including subject knowledge service, subject user training service and subject resource service. Subject knowledge service group is the core of subject service team and crucial to building subject knowledge platform. Subject knowledge service group is not responsible for doing scientific research, but provides knowledge services for scientific researchers, including science and technology novelty search, selective dissemination of information service, literature retrieval service and patented information service, etc. Through the specialized evaluative database, subject knowledge service group gives play to its advantages in information retrieval, information filtering, analysis and prediction to identify the research topics and hot spots in a subject and track the key works, journals, scientific research topics and other resources in the research field in a timely manner, in order to establish the subject knowledge platform. Subject knowledge platform provides virtual service for users. Through the resource integration technology, online acquisition technology and knowledge mining technology in the system of the platform, subject knowledge service group can realize mutual conversion between implicit knowledge and explicit knowledge, and make use of the platform to share subject knowledge, so as to facilitate the innovation of knowledge.

2.4 Reform of organizational structure of subject service

After library knowledge service has become the key competence of library and the growth point of its management, organizational management mechanism is also constantly improving and changing simultaneously. In subject service, knowledge management is applied in reforming and innovating the organizational structure of subject service. To give better play to the role of internet environment, the organizational structure of knowledge management has been changed from traditional pyramidal structure to flattened structure, so as to establish the organizational mechanism and management model for fully supporting knowledge service.

For academic library, the traditional organizational structure means that the leader of library directly governs all departments, e.g. consulting department, editing department, technical department and digital department, etc. Each department is managed by the responsible manager. Departments do not closely connect or cooperate with each other. When a library employs the matrix organizational structure of subject service, it follows the needs of users, breaks the borderlines of functional departments and arranges the subject service teams for subject cultivation to provide services for users. To realize this objective, the library must reorganize its business process and organizational structure, and consulting department must cooperate closely with other departments. This structure strengthens the connection among departments in the library, while subject service teams have also saved labor and money for departments considerably, optimized organizational structure and enhanced the competitiveness of organization.

3 Modeling of Subject Knowledge Platform

The subject knowledge platform of the Library of Wuhan University of Technology¹ is a user-based subject and knowledge-oriented service platform, which integrates resources and tools including internet resources revealing, subject knowledge portal, specialized database link and knowledge mining, etc. to support such services as subject demand analysis, interaction between library and college, subject knowledge selection and integration, design and management of customized service. It is a subject knowledge platform based on Web 2.0 technology. The subject knowledge platform acquires a large number of disorderly and unrelated knowledge resources, electronic resources of the library and other explicit knowledge from the library, gathers the experience of librarians and other implicit knowledge, and processes them into the subject knowledge base, so as to establish a subject knowledge base with multiple carriers for various subjects appears in multiple forms, integrate library resources with internet resources and provide accurate subject resources for users on the subject knowledge platform. This subject knowledge management model consists of knowledge acquisition, knowledge conversion and knowledge service. Through combining the knowledge management of subject service with the people-oriented knowledge management and the knowledge resources with the advanced information technology, this model integrates all kinds of resources inside and outside the library to provide knowledge service for users. This platform completes the conversion from information to knowledge and provides knowledge service. The model of platform is established as presented in Fig. 1:

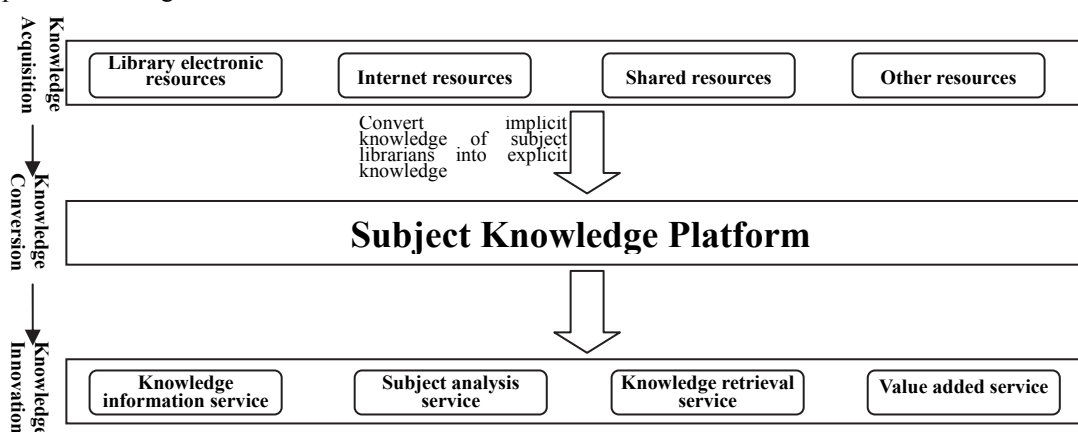

Figure 1 Subject Knowledge Platform

4 Initial Achievements in Construction of Subject Knowledge Platform

Subject service platform is an important part of subject knowledge service system. Through extensively searching, analyzing, evaluating and selecting the useful information resources, subject librarians can input information into subject service platform for classification, sorting, indexing and database creation, carry out the organization, integration, customization and analysis of information knowledge in the library, provide subject knowledge tracing service, topic service and knowledge analysis, and perform subject analysis and evaluation, academic communication, storage and management of various academic achievements, etc.

So far, the construction system of one-stop integrated subject knowledge platform for information and communication engineering has been preliminary completed. The platform reflects the knowledge resources of the subject in a centralized and comprehensive manner, covering subject status, project funds, research institutions, experts & scholars, academic achievements, subject analysis, database navigation, free online academic resources and other subject resources, one-stop resource retrieval, online consulting and other subject programs, in order to offer the one-stop channel for teachers and students to acquire all kinds of knowledge resources and services related to their subjects and majors. Since its test run was carried out in September, it has obtained 20,797 visits and 2,059 entries uploaded, and made practical achievements in the process of insightful, subject-oriented, real-time, interactive and customized service for scientific research. This platform has effectively integrated subject knowledge

¹ Subject Knowledge Platform of Library of Wuhan University of Technology[EB/OL].(2015-06-16). <http://iace.wl.lib.hnlat.com/>

service into teaching and scientific research, and been widely praised by users in my university.

Compared with other subject platforms at home and abroad, this platform is superior in terms of resource integration, indexing & cataloguing, service coverage and content abundance. Taking the knowledge management platform for the subject of information and communication engineering, the specific standards and achievements of construction are as follows: setting up the column for publishing the knowledge resources of the subject; integrating the library resources of the subject with the free resources on the internet; offering the unified access to search for the knowledge resources of the subject; providing subject analysis service and value added service for scientific research; integrating teaching service system; integrating scientific research institutes at home and abroad and related dynamic resources; strengthening real-time interaction between subject librarians and users, etc.

1) Setting up the column for publishing the knowledge resources of the subject: The column is mainly used to release the latest hot topics in the research of the subject, the academic trend, the upcoming meetings, policies and regulations at home and abroad, update the cutting-edge knowledge of the subject at home and abroad in a real-time manner, realize the all-directional integration and revelation of subject resources and help users with a general overview of the resources in the subject.

2) Integrating the library resources of the subject with the free resources on the internet: The navigation bar of databases integrates 66 subject databases, 20 trial databases and 67 free internet resources, presents an overview of databases and how to use, and allows to directly access the required database.

3) Offering the unified access to search for the knowledge resources of the subject: All kinds of resource databases in the library are linked to the subject service platform to realize the one-stop and unified search for specialized databases in the library, provide the service of subject-oriented, accurate and unified search for literature, and offer convenient link to the original texts.

4) Providing subject analysis service for scientific research: Literature count and analysis tools and specialized assessment databases are mainly utilized to perform the statistical analysis from various approaches and complete the analysis report on periodicals collected in SCI, SCIE, EI and ESI in 2013 and 2014, the analysis on the collection of articles published by teachers in SCIE, CPCIS, CSCD and EI, and the analysis report on ESI ranking of subjects. Also, the information sheet of subject periodicals in ESI and highly influential periodicals is prepared and distributed to the teaching and scientific research personnel of subjects, etc. The analysis report on subjects provides very important reference and guidance for universities to decide upon subject cultivation and for teachers and students to publish articles.

5) Providing value added service for scientific research: One-stop service is provided in the application for scientific research programs through offering the notifications and announcements, application guidelines and documents regarding the programs and funds of the subject, the related websites of such programs and funds and the people-oriented inquiry for scientific and technological programs.

6) Integrating scientific research institutes at home and abroad and related dynamic resources: The platform introduces the domestic and overseas academic organizations, teaching and scientific research institutes, domestic and overseas colleges and universities for scientific research, post-doctorate positions of domestic universities, research bases, and releases the events and news regarding scientific research of other institutions; provides analysis of cutting-edge topics, periodicals and influence factors of subject, hot topics and breakthrough focuses of subject, cooperation among institutions of subject, and news makers of subject, etc., so as to help local users discover potential cooperators in scientific research and learn about fellow researchers more conveniently.

7) Integrating teaching service system: For instance, it provides 65 video resources and courseware resources and 20 exquisite course resources, etc.

8) Strengthening real-time interaction between subject librarians and users: For instance, interaction can be achieved via QQ group, telephone call and email, etc.

5 Enlightenments from Construction of Information and Communication Subject Knowledge Platform

In the construction of information and communication subject knowledge platform, knowledge service is realized with some tools for knowledge revealing and knowledge extraction, and preliminary effect has been achieved in subject service. However, the technology of knowledge discovery for scientific research has not been realized for data mining, data processing, index management and

warehouse management, etc. at a deep level. In addition, in order to realize the embedded subject services, the subject service attempt to use LibGuides, but it is an independent platform which has not been embedded into the information knowledge platform and later gradually integrated into a whole. In the future, it is expected to further improve the information subject knowledge platform and eventually establish an subject knowledge platform that is oriented by subject content, relies on scientific research capabilities and integrates scientific research projects and achievements, subject research status and progress, related literature and scientific data, research institutions, and all other scientific research knowledge and factors, so as to promote the construction for other subjects. To sum up, subject knowledge management platform is a dynamically expanding system, which requires the active participation of users, so it is necessary to analyze the needs of users constantly, classify user groups in college, develop different service packages, and adjust services in a constant and dynamic manner, in order to improve subject knowledge service to information support for users eventually.

Study on the Construction of Intellectual Property Strategy of Universities in China*

Cui Hao

School of Humanities and Law, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: cuihao0538@163.com)

Abstract: Universities are the frontier of intellectual property production in China, which keeps pace with the intellectual property strategy of the country and the strategy of innovation-driven development, in order to construct and implement intellectual property strategy in universities. This article focuses on the construction of intellectual property strategy. With abundant statistics, it systematically analyzes the results and problems of intellectual property undertakings of universities. In virtue of the successful practices of foreign universities, it puts forward suggestions about the strategic construction of intellectual property: raising the public awareness of intellectual property, enhancing related laws and regulations, standardizing the construction of management system and strengthening technological creativity.

Key words: Innovation-driven; Intellectual property; Universities; Strategy

1 Introduction

Intellectual property is a strategy to safeguard national interests and to strengthen comprehensive national power. The major content of intellectual property strategy involves the creation, management, protection and utilization of intellectual property, which is integral to the national strategy of innovation-driven development. University is the major source of knowledge and technology innovation, which plays a critical role in the implementation of national intellectual property strategy. As a result, the development of intellectual property in universities will exert direct influences on the acceleration of accelerating transformation of economic development mode and on the adjustment of economic structure.

2 Analysis of Intellectual Property Status of Universities in China

In recent years, the intellectual property undertakings in universities are increasingly strengthened. However, generally speaking, the intellectual property undertakings are relatively weak, especially in terms of intellectual property awareness, management institutions and system.

2.1 The achievements of intellectual property undertakings

From 1986 to 2013, the total application of patents from universities in China was 536,250, among which 351,034 were invention patents, accounting for 65.5%; 130,582 were practical patents, accounting for 24.4%; and 54,674 were appearance design patents, accounting for 10.2%, as is shown in Figure 1.

Figure 1 Number of Application for Patents from Universities

Until 2013, the total number of patent authorization of universities reached 274,469, among which 141,843 are invention patents, accounting for 51.7%.^[2] From 2009 to 2013, the average annual growth rate of patent application reached 27.4%, and the average growth of annual authorization reached 41.0%.

* This paper is supported by Humanity and Social Science Youth foundation of Ministry of Education of China(12YJC630139).

From 2009 to 2013, invention patent accounted for 64% of the total number of patent application of universities, which was much higher than the figures of practical patent and appearance design. Invention patent was the most essential, which attested the remarkable improvement of research and improvement ability of Chinese universities.

2.2 The problems facing intellectual property undertakings

2.2.1 The weak awareness of intellectual property. The students and staff in universities still have a shallow understanding of intellectual property. Among university students, only 20% know how to protect their innovative products. 60% of them have the awareness to protect their products, but don't know the relief for intellectual property infringement. A large number of university researchers pay more attention to publish articles rather than protecting intellectual property. A large number of research products are not protected by intellectual property and thus don't turn to actual productivity.

2.2.2 Unsound management institutions and systems. The management organizations of most Chinese universities are not sound enough, leading to the lack of effective institutional assurance. According to a sample survey, 36.4% universities set up intellectual property offices, or patent department under Scientific Research Office. 45.5% universities clarify Scientific Research Office as an institution for intellectual property management and equip it with staff in charge of patent management. However, 18.1% universities don't have special institution or staff for patent management.^[3] In addition, universities are also in lack of strict confidential system of technological achievement and sound system of laboratory management, intellectual property contract-signing and evaluation and achievement transformation, without the establishment of sound and standard management system.^[4] It also leads to the serious loss of intellectual property of Chinese universities.

2.2.3 The low conversion rate of patents. From 2009 to 2013, the annual sales of patents of universities stood at 1311, 1571, 1745, 2143 and 2357, and the conversion rate was 7.5%, 6.4%, 5.0%, 4.3% and 3.4%. The total sales of patent reached 9127, with an average conversion rate of 5.3%, as is shown in Figure 2. Various factors lead to the low conversion rate of university patents. One of the major reasons is that the initial tests conducted by university laboratory occupy a larger proportion of patent application, which cannot be easily promoted or applied. Many achievements can only be applied in laboratory, which is fairly limited.

Figure 2 Sales Amount and Conversion Rate of University Patents

2.2.4 Unreasonable talents training and the lack of professionals. The talents of intellectual property are talents with comprehensive and cross-sectional knowledge. However, during the process of intellectual property cultivation in universities, there is no case for reference and imitation. With a lack of social practice consultation, and with only abstract concepts and simple memorization, students are deprived of a deep understanding and flexible application of intellectual property, and the methods of talents training also have flaws.^[5] In addition, the staff in charge of intellectual property management is of scarce number, and fewer persons receive systematic education and training of intellectual property. The professionals are not familiar with intellectual property searching consultation, agency, evaluation, transaction and protection. The lack of intellectual property talents of high quality and specialization results in the low level of overall management.

3 Learning from the Intellectual Property Experience of Universities in Developed Countries

Long before, such developed countries as European countries and Japan started to pay great attention to the setting up and application of intellectual property strategy in universities and made great achievements. Generally speaking, there are some features of the intellectual property strategy of universities in these countries.

3.1 The intellectual property strategy in the US attaches great importance to practical application.

The first is substantial financial support. The American government invests substantial funding to

ensure technological innovation, in order to strengthen the construction of intellectual property ability of universities. Substantial funding provides strong support to the technological innovation of American universities, which remarkably stimulates the initiative of researchers, improves the innovation ability and raises the commercialization rate of scientific achievements. The second is relatively sound law system. The American federal government issued Bayh-Dole Act, which denoted that universities have the property rights of the scientific invention sponsored by government. Universities have the rights to sell their invention patent licensing to American corporations. The profits made by patent licensing are attributed to universities and the inventors of patents have the rights to the earnings, which largely promotes the conversion of research achievements to intellectual property. In addition, by reasonable economic benefits distribution, the initiative of researchers is stimulated. The third is the establishment of special patent management departments. For example, the establishments of AUTM, OTL and NTTC are responsible for the management function of intellectual property, receiving achievement application, patent application and patent approval for researchers.

3.2 The intellectual property strategy in the UK attaches great importance to practical application

Firstly, influenced by Bayh-Dole Act, the UK changes the possession of intellectual property of government-sponsored projects. It clearly denotes that the intellectual property of projects sponsored by higher education funding committee or the national research committee belongs to universities, which is not a public property. With stimulation mechanisms, including financial and non-financial stimulations, two thirds of the universities provide direct financial stimulation to researchers and award the staff with parts of the profits made from intellectual property. Secondly, by reducing funding for universities, it forces universities to cooperate with industries for funding support. It guides the industrialization of technology of universities and applies the test technology to production field, turning it into productivity. Thirdly, the establishments of technology office, cabinet technology committee, technology council are responsible for the coordinating and promoting the cooperation between university and industries to raise achievement conversion. In addition, the media are set up to organize evaluation system, with the major indicators of technology production and conversion rate to evaluate scientific practices.

3.3 The intellectual property strategy in the UK attaches great importance to the combination of “production, study and research”.

As one of the most technologically advanced country in the world, Japan has accumulated a series of effective measures to promote technological innovation and the application of innovative achievements. 1. By raising the rewards to researchers and funding to universities, the initiatives of teachers, students and researchers are simulated. In 2000, 3.12% of GDP was invested to scientific researches, which was higher than the US. 2. By making the most of the demands between different market players, the fluent connection between research, conversion and application (production, study and research) is formed, to maximize the utilization of resources and to increase social profits by promoting innovation and competition. In 1997, the Japanese government took a series of measures, including the adjustment of laws concerning the part-time work of university teachers in corporations, the implementation of encouragement policy and the transformation of government function. The research, industrialization and corporation demands were integrated from the “macro-government” coordinating all the aspects to “micro-government” regulating market operation. The changing conception of government function further stimulated the creativity of university. At the same time, the corporations entered the global competition.

4 Suggestions about the Implementation of Intellectual Property Strategy in Chinese Universities

At present, the Chinese universities have sufficient conditions to learn from the successful experiences of intellectual property undertakings in developed countries, in order to reach a higher level and to make breakthroughs.

4.1 Strengthening the awareness of intellectual property

The first is to raise the awareness of intellectual property. The universities popularize intellectual property knowledge, in order to strengthen the teachers' and students' awareness of the importance and values of intellectual property. This process can be realized by various means. For example, among the special majors of universities, intellectual property is taken as compulsory course. Among other majors, intellectual property is optional course. The lectures about intellectual property are organized to train teachers, and the culture of intellectual property is included in the study of politics in universities. The second is to spread and communicate intellectual property culture. The media on campus, including

radio, newspaper, journals and publication, should regularly broadcast and publish contents related to intellectual property culture, in order to create a general environment for the construction of intellectual property culture and to promote the spread of culture on campus. The third is to strengthen the integration of intellectual property culture and scientific knowledge to promote academic research. Science and culture interact with each other for mutual survival, in order to promote the formation of intellectual property culture.

4.2 Consummating related laws and regulations

At a proper time, the Trademark Act, Patent Law and Copyright Law in China should be revised to integrate the safeguard of rights of intellectual property oblige, the public interests, the maintenance of law stability and the increase of the adaptability of laws. The aims of laws to ensure intellectual property strategy and the demands of current development are fully expressed. Because the two regulation documents of *Management Regulation of Intellectual Property Protection in Universities* and *Suggestions about Further Strengthening the Intellectual Property Undertakings* were carried out at an earlier time, their notions, guiding principles and measures have many unreasonable points, which entail revision as soon as possible.

4.3 Regulating the construction of management system

Based on the existing intellectual property management institution, the management mechanism should be further upgraded to improve the management and service level of intellectual property to standardize and institutionalize intellectual property management. The specific measures include the followings. The first is to upgrade the management system of all intellectual properties, including systems for property rights registration and demarcation, verification of non-work-related achievements, intellectual property evaluation and achievement conversion, intellectual property stimulation and support and promotion-related intellectual property.^[6] The second is to set up sound stimulation mechanism. The country should specify the belonging of intellectual property in universities, allowing the universities to have the full control of research achievements sponsored by governments, encouraging researchers to apply for patent and acquiring propriety intellectual property rights. Gradually, the intellectual property achievements should be increased to become a weight in the indicator of the evaluation system for academic performance, which tends to offer the technological rewards and research funds to outstanding universities. The interest promotion mechanism and safeguard mechanism for technological achievements conversion and application are established, in order to raise the ratio of private rewards among the inventions and technological achievements. The third is to reform the performance evaluation system for teachers. The intellectual property achievements are listed as an important indicator for the professional title appraisal, promotion rewards and performance assessment.

4.4 Increasing the ability of independent technological innovation

The first is to increase the capability of independent innovation. Improving the ability of independent innovation is a major measure to construct innovative universities and to ensure the effective application of intellectual property strategy in universities. Meanwhile, it is also the key to the development strategy of innovation-driven. Independent innovation takes three forms, including the original innovation, integrated innovation and the re-innovation after introduction, digesting and absorbance. The three modes have their own features. The universities can decide which mode to take according to their specific situations. For example, for universities with high research abilities, they can make technological breakthroughs in their advantageous disciplines by adopting independent innovation models. As for ordinary universities, they can focus on integrated innovation and re-innovation after introduction, digesting and absorbance, with the help of original innovation. The second is to pay attention to coordinative innovation strategy. "The 18th Party Congress" put forward the innovation-driven development strategy, and attached great importance to coordinative innovation, which can be realized by strengthening researches in three aspects: intellectual property system promotes the study on the connection between economic and social development; the study on the connection effects of intellectual property public policy and technology policy, industry policy, trade policy and regional policy; the coordinative innovative study on the intellectual property strategy in universities and technological innovation strategy. In order to achieve these goals, universities should break the traditionally closed and isolated innovation model, and integrate corporations, research institutions and government to make innovative coordination and coordinative innovation strategy.

5 Conclusion

Under the background of innovation-driven development and with a consideration of the current status of intellectual property undertakings in Chinese universities, we should be fully aware of the frequency, urgency and burden of the problems. To achieve this, we should further promote the intellectual property strategy in universities in order to make greater achievements and to make contributions to the construction of an innovative country and to the rejuvenation of our Chinese nation.

Ranganathan's Five Laws and Its Impact to the Technological Innovations of Library and Information Sciences

S.K. Illangarathne, Wang Yingming

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: skillangarathne@gmail.com, 22530958@qq.com)

Abstract: This paper analytically reviews the five basement laws appear in the field of Library and Information Science (LIS) that, introduced by Dr. S.R. Ranganathan, who was the first class Indian library scientist, and his laws theoretical impacts to the technological enhancements of the field of LIS. Technology transitions from conventional age to electronic age, and individual impacts on element of R's laws for that, were analytically revived throughout the available literature. Finally, concluded that, most of the technological innovations available at the field of LIS have based Ranganathan's five laws, and his five laws are still on live of the library and information science domain.

Key Words: S.R. Ranganathan; Five laws in library science; Technological innovations; LIS

1 Introduction

1.1 Recent developments of LIS as a public domain

In 1900s, the libraries were began to more popular among general public, after liberzed them from royal prerogatives, who ruled world before 1900s and transferred the management of the libraries into the progressive philosophers called librarians^[1].

During this renaissance period, many researches and developments taken place toward information organizing and distributing, formulating standards for librarianship and form a better library management system. These were devilishly effected to the revolutionary development in the field of Library and Information science.

The contemporary period, the American Library Association (ALA) involved to introduce suitable standards and frameworks for libraries. Those also directly impacted to achieve the organization goals of the field. Under the industrial revolution, technology and instruments were invented for enhance the printing and publishing, also were remarkable support to the development of the Library and Information Science field^[2].

In 1960s dada communication via cables (ARPANET after World Wide Web & Internet)^[3] was implemented and it affected to the massive change at the telecommunication industry. Information could be able to send one place to another very fast as packet data, and this technology gradually impacted to the field of LIS to store information and send to another party very quickly on requests.

As the result of above technology driven developments, the libraries were become most essential institutions among the people and societies. They continually used to visit the libraries to full fill their day to day information needs and gradually they become the most valuable communication centers worldwide. According to these enhancements, its shape also tremendously began to change day by day, and their staff also were used to find out the optimum solutions to provide correct information into correct user at the correct time with the aid of modern information and communication technology^[4].

Present era called as "Information era"^[5]. Therefore, information is considered as an important tool in every aspect of human life and very recently it has become the fifth need of human life. Today people are searching information from mobile devices which have connected to the super speed 4G internet. The shape of the libraries also have become an invisible mode (virtual library). Many cloud based information clusters are waiting until users are requested information. Finally information has become a most important need of the human life.

1.1.1 What is Library and Information Sciences?

Library and Information Science is a profession that is full of people passionate about making a positive change in the world & they tend to be wildly happy about what they do. According to one recent survey, over 85% of information professionals questioned said if they had the choice, they had do it again. Librarians bridge the gaps that exist between people, information and technology. In their professional lives, librarians and information professionals work to: design and develop knowledge-organization systems, create reader's advisory resources to encourage young students to develop a lifelong love of reading and learning, help scholars locate archival and other resources crucial to their work, identify sources of assistance in family and personal crises and help doctors more quickly

locate health information in critical situations ^[6]

1.1.2 What is Technological Innovations?

Technological innovations comprise new products and processes and significant technological changes of products and processes ^[7]. There is no doubt that technology has had a lasting impact on libraries. Once thought to be going the way of traditional bookstores, libraries have rebounded and are thriving in a technology fueled world. With the help of innovation, re-imagination and vision, libraries are embracing new technologies while creating dynamic community centers filled with life ^[8].

1.1.3 S.R. Ranganathan & Five Laws of LIS

Dr. Shiyali Ramamrita Ranganathan considered the father of library science in India cover certain facets of library and information science. He was a university librarian and professor of library science at Benares Hindu University (1945–47) and professor of library science at the University of Delhi (1947–55). The last appointment made him director of the first Indian school of librarianship to offer higher degrees. He was president of the Indian Library Association from 1944 to 1953. In 1957 he was elected an honorary member of the International Federation for Information and Documentation (FID) and was made a vice-president for life of the Library Association of Great Britain. As well as he was the author of many LIS text books and founder of Colon Classification system ^[9].

In 1931, he introduced the five laws to LIS, and most of the contemporaries were accepted those laws as the basic fundamentals of the library management system. These laws are as follows:

Books are for use.

Every reader his [or her] book.

Every book its reader.

Save the time of the reader.

The library is a growing organism.

The Five Laws of Library Science are some of the most influential concepts in the field (*see illustrator 1*). Since they were published in 1931, these five laws have remained a centerpiece of professional values of LIS. These basic theories of LIS continue to directly impact the development of this discipline and the service of all libraries.

1.2 Methodology

When consider the past several decades, it can be seen the field of LIS has developed by multiple ways especially through technological innovations. This paper plans to discuss the interrelationships and impacts of Ranganathan five laws with those enhancements. Latest developments of products and services in field of LIS are considered as technological innovations and compared effectiveness and efficiency of those innovations with his basic learning of five laws.

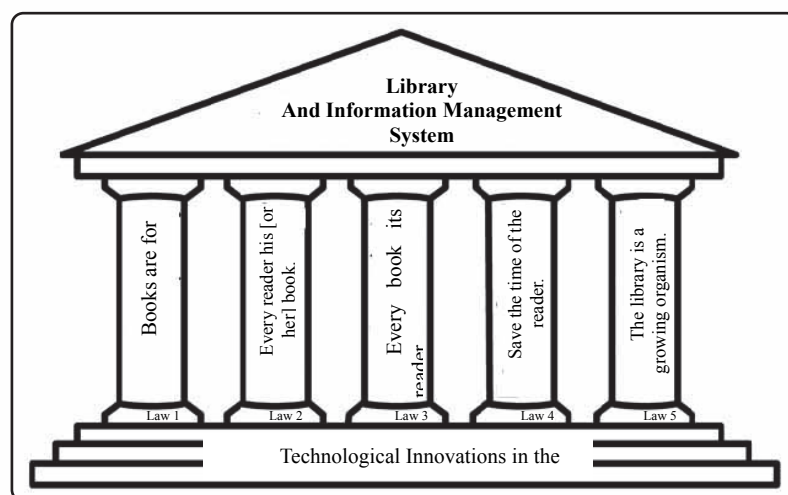

Figure 1 Five Pillars of Modern Library Management System

1.3 Technological innovations in library materials

Modern libraries are increasingly being redefined as places to get unrestricted access to information in many formats and from many sources. They are extending services beyond the physical walls of a building, by providing material accessible by electronic means, and by providing the assistance of librarians in navigating and analyzing very large amounts of information with a variety of digital tools.

Modern e-books has substituted for printed books. Mobile communication and digital technology have made good bridge for users to read e-books via kindle or ipads. People are used e-library to access into the information and their reading environment has totally changed by the modern technology.

At the present information era, the shape of the information materials already has changed and becoming a smallest. Many e-books are existed without any printed equivalent. Commercially produced and sold e-books are usually intended to be read on dedicated e-readers. However, almost any sophisticated electronic device that features a controllable viewing screen, including computers, tablets and smartphones can also be used to read e-books.

E-book reading is increasing in the US; by 2014 28% of adults had read an e-book, compared to 23% in 2013. This is increasing because 50% of Americans by 2014 had a dedicated device, either an e-reader or a tablet, compared to 30% owning such a device by the end of 2013 ^[10].

Ranganathan's first 4 laws discussed about the library materials and their effectiveness to save the users' time. After he raised the importance of open the books for public readers, it was directly impacted to material enhancements of the libraries. Therefore today it has totally changed the environment of the libraries.

With the acceptance of his laws, the general public were invited to use libraries and their information materials more and more affected to enhance the research and developments of its technology. With these enhancements there were many organizational, structural and management changers at the libraries. After the law published, books were very user friendly information sources, and publishers also were started to think about convenient of readers. They used to adopt technology to publishing industry as well. New systems for book loans, circulation rules and technologies, fine system, user recording system and resource verification systems also were reformulated accordingly.

1.4 Technological innovations in library services

The internet has become the most technological innovative factor in LIS. It has already had a major impact to small the library and expand their services. As an added service to the lending books the libraries can be able to start e-mail alert information services, Selective dissemination of information (SDI) services and Current Awareness Services (CAS). With this massive change of the LIS field it has become reverse impact like libraries are becoming smallest and services and storage of information are becoming larger. What Ranganathan says in his fifth law "Libraries are a growing organism" now starts to become a shape up with new technology (*see illustrator 2*).

E-borrowing, e-reading, and online "ask a librarian" research services are another most innovative developments in LIS. Many librarians now can connect with their readers online to solve their information needs. Saving readers' time has become a most important factor of the LIS. This need has pointed out by Rangathan on his fifth law. This law is a recognition that part of the excellence of library service is its ability to meet the needs of the library user efficiently. He paid more attention about users and always directed to the librarians to minimize the users' time from begin of information search to finish his or her information need. The base of this law was adopted by alternative information providers also to complete their organization goals.

Many technological innovators in LIS domain used to base this law before design their product or service. Library classification schemes, indexing & abstracting services and every kind of selective dissemination of Information services are based on saving the users' time. Because saving time is the major satisfaction factor of every kind of customers in product and services.

Librarians' reference skills are most impacted to save the users' time. Library cross-reference services, cataloguing technologies, online public assess catalogues (OPAC) are can be named as technological innovations of LIS which accompany with Ranganathan's forth law.

As the growing organism the libraries facilitate to their users to access information in correct format and in time ^[11]

The R's fifth law of library science "the library is a growing organism" means that a library should be a continually changing institution, never static in its outlook. Books, methods, staff and the physical library should be updated over time. He supposed that libraries should be growing at least its users, materials and staffs.

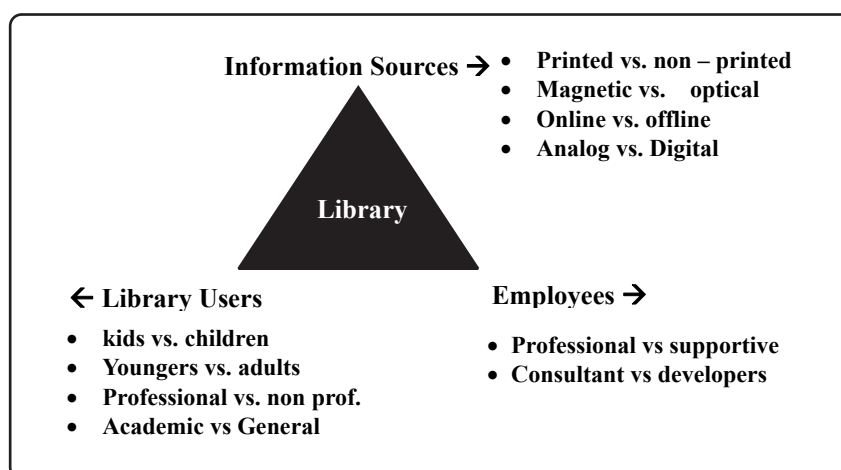

Figure 2 Library is a Growing Organism

2 Conclusion

At this information age, the libraries have been in the most prominent information and communication dissemination centers, collection development centers and latest technology using centers. Libraries acquire and secure ownership of digital content (typically through license), store the content as the local services, and make it accessible to a target community. Libraries attempt, as technological innovators, to ensure fully access to the digital collection through their various kind of information services, and to migrate the content according to latest technology. In the meanwhile, libraries host as a social partners, and growing organism of this global era.

As a result of above approaches, domain of LIS is always renew with the modern developments of technological innovations. E-books, e- journals, web 3.0 technology, social media interaction, online user feedback systems, worldwide catalogue searching facility (world cat), and web based library circulations, cloud library initiatives, library access via iPhones, kindles, QR code, 3M library gates are the main approaches they applied with modern technological innovations in this information era^[12].

Dr. S.R. Ranganathan's five laws of Library Science are still suit for the modern library developments due to their liveliness. Those laws contain whole library management skills and especially as a growing organism, libraries can be able to shape up their basic organization structure according to the users' needs. It is reviled that most of LIS oriented innovations have being started using conceptual framework of R's five laws. Most of the new technology innovations happening on the LIS field based on these five laws foundation.

When consider individual law it is shown interconnection between each law with others. As an organization, they library cannot be avoid any of law as thinking they are unusual. These interconnectivity has manipulated the organization culture according to the current requirement as well as productivity of newer innovations.

Research on the Problems and Countermeasures of Urban Minimum Living Guarantee System in Current China

Lu Meng¹, Guo Guoxiang²

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 82330646@qq.com, 38701854@qq.com)

Abstract: Urban poverty in social and economic transition is a special phenomenon; The urban poor is the part of the national poverty population, which has its own characteristics. Solving the urban poor poverty is one of the most important measures for establishing and perfecting the social security system. The paper first related ci-theory concept is defined, and then analyzed the status quo and the urban poor effect. Emphatically analyze the Chinese urban poverty population to social security system present situation, the urban poor social security problems in the system. Then analyze foreign urban poverty population to social security system of experience and enlightenment. Finally establish and perfect our country's urban poverty population to social security system countermeasures. Including perfecting the urban poor social assistance system, speeding up social security legislation steps, establishing social security and the employment problem ease cohesive mechanism.

Key words: Urban poverty; The social security system; Unemployed security; The pace of legislation

1 Introduction

Poverty is a worldwide problem. There are many number of people living in poverty in the vast majority of countries or regions in the world. Because the emergence of the urban poor has been a disharmonious factor for the development of our society, so the government and all sectors of the society have paid great attention to the urban poverty issue. Anti-poverty and the social security system are closely linked together, therefore, the social security system is an important means to fight for poverty. The establishment and perfection of the social security system are related to reform, development and stability in China. The stability of a society cannot do without the healthy development of the social security system; the adjustment of the economic structure also needs the support of the system. Therefore, it is of great significance to research the urban poor social security situation, establish and perfect the social security system.

2 The Formation and Composition of Urban Subsistence Allowances System in China

2.1 The formation of urban subsistence allowances system in China

Since founding new China, the historical vicissitude of the urban poor social security system has mainly experienced four different historical periods: the creation of the urban poor social security system (1949-1956); the development period of the urban poor social security system (1957-1965); the urban poor social security system's construction of stagnation period (1966-1977); the urban poor social security system's recovery and reform period (1978-).

2.1.1 The creation of the urban poor social security system (1949-1956)

Early of the China, the government started to solve the serious social problems. The government had promulgated a series of social politics and regulations to establish the social security system in China during the process of solving these problems of reality. With the efforts of the government, China's social security has taken shape before the Great Cultural Revolution. It had generally formed a social security system which is about social insurance, social relief, social welfare and social special care. There-into, the social security system which faces the city urban poor includes social insurance system and social assistance system, and social assistance system is the lowest level of measure and basic means.

2.1.2 The development period of the urban poor social security system (1957-1965)

Our country has carried on some adjustment to labor insurance system for workers and staff of the state organs and institutions. According to the social development situation, it increased treatment after retired of works and staff who lose labor ability completely because labor causes damage. In March,1957 and March 1958, our country enacted some laws like 《Interim Provisions on workers, employees retirement process》, therefore retirement of workers and the staff has been an independent system arrangement. Also, the condition for retirement was changed. Easing the retirement age---the

male's retirement age reduces from 25 years to 20 years; and the female's retirement age reduces from 20 years to 15 years. Moreover, there are more detailed provisions for retirement treatment. There has formulated corresponding treatment according to seniority. In the aspect of medical insurance system, the Ministry of Health promulgated "the provisions on the scope of the provisions on occupational and patients approach" in 1957, and this stipulation made the 14 kinds of disease including in the scope of the occupational disease, increased the occupational disease's treatment of medical insurance.

2.1.3 The urban poor social security system's construction of stagnation period (1966-1977)

China's social security system's construction had taken a knock during a period of the Great Cultural Revolution happened in 1966. At that time, the social security regulation was repudiated, there was unable to properly conduct social security business, moreover, the whole society was basically in a state of chaos, the construction of the urban poor social security system remained stagnant. Afterward, labor insurance which is a main content of China's social security lost the whole function and evolved into enterprise or unit security system. The social security system could only rely on each unit to organize to maintain and perpetuate.

2.1.4 The urban poor social security system's recovery and reform period (1978-)

Our country social security system of the urban poor had been recovered and rebuilt from 1978 to 1984. The fifth National People's Congress decided to set up the Ministry of Civil Affairs, this move ended a situation that social relief, social welfare and special care and placement system operated without a competent department: the State Council enacted 《Interim Measures on Resettlement of the sick and elderly cadres》、《Interim Measures of workers retire or resign》; at the same time, some areas began pilot reform of the institution of unemployment insurance of staff and workers in state-owned enterprises and pension insurance and disaster relief insurance of the collective enterprise employees. However, according to the whole social security system, the work of this period was mainly in order to solve the problems left over by history and restored the normal retirement system, and it was to save the chaos which was caused by the Great Cultural Revolution.

The social security of urban poverty in our country has carried on reforming and restructuring since 1984. The social security system of China transformed from traditional system to social pooling at that point. There was the social pooling of the types of insurance like retirement, medical treatment and unemployment etc. which promoted gradually from point to surface. At the same time a career of social assistance for the urban poor got great development. However, there are a large number of laid-off workers and workers in enterprises with difficulties while China has done further deepening of social and economic structure adjustment and state-owned enterprise reform. The traditional social relief system did not classify city of new poverty into the scope of the relief. At the same time, because of the rising prices and the low-side relief standard, the original city poverty was hard to maintain the minimum living standard. In this case, to reform the original social security system and establish a social security system to adapt new situation was extremely urgent.

2.2 The composition of urban subsistence allowances system in China

According to 《Urban minimum living security regulations》, the basic framework of urban subsistence allowances system in China includes principles and guidelines, target people, assistance standard, financial source, management and supervision, complete policy. This part will mainly analyze several aspects associated with this study.

2.2.1 Principles and guidelines: the lowest social security system of urban residents follows to a principle which is to ensure the basic life of urban residents. Insisting on a policy that the state guarantees combined with social support and encouraging labor save by themselves.

2.2.2 Target people: if the per capita income of a family is below the local minimum living standard, holding non-agricultural registered permanent residence' city people whose family members that living together have the rights that getting the basic life material help from the local government. The identity and economic condition of target people are different, so their treatments are different. City resident without life source, working ability or legal guardian could get the whole security funds which are based on local minimum living standard. On the other hand, citizen who gets certain income could get differential security funds which are based on local minimum living standard.

2.2.3 Assistance standard: to ensure urban minimum living guarantee standard is based on citizen's basic living necessities like clothing, food, housing costs, water and electricity (gas) costs and expenses of compulsory education of minors.

2.2.4 Financial source: the urban minimum living guarantee funds is included in the budget by the local government. The central government subsidies for the poor provinces are included into the social relief

fund expenditure. There are special management and earmarking a fund for its specified purpose only. The state encourages social organizations and individuals to donate funding for the urban minimum living security. This funding is all included into the local minimum subsistence funds.

2.2.5 Complete policy: the minimum living standard security system is the last line of defense the entire social security system. The pressure of the minimum living standard security system will be increased so that the system is hard to exit and operate if other social security policies are poor implementation and too many loopholes. Therefore, it is important that three guarantee lines (the minimum wage, SOE basic living allowances of laid-off workers and unemployment insurance) are well coordinated. They can apply for city residents of the minimum living allowance basing on a situation that household income per capita is still lower than the local minimum living standard only when the laid-off workers, the unemployed, enterprise retirees and active employees receive the basic living expenses, unemployment insurance, pensions and wages respectively. Meanwhile, the implementation of preferential policies in education, housing, health care, water and electricity etc. is help to reduce a part of the expenses of the poor households. Even so, it is still not enough for the urban poor families rely on cash guarantee, it needs services to compensate for the lack of funds. Community service and other benefits should be given to those poor families first. Moreover, local governments and departments should give the necessary support and care to employment, self-employment and other aspects of urban residents who enjoy the minimum living allowance.

3 The Problem to the Urban Poor Population of Social Security

3.1 Lack of awareness to the urban poor population urban subsistence allowances

Poverty is a process accompanied by Health and Human Development of the social phenomenon. Perceptions of poor groups mixed with many complicated factors. But there has been accustomed to the poor as an alternative society, which is a purely burden on society. Under the guidance of this negative thinking and relief for the poor is seen as alms to the poor, it has become a one-way flow of resources.

Urban subsistence allowances negative view of the existence of the urban poor signs. If a negative view of the poor, and let them idle, it is not only a waste of human resources, and with the further transition economies, further expand the low number of financial burden on the state will further increase. What the poor should be in position of Urban Poverty Strategy? Positive or negative view of the poor, there will be very different results. In this regard, some experts have this appeal, it was believed that the government and the whole society should actively look at urban poor groups, never see them as a burden on society, but still treat them as are valuable human resources; I believe they can, through their own efforts to create their own jobs, to obtain sustainable livelihoods. It is unfortunate that the current government as the main anti-poverty, ignoring the poor play to their capabilities and functions.

3.2 Relief function of the urban subsistence allowances is insufficiency

Urban subsistence allowances failed to properly reflect the voice of urban poor groups, there is a relief dysfunction problem. Such low premiums low, low system itself has a negative orientation, it is difficult to promote poverty alleviation minimum target. Target urban subsistence allowances are basically located in the guarantee basic living. Then because of the "basic" understanding of the lack of operational provisions, in some places it will be "to protect the basic livelihood" as "safeguard eat," even too much emphasis on "minimum guarantees" to determine very low security standards. Minimum target if not starvation, but it is difficult to ensure the necessary nutrients. Let alone meet other needs of life. In fact, the negative impact of poverty alleviation, so the poor have a respite possible angle of view and poverty, guaranteeing the system becomes too negative. Moreover, the minimum living standard security system design is too simple, ignoring the special needs of different types of poor families.

From the cause of poverty, the part because of the loss of or does not have the ability to work, such as the "three non-officers", the disabled, elderly, the sick, etc., part of the temporary loss of the ability to work but not enough jobs or job opportunities, such as laid-off, unemployed or low-income workers; From the family structure, the presence of single-parent families, families school children, the elderly, the disabled and other special family circumstances. The structure of the current minimum living security system over a single, complex situation of poor families simplification, regardless of how the situation is different from relief objects, in accordance with the same standards to implement relief.

Institutional structure could not design a different standard sizes of poor households per capita subsistence minimum, no studies of single-parent families and the special needs of the elderly, children, the disabled, but did not consider how the able-bodied poor implementation of effective incentive, It is to be

treated equally with those who are unable to work, or simply to resist the outside subsistence allowance s. Security System This single structure is not only unable to meet the different needs of the poor living minimum, while also making efficient use of the limited relief funds reduced.

3.3 Urban minimum living security system's development faces bottleneck

Urban minimum living security system's development has emerged bottleneck, which includes: currently, minimum living standard security system does not provide relief after the deadline, according to the current provisions guaranteeing that any able-bodied person must apply for employment first, subsistence allowances is for people who fail in applying for a job twice. According to the survey, unemployment consists of a considerable amount of people who apply for subsistence allowances. The so-called “unemployment” is not without a suitable job, but ideologically prefer not to work, depending on aid. Driven by this idea, they do not value the work recommended, and unwilling to bear the hard work and then with the “faked illness proof” to prove themselves “unable to work”, so they can be get into the government’s scope of protection.

Secondly, the “family property survey” faces obstacles in practice. “Family property survey” is an important part of guaranteeing access mechanism. Determining whether the applicant meets the eligibility criteria. It's first checked by committees of first instance, and then the Office of the streets do the “family property survey”, the result of the approval plays a vital role. According to our current operating mechanism, financial institutions can't reach “investigation” requirement, social security sector's right is limited, coupled with inadequate laws and regulations, resulting in difficult to operate “family property survey” in practice.

Finally, aid averaged makes it unable to meet the “poor households” needs. In general, we tend to rescue the standard averaged, ignoring the differences in size of each family structure, demand, and can't meet the actual needs of “poor households”. It turns out that poor households are generally in the loss of the ability to work while suffering from serious illness, and permanently, leading to ruin. For such families, relying on government-issued monthly assistance payment is certainly inadequate.

3.4 To separate social security and employment from urban subsistence allowances

Excepting reemployment, when Social Security just preserve the negative life that who get the subsistence allowance caused the low social mood easily and keep on immediate interests of narrow mind cautiously. Excepting Social Security, when reemployment policy just participation competition in the market, the poor can lose their job in tomorrow of that days' the unstable labor markets. Not unnaturally, then will do everything to keep the treated for Social Security. Then lots of the “unregistered employment” and “off-payroll income” have arisen. Today, subsistence security system just aims to solve the problem of minimum living of citizen but without any action to helping the poor come true again of obtain employment. On the one hand, the urban poor reflection of the lack of effective self-interest requirements and participation in decision-making channels, on the other hand, many of the poor lack the appropriate skills. Therefore, the poor express their interest in the manner required often non-institutionalized sudden. This approach can easily lead to social instability. In addition, because the poor have not reflect self – interest demands, the lack of appropriate capacity. Therefore, the policy on poverty reduction is actually carried out by the non-poor. This policy lacks the necessary institutional constraints to effectively meet the needs of the poor, we rely on good intentions of policy makers. The fact that such good intentions in many cases are unreliable.

4 The Improvement of Urban Poverty Population Social Security System Strategies

4.1 Accelerate the pace of legislation

Social security objects are dramatically changing, laws and policies are failed to timely adjustment: ownership compositions of companies are diversification. It has been unable to continue to classify enterprises according to ownership in the aspect of social security, and those original policies relating to state-owned enterprises could not to follow. There are more and more people select the informal employment like elasticity of employment and flexible employment etc., at the same time, a lot people keep several labor relations with different corporations, we can not claim them to join the social insurance with the same approach like those formal employment. Therefore, we should accelerate the pace of social security legislation and improve the social security laws.

4.2 Strengthen law enforcement and supervision of social security

Establishing a social security system with Chinese characteristics is major social system engineering. The economic of our country is stable and healthy development, it has laid a solid material foundation to speed up the reform of social security system. Nowadays, should attention pay close to the

development and improvement of the legal system of social security, clear the function and role of social security in urban poverty reduction in the legally and guarantee the survival and development of the urban poor. At the same time, we also need to strengthen law enforcement and supervision and positively make government affairs public. Basis, authority, procedures, results and supervision approach of social security administrative enforcement should be announced to the public. This is help to the public supervise social security administrative enforcement.

4.3 Improving the social security system project for the urban poor

Because of the realities of social security system's function is not perfect, narrow coverage and low security level, so improving the urban social assistance system should include financial assistance, legal aid, humanities aid and education assistance for the urban poor. Generally, after poor families receive financial assistance, it just is to maintain the most basic living conditions, but the demand is still not contented in health, education and social interaction, so improving the social assistance system is imperative. There can be done from the following:

Firstly, providing financial assistance for the urban poor. Social security system is an institutional security system which is set up by legislation. The assistance to the poor is to provide minimum social living. All levels of government, social organizations and communities are responsible to give hand to the poor with many aspects like funds, substance and services in order to guarantee their basic living conditions, alleviate pressure on the survival of the poor, alleviate social contradictions and achieve social stability.

Secondly, providing legal aid for the urban poor. Determine the status and role of social assistance in the social security system from the law. Under the situation of the growing complexity of labor relations, the increasing pressure of labor supply and the poor have no money to court, providing legal aid for the poor and protecting the legitimate rights and interests of the weak. This is an important exemplification of social justice and equity, and it has become an important way to safeguard the rights of the poor.

Thirdly, providing medical assistance to the urban poor. The first step to establish and improve the medical care system is to rely on a reality of uneven regional development, it can not work in a hast. Gradual promotion is on the basis of practice, so forming a nationwide network of medical assistance and establishing an effective legal system of medical assistance.

Fourthly, providing educational assistance to the urban poor. Especially, our country should attach great importance to education of the children of the urban poor households. There are many channels, for example, providing free education of the urban poor on the basis of nowadays compulsory education. Otherwise, to non-compulsory learning period, it could provide several ways like student loans and on-campus jobs etc. to solve their continuing education, those poor children could get a relatively fair education opportunity through a variety of ways, thereby avoiding the problem of poverty inter-generational transfer.

4.4 Establish and improve the urban poor's social insurance system

Further improve the social insurance system for the urban poor including pension insurance, medical insurance, unemployment insurance and industrial injury insurance. These social insurance programs for the urban poor have a fundamental role in safeguarding. Based on the respective functions and features of the urban poor, they are a question of priorities.

4.4.1 Unemployment insurance

Laid-off workers and unemployed workers of towns mostly are belong to the working age population. Therefore, our current top priority is to improve the unemployment insurance system as soon as possible to protect this segment of the population do not fall into the plight of unemployed. Nowadays, China has initially realized the urban minimum living security system merged with the unemployment insurance system, unemployment insurance should move towards to the integration of the object. Breaking the boundaries of identity between enterprises of different ownership workers so that the workers of the individual companies, joint-stock enterprises and township enterprises could enjoy the same social benefits and labor security with the workers in state-owned enterprises and collective enterprises, then achieving the docking of unemployment insurance and employment promotion programs while improving the overall level of unemployment insurance. Unemployment insurance has a concentration of funds and anti-risk capabilities.

Take full advantage of this feature to ensure that our country in different regions, different periods of unemployment insurance balance should be to maximize the level of co-ordination. Enhancing scheduling capability of funds transfer, seriously implement effective forms of municipal co unemployment insurance fund, increasing the proportion of provincial adjustment fund financing, and

enhance the funds ability to adjust the remaining places. There should pay closely attention to the payment problems caused by business closed, fund bankruptcy, transition and lay-offs, persist a system of unemployment insurance situation monthly bulletin and warning reporting and make response options in advance. Immediately allocate funds while a region emerges fund gap to ensure the needs of the fund. Make efforts to improve the overall level of unemployment insurance so that to achieve the fund has sufficient capacity to respond to the situation, and then provide strong support for the effective functioning of the unemployment insurance system.

4.4.2 Medical insurance

There are many urban poor is infirm, but few of them buy the health insurance, therefore, medical costs become a heavy burden to those poor families. Fear of illness and medical treatment is a general psychology of poor people. Minor illnesses do not be take care by the doctors then causing serious illness and eventually caused the collapse of the family, this is one of the reasons causing the poor and a vicious cycle of poverty. First, the rate of basic medical insurance is low. Second, a considerable number of family members can not get timely medical treatment when they are sick. The third is sick in the hospital, expensive medical and heavy burden of medical expenses are troubled the low-income families. Nearly half of the surveying households reflect that the problems of they are often worried and concerned are ill in hospital and medical expense burden.

Therefore, establishing and improving the medical insurance system for urban poor is urgent. Multi-level medical insurance system is the basic experience of developed countries. Our country should establish the same multi-level medical insurance system which is based on health insurance and supplied with commercial health insurance, and the core of this system is basic medical insurance. To the basic medical insurance, the current need is to expand coverage, the urban poor population groups are all included into the system, then the social medical aid system and cooperation system are supplemented, as far as possible to make the system tilting to vulnerable groups so that to meet the medical needs of this part of the group.

4.4.3 Pension insurance

According to United Nations projections, in 2015 the proportion of China will reach 9.6% and in 2050 to reach 23.6%, which means there will have about one in four people are the old at that time. According to the above analysis and taking into account the huge population of our country, this shows that it is necessary and urgent to increase efforts to the relevant aspects and improve pension insurance.

To improve pension system of the urban poor should mainly pay attention to improve the overall level of pension in current. Make clearly the personal accounts and do in prevention to the risk of pension insurance “empty account” running. The higher level of social security co-ordination is the stronger elasticity of social security funds. Nowadays, there should be make a formation of east, center and western regional co-ordination level by the pilot that based on the initial realization of the social insurance at the provincial level, then establishment of a national co-ordination level in proper time. Moreover, to increase the pension fund appropriately, by selling of state assets inventory, the first level of national land and other ways to enrich the national pension fund so that to solve the status of pension accounts “empty account” operation, then to defuse the risk of future payments.

4.4.4 Promoting active employment

Although social security can play a role in poverty mitigation and prevention, but it is also a double-edged sword. The slightest mistake will cause a “poverty trap” to make the poverty issue more complex and intractable, and the role of social security to alleviate poverty prevention is difficult to achieve the desired objectives. The so-called “poverty trap” is that the availability of the personal income-relating subsidies are declined while the income is increased so that resulting in the real income is declined which earned thought personal efforts. This phenomenon makes those poor people who are below the poverty line unable to extricate themselves, it has against the enthusiasm of the poor to work hard to get more revenue. Many scholars researched the minimum living standard security system and found that Chinese low regime had made a long term poverty in low-income groups. The will that increasing income by employment of residents entitled to basic living allowances is not strong, and the mentality is negative. This shows that if the subsistence security system is not properly changed, the people falling into “poverty trap” will be more in China.

It requires a corresponding social security during the period of employment. To the urban poor, the unemployed financial assistance is an irreplaceable mean of relieving worries of workers and enhancing the security expectations. However, if helping the poor is blindly stuck in the “bleeding” level, will only increase the financial burden to the state, and the poverty will not be fundamentally changed. Employment is the real living protection of the poor. There should be completely removing the poverty

of the poor population groups, it can cure this group by “bleeding”, tackling the problem, and to help the poor to improve the ability of relieving poverty. It should carry out strict dynamic management to subsistence allowance system, carrying out the difference rescue in case of investigation and verification. Actively guiding the able-bodied person to support them, and stressing that the unemployment insurance system is converted to employment security mechanism. The original intention of the unemployment insurance system is to promote employment services, gradually shifting the focal point to employment services and job training etc., this also is the proper meaning of its title, and this is help to let a mission which enhance the labor skills and competitiveness of employment to be same important with rescue the unemployed people. This transformation will not only be help to improve the employ ability of workers, but also the overall quality of China’s labor resources will be enhanced which is a not your aspect of improving our country’s international competitiveness.

5 Conclusion

In summary, this article has analyzed the real life situation of the urban poor after receiving aid, then summing up the defects and shortcomings of the current aid system. Focusing on the fundamental goal of relief and standing perspective of the poor so that to make a useful exploration of building a comprehensive and innovative urban poverty relief system basing on learning the relevant experience form foreign country. However, this study is only a preliminary exploration. There are many questions for future research to be further explored. Anti-poverty is a worldwide problem. The anti-poverty problem is carrying out sustained efforts in the world. With our government and the social have the awareness of the importance of these issues of urban poverty and social assistance which is gradually deepened, we have reason to believe that anti-poverty policy will be more robust and perfect in the 21st, moreover, China will get more achievement on the issues of urban poverty and social assistance.

The Proposed Punitive Damages System of Chinese Patent Infringement and the Comparison with America*

Feng Ling, Yu Xiang

School of Management, Huazhong University of Science & Technology, Wuhan, P.R. China, 430074
(E-mail: bell0308@163.com, yuxiang@163.com)

Abstract: The proposed fourth amendment mainly focuses on some difficult problems that need to be dealt with urgently during the implementation of the existing Patent Law. The main points of the fourth amendment of the Chinese Patent Law include protection of design patent, patent implementation, decision of patent invalidation, administrative enforcement, as well as punitive damages, and this paper will only discuss the punitive damages. By the simple comparative analysis of Chinese and American patent infringement damages system, the research found that the introduction of punitive damages of willful patent infringement is absolutely necessary in China. However, the case study told us that the application of any system should have strict applicable conditions, which include the applicable standard for willful patent infringement and calculation method of willful infringement damages.

Key words: Willful Patent infringement; Punitive damages; American patent infringement damages System; Comparisons

1 Introduction

The fundamental purpose of the patent system is to protect the invention creation and encourage innovation. The substantial increase of patent infringement cases and the status of "high cost of rights protection, low income" greatly reduce the function of the patent system "incentive and innovation". The controversy arises at the historic moment of the introduction of the system of punitive damages in the patent law of our country.

With the number of patent infringement cases increased year by year, the controversy of the patent infringement compensation amount has become more and more, and the academic and practical circles pay more and more attention to this problem. When patent encounters unlawful infringement, scientific and rational determination of the amount of damages has always been a hot spot and difficult problem in patent infringement litigation.

2 Proposed New Provision on Damages for Willful Patent Infringement

Patent infringement damages in Chinese Patent Law adhere to the compensatory principle, which means that the damages caused by the infringement liability shall be limited to the actual occurrence of damage. Paragraph 2 of Article 65 of the existing patent law states "Where it is difficult to determine the losses suffered by the right holder, the profits the infringer has earned and the exploitation fee of that patent under a contractual license, the people's court may award the damages of not less than RMB 10,000 Yuan and not more than RMB 1,000,000 Yuan in light of such factors, as the type of the patent right, the nature and the circumstances of the infringing act." In accordance with the present patent law, "the loss of the right people", "the gains obtained by the infringer", "the patent license fees" and "statutory compensation" are four sequence modes to determine the amount of compensation for patent infringement, however, since it is difficult to obtain evidence for the former three methods, the "statutory compensation" is the most common way for court to determine the amount of compensation in litigation. Applying the compensatory principle for damages in the judicial practice to punish patent infringement behavior and protect the patent right can easily lead to high protection cost and low infringement cost. "Win lawsuit, lose money" is a common phenomenon among patentees in patent infringement cases in China. These problems discouraged patentees to protect their patent rights and weakened the relief system for preventing patent infringement. Whether to improve patent infringement compensation and introduce the punitive damages system has become a tough problem that need to be solved urgently.

Under this circumstance, the new added paragraph of Article 65 stated as "As for the intentional patent infringement, based on the factors, such as the situation, the scale or the damage result of the infringement act, the people's court shall double or triple the amount of the damages determined in

* This paper is supported by the National Nature Science Foundation of China, Project No. 71072033.

accordance with the stipulation under the first two paragraphs.”

Combined with Paragraph 2 of revised Article 61, the amount of damages for willful patent infringement will be increased dramatically. The case *Chint Group Corp (Chint) v. Schneider Electric Low-Voltage (Tianjin) Co. (Schneider), Ltd.* is known to public because of its long trail and exorbitant compensation. In September 29, 2009, Wenzhou Intermediate People's Court announced that Schneider and its authorized distributor Star Electric Equipment Co. Ltd. in Zhejiang, were guilty of patent infringement. Under the ruling, Schneider shall cease infringement and make a RMB 330 million compensation to Chint Group. It was the largest compensation ever in a domestic intellectual property dispute. If the case was judged according to the new patent law, compensation of RMB 330 million may become 660 million or 990 million. This amount is enough to explain the impact caused by the amendment of patent infringement compensation principle.

However, high amount of compensation dose not mean that new compensation principle is necessarily good, the adverse consequences it may bring about also need to be considered and prevented. An example can give us a warning. Regulation of punitive damages in "Chinese Consumer Protection Law" is the background of this case. In 1995, Wanghai bought 12 pairs fake SONY earplug from a store in Beijing, and then he requested for double compensation according to Article 49 of Consumer Protection Law. Since then, Wanghai began his career of anti-counterfeiting. To prevent the field of patent from appearing above phenomenon and “patent troll”, the condition on which punitive infringement damages can be applied must be strict.

3 The Comparison of the Infringement Damages Between Chinese and American

While the introduction of punitive patent infringement damages is in a vigorous debate in China, treble damages have been adopted for about 210 years (1793-) already in America. So far the United States is the only country applies punitive damages in the patent law. 35 U.S.C. § 284 stating that the court may increase the damages up to three times the amount found or assessed when a patent is willfully infringed. However, the rising presence of NPEs in American economies let to a strong debate on the patent infringement damages. Some scholars acknowledge that high patent infringement compensation is one of the reasons for the emerging of “patent troll” phenomenon (Markus Reitziga etc. al, 2007).^[1] In recent years, the United States congress has been considering all kinds of legislation suggestions to solve the problem of huge patent infringement damages. However, as a hot topic debated within Congress, the damages in patent infringement matters were not included in the ultimately published America Invents Act. Moreover, the America Invents Act does not contain any language regarding the calculation of damages in patent infringement matters.

3.1 The comparison of method for setting the standard of “willful infringement”

Although there are no specific provisions of constitutive requirements for punitive damages in American Patent Law, it does not mean that all patent infringements can apply for punitive damages. In America, for the conducts not specified in the law, juridical practice gradually taking its shape in accordance with judicial precedents will prevail. Series willful patent infringement cases judged by CAFC have confirmed that punitive damages can only be applied for on the premise of willful infringement (Christopher B. Seaman, 2010).^[2] Therefore, the standard of “willful infringement” almost set by courts with reference to previous judicial precedents in America.

Judicial precedent is not one of the Chinese legal sources. Article 65 of the proposed *Chinese Patent Law* amendments has set forth the consequences of willful patent infringement, which are imposition of punitive damages for this behavior. However, constitutive requirements of willful patent infringement are not defined in Article 65 or other articles. In order to implement Paragraph 3 of Article 65 smoothly, a judicial interpretation by the Supreme People's Court is necessary. Unless otherwise provided by law or relevant judicial interpretation, courts cannot determine the amount of compensation for willful patent infringement cases based on precedents.

3.2 The comparison of the calculation of punitive infringement damages

In America, the patent infringement compensation may take the form of lost profits, a reasonable royalty, or a combination thereof (Shapiro C, 2010).^[3] For many patentees, to prove the loss of profits is not realistic due to limited evidences, so reasonable royalties remain the predominant measure of patent damages awards.

Regarding the abovementioned Chinese patent infringement damages, Article 65 of the existing patent law stipulates that "the loss of the patent holder", "the gains obtained by the infringer", "the patent license fees" and "statutory compensation" serve as the four bases on which patent infringement

damages are calculated. Actually, from Chinese scholar's empirical research we can see that the last one is the common basis to calculate patent infringement damages (He Ningxing and Yuan Xiaodong, 2012).^[4] The scholar collected samples from 42 courts distributed in 23 provinces, autonomous regions and municipalities. All 552 cases are selected with the principle that patentees win the lawsuit. It turns out that 546 of the total 552 cases are applicable to the calculation rules of "statutory compensation".

Using "statutory compensation" as the basis for calculating punitive damages is controversial. Statutory compensation is applied to patent infringement cases of which the damages cannot be calculated clearly (Cao Xinming, 2013).^[5] Accordingly there is a perception that it should not be taken as the basis to calculate punitive damages. The contrary argument is this: Currently 97% of cases are applicable to statutory compensation, and it has been a common method for determining the amount of compensation; if you do not use it as a basis for punitive damages, then the introduction of punitive damages is of no great significance. In the authors' option, calculation of punitive damages for patent infringement can also refer to 2013 revised "*Trademark Law*". The calculation of punitive damages for malicious trademark infringement is based on "the loss of the right holder", "the gains obtained by the infringer" and "the trademark license fees". Meanwhile, the upper limit amount of "statutory compensation" for trademark infringement was increased from half a million to 3 million, but it isn't taken as the basis of punitive damages.

4 Conclusion

The application of any system should have strict applicable conditions, including the objective existence of the tort and the subjective psychological. Therefore, we should pay attention to the following two aspects in the introduction of the patent infringement punitive compensation system.

Firstly, the applicable standard for willful patent infringement needs to be further defined. Punitive damages are a supplement to the compensatory system which can only be applied in willful infringement situation rather than all patent infringement cases. Therefore, the determination of willful infringement is crucially important. The aim of introducing punitive damages is to resolutely resist willful infringement act and encourage patentees to actively protect their own legal rights, but overextended patent rights are not conducive to technologic innovation. The interest between patentees and public must be balanced.

Secondly, even though the willful infringement damages is increased by three times, there is still no obvious difference between punitive damages and compulsory damages for the enterprises based on the average amount of current patent infringement damages. Moreover, the deterrent effect of punitive damages can hardly achieve the desired result. Lessons can be drawn from American calculation method of willful infringement damages and an operable calculation method for Chinese courts and relevant offices should be set up.

At the same time, in order to resolve the conflict in the process of establishing applicable standard of willful infringement, a strict standard and high compensation for willful infringement should be considered.

The Economic Effects of RMB Exchange Rate on ASEAN Countries

Dmitry V. Zhukov, Miraj Ahmed Bhuiyan, Xu Fengju

Wuhan university of Technology

(E-mail: d_v_zhukov@list.ru, 1265793302@qq.com, mxufju@163.com)

Abstract: Effects of currency rate are always being a vital issue for any concern economies. Fluctuations rate not only effects the own economics systems and policies but also to others direct and indirect related economies. No wonder it's going to be a burning issue for East Asian countries if there are any changes in Chinese yuan exchange rate. This paper will talks about the possible effects that maybe concern for the respective economies in the Association for South East Asian nations (ASEAN) region.

Key words: RMB exchange rate; ASEAN economy; Trade partner; Offshore currency

1 Introduction

Macroeconomic theory has long established that export and import growth, and thus the trade balance, are determined by changes in price competitiveness, economic growth of trading partners, and income growth in the home country. Exchange rate changes alter both price competitiveness and income growth of countries. Thus, exchange rate changes have a great impact on trade balance along with some other economic indicators for the participating countries. Also there is a huge influence on changes of one currency rate on other related economies. ASEAN is a big trade partners for china and vice-versa. Obviously there is a huge impact on RMB exchange rate changes on ASEAN countries economies.

1.1 Objective and scope of the research:

The main objectives of the research are to resolve:

- How the ASEAN countries can be effected if there is a change of RMB transaction rate
- Social and other Impacts on ASEAN of RMB depreciation and appreciation
- Understanding the regional trade benefits and its pitfalls incase currency rate variation.

1.2 Methodology

In this report we have mostly used the secondary information sources. We have covered the topics related to the title from several books, journal, articles, and publications and so on. Some data we have used here were taken directly from the ASEAN websites. Some data we have used for some calculations. Besides we have personally talked with some close friends who already travelled these countries and region. I tried to explore their comments, experiences, excitements, attitudes and so on. They have already shared with me their personal point of view regarding their travel and tourism.

1.3 Literature review

According to (Akhtar and Spence, 1984) , Exchange rate volatility is a source of concern as currency values partially determine the price paid or received for output/goods and, consequently, this affects the profits and welfare of producers and consumers . so the exchange rate volatility has a good relation with the volume of goods traded internationally by making prices and profits indeterminate.

Some Theories suggests that the exchange rate volatility has its effects on exports negatively or positively (Doyle, 2001 and Baak, 2004), based on the how the agents are playing role in the market . If economic agents are moderately risk averse the impacts of exchange rate volatility to exports will be negative (Cushman, 1983 and Koray and Lastrapes, 1989). This negative impact may come directly through uncertainty and adjustment costs, and indirectly through its effect on allocation of resources and government policies (Cote, 1994).

2 Direct Economic Impact of RMB Exchange Rate on Other Economies

From the above diagram we can see the effects of currency depreciation and on its impacts on economy of the respective country. If in case of ASEAN it happens (any country) against RMB, then the situation can be like this. For an example Malaysian ringgit depreciate, the price competitiveness will be higher. And it will have an effect on bilateral trading as import will less and exports should increase. For this reason the aggregate demand with go up as well as balance of payment. In this situation there will be an internal and external pressure to appreciate the currency. The government of financial leaders would intervene to maintain the peg. If so happens the money supply with increase in a numerous numbers and that will hit again on prices.

Figure 1 Macroeconomic Impact of Exchange Rate Depreciation under a Pegged Exchange Rate Arrangement

Source: Emma Xiaoqin Fan, Implications of a US Dollar Depreciation for Asian Developing Countries

2.1 Exports volatility

With respect to trade flows in East Asia, time series analysis of exchange rate volatility and trade has produced mixed results. Poon et al. (2005) found a negative relationship between volatility and trade for Singapore, but a positive relationship for Thailand and Indonesia. More recent studies using panel data have found a negative relationship between exchange rate volatility and trade, e.g., Chit et al. (2010) for ASEAN countries and the PRC, and a conditional relationship where volatility is harmful for trade when the financial sector is underdeveloped (Chit and Judge 2011). Thorbecke (2008), using data from the five largest ASEAN economies, the PRC; found a negative relationship between exchange rate volatility and export of electronic components, and Hayaka and Kimura (2009) found similar evidence for machinery goods and parts. Tang (2012) links these results to the strengthening of regional value chains, finding that the link between volatility and trade is strongest within a grouping of the five largest ASEAN economies, the PRC; and stronger for trade in intermediate and equipment goods than for trade in primary products or consumption goods. This argument suggests that the relationship may be time-sensitive, becoming stronger as regional value chains have become more prevalent.

2.2 Investment

Investment Flows. Both ASEAN and China have invested considerable resources overseas. Foreign direct investment (or FDI) made by China in other countries averaged US\$ 2.1 billion per year during 1989-1994; it rose to US\$ 2.2 billion a year over 1995-2000. Outward FDI from the old ASEAN-5 members (except Brunei Darussalam) averaged US\$ 3.7 billion a year during 1989-1994; it reached US\$ 7.0 billion in 2000.

China has been a destination for FDI from some ASEAN member countries -- directly or via the Special Administrative Region of Hong Kong. Likewise, several ASEAN member countries have also been the host to important FDI flows from China, both directly and via third party ventures. For example, China's FDI in ASEAN amounted to about US\$ 114.4 million in 1995 but fell to US\$ 135.8 million in 1999. The flows of such investment in ASEAN have thus been modest, averaging some US\$ 146 million a year during 1995-1999. In relative terms, they accounted for less than 0.5 per cent of the total inward FDI in ASEAN per year, except for 1998-1999 when the percentage averaged 1.3 per cent a year. Wagner School researchers compiled a list of Chinese aid and related investment projects or offers to ASEAN from 2002-2007 and arrived at a combined total value of \$14 billion. They estimated that 43% of that figure went to infrastructure and public works projects, 32% for natural resource extraction or development, 3% to military, humanitarian and technical assistance and the remaining 22% to unspecified activities. Mutual investment has also expanded. From 1991-2000, ASEAN investment in China increased at an annual average rate of 28%. In 1991, ASEAN investment in China was only US\$90 million which increased to US\$26.2 billion by 2001, accounting for 7.7% of China's overseas investments. According to ASEAN statistics, the net FDI inflow from China to ASEAN in 2009, 2010 and 2011 were US\$1.85, US\$2.78 and US\$6.03 billion US dollar respectively. (Sabit, A.H.) The rapid rate of urbanization, which is also accompanied by the rise of middle-class families in China, will also change consumer behavior and lifestyles, stimulating the demand for imports of quality and luxury products and services that will benefit ASEAN countries.

3 Indirect Economic Impact of RMB Exchange Rate on Other Economies

3.1 Foreign debt

The Chinese aid package includes a US\$10 billion investment fund, geared for cooperation in infrastructure construction, energy and natural resources development, and improvements in information and communications. China also announced it would extend a \$15 billion line of credit over the next

three to five years to needy ASEAN countries. Although the terms were not made public, the loans include preferential terms for \$1.7 billion in cooperation projects. Four loan agreements for unspecified projects worth about \$420 million were signed when Cambodian Prime Minister Hun Sen visited China over the weekend, Secretary of State for Finance Aun Porn Moniroth told a briefing late on Monday. Another three loan agreements, worth more than \$80 million, are expected to be signed this year, Aun Porn Moniroth said, adding that Wen had also promised a grant of 150 million yuan (\$24 million) as "a gift" for Cambodia to use on any priority project.

3.2 Foreign remittance

According to China Daily (2013—08) every morning, more than 7,000 Vietnamese walk across the border and start work in a Chinese town. For example Dung, a Vietnamese sea food worker earns at least 200 yuan (about \$33) every day, nearly five times the amount of the average Vietnamese do. "It's been my dream for a long time to speak Chinese well and work in China," she said. The free trade area built by China and the Association of Southeast Asian Nations (ASEAN) provides opportunities for more people to make decent salaries like Dung. The preferential trade policies and zero tariffs for thousands of commodities have resulted in an increasing number of Chinese and ASEAN citizens working across borders.

4 Social and Other Effects of RMB

4.1 RMB denominated foreign aid:

According to the NAY PYI TAW, Nov. 13 (Xinhua) -- China pledged to offer assistance worth 3 billion yuan (about 480 million U.S. dollars) to less developed members of Association of Southeast Asian Nations (ASEAN) next year to help the regional bloc reduce poverty. China will also offer 100 million yuan (16 million dollars) for rural poverty reduction project in East Asia as confirmed by the Chinese Premier Li Keqiang while attending the 9th East Asia Summit. He added China will put forward the East Asia Cooperation Initiative on Poverty Reduction at this year's ASEAN plus Three Summit. An additional \$39.7 million was earmarked for "special aid" to Cambodia, Laos and Myanmar, the 10-member groupings poorest members and closest China allies, to meet "urgent needs". China also announced it would donate \$5 million to the China-ASEAN Cooperation Fund and an additional \$900,000 to the ASEAN plus China, Japan and South Korea cooperation fund. Beijing also donated 300,000 tons of rice to an emergency East

4.2 Travel and tourism

Trade in Services. The two-way flows between ASEAN and China have also been on an increase. Tourism is a good case in point. ASEAN tourists visiting China totaled almost 1.1 million in 1995; the number reached an estimated 1.8 million in 2000. Meanwhile, ASEAN received about 0.8 million tourists from China in 1995. More remarkably, however, the number of Chinese tourists to ASEAN almost tripled to 2.3 million persons in 2000. The potential for two-way tourism is really inviting. At present, ASEAN tourists were less than 8 per cent of the total tourist arrivals (19.8 million) in China during 1999 while Chinese tourists in ASEAN made up just 10 per cent of the 22.6 million persons visiting ASEAN in 2000 (W. Thitapha, 2001)

5 Conclusion

The differences in currency values can affect our ability to buy imports or sell exports, affecting the standard of living. Therefore, the effects of currency crises in other nations are not limited to those nations they can affect other economy and lives in important ways. An appreciation of the exchange rate has economic consequences both in the short and long term. As the economy adjusts to a higher exchange rate, some of the main beneficiaries and losers start to emerge. A high currency appreciation leads to lower import prices - this boosts the real living standards of consumers at least in the short run - for example an increase in the real purchasing power of the residents when traveling overseas. When RMB is weak, it is cheaper for ASEAN countries to import raw materials, components and capital inputs good news for businesses that rely on imported components or who are wishing to increase their investment of new technology from overseas countries. A strong exchange rate for ASEAN also helps to control the inflation - domestic producers face stiff international competition from cheaper imports and will look to cut their costs accordingly. Cheaper prices of imported foodstuffs etc. will also have a negative effect on the rate of consumer price inflation. Cheaper imports lead to rising import penetration and larger trade deficit. But it also has an opposite effects. In case of export, Exporters lose price competitiveness and market share - this damages profits and employment in some sectors - notably

manufacturing industry. If exports fall, this has a negative impact on economic growth. Some regions are affected more than others. Many business organizations have identified the strength of the exchange rate as a major economic problem over recent times. Economists working for the ITEM club argued in the summer of 2001 that the pound should be lower by at least 10% in order to prevent manufacturing industry falling into an economic slump. So this also might be tonic for the ASEAN countries in term of trading with china.

(E-mail: asadecon@yahoo.com, haroon.rasheed@umt.edu.pk, d_v_zhukov@list.ru)

Abstract: The study aims to examine how social interaction, incentives and leadership support affect knowledge sharing and how knowledge sharing affects innovation capability in knowledge intensive micro-businesses. For this purpose data from 30 knowledge intensive micro-business organizations were collected through a self administered questionnaire. Cronbach's alpha, correlation and regression analysis were used to examine validity of the scale, association among the variables and testing of the hypotheses respectively. The study implies that social interaction and leadership support are important factors for enhancing knowledge sharing in micro-businesses which positively affects innovation capability of knowledge intensive micro-businesses. The relationship of incentives with knowledge sharing is found insignificant. The study is limited to test the relationship at workers' level therefore management and owners were not included in the respondents.

Key words: Social interaction; Knowledge sharing; Innovation capability; Micro-businesses

1 Introduction

Knowledge is becoming a key factor in the success of contemporary organizations and is rather a source of competitive edge for enterprises^[1] Organizations nowadays are hiring more of brains than hands^[2] thus focusing on the need of knowledge for successful business operations. Similarly, businesses that can successfully capture and deploy knowledge in their systems and processes will have an advantage over others^{[3][4][5]}. However, for successful management of knowledge in organizations, human behavior has been cited as the key^[6]

Researchers and practitioners have been increasingly advocating knowledge sharing as essential process of the knowledge economy and it would ultimately lead to knowledge accumulation, knowledge dissemination and knowledge acquisition^[7] Knowledge sharing is the process of sharing expertise, lessons learned and skills among the employees of an organization^[8] It is considered fundamental by researchers for generation of new ideas, development of business opportunities and learning process of knowledge workers.^[9]

Sparrow states that knowledge management issues and processes may be different for small and medium enterprises than as they work for large organizations^[10]. Micro-businesses are the smallest of the businesses but are of crucial importance to an economy. In the United States 95.8% of businesses are micro-business enterprises with one or two owners and upto 10 employees^[11]. European commission defines micro-business as a business with less than 10 or fewer employees and an annual turnover of 2 million Euros^[12]. Small and medium enterprises are major contributors of any economy. However, in developing countries the importance of small enterprises is even more because it's the main source of employment^{[13][14]}. In Pakistan, the contribution of small and medium enterprises to GDP is 40% and employees 90% of the non-agricultural labor force^{[15][16]}. Small and medium enterprises are also regarded as important innovators of an economy^[17]. Being good knowledge generators because of their capacity to innovate, SMEs still lack the capacity to exploit knowledge^[18]. Hence, there is a need to understand how knowledge is managed in the SMEs.

Several studies have been conducted on the relationship between knowledge management, leadership support and innovative capabilities in medium and large organizations having advance IT infrastructure^{[18][19][20][21][22]}. However, the relationship of innovation capabilities and knowledge management in micro-business enterprises with little or no IT infrastructure remains under researched. Therefore there is a need to focus on this important part of the business that form the bulk of business organizations in the economies. This research covers this research gap and the results can guide micro-business owners in enhancing innovation capacity of their business.

2 Literature Review

2.1 Knowledge sharing

Knowledge sharing is the process of sharing expertise, lessons learned and skills among the

employees of an organization. Knowledge is shared at individual as well as organizational level^[8] Individual employees share knowledge by talking to colleagues to help them accomplish their task better, and more efficiently. At organizational level, knowledge sharing is capturing, organizing, reusing and transferring tacit and explicit knowledge and making it available to other firms^[23]^[24] Knowledge sharing among employees, results in knowledge creation which is crucial for sustaining the competitiveness and innovation capability^[25]. Researchers have identified several factors that influence knowledge sharing like open culture, leadership support, intrinsic and extrinsic motivational factors, IT, and social interaction etc^[23]^[26]^[27]^[28]^[29]^[30].

Most of the research in KM and KS field is focused on the large size organizations and there is a need to study the influences of knowledge sharing in small and medium sized businesses^[31].

2.2 Social interaction and knowledge sharing

Knowledge sharing is encouraged by social interaction, as employees who are sociable are more active in knowledge sharing. Lack of trust is a major knowledge sharing barrier which is minimum among friends. Therefore there are more chances of knowledge sharing between friends^[32]. Knowledge sharing can occur at the time of communication, formal and informal interaction. Even the employees having a cup of coffee at a coffee shop or talking about their work; some knowledge is shared and exchanged among them^[27]. Lin and Lee, concluded that social-oriented organizations and open communication promote knowledge sharing^[33]. This behavior applies micro-businesses as well because there are more chances on interaction between the employees because of the small size and closeness in relationships. More importantly, tacit knowledge is shared mostly in informal rather than in bureaucratic environment. Informal face to face social interaction is the most effective technique used by SMEs for enhancing knowledge sharing^[26] Therefore employees should interact more in order to share knowledge. Lin, found that only technological factors are insufficient in creating a knowledge sharing culture, in the absence of social relationships and social interaction^[23]. Communication and social interaction reduce barriers to knowledge sharing, which may increase knowledge sharing^[27]. Therefore, many organizations encourage their employees to interact more by providing rest rooms or provide food or drinks for them^[34].

2.3 Incentives and knowledge sharing

Reward is one of the factors which encourage people to share knowledge with others. Knowledge is shared among employees because monetary rewards are expected and when the reward system is taken back, employees may share less knowledge with each other^[29]. Rewards or bonuses are termed as extrinsic motivations^[28]. Apart from monetary value employees generally perceive as being remunerated; and they feel that they are achieving their intrinsic or extrinsic well-being^[30]. One way of helping to convince employees of their value to the organization is to offer enticements in a form that are linked to the well-being of the organization, like stock options etc.^[35] Rewards definitely encourage employees to share their knowledge while they are busy with their own work^[36]. Organizations have to reward the employees who are willing to share their knowledge with others. Hariharan and Cellular emphasize that the management should announce reward and recognition schemes to measure and reward knowledge sharing behavior^[37].

2.4 The role of leadership in knowledge sharing

Leadership is one of the most important factors in implementing and sustaining knowledge sharing activities. Owner's support for knowledge sharing among employees is important for creating a knowledge sharing culture^[33]. Managers and owners can enhance their organizational competencies and skills by establishing a knowledge sharing environment^[38]. Similarly supervisors can facilitate the process of knowledge sharing which can result in capturing and building tacit knowledge^[39]. The role of leaders starts at the time of hiring motivated employees who are willing to share and utilize their knowledge. After hiring, leaders and owners should create an environment that support knowledge sharing by using their authority, personal relationship and charisma^[40]. Relative advantage, relative complexity and compatibility of knowledge sharing process are results of the intensions of decision makers in an organization^[33].

2.5 Knowledge sharing and enterprise innovation capabilities

The ability of a small and medium enterprise to innovate and improve its products continuously has been proved to be related to its employee's skills and knowledge^[6]. The same process is assumed in micro-business as well. Therefore identifying and capitalizing on tacit knowledge and sharing it in an organization may lead SME's (including micro-business enterprises) for a better performance, specifically in producing new products and services^[7]. Similarly, Lin found that knowledge sharing in an organization lead to the implementation of new ideas, processes, products and/or services^[8]. Jantunen

[41] implied that there may be a relation between knowledge sharing and firm’s innovative capabilities and suggested further research. Sa’enz et al [42] in a comparative study proved that knowledge sharing is a key factor in improving and enhancing innovative capabilities in both hi-tech and low-tech business firms.

Various studies have verified these relationships in relatively large business firms. [7] [42] [23]. However, less work is done on knowledge sharing in micro-businesses especially in developing countries.

This study aims at testing the model shown in figure 1, which shows relationships at the level of micro-businesses. The model suggests that knowledge sharing can act as a moderating variable between social interaction, incentives and leadership support to enhance innovation capability of the enterprise.

Figure 1 Model

H1: Social interaction has a positive significant influence on knowledge sharing.

H2: Incentives have a significant positive relationship with knowledge sharing.

H3: Leadership support has a significant positive influence on knowledge sharing.

H4: Knowledge sharing has a significant positive relationship with enterprise innovation capabilities.

3 Methodology

The research is based on hypothetico-deductive quantitative methodology. Multi-variate regression analysis is used to test the hypotheses mentioned above. Data have been gathered through a self-administered interview questionnaire from 100 employees of different age groups working in 30 knowledge intensive micro-business enterprises having up to 10 employees. The scope of the study is limited to two cities of Pakistan i.e. Rawalpindi and Islamabad which are typical of the country.

The five point Likert scales for knowledge sharing, incentives and leadership support have been adopted. Scale for social interaction has been developed by the authors and approved from two university professors. Scale for knowledge sharing was adopted from Spreitzer [43] and Van den Hoof [44][45]. Leadership support from Tan and Zhao [20]. Incentives from Hargadon, [33] and Innovation capability from Calantone and Zhao [19]. Adopted scales are already tested by Lin [23]

4 Results and Discussion

The reliability of each variable is given as follows in table-1. Reliability of each adopted scale is compared with the reliability results of [23]

Table 1 Reliability of Measure

Variable	No. of Items	Cronbach’s Alpha	(Lin, 2007)
Ksharing	5	.79	.79
Interact	5	.64	-
Incentive	4	.71	.75
Innovcap	5	.84	.77
Leadsupp	4	.76	.72
Overall reliability	24	.86	-

Descriptive statistics show that the means of knowledge sharing, social interaction and innovation

capability are closer to each other. The values are closer to the maximum value which shows that most of the responses for these variables are positive and moving in the same direction. The results are shown in the following table.

Table 2 Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation	Variance
ksharing	100	11.00	25.00	21.5200	3.21449	10.333
Interact	100	12.00	25.00	20.3600	3.40089	11.566
incentiv	100	5.00	20.00	16.2900	3.34028	11.157
innovcap	100	8.00	30.00	23.6100	4.27087	18.240
leadsupp	100	5.00	20.00	17.0600	2.64315	6.986
Valid N	100					

Bivariate correlational analysis was used to initially test the degree of association between the variables. Table 3 presents the coefficients of correlation for the given variables.

Table 3 Correlations

		ksharing	interact	incentiv	innovcap	leadsupp
ksharing	Pearson Correlation	1	.507(**)	.064	.499(**)	.354(**)
	Sig. (2-tailed)		.000	.528	.000	.000
	N	100	100	100	100	100
interact	Pearson Correlation	.507(**)	1	.057	.579(**)	.482(**)
	Sig. (2-tailed)	.000		.571	.000	.000
	N	100	100	100	100	100
incentiv	Pearson Correlation	.064	.057	1	.194	.222(*)
	Sig. (2-tailed)	.528	.571		.053	.026
	N	100	100	100	100	100
innovcap	Pearson Correlation	.499(**)	.579(**)	.194	1	.596(**)
	Sig. (2-tailed)	.000	.000	.053		.000
	N	100	100	100	100	100
leadsupp	Pearson Correlation	.354(**)	.482(**)	.222(*)	.596(**)	1
	Sig. (2-tailed)	.000	.000	.026	.000	
	N	100	100	100	100	100

** Correlation is significant at the 0.01 level (2-tailed).

* Correlation is significant at the 0.05 level (2-tailed).

Coefficient of correlation for social interaction and knowledge sharing is 0.506 which is significant at $p=0.01$ level of significance. Similarly the coefficients of correlation for innovation capability and leadership support are 0.499 and 0.354 respectively which are significant at $p=0.01$ level of significance. Correlation is insignificant for incentives with a coefficient of 0.064. However, correlation has been found among independent variables as well as shown in the above table.

Keeping in view the correlation in the independent variables, step by step regression analysis was conducted. In the first step regression was carried out for social interaction as independent and knowledge sharing as dependent variable as shown in table 4. The results returned a higher Beta value of 0.507, t- value of 5.81 and adjusted R square value of 0.25 which signifies the first hypothesis.

Table 4 Model Summary: Step One of Regression Analysis

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	11.77	1.67		6.928	.000
s.interaction	.479	.08	.507	5.81	.000

Adjusted $R^2 = 0.25$

In the second step of regression analysis incentive was taken as independent variable and knowledge sharing as independent variable. The relationship is insignificant with a Beta value of 0.06, $t=0.634$, $p=0.528$ and adjusted R Square value of -0.006 . Thus H2 is not substantiated.

Table 5 Model Summary: Step Two of Regression Analysis

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	20.51	1.61		12.72	.000
incentive	.06	.097	.06	.634	.528

Adjusted R square= -0.006

In the third step of regression analysis leadership support is taken as independent variable and knowledge sharing as independent variable. Beta value is improved to 0.354, $t=3.749$, $p=.000$ and adjusted R square of 0.24 which signifies H3.

Table 6 Model Summary: Step Three of Regression Analysis

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	14.17	1.98		3.692	.000
Leadsupp	.431	.115	.354	3.749	.000

The fourth step regression analysis was conducted for innovation capability as dependent variable and knowledge sharing as explanatory variable. The model shows adjusted R square value of 0.241 which indicate that 24% of the variation in innovation capability is explained by knowledge sharing.

Table 7 Model Summary: Step Four of Regression Analysis

Model	R	R square	Adjusted R square	Std. error of the estimate	R Square change
1	.499(a)	.249	.241	3.71985	.249

a Predictors: (Constant), ksharing

Further the β value is 0.499 with a t value of 5.701 which is significant at $p=0.000$ level of significance as shown in table 8.

Table 8 Model Summary: Step Five of Regression Analysis

Model	Unstandardized Coefficients		Standardized coefficients	t	Sig.
	B	Std. Error	beta		
1 (Constant)	9.341	2.530		3.692	.000
ksharing	.663	.116	.499	5.701	.000

Dependent Variable: innovcap

Discussion: First the results of Cronbach's alpha shows that the overall reliability of the scale is good. These results are consistent with the results of Lin [23]. Reliability of the developed scale for social interaction showed an increase with increasing number of questions. The regression analysis for social interaction, incentives and leadership support as independent variables and knowledge sharing dependent variable shows that the model is significant. But β and t values for individual variables indicate that social interaction is the only variable that is significantly influencing knowledge sharing. However a step by step regression of the three independent variables and knowledge sharing substantiate H3 i.e. leadership support is positively influencing knowledge sharing. Apart from signifying the relationship of leadership support and knowledge sharing, step wise regression improved the β and t values for social interaction (β value improved from 0.438 to 0.507, t value increased from 4.401 to 5.81). This may be due to multicollinearity among the variables because the independent variables are correlated with each other as shown in Table-1. Connlley and Kelloway [27] found similar results for the relationship of social interaction and knowledge sharing, with a slightly higher correlation coefficient of 0.61 compared to 0.507 found in this study. This maybe because of the cultural reasons as the workers regard sharing knowledge as a duty and not something that they should be paid for. The fourth step of regression analysis signifies hypothesis that knowledge sharing is positively influencing innovation capability. Lin [23] found similar results at the level of large organizations.

5 Conclusion

The study tested relationship between knowledge sharing and innovation capability of knowledge intensive micro-business organizations. Correlation and regression analysis were used for data analysis to verify the four hypotheses. Results of the study show that social interaction and leadership support are important factors for knowledge sharing in knowledge intensive micro-business enterprises. Similarly knowledge sharing is important in enhancing the innovation capability. However incentives are not found to be associated with knowledge sharing.

Study on Performance Evaluation of Knowledge Management in Products Innovation

Hu Lin

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: m18671874055@163.com)

Abstract: With the arrival of knowledge economy era, knowledge is regarded as one of the most important resources, and knowledge management greatly influence the effectiveness of enterprise's innovation capacity. In order to elevate the ability of innovation, elites of enterprises are becoming increasingly relied on knowledge management. Knowledge management is one of the most vital section deciding whether the products profitable. In this article, documents about knowledge management process will be summarized at first. Then the application of knowledge management in product innovation will be discussed. Lastly the performance evaluation system in product innovation process will be built, meanwhile empirical analyze will be conducted.

Key words: Knowledge management; Products innovation; Fuzzy comprehensive evaluation

1 Introduction

Innovation is the key point which enterprises are pursuing for. Product innovation means a lot to market expansion and market share elevation. Nowadays, a lot of industries in China are staying in the beginning stage. Faced with the challenge of economy globalization, market globalization and technology competition, product innovation has become the lifeblood of the enterprises. Especially in high-tech industries, innovation matters to the vitality of the enterprise in big colossal. In knowledge economy era, innovation relies more on information collection, reorganization, transforming and so on. Therefore, how much a enterprise can manage the knowledge decides knowledge absorbing ability, technology transforming ability and product innovation ability. In order to escalate product innovation ability, enterprises become more and more tend to conduct knowledge management.

Knowledge management refers that through external knowledge obtaining and sharing process, create and apply new knowledge. In other words, it's knowledge oriented enterprise management. Knowledge management during product innovation process enriches the enterprise management. Within identical innovation project and distinctive product innovation projects, knowledge management emphasize the sharing of internal knowledge in the project and the cooperate between projects. Thus the evaluation system of the knowledge management in product innovation is of great vitality.

2 The application of the Knowledge Management in Product Innovation

In an organization, knowledge stores not only in the workers' brain, but also rooted in the documents, daily routines, programs, drills and principles in the organization. The knowledge in the organization can be classified into 2 categories: recessive knowledge and dominate knowledge. See in Table 1.

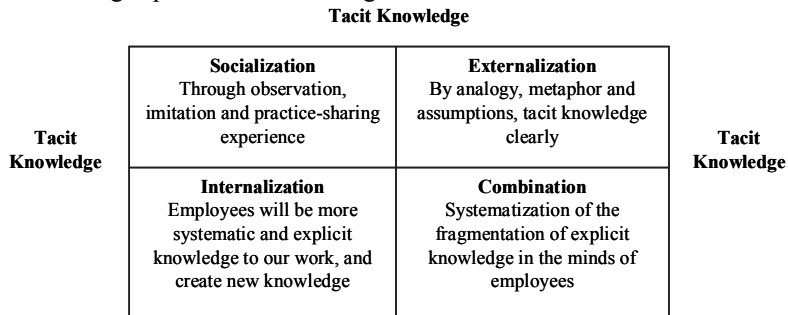

Table 1 Classification of Knowledge Types

Types	Contents	Features
Tacit knowledge	Is very difficult to express clearly and implied in the process of knowledge and action	It has the features of the highly personal and hard to communicate, it is not easy to achieve sharing of personal
Explicit knowledge	It is the knowledge that you can clearly express in language, such as text, numbers, graphics, etc	It is easy to express, encoding features, making it easy to communicate and share

There is a transformation relation between recessive knowledge and dominate knowledge. Since the dominate knowledge can be communicated and shared easily, technologies can be learned by other competitors. Thereby, to a organization, it's obvious that dominate knowledge don't actually form consistent advantage. The core ability of a organization is based on recessive knowledge. Thus the core intension is to excavate the recessive knowledge within the employers' brain.

As a special practical activity, the main content of product innovation is streaming and the transformation of knowledge and the knowledge itself. Product innovation is a consistent changing process of the invention, the development, the transformation and the application of the knowledge. The invention of the knowledge is the process of inventing and discovering new knowledge. The

transformation, transferring and invention is a dynamic and advancing process. It can be divided into 4 stages: socialization, externalization, combination and internalization. When the recessive knowledge among individuals finally completed a spiral movement, in other words have become new recessive knowledge, new knowledge spiral movements begin.

Tacit Knowledge
Figure 1 The Knowledge Spiral

Enterprise knowledge management have permeated, and is reflected, into every sections in production innovation. According to the reflection of the knowledge management in product innovation, it can be divided into 4 stages:

(1)Product conceiving

Specifically, is the original concept of knowledge, experience based for deep processing, the burst produced in the process of product design, and before this process. In fact, there have been the knowledge internalization of "participation", knowledge sharing and exchange has begun operation, and through exchanges between groups discuss the formation of the basic idea of product innovation.

(2)Innovation realization

New and innovative ideas formed to outside of expression, so that the organization departments of the enterprise staff clarify which contains the core idea, must to the tacit knowledge constantly outside for specific concepts, through the description of the text, the specific test operation and so on. In the final analysis these are dependent on the implementation of knowledge management through the knowledge management

(3)Marketization

The potential value of new products is the most direct embodiment of the process of the market, in the realization of the commodity market, it must be involved in the integration of knowledge management. On the one hand to enterprise's existing knowledge and strategic partners of knowledge integration and fusion to market values; on the other hand, and strengthen the knowledge exchange with suppliers, distributors, advertising agencies, customers, and so on, so the production to create economic value can be accepted and recognized, said the only way to realize the commodities market.

(4)Knowledge sharing

The realization of commodity market, must be on the market in the process of success and failure experiences were summarized, formed the enterprise on the product development philosophy unique knowledge system. At the same time, using inside and outside the enterprise staff knowledge sharing, forming a virtuous cycle, so that it can be for the next product innovation and lay a good foundation.

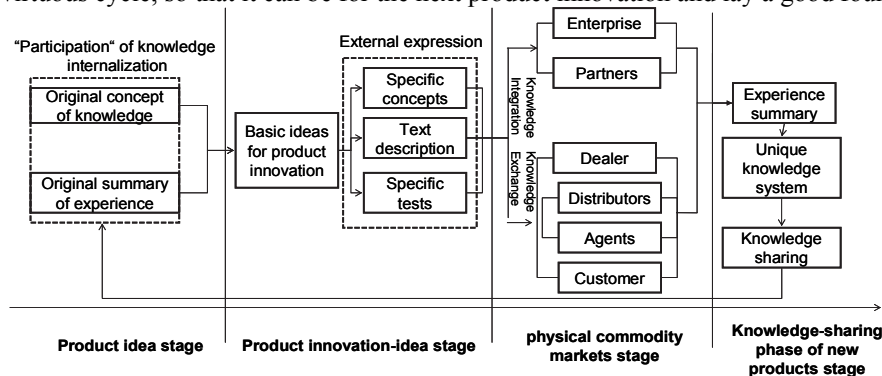

Figure 2 Knowledge Management Applications in Various Stages of Product

3 Evaluation System Building

3.1 Principles

Knowledge management in product innovation performance evaluation is a dynamic and complex process. First of all, the product innovation process is dynamic, it is an ongoing and continuous improvement process, knowledge reuse, transformation of innovation; secondly, product innovation process is a comprehensive application of all kinds of resources, knowledge, and is affected by various factors, including market demand, competition environment. In addition, the evaluation is based on the model of quantitative analysis, so in the selection of evaluation indicators, to combine quantitative and qualitative factors in two aspects. Therefore, when constructing the evaluation system must pay attention to the index system of the science principle, system principle, principle, static and dynamic combination principle, quantitative and qualitative unifies the principle, the principle of operation.

3.2 Selection of performance evaluation index of knowledge management in product innovation

According to the principle of performance evaluation, based on the research results of management performance evaluation, the paper sorted out the performance evaluation index system. In this paper, the evaluation system is mainly divided into five parts. Also, referred to a series of references, the evaluation index is subdivided.

Table 2 Evaluation Index System of Industrial Cluster Collaborative Innovation Capability

Target layer (X)	Criterion layer (Y)	Index layer (Z)
Knowledge Management Performance Evaluation System in product innovation	Knowledge Innovation Ability(Y1)	Utilization of knowledge (Z11)
		Inventory increase rate of knowledge (Z12)
		Number of cooperation projects with research institutions of growth (Z13)
		Cooperation project success rate (Z14)
		Improve the degree of R & D staff's ability to take advantage of knowledge (Z15)
	Technical Capabilities(Y2)	The proportion of product innovation of R & D investment accounted for total R & D expenditure (Z21)
		The improvement degree of Speed and number of R & D (Z22)
		R & D success rate (Z23)
		Growth rate of number of patent applications (Z24)
	Market Performance(Y3)	Market share (Z31)
		Sales growth (Z32)
		Customer loyalty (Z33)
	Economic efficiency (Y4)	Sales profit growth rate (Z41)
		ROI of Innovative products (Z42)
		Innovative product revenue share of total revenue (Z43)
	Competitive position (Y5)	Improvement of enterprises' reputation (Z51)
		Improvement of corporate image (Z52)
		Future sustainable competitiveness (Z53)

(1) Knowledge innovation ability

In product innovation, it is necessary to make use of the existing knowledge and produce new knowledge on the basis of the original knowledge. Therefore, it should include the utilization rate of inventory knowledge and the increase rate of inventory knowledge. In addition, it should be in cooperation with external research institutions, make use of the existing stock of knowledge, and develop a new ability to meet the market demand of the products through the innovative use of existing knowledge. So it should cooperate with research institutions, to increase cooperating chance, to increase project success rate, and to increase researchers' ability.

(2) Technical ability

In a large extent, knowledge is one of the expression forms of technical, and knowledge and technical are closed related. In the enterprise organization, knowledge of these technologies is attached to the technical research and development, and also internal of organization, including R & D quantity

and speed improve degree, research and development success rate, number of patents increase rate.

(3) Market performance

Customer's personalized demand is more and more high, and product innovation has become an important strategic choice for enterprises in the fierce market competition to obtain long-term development. Knowledge exchanges with suppliers, distributors, advertising agencies, customers and so on must be strengthened, and the economic value of the production of the products can be accepted and recognized. The second level index should include three aspects: market share, sales growth rate, customer loyalty.

(4) Enterprise economic benefit

The ultimate goal of knowledge management in product innovation process is to realize the growth of enterprise's economic benefit, and the evaluation of economic indicators is essential. To evaluate knowledge management performance of product innovation, it should include Profit growth rate, the rate of return on the investment, and the total revenue of the innovation products.

(5) Enterprise competitive position

Different enterprise performance from different enterprise competition characteristics, through product innovation, its performance will have an impact on the competitive position of enterprises, ultimately reflected on the good impression of customers and the enhancing of corporate visibility.

4 Empirical Research on Performance Evaluation of Knowledge Management in Product Innovation

In this paper, Knowledge Management Performance Evaluation Index System is based on qualitative index. Usually, Fuzzy Comprehensive Evaluation use quantitative methods to deal with uncertain information and increase the authenticity and accuracy of the judgment by turning qualitative decision into quantitative decision. So Fuzzy Comprehensive Evaluation is one of the best choices. In Fuzzy Comprehensive Evaluation, the determination of evaluation factors is a key factor to affect result. To determine weighting, Analytic Hierarchy Process (AHP) was adopted.

(1) Comparison matrixes and conformance testing

In this paper, an enterprise which design and product electric products and managing and producing at a high level is treated as a research sample. Enterprise manager and researcher built a team to conduct comprehensive importance evaluation, using 1~5 Scaling Method and combing personal experiences and understanding with method. Based on these, comparison matrixes was set up and conformance testing was executive.

Table 3 Evaluation System and Analysis of Total Index

Evaluation parameters	Y1	Y2	Y3	Y4	Y5	W
Y1	1	1/2	1/3	1/4	1/2	0.0815
Y2	2	1	1/2	1/2	1	0.1539
Y3	3	2	1	1	3	0.3151
Y4	4	2	1	1	2	0.3077
Y5	2	1	1/3	1	1	0.1419
Consistency index						

In the same way, we can calculate the weight and the consistency index of the index layer.

(2) Evaluation set

In this case, the evaluation set uses five gradient standards, and set up the following evaluation set. {Excellent, Good, Average, Less, Lest}

Experts Evaluation Method is adopted: invite 10 experts to the evaluation of each index score, calculate each average number, and get the final score. The final score is the corresponding membership degree.

(3) Evaluation membership matrix

Determine the degree standard, and get the membership vector of the factor layer Z for the evaluation set E.

(4) Fuzzy comprehensive evaluation

According to the evaluation of the W and the evaluation of the R, the fuzzy comprehensive

evaluation of fuzzy comprehensive evaluation set , and the corresponding conclusions are obtained.

Table 4 Index layer Weight and Consistency Index

Criterion layer	Y1	Y2	Y3	Y4	Y5	Consistency index
Index layer	0.0815	0.1539	0.3151	0.3077	0.1419	
Z11	0.3445					0
Z12	0.1979					
Z13	0.1589					
Z14	0.0891					
Z15	0.2096					
Z21		0.4668				0
Z22		0.2776				
Z23		0.0953				
Z24		0.1603				
Z31			0.1283			0
Z32			0.5954			
Z33			0.2764			
Z41				0.4434		0
Z42				0.1692		
Z43				0.3874		
Z51					0.6250	0
Z52					0.1365	
Z53					0.2385	

After calculation, S is the Y's membership vector, that is, the total evaluation results.

(5)Result evaluation

According to the formula

The calculated as shown in formula (4.2):

Through the evaluation of the enterprise, it can be seen that the knowledge management performance of the enterprise is between the Average and Good, and this result is in line with the actual situation of the enterprise.

5 Conclusion

Product innovation has a decisive role in the survival and development of enterprises. Through the evaluation of knowledge management on product innovation performance, we can provide a basis for formulating scientific and reasonable strategy of knowledge management and improve the enterprise products innovation ability and level of innovation. Also improving management innovation and producing innovation uncertainty reduction has important significance and accumulate experience for the next stage of product innovation activities. In this paper, the application of knowledge management in product innovation and performance evaluation system is designed to provide reference for the relevant research, and provide a theoretical reference for the enterprise to improve product innovation capability.

Abstract: The investment of current Chinese government in higher education is increasing year by year. This paper mainly explores the relationship between undergraduate talent development and education system among universities in China with the empirical study. It is proved that there exists the problem on the orientation of undergraduate talent development in colleges and universities. As a result, the assumed curve and related enlightenment from the survey is proposed for education administration to guide undergraduates to select correct development orientation and become creative talents to the most extent.

Key words: University undergraduates; Development survey; Education management; Enlightenment

1 Introduction

At present, most universities in China have set up optional courses about career development, yet students just take them as a kind of interest. With about 7.5 million undergraduates each year in China, career plan and employment becomes a big issue. There are some researches on university undergraduates' career plan at home and abroad, covering different perspectives of management role in undergraduates' development, such as the economic value of education^[1], the predicative model of strategic development of a university^[2], the improvement of entrepreneurship education management^[3], the system construction of undergraduates' career plan^[4]. With the survey conducted, this paper will display the related enlightenment.

2 Research Question

The research probes into the development of nearly 500 university undergraduates randomly from freshmen to seniors among the key universities, participating in work, competitions, IELTS, TOEFL, postgraduate program, business establishment. More than 100 university undergraduates have been traced and recorded. Through the extensive investigation, on the basis of data analysis with several models, some conclusions will be drawn for the present development situation of university students and some suggestions will be given for the future education management. This study discusses the relationship between undergraduate talent development and education system among colleges and universities in China by interview, questionnaire and empirical record, etc.

3 Result Analysis

With the record on 100 students, it can be found that the rate of Chinese university undergraduates concerned about the employment information in their daily life exceeds 80%, i.e. they pay much attention to the future employment development, no matter they will directly hunt a job or not when they graduate. From the overall distribution, current university students can be divided into six typical groups: further study in postgraduate program, further study abroad, direct employment, clear targeted companies, business establishment and desire inaction group, among which students who plan further study in postgraduate program and direct employment are the main body, taking up more than seventy-five percent of interviewees, while the other groups account for a relatively small number of people. The interviews show that the proportion of postgraduates concerning about the information of entrepreneur establishment has reached to 47%, higher than that involving in the real entrepreneur establishment. The tracked interview indicates that more than 60 percent of postgraduates would choose to start a business in the future, however, they have no idea of business establishment on campus. From the investigation, it is surprised to find that undergraduates' concern for the IELTS and TOEFL is 8%. Besides, the rate of their concern for the relevant lectures is quite low, almost the same with the questionnaire results. The return visit shows that IELTS and TOEFL have their own fixed participants. From the employment information, the representatives in some fields think that university is mostly a kind of life experience, which will have an influence on their future orientation of development, but the

influence is not decisive. The degree of the influence has great difference among different fields, such as those of employment and going abroad, which has high requirements for the effectiveness of campus development.

4 Related Enlightenment

According to the above survey result, the development branch of university undergraduates can be illustrated by different kinds of models as the following, which would be the enlightenment to practical education.

4.1 The branches of campus development orientation and Philips assumption curve

Campus development has various directions. It is assumed that there really exist a large number of road choices on campuses. However, due to the limited time and energy, undergraduates have to choose only one or at most two or three points and also will focus on one point, which requires them to make their own choices. They have to choose their own suitable way to set down the direction of their future development^[5]. Through the survey, six development paths are obtained with different shares in Figure One.

Figure 1 Percentage of Students in Different Development Orientation

It fully demonstrates the diversification of the existence of branch roads on campuses. Hence, a standardized university production assumption can be presented: given that the orientation of university talent development is convergent and each person develops in a fixed pattern, then the final yield would be much higher, but with few innovative components; however, if in different development paths, the rate of success among university graduates would decline, but the innovative achievements would be much higher. The relationship between the two can be represented by an assumed curve in education management, as is shown in Figure Two.

Figure 2 The Assumed Curve in Education Management

This curve has nothing to do with good or bad for the creative degree of the talents and the talents cultivated like finished products, but just related to the demand of the talents in different period. For example, in high school, fundamental knowledge is emphasized, so mode B is applied, i.e. cultivating talents like finished products. Whereas in colleges and universities, mode A is thought to be necessary in order to cultivate innovative talents. When the popularization of university education appears on the agenda of the state and the government, university students around point B become the majority. To cultivate talents as the finished products does not only mean to study, but to obey the rules of university development road to plan several choices for the students, so that they could have their own

development orientation as soon as they enter the universities. In this way, although we have the fixed mode, there would be still a lot of explosive innovations, i.e. point C as the ideal point can be achieved, forming the double high capacity mode, or the most beneficial point of balance. It is compulsory to solve the communication problems among universities or students and then to help the freshmen have their own choices and life once they enter the university. The above is the campus road branch with the assumed curve.

4.2 The target and layer of campus development mode

According to the preliminary investigations, from the beginning, there exists a tendency of choice convergence in different groups, which is not just a coincidence. More likely it is a common choice under the same goal; that is under the rational situation, the choices of most people sharing the same goal are strikingly consistent in campus road development. Each campus development road should have its correspondent target audience, and that audience is the group having a correspondent goal^[6]. For example, students who want to go abroad should correspond to IELTS and TOEFL training roads, instead of focusing on students' affair. Therefore, the target and layer of campus development mode can be sorted out based on the statistical analyses and summaries of the research data to present the rules of campus development mode. The specific form is shown in Figure Three.

Figure 3 Students' Ability in Different Development Orientation

4.3 The effective campus development model

In the research process, in order to illustrate the choices of campus roads, a choice figure is designed to reflect the choices of undergraduates in Figure Four.

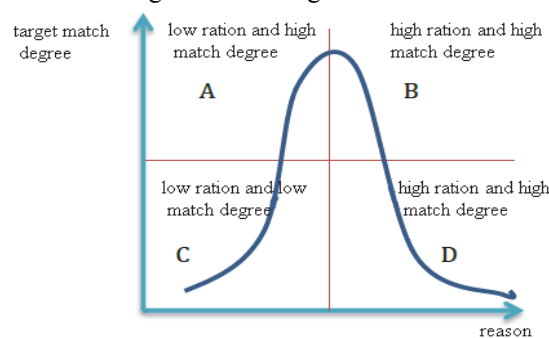

Figure 4 Model of the Selection Of Campus Orientation

The best way is to select region B, however in reality region A and C occupy a relatively large proportion, that's to say, at present there are more irrational choices of campus development which will then lead to the risk of matching between the development of campus and their own development goals. Once the students have a wrong choice, a lot of time and effort will be spent with low efficiency as well as the lost of other opportunities. Therefore, in order to lower the opportunity cost, campus development model should be proposed to postgraduates as soon as possible, so that students can make a rational thinking. And it's really essential for students to make their own choices of development road^[7].

To illustrate the effectiveness of the campus, the validity of the campus development model is established, as shown in Figure 5.

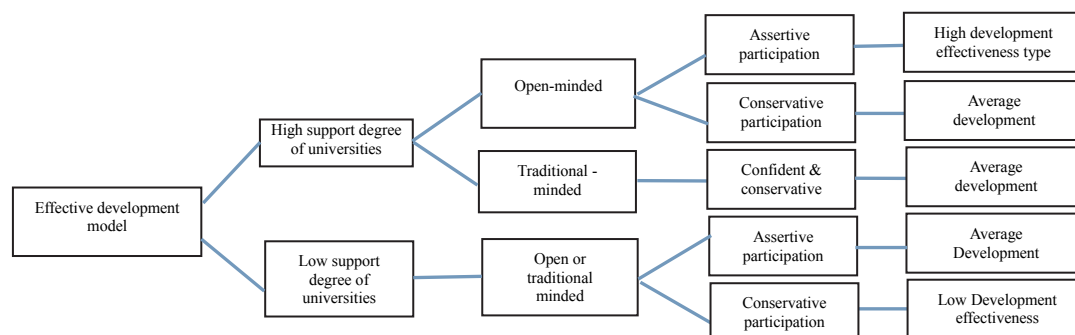

Figure 5 Effective Campus Development Model

5 Conclusion

From the above analysis, it is concluded that the effective campus development model illustrates the three determinate factors for the development of university students. Through the investigation into the orientation selection of the university students, the present state and the best state for the development selection are proposed, which can guide the plan and development of the future university students. On the one hand, the school authorities should take the responsibility for cultivating new campus development orientations and bear the obligation to remind university students of their development orientations. On the other hand, the university students, as a new and young generation, must have the courage to be pioneering and creative and learn to discard the confinement of the traditional thoughts and to pursue something new with rational attitudes and clear objectives^[8].

Consideration about Precedence Diagram for Start-to-Finish Relationship*

Naoki Ohshima, Shinobu Komai
Japan International Institute of Japan, Universiti Teknologi Malaysia, Malaysia
(E-mail: naoki.ohshima@mjiit.jp)

Abstract: Precedence diagram method includes four types of dependencies, which are “Finish-to-start”, “Finish-to-finish”, “Start-to-start” and “Start-to-finish” as logical relationship. In PMBOK, the predecessor (successor) activity is defined as an activity to come before (after) a dependent activity in a schedule. Based on this definition, four types of dependencies in PMBOK are explained definitely logically. However, logical relationship and time relationship do not accord in Start to finish relation. Therefore, in this paper, author replaces logical relationship of activities with time relationship and priority of activities and then considers a description of four types of dependencies in the precedence diagram method.

Key words: PMBOK; Project time management; Sequence activity; Precedence diagram; Start-to-Finish Relationship

1 Introduction

As for the method to visualize the schedule of the project, many researches were conducted for a long time. An arrow diagram method (ADM), Precedence, a diagram method (PDM), and a bar chart (Gantt chart) are well known as a notation method adopted by many projects today^[1-4]. In 1961, J. W. Fondahl (1924-2008) published the critical path method (CPM) based on the schedule diagram of the activity on node (AON) method that replaced the role of the arrow with a node of ADM as a new method for conventional ADM^[5-7].

In ADM, the task is expressed with an arrow. Therefore it is able to write order of tasks relations easily, but on the other hand ADM cannot plot the time required of the task as a graph element. Therefore it is necessary to introduce a dummy arrow to often adjust a phase at the time between a node and nodes. CPM solved a problem of the time consistency that ADM had^[5].

However, only the “Finish-to-Start” relation was defined as the sequence activities in AON by J. W. Fondahl. Early AON was insufficient to describe the scheduling of the project. Therefore improvement is added to AON and develops into PDM which can describe four kinds of activities relations^[6].

These days, PDM ceases to be distinguished from AON in particular, and it is said that John W. Fondahl is a prophet of PDM^[8]. It is written down in the obituary of Stanford University as follows;^[9]

“He developed the precedence diagramming method for project planning and scheduling, which used flow charts that represented activities as the nodes of a graph, to replace the activity -on-arrow methods previously developed by DuPont and the U.S. Navy Special Project Office.”

PDM showed a superior feature other than four kinds of relations. In the scheduling of the project, overlap between tasks (Lead) and a delay between tasks (Lag) are often necessary. In PDM, it is able to implement these Lead and Lag as a graphic element of the schedule network. Using this feature of the PDM, the research on scheduling of the project developed as study on the optimization of the cost and schedule of projects^[10-13]. Furthermore, the study on optimization of the scheduling for the project that human and cost resources were limited was carried out^[14]. In these studies, the dependence of activities targeted for the analysis is three types as “Finish-to-Start”, “Start-to-Start” and “End-to-End”. Though many studies on scheduling and activity relations are carried out with development of PDM, there has been no report about “Start-to-Finish” relations.

Many project managers replace “Start-to-Finish” with “Finish-to-Start” relationship artificially and they know that they can substitute it experientially. And many project managers think that it is not necessary to set “Start-to-Finish” relationship daringly almost in many cases, because scheduling of projects is possible even if they do not set “Start-to-Finish” relationship. However, such a way of thinking may be based on big misunderstanding about “Start-to-Finish” relationship. “Finish-to-Start” and “Start-to-Finish” relationships show exactly different behavior about the propagation of the delay of the task. Therefore, it is desirable to use these two activity relationships appropriately.

By the way, it can be pointed out another problem here. In any text book of the Time management,

* This paper was supported by JSPS Grants-in-Aid for Scientific Research No.24501190.

it is relatively easy for anyone to understand a definition of the “Finish-to-Start” relationship. On the other hand, it is very difficult and hard to understand a definition of “Start-to-Finish” relationship. The definition that it is easy to understand by an easy description is desired earnestly to solve the problems about the misunderstanding of “Start-to-Finish” relationship.

In this article, authors pay attentions to activity sequence based on the time and priority of the activity, and consider a new description method of four type of the activity relationship. This paper is composed of the following contents.

- Section 2 Verification of Precedence Diagram for "Finish-to-Start" Relationship
- Section 3 Verification of Precedence Diagram for "Start-to-Finish" Relationship
- Section 4 Priority of the activity
- Section 5 Conclusion

In Section 2, verification of precedence diagram for “Finish-to-Start” relationship is clarified by using graph theory. Section 3, verification of precedence diagram for “Start-to-Finish” relationship is discussed. Authors will show unconformity of the precedence diagram for SF. In Section 4, we propose an idea to explain the all of sequence activities relationship with introducing “priority of the activity” as a new concept.

2 Verification of Precedence Diagram for “Finish-to-Start” Relationship

2.1 Inspection by the graph theory

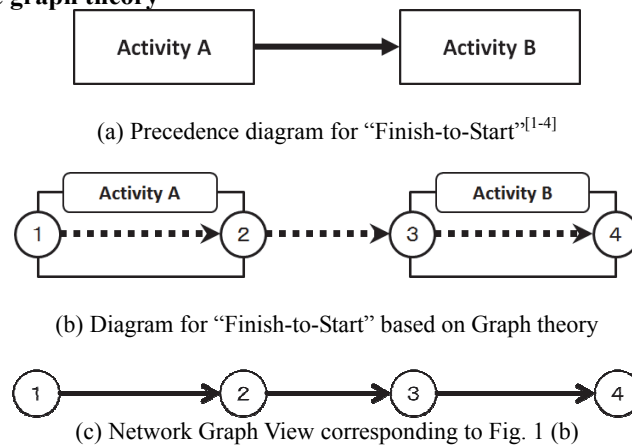

Figure 1 Schematic Diagram for “Finish-to-Start” Relationship

Based on graph theory, it is able to describe “Finish-to-Start” relationship by Precedence diagram mathematically. The arrow (solid line) in Precedence diagram is replaced by a graph (arrow, dotted line). Furthermore, the node in Precedence diagram (displayed by a rectangle in figure 1) is also replaced by a graph (arrow, dotted line). And, the initial point and the endpoint of these graphs rearrange as graph nodes. Then the precedence diagram for “Finish-to-Start” relationship (figure 1 (a)) can be rearranged as a graph view shown in figure 1 (b). Then we can describe the network graph by using nodes and arrows corresponding to figure 1 (b) as figure 1 (c). Table 1 show a matrix based on the sequences of figure 1(c).

Table 1 Direct Relation Between Subordinate and Superior Nodes

		Superior Element			
		①	②	③	④
Subordinate Element	①		1		
	②			1	
	③				1
	④				

Expression (1) shows the adjacency matrix corresponding to the Table 2(a).

$$\begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix} \tag{1}$$

The adjacency matrix shown in expression (1) is marked by A , and the unit matrix is marked by I . An operational matrix $A+I$ corresponding to “Finish-to-Start” relationships is described as expression (2) [15]. Then, a reachable matrix M is obtained by a Boolean product operation shown in expression (3).

$$\begin{pmatrix} 1 & 1 & 0 & 0 \\ 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 1 \end{pmatrix} \tag{2}$$

$$(A + I)^{k-1} \neq (A + I)^k = (A + I)^{k+1} = M \tag{3}$$

The reachable matrix M for the adjacent matrix A in (1) is given with expression (4). In other words, it is found that the flow described with the reachable matrix M in (4) begins in the node 1 and returns to the node 4. This is an extremely natural result.

$$\begin{pmatrix} 1 & 1 & 1 & 1 \\ 0 & 1 & 1 & 1 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 1 \end{pmatrix} \tag{4}$$

2.2 Definition in PMBOK

According to a guide book of PMBOK fifth edition, it is defined as follows; [1]

A logical relationship in which a successor activity cannot start until predecessor activity has finished. Example: The awards ceremony (successor) cannot start until the race (predecessor) has finished.

3 Verification of Precedence Diagram for “Start-to-Finish” Relationship

3.1 Inspection by the graph theory

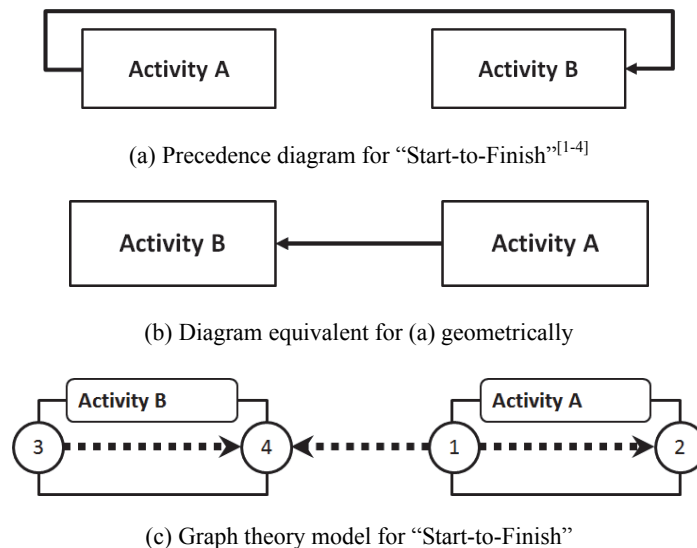

Figure 2 Schematic Diagrams for “Start-to-Finish” Relationship

The precedence diagram of “Start-to-Finish” relationship [1] shown in figure 2 (a) is equivalent geometrically with figure 2 (b). Based on a rule same as section 2, the graph theory model for figure 2 (b) is given as figure 2 (c). As for the adjacent matrix corresponding to figure 2 (c), it is given as

expression (5).

$$\begin{pmatrix} 1 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 1 \end{pmatrix} \tag{5}$$

The saturated operation for the adjacent matrix (3) becomes equal to matrix (3) own. This means that there is not a reachability matrix for expression (3). This results suggests that the precedence diagram expressing "Start-to-Finish" relationship is unnatural for the graph theory. The prospective flow begins in node 3 intuitively and returns to node 2 via node 4 and 1 as shown in Fig 2(c). The reachability matrix indicating such a flow should be shown with an expression (6).

$$\begin{pmatrix} 1 & 1 & 0 & 1 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 1 \end{pmatrix} \tag{6}$$

Figure 3 Graph Theory Model for "Start-to-Finish" Corresponding to Expression (4)

It is found, however, the relationship including self-contradiction, because Mathematical network relationships in figure 3 are the same as in figure 1. Therefore, to illustrate without including inconsistencies the relationship between FS and SF, it is necessary to introduce a new concept. In the next section, we introduce a priority as a new concept, to try a new description.

3.2 Definition in PMBOK

According to a guide book of PMBOK fifth edition, it is defined as follows; [1]

A logical relationship in which a successor activity cannot finish until a predecessor activity has started. Example: The first security guard shift (successor) cannot finish until the second security guard shift (predecessor) starts.

"The precedent activity" in this definition is an activity leading logically and points to "activity A" in figure 2 (a). One premise is necessary to understand this definition. In other words, in this definition, "the logical order relations" do not necessarily accord with "time order relations". In our logical thought, "the time order relations" usually accord with "logical order relations" implicitly. In other words, activity B should be placed earlier than activity A in terms of time. The precedent activity should be activity B in our mind. This result causes self-contradiction.

4 Priority of the Activity

When we discuss the dependence of two activities, considerable relations exist in conjunction with time order relations one more. An activity includes importance (priority). We can replace "the logical order relations" as in PMBOK with two indexes of "time order relations" and "the priority". Then the limitation condition in the finish (or the start) point of the activity could be defined as the condition depending on the priority of the activity. Then we can lead the dependence between two activities from a limitation condition set by priority. Therefore, about relationship of four kind of dependence, the results by arrangement with the propagation of a limitation condition depending on priority and the delay are shown in Table 2 - Table 5.

Table 2 Limitation Condition Depending on Priority of "Finish-to-Start"

"Finish-to-Start"	Activity A	Activity B
Time order	Precedence	Subsequent
Priority	1st	2nd
Schematic diagram		
Description	Activity B cannot start until Activity A is finished.	
Propagation of the delay	The end delay of Activity A propagates as a start delay of Activity B.	

In the case of “Finish-to-Start” relationship, priority accords with time order and it match intuitive understanding of us. In the case of “Start-to-Finish” relationship, the time order and priority shall reverse. In other words, we can describe the end condition of the precedent activity by setting a condition to be higher in the priority of the following activity than a precedent activity without raising self-contradiction.

Table 3 Limitation Condition Depending on Priority of “Start-to-Finish”

“Start-to-Finish”	Activity A	Activity B
Time order	Precedence	Subsequent
Priority	2nd	1st
Schematic diagram		
Description	Activity A cannot be finished until Activity B starts.	
Propagation of the delay	The start delay of Activity B propagates as an finish delay of Activity A.	

Table 4 Limitation Condition Depending on Priority of “Start-to-Start”

“Start-to-Start”	Activity A	Activity B
Time order	Simultaneous start	Simultaneous start
Priority	1st	2nd
Schematic diagram		
Description	Activity B cannot start until Activity A starts.	
Propagation of the delay	The start delay of Activity A propagates as a start delay of Activity B	

Table 5 Limitation Condition Depending on Priority of “Finish-to-Finish”

“End-to-End”	Activity A	Activity B
Time order	Simultaneous finish	Simultaneous finish
Priority	1st	2nd
Schematic diagram		
Description	Activity B cannot be finished until Activity A is finished.	
Propagation of the delay	The finish delay of Activity A propagates as an finish delay of Activity B	

5 Conclusion

In this paper, we replaced “the logical order relations” with two indexes of “time order” and “the priority” and considered a description method of sequence activity in the Precedence diagram method.

Research on Enhancing the Influence Through the Convergence of Campus Media

Qian Zheng

School of Liberal and Law, Wuhan University of Technology, Whuan, P.R.China, 430070
(E-mail: 5197605@qq.com)

Abstract: As a special common resources campus media played an important role in uniting students and faculty members and building a harmonious campus. This paper mainly uses the empirical research method, the literature method and logical analysis method. According to a questionnaire survey carried out among 448 college students in Wuhan, the research shows that mobile media can bring traditional media potential to the full and make it more advantages. There are three ways of convergence of the campus and mobile media: from mobile media to campus media, campus media on mobile internet platform, and wireless campus media.

Key words: Media convergence; Campus media; Mobile media; Positioning

1 Introduction

Campus media refers to all forms of media including traditional media and new media. Traditional campus media includes campus newspaper, TV, radio, school-run magazine etc; new media mainly refers to internet (J. Lihong and Z. Yanlin, 2011). As a special common resources campus media played an important role in uniting students and faculty members and building a harmonious campus. Nonetheless, there are many shortcomings: the influence of university media is not heavy enough, it could not attract students and a talent deficit has dogged the media and so on.

The students are the main service targets who are the typical Mobile generation. “Cell phones, personal digital assistants and other handheld devices have become daily necessities for many teenagers and young adults” (Fareena Sultan and Andrew J.Rohm, 2008) . All of them are “thumb race”, “digital natives” (John Palfrey and Urs Gasser, 2008), they use mobile terminal, basically a mobile phone, for socializing and entertainment. “Mobile phone is the totem of teenager. To them mobile phone symbolizes a social distinction and represents individual self” (Sun Huiying, 2010).

As a result of little empirical research about influence of campus media in China a questionnaire survey was carried out among 448 college students in Wuhan. The survey informs that over 70% students spent less than 15 minutes on campus media per day (Figure 1). In striking contrast 67% college students spent more than 1 hour on mobile media per day, 31% spent more than 2 hours (Figure 2).

Figure 1 Time Spent on Campus Media Per Day

Figure 2 Time Spent on Mobile Media Per Day

On the one hand the use of the campus media is scarce, on the other hand the mobile generation addict to mobile phone. This article will discuss the possibility of enhancing the influence of campus media through mobile media and the effective way to carry out it. The campus would not guide public opinion in an efficient way until it fascinates the college students.

2 Possibility of Campus and Mobile Media Convergence

In general, media refers to various means of communication. Mobile media is the vehicle for communicating messages. With the arrival of 3G times, with development and popularization of computer technology, mobile phone became the mini-computer with correspondence function (K. Wenbo, 2010). The mobile phone is one of the few devices, which people carry all day long and become a ubiquitous medium (S. Soroa-Koury and K.C.C. Yang, 2010). The advantage of mobile phone provides the possibility of two kinds of media.

College students spent much of their time in class and it is not convenient to use computer after 12 o'clock because of other roommates maybe want to get to sleep. This kind of lifestyle is limited by time and space particularly suits to the use of mobile. Mobile phone is characterized by high mobility including always online connectivity, providing versatile and contextually relevant information and services to users wherever and whenever needed (O. Rashid, P. Coulton and R. Edwards, 2008). This feature makes the use of mobile phone very heavy and lasting for a long time.

College students are often called "the post 80s" or "the post 90s" generation, "strawberry generation", "Y generation" and "me generation". They are labeled as "rebellious", "spoiled" and "self-centered". They declare that there is nothing I can't do as long as I like it. They speak out that I am the owner in my world. In a word they are personalized generation. Mobile communication technology has spawned wireless internet. Chinese wireless marketing expert Zhu Haisong once pointed out that wireless internet has two prominent features which make it different from internet: real time and personalization. Mobile media is the most personalized media. The mobile almost became an organ of human being (Z. Haisong, 2011). Personalization brings them together.

Mobile media can bring traditional media potential to the full and make it more advantages. Mobile media is super engine of media convergence and almighty terminal (Z. Haisong, 2011). Mobile media help traditional media create value instead of threatening or even replacing it. All kinds of media find a way to survive combining with mobile media through mobile magazine, mobile newspaper and mobile TV. The interactivity of mobile media passes on to traditional media. Lacking of interactive was one of the most important reasons that prevent it from developing. Traditional media will be new media by integrating with mobile media. The character of multimedia convergence makes campus and mobile media convergence possible.

3 Strategies of Campus and Mobile Media Convergence

The convergence of campus and mobile media is a complicated work. First the positioning of campus media must be identified. Campus media could maintain a momentum of healthy development only if the media orient correctly.

3.1 The positioning of campus media

Chinese television media pluralism an intense competition urges the domestic media industry has entered a time of competition. It has an agreement about media industrialized. Although Campus media are not operated on a self-financing basis, which is under the propaganda department of the party, student affairs department or communist youth League, there is intense competition between campus media and outside campus media. Though it is impossible to make campus media market-oriented, the market-oriented thought that takes the students as center must be established gradually.

Philip Kotler, the undisputed heavyweight champion of marketing, argued that all marketing strategy is built on STP: segmentation, targeting and positioning (P. Kotler, 2005). Since campus media no doubt target faculty members and students -mostly students, the positioning is vital to campus media development. Positioning is a marketing method for creating the perception of a product, brand, or company identity. Positioning is not what you do to a product. Positioning is what you do to the mind of the prospect. That is, you position the product in the mind of the prospect (A. Ries and J. Trout, 2002).

It has long been upheld that news unit is the public mechanism of the party, media is the mouthpiece of the party, and the basic task of media is to lead a person. Although non-campus media are devoting great efforts to transform operation mechanism toward market, campus media still haven't formed the market concept and service consciousness. Campus media has long been defined as tool of

guiding public opinion and teaching student, so it could not appeal to students strongly. The campus media should be a student-centric media, whose object is to meet student's requirements and improve their satisfaction.

In Harold Lasswell's book *The Structure and Function of Communication in Society* the communication master pointed out that the communication process in society performs three functions (a) surveillance of the environment, disclosing threats and opportunities affecting the value position of the community and of the component parts within it; (b) correlation of the components of society in making a response to the environment; (c) transmission of the social inheritance. In 1957, sociologist Charles Wright added the fourth function: entertainment which further completed the communication theory. Campus media should satisfy students' associated four needs: information, sociality, knowledge and entertainment.

Having solved the problem with position, the concrete measures how to enhance the influence of campus media through the mobile media come to the agenda. Professor Hu Yong of School of Journalism and Communication of Peking University argued that an important characteristic of contemporary media is the more dependency between traditional media and new media. The synergy between these two media is a vital necessity of new media market paradigm and enlarging globalization of production and marketing (H. Yong, 2008). There are three ways of convergence of the media: from mobile media to campus media, campus media on mobile internet platform, and wireless campus media (figure 3).

3.2 Three ways of convergence

3.2.1 From mobile media to campus media

This is a basic form of convergence which comes to true by media link. The students accustomed to use their mobile phones to get information, contact each other and entertain themselves. Making the mobile phone as an entrance could improve the rate of campus media utilization. University could push some attractive messages to students through SMS or MMS. Although mobile other applications are growing, SMS is still the most dominant form of mobile application. Most industry analysts believe that SMS traffic will continue to grow and will be the mainstay of mobile data revenues for several years to come. MMS extends the richness of messaging by adding pictures, caption, sounds, music and moving images. (J A Harmer)

Based on the student-oriented mentality these messages transferring to the students could be about curriculum and exam, products sales promotion, interesting game or other students. All the details must be achieved in the campus media. The campus media may be the TV, newspaper, internet or any other class. In this way, the mobile media is a tool of informing and reminding, which make students' access to campus media.

In particular, the SMS and MMS are with the mandatory color; therefore the pushing content should target the students precisely. The feature of mobile' individual identification makes accurate targeting possible. The accuracy of target must base on the students' database, the process from mobile media to campus media cannot be completed without it.

3.2.2 Campus media on mobile internet platform

The second way of convergence these two media is to build small campus platform on the big internet platform. Without doubt the small platform must be mobile internet platform. Finding the most popular mobile applications of student and taking full advantage of them are essential for convergence. For example campus media manager could create a Weibo account and attract students as fans to expand influence. Of course campus Weibo must offer the value; otherwise the students will not focus it.

3.2.3 Wireless campus media

With the coming of 3G era, more and more users use the mobile phone to access the internet, the student are the main force. According to CNNIC (China Internet Network Information Center) Statistical Report on Internet Development in China 66.2% net citizens use mobiles to access internet.

Campus media could become wireless campus media through establishing their own mobile website, or create their own mobile phone application instead of subordinate to other mobile internet platform (Figure 3). It demands higher level of technology and management which need more high quality talents.

Figure 3 Wireless Campus Media

4 Conclusion

Campus media played an important role in uniting students and faculty members and building a harmonious campus. The students are the main service targets who spent much of their time on mobile because students' lifestyle is limited by time and space. Mobile phone is characterized by high mobility including always online connectivity, providing versatile and contextually relevant information and services to users wherever and whenever needed. Traditional media will become new media by integrating with mobile media. The character of multimedia convergence makes campus and mobile media convergence possible.

It is critical to make full use of three ways of convergence of the media: from mobile media to campus media, campus media on mobile internet platform, and wireless campus media. The relationship of campus media and outside media is more than competition, there is competition in presenting collaboration, and there is cooperative characteristic in competition. Campus media, especially internet media, develop themselves by convergence with outside media.

A Comparative Study on the Characteristics of Chinese and American Teachers' Talk in EFL Classroom

Zhou Dan

School of Foreign Languages, Wuhan Textile University, Wuhan, P.R.China, 430073

(E-mail: zhoudan@wtu.edu.cn)

Abstract: Recently, more and more native English speakers appear in our English classroom in China, which results in obvious changes to traditional EFL classrooms. Carrying out a comparative study on the quantitative and qualitative characteristics of Chinese and American teachers' talk in EFL Classroom is worthwhile to improve the effects of the teacher talk and creating a favorable language environment for their learners.

Key words: Teachers' talk; EFL Classroom; English learners

1 Introduction

EFL classroom provides the major opportunities for the domestic English learners to use and expose to English, where the quantity and quality of teacher talk (TT) plays a crucial role in the instruction and learners' language acquisition. Teacher talk not only serves as a tool of classroom teaching, by which teachers organize and manage the classroom, but also it is one part of the content of language study. For the learners, teacher talk sets a model of target language. The model Zhou Xing and Zhou Yun (2012) have built encompasses the fundamental natures of TT--- input features, interactional features and features of facilitating output, with which we could study any TT of EFL classroom in any cultural context. The features of TT summarized by scholars at home and abroad maybe fail to cover the essential natures of TT in EFL classroom that ensures relevant studies in any cultural settings and appears bits and pieces instead of systematically arranged.

2 Research Design

2.1 Research questions

For the purpose of revealing the characteristics of American and Chinese teachers' talk in EFL classroom and of putting forwards constructive suggestions for both teachers to improve their language performance, the present study intends to answer the following questions:

1) What is the respective amount of teacher talking time in American and Chinese teachers' EFL classroom under investigation? Is there any significant difference?

2) What are the respective qualitative characteristics of TT with regard to patterns of questions, interactional modifications and feedbacks used by the American and Chinese teachers in EFL classroom? How do they differ respectively in these two EFL classrooms?

2.2 Subjects

The subjects for in the research are divided into two groups of teachers: group 1 comprising five American teachers, and group 2 comprising five Chinese teachers in Wuhan Textile University (WTU). All of them teach Non-English major students most of whom have passed CET-4 examination and are intermediate English learners. There is an average of 30-45 students per class. Five Chinese teachers involved in this study give lessons on the subject of Listening and Speaking English at WTU. All of them are experienced teachers with more than 3 years' teaching experiences and obtain their MA degrees in English linguistics and pedagogics. They regard the student-centered classroom as their essential part of teaching methodology. As for the five American teachers, they teach Oral English at WTU with more than 3 years' teaching experiences in China and have been trained as a foreign teacher regularly. Since all of them have received much training and practice, they have sufficient preparation of their work.

2.3 Instruments

The quantitative study mainly analyzes the comparative characteristics on amount of teacher talk, questioning, interactional negotiations and feedbacks. The qualitative study is to analyze the results of the interviews with those two groups of teachers investigated.

2.4 Data collection

The data in present study is collected in WTU. This study selects five classes by those Chinese teachers and, of about 30-45 minutes each, using different teaching materials to non-English students of

'Level One', which is true of the American teachers apart from the different students they teach. The American teachers mainly teach the non-English major postgraduate students. Definitely, the students taught by different groups of teachers have different levels of command of English, which may affect the interaction pattern between teachers and students. However, this variable is ignored for the limitation of the facts that neither the non-English major graduate students have access to native English speakers in their Listening & Speaking course nor the postgraduate students are provided with English Listening & Speaking course in WTU. The rest of the universities encounter the same situations.

2.5 Data analysis

To begin with, the author figured out the frequency of TTT, display and referential questions, confirmation checks, comprehension checks and clarification checks, positive feedbacks and error corrections from the two groups of teachers, based on the transcriptions. Then, by using the statistical software SPSS 11.0, the author adopted independent T-test to examine whether the frequency of the terms above made by those teachers are significantly different. Finally, the author analyzed the results from interviewing the teachers.

3 Results

3.1 Results from the quantitative study

3.1.1 Amount of American Teacher Talking Time Surpassing That of Chinese Teachers'

In correspondence with research question (1): "What is the respective amount of TTT (Teacher Talking Time) in American and Chinese teachers' EFL classroom? Is there any significant difference?" The author made analyses based on transcriptions of all these ten classroom recordings. The results of the respective amount of TTT from the two groups (group 1 refers to the American teachers, while group 2 refers to the Chinese teachers) are shown in the following Table.

Table 1 Amount of Teacher Talking Time

Teacher	Total amount	Teacher amount		Student amount		Other activities	
	n(min/s)	T(min/s)	%	T(min/s)	%	T(min/s)	%
AT1	45'20	26'10	7.7	5'30	12.1	13.40	0.2
AT2	41'15	30'15	3.0	4'40	11.3	6'20	15.7
AT3	42'50	23'40	5.3	7'30	7.5	11'40	27.2
AT4	40'20	20'10	1.3	8'54	2.1	14.56	26.6
AT5	44'10	21'15	48.1	5'10	11.7	18.15	36.4
Total amount	213'55	121'30	56.8	31'44	14.8	64.51	28.4
CT1	47'30	20'40	43.52	5'30	11.6	21.20	44.9
CT2	45'00	16'20	36.33	6'07	13.6	22.33	50.07
CT3	48'05	21'20	44.23	11'40	24.3	15'05	31.47
CT4	46'35	15.18	32.85	10'12	21.9	21'05	45.25
CT5	49'20	20'14	41.03	4'10	8.5	24'56	50.2
Total amount	235'30	93'52	39.86	37'40	16	105	44.15

Note: AT stands for American teacher, CT for Chinese Teacher. Other activities refer to group discussion, role play and listening to the tape

Statistics in Table 1 shows that either the amount of TTT by the American teachers or the Chinese teachers accounts for the most part of the classroom talk with the range of 39.86%-56.8%, whereas the talk by students in both classrooms is much the same, ranging between 14.9%-15.99%. Neither the students in American teachers' classroom nor in the Chinese teachers' classroom have much chance to talk or communicate with the teachers. And the other activities take up 28.4%-44.15% of the whole class, which is not a small part we could ignore. From the percentage, the author notices that the American teachers talk even more than the Chinese teachers.

3.1.2 More referential questions by american teachers than by chinese teachers

Table 2 Frequencies of Teachers' Questions

teacher	Total n	Display Question		Referential Question	
		n	%	n	%
A T 1	30	6	20.00	24	80.00
A T 2	42	11	26.20	31	73.8
A T 3	25	4	16.00	21	84.00
A T 4	22	5	23.00	17	77.00
A T 5	21	4	19.00	17	81.00
Total	140	30	21.43	110	78.57
C T 1	40	28	70.00	12	30.00
C T 2	23	17	73.91	6	26.09
C T 3	42	30	71.42	12	28.58
C T 4	20	13	65.00	7	35.00
C T 5	19	11	57.89	8	42.11
Total	143	99	69.23	38	26.57

Table2 reveals that among all the questions raised by the American teachers are referential questions ('wh-'/'how' question) that take up 78.57% of the questions, 57.14% more than the display questions ('yes/no' question or gap-filling question). On the contrary, the Chinese teachers raise more display questions that account for 69.23% of their questions, 42.66% more than the referential questions. Then we need to take a close examination on whether the two groups have significant difference on the two variables: referential questions and display questions.

3.2 Results from the qualitative study

From the twenty-minute face to face interview, we find out that few teachers pay attention to the language the use in the EFL classroom or consciously reflect their language and the functions of teacher talk in EFL classroom. But they focus on the importance of improving their oral English, which is one of their qualifications as a language teacher. According to the recordings of this interview, the author finds that most of the Chinese teachers communicate with her as they do with their students, at much the same speaking rate and with the same language complexity. By contrast, the American teachers realize their role of native speakers and the significance of providing idiomatic English. But they seldom use slang or idioms or tell black jokes in classroom, which are embedded with so much the culture factors. Some American teachers try to add some black jokes in the communications with students, which proves to be not feasible in classroom setting and fail to invoke expected response from the students. It is not easy job to give detailed explanations in a class with designed teaching plan, and blocks the real interactions between the teachers and students. When learners come across difficult words, the American teachers tend to ask the students refer to the dictionary and make discussions. Besides they usually turn to body language, examples, paraphrase into simple words or ask students to translate them into Chinese and repeat what students have said to confirm the understanding so that the interactions could keep going. The American teachers try to avoid immediate corrections because they assume that those students they teach are adults and correcting their errors in the presence of whole class could result in frustration and humiliation and lessen the chance to practice speaking English next time. Chinese teachers interviewed share the same view on that. That could further explain the reason why they turn to more guidance leading to learners' self-correction rather than instant correction They would rather spend more time on the individual students in the class. But Chinese teacher always skip to another topic if silence occurs or individual students could not answer question smoothly, owing to the time limit and the pressure of teaching plan. Most of them are informed of the communicative teaching method and the importance of learner-centered classroom. But when carrying out those guidelines, they unconsciously dominate the classroom.

4 Conclusions

The findings in the present study suggest a number of implications for EFL teaching and teacher training. Teachers should consciously decrease their talking time to an appropriate amount and attempt

to encourage learners to produce as much Interlanguage as possible by creating a relaxed and unthreatening environment in EFL classroom. Moreover, teachers should be trained to improve and polish their language constantly so as to provide learners with more comprehensible language input.

4.1 Major findings of the study

The present study sets out to compare the Characteristics of the American teachers' talk and that of Chinese teachers', and whether there is any discrepancy between those two groups of teacher or not. The author mainly examines the major four aspects of the teacher talk: the amount of teacher talk, the pattern of questioning (display questions and referential questions), the mode of interactional modification (comprehension check, confirmation check and clarification check), feedbacks (positive --simple praise, repetition plus praise, praise plus remarks; negative feedbacks --error corrections).

4.2 Limitations of the study

The subjects of this study—the two groups of teachers are not strictly controlled on their age, teaching experiences. And the courses they teach are not exactly the same, due to some practical difficulties. Besides, the sample size is not large enough to be conclusive about the real situation of teacher talk that occurs in EFL classroom. The subjects were chosen only in the universities in WTU. The multiple techniques for data collection should be used to get more accurate results.

Research on Bilingual Education Frontier Trend Based on Burst Detection

Fu Zhuheng, Zhou Xiang*

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 510753750@qq.com, 6149206@qq.com)

Abstract: Taking the articles from CNKI relevant to English-Chinese bilingual education as data source, this paper conducts a visualized analysis on China's English-Chinese bilingual education research with the help of Citespace software, and identifies its research fronts by adopting burst detection arithmetic, which reveals the dynamic trends of this field. In conclusion, the research front trend of China's bilingual education evolves as tree-form atlas and the future research fronts will develop along this path.

Keywords: Bilingual education; Research fronts; Burst detection; Information visualization

1 Introduction

With the rapid development of global economic integration and education internationalization, and deepening implementation of quality-oriented education, bilingual education has increasingly captured the attention of modern society. Bilingual education reflects the demands of current society informatization and economic globalization, which not merely requires modern universities to cultivate high-quality innovative talents, but necessarily promotes reform and development of university education. In order to adapt to the new time, the national educational administration has begun implementing the reform in bilingual education. However, as an emergent novelty, bilingual education in China is still at the initial stage without complete theoretic cognition. It is crucial to form a comprehensive set of theoretical system to guide its application and benefit all teachers and students.

2 Methodology and Data Sources

"Bilingual education" mentioned in this paper refers to that carried out in Chinese universities at present. University bilingual education has been popularized in steps all over the country to comply with the general trend of China's opening-up policy. The research on its status quo and frontier trends is a challenging project. In this paper, burst detection method with the information visualization tool CiteSpace, is employed to summarize and analyze some guiding education and teaching theories, which illustrates the frontier trend of China's bilingual education field. Burst detection arithmetic is used to detect the sudden acceleration of research enthusiasm in a certain discipline. The information visualization tool CiteSpace was developed by Pro. Chen Chaomai of Drexel University as a visualized tool of mapping knowledge domain, which displays the evolution course of some research fronts of an academic field based on relevant articles within a certain period through burst detection technology and arithmetic. In CiteSpace software, burst detection is applied into two kinds of variables: the frequency of words or phrases in citing articles and the quotation frequency obtained by cited articles.

The data adopted in this paper are fall from Chinese Journal Full-text Database of China National Knowledge Infrastructure (CNKI). Setting the topic "bilingual education" including "English" as retrieving expressions, we have retrieved the full-text database of CNKI journals, the retrieving time quantum confined within 10 years during 2003-2013. Altogether, 3328 data are obtained, each of which mainly includes the author(s), title, keywords, and abstract of an article. The last retrieving day was on April 4th, 2014.

3 The Frontier Trend Analysis of Bilingual Education

Analyzing the frontier trend of some academic field is significant for understanding its latest research orientation and predicting its development direction^[1]. The frontier trend can be defined as a series of emergent dynamic concepts and potential research questions which is the appearance of large numbers of theory trends and new themes. Those terms at high word frequency growth rate are determined as frontier terms of academic research^[2]. A great innovation in scientific knowledge map research, the function of Burst Detection, is added into CiteSpace software. Burst terms refer to the terminology surging into the articles published within some years, fit for the development tendency of

* Corresponding Author

representation research fronts^[3]. The downloaded data are input into CiteSpace software, then with Burst Detection technology and arithmetic those terms at high frequency change rate are detected from plenty of subject terms by inspecting temporal distribution of word frequency to determine the frontier domains and development tendency of China's bilingual education mainly by both changing trend of word frequency^[4]. After operating CiteSpace software, a burst term list is obtained to indicate in clarity the chronological distribution and bursting intensity of burst terms, as is shown in Figure 1, Figure 2, Figure 3, and Figure 4.

Figure 4 The Burst Term List Based on CiteSpace Software (2011-2012)

3.1 Trend variation of front burst terms in years – the issue of policy has become the division of bilingual education research

According to the burst term list produced by operation of CiteSpace, we have drawn the burst term distribution about China’s bilingual education research during 2003-2013, as is shown in Figure 5.

Figure 5 The Burst Term Distribution about China’s Bilingual Education Research during 2003-2013

Judging from the distribution in each year, burst terms during 2003-2004 are of great numbers. There were respectively 36 and 15 in those two years, with big difference from other years when the number of burst terms were all under 10. According to their yearly variation, high fluctuation existed from 2003 to 2004, while low fluctuation occurred during 2005-2013 with fairly small yearly variation amplitude. Therefore, based on the distribution of burst terms in years, the frontier trend of China’s bilingual education research from 2003-2013 is divided into 2 phases: the starting phase during 2003-2004, and the stationary phase during 2005-2013. It is well known that policy, practice and theory promote and influence each other. Policy guides practice; practice influences theoretic research; theory promotes further perfection of policy^[5]. In *Several Opinions on Reinforcing Undergraduate Teaching and Improving Teaching Quality in Universities*, Ministry of Education clearly demands that universities actively promote the use of foreign languages including English to teach common required and specialized courses in respect to undergraduate education. With the guidance of this policy, bilingual education work has begun to spread and scholars have started their exploration into bilingual education. After some amendments in 2004, Ministry of Education released *the Evaluation Scheme of Undergraduate Teaching Proficiency in General Institutes of Higher Education (Trial Implementation)* which formulated rigid index to bilingual education in biotechnology, information technology, finance, law, etc., and included bilingual education into fixed points of evaluation and inspection of undergraduate teaching proficiency^[6]. The issue of those policies best explains the yearly distribution

trend of burst terms in China's bilingual education research fronts, becoming the division of frontier variation in bilingual education research.

3.2 Trend change of research front content – bilingual education research presents the tree-form atlas of the “trunk-branch-leaf” approach

Since the issue of relevant policies in 2001, research enthusiasm has sprung up about bilingual education in the academic circle. Nevertheless, it is found by deliberating upon the burst terms in 2003 that most research in this period remained in the preliminary discussion about concepts, fundamental theories and relevant fields of bilingual education. From 2004 bilingual education research in China began to be further deepened. Scholars worked a great deal on the specific key elements of bilingual education. In this period, lots of burst terms started to occur such as original teaching material, English teaching material, teachers, specialized English level, English-Chinese bilingual, turning into the research fronts. After anatomization, however, it turns out that the research of fundamental theories still prevailed. As a consequence, this period (2003-2004) can be considered as the starting point of theoretical research of bilingual education. What is more, according to Figure 2, Figure 3, and Figure 4, some burst terms similar to those in the theoretical period still occurred after 2005, indicating that enthusiasm for theoretical research of bilingual education had always been very high. This theoretical research was closely related to the following research front topics, becoming their knowledge basis and theoretical source. Since Ministry of Education issues the Amendments about bilingual education in 2004, scholars have begun to switch the attention focus from fundamental research to practical exploration of implementing bilingual teaching in certain academic fields. The burst term “human anatomy” appeared in 2005 and the burst terms representing medicine “seven-year program” and “medical students” appeared in 2006, which means bilingual education in medical courses became the research front in this period. With the relevant fruit and inspiration of bilingual education research in medical courses, scholars began to expand their study into wider application domain. In 2007, bursting rate of terms representing specific disciplines was increasing such as “molecular biology”, “computer networks”, “infant education”, “physiology”, “accounting major” etc. During this period the research fronts are characterized by diversification, specialization and domain intersection, known as a very active period throughout the evolution process of frontier research. It is worth mentioning that since 2010 those keywords with high bursting rate, such as international finance, international trade affairs, international trade, ESP English, increased as greatly as blowout, becoming most active research front trend recently. These fruits emerge constantly in large numbers, providing new viewpoints and injecting new vitality into China's bilingual education research.

It is revealed that China's bilingual education research fronts at early stage mainly focused on general and comprehensive study, and macro exploration of its basic principles, which has maintained great enthusiasm so far. But the research in later period was different in that some studies gradually appeared directing at specialized orientations and became the mainstream. For instance, many bilingual education research fruits about some disciplines have got published, such as medical curriculum, biological technology, computer science, finance and trade, and ESP etc., to make China's bilingual education research take on a tree-form atlas approach of “trunk-branch-leaf”. The subsequent research fronts will develop along this approach.

4 Conclusion

This paper adopts the academic papers as research objects highly relevant to bilingual education published in CNKI periodical full-text database during 2003-2013 and uses the information visualization tool CiteSpace to conduct fronting analysis and visualized demonstration of China's bilingual education research. The main conclusion is as follows:

With Burst Detection method and CiteSpace software, the research analysis is made to China's bilingual education research. Judging by chronological change of number of burst terms, the high fluctuation state was during 2003-2004, while the low fluctuation state during 2005-2013 with small yearly variation amplitude. The cause lies mostly in mutual promotion and influence of policies, practices, and theories. Documents of Ministry of Education, Several Opinions on Reinforcing Undergraduate Teaching and Improving Teaching Quality in Universities in 2001 and the Evaluation Scheme of Undergraduate Teaching Proficiency in General Institutes of Higher Education (Trial Implementation) in 2004, have become the great divide of bilingual education research front variation.

In terms of the contents change of research fronts, the burst terms during 2003-2004 are all related to the basic concepts and theories of bilingual education. Hence, this period can be viewed as the

starting point of its theoretical research. In the later period, such burst terms still appeared continuously, which indicated that the theoretical research enthusiasm kept existing actively and it was closely related to the subsequent research front topics as their knowledge base and theoretical sources. It is essential to explain that in later period of bilingual education research, the research fronts are characterized by diversification and the burst terms representing subject major increases as blowout, indicating that many studies directing at bilingual education specialized orientations spring up in great numbers to become new research fronts. Recently, the research front of China's bilingual education is about bilingual education in financial trade major. To sum up, the research front trend of China's bilingual education evolves as tree-form atlas and the future research fronts will develop along this path.

Contrastive Rhetoric Theory and ESL Writing

Wang Yingfang

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: wyfjessica@163.com)

Abstract: The theory of contrastive rhetoric (CR), pioneered by Kaplan in 1966, focuses on two main perspectives: a) the unique rhetorical features of each language and culture; and b) the interferences of first language (L1) rhetorical conventions in English as a Second Language (hereafter, ESL) writing. Through examining the rhetorical differences between Chinese and English along with a brief review of the development of CR theory and pedagogical implications, this paper contends that the study of CR theory has exerted beneficial influences on ESL writing.

Key words: Contrastive rhetoric; ESL writing; Differences; Pedagogical implications

1 Introduction

It seems reasonable to assume that different cultures would orient their discourses in different ways. Each culture has its specific writing conventions: preferred length of sentences, choice of vocabulary, acceptability of using first person, extent of using passive voice, degree to which writers are permitted to interpret, amount of metaphorical language accepted. The studies of the culture-specific difference in writings of another language fall into the scope of Contrastive Rhetoric.

Contrastive rhetoric (hereafter, CR) as a promising area of linguistic study and second language (L2) research, proposes valuable generalizations about how people structure written work and how learners learn to write. The theory of CR, pioneered by Kaplan in 1966, focuses on two main perspectives: a) the unique rhetorical features of each language and culture; and b) the interferences of first language (L1) rhetorical conventions in English as a Second Language (hereafter, ESL) writing.

2 Development of CR Theory

Through examining nearly seven hundred English essays written by University of South California students from all over the world, Kaplan (1966) identified five different rhetorical organization patterns, each of which he claimed represents a kind of cultural thought pattern: English, Semitic, Oriental, Romance and Russian. English rhetoric is logically linear based on its linear thought pattern; while the Oriental thought pattern is presented as spiral and circular, which leads to an indirect rhetorical pattern (Kaplan 1966). In Classical CR theory, Kaplan (1966) suggested that L2 learners' using single words or sentences correctly does not imply producing effective paragraphs or essays because of their different ways of logical thinking, which are largely affected by their own cultures (Kaplan 1966). In other word, culture plays a crucial role in ESL writing. Kaplan recognized that mastering of English rhetorical patterns was simply beyond the students' reach, with their abilities to largely control English sentence structures. They were always displaying rhetorical styles unlike those of native English speakers. They were not incorrect, but only different. This led him to conclude that there existed a relationship between a society's culture and its mode of verbal expression. He coined the term "contrastive rhetoric" for the new field, parallel with contrastive analysis of phonological and grammatical structures, with the purpose of facilitating writing in a second language. Based on this research, he put forward two hypotheses, which are later considered as the fundamental assumptions for traditional contrastive rhetoric:

(1) Each language has culturally specific rhetorical conventions. People from different cultures think and write by employing culturally determined rhetoric and logic.

(2) The rhetorical conventions of students' first language interfere with their second language writing.

Though Classical CR theory has opened up a new direction of rhetorical research, it has met with some difficulties and criticisms in regard to its inadequacy of empirical research, the privileged standards of native English speakers' writing, and the overgeneralization of organizational patterns, which will be elaborated later. Among many critics, Connor (1996) advanced two major revisions in her Revised CR theory (Connor 2002, 2003). First, the Revised CR theory moved from the text linguistic perspective to studying writing as an activity perception; that is, writing is examined as process rather than product.

Second, Connor's (1996) Revised CR theory is based on a multi- theoretical framework. According

to the framework, in addition to linguistic relativity theory, the theory of applied linguistics, the theory of rhetoric, the theory of text linguistics, the theory of discourse types genres, the theory of literacy and the theory of translation aim at cultural effects in ESL writing. All these help build a stronger and richer theoretical web for CR theory, and pave the way for new directions in CR studies.

Connor (2002, 2003) has in recent years further revised and expanded CR theory in terms of redefining culture, literacy, and critical pedagogy. One paradigm proposed by Connor (2002) has gained wide popularity among many contrastive rhetoricians, i.e. cultural differences should be taught in order to help writers to be proficient in the target language writing. Besides these new developments, current CR theory has embraced other dimensions, such as analyzing particular cultural writing styles and explaining different writing patterns (Connor 2003).

In China, there is a long history of contrastive studies between Chinese and English, which have been concerned with many aspects of language and related fields such as lexicon, syntax, semantics, pragmatics, rhetoric, culture and psychology. But in terms of contrastive rhetoric, a complete system has not formed yet. Only after 1989 did Kaplan's view that discourse structure varies widely with cultural-linguistic systems receive considerable attention in Chinese academia (Coe & Hu Shuzhong, 1989; Wang Moxi and Li jin, 1993; Lin Dajin, 1994; He Shanfen, 2002; Tao Jiawei, 1998; Wen Qiufang and Guo Chunjie, 1998). Just like things happened in overseas, no consensus has been reached among Chinese scholars as well, as Kaplan's claim is either in the midst of pros and cons or met with neutral attitudes. Coe and Hu Shuzhong (1989) reached three conclusions of English and Chinese contrastive rhetoric studies: firstly, there is one discourse form identified as "inductive" in Chinese similar to that in English, another is like what Kaplan called the spiral structure, and some others demonstrate non-English rhetorical patterns. Secondly, though it is almost impossible that the eight-legged essay form still exerts a direct influence over modern Chinese writing, it reflects a habitual mode of thinking. Thirdly, the textual structure in English constructed by Chinese writers is neither fully like the English text by English natives, nor identical to the Chinese text by Chinese writers.

Liu Lijin (2004) contrastively analyzes English textual patterns composed by Chinese ESL learners and English native writers from the perspective of semantics, and points out that Chinese writers prefer coordination to subordination, while the latter is the dominant pattern in English writing. Wang Moxi and Lijin (1993) carried out empirical surveys of Chinese ESL thought patterns according to the three standards of discourse patterns set by Michael Hoey (1983), the problem-solution pattern, the general-specific pattern, and the matching pattern. After surveying, they find out that the general-specific pattern, the base of English writing, is most lacking in Chinese students' essays. The dominant one is the problem-solution pattern in which the writer does not start his/her essay with a thesis statement, but rather, by dropping a hint for the reader to take, until a solution to the set problem is finally supplied in the concluding paragraph. Tao Jiawei (1998) emphasizes the impact of cultural difference on writing and believes that writing is the representation of culture.

3 Generalized Differences Between Chinese and English Rhetoric

3.1 "Linear" vs "Spiral" textual patterns

As early as 1966, the famous Kaplan's "doodles" contrasted a straight-line Western approach with a spiral Oriental thought process. He pointed out that the structure of English exposition is linear, because a paragraph in English typically begins with a topic sentence supported by examples that are related to the central theme. Actually, this kind of linear structure not only appears in the individual paragraph, but also in the whole passage of the typical English exposition. The employment of one definite sentence to elucidate the central idea is always required in English essays, and the sentence, usually called thesis, is often presented very early in the essay. According to English style manuals, which can be easily found everywhere in China, say that an essay should have a thesis. A thesis is a straightforward statement of the main point of the essay. In a short essay of several paragraphs, the thesis should appear in the first paragraph, while in a longer essay, the thesis might be delayed until after a bit of preliminary introductions. But in any event, the reader should be able to determine the main point within the first formal section of the text. Accordingly, each section of the essay, each paragraph should have a topic sentence, and that sentence is required at the beginning of each paragraph. Stern (1981) concluded that "good paragraphs always (or usually) contain identifiable topic sentences which always (or usually) occur toward the beginning of the paragraphs". Thus, whether from sentences (subject - predicate -object) to paragraphs (one topic sentence- supporting sentences-conclusion) or to texts (a thesis statement- development - epilogue), all strictly follow linear structures. And this kind of

linear structure is best realized by the deductive pattern - the preferred structure for an essay within the western tradition. (Scollon & Scollon, 1991)

Contrary to the essential rule of the use of a “thesis” and a “topic sentence” in English writing, the Oriental texts prefer the rule of “from surface to core”, which means that one thought ought to reach a topic gradually and “systematically”, and this “systematic” way is best realized by the inductive pattern. That is, thesis often occurs at the latter part of the text, some at the very end, and some even with no thesis statement at all. Furthermore, English writing by Chinese students are often viewed as “lack of unity”, as relevant facts and irrelevant ones are often mixed together into one paragraph. Kaplan (1972) remarked once that although the ESL essays did include an introduction, a body, and a conclusion, “along the way” there was a lot of seemingly unnecessary wandering around the topic.

The indirect or spiral textual development is to a great extent attributed to the traditional Chinese rhetorical structure: qi-cheng-zhuan-he. (Cai Guanjun, 1993) “Qi” means the opening of an essay. “Cheng” is the preliminary discussion of the topic of the essay. It may be realized by a paragraph, or a sentence, or a conjunction. In the part of “Zhuan”, a much emphasized aspect of organization in Chinese writing, the essay abruptly develops into a subtopic which is only indirectly related to the thesis statement. And it is exactly in this part that the essay deviates from the central idea and breaks the unity of the whole text in western eyes. The last part – “He”, is the summary of the whole essay. (Si Hongxia, 2002) Si went on to owe the preference for the qi-cheng-zhuan-he style among Chinese writers to the notion of avoiding monotonous or boring in writing.

The linear and non-linear textual patterns recognized in English and Oriental texts have caught attentions of linguistics at home and abroad long before. They concluded that the opening part of the English texts tells people where the argument/talk is going, while that of the Chinese ones tells people where the argument/talk is coming from (Jia Xuerui, 2001), and thus they called the deductive pattern the unmarked English exposition rhetorical structure, and the inductive one the unmarked Chinese exposition rhetorical structure.

3.2 “Logic” vs “Emotion” in paragraph partition

Western culture emphasizes the integration of meaning. Paragraphs are formed mainly through logic. Most of the paragraphs are conventional units, not arbitrary ones (Becker, 1976). The principle of paragraph partition is that each paragraph should represent a distinct unit of thought. Each paragraph is viewed as a semantic unit, and this unity is represented by a key sentence, from which the rest of the paragraph develops. Every sentence in the rest of the paragraph should be relevant to the topic sentence, while erasing materials that are irrelevant. Here, the notion of semantic paragraph is introduced. Semantic paragraph is a kind of language unit between text and natural paragraph. In English writing, in most cases, one natural paragraph conveys one sub-point, thus corresponding to one semantic paragraph.

Through endeavors of Lindly Murray (1808) and Joseph August (1862), Alexander Bain finally put forward the standard pattern of English paragraphs in “English Composition and Rhetoric” in 1866. In the book, he treated the development of paragraphs as a kind of deductive system. Paragraphs are developed through a logically ordered sequence of statements, with one controlling idea represented by a topic sentence put at the beginning of paragraphs. He further raised six principles in separating paragraphs: explicit reference, parallel structure, topic sentence, consecutive arrangement, global unity, and subordination. (Cai Jigang, 2003)

Due to the negative influence from the rhetorical pattern of Chinese on paragraph partition, many ESL students in China “have a habit of separating the topic and conclusion into separate paragraphs” (Mao Ronggui, 1997), in an effort to highlight the conclusion, which is differing greatly from the English way that the paragraph does not end until everything that the writer has to say about the topic sentence has been said, and only change the paragraph when introducing a new idea.

3.3 Non-innovation vs. innovation in modeling

A variety of studies offer the insight that Chinese writers are more likely to comply with conventional writing rules than are Western writers (Matalene 1985). For instance, some researchers believe that Chinese traditional examination system is responsible for this rhetorical feature (Bloom 1981; Clyne 1994; Kaplan 1966; Liu 1990). Tracing back to the Sui dynasty (607 AD), the traditional Chinese examination system has exerted a significant impact on the Chinese language (Miyazaki 1963). Through examining the civic service examination of imperial China, Miyazaki stated that this examination emphasized a person's compliance and loyalty to the sovereignty, since passing this examination means to step into the upper society. Since the main purpose of this exam is to select officials for monarchy, it consisted of writing an essay with extremely rigid rules in order to show obedience (Levenson 1968). The eight-legged essay, requiring fixed Confucian content and a rigidly

prescriptive structure, was employed and developed as a highly valued traditional genre for this civic service exam (Kaplan 1966). Kaplan argued that the eight-legged conventional form has exerted a profound influence on Chinese rhetoric, which follows the pattern of beginning transition turn synthesis (Liu 1990). This new model is equally rigid, which writers tend to focus on without innovation just as they once did. In other words, Liu claimed that the non-innovative writing model continues unabated.

Philosophically, Oliver (1971) stated that this rhetorical feature comes from the principle of loyalty and obedience emphasized in Confucianism, which highlights the absolute obedience to and total respect for authority and seniority. Another critical factor that leads to this non-innovation rhetorical feature for Chinese writers is the principle of Chinese social decency in Chinese social relationship (Graham & Lam 2003). In view of Graham and Lamps description, social decency means to keep to the conduct and speech of a series of standards that are determined by various cultural contexts. By analyzing Chinese negotiation, Graham and Lam (2003) claimed that westerners are frequently confused why sometimes Chinese behave so formally even in casual circumstances. As a matter of fact, acting formally caters to Chinese social decency because formality is an indicator of a person's social status. As a result, writing can be seen as a form of exercising a certain social function. Consequently, Chinese written discourse normally follows the preset forms without much innovation.

3.4 “Writer-Responsible” vs “Reader-Responsible” rhetoric

Hinds (1987) categorizes the rhetoric of various cultures into two patterns-writer versus reader responsibility, according to the degree of the writer's duty to explicitly provide explanations of propositions, as opposed to the degree to which the reader is required to make inferential bridges between propositions and deduce meaning from a text. Based on these criteria, he analyzed English as belonging to the writer-responsible pattern, Japanese as belonging to the reader-responsible pattern, and Chinese as being in transition from the reader-to-writer- responsible pattern.

In English writing, the requirement of clear thesis statement, the inevitable topic sentence in each paragraph, the logical arrangement of propositions, is kept strictly to ensure readers to easily understand and follow the text. "The desire to write or to speak clearly is an integral and historically long standing part of English culture." (Scollon, 2002) The writer is expected to know the characteristics of his/her audience before s/he begins to write, and it is the writer's responsibility to guide his/her audience to an understanding of the written texts. The reader needs to be convinced of the validity of the writer's position and that the aim is put more on the writer to explicitly provide explanations of propositions.

Comparatively, in Chinese rhetoric, indirect communication is preferred and extreme stances are avoided, in an effort to keep social relationship in harmony and to save each other's face. "To be indirect in both spoken and written discourse, to expect the audience to infer meanings rather than to have them spelled out is a defining characteristic of Chinese rhetoric." (Matalene, 1985) It is common in Chinese writing to hold the intention of the writer, and to delay it until the end of the essay. This requires more reader involvement by evoking communal knowledge between reader and writer. And it is the shared knowledge that controls the interpretation of the essay. It is the duty of the reader to understand what the writer has intended, to be able to read between the lines, not the duty of the writer to communicate his ideas in a clear and direct way.

4 The Impacts of Rhetorical Differences on ESL Writing

The impacts of the aforementioned rhetorical differences on ESL writing can be seen in some Chinese ESL learners. Some studies have examined the impact of indirect and circular organization in Chinese students' ESL writing. For example, Fagan and Cheong's (1987) analysis of 60 English compositions written by Chinese ESL ninth graders in Singapore showed that 50.9% of students still employed the traditional Chinese four-part model of qi-cheng-zhuan-he, an obvious transfer of the indirect organization from Chinese to English writing. Through examining a Chinese writing class in Taiwan, Chou (1989) claimed that qi-cheng-zhuan-he was still being taught in Taiwanese schools. The students had two options while writing an essay: 1) Qi conceals the main thesis through a sub-theme, Cheng develops the sub-theme. Zhuan introduces the main theme, and he concludes; or 2) Qi introduces the main theme, Cheng develops the main theme, Zhuan provides an anecdotal example, and he concludes. In contrast, the standard three-step pattern in English is: 1) introducing the main theme; 2) developing the main thesis; and 3) concluding (Kaplan 1966).

Furthermore, Matalene's (1985) analysis of English essays written by Chinese ESL students revealed many awkward narration and unrelated statements before the arguments. Also, these English compositions tended to refer to historical philosophies and rely on customs and authorities, rather than

express the writers' own viewpoints freely and directly. Matalene further stated that factual sentences occurred in these ESL essays more often than in native English writing, and indicated that this rhetorical characteristic should be identified by ESL writing teachers and appropriate teaching syllabus should be adopted to address this issue.

Having discussed the impacts of rhetorical differences on ESL writing, it seems that rhetorical differences are significantly affected by writers' cultural backgrounds. Even so, one cannot deny that CR theory still has limitations. For instance, because essays analyzed are written by students in their developmental stages, with the development of students' L2 proficiency, rhetorical structures would change (Noor 2001). Thus, CR theory needs to take into account ESL learners' writing development as well.

5 Pedagogical Implications of CR Theory

Many researchers indicate that the most advantages of CR theory are to help ESL teachers with teaching ESL writing and to provide writing guidance for ESL students, which informs ESL writing learners in terms of conceptual learning, paying attention to discourse level, and Kirkpatrick's (1997) Seven Principles (Chen & Sanchez 2001; Kirkpatrick 1997; Kaplan 2005). Through investigating how cultural thinking and discourse organizational patterns influence Chinese ESL learners' writing skills, Gonzalez et al. (2001) proposed that an important implication for ESL learners is to achieve conceptual learning, which means learning how native speakers think and how to use social and cultural conventions in specific contexts, i.e. learning target language thought patterns and its pragmatics, such as "idiomatic expressions, adaptation to audience, and content knowledge domain" (Gonzalez et al. 2001). Gonzalez et al. further stated that conceptual learning will lead students to become bi-cognitive and bicultural, and ultimately become a confident bilingual through transcending the semantic and pragmatic knowledge in syntactic and grammatical learning.

Shen's (1989) account reveals that bicultural conceptual learning is instrumental to target language learning and writing, which suggests that conceptual learning should be included in ESL teaching curricula.

Kirkpatrick (1997) presented seven principles about pedagogic CR theory: a) because rhetorical features of a language can only be drawn out through examining authentic essays, L2 learners should be exposed to large quantities of L2 materials to understand L2 rhetorical structures; b) there must be stylistic symmetries in two examined essays, in terms of the same genre; c) writers should always bear in mind the potential readers; d) it is impossible to find out prescriptive manuals for learning L2 writing; e) models are important while learning L2 rhetorical patterns; f) practice makes perfect; and g) CR theory is evolving over time. Kirkpatrick's seven principles provide useful principles for teaching ESL writing, and ESL teachers can adopt them critically according to the teaching environment.

Furthermore, in Kaplan's (2005) latest work on CR theory, he pointed out that the most value of CR theory lies in helping to create an environment which takes into consideration not only sentence structure but also structural differences in discourse across languages. That is, CR theory turns the teachers' focus in teaching from the sentence level to the discourse level. Also, Kaplan claims that rhetorical patterns and texts may differ widely across cultures, and ESL writing needs to focus more on influences of cross-cultural knowledge.

With the intent of facilitating "reading and writing in English, creative use of the second language, and the ability to express one's ideas in text in the second language" (Kaplan, 2001), contrastive rhetoric studies potentially have a great deal to offer ESL writing teachers in theory, as it describes culturally based schemas at the paragraph level in written discourse. According to Ulla Connor (1996), "Contrastive rhetoric is an area of research in second language acquisition that identifies problems in composition encountered by second language writers and, by referring to the rhetorical strategies of the first language, attempts to explain them." At this point, however, the immediate practical use of the findings of contrastive rhetoric into ESL classroom is not as clear as it once thought to be due to its complex nature. In a sense, this change can be positive, as it becomes much less likely to put the hypothesis into use prescriptively in the classroom. Contrasting rhetorical patterns with the aim of changing the behavior of users who are not native speakers is a form of behaviorism which is no longer acceptable in linguistic research or language education. (Kachru, Y. 1997)

Anyway, contrastive rhetoric is the first serious attempt by applied linguistics in the United States to explain second language writing. Before, writing was neglected as an area of study because of the emphasis on teaching spoken language during the dominance of audio-lingual methodology. The most

obvious application of the findings of contrastive rhetoric is directly related to the power of raising cultural awareness among ESL teachers and students (Raimes, 1991; Leki, 1991). Examining the rhetorical practices of a culture other than our own can make us more aware of our own rhetorical value system and can provide us with a clearer understanding of the culture we study. As a matter of fact, not a few of ESL teachers take it for granted that logic is universal and it never occurs to them to consider the differences and similarities of two linguistic systems. So they merely ask their students to adopt linear rhetorical patterns mechanically in writing English essays. They will “probably simply more or less impose typical English forms on all nonnative speakers, regardless of their L1, in much the same way English grammar is imposed” (Leki, 1991). As for students, the findings of contrastive rhetoric can often produce sudden enlightenment, as they become conscious of the implicit assumptions behind the way they construct their essays and behind the way English does. They will clear off their previously mistaken ideas about writing and will no longer view themselves as lack of talents for efficient writers and build up their self-confidence again, once they realize that their trouble in English writing does not result from individual inadequacies, but from different rhetorical traditions.

Furthermore, the exploration of rhetorical contrasts across cultures may also help us to avoid uncritically adopting writing techniques from native language into second language contexts, since writing is a process of negotiation between self-expression and social norms. Away from a particular cultural and rhetorical context, the so-called elegant writing can find no reality. In short, through the study of contrastive rhetoric, we can better understand the limits as well as the virtues of our rhetorical traditions.

6 Conclusion

As contrastive rhetoric directly addresses the problem area in which learners’ knowledge of L1 rhetoric norms interferes with the acquisition of L2, the study of CR can shed light on the improvement of teaching English writing. Reader expectations, which are internalized as patterns of discourse, are the primary reason for cross-cultural differences in writing styles. English teachers should help English major students enhance their awareness about these differences and the very reasons behind them. Only in this way will the students gradually form the habit of applying culture-embedded textual patterns to their English writings consciously and then subconsciously or even unconsciously.

Abstract: In college students' career planning teaching, ideological and moral quality education plays an important role that cannot be ignored, and is directly related to their professional ethics and thoughts and behavior. This paper, combining with practical situation, analyzes the deviation of ideological cognition existing in college students' career planning, and on this basis, proposes pertinence solving solutions, in order to provide colleagues some useful suggestions and draw more attention on ideological and moral quality education in college students' career planning.

Key words: College students; Career planning; Ideological and moral quality; Education

1 Introduction

As in 2008 the Ministry of Education clearly put forward the requirement that colleges and universities should give more guidance in college students' career planning and employment, career planning series courses get the attention of major colleges and universities. Especially in the "CPC Central Committee and State Council Suggestion on Further Strengthening and Improving Ideological and Political Education" (the 16th document released by CPC Central Committee in 2004), it is clearly stated that "ideological and political education should be merged into all aspects of college students' professional learning and infiltrate into all aspects of teaching, research and social service", which fully demonstrates the importance of ideological and moral quality education.

Scholars have also been actively explored merging the ideological and moral education into college students' career planning teaching. Chen Chunyi and Gao Peijun hold that the relationship of college students' ideological and political education and career planning manifests at consistency in educational objectives, staggered feature in educational content and complementarities in educational role (Chen Chunyi, Gao Peijun, 2010). Qu Shanxiao thinks that the ideological and political education should be carried out throughout the college period, with pertinence ideological and political education according to the different characteristics of freshman stage, professional learning stage and graduation stage (Qu Shanxiao, 2010). College students' subject consciousness enhances, their needs and values increasingly diverse, and they are more concerned about their own growth and future development. At the same time, problems of lacking awareness of career planning, weak professional ability and vagueness of the objective also widely exist among college students.

Therefore, this phenomenon indicates that in China there is a certain gap between college students' professional ability and social development needs currently, and professionalism and occupation principle need to be urgently improved and enhanced. College students' career is inseparable from the edification of ideological and political education, which is the moral foundation of career development of the college students and the guarantee and force of college students' sustainable occupational development (Du Bin, Gao Shutao, 2015). Ideological and political education is the bridge for college students to achieve all-round development of morality, intelligence, physique, aesthetic ability, and is the necessary choice for college students to noble moral virtue and to achieve self-value (Yi Yumei, 2013).

In China, the ideological and political education has not guided college students' career planning for a long time. Many theories about educating college students' career planning are still being established and perfected. The educational content of ideological and political education is subject to various factors, lacking pertinence for college students' career planning. In career planning courses, deviation of ideological cognition still exists widely among college students.

2 Deviation of Ideological Cognition in College Students' Career Planning

We collected data from the graduates the Wuhan University of Technology in 2014, the

* Supported by National Social Science Fund Project Youth (Grant No.13CKS046) Study on Effectiveness of New-generation College Students' Ideological and Political Education from the Perspective of Career Planning

questionnaires were distributed to 2500 employees. Among them, 1950 (78 percent) responded to the survey, and 73.03 percent were male, 26.97 percent were female. The data shows that deviation of ideological cognition still exists widely among college students in career planning courses.

2.1 College students' lacking a clear understanding of career planning

The prevalent priority issue is that most college students do not really know the meaning of career planning. Although many students aspire to their own future career, they just stay at the level of longing, and do not own it as motivation to study and plan their own learning and practice in college, without any preparation for their ideal career. Since they do not form clear career goal, they tend to feel confused and overwhelmed when they graduate, and cannot find a job they really want. Table 1 is the Person-Post Matching data from the graduates of Wuhan University of Technology in 2014. College students' lacking a clear understanding of career planning leads to their blindness in the process of selecting and obtaining employment.

Table 1 Person-Post Matching Data from the Graduates of WHUT in 2014

	Strongly Match	Match	Neutral	Mismatch	Strongly mismatch
Professional Values	12.50%	43.55%	27.83%	12.19%	3.93%
Professional Interest	15.72%	41.12%	28.69%	9.75%	4.72%
Professional Personality	15.09%	44.58%	28.38%	9.43%	2.52%
Professional Ability	14.70%	47.17%	28.46%	7.31%	2.36%

2.2 College students' inaccurate judgment of professional quality

An excellent university graduate, in addition to having a professional knowledge structure and strong practical capability, should also have a sound personality, healthy body and mind, and some humanities accomplishment. However, in fact, even though many students have "good" test scores in subjects, they are weak in terms of professional ethics, psychological quality, teamwork spirit and practical ability. From table 1, a common problem is that college students cannot accurately judge their own professional ability, thus positioning their career ideally. College students judge inaccurately their own professional quality, resulting in the deviation. The wide gap between ideal and reality leads to a sense of loss and frustration among college students. The occurring of professional judgment error is mainly due to students' lack of ability and unrealistic expectations, and colleges' lack of career education.

2.3 College students' standards of professional values tending to be pragmatic

The fact that today's society is in a transitional period and market-oriented economic reform continues to develop directly affects the professional values of college students, which have also undergone some changes. College students begin to pay attention to personal values, wages and benefits as well as treatment of work unit, and their career expectations tend to be idealistic, unrealistic and overstating. In career choice, college students' standards of professional values tend to be pragmatic, putting more emphasis on the economic value, while ignoring the ideal value of the profession.

3 Ideological and Political Education Approaches Based on College Students' Career Planning

3.1 Guidance of ideological and political education

In college students' career planning and employment guidance education, with ideological and political education as guidance, students' inherent potential of focus on improving their ideological and moral qualities can be aroused. Due to the strong pertinence in career planning, college students can learn about the employment situation in the whole society, the industries and the careers. After this, they determine their future career goals through self-assessment, and then plan their lives. In the process of career planning, career awareness of college students will be further strengthened, career aspirations further clarified, and professional quality further improved, providing a strong impetus for their growth and development. Therefore, in college students' career planning and employment guidance education, colleges and universities should regard ideological and political education as guidance, enable students to acquire a proper understanding of their interests, abilities, attitude, personality, ability, limitations and other personality characteristics through college students' career design, self-management and self-awareness, strengthen the college students' understanding and awareness of career planning and personal development, and ultimately inspire and mobilize college students' inherent power of conscious

development and active learning, so as to fundamentally improve the professional quality of college students.

3.2 Comprehensive and systematic integration of the ideological and political education content

In college students' career planning and employment guidance education, the content of ideological and political education should be comprehensively and systematically integrated into teaching. Since college students' career planning education is a gradual process with laws, the laws of ideological and political education must be correctly grasped. For example, in the first year of college, professional consciousness cultivation and talent education should be conducted, to make students understand the importance of their own career planning and help them develop career plans for realizing their career aspirations. In the sophomore year, students' successful awareness of career should be consolidated to stimulate students' interest in their own professional and develop their professionalism. In the junior year, focus is put on education of college students' professional knowledge and professional ethics, and exercise of students' various occupational abilities, to improve students' overall capacity of social adaptation. In the senior year, there should be guidance of psychological test, tips, policy and other aspects, and pre-job skills training related to their majors, conducting pre-employment training and focusing on individualized instruction. Thus, the ideological and political education can play a great incentive, coordinating and guiding role, making educational content more in line with educational objectives.

3.3 Use of various educational means

In college students' career planning and employment guidance education, means of education should be diversified, and form of college students' ideological and political education enriched. In colleges and universities' traditional ideological and political education, teaching is mainly conducted in a systematic, conscious and organized way, and classroom becomes the main site and the main channel for students to accept teachers' ideological and political education. However, the main feature of career planning education is focusing on personalization, with students as educational body. Therefore, in the ideological and moral qualities education, diverse educational means should be used, for example, combining theoretical education and practical education, focusing on complementarities of classroom instruction and after-school guidance, and combining classroom teaching and network interaction. Through rich forms of education, the ideological and moral qualities of students can ultimately be improved. In addition, colleges and universities should promote the practice of educational theory and strengthen the practical aspects, for example, establishing employment and practice base and providing the opportunity of visit or internship in companies during summer vacation. By receiving active guidance and further exploring vocational society, college students can truly understand the needs of society in the actual work environment and have a clear understanding of their capabilities and their development, and form the correct employment outlook, career outlook and values.

4 Conclusion

The diverse form of ideological and political education can create optimized ideological platform for career planning course and inject fresh vitality to career planning education, to help students achieve double harvest in thought and career.

Ideological and moral qualities can provide college students with scientific value orientation of occupational selection and provide spiritual protection for further improvement of the psychological quality, so in college students' career planning and employment guidance education, ideological and moral qualities education has extremely important theoretical and practical significance. We should combine problems existing in college students' vocational ideological and moral qualities, further explore the ideological and political education, and ultimately promote development of career and employment guidance education, to improve students' overall professional level.

Abstract: Netnews post-bumping is beloved by netizens because of its openness, convenience and anonymity. By Netnews post-bumping, netizens can not only voice their opinions about news events but also express their demands, which makes the internet become a staging grounds for online public opinion and public opinion. In virtual cyberspace, due to the anonymity of commenter's identity, their behaviors are unhindered by "acquaintances" in the real world, so they tend to do whatever as they wish. By gathering firsthand data of Netnews post-bumping, with concrete data in detail, this paper is going to analyze hot topics involving in Netnews post-bumping as well as the characteristics of the main groups, who have anomic behaviors in comments. And then coupled with current social situation and cognitive psychology, reasons leading to moral deviation will be analyzed with the method of content analysis.

Key words: Online comments; Online morality; Online behavior; Moral deviation; Group polarization

1 Introduction

With the development of internet, network has infiltrated into every aspect of the social life. According to the 34th Statistical Report on Internet Development in China released by CNNIC in July, 2014, as it unfolded, up to the 30th of June, of all the netizens, 632 million used broadband and 527 million used mobile phones to access the Internet, and the popularization rate of the internet has reached 49.6%^[1]. Psychological and ethical issues shown by people in cyber space have already become an important topic under research for sociologist both at home and abroad. Literature review^[2-3] have discussed issues, such as ethical subject, network behavior regulation, internet privacy and rights online from the angle of philosophy and ethics, aiming at establishing a viable network ethical norm. Literature review^[4] has studied the values of public opinion in mass incidents online. Literature review^[5] has explored identity cognition in cyberspace from the perspective of anonymity, in which both advantages and disadvantages that anonymity brings to the cyber space has been analyzed. Literature review^[6] combed the research status of network morality both at home and abroad in recent years. However, the study of cyberspace are restricted to the appearance of network behavior, ignoring of the crowd structure and psychological behavior behind the network behavior.

2 Analysis of Hotspot in Netnews Bump-posting

Online comments refer to opinions given by netizens based on news facts or very serious social problems and events. In the network society, by using online comments, netizens can express their opinions freely. Comments include all the posts and reply in We Chat, micro blog and forum, as well as all the left comments on news reports. But this paper will mainly discuss some left comments, posts and reply on news reports. Internet aligns well with the development tendency of multi-cultural and value diversity objectively, so it is popular to internet users of all ages and then rebounds vigorously.

1) Incidents regarding to officials

When the involved subjects in incidents are government agencies or administrative institutions, such as government officials, civil servants, the police etc., it is particularly easy for netizens to pick them up. Generally speaking, once incidents concerning to officials, government or civil servants occur, netizens tend to make negative judgments, which is a typical feature of online public opinion. Official corruption, officials' behavior, lifestyle and ever wearing can be the center of attention among Internet users. If officials are involved in news, no matter it is positive or negative, comments given by internet users always turn out to be negative. on 8th February 2015, an article titled A college student in Hunan province having been beat to death by a "guan er dai"---Police said the murder had been arrested published in Xinhua.com on 8th February 2015. 271038 have participated in this news and 5565 pieces of comments have been gathered. Because subjects involved in this news are "guan er dai" and officials, it has received widespread attention. But almost all the comments are directed at the view that the police has shielded "guan er dai", questioning about police's impartiality in law enforcement, and the police has even been attacked with abusive comments. In those incidents regarding to officials, without objective analysis and no careful reading, some internet users just belittle and irony towards their

personality according to the headline to express their anger and question and to show their dissatisfaction towards both the government and the official freely.

2) Livelihood issues

Another type of events that wins a large number of online comments are grassroots and major social events which are relevant to most people. The main reason is that those events are bound up with people's life, so they can resonate with both sides in emotion easily. And common netizens can also find a sense of identification and a sense of existence more easily in those events. The news whose title is IOUs of the New Fourth Army are identified as imitation Family members say they reserve the rights to be identified again published on 23rd January 2015, has attracted 84581 internet users and 6933 pieces of comments in total. One of those comments---The authentic is fake. The false is fake Unwilling to be cashed. So what? Has won an approval of 15018; another piece of comment---No compensation for the lost money in bank. Don't count on it, if it is true, so what? Has won an approval of 13257, just few objective comments included. The fact is that no matter the IOUs are fake or not, netizens' subjective assertion in the comment is that it is believed to be fake without objective basis, which fully testifies that the public are doubtful to the government and the experts and that the credibility of the government and the experts is inadequate.

3) Incidents regarding to the rich

Besides, the news regarding to the rich and the high-profile celebrities have attracted the most public attention as well. And most of comments given by netizens regarding to the mentioned subjects are negative. On 8th February 2015, the news titled Wangfeng proposed a marriage with a 9 carat diamond ring Zhang zhiyi moved to tears and friends and relatives wishing the very best of the marriage was published on Sohu.com. 116765 has participated in this news and 11110 pieces of comments have been gathered. The comment---As for them, where they is divorce, there is hurt has won an approval of 20252; and another comment---if your think they will get a divorce, add in, has won a posted threads of 17573. In all, 90 percent of the comments online are mainly either ridiculous or abusive in words. In fact, this wedding news should have been blessed. Due to the subjects involved in the news are celebrities, the comments turns out to be full of scolds sound.

In conclusion, in all the online comments, netizens show an objective and negative attitude towards incidents regarding to officials, the rich and the high-profile, and they show a wait-and-see & doubtful attitude towards positive information regarding to those groups. As for the negative information, the basic ecology on the internet is that internet users stand on the opposite side against the rich and the officials. But when it comes to the social events considering to every ordinary people, most of the comments are neutral and rational.

3 Features of Netnews Post-bumping

The analysis of Netnews post-bumping found that the features of which can be summarized as follows:

Diversification. The network society is virtual, anonymous, borderless etc. and instantaneous interactions can be realized, which can make online comments diversified and non-mainstream in value delivery and interest demands. The diversification of social needs can lead to the diversification of value views. When people are in an open, free and equal discourse space, the diversification of value views can be reflected over different words and sounds. Opinions cognition and are varied from person to person on the same problem. Under this circumstance, unreasonable behaviors such as: abuse, conflict, defamation and privacy disclosure will develop easily.

Randomness. Network can break the limitations of space and time. While big news events become the focus on the internet, they can spread quickly to be public hotspots. Network is not only a magnifying glass, but also a loudspeaker to the public opinion. In the virtual world, without face-to-face community supervision, netizens, whose self-control ability are poor, may be prone to be unpredictable and random in words and behaviors on the internet.

Discrepancy. Post-bumping is one of the most active and acute part of public sentiment. Via post-bumping, forum, blog or tweet, internet users have a greater say to express their opinion and sentiment freely. Due to limited value for law and ethical values in the cyber space, internet users who lack self-discipline, may comment some irresponsible remarks. Under the influence of public opinion, some tiny things usually turn out to be "tornadoes", and then they will have a huge impact on their cognition, leading to cognitive bias.

Anonymousness. The internet is a fictitious world. Since the identity of netizens is concealed, the

rules limiting the netizens and effective supervision are inadequate, internet can be a space where internet users vent their emotions naturally. Lacking of the pressure in the presence of others, internet commenter can express their most realistic idea in the anonymous space freely. And under the network environment of not to name, the separation between the knowing and doing of moral subject can be worse. Since anonymous or pseudonymous comment on the internet are legal, and netizens needn't be responsible for their verbal gaffe, driving netizens' deeds and words on the internet to be irrational or violent.

4 Reasons Leading to Moral Deviation in Bump-Posting

4.1 Analysis of main internet users with moral deviation

According to the 34th Statistical Report on Internet Development in China released by CNNIC in July, 2014. Characteristics of internet users in China are young and of low degree, among which netizens who are in his tens or twenties account for the largest proportion, with a percentage of 55.2%. And the degree of most internet users is not high. Those with a college degree or below account for 79.3% of all the internet users. Based on the analysis of age structure and educated structure of those who have moral deviation, the largest group in internet users are young men in cities and towns who have a bunch of time searching on the internet. Those internet users are young people with low degree, limited job prospect, low income and weak economic foundation. So they tend to hate the society and conduct internet abuse or attack. At the same time, since they are poor in legal system consciousness and self-discipline consciousness, and they have a very low position in the realistic society and a poor social identity, they enjoy looking for existence in the virtual world to seek stimulation, aimed at expressing themselves.

In a virtual network environment, the ability of self-control formed based on inside guidelines and social norm will be greatly weakened or no more exist, which will in turn make their network behaviors out of control due to disinhibition. Moreover, those internet users can get a fair and free rights of speech, unreachable sense of equality and freedom via the internet^[7].

4.2 Analysis of reasons leading to moral deviation

1) Psychological condition in convergence of interest

All social phenomena can be probed from the angle of interest, and the results can always be more close to its essence^[8]. Since the network society is universal, the standard of value in network society is diversified, and the social groups involved in network are different, groups coming from various hierarchies hope to set up their own standard of value according to their interests, and desire to be accepted by others. So post-bumping is also an interest game developed by different groups so as to maintain their own standard of value.

When the news events happen, people of different hierarchies judge the relevance between themselves and the news object, resonance value condition and emotion resonance according to the roles they plays in the news object, and then they can express their position and opinion directly or indirectly. Generally speaking, those positions and opinions begin in the best of their interest, which are all effected and restricted by many inner drives. If the interest of news object is in line with the interest of main internet users, they may tend to make positive evaluation so as to maximize their own interests; if the interest of news object can be harmful or of potential harm to the interest of main internet users, the principle body of commenter will quickly form the same or similar ideology to maintain their own interest.

2) Psychological condition to vent dissatisfaction and emotion

Freud says, "people have a tendency to outbound their gathering strength, if this desire can be satisfied, they will be filled with a kind of pleasure, or they will be depressed". Along with the development of construction economy, together with income gap narrowed, social wealth gap widened, difficulties encountered in securing employment and buying a house and the missing of social justice, considerable public go into panic. As a result, their negative emotions can be easily ignited. When the object of news event aligns well with the anxiety of the public, it could be a chance for the public to vent their dissatisfaction and emotion. At that time, all their comments aiming at expressing their negative emotion have nothing to do with the event itself actually. Online comments driven by such kind of emotion are filled with words which do not conform to the truth, or are irresponsible, one-sided and extreme, with strong individualism.

Public opinions concerning relevant officials are negative. And the content involving in online comments are also mainly sarcastic, with a scurrilous attack upon the officials. Being tagged and

stigmatized by the public opinion, all the comments regarding to officials are neither negative nor abusive. And those groups who called for rational look at these issues are tagged with a poster of Mouthpiece of the authority, having a place which is opposite to the public opinion.

4.3 The network group polarization phenomenon.

While giving online comments, internet users can easily be influenced by group polarization, which refer to the phenomenon that a sizeable network group who express the words or conduct the behaviors which is deviating from the things itself^[9]. Events concerning to the great changes of society structure, conflicts between different groups in interest and complication of social contradiction are easy to trigger internet users' attention and discussion. If the group consistency degree is high, the network group polarization phenomenon may happens easily. When a certain aspect of the event touches the tripping point of the social emotion, it can trigger internet users' attention and discussion. And at that time, the emotions gathered by internet users are also negative. For example, all the critical comments, and even abusive attacks given by internet users towards incidents regarding to the rich or the officials due to the psychology of hating the officials or the rich are can be called the network group polarization phenomenon. Just the same as the dilemma in collective action, internet users get together as a particular group, some irrational situations can occur as well. During the transmission of the online public opinion, discussions upon social hotspots occur by means of group discussions, such as forums. These ways of discussion are easy to result in groups' emotionality and extreme since the internet is virtual and anonymous. The polarization phenomena triggering by bad online comments is a primary cause of network moral deviation.

5 Countermeasures

Firstly, reconstruct the media by starting from social responsibility consciousness. Secondly, advocate Internet users for conducting civilized criticism and reasonable comment, and social media for shouldering more social responsibility. In real life, without any in-depth study and research, some media reporters reported with a strong subjective tendency, for example, by using some attractive titles to increase traffic. At the same time, some injustice and false report may be reprinted in the network media, which can make Internet users have cognitive bias, producing malicious influence on social values, and even leading to lost and confusion. The mass media can guide public opinion in society. So in order to provide the public with actual, objective and injustice report, media should conduct independently of any interest group, strictly abide to the news principia, and uphold the requisite of journalistic professionalism. In this way, it can guide the public opinion to develop in a rational direction. That is to say, it is very important to strengthen media's social responsibility consciousness.

According to the discusses concerning to the main Internet users who have moral deviation above, most Internet users' qualifications are not high. Those Internet users are only educated in primary and secondary education stages—Compulsory Education in China. But at present, due to the current exam system, Compulsory Education in China has been under influence. For example, little attention was paid to moral education, so graduates of junior secondary schools may be serious in moral deviation, especially those who comes from rural areas. Thus the moral and psychology education in the Nine-Year Compulsory Education should be strengthened. Value the individual and cultivate the Internet users, as a basic moral quality of a netizen, can help cultivate the teenagers to form a moral character of respect others, themselves and the facts. After this moral rule was transformed into an individual's internal moral demand, he or she can cultivate a better moral habit and moral belief.

Rule and use the net by law, network behaviors should be taken in legal track. As for news and information, information symmetry should be stressed. On one hand, netizens' freedom of speech can be ensured; on the other hand, uncivilized words and illegal network behaviors can be prevented. Define clear the responsibilities, duty and rights of online marks by law can not only guarantee Internet users to enjoy legal right of information, participation, expression and supervision, but also to express their opinions civilly, reasonably and responsibly. Furthermore, network technology should be strived for novelty, for example, to identify harmful information by technologies, such as keyword recognition, text mining, etc. By this way, harmful information can be identified and unhealthy information can be shielded, so abusive and aggress comments can be hidden so as to purify the network environment.

6 Conclusion

Netnews post-bumping, is the rights of speech shared by every Internet users. But whether those online comments are civilized or not, matters to the socialist construction of political civilization,

material progress and spiritual civilization, as well as the healthy growth of juveniles. The value orientation of post-bumping, which plays an ignorant part in promoting and building a harmonious society can be the guide to the value Orientation of the whole community directly or indirectly. Both the government agencies, news media and all the Internet users should work together to ensure the cyber space develop orderly and healthy. By advocating for civilized criticism and reasonable comment, resisting disgusting network culture and purifying network environment, can not only make the internet to be a ground where Internet users can speak out their opinions freely, but also a key position where the socialist political civilization and spiritual civilization embodies.

The Present Development Conditions and Studies on Countermeasures Concerning College-Graduate Village Officials

Li Chang, Zhang Huaimin

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 253591338@qq.com, 34788192@qq.com)

Abstract: The plan of college-graduate village officials has, to some extent, accelerated and driven the harmonious development of China's society, improvement of village officials' qualifications as well as the construction of new villages. However, in terms of the reality, there still exist some problems in this respect. This paper takes village officials with college degrees in Hubei Province as an example and observes all aspects of them by adopting theoretical studies, field survey, questionnaires, etc. We investigate and analyze the present conditions of such officials. Finally, this paper gives several suggestions to build a sound, long work mechanism and to ensure better implementation this plan.

Key words: College-graduate village official; Countryside; Present conditions; Countermeasure

1 Introduction

With the construction of the socialist new village, governments of all levels have issued some relevant policies to select college graduates to work in rural regions, i.e., college-graduate village officials. As a part of these policies, which is of great significance to develop socialist new village construction, it consolidates CPC's ruling foundation and fosters alternative talents for China and the CPC.

Recently, domestic scholars have done positive researches on the plan of "college-graduate village officials", which mainly evolve the significance, implementation conditions and countermeasures of this plan. In terms of its significance, scholars mainly study on some aspects, such as college graduates' employment, grass-root construction, talent fostering of new villages, team building of cadres, etc. For the effects of this plan, most scholars believe that the implementation of college-graduate village officials is significant to enhance new village construction, to improve talent fostering, to solve graduates' employment, to move forward the integration of urban and rural areas and to boost ruling foundation of the CPC. Some of them also raise some questions, such as the present legal difficulties, motivation and the rule of talent flow. With the implementation and deepening of the plan of village officials with college degree, many institutions and scholars have conducted summaries, surveys and analysis, which are in general positive. Some of them find that the work process of these officials are facing difficulties, thus, it is the key problem to seek for positive guidance, policy support, system guarantee, mechanism creativity and sound development of this plan. They believe that only by seeking out countermeasures of these difficulties that the plan can be guaranteed to proceed positively. Besides, as it is a unique Chinese policy, no oversea literature has been found about this issue.

2 The Development and Achievement of College Student Village Official Policy

2.1 The policy development of college-degree village officials

The college-degree village officials refer to college graduates with associate degrees and/or above of the year or the previous who come to rural regions (including communities) to be the secretary of Party branch in the village, director assistant of the village committee or be in others positions in the Party committee or the village committee, whose job scope is mostly community or village affairs. Since the middle of 1990s, this plan began to carry out and experienced a rapid development with profound accumulation. It is called "Policy of College-degree Village Officials" which encompasses a series of system arrangements and related administration, trainings and appraisals. Policies in different places vary with names like "Plan of One College Graduate for One Village", and some remain the original name.

Since 1995, this policy has a history more than a decade. Based on features in different phases, the policies of college-degree village officials can be divided into 3 phases, namely, the starting phase, the developing phase and the popularizing phase. The period 1995-2001 is the starting phase, which can be dated back to the "Young Talent Project" in Fengxian County, Jiangsu Province in 1995. After this, relevant policies were issued in Hainan Province, Ningbo in Zhejiang Province, Huailai County in Hebei Province. 2002-2005 is the developing phase. With increasing attention on issues of agriculture, villages and farmers as well as graduates' difficulties in employment, policies of college-degree village officials have been generally acknowledged and popularized. From 2006 to the present it is the popularizing

phase. Since the announcement of “Opinions on Guiding College Graduates to Work in Rural Areas” by the central committee, most provinces in China began to stipulate policies related to college-graduate village officials and promotion of these officials. By the end of February, 2008, 28 provinces, cities and autonomous prefectures have launched the plan of college-degree village officials. They come to villages to take a job and the plan has entered a completely new era of development.

2.2 Achievements of college student village official policy

Policies of college-degree village officials impose positive influence and effects on rural regions without any doubts. Village officials with college degrees review the rural regions from a new perspective, exploit business opportunities for profits and transform villages with new ideas and technologies. They gradually change farmers' ideals and life with their own comments and behaviors, which brings wholly new temperament to the villages.

Firstly, optimizing the structure of grass-root officials. At present, among these officials, some negative phenomena exist, such as aged officials, low educational level, weakness in accepting new ideas and objects, outdated thinking pattern with new social trend and requirements by the development of new situations. College-degree village officials are young, knowledgeable, cultured, dynamic, mentally liberal and flexible. They can be trained and fostered to be new rural officials with modern administration ideas and agricultural technologies. Furthermore, they have better comprehensive qualities, legal awareness, which make them able to deal with affairs based on laws and regulations, being proper to advance democratic and legal construction of village-level organizations.

Secondly, promoting the all-way development of rural economy and society. The construction targets of new villages include not only increasing in farmers' income, but also promotion in their spiritual life and living standards. This issue is evolved with economy, society, culture and education, etc. Villages at present need a long-term oriented and scientific planning likewise, as well as cracking of development difficulties. College-degree village officials rejuvenate the work in rural areas with their practical efficiency and pursuit of creativity and changes, who lead villages to grow with more targets under the help of their new knowledge and new thinking patterns.

Thirdly, expanding employment forms and ameliorating employment pressure. Recently, graduates' employment pressure is increasing as the job market is increasingly competitive, being one of the hottest social issues. The policy of college-degree village officials is undoubtedly seeking for new chances for students. Faced with the present fierce employment situation, some college graduates find a number of chances in villages, which as a result start their own business there. That can be regarded as a way to expand job opportunities and relieve the pressure.

3 An Analysis of College-Degree Village Officials Conditions:Hubei Province as an Example

3.1 Survey methods and features of subjects

Table 1 Main Features

Items	Category	Percentage (%)
Sex	Male	60
	Female	40
Age	Under 22	11
	22~24	23
	25-28	41
	Above 28	25
Political status	Member of CPC	52
	League member	38
	People	9
	Democratic Party	1
Education	Postgraduate	5
	Undergraduate	76
	College	19
Years being officer	T≤0.5 year	18
	0.5 year<T≤1.0 year	25
	1.0 year<T≤1.5 year	24
	1.5 year<T≤2.0 year	9
	T≥2.0 year	24

During the promotion of the plan of college-degree village officials, much is under exploration with a number of problems to be solved. We analyze a series of contents of this plan such as its development issues via questionnaires to further understand these officials' current conditions and problems.

This survey emphasizes on quantitative questionnaire. The sampling plan is divided into 4 levels and selects 5 prefectures in Hubei Province, together with 16 urban districts, 10 county-level cities and 12 counties encompassing 126 college-degree village officials with 100 effective feedbacks. From the view of the officials themselves, we survey and understand their present work and their views and consideration of the job. While we will present the research results in a more detailed, direct way.

According to the analysis results, main features of 100 subjects are as follows:

3.2 Problems college-degree village officials are facing

We analyze the main features and strive to understand their routine work, actual difficulties and salaries and benefits. Problems are found as follows:

Figure 1 Problem

3.2.1 Specialty mismatch and a lack of applied skills

From Figure 1 we can see that the specialty mismatch is one of the largest difficulties for college-degree village officials, taking up 28%. That leads to their lack of knowledge in actual work. Most of them majored liberal arts, accounting for 46%, while those with agricultural science degrees only take up 5%. When villagers ask them agricultural questions, they fail to answer, which makes them hard to adapt to grass-root work.

3.2.2 Difficulties in start-up business and fund shortage

It is an important item to encourage college-degree village officials to start their own business locally. However, the implementation of this policy is hard. According to table 2, the most challenging difficulty in grass-root work is fund shortage in developing programs, accounting for 36%. Reasons can be divided into 2 types: 1. stagnant local economy leads to tight financial conditions and loan application there is difficult; 2. the government only focuses on the administration by collage-degree officials. It issues a series of policies; however, when it comes to supporting star-ups, concrete items are hard to be materialized such as funds, venues, etc.

3.2.3 Uncertain role positioning

When college-degree village officials come to rural areas, they are usually brought temporarily by town administration as document administrator and actually do not be in the post. Thus, they will not genuinely integrate into grass-root organization construction in rural areas. Besides, as they lack experience in rural areas, they are interfered by local officials and cannot successfully finish their work. While they often act as the village head or secretary assistant, and they usually meet problems which contradict with their lack of practice. The rural work is trivial, complicated and interrelated. Once such matters are not properly dealt, they will not be recognized by villagers in a short period.

3.2.4 Low salaries and poor recognition

Salaries are material foundation for the policy of college-degree village officials, so officials' satisfaction towards their salaries is an important index to determine whether to continue their terms. Most college-degree village officials use their salaries to pay for food, communication fee and transport each month, with some inevitable social activities, so most of them have nothing left in the end of each month. Sometimes they even have to borrow money from their families and friends to support their life. Therefore many college-degree village officials are unsatisfied with their salaries.

Besides, factors like marriage, frequent job transfer and relation with villagers will partly influence

the development of the plan.

4 Countermeasures of Advancing College-Degree Village Officials' Vocational Development

The college-degree village officials offer opportunities for the reconstruction of the relation between China and its society; they are the third party to participate in grass-root and rural administration; and they are an important way of enhancing grass-root organization construction of new-type villages in China. Being a special policy in the transitional period of China, college-degree village officials have great merits in terms of their execution ability. Nevertheless, during the implementation, such a new policy needs constant experience summary and then draws up corresponding countermeasures for problems in the project of college-degree village officials.

4.1 Guarantee of policy legalization and standardization of systems and procedures

Rule of law is China's fundamental guideline of country governing. To complete the policy of college-degree village officials, firstly, it is required to stipulate related laws and regulations as the foundation of the policy. The identity of college-degree village officials should be ensured and the title of "college-degree village officials" should have supporting laws. Such village officials should be allowed to take part in the democratic election of the village committee to be real village administrators. The CPC branch and the Organization Department of counties should further define the job scope and responsibilities of college-degree village officials, as well as their work and job characters. These officials should be allowed to join or listed in the conferences of the village committee and the party branch, as well as the administration and decision-making of village affairs instead of acting as a document administrator in grass-root organizations.

4.2 Guarantee of financial support and increase in compensation and benefits

To have college-degree village officials serve for a long period steadily and well, it is key to improve all compensation and benefits, which directly affect their job satisfaction. Thus, the appraisal of grass-root organization construction should evolve officials' basic salaries, subsidies stipulated by the central government, and social insurance. Improving college-degree village officials' compensation and benefits is beneficiary for college graduates to stabilize in tough environment, which then help them adapt to their job and motivate them to the largest extent.

4.3 Improving the mechanism of selection and appointment of college-degree village officials

It is a key part of implementing the plan of college-degree village officials to choose excellent graduates with knowledge and good moral qualities. To achieve this goal, the authorities should firstly abide by the principle of "fair, justice and public" and select qualified knowledgeable college graduates for rural areas after strict selection procedures. The selection process should be transparent, while the process and result should be posted publicly. Furthermore, combined with local requirements for talents, the authorities should select college graduates in a targeted way to define their future roles in rural work.

4.4 Improving mechanism of employment and contract termination

When the college-degree village officials' contracts are coming to end, it is necessary to properly guide their present or even future career planning. Enterprises should be encouraged to employ college-degree village officials whose contracts have terminated. These should be done to help them work in rural areas without any worries and perform well. Besides, another approach of their career development is to encourage starting their own business, to have such awareness and to improve abilities of starting business. In terms of college-degree village officials' further academic pursuit, I believe they should be supported with some policies to advance academically.

5 Conclusion

The policy of college-degree village officials is an important strategic arrangement by the CPC central committee and this policy is of great significance to grass-root organization construction in new-type villages in China. At present, this project is under continuous development and improvement. Therefore, to select qualified college graduates working in rural regions is of profound and deep strategic significance to foster backup officials for daily administration and the CPC affairs. This survey and analysis impose positive effects on establishing work mechanism of college-degree village officials in Hubei Province, as well as the advancement of college-degree village officials.

The Application of Fuzziology to Translation Quality Assessment and Management*

Mo Yinli

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: moyinli@whut.edu.cn)

Abstract: Translation quality assessment and management (TQAM) is an indispensable part of translation studies, and with the advent of translation activities, translation qualities have always been discussed, evaluated and criticized. By introducing the theory of fuzziology, this paper aims at setting up a fuzziology-based TQAM model, attempts to offer a qualitative and quantitative combined TQAM approach, and intends to prove that the fuzziology-based evaluative approach could avoid over subjectivity and inconsistent criteria in TQAM. After a thorough study, the author concludes that it is feasible to apply fuzziology to TQAM study, and a fuzziology-based TQAM model will make translation assessment and management more objective and comprehensive.

Key words: Fuzziology; Translation quality assessment and management; Model; Parameter

1 Introduction

In an age when communication becomes almost inconceivable without translation, special attention needs to be paid to the quality of translations. TQAM is an indispensable part of translation studies, which comes shoulder by shoulder with translation practice and translation teaching. For years, translation scholars and experts focus on general translation criticism, making some subjective criticism and giving some error analysis.

In 1965, Professor Lotfi A. Zadeh of Berkeley University of California published his paper on Fuzzy Sets, in which he first introduced the concept of a class with unsharp boundaries. It is widely accepted that the publication of Fuzzy Sets marked the birth of a new discipline—fuzziology. Fuzziology is the study about fuzziness in our human life, and it is the product of modern science. When the traditional mathematics can not fulfill its role to solve all the complex problems, and can not give precise description or measurement to things without clear-cut borderlines, fuzziology comes into being.

With the introduction of fuzziology to linguistics, fuzziology is no longer a new term in translation studies. According to fuzzy linguistics, fuzziness is an innate feature of language, which can be easily seen in both Chinese and English. As translation is an activity between two languages, fuzziness becomes an unavoidable problem in translation as well. The discovery of fuzziness in translation provides new approaches to TQAM research.

2 Basic Terms in Fuzziology

2.1 Fuzziness

Fuzziology is the study about fuzziness in our human life. In a broad sense, fuzziness is the opposite of being precise. Everything that cannot be defined precisely and everything that has no clearly described boundaries in space or time are considered to be fuzzy. In a narrow sense, fuzziness primarily relates to the definition of fuzzy sets as proposed by Zadeh (1965), that is, the indeterminate property of belongingness.

2.2 Fuzzy logic

Fuzzy logic is a superset of traditional logic dealing with the concept of partial truth—truth values between completely true and completely false. It was first introduced by Dr. Zadeh in 1965 as a means to model the uncertainty of natural language. This allows for values between 0 and 1, and the concept of “maybe.” Specifically, it allows partial membership in a set.

2.3 Fuzzy set

Before elaborating on fuzzy set, a brief introduction to the classical set theory could be necessary and helpful. In the classical set theory, set is defined as the collection of homogenous elements. Anything that belongs to the set is called an element. The classical set theory is based upon the classical logic system. For example, there is an arbitrary element x and a set A , the relationship between x and A could only be: x belongs to set A or x does not belong to A , which can be expressed in the mathematical

* This paper is supported by funds for Independent Innovation of Wuhan University of Technology.

formula as:

$$f_A(x) = \begin{cases} 1, & x \in A \\ 0, & x \notin A \end{cases} \tag{1}$$

From the above formula, we can see that the classical set theory is a binary, absolute prescription on the belongingness of explicit elements. It imposes rigid membership requirements upon the objects within the set. An object is either completely in the set, or it is not in the set at all.

Fuzzy set is an extension of the classical set theory used in fuzzy logic, the introduction of which is to describe elements with indefinite belongingness. A fuzzy set is characterized by a membership-degree function, which maps the members of the Universe into the unit interval [0, 1]. The value 0 means that the member is not included in the given set, 1 describes a fully included member. The values between 0 and 1 characterize fuzzy members. For any fuzzy set A, μ_A represents the membership function, and $\mu_{A(x)}$ indicates the degree of membership that x belongs to set A and is, usually, expressed as a number between 0 and 1:

$$\mu_A(x): X \rightarrow [0, 1] \tag{2}$$

For the universe U ($U = \{x_1, x_2, \dots, x_n\}$), A is a fuzzy set in the Universe, μ_i is the degree that x_n belongs to A. According to Zadeh, fuzzy set A can be expressed as:

$$A = \frac{\mu_1}{x_1} + \frac{\mu_2}{x_2} + \dots + \frac{\mu_n}{x_n} \tag{3}$$

It is worth mentioning that the right part of the equation does not mean any mathematical calculation, in the fraction $\frac{\mu_i}{x_i}$, the denominator is the element in the Universe, while the numerator refers to the degree of membership that this element belongs to set A. The mark “+” in the equation does not mean fuzzy plus, and it just refers to the concept of a set and means the accumulation of elements.

2.4 Degree of membership (DOM)

Degree of Membership indicates the degree that an element belongs to a set. It serves as the foundation in fuzziology application. If we want to make a quantitative analysis of a fuzzy object, we must first set the DOM, and then give a practical membership function. As discussed above, the elements in a fuzzy set normally do not have an absolute membership; in contrast, the membership changes gradually from total-belongingness to non-belongingness. Therefore, the DOM value of an element in a fuzzy set is usually between 0 and 1. A higher DOM value marks a higher degree that an element belongs to a set.

Tallness is a fuzzy concept, and if we take “Tall Men” as a set, then a man who is 1.5 or 1.6 meters tall is not tall at all, so the degree of this man belonging to the fuzzy set “Tall Men” is 0. A man who is 1.8 or 2 meters is absolutely tall, so the DOM of this man belonging to the fuzzy set “Tall Men” is 1. In order to understand the DOM better, we can set the DOM according to our daily experience and express the membership function in a figure. The membership function can be expressed as:

$$\mu_A(x) = \begin{cases} 0, & x \leq 1.6 \\ (x - 1.6) / 2, & 1.6 \leq x \leq 1.8 \\ 1, & x \geq 1.8 \end{cases} \tag{4}$$

Accordingly, we can draw a figure of the membership function “tall men” and “Short Men respectively:

Figure 1 Membership Function of "Tall Men" $\mu_T(X)$

Whether or not a membership function is practical cannot be decided by a single DOM value, and what counts is that the DOM values should reflect the relative belongingness between the elements and a fuzzy set. Then how to determine the DOM value of an element in a fuzzy set? There are generally two ways: one is to give or fix the DOM values by experts in a particular field; the other is to determine the DOM values through fuzzy statistics, that is, the values are decided by the concentrating tendency shown among common people. DOM is a measurement to the fuzziness of things. The objectivity of fuzziness decides the objectivity of DOM.

2.5 Linguistic variables

The concept of linguistic variables introduced by Zadeh is an alternative approach to modeling human thinking. Information is expressed in terms of fuzzy sets instead of crisp numbers. A linguistic variable is a quintuple $\{x, T(x), X, G, M\}$ where x is the name of the variable, $T(x)$ is the set of linguistic terms (or values), X is the universe of discourse, G is a syntactic (grammatical) rule that generates the linguistic values, and M is a semantic rule which provides meanings for the linguistic values. Linguistic variables are usually adverbs or adjectives used to describe the belonging relations between an element and a fuzzy set, and are frequently listed in a grading linear chain.

3 Fuzziology and Translation

If we want to study the property of translation, we need to know something about the property of language first. Fuzziness, as one of the most arresting and complex features of language, might also be an objective property of translation. The exploration of the property of fuzziness in translation would provide a theoretical basis for the application of fuzziology to TQAM.

3.1 Fuzziness—the innate feature of language

Language is used to describe the objective world. Compared with the infinite objects in the universe, language is relatively limited and finite; moreover, there are lots of objects which cannot be categorized clearly in the world. Therefore, fuzziness is an innate feature of language, and it is ubiquitous in language.

3.2 Fuzziness— an objective property of translation

Translation is an activity between two languages, so the study of translation should go hand in hand with the study of language. According to our conclusion above that fuzziness is the innate feature of language; we can bravely infer that fuzziness is inevitable in the activities of translation.

3.2.1 Fuzziness in the process of translation

Up till now, translation is an activity mainly conducted in human mind; thus, human thinking becomes a main factor in the process of translation. It is widely accepted that human beings have both precise and fuzzy thinking competences. For example, when we calculate a formula "two plus two," we can get the answer "four," and this is the result of precise thinking; and when we figure out the sentence "He is ten times the man you are" means "He is much cleverer than you," we are using fuzzy thinking although there is a precise number "ten times" in the sentence. Whether we notice it or not, we are incessantly using fuzzy thinking in daily life; likewise, translators may consciously or unconsciously use fuzzy thinking when they analyze the information of the source language text (SLT), transfer information from source language (SL) to target language (TL), and reorganize the information. As a result of fuzzy thinking, we can be certain that fuzziness is omnipresent in the process of translation.

3.2.2 Fuzziness in translation criteria

Translation criterion is a tool used to guide translation practice and measure the quality of

translations. Ever since the emergence of translation activities, different translation criteria have been put forward. The changing feature of translation criterion and the complexity of translation activities jointly result in the fuzziness of translation criterion.

4 Translation Quality Assessment and Management

Viewing from the previous studies, TQAM models can be divided into two main types: models with a quantitative dimension, and non-quantitative, textological models. A review on TQAM study in the west and at home will keep us informed of the great achievements in TQAM study and its status quo.

4.1 TQAM study home and abroad

The pioneer in TQAM study was the German translation theorist Katharina Reiss. Her great work *Translation Criticism: the Potentials & Limitations* has long since achieved the status of a pioneer work in the study of translation criticism and also opened a window for the study of TQAM.

Several years after the pioneering work of Reiss, another German scholar, Juliane House, published her PhD dissertation "A Model for Translation Quality Assessment".

In China, translation criticism and assessment have been viewed and practiced as an act of error analysis for quite a long time. Although the inadequacy of this traditional translation criticism is gradually realized by some translation critics and theorists, translation assessment and management, to a large extent, is still spontaneous and impressionistic. In general, the domestic TQAM study lags relatively behind, comparing with the findings of TQAM research in western countries.

4.2 Attempts of applying fuzziology in TQAM

Fuzziology was born in the west, and has been widely used in many different disciplines, but the writer has found no reference of combining fuzziology with TQAM abroad at present. While in China, there are some scholars who have made such attempts.

In 1987, Fan Shouyi made an initiative attempt on applying fuzziology to translation assessment. His article, *Fuzzy Mathematics and Translation Assessment*, published on the Chinese Translators Journal aimed at exploring a quantitative evaluation method, so as to compensate the deficiency in the traditional qualitative evaluation method. In the article, Fan Shouyi took faithfulness as the translation criterion, and set the DOM empirically. Based upon Fan Shouyi's research findings, Mu Lei made a further study on applying fuzzy mathematics to translation assessment and management, in which she enlarged the criterion from "faithfulness" to "faithfulness" "fluency" and "elegancy" and proposed that certain weighting should be given to the three criteria according to the characteristic and requirement of the translation. Mu Lei's research is a further step in this interdisciplinary study and her suggestion of using computer to assess the quality of translation is instructive and prospective.

Obviously, by introducing a new theory and method, Fan Shouyi and Mu Lei's contribution to translation studies is great with regard to TQAM, but their limitation is they didn't further study a detailed and reliable TQAM model based upon fuzziology.

5 The Construction and Application of a Fuzziology-based TQAM Model

The previous study has made a thorough investigation on the relationship between fuzziology and translation. After careful examination, we have found that fuzziness is both the innate feature of language and an objective property of translation. In accordance with the analysis in 3.2, the descriptions about the nature of translation, the criteria of translation and the process of translation all possess fuzzy features; hereby, we should also consider this fuzzy property of translation in assessing and managing the quality of translation.

5.1 The establishment of fuzzy set and fuzzy elements in TQAM

As introduced in 2.3, fuzzy set is an extension of the classical set theory used in fuzzy logic, which is used to describe elements with indefinite belongingness. TQAM takes translated versions as its main research object. In evaluating and managing a translation, we may often make judgments as: this version is good, that one is bad, and that is all without any further steps. However, to give comprehensive and objective assessment and management, we have to go further by studying how good a version is, and to what extent one version is better than others. As we may notice here, both good translations and bad translations are fuzzy sets, because there is no absolute criterion to mark a good translation or a bad translation; in the same way, there is not a clear-cut borderline between good translations and bad translations. We can choose the fuzzy words "good" or "bad" to denote the fuzzy sets in TQAM; similarly, we may use other fuzzy expressions such as "appropriate", "inappropriate," "faithful," "close"

and so on. The name of the fuzzy set is normally decided by the superlative criterion we will use in the assessment and management.

In TQAM, fuzzy set covers a wide scope, and the elements belonging to the fuzzy set can refer to any translated versions. For instance, we establish “good translations” as fuzzy set A, and an arbitrary translated text X is an element of A. Whatever the case, this element X belongs to A with a certain DOM. If X is a distinguished version, then X has a higher degree of belonging to A, and the DOM might reach 0.95, and if X is a poor version, it may have a very lower degree of belonging to fuzzy set A, and the DOM might only be 0.1.

5.2 The establishment of DOM in TQAM

The elements of a fuzzy set change gradually from belonging-to to not-belonging-to from the kernel part of a set to the peripheral part. So the degree of an element’s belongingness to a fuzzy set can be marked by the values between 0 and 1. From the concept of DOM, we know that a common set is actually the special case of a fuzzy set: there are only two values for DM, 0 and 1. That is, in a common set, an element in the universe either belongs to the set or doesn’t belong to it. The significance in the concept of fuzzy set lies in that it gives much attention to the elements standing between the outer (DM=0) and the kernel (DM=1).

The concept of DOM is the cornerstone of applying fuzziology to solving practical problems. In TQAM, DOM also plays a quite significant role. In some cases, the DOM values are directly used to judge the quality of a translation or to compare the quality of different translated versions with the same SLT. Then how to determine the DOM value in TQAM?

In 1.4, we have already discussed that there are generally two ways to determine the DOM value of an element in a fuzzy set. One is to set up a DOM value by the experts in the particular field empirically. Although this method cannot be deprived of subjective influence, DOM values given by experts are relatively reliable and objective. If we want to get a more objective and scientific DOM, we may also choose to use fuzzy statistics, that is, the values are determined by the concentrating tendency shown among common people. DOM value is a kind of quantitative prescription, but not the same to the measurements of height or length in physics. Different people might give different DOM values to the same translation. The differences between the values don’t count much, what is of importance is that the values should indicate the relative belonging relations between the elements and a fuzzy set. For the time being, as there are not many people setting foot in the research of the application of fuzziology to TQAM, the DOM value is generally given by translation experts based on their empirical research and professional knowledge, as is the case in Fan Shouyi’s article, in which the DOM values are given by the professor himself. If the fuzziology-based TQAM model can be widespread or be used in machine translation, related research on setting up DOM values through fuzzy statistics will be more popular and easier.

5.3 The criterion of TQAM and concrete parameters

To evaluate the quality of a translation, an appropriate criterion is certainly needed. Viewing the translation history at home and abroad, translation criterion has been a key issue in translation theory over the last 3000 years. Gu Zhengkun ascribed any efforts and attempts of setting up an absolute translation criterion to the one-dimensional and stereotyped thinking modes. In his opinion, specific translation criterion is not exclusive, whereas, there should be multiple criteria. Gu Zhengkun’s multi-criteria system incidentally explains the fuzziness of translation criteria. To make translation assessment and management more objective, a superlative standard is needed. Gu Zhengkun replaces the commonly used “faithfulness,” and “equivalence” with “closest approximation,” and he believes “closest approximation” as a superlative criterion is more objective because any translation is an attempt to come as approximate as possible to the ST. In this paper, we will quote Gu Zhengkun’s “closest approximation” as the comprehensive and superlative criterion in TQAM.

As Professor Gu himself comments: “closest approximation” is an abstract concept, to judge whether translation has a high degree of approximation, we need to set some concrete parameters. The next questions, then, are about “How many concrete standards or parameters should be set?” and “What kind of parameters should be chosen?” In theory, there might be numerous parameters, but to list all the possible parameters does not have any practical meaning. What means is that the parameters should be set according to the specific conditions such as the types of texts, the demands of the receptors and so forth.

In this paper, the goal is to present a new approach for translation assessment and management, so the author will just concentrate on several key concrete parameters. Generally, the objective assessment and management of a translated text seeks to measure the degree of efficiency of the translation with

regard to the syntactic, semantic and pragmatic function. Taking into account the above mentioned factors we are supposed to consider in TQAM as well as referring to the parameters raised by Fan Shouyi, we can highlight six parameters, which are: syntactical structure, semantic collocation, pragmatic function, rhetoric, style, and transformation of cultural images.

5.4 Setting of weight

The use of multi-dimensional translation criteria keeps us from being too arbitrary in TQAM contrasting to the use of only one criterion. Multiple criteria enable evaluators to assess a translation from different angles and levels, which thus does more justice to both the translation and the translator. However, the simple use of multiple criteria is still not enough to make the assessment objective. For each individual translation, the parameters may have different importance. For example, in scientific translations, the importance of rhetoric may be less than that in literary translations. As a result, we should allocate different weight values to the parameters by careful analysis of the specific ST and TT. Weight is usually abbreviated as “W” in mathematics and statistics, and one rule we must obey in determining the weight values is that the total number of all the weight values amounts to 1, which can be expressed as the following formula:

$$W_1+W_2+...+W_i=1 \tag{5}$$

With the introducing of weight, the process of assessment and management can be divided into two steps: first, assess the translation according to each separate parameter and get the DOM value of these parameters; second, make a comprehensive assessment in terms of weight allocated to each parameter and the final evaluative result is the value of the superlative criterion. In this paper, the final result will be the degree of approximation.

5.5 The construction of the fuzziology-based TQAM model

After discussing all the possible factors that may be involved in the model, we will explain in detail how the fuzziology-based TQAM model works. In fuzziology, the belonging relationship between an element and a fuzzy set is usually expressed in linguistic variables. The variables are listed in a grading linear chain that starts from one extreme and ends at another. For the convenience of calculation, the variables can be changed to the corresponding DOM values between 0 and 1. According to the superlative criterion, we can list the linguistic variables and its corresponding DOM values in the following table:

Table 1 Linguistic Variables and DOM Values

Order	Linguistic variables	Corresponding DOM Values
A	Extremely Approximate	0.9
B	Very Approximate	0.8
C	Rather Approximate	0.7
D	Relatively Approximate	0.6
E	Not Approximate	0.5
F	A Little Far	0.4
G	Rather Far	0.3
H	Very Far	0.2
I	Extremely Far	0.1

If we regard “relatively approximate” translation to be adequate, then DOM values below 0.6 will be inadequate. These linguistic variables will also be used to mark the value of each parameter, and thus they together combine a universe of comments. Suppose U is a set of the minor parameters, and V is a set to mark the goodness of the translation, then the two sets can be expressed as:

$$U = \{u|u_1, u_2...u_6\} (u_1=\text{syntactical structure}, u_2=\text{semantic collocation}...)$$

$$V = \{v|v_1, v_2...v_9\} (v_1=\text{extremely approximate}, v_2=\text{very approximate}...)$$

In the following, the method of fuzziology-based TQAM will be introduced in three steps.

First, evaluate the translated version based upon the individual parameter. If the version is composed of ten sentences, we can first assess the sentences separately, get the DOM of each sentence, and then calculate the average DOM value of all the sentences, which will be the DOM value of the version. To make things simpler, here we will take the whole version as an evaluation unit. Suppose there are 10 experts to evaluate the version, and the DOM value for each parameter is:

$$Ru_1 = \{0, 0.2, 0.6, 0.2, 0, 0, 0, 0, 0\}$$

$$\begin{aligned}
 Ru_2 &= \{0.1, 0.1, 0.5, 0.1, 0.2, 0, 0, 0, 0\} \\
 Ru_3 &= \{0, 0.1, 0.3, 0.3, 0.2, 0, 0.1, 0, 0\} \\
 Ru_4 &= \{0.1, 0.1, 0.4, 0.1, 0.2, 0.1, 0, 0, 0\} \\
 Ru_5 &= \{0, 0.2, 0.3, 0.1, 0.1, 0.2, 0.1, 0, 0\} \\
 Ru_6 &= \{0.1, 0.1, 0.5, 0.1, 0.1, 0.1, 0, 0, 0\}
 \end{aligned}$$

Accordingly, we can have a fuzzy matrix:

$$R = \begin{matrix}
 & \begin{matrix} 0 & 0.2 & 0.6 & 0.2 & 0 & 0 & 0 & 0 & 0 \end{matrix} \\
 \begin{matrix} 0 \\ 0.1 \\ 0 \\ 0.1 \\ 0 \\ 0.1 \end{matrix} & \begin{matrix} 0.1 & 0.1 & 0.5 & 0.1 & 0.2 & 0 & 0 & 0 & 0 \\
 0 & 0.1 & 0.3 & 0.3 & 0.2 & 0 & 0.1 & 0 & 0 \\
 0.1 & 0.1 & 0.4 & 0.1 & 0.2 & 0.1 & 0 & 0 & 0 \\
 0 & 0.2 & 0.3 & 0.1 & 0.1 & 0.2 & 0.1 & 0 & 0 \\
 0.1 & 0.1 & 0.5 & 0.1 & 0.1 & 0.1 & 0 & 0 & 0 \end{matrix}
 \end{matrix}$$

Second, allocate different weight values to the parameters according to the characteristics of the text:

$$A = (0.3, 0.3, 0.1, 0.1, 0.1, 0.1)$$

Third, give comprehensive evaluation to the version:

$$\begin{aligned}
 B &= A \bullet R \\
 &= (0.05, 0.14, 0.48, 0.15, 0.12, 0.04, 0.02, 0, 0)
 \end{aligned}$$

The result is a comprehensive considering of the six parameters, and shows the percentage of the degree of approximation between the ST and the TT. Referring to table 1, we can work out the DOM value of the translated version by applying the corresponding DOM values of each linguistic variable to the formula:

$$\begin{aligned}
 \text{DOM} &= 0.9 \times 5\% + 0.8 \times 14\% + 0.7 \times 48\% + 0.6 \times 15\% + 0.5 \times 12\% + 0.4 \times 4\% + 0.3 \times 2\% + 0 + 0 \\
 &= 0.665
 \end{aligned}$$

Thus, we can conclude that the translated version is approximate to the original text with a degree of 0.665, and comparing value with the linguistic variables in table 1, this version is relatively approximate to the ST.

So far we have discussed the method of applying fuzziology to TQAM, and the practical value of this TQAM model is obvious.

First, the application of fuzziology to TQAM makes the evaluation more objective. As has been demonstrated above, this model takes into account the different factors that may influence the objectivity of the assessment and management, for instance, the setting of parameters and considerations of giving different weight to the parameters.

Second, in this TQAM model, qualitative and quantitative techniques are combined, so a consistent and reliable result can be reached. As there is always a numerical value to show the goodness of a translation, it makes the comparison among different versions easier.

Third, the fuzziology-based TQAM model is largely an open model, that is to say, it is widely applicable. To evaluate different text types, what we should do is to change the parameters or alter the weight values, yet, the overall method remains the same.

6 Conclusion

From the discussions and analysis in this paper, it can be concluded that it is feasible to apply fuzziology to TQAM and the practical values of the fuzziology-based TQAM model should be great. First, it makes TQAM more objective because this model takes into account the different factors that may influence the objectivity of the assessment. Second, the combination of qualitative and quantitative techniques in this TQAM model makes it easier to compare the goodness of different versions with the same SLT. Third, the fuzziology-based TQAM model being largely an open model is widely applicable. In addition, this model should play an important part in translation teaching, because it will help the teachers to assess and manage the students' translation exercises and tests more objectively and thoroughly, which in turn, will improve students' competence and promote translation teaching.

Study on the Influence of Lexical Chunk on the Development of Non-English Majors' Oral English Proficiency

Zhu Yushuang

School of Foreign Languages, Jiangnan University, Wuhan, P.R. China, 430056

(E-mail: Shirley_tony@163.com)

Abstract: This study was accomplished to examine whether the lexical chunks could improve non-English majors' oral proficiency. Two classes of non-English majors participated in this experiment which lasted ten weeks with a hundred periods. The teaching methodology of the experimental class was lexical approach while the teaching methodology of the control class was functional approach. The researcher hopes that this study can to some degree help to expand the range to improve spoken language teaching and learning.

Key words: Lexical chunk; Non-english majors; Lexical approach; Oral english proficiency

1 Introduction

In recent years, Lexical chunks research has been popular. Lexical chunks refer to those multi-word units with relatively fixed form. Lexical chunks are usually prefabricated units which are stored and memorized as a whole. They are convenient and useful for speaker to retrieve from memory to generate spoken language. The development of corpus linguistics shows that 70 percent of natural utterances are completed by the semi-fixed "chunks" existing between words and fixed phrases (Altenberg, 1991). Lewis (1993) proposes that lexical chunks learning and teaching can improve learners' language proficiency by the means of lexical approach. Whether oral proficiency, as one of the important goals of foreign language teaching, could be improved by the means of lexical approach began to draw close attention from researchers. It is very common in China that most Chinese EFL learners can not speak English proficiently even after they have learned English for many years. Researches in the field studying the relation between lexical chunk and Chinese EFL learners oral proficiency is quite few. It is undoubtedly significant to probe into this question.

2 Methodology

2.1 Research questions

This research is going to address the following two questions:

- 1) To what degree will lexical chunk approach influence students' oral proficiency?
- 2) What is the better approach to lexical chunk teaching?

2.2. Subjects

60 sophomores in 2 classes in Non-English Majors in Wuhan Textile University (WTU) responded to the Vocabulary Learning Strategies Questionnaire and English Vocabulary Test. Among the 60 subjects, there were 35 females and 25 males. The age group ranges from 19 to 21 with an average of 20. The subjects are divided into 2 classes and each class has 30 trainees. One class is designed as control class and another one is the experiment class.

Table 1 The Descriptive Statistics of the Pretest Scores of the Control Class and the Experimental Class Group Statistics

Class		N	Mean	Std. Deviation	Std. Error Mean
Pretest Score	control class	30	9.563	1.1409	.2083
	experimental class	30	9.473	1.1808	.2155

The descriptive statistics of the pretest scores of the control class and the experimental class shows that the mean of the control class is 9.563 and the mean of the experimental class is 9.473.

The significance of the test of equality of variance is .798, far above .05. Thus an independent sample T-test can be conducted subsequently. The descriptive statistics displays that the significance level is .765, far above .05, signifying that the trainees in both the control class and the experimental class were at almost same level in terms of the oral English before the experiment.

Table 2 Independent Samples T-Test of Pretest Scores Between Control Class and Experimental Class

	Equality of Variances		Equality of Means				
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference
Equal variances assumed	.066	.798	.300	58	.765	.0900	.2997
Equal variances not assumed			.300	57.932	.765	.0900	.2997

3 Results and Discussion

3.1 Statistical comparison of control group’ oral proficiency in pre- and post- oral test

Table 3 the Descriptive Statistics of the Paired Sample T Test Between Pretest Score and Posttest Score in Control Group

	Mean	N	Std. Deviation	Std. Error Mean
Control Pretest Score	9.563	30	1.1409	.2083
group Posttest Score	9.770	30	1.1659	.2129

Table 4 Correlation Test Statistics of the Paired Sample T Test Between Pretest Score and Posttest Score in Control Group

	N	Correlation	Sig.
Control Pretest Score & Posttest Score	30	.983	.000

The correlation between the pretest scores and the posttest scores is .983 and the significance is .000. Thus a paired samples test of the pretest scores test and the posttest scores of the control class can be conducted.

Table 5 Paired Samples Test of Students’ Pre- and Post- Test (Control Group)

Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
			Lower	Upper			
-.2067	.2164	.0395	-.2875	-.1258	-5.230	29	.000

From table5 above, we can see that, the sig is .000 which means there is significant difference between the pretest scores and the posttest scores of the control group, in other words, the trainees of the controlled class have made significant progress. The functional teaching methodology was employed in this class and it is a very popular teaching method in the EFL class in China.

3.2 Statistical comparison of experimental group’ oral proficiency in pre- and post- oral test

After the above paired samples test, the author consequently conducted another paired samples test of the experimental class for a purpose to make clear if there is a significant difference between the pretest scores and the posttest scores, thus the progress of the experiment after its pretest will be known. The test result is as follows:

Table 6 the descriptive statistics of the paired sample T test between pretest score and posttest score in experimental group.

Table 6 Paired Samples Statistics

	Mean	N	Std. Deviation	Std. Error Mean
Experim Pretest Score	9.473	30	1.1806	.2155
ental Posttest Score	10.373	30	1.1123	.2031

Table7 the correlation test statistics of the paired sample T test between pretest score and posttest

score in experimental group.

Table 7 Paired Samples Correlations

		N	Correlation	Sig.
Experimental group	Pretest Score & Posttest Score	30	.993	.000

The test of the paired samples correlations shows that the correlation between the pretest scores and the posttest scores in the control class is .983 and the significance is .000. Thus a paired samples test of the pretest scores and the posttest scores of the experimental class can be conducted.

Table 8 Paired Samples Test of students' Pre- and Post- Test (experimental group)

Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
			Lower	Upper			
-.9000	.1554	.0284	-.9580	-.8420	-31.729	29	.000

Data in Table 8 above shows that, the sig is .000, signifying there is significant difference between the pretest scores and posttest scores of the experimental class. In other words, the language proficiency of students in this class has increased significantly, comparing with the level before experiment. In the experimental class, functional teaching approach was also employed, meanwhile, a new approach was also introduced, and that is lexical approach. Lexical approach is a teaching approach that is centered on chunks learning activities which in the end serve to improve the language learners' competence level. Lexical approach should be combined with other teaching approaches to maximize its pedagogical effect. Its advantage over other teaching methods is that lexical approach can bridge the opposition between the structuralist teaching approach and the functional approach or the other teaching approaches because of its at grammaticalized lexis nature which could be processed and stored as "chunks", and the "chunks" can also be "copied" into larger and larger structures of "chunks" which can serve all kinds of language functions as called. In other words, "chunk" itself, an independent language unit, can make itself an easy way to be remembered and used so that language learning could be efficient.

3.3 The difference of students' language proficiency between control group and experimental group after Experiment

Because the paired samples test still can not tell which class' oral proficiency level is higher than the other, than the author conducted the independent samples test of between the posttest scores of the experimental class and the control class to see if there is a significant difference between the posttest oral proficiency level of the control class and its counterpart of the experimental class. The result is as follows:

Table 9 The Descriptive Statistics of the Posttest Scores of the Control Class and the Experimental Class

Class		N	Mean	Std. Deviation	Std. Error Mean
Posttest Score	control class	30	9.770	1.1659	.2129
	experimental class	30	10.373	1.1123	.2031

Descriptive statistics displays that the mean of the control class is 9.77, and the mean of the experimental class is 10.373.

Levene's Test for Equality of Variances		t-test for Equality of Means							
F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference		
							Lower	Upper	
.272	.604	-2.051	58	.045	-.6033	.2942	-1.1922	-.0144	
		-2.051	57.872	.045	-.6033	.2942	-1.1923	-.0144	

After the experiment, a significant difference can be found between the two groups of students. Table 4 above shows that, after a three-month training program, the language proficiency of students in the experimental group is higher than their counterparts in control group (Mean= $-.6033$), and the difference is of great significance (sig = 0.045).

3.4 Degree of the influence of lexical chunk approach on students' oral proficiency.

In the author's opinion, though both the functional approach and the chunk approach proved to be effective in improving students' language proficiency, to the special learner group as the non-English majors in this experiment, by applying the chunk approach, the teacher could inform them of more targeted and meaningful basic language knowledge to strengthen their language foundation and improve their self-confidence as well. In the followed interviews, student X from the control group revealed that, though the teacher has provided them a lot of communication patterns by tending to the functional approach, these communication patterns and formats are very necessary for their future communication abroad. But due to the fact that most trainees at their age have a weak language foundation, a lot of language knowledge has already been forgotten with the passage of time, besides, the busy work leaves them with little time to digest and absorb, not to mention the independent learning of language knowledge as vocabulary, phrases, language structure and so on. Even though they made some efforts toward this direction, they often get frustrated as no appropriate approach can be found. In such case lexical approach is a good choice to solidify the trainees' language knowledge; lexical approach is also a good way to develop the trainees' self-learning ability. Student F from the experimental class confessed that, the chunk approach introduced employed by teacher is very helpful for his learning of vocabulary and phrases. After learning and trying of this new approach, his efficiency of language learning, including the memorization of words, the reciting of texts have been improved clearly, so is his self-confidence, as a result, his oral proficiency is improved.

4 Conclusion

This teaching research shows that lexical chunk has significant influence on oral English proficiency. The score increase of the experiment class is more significant than that made by the control class. This research shows that even non-English majors can also master great number of lexical chunks to speak English correctly and proficiently and that lexical chunk has positive influence on oral proficiency in both broad and narrow senses. As for its limitations, firstly, length of the training is only 3 months. Data collection of three months seems not long enough to back up a perfectly cogent result. Thus a plan of long term experiment is necessary to consolidate the result. Secondly, the number of sample cases is not big enough to produce more convincing results. The author supports the idea that it is natural and effective for lexical approach to combine with functional approach.

Abstract: The status quo of market demand for interpreters has presented a tremendous challenge to interpreting teaching in universities. In virtue of the theories and methods of bibliometrics, this paper analyzes the development of interpreting teaching in China from the perspective of time and space development orientation and hence proposes some countermeasures in favor of its future development. The analysis results indicate that: at present, the research of interpreting teaching in China is steadily advancing and developing; interpreting teaching has been comprehensively improved, but the research gross is insufficient and the research topics are disperse, unfocused and discontinuous; research areas of most institutions are relatively narrow and single, and the main topics of each institution are prominent whereas the main institutions of each topic are obvious; three countermeasures are proposed to improve the future development of the interpreting teaching in China.

Key words: Interpreting teaching; Spatial and temporal analysis; Co-occurrence analysis; Visualization

1 Introduction

With the formation of the omnibearing and multi-field pattern of opening to the outside world, exchanges between China and foreign countries have become increasingly frequent and the Chinese interpreting market demand for highly skilled interpreters in various fields has been escalating^[1]. From the first UN translation training class established in Beijing Foreign Studies Institute in 1979 to official enrollment of Master of Translation and Interpreting (MTI) in 2008, China's interpreting teaching has achieved striking progress within no more than 30 years, a number of new changes occurring. Likewise, our interpreting teaching practices and researches have caught more and more attention in recent years^[2].

Based on the status survey of interpreting teaching evaluation for undergraduate translation majors, Zhang Min (2015) has analyzed the present problems and proposed that the solutions rest in establishing a complete interpreting teaching evaluation system^[3]. Based on the present situation of English-interpreting teaching in Chinese institutes of nationalities, Zhang Jinwei and Zhang Liyu (2015) have put forward a multi-dimensional and integrated new reform model of interpreting teaching in institutes of nationalities by intensifying the research to those individual factors such as interpreting teaching objectives, syllabus, basic education, characteristic teaching materials, curriculum system, teaching methods, and evaluation system^[4]. Based on the five research topics of teaching model, teaching method, technological tool, independent study, and corpus development, Liu Zhen and He Mingjia (2014) have conducted statistic analysis of papers in the field of computer-assisted interpreting teaching and raised some relevant advice accordingly^[5]. Jia Rongxiang (2010) has suggested that universities should reinforce undergraduate interpreting training in the aspect of college English interpreting course arrangement and guide the college English interpreting teaching, starting with interpreting test, and that universities should help improve educators' own interpreting proficiency and teaching awareness and renew their educational ideals^[6].

In order to understand the general development and research status of interpreting teaching in China, we have conducted a bibliometric analysis about the journal articles published by scholars studying interpreting. From the angle of combination of qualitative method and quantitative method, we have analyzed the timing sequence development and spatial development of interpreting teaching in China and come up with countermeasures for the future development accordingly, hoping to offer some reference for the research and discipline construction of interpreting teaching of China.

2 Data Sources and Processing and Researching Methods

All the data used in this paper are from *China Academic Journals Full-text Database* of CNKI (China National Knowledge Internet). Document retrieval is made with unlimited number of years and unlimited journal source category, interpreting teaching being the topic, matched pattern being precision. After removing conference notices, periodical directories, book reviews, calls for papers, instructions for authors, news in brief, and documents without keywords, authors, and institutions, we obtained 1497 papers meeting the standards and set up a database, the data of which were downloaded on May, 31, 2015.

The collected data were processed: to begin with, via the self-compiled program the field data, such as time, keywords, institution, etc., are transformed into the format which can be processed by Bibexcel software; then, a broken line graph is drawn to show the document quantity changes with time, and the time-keyword co-occurrence matrix is structured and the 2-norms network graph is visualized to dig into the timing sequence development status of interpreting teaching; thirdly, the major research institutions in interpreting teaching field are counted to structure the institution-keyword co-occurrence matrix and visualize the 2-norms network graph, in order to analyze the spatial development status of interpreting teaching; finally, some countermeasures are proposed, which are favorable for the future development of interpreting teaching in China.

2.2 Researching methods

(1) Co-occurrence analysis: the analysis quantifying the co-occurring information in various carriers to reveal its content correlation and underlying information. In bibliometrical studies, some relevance is bound to exist between the co-occurring characteristic items and its degree can be measured by co-occurrence frequency. Mainly through establishing time-keyword co-occurrence matrix and institution-keyword co-occurrence matrix, this paper explores the variation trend of China's interpreting teaching research topics with time and the major research topics of different institutions in this field.

(2) Visualization method: the technology which transforms data into graphs or images shown on the screen and processes them interactively by using computer graphics and image processing techniques. In the late of the 20th century, visualization method was gradually applied into information analysis because it could directly and effectively display the information analysis result, discover concealed information, making up for the deficiency of traditional information analysis. This paper vividly demonstrates the status quo of interpreting teaching in China and makes a further analysis by drawing the time-keyword and institution-keyword 2-norms network graph with UCINET software.

3 The Timing Sequence Development Status of Interpreting Teaching

3.1 Analysis about number of published papers in time dimension

The statistic analysis is performed about the publication year of data concentration journal articles and the broken line graph is drawn to show the change of document quantity in different years, as is displayed in Fig. 1.

Figure 1 The Broken Line Graph about Sequential Variation of Document Publishing

By looking into Fig. 1, the number of journal articles about interpreting teaching was relatively fewer published in each year before 2002, and its growth rate was slow; since 2003 the number of articles has been soaring rapidly and continuously, reaching the peak value of 186 in 2012, which

indicates an increasing number of scholars were engaged into the research of interpreting teaching; hereafter, its growth rate tended to be flat, meaning the China's interpreting teaching research boosted and developed steadily. A trend line is added into the graph. When trying adding the exponential trend line, the maximum of coefficient of determination R^2 is obtained as 0.8827 with fairly high fitting degree, and the trend line equation is $y = 1.0469e^{0.2568x}$, indicating that the number of journal articles about interpreting teaching has increased in approximately exponential trend in the last two decades, which satisfies the Price document exponential growth law.

3.2 Analysis about research topics in time dimension

Keywords are the concentration and refinement of the core content of an article. If a certain keyword occurs repeatedly in the articles of this field, it reflects that this keyword or the research topic represented by it is the research hotspot in the field, and that the more frequent the keyword occurs, the hotter the research about this field is^[7]. Based on keyword frequency statistics, this paper analyzes the research topics of the retrieved interpreting teaching articles. As the basis of the database establishment in this paper, "interpreting teaching", "interpreting", "teaching" are without keyword statistic significance, so they are omitted during counting word frequency. When handling keywords, we firstly merge the synonyms and near-synonyms, then preprocess the fields of the keywords and transform them into the format which can be identified by Bibexcel, and finally count the word frequency with Bibexcel. Statistically, 1497 articles include 2424 keywords whose total frequency is 5823.

To show the time-dependent trend of topics clearly, the keyword-time 2-dimensional matrix is structured, in which the time-dependent trend of the top 10 frequent keywords are shown in Table 1. And the 2-dimensional matrix is led into UCINET software to draw the time-keyword 2-norms network graph with NETDRAW plug-in, as is shown in Fig. 2.

Table 1 The Time-dependent Trend of the Top 10 Frequent Keywords

	1991	1992	1994	1995	1997	1998	1999	2000	2001	2002	2003	2004

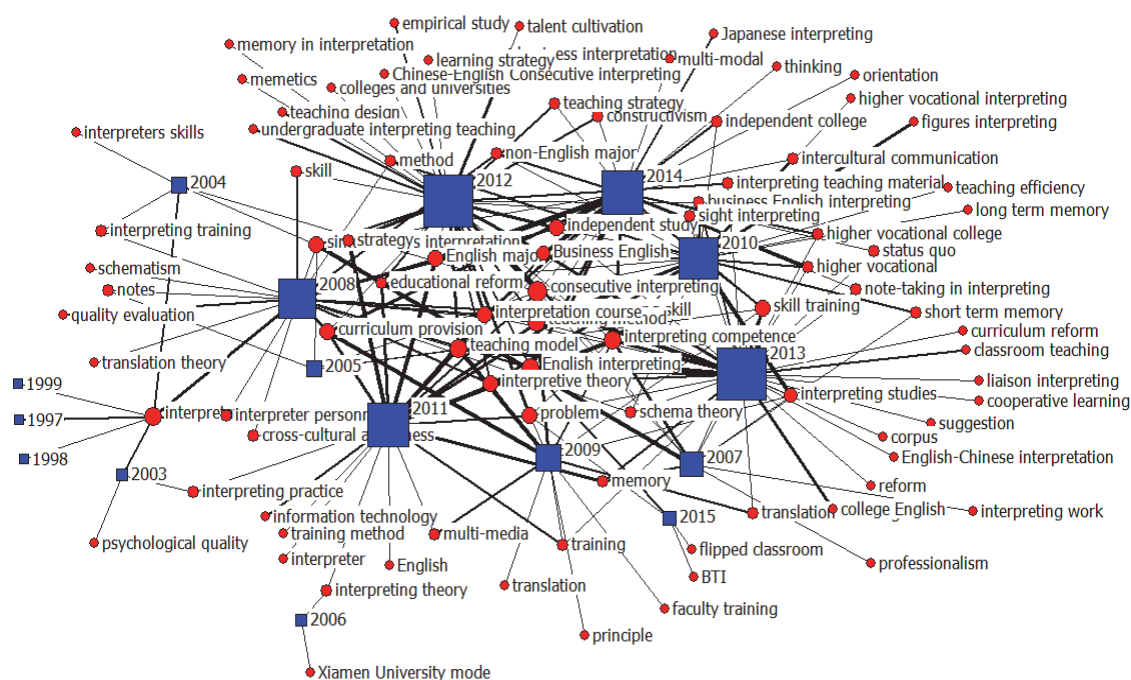

Figure 2 The Time-Keyword 2-Norms Network Graph When Threshold is 3

In Fig. 2, square nodes represent time and round ones keywords. The size of nodes represents their degree; the thickness of lines stands for the weight, reflecting the co-occurrence frequency of time and keywords. To show the time-dependent trend of keywords clearly, the threshold value is set to be 3 and nodes are deleted. With Table 1, Fig. 2 and background data, it is discovered:

(1) In terms of time, before 2002 the research topics of interpreting teaching were disperse and inconspicuous. Only the interpreting course was steadily studied for many times in 1997, 1998, and 1999. During 2003-2007, the research of interpreting teaching was mainly the summary of teaching methods and practical experiences. The research topics in this period included interpreting practice, interpreting training, interpreting skills, interpreting theory, Xiamen University mode, simultaneous interpreting, consecutive interpreting, notes, professionalism, interpreting work, interpreting studies, etc., indicating that the contemporary interpreting teaching research had been extended to interpreting theory, skill and method and that the relevant research about interpreting teaching had been consolidated and promoted all the time. Since 2008, the number of journal articles about interpreting teaching has increased rapidly. For one thing, some research topics such as teaching model, consecutive interpreting, interpreting competence, business English, problems and countermeasures of interpreting teaching etc., have been studied continuously, which are both hot subjects of interpreting teaching in China and core research topics; for another, some characteristic research topics occur each year. For instance, 2008 concerned translation theory and schematism, and quality assessment of interpreting teaching; 2009 concerned the translation and interpreting principles and faculty training; 2010 concerned teaching efficiency, figures interpreting and high vocational interpreting; 2011 concerned information technology and training method; 2012 concerned undergraduate interpreting teaching, memetics, learning strategy, memory in interpretation; Chinese-English consecutive interpreting, teaching design and talent cultivation etc.; 2013 concerned liaison interpreting, English-Chinese interpreting, and class teaching reform etc.; 2014 concerned Japanese interpreting and multimoding theory; 2015 concerned BTI (bachelor of translation and interpreting) and translation class etc.

(2) In terms of topics, the hot topics of interpreting teaching are not prominent, which are reflected as lack of keywords with high frequency. But the present research range is relatively comprehensive, involving all aspects of interpreting teaching development. Through induction and reorganization, all the keywords are divided into 11 general categories: theory and model research, teaching method and strategy research, curriculum provision research, syllabus research, faculty training research, teaching test and evaluation research, reformation and countermeasure research, application domain research, sci-tech method research, introduction and comparison research of overseas interpreting teaching, and other comprehensive researches. To sum up, as an important component of interpreting research,

interpreting teaching still develops in a comprehensive way, though it is not paid enough attention to and short of research quantity and prominent emphasis.

4 Spatial Development Status of Interpreting Teaching

4.1 Analysis of prolific institutions

Due to different ways of labeling institutions by different authors, this paper only takes the names of first-grade institutions for unification. For instance, Information Management Department of English School in Guangdong University of Foreign Studies is just labeled as Guangdong University of Foreign Studies. By analyzing the authors' institutions, it is discovered that totally 687 institutions are involved in writing articles with interpreting teaching topic. Among them, 79 institutions have got no less than 5 articles published, accounting for 11.50% of the total number of institutions. And those 79 institutions have got 648 articles published altogether, making up 43.29% of the total number of articles. There are 394 institutions writing only 1 article, representing 57.35% of the total number of institution. Those institutions with no less than 8 articles getting published are listed in Table 2.

Table 2 Institutions with No Less Than 8 Articles and Their Numbers of Articles

No.	names	number of articles	No.	names	number of articles
1	Guangdong University of Foreign Studies	56	12	Gannan Normal University	11
2	Shanghai International Studies University	35	13	Harbin University of Science and Technology	10
3	Guangxi University	24	14	Xiamen University	10
4	Beijing Language and Culture University	17	15	China University of Mining and Technology	10
5	Nanjing University	14	16	Sichuan International Studies University	9
6	Beijing International Studies University	13	17	University of Hainan	9
7	Zhejiang Wanli University	13	18	Shenzhen Polytechnic	8
8	Guangxi Normal University	12	19	Beijing Foreign Studies University	8
9	Dalian University of Foreign Languages	12	20	Hubei University of Economics	8
10	Northeastern University	12	21	Jilin Huaqiao Foreign Languages Institute	8
11	Hengyang Normal College	11	22	Shenyang Normal University	8

Table 2 reveals that all the 22 institutions with no less than 8 articles getting published are universities, mainly language universities, normal universities and comprehensive universities. Among them, Guangdong University of Foreign Studies has the greatest number of published articles – 56 articles. This university is not merely one of the 19 universities in the world to offer top translation talents to the UN, but one of the 3 most prestigious universities of foreign languages affiliated with Ministry of Education (the other two are Beijing Foreign Studies University and Shanghai International Studies University), and has the national-level teaching staff of English interpretation. Shanghai International Studies University ranks second. It is the first university of foreign languages after the establishment of People's Republic of China. Having the leading Graduate School of Translation and Interpreting in Asia and International Association of Conference Interpreters (AIIC) with the highest global grade, this university is the only Chinese (including HongKong, Macao and Taiwan) educational institution for professional conference interpreting ranking in the top 15 in the world. Guangxi University ranks third. The predecessor of its foreign languages school was the college English teaching department in School of Humanity and Law set up in 1947 which enrolled the first term of English majors. And the university also set up the excellent course English Interpretation. Other universities are similar in number of published articles. All of these 22 universities are the nucleus of interpreting teaching research in China.

4.2 Research topic analysis in spatial dimension

By studying the institution-keyword co-occurrence network graph, on the one hand, the main research topics of each institution in the field of interpreting teaching can be discovered. On the other hand, the major institution in the field of interpreting teaching can be discovered and some potential cooperative institutions can be excavated. Our self-compiled program is used to process the original data

to structure the keyword-institution 2-norms data matrix, some of which are shown in Table 3. Then the 2-dimensional matrix is imported into UCINET software to draw the keyword-institution 2-norms network graph by using NETDRAW plug-in, as is shown in Fig. 3.

Table 3 The Keyword-Institution 2-Norms Data Matrix

	Guangdong University of Foreign Studies	Shanghai International Studies University	Guangxi University	Nanjing University	...
Interpretation course	1	1	0	0	...
Interpreting competence	2	1	0	2	...
Interpreting skill	2	1	0	0	...
Simultaneous interpretation	3	2	0	0	...
English major	0	1	1	0	...
...

Figure 3 The Keyword-Institution 2-Norms Network Graph When Threshold is 2

In Fig. 3, square nodes represent institutions and round nodes keywords. Size of nodes represents the degree of nodes; thickness of lines the weight, reflecting the co-occurrence frequency of institution and keyword. To clearly demonstrate the network graph, the threshold value is set to be 2, and those acnodes are deleted. Through Fig. 3 and background data, it is revealed that:

(1) Although in China there are numerous institutions engaged in interpreting teaching research, the research fields of most are narrow and single. Fig. 3 illustrates that the research fields of Guangdong University of Foreign Studies are the most extensive and Shanghai International Studies University takes second place, while other universities are less prominent. For one thing, it is in direct proportion to the number of published articles of the certain institution. The greater the number of published articles is, the more fields the institution is engaged in. For another, 19 keywords in Table 3 are linked with Guangdong University of Foreign Studies and 10 keywords with Shanghai International Studies University, while no more than 5 keywords are linked with any other university.

(2) The main research topics of each institution are prominent. Because the threshold value in Fig. 3 is set to be 2, the keywords linked with institutions are studied at least twice. For instance, the research topics about interpreting teaching in Guangdong University of Foreign Studies which are studied more than twice include: interpreter competence, interpreting study, interpretation course, corpus, topic-based interpreting, method, simultaneous interpretation, network environment, figure pattern, translatology,

introspection, interpreting skills, interpreting training, translation theory, independent college, interpreting competence, interpreting quality assessment, Translators Association of China, and English interpretation; the research topics about interpreting teaching in Shanghai International Studies University which are studied more than twice include: interpreter, simultaneous interpretation, skill, formative evaluation, notes, miss of interpretation, advanced interpretation, interpretive theory, independent study, and interpretation process.

(3) The major institutions studying each research topic are obvious. For example, the major institutions studying simultaneous interpretation include Guangdong University of Foreign Studies, Shanghai International Studies University, Xiamen University, Beijing Foreign Studies University, and Beijing Language and Culture University; the major institutions studying English interpretation include Guangdong University of Foreign Studies, Pingdingsan Institute of Technology, Hainan Foreign Language College of Professional Education, Wuhan University of Science and Technology, Tieling Normal College, and Jilin Huajiao University of Foreign Languages; the major institutions studying interpreting competence include Guangdong University of Foreign Studies, Lanzhou Commercial College, Nanjing University, Xi'an Fanyi University, and Guangdong University of Technology; and so on. Potential cooperative relationship lies in those major institutions studying the same topic. Promoting cooperation among those institutions is more beneficial to the development of interpreting teaching research in China.

5 The Future Development Countermeasures of Interpreting Teaching

By analyzing the timing sequence and spatial development status of interpreting teaching, it is revealed that although China's interpreting teaching research has developed in a very comprehensive way, limitations still exist such as insufficient gross research quantity and less prominent emphasis. What is more, most institutions have narrow and singly research fields, disperse topics and lack of continuity. To solve those deficiencies, 3 ideas are presented to improve the future development of interpreting teaching in China.

(1) The national Ministry of Education and the decision-making level of universities are supposed to think highly of interpreting teaching development. Reformation and development of any course teaching cannot be done without financial and authoritative support. As a result, in order to promote the future development of interpreting teaching, firstly the national Ministry of Education should increase the investment into scientific research funds for interpreting, guaranteeing teachers to carry out scientific research and then improving the gross research quantity; secondly universities should regulate teaching plan and increase practical teaching programs for interpreting according to actual conditions; thirdly, universities should update teaching equipment to provide favorable hardware facilities for interpreting teaching; fourthly, universities should train teachers of interpretation course to improve the faculty continuously^[8].

(2) Set up unified syllabus and curriculum system, and formulate assessment criteria of interpreting teaching. In the present interpreting teaching research, the limitations of less prominent emphasis, disperse topics, and lack of continuity are caused by no unified syllabus and curriculum system. Each institution researches, teaches, and assesses in its own traditional way, being out of line with the time and lacking in assessment standards, systematicness and scientificity. Setting up unified syllabus and curriculum system can guarantee universities to follow the guidance in interpreting teaching and to grasp the key points; assigning reasonable assessment criteria avails the constant self-detection of the institutions and guarantees the quality and quantity of teaching.

(3) Promote the mutual exchange and cooperation between different institutions. This paper states that both Guangdong University of Foreign Studies and Shanghai International Studies University take the leading positions whether in curriculum provision or the number of published articles. But there are few cooperative articles between these two universities, between the two universities and other institutions, or among other institutions. One single institution only has fixed knowledge structure and thinking mode, and limited manpower and material resources. To overcome the restriction, different institutions, esp. the leading institutions, are supposed to be promoted to reinforce mutual exchange and cooperation to draw on each other's strength and form colony heterosis, conquering the challenges jointly and creating new achievement impossible to a single individual.

6 Conclusion

Based on bibliometric analysis about the journal articles in the field of interpreting teaching, this paper analyzes the development status of interpreting teaching in China and reaches the following conclusion:

Firstly, the number of the journal articles about interpreting teaching published each year in China satisfies the Price document exponential growth law, and the present number of articles has reached the fastigium, meaning that the present interpreting teaching research is steadily advancing and developing.

Secondly, from the angle of time development tendency the gross research quantity of China's interpreting teaching is insufficient, research topics are disperse, and emphasis is less prominent and incontinuous. But it still has achieved comprehensive development.

Thirdly, from the angle of space development tendency, though many institutions in China have begun to be engaged in interpreting teaching research, the research fields of most are narrow and single. However, the main research topics of different institutions are prominent and the major institutions studying each topic are obvious.

Fourthly, three ideas are put forward to improve the future development of interpreting teaching: the national Ministry of Education and the decision-making level of universities should think highly of interpreting teaching development; set up unified syllabus and curriculum system, and formulate the assessment criteria of interpreting teaching; promote the mutual exchange and cooperation between different institutions.

In spite of some conclusion, two problems still exist: the similar keywords are processed without perfect refinement; the threshold value is set artificially during drawing the network graph, which cannot bring about the overall reflection of network details. But those problems do not influence the reference value of this paper.

Study on Effective Reading Strategies of Web-Based Autonomous Learning*

Duan Linlin

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 416358202@qq.com)

Abstract: As modern college English teaching reform being put into practice, students are required to learn autonomously. Therefore, studying the effective learning methods of autonomous learning becomes more and more important. This study was conducted among more than 50 students on web-based autonomous learning. Results indicate that students' metacognitive strategy and cognitive strategy are positively correlated with their reading test scores, while the socio-affective strategy is not highly correlated with reading performance. Among the metacognitive strategies, the strategy of selective attention, self-monitoring, self-evaluation are highly correlated with their reading achievements, they are the effective reading strategies; among the cognitive strategies, note-taking appears to be the most effective strategy, follows by the strategy of syntax, transfer, and grammar; while cooperative strategy is the only effective strategy among the socio-affective strategy. The findings have both theoretical and pedagogical implications. It provides actual statistics for the impact of reading autonomous learning strategies on reading performance. At the same time it pushes forward the college English teaching innovation.

Key words: Autonomous learning; Learning strategy; Reading; Network technology

1 Introduction

The field of language learning has been in a constant state of motion over the last twenty years. The main change has been a shift from teaching method to the language learner. More attention has been paid to the language learner's individual difference related to language learning. Research in fields such as psychology, cognitive psychology, sociology, linguistics and others, added to our knowledge of how language learning takes place.

With the development of college English reform, students are required to learn autonomously. Therefore, making a research of the effective learning methods of autonomous learning becomes more and more important. While reading is an important step in English learning, students' reading ability directly affects their listening, speaking and writing ability, so finding out a set of reasonable and effective reading strategies of autonomous learning is the key problem the English learners will face, the same is true for English teaching. The accumulation of reading is the key in English learning. A lot of students spend much time on reading training and get little effect. English teachers also put much energy in this aspect, but up to now many students rely on their own experience and methods, so a set of scientific and effective reading strategies is greatly needed.

This study made a survey of the reading strategy in autonomous learning of some classes, mainly from Material Science & Chemistry Engineering College in China University of Geosciences, and it also compared their reading scores with the reading strategies. The purpose is to find the correlation between reading ability and effective reading strategies, and to explore more reasonable and effective reading strategies and methods for college English learners, and this research will provide valuable suggestions and pedagogical implications for English teachers.

2 Theoretical Basis

2.1 Autonomous learning

For many years, "autonomy" in language learning has been a popular focus for discussion in the West. It is generally accepted that language learning requires the active involvement of learners. Language can only be learned and not be taught. The focus of classroom activities has shifted from teacher-centered to learner-centered. The goal of language teaching is to help learners to become independent from their teachers in their learning and use of language. Although there has always been the Chinese idea of Zi Xue(self-teaching), the idea is different from the concept of autonomous learning and is only peripheral in the Chinese educational culture. The goal of education is the facilitation of

* This paper is supported by "The Fundamental Research Funds for the Central Universities". Grant No. 2014-Ib-087

change and learning. Learning how to learn is more important than being taught something from the superior vantage point of a teacher (Cao Rongping, 2003). The current situation of EFL is that many students are used to an educational setting in which teachers overtly control the activities of the group in a relatively formal manner, emphasize the memorization of grammatical rules and vocabulary, administer frequent achievement tests, and generally requires their students to maintain a passive and subordinate role.

2.2 Application of multimedia to language learning

Key writings on hypertext were mainly published in the 1970s and 1980s. After this period, the focus and terminology shifts to multimedia even though much of the content and many of the issues remain the same. But there are also additional advantages more central to language learning. For example, Montali and Lewandowski (1996) review studies conducted with first language secondary school students favoring multimedia as a way of improving reading skills among average and less-skilled readers. They suggest that readers who enjoy reading tend to read more and are more motivated to read and that a computer can be useful in promoting interest.

2.3 Reading

An increasingly common view in the research literature is that reading is essentially divided into two components: decoding and comprehension. The latter is often described as consisting of parsing sentences, understanding sentences in discourse, building a discourse structure, and then integrating this understanding with what one already knows. This comprehension process, however, is not seen as unique to reading, but also describes the process of listening (Alderson, 2000).

Modern psycho-linguistics and cognitive linguistics hold that reading is a kind of complicated and active-thinking mentation, it is a thinking process in which the readers sift, test, process and combine the information according to their own knowledge and experience, it is a kind of relatively independent cognitive behavior.

3 Data and Methodology

3.1 Subject

The subjects in this study were first-year non-English majors from China University of Geosciences. A random sample of 60 students enrolled in the course was drawn mainly from Material Science & Chemistry Engineering College. It is a pity that 9 students failed to respond to the questionnaire correctly or they did not have the reading scores. Therefore, the data adopted for statistical analysis are from 51 autonomous learners.

3.2 Aim

The purpose of this study is to find out the correlation between reading ability and reading strategies, and to explore more reasonable and effective reading strategies and methods for college English learners to consult, and it also provide valuable suggestions and pedagogical implications for English teachers to improve their teaching.

3.3 Instruments

The questionnaire and oral interviews were employed to collect data and information for this study. The following is a brief description of the instruments.

3.3.1 Questionnaire

The questionnaire is employed to elicit autonomous learners' attitudes towards reading studies and multimedia environment and their individual experiences in the reading strategies. The questionnaire consists of the following three parts:

Part A includes the students' attitudes towards English reading learning under the multimedia environment. The statements in Part A were adopted from Wen Qiufang's "On English Learning strategies" (1996). Part B is about students' hopes and suggestions on English learning. Part C aims at examining students' actual use of reading strategies, designed on the basis of O'Malley and Chamot's (1990) typology on learning strategies and Vandergrift's (1997) comprehensive description on individual reading strategies. These statements fall into the following 3 major dimensions: metacognitive strategies, cognitive strategies and social/affective strategies. It is composed of 36 statements, some of which were adopted from Oxford's (1990:293-300) Strategy Inventory for Language Learning. The raw data were processed by means of Statistical Package for Social Science (SPSS Software).

3.3.2 Interviews

The interviews are mainly based on the following questions: 1)Autonomous learning and classroom teaching, which one do you prefer? 2) Do you think applying appropriate reading strategies is important?

3) Do you think strategy training and the teacher’s instruction a must in autonomous learning model? 4) What are the problems the multimedia environment existing now?

4 Results

This section presents the research results as well as corresponding analysis. First is the respective analysis of 3 main strategies: metacognitive strategies, cognitive strategies and social strategies (Table 1, Table 2, Table 3). Secondly analyzing the relationship between various strategies and reading achievements (Table 4, Table5, Table 6).

3.4.1 Correlation between 3 main strategies use and reading performance

Table 1 Correlations Between Metacognitive Strategies and Reading Scores

		VAR00001	VAR00002
VAR00001	Pearson Correlation	1	.316(*)
	Sig. (2-tailed)	.	.024
	N	51	51
VAR00002	Pearson Correlation	.316(*)	1
	Sig. (2-tailed)	.024	.
	N	51	51

Correlation is significant at the 0.05 level (2-tailed).

In the questionnaire, 15 questions belong to the metacognitive strategies. The sub- strategies include planning strategy(S1,S4); advanced preparation strategy(S3, S28); self-management strategy (S2,S13,S32); self-monitoring strategy(S8,S9,S33); direct attention strategy(S6); selective attention strategy(S7); self-evaluation strategy(S11,S12,S36). I designed 5 choices(A,B,C,D,E) for each question, and valued them in different scores, A=5 scores, B=4 scores, C=3 scores, D=2 scores, E=1 score. At last, I added the scores of the 15 questions as VAR00001, VAR00002 is the students’ reading scores, then the result of the correlation between metacognitive strategies and reading scores is as above chart.

Table 2 Correlations Between Cognitive Strategies and Reading Scores

		VAR00001	VAR00002
VAR00001	Pearson Correlation	1	.342(*)
	Sig. (2-tailed)	.	.014
	N	51	51
VAR00002	Pearson Correlation	.342(*)	1
	Sig. (2-tailed)	.014	.
	N	51	51

Correlation is significant at the 0.05 level (2-tailed).

In the questionnaire, 14 questions belong to the cognitive strategies. The sub- strategies include predicting strategy(S14,S15); association strategy(S27); note-taking strategy (S5,S21); syntax strategy (S18); gist reading strategy (S16,S20,S22); grammar strategy (S10,S34); transfer strategy(S17,S35), substitution strategy(S19). Then I added the scores of the 14 questions as VAR00001, VAR00002 is the students’ reading scores, then the result of the correlation between cognitive strategies and reading scores is as above chart.

Table 3 Correlations Between Affective/Social Strategies and Reading Scores

	Sig. (2-tailed)	.	.361
	N	51	51
VAR00002	Pearson Correlation	-.130	1
	Sig. (2-tailed)	.361	.
	N	51	51

In the questionnaire, 7 questions belong to the affective/social strategies. The sub- strategies include questioning for clarification strategy(S31); cooperation strategy(S23,S29); self-reinforcement strategy (S25,S26); self-talk strategy(S24,S30). Then I added the scores of the 7 questions as VAR00001, VAR00002 is the students' reading scores, then the result of the correlation between affective/social strategies and reading scores is as above chart.

The three tables show that metacognitive strategies and cognitive strategies are highly correlated with the students' reading scores, both of the correlation is significant at the 0.05 level. While affective/social strategies has not positive correlation with the corresponding reading achievements.

3.4.2 Correlation between sub-strategies use and reading performance

Table 4 Correlation Coefficient Between Metacognitive Strategy Use and Reading Scores

Categories of Strategies	Sub-categories of Strategies	Pearson Correlation
Metacognitive Strategies	Planning	0.060
	Advance preparation	0.166
	Self-management	0.216
	Self-monitoring	0.399 **
	Direct Attention	0.225
	Selective Attention	0.480**
	Self-evaluation	0.437**

This table indicates that among metacognitive strategies, self-monitoring (R=0.399**); selective attention(R=0.480**) and self-evaluation (R=0.437**) are positively highly correlated with the reading comprehension scores. Among metacognitive strategies, strategy of selective attention has the highest correlation with reading scores, self-evaluation is also closely related with the readers' achievements. Besides these two strategies, the employment of self-monitoring strategy also plays a positive role in reading test. The significant correlation coefficients indicate that the strategies of selective attention, self-monitoring and self-evaluation are of great help to the students for improving their reading comprehension ability. They all belong to the effective reading strategies.

Table 5 Correlation Coefficient Between Cognitive Strategy Use and Reading Scores

Categories of Strategies	Sub-categories of Strategies	Pearson Correlation
Cognitive Strategies	Predicting	0.150
	Association	-0.141
	Note-taking	0.695**
	Syntax	0.467**
	Gist reading	0.213
	Grammar	0.328*
	Transfer	0.352 *
	Substitution	0.104

Among cognitive strategies, note-taking(R=0.695**), syntax(R=0.467**), grammar(R=0.328*) and transfer(R=0.352*) are also positively correlated with reading scores. However, the data shows that association strategy(R=-0.141) has a negative correlation with reading achievement. Among the cognitive strategies, note taking turned out to be the most effective strategy. It positively correlated with the students' performance on reading comprehension test at a significant level of 0.01. In addition to note taking strategy, strategy of syntax, strategy of grammar and transfer among cognitive strategies also show high correlation with the readers' performance.

Table 6 Correlation Coefficient Between Affective Strategy Use and Reading Scores

Categories of Strategies	Sub-categories of Strategies	Pearson Correlation
Affective & Social Strategies.	Questioning for clarification	0.178
	Cooperation	0.275*
	Self-reinforcement	0.163
	Self-talk	0.139

As for affective and social strategies, cooperation($R=0.275^*$) strategy also has close correlation with the reading results. Only cooperation strategy is correlated with students' reading comprehension performance.

3.4.3 Interviews

In addition to the questionnaire, some students were chosen to take the oral interviews in order to reflect some information that could not be directly got through written forms. This interview also reveals the students' attitudes and hopes toward autonomous learning model. The interviews are mainly based on the following questions: 1) Autonomous learning and classroom teaching, which one do you prefer? 2) Do you think applying appropriate reading strategies is important? 3) Do you think strategy training and the teacher's instruction a must in autonomous learning model? 4) What are the problems the multimedia environment existing now? The results are as follows:

First, among the 15 interviewees, 12 students preferred autonomous learning model. For the reason that they have more freedom in controlling their own learning pace under the autonomous learning model, so they can allocate different time on different learning emphasis. They welcome the autonomous learning model, they think that it is a very good way to work on English reading learning at their own pace. Whereas 3 students preferred teacher-centered classroom. Second, 100% of the 15 interviewees believed that applying appropriate reading strategy is important in reading comprehension. Third, all the 15 interviewees agreed that teachers' instructions and strategy training is a must even in the autonomous learning model.

5 Conclusion

The results were analyzed in terms of reading strategies with the help of SPSS. The major findings obtained from the statistical analysis of 51 subjects' data are as follows: Firstly, metacognitive strategies and cognitive strategies affect students' reading performance greatly, while social/affective strategies are not closely correlated with their reading achievements. Both of the correlation between metacognitive strategy and reading performance, cognitive strategy and reading performance are significant at the 0.05 level. Secondly, the strategy of self-monitoring, selective attention, self-evaluation among the metacognitive strategy are the three most effective strategies for the improvement of reading comprehension ability; among the cognitive strategy, the strategy of note-taking and syntax are the two most effective strategies for students' reading achievements, followed by the strategy of transfer and the strategy of grammar; as for socio-affective strategy, only the strategy of cooperation plays an important role in reading performance. The findings have both theoretical and pedagogical implications. It provides actual statistics for the impact of reading autonomous learning strategies on reading performance. At the same time it pushes forward the college English teaching innovation.

Investigation on Discipline Factor Impact upon Peer Influence in Moral Education of Chinese Undergraduate*

Shang Dan

School of Humanities and Law, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: sd1220@sohu.com)

Abstract: In recent years, the moral education of undergraduate has shown less attractive trends. Peer education was applied into moral education as a useful exploration. In this study, the impact of peer education was evaluated on three basic factors: gender, grade and discipline. This survey was involved in undergraduates of seven disciplines in PR china. The results showed that most undergraduates were sensitive to peer influence: and sought help immediately from their peers in difficulty during school; peers played a positive role in the concrete behaviors. In three basic factors, only discipline causes significant difference on peer influence. The disciplines in undergraduate education bring out the different culture and the formation of wisdom, and this discrepancy might come from the teaching methodology, discipline personality and the mindset of discipline education, which impact upon the value and judgment of undergraduates. Peer education in moral education should be taken according to the different discipline personalities.

Key words: Peer; Gender; Grade discipline; Empirical research

1 Introduction

From the previous literatures, the peer education has been widely used in America and Europe, and its mechanism of peer education is based on the psychological theology among a sense of sociology groups, and capable to relieve the problems in the individual or social level by the effective peer communication.^[1] The academic Status of Peer influence in China is showed the following characteristics: In the first place, the procedure of peer work is similar in a certain degree, such as selecting peer counselor (peer counselor, psychological committee member, etc.), carrying out all activities through training and coaching. Even senior student of the high grade or members in student union could be selected as peer educator for their substantial experience, ideological consciousness, communication capacity, sense of responsibility and benevolence.^[2]

Second, there were still deficiencies in the practical and theoretical researches. Most descriptions on the related methods are insufficient in the theoretical researches, and the statistical analysis rarely applied in the practical researches. Moreover, it cannot be taken for granted that peer has some positive influence on students as this premise of peer education, and this applicable premise is a lack of support from empirical research. The majority studies approval the psychological factors in peer influence under the hypothesis that peer have the same effect on all different college students. There was little further investigation on whether other factors can cause differences in peer influence on college campus.

Third, Instead of most researches on students, only few empirical researches have involved the perspectives of educators on peer education. A empirical research of Nanjing University in china have put out peer psychological counseling, and the project participants join in the peer consulting through interviews in the whole process. It is regarded that peer counseling is capable to solve the contradiction between demand and supply in psychological counseling. And counselors of peer education proposed to help others at same time which was an effective way to enhance the mental health status.

Forth, researches on peer influence in China are still in the primary stage, which still exists in the operational level in moral education. A system of theories on peer influence in China does not form yet. In the present literatures, the concept of peer education in china was gradually formed as follows: peer education mainly applied in the field of mental health, which gradually was extended to the funding system of the financially strapped students, the adaptability education of new pupil, and career planning of graduate.

Therefore, Peer influence was elucidated from the four perspectives of the size of impact from peer counseling upon undergraduate, the optimal objective to seek help in difficulty during school,

* This paper is supported by “Humanities and Social Science Program of Hubei Province Education Department”
The communication mechanism of the Socialist Core Values in the social network of college Students, No.15Z045.

the various attitudes towards peer proposal, and the subsequent behaviors under the impact of peer comment. Possibility of peer education was discussed as an effective measure at the operational level to strengthen moral education of China.

2 Materials and Methods

This survey was carried out in Wuhan University of Technology and permitted by the ethics and academic committee of this university. 1000 undergraduates have anticipated this research, which involved seven disciplines: art and design, literature, management, electrical and mechanical, law, educational technology, science during the four years of undergraduate education. A total of 260 questionnaires were randomly distributed to 1000 undergraduates, and all questionnaires were collected, and the recovery rate of 260 questionnaires is 100%. In this research, boys and girls accounted for 58.1% and 41.9% respectively; each university grade accounted for 33.5%, 31.9%, 18.1%, 16.5% from freshmen to senior respectively; the various disciplines categories of engineering, science, law, literature, management, art, education accounted for 40:40:40:40:40:40:20. The education undergraduates in this survey were much less compared to other disciplines because the enrollment of disciplines was very low.

The questionnaire of the survey consists of two parts; the first part is the basic information about students including gender, grade and discipline, and the second part is the subjective evaluation content. These subjective questions were designed to evaluate how deep the students were influenced from their peers, who was the first choice to listen to or seek solutions, what extent to accept the peer proposals, whether to put peer opinions into the practical behaviors. The comparisons of the overall data were information on gender, grade and discipline, and it was investigated whether there are significant differences on information. These factors had been taken into account in the four perspectives: (1) the impact from peer was subjectively evaluated in undergraduates, and these impacts are divided into five levels from minimal, small, medium, large to great. The evaluations could reflect the impact from peer directly, and might reflect the world outlook of undergraduates indirectly. Therefore, the impact from peer may affect the behavioral attitude of undergraduates in the future. (2) The first counseling object was analyzed for the college students in difficulties on campus. The first objective to seek help was an important factor on following behavior, and the impact from the first suggestion is very deep and difficult to change according to the principle of primary effect. (3) The attitudes towards peer opinions were evaluated, and these attitudes may directly affect the acceptance and absorption towards peer opinions. (4) The transformation from the peer opinions to the concrete behaviors is evaluated in students.

All statistics in the survey were conducted by software packages SPSS 18.0. The three basic factors of gender, grade and discipline were used to analyze peer influence in students. Factors of gender, grade and discipline were performed as the independent variables to evaluate the attitude on peer influence, the optimal objective to seek help, absorbing the proposals from their peers, as well as whether to put into action. The independent samples T-test analysis was used to analyze the first assumption that students are subject to peer influence. A single factor ANOVA test verified other three assumptions that the different gender presents no difference towards peer influence; the different grades present fairly different towards peer influence; the background of different disciplines presents considerable difference towards peer influence. Discipline factors are determined whether there are differences on the concrete behavior following peer influence, assuming that the various disciplines are the same towards peer influence.

3 Results

3.1 It was estimated that the gender factor of undergraduate affected peer influence in difference.

In 260 samples of the survey (151 male and 109 female), it was determined whether gender factor had significant influence on peer education in statistics. The means of peer influence were generally assumed equal in the comparisons of male and female groups. Together gender factor in peer influence do not produce a significant difference between male and female by independent samples T test (Table 1). Both of boy and girl are sensitive for peer influence.

Table 1 Gender Factor in Peer Influence Presents No Significant Difference Between Male and Female Undergraduate by Independent Samples T test

	151 Male cases Mean (SD)	109 Female cases Mean (SD)	T	<i>p</i>
The size of impact from peer counseling upon undergraduate	3.06(1.103)	2.96(1.027)	0.7 1	> 0.0 5
The optimal objective to seek help for undergraduate in difficulty during school	2.48(0.782)	2.35(0.886)	1.2 3	> 0.0 5
The various attitudes towards peer proposal taken by undergraduates	2.91(0.692)	2.89(0.416)	0.3 5	> 0.0 5
The various subsequent behaviors under the impact of peer comments	3.87(1.100)	4.02(1.018)	1.1 3	> 0.0 5

3.2 It was estimated that the grade factor of undergraduate affected peer influence in difference.

87 freshmen, 83 sophomores, 47 juniors, and 43 seniors were included in this survey of 260 samples. It was determined whether there was difference on peer influence by grade factor of undergraduate. It was assumed that the mean of peer influence in four grades was equal in general. The results showed no significant difference by a single factor ANOVA test. Homogeneity of variance, Levene statistic 1.996, $P = 0.115$, can be considered as the homogeneity of variance ($P > 0.05$). Analysis of variance, $F = 2.387$, $Sig = 0.07$ ($\alpha = 0.05$ level), thought that grade factor of peer influence did not exist significant difference.

Furthermore, the grade factor in this survey showed no significant difference on the three perspectives of peer influence: the optimal objective to seek help, the various attitudes taken by undergraduates and the concrete behaviors following peer comments. Therefore, the grade factor in whole process of peer influence did not exhibit significant differences, and the undergraduates at all grades might be sensitive to the various form of peer education.

3.3 It was estimated that discipline factor significantly affected peer influence in difference.

(1) Discipline factor was investigated in the size of impact from peer counseling.

In this survey of 260 samples, seven disciplines were involved in engineering, science, law, literature, management, science, art, educational technology. It was to determine whether discipline factor was affected differently in the perspective of the size of impact. It was assumed that the means of peer influence in these seven disciplines were equal in average. The results showed significant difference by a single factor ANOVA test in Table 2.

Table 2 The Size of the Impact from Peer Counseling was Investigated in the Different Disciplines

Disciplines	number	Mean(Standard deviation)	95% confidence interval of mean
Art and Design	40	2.95(1.037)	2.62-3.28
Literature	40	3.48(1.086)	3.13-3.82
Management	40	2.53(0.847)	2.25-2.80
Electrical and Mechanical	40	2.70(0.966)	2.39-3.01
Law	40	3.25(1.256)	2.85-3.65
Educational Technology	20	3.60(1.142)	3.07-4.13
Science	40	2.93(0.829)	2.66-3.19
Total	260	3.02(1.071)	2.89-3.15

The changes of the impact size from peer influence were significantly caused by different disciplines by a single factor ANOVA, $F(6, 253) = 5.019$, $p = 0.000$, $\eta^2 = 0.11$.

Tukey's post-test program demonstrated that, Management ($M = 2.53$, $SD = 0.85$), Engineering ($M = 2.70$, $SD = 0.97$), Science ($M = 2.93$, $SD = 0.83$), Art ($M = 2.95$, the $SD = 1.04$), Law ($M = 3.25$, $SD = 1.26$) between undergraduate disciplines showed no significant difference on the size of peer impact. Science, art, law, literature ($M = 3.48$, $SD = 1.09$), education ($M = 3.6$, $SD = 1.14$) showed no significant difference on the impact size of peer influence, and management, engineering, literature, education on impact size from peer appear significant difference. In the previous five disciplines, the means of peer influence on Science and Art were significantly less than that of Literature and Education. According to the questionnaire option of sort, the means of peer influence on Management and Engineering were significantly more than that of Literature and Education.

(2) Discipline factor was investigated in the optimal objective to seek help for undergraduate in difficulty during school.

The survey of 260 samples, discipline factors were determine whether there are differences on first objectives for peer influence. It was assumed that the optimal objective for help was equal overall in the different disciplines. The results showed no significant difference by a single factor ANOVA test in Table3.

Table 3 The Optimal Objective to Seek Help for Undergraduate was Investigated in the Different Disciplines

Disciplines	number	Mean(Standard deviation)	95% confidence interval of mean
Art and Design	40	2.28(0.816)	2.01-2.54
Literature	40	2.55(0.815)	2.29-2.81
Management	40	2.55(0.815)	2.29-2.81
Electrical and Mechanical	40	2.48(0.716)	2.25-2.70
Law	40	2.50(0.816)	2.24-2.76
Educational Technology	20	2.30(0.923)	1.87-2.73
Science	40	2.28(0.933)	1.98-2.57
Total	260	2.43(0.828)	2.33-2.53

Note: The changes of the optimal objective to seek help cannot be significantly caused by different disciplines for undergraduates in difficulty, $F(6, 253) = 0.89, p > 0.05$

There was no significant difference on who was optimal objective for help among different disciplines, $F(6, 253) = 0.89, p > 0.05$. In the seven different disciplines such as Management, Engineering, Science, Arts, Law, Literature, and Education, it was roughly the same on mean who was first objective turned for help. It indicated that the optimal objective to seek help was their peers for undergraduate of each discipline in difficulty during school.

(3) Discipline factor was investigated in the various attitudes taken by undergraduates towards peer proposals.

The survey of 260 samples, disciplines factor was determined if there are differences in attitudes towards absorbing the peer views. It was assumed that the attitude of various disciplines students was same on the whole. The result showed significant difference by a single factor ANOVA test in Table 4.

Table 4 The Various Attitudes towards Peer Proposals was Investigated in the Different Disciplines

Disciplines	number	Mean(Standard deviation)	95% confidence interval of mean
Art and Design	40	2.58(0.747)	2.34-2.81
Literature	40	2.93(0.350)	2.81-3.04
Management	40	2.85(0.483)	2.70-3.00
Electrical and Mechanical	40	3.10(0.841)	2.83-3.37
Law	40	2.98(0.423)	2.84-3.11
Educational Technology	20	3.10(0.447)	2.89-3.31
Science	40	2.90(0.496)	2.74-3.06
Total	260	2.90(0.591)	2.83-2.98

Note:The changes of attitudes towards peer proposals was significantly caused by the different disciplines for undergraduate, $F(6, 253) = 3.52, p < 0.05, \eta^2 = 0.08$.

Tukey post hoc test procedures demonstrated that, there was no significant difference on mean change of the attitude of these five discipline undergraduates, Art ($M = 2.58, SD = 0.75$), Management ($M = 2.85, SD = 0.48$), Science ($M = 2.90, SD = 0.50$), Literature ($M = 2.93, SD = 0.35$), Law ($M = 2.98, SD = 0.42$). In the six disciplines of Management, Literature, Law, Engineering ($M = 3.10, SD = 0.84$), Education ($M = 3.10, SD = 0.45$), the mean of attitude towards peer presented no significant difference, but the mean of impact size of peer influence in the Art was significantly less than that of Engineering, and Education. According to the questionnaire option of sort, Art students presented more active to absorb the peer views, while undergraduates of Engineering and Education were even more conservative for the peer views.

(4) The discipline factor was investigated in the concrete behaviors under the peer impacts.

In the survey of 260 samples, it was determined whether there are differences on concrete behavior following peer influence in the different disciplines. It was assumed that the behavior affected by peer influence in various discipline was the same as the whole, the results showed significance in Table 5 by a single factor ANOVA test.

Table 5 The Various Subsequent Behaviors Under Peer Comments was Investigated in the Different Disciplines

Disciplines	number	Mean(Standard deviation)	95% confidence interval of mean
Art and Design	40	3.58(1.107)	3.22-3.93
Literature	40	4.10(0.928)	3.80-4.40
Management	40	4.43(0.958)	4.12-4.73
Electrical and Mechanical	40	3.80(0.966)	3.49-4.11
Law	40	3.98(1.121)	3.62-4.33
Educational Technology	20	3.50(1.357)	2.86-4.14
Science	40	3.93(0.971)	3.61-4.24
Total	260	3.93(1.067)	3.80-4.06

The mean changes of concrete behaviors following peer counseling was significantly caused by the different disciplines, $F(6, 253) = 3.41, p < 0.05, \eta^2 = 0.07$.

Tukey post hoc test procedures demonstrated that, Educational technology ($M=3.50, SD = 1.36$), Arts and design ($M = 3.58, SD = 1.11$), Engineering ($M = 3.80, SD = 0.97$), Science ($M = 3.93, SD = 0.97$), Law ($M = 3.98, SD = 1.12$), Literature ($M = 4.1, SD = 0.93$), in these six disciplines, there was no significant difference on the attitude towards peer views. There was no significant difference in the acceptance attitude towards peer in Education, Art Management, but undergraduate of Education and Art appears significant more inclined to put into perform than that of Management. According to the questionnaire option of sort, the undergraduate of management showed more positive identity of peer education and putted into action. The undergraduates of Education and Art were relatively weak in identity of peer education and relatively less zealous to action.

4 Discussions

4.1 The cause of the discrepancies from discipline factors in peer influence

According to this empirical study on peer influence, gender and grade factors do not present significant differences at all grades, but discipline factors appear significant differences in statistics. In this survey, it is essential to probe the relationship between peer education and discipline factors as independent variable. Whatever discipline the undergraduates were in difficulty at school, peers were the first choice for help. This first choice showed high consistency in various disciplines, which proves once again that peer influence should be the primary considerations in moral education.

This survey indicates that undergraduate of management and engineering disciplines is more sensitive to peer influence than that of literature and education; Art students are more likely to absorb the opinions from their peers, but that of engineering and education take even more conservative views on suggestion from the peer; Management undergraduate is more positive to perform peer suggestion under the feeling of similar identity, while undergraduate of education and art is lack of peer influence because of the relatively weak feeling of identity on and relatively less active to put into practice.

These discrepancies from different disciplines should mainly come from the discipline personality, which was gradually cultivated and formed in stage of undergraduate education. The so-called discipline personality is the sum of the individual psychological characteristics in the specific discipline. And discipline personality was deduced from learning and practical activities, which was distinguished from that of other disciplines. Discipline personalities present a certain tendency of specific awareness and characteristic of specific discipline capacity. Scholars have pointed out that the discipline personality is the actual existence with stability^[3]. The discipline personalities could determine the specialized and professionalized model of thinking. For example, their thoughts of art students show the iconic features, while mathematical and philosophical students think more abstract and profound way. The mindset and methods in the discipline education could impact on the value perspective and judgments of the undergraduate.

4.2 How do the discipline personalities make influence on moral education?

The cultivation of the discipline personality mainly derived from the three sources: the class teaching of specialized professors, the social practice of the related discipline and the public comment towards the related discipline. Its discipline personality influences on moral education were interpreted as follow:

First, the discipline values were permeated into the undergraduate outlook on life, world and value by teaching in the classroom. The undergraduate may not be fond of the traditional moral education while they regarded that the value and judgment from professional class was indispensable skill or useful knowledge, which is also easier for students to accept and internalize. For instance, because discipline personalities of law focus on pursuing fairness and justice, this discipline personality of law anticipate establishing the internal social values of law students. It always leads law students to judge the actual problem and interpret the social phenomena by the perspective of fairness and justice.

Second, the peers from the same discipline can correct the values from class teaching in some degree. What's more, the professional practice is the first stage that the undergraduates transform theoretical knowledge into practical application. Peer clarifications on the nature of discipline in professional practice were combined with student's own professional experiences. This combination of interpretation will put great influence towards employment option in future even after the student leave the practice site back to learn professional knowledge again. For instance, advertising students have the great enthusiasm to apply for rare internship places in 3A advertising agency; on the contrary, they have the hesitation to sign contract with this same company after graduation.

At last, this network comments on the related disciplines significantly affected the behavior and choice of undergraduate. The network public opinion on related discipline becomes one of the important channels for student to contact his unknown professional world. Because the network comments were in favor of the social status of government officials, this prejudice pushes college students into the civil government instead of in the undeveloped western.

In the perspective of the formation of discipline personalities, it is an important link to connect moral education with professional knowledge.

4.3 How do peer educations combine with discipline educations in moral education?

First, the discipline personalities should be understood further because the key in pedagogy principles is to teach students according to their aptitude and discipline personality. Only after the different demands based on discipline personalities was known fully, peer educational activities could be opened up on this major premise, and it is the foundation of peer education.

Second, there are important to carry out the peer activities according to the different discipline personalities. So this research indeed confirms that, it is necessary to carry out the different form of peer education for different disciplines, and the operational characteristics of specific disciplines were recommended in detail.

Third, the early warning system and interventional mechanism should be established in all peer activities because the consequences of peer influence are absolutely a two-edged weapon. The concept of peer determines the wide scope of peers in the undergraduate activities. The educator of moral education cannot restrict undergraduates to contact with their peers around, but establish early warning system and interventional mechanism to avoid the negative influence from the peer activities. In the opinion of authors, the concrete peer activity on campus is selected for communication or guidance, which process is a part of generalized peer education. Although its effect of this measure is also limited, it just represents the tip of the iceberg in peer resources. It is indispensable for educator to found observer system so as to early warn the indication of non-mainstream values and intervene promptly.

5 Conclusion

The results showed that most undergraduates were sensitive to peer influence: and sought help immediately from their peers in difficulty during school; peers played a positive role in the concrete behaviors. In three basic factors, only discipline cause significant difference on peer influence. The disciplines in undergraduate education bring out the different culture and the formation of wisdom, and this discrepancy might come from the teaching methodology, discipline personality and the mindset of discipline education, which impact upon the value and judgment of undergraduates. Peer education in moral education should be taken according to the different discipline personalities.

Abstract: Based on the conservation of resources theory, we used quantitative analysis method to test the influence of work-to-family conflict (WFC) on the task performance and contextual performance. We found that WFC doesn't have a negative effect on task performance. WFC has a negative effect on job dedication and interpersonal facilitation. Interpersonal facilitation and job dedication fully mediate the relationship between WFC and task performance. The results enrich the study on work family conflict and job performance, and provide a useful implication for the enterprise to manage employee's work family conflict and job performance.

Key words: Work-to-family conflict; Task performance; Job dedication; Interpersonal facilitation

1 Introduction

Work and family represent two important spheres in an adult's social life (Mian zhang,2012) If employees cannot manage various problems that emerge from work and family domains,they experience work- family conflict (Osman .M,2014) . According to Greenhaus and Beutell (1985), work-family conflict is defined as a "form of interrole conflict in which the role pressures from the work and family domains are mutually incompatible in some respects" .Accordingly, work-family conflict occurs in two distinguishable directions: family interfering with work (i.e., family-to-work conflict, FWC) and work interfering with family (i.e., work-to-family conflict, WFC; e.g., Frone, Russell, & Cooper, 1992; Kelloway, Gottlieb, & Barham, 1999).

Previous studies have mostly studied the relationship between the work-family conflict and the outcome variables based on the Hobfoll's Conservation of Resources theory. COR theory(Hobfoll,1989) points out that the employees in experiencing conflict will use their limited resources (e.g. time, energy, etc.) to deal with problems they face, the consumption of these resources will make employees cannot meet the demands of their job duties or responsibilities at home , which will bring some negative consequences. Scholars have pointed out that the relationship between family and work has a direct impact on the performance of employees (Van Steenbergen and Ellemers,2009) and a research found emotional exhaustion fully mediate the relationship between work-family conflict and job performance (Osman M.Karatepe, 2013). But there is also a study found that the correlation between WFC with task performance and contextual performance are not significant, so the author calls for more empirical studies to examine the relationship between WFC and task performance with contextual performance (Lori A ,2011)。

As previous studies have mostly studied the relationship between work-family conflict and job performance limited in central formal job responsibilities and ignored the interpersonal and autonomous behaviors (Conway, 1999), namely used task performance instead of job performance (Emin,2007).According to the two-dimensional performance model (Borman and Motowidlo,1993), job performance should package task performance and contextual performance. Therefore, some scholars (Dawn S. Carlson et al., 2008) pointed out in the study of the relationship between work and family .Future studies need to study the relationship between work-family conflict and task performance with contextual performance together.

According to the match-domain perspective, WFC will better predict the variables in work domain than FWC (eg, Turnover intentions) (Amstad,2011;Christoph,2014). Therefore, this article based on the COR theory(Hobfoll,1989),choose WFC as the antecedent variable to test the relationships between WFC and task performance with contextual performance. Since the contextual performance is defined as the extral-role behavior that beneficial to the development of the organization, and has a supporting role to task performance (Borman & Motowidlo, 1993),this article assumes that WFC will indirectly influence task performance through contextual performance.

2 Conceptual Background and Hypotheses

Task performance is defined as a specific work-related role performance, it comes from the cognitive ability, knowledge, work efficiency and work experience of the employees. According to the COR theory (Hobfoll,1989), when employees experience WFC, they tend to protect the existing resources are not consumed, so we think it will make the resources for the task performance reduced, and thus will negatively affect the task performance.

When employees experience WFC, it will tend to reduce the role of independent behavior to protect the constant consumption of resources, in order to reduce the pressure on their own (Samuel, 2008).This will encourages individuals to narrow their behavioral and attitudinal focus (Fredrickson, 1998; Fredrickson and Losada,2005). As individuals narrow their focus at work, core job tasks likely have greater priority than more discretionary activities such as working extra hours (indicative of job dedication) or department lunches/ socials (indicative of interpersonal facilitation)(Dawn S., 2008) . Studies have found that WFC has a negative impact on the job dedication and interpersonal promotion(Carlson,2008).While in China, according to the authors' knowledge, empirical research on work-family conflict and contextual performance is also relatively scarce. So based on the COR theory(Hobfoll,1989), the author assumes that employees who in the experience of WFC, will continue to consume the limited resources, which makes them do not have enough resources to perform extra role behavior, such as job dedication and interpersonal facilitation. In summary, we propose the following hypothesis:

H1: WFC has a negative effect on task performance.

H2: WFC has a negative effect on job dedication.

H3 :WFC has a negative effect on interpersonal facilitation.

When employees experience work-family conflict, staff time, energy and other resources will continue to consume, the employees will don't have sufficient resources to deal with the work-related things (Hobfll, 1989), such as the promotion of interpersonal behavior, making extra dedication to work roles, and as the contextual performance has an important role in promoting task performance (Van Scotter & Motowidlo, 1996), this will make WFC has a indirect negative impact on the task performance. Since the task performance are the main responsibilities of the job, and contextual performance generated from the promotion of interpersonal relationship and employee behavior's for task completion, we think that the impact of the promotion by the WFC, will affect the task performance. Based on the above analysis, we propose the following hypothesis;

H4:Interpersonal facilitation mediates the relationship between WFC and task performance

H5:Job dedication mediates the relationship between WFC and task performance

Comprehensive above, the theoretical model of this paper is:

Figure 1 Theoretocal model

3 Method

3.1 Sample

We collected survey data from the MBA students of the Wuhan University of Technology. A total of 350 questionnaires were distributed to the students. A total of 289 questionnaires were retrieved by the cut-off date for data collection. 58 questionnaires were eliminated because of incomplete information. Consequently, 231 questionnaires were retrieved, yielding a response rate of 79.9percent.Table 1 descriptive statistics for sample characteristics.

Table 1 Descriptive Statistics for Sample Characteristics.

Sample characteristics	Result
Sex	Male (52.8%), Female (47.2%)
Marital status	Married (67.1%), Unmarried (32.9%)
Organizational tenure	1-3years (21.6%) 4-6years (22.9%) 7-9years (14.7%) over 10 years (40.7%)

3.2 Measures

All the variables in our study were measured with well-established scales. Items in the scales were originally in English. We followed the process of back translation to ensure the quality of the measurements (Brislin et al., 1973). If not otherwise indicated, items had to be answered on a seven-point Likert scale ranging from 1 “I do not agree at all” to 7 “I completely agree”.

Work-to-family conflict(WFC): We assessed work-to-family conflict with Frone and Yardley’s (1996) scale. The scale contains 6 items. A sample item is “My job or career keeps me from spending the amount of time I would like to spend with my family.”, The alpha coefficient for this scale was .85.

Task performance(TP): We used a seven-item scale developed by Williams and Anderson (1991) to assess task performance. A sample includes “Fulfills responsibilities specified in job description” .The alpha coefficient for this scale was .90.

Contextual performance: We assessed contextual performance with Van Scotter and Motowidlo’s (1996) scale. This scale contains two aspects: job dedication(JD) and interpersonal facilitation(IP). Job dedication was measured with eight items. An example item is, “He/she is personally committed to meeting high performance standards.” The alpha coefficient for this scale was .85. Interpersonal facilitation was measured with six items. An example item is, “He/she maintains positive attitudes in dealing with difficult people.” The alpha coefficient for this scale was .91.

Controll variables: We controlled for participant’s gender(1=male and 2= female), marital status(1=unmarried and 2=married)and organitional tenure (1<3years,2=4-6years, 3=7-9years, 4>10years).

3.3 Data analysis

The collected data was analysed using SPSS 22.0 and Amos 22.0 software programs. We used confirmatory factor analysis to test validity of the proposed measurement, and then we performed linear regression analysis to test the hypotheses.

4 Result

According to the table 2, four-factor model fit the data better, therefore, the proposed theoretical four-factor model was acceptable. Table 3 shows the means, standard deviations, and correlations of composite measures for the model constructs. It indicates that WFC had no significant correlation with task performance, but WFC had a significant negative correlation with Job dedication ($r = -0.21, p < 0.01$) and Interpersonal facilitation ($r = -0.25, p < 0.01$). Job dedication, interpersonal facilitation and task performance are significantly positively correlated.

Table 2 Model Fit for Confirmatory Factor Analysis.

Model	Factor-structure	X ² /df	NNFI	CFI	RMSEA	AIC
Four-factor	WFC,JD,IP,TP	2.808	0.904	0.919	0.089	446.274
Three-factor	WFC,JD+IP,TP	3.995	0.842	0.863	0.114	605.326
Two-factor	WFC,JD+IP+TP	6.552	0.707	0.743	0.155	952.015
One-factor	WFC+JD+IP+TP	10.770	0.484	0.545	0.206	1525.987

Table 3 Descriptive Statistic and Correlation among Variables

Variables	Mean	SD	1	2	3	4	5	6	7
1. Gender	1.47	0.50	-						
2. MS	1.33	0.47	0.08	--					
3. OT	2.74	1.20	-0.08	-0.63**	-				
4. WFC	3.38	1.37	-0.13	-0.05	0.07	(0.85)			
5. JD	5.87	0.77	0.04	-0.14*	0.05	-0.21**	(0.85)		
6. IP	5.87	0.97	0.15*	-0.06	0.07	-0.25**	0.68**	(0.91)	
7. TP	5.65	0.94	0.03	-0.15*	0.06	-0.11	0.55**	0.57**	(0.90)

Note: MS=Matital status, OT=Organizational tenure, WFC=Work-to-family conflict, JD= Job dedication, IP= Interpersonal facilitation, TP=Task performance. * $p < 0.05$, ** $p < 0.01$, two-tailed test.

We used the linear regression analysis to test the hypotheses. According to table 4, WFC doesn’t have a negative effect on task performance ($\beta = -0.079$, null). WFC has a negative effect on job dedication (model 4, $\beta = -0.12, p < 0.01$). WFC has a negative effect on interpersonal facilitation (model 2, $\beta = -0.162, p < 0.01$). Interpersonal facilitation and job dedication fully mediate the relationship between WFC and task performance (See model 9, model 10). So H1 is rejected, and H2, H3, H4, H5 are supported.

5 Conclusion

Our study has several limitations that highlight fruitful avenues for future research. First, because all our measures are based on self-reports, common method bias may have inflated the observed relationship. Second, we cannot draw strong causal inferences from this research. Future research is needed to test our results with different samples. As we just tested the relationship between work-to-family conflict and task performance and contextual performance, it would be worthwhile to examine the relationship between family-to-work conflict and task performance and contextual performance. We found that WFC doesn't have a negative effect on task performance directly, but it can influence task performance through job dedication and interpersonal facilitation. In order to ensure the task performance, companies need to pay more attention to WFC. The results have enriched the study on work-family conflict and job performance, we hope those would be useful for the future research.

Abstract: American southern writer Anne Tyler is attracting increasing research interest in China today. *A Patchwork Planet* is a typical Tyler novel that addresses much more than the superficial subject matter of family and marriage like other mature Tyler stories, and is worthy of in-depth analysis. *A Patchwork Planet* is clearly an Ego-reconstruction story. And Tyler ingeniously shapes it into a Lacanian Ego-construction structure and embeds it into a background of two contrastive spaces. The paper thus approaches the novel from both a psychological and a spatial perspective and unfolds the Lacanian self-reconstruction structure of the novel and discloses the interwoven theme of the aging heterotopia. Finally the paper concludes that Tyler shows her concern for and belief in the value of the neglected aging heterotopia in *A Patchwork Planet* by making it a decisive instrument in realizing the self-reconstruction of the protagonist.

Key words: Ego; Self-reconstruction; Heterotopia; Theme of old age

1 Introduction

When it comes to contemporary American woman writers, Anne Tyler undoubtedly holds a very important position, especially as a southern writer. As a matter of fact, Anne Tyler is compared to Jane Austen, Eudora Welty and John Updike in the literary circle for her keen observation and expertise presentation of her eternal subject matter, the intricate familial relationships. Years of industrious work earned her various important prizes such as the Pulitzer Prize for Fiction, the National Book Critics Circle Award, and the Sunday Times Award for Literary Excellence, to name but a few. The Telegraph even remarks that “Tyler’s unflinching fictional portraits of family life should secure her a place at the literary top table”¹

Successful as Anne Tyler is in her publishing career, research effort on her works is quite limited in America. This might be because as a southern writer, Tyler’s chosen field of subject matter is of familiar everyday life, looking quite dwarfed in front of the southern giant Faulkner’s grand narration. Besides, many Tyler novels are branded as bestsellers which would automatically disfavor Tyler from some research consideration. Most Tyler reviews are publishers’ or editors’ reviews. The few serious critical studies as represented by Paul Bail’s *Anne Tyler: A Critical Companion*, Alice Petry’s *Understanding Anne Tyler*, and Voelker’s *Art and Accidental in Anne Tyler*, though each presenting insights into themes, styles and art of Tyler’s works, their analyses all cover several Tyler’s works that makes it impossible for them to give any work concerned a detailed and thorough treatment.

However, Tyler’s works are worth close investigation. In addition to her widely acknowledged “fully developed characters”, “brilliantly imagined and absolutely accurate detail” and “rigorous and artful style” and “astute and open language”², Tyler is really good at penetrating the ordinary to reveal the extraordinary, like Eudora Welty. Maybe because of this, Tyler’s works are gaining more and more research interest in the past few years in China. Tyler’s studies in China generally go to two types, those on her as an author and those on her works. Of all Tyler’s works, *Dinner at Homesick Restaurant* (Liang Jianwei, 2013; Huang Feifei, 2011), *Breathing Lessons* (Wang Yumei, 2006), *The Amateur Marriage* (Liu Xiaobo, 2011) and *The Accidental Tourist* (Li Mengshi, 2014) are most appealing to many Chinese scholars. The paper takes one other typical novel of Tyler’s, *A Patchwork Planet*, to be its target of study. Yu Jiaqi (2012) did a comparative study of *A Patchwork Planet* and *Catcher in the Rye* to reveal the theme of loss and return in her master thesis. Exclusive reviews on *A Patchwork Planet* are not found in publication. The paper would approach the novel from both the psychological perspective and the spatial perspective to appreciate the structural and humanistic themes of the novel.

2 The Lacanian Ego-reconstruction Structure

A Patchwork Planet has a clear structure of Lacanian Ego-reconstruction process. Jacques Lacan's Ego theory is complicated and multi-phased. Among them, the early phases of Ego development are well-acknowledged, such as the Mirror Stage and the Oedipus Period. A Patchwork Planet shows a clear mold of the Mirror-Stage and the Oedipus-Period process.

2.1 Lacan's mirror stage and the oedipus period

According to Lacan, ego-construction is a process of self-alienation that starts from the Mirror stage and lasts one's whole life long. At the Mirror Stage, by watching its own image in the mirror, the baby learns to separate itself from the environment, and gradually acquires the sense of Ego that launches it on the way to the final acquisition of self-identity. The key step here is the building of the self-consciousness of Ego through identification with the mirror reflection. By manipulating the mirror images, the baby begins to separate itself from the surroundings; hence the Ego takes shape. Following the Mirror stage, the development of Ego faces two other crucial periods, namely the early and late Oedipus periods, whereby the child has to go through two identifications successfully. Failures to fulfill the identification requirements during the two periods would result in developmental Ego problems and confusion of self-identity in the future. At the early Oedipus period, the child needs to feel secured in its attachment to the mother. To achieve that, the child has to identify with the mother's "phallus". Only when it becomes the mother's "phallus" can the child enjoy the mother's love. Later the child realizes that mother does not possess "phallus" because Father takes it away from mother. The inclusion of Father into the picture signifies the entry into the late Oedipus period. Now the child faces a problem: should it accept Father's taking away of the "phallus"? Accepting it would mean the denial of the child's own desire. The only way out of the dilemma is to identify with the father. Identification with the father signifies the end of the Oedipus period. Father is not the father in real life; it is more a symbol of laws and order. (Huang Zuo, 2005)

2.2 The lacanian ego-reconstruction structure of the novel

A Patchwork Planet is in structure a literary metaphorical story of the process of Lacan's Ego-construction, here specifically an Ego-reconstruction through the Mirror Stage and the Oedipus period.

At the very beginning of the story, the protagonist Barnaby Gaitlin is 29 years old and seems stuck as a loser in life, divorced and outcast by his family, and having serious self-identity problems. The story begins with a train journey in which Barnaby meets his "Gaitlin angel" Sophia and they then begin to date. With the dates going on, Barnaby talks about his past to Sophia, and literally begins a journey of self-reflection. The novel begins with self-reflection and ends with self-reflection, echoing right to the Mirror Stage and its lasting influence.

Although their relationship does not work out at the end, Sophia is really an angel to Barnaby as she takes him to re-examine rationally his inner self, giving him a chance to rebuild his Ego. She may not be a common "Gaitlin angel" of material wealth, but she is surely an angel of great spiritual wealth to Barnaby. Here, Sophia functions quite vividly as the mirror, metaphorically allowing Barnaby to separate his true self from the confusing environment and to launch on a new journey of self-reconstruction.

By reflecting repeatedly upon his obsession of spying into other's family albums on his thieving missions to their privileged neighbors in the past, Barnaby's first major step of Ego-reconstruction accomplishes when he finally realizes that his real point in making these missions was to find an answer to a tormenting question of his: can he ever change? He was afraid unconsciously that he would always be a hopeless shame to his family. The realization gives Barnaby confidence to have faith in him again and convinces him that he was not a down-and-out trouble-maker who has no future, laying down a sound base for the Ego development in the future.

Barnaby's next major step of Ego-reconstruction is the fixation of his relationship problem with his mother, mimicking the early Oedipus period. Barnaby used to feel great frustration when dealing with his mother, as he seemed never able to fulfill his mother's wish. The sense of failure to become his mother's "phallus" made it impossible for Barnaby to correctly evaluate his mother's love toward him. Therefore, Barnaby encounters relationship difficulties with his mother, a result from the failed early Oedipus period. When Barnaby can rationally assess his situation and takes control of his life, he finally decides to right his relation with his mother and takes initiative in solving it. After several confrontations, his mother eventually admits in words to him that "you are always my boy". Barnaby then sees his mother's love under the hard mask of blaming him all the time. They two reconcile, hence the successful

ending of the early Oedipus period.

Then it comes to the final part of identifying with the Father. According to Lacan, Father here represents actually not the physical father in life, but rather a symbol of laws and order. In the past, Barnaby always wished to become a man like his father or the other successful Gaitlin men who met their “angel” and made their fortune. Obviously he was not successful in this aspect. He could barely support himself. However, as the story and Barnaby’s reflection progresses, Barnaby gradually learns that it is the general populace who made the Gaitlin’s fortune, not the assumed “angel”. With this knowledge, Barnaby critically evaluates his family belief and forms his own value, thus finishing up his identification with the Father. The Oedipus period is accomplished. Until then, the self-reconstruction of Barnaby is structurally complete, and the story stops.

3 The Aging Heterotopias and Theme of Old Age

Like other great works of art, *A Patchwork Planet* is not a single-themed work. The Lacanian self-reconstruction feature is only one structural theme of the novel. *A Patchwork Planet* is also a novel of Third Space. Tyler achieves it by setting this self-reconstruction story in two paralleling spaces – the mainstream self-sufficient society and the endangered heterotopias of the aging society of the underprivileged, and letting the protagonist Barnaby Gaitlin, a confused loser from the mainstream society, reconstruct his Ego, regain confidence and develop wise attitudes toward life only through the support, strength and wisdom from this long neglected heterotopia of the poor old.

3.1 Heterotopia and its significance to the mainstream society

Heterotopia is a term first used by Michel Foucault to stress the heterogeneity of the space we live in. According to Foucault, we human beings are not living in void, but rather in a network of relationships. The various relationships define every space we live in, while no two spaces mutually commensurate or overlap. Unlike utopia, which is non-existent, heterotopia truly exists in each culture. Foucault concludes that the various heterotopias share the following features: every culture has its own particular types of heterotopias in absolute existence; their functions may change with times; they can juxtapose several mutually exclusive spaces in one physical site, and it is in special relation to time; heterotopias are independent spaces, accessible and permeable, and they could create a fantasy space that makes the real world seem unreal and they are of great and varied significance to the outside world where they reside. (Soja, 2005)

American culture is hostile toward old age. The deep-rooted American value of independence makes old age especially agonizing and the aging society exceptionally trivial and elusive. The aging society is a typical heterotopia in the American society that bears every feature Foucault concludes, a heterogeneous space that exists along side and in contrast to the mainstream affluent American society, which is marginalized and silenced that waits to be projected against the established order.

3.2 The Heterotopia of the poor old in *A Patchwork Planet* and the theme of old age

In *A Patchwork Planet*, readers travel between two spaces with the protagonist Barnaby Gaitlin, the mainstream world we are familiar with and represented by Barnaby’s parents’ society and a completely different world as represented by Barnaby’s working space. Barnaby works for “Rent-A-Back,” a business that sends strong young people to help old folks put their Christmas trees up, move furniture, bring in the groceries, take out the trash – whatever they need to continue to live independently. The world the old folks inhabit is neglected and lonely as their children seldom come, and the grandchildren’s visits and broken hips dominate it. The old folks even make it look uglier than it should be. Like the old scrimp even on Barnaby and his colleagues’ service hours by complaining that they were not doing the Christmas tree the way they wished and asking them to redo it without paying fees for the extra hours taken since it’s their fault. They are bitter-tongued, their conversations are uninteresting and they are deep-down afraid of the outside fast-changing world. However, such a seemingly unappealing world gives Barnaby irreplaceable support during the very hard days of trying moment and saves Barnaby from self-destruction.

Consider what the affluent society left Barnaby? A young man confused in youth by the hypocritical sparkling world around him and grown into a shameful son to his parents, a good-for-nothing husband, a better-off without father, and a hopeless loser in life. The whole world seems in conflict with Barnaby.

What did the other world give Barnaby? Salvation! Tyler shows the value of the old to the general society in three phases during Barnaby’s transformation process through self-reconstruction. The first aid comes when Barnaby is dismissed from his work as unreliable as he sells a board to a customer as

the customer demands and puts the store at a disadvantage. The customer, also boss of “Rent-A-Back”, sees him as a responsible and reliable young man and offers him a job on the spot. She never doubts Barnaby even after knowing his entire history and has always held him as a trust-worthy young man whom she finally makes the successor of her business. That’s the first and also an ever-lasting trust Barnaby has never received in his other mainstream affluent society. The trust pulls Barnaby to hang on to the right track of life and leads him into the heterotopia world that finally contributes to his self-reconstruction.

Barnaby encounters his second life crisis when Sophia’s aunt Grace accuses him of stealing her money. To make things worse, Barnaby then is trying to work out his problem with his mother by saving to pay back his mother. The whole “civilized” world suspects him. Deep down, Sophia may never truly trust him. Upon realization of this, even Barnaby himself gives up trying to convince others of his innocence. At this time the old folks he works for reach out their hands voluntarily and book extra hours from him to show that they believing in him. The unconditional trust warms Barnaby up, and encourages him to get over the hardest trial of reconciliation with his mother. The second aid delivers Barnaby over the early Oedipus period of self-reconstruction.

During the last critical period of identifying with Father, the late Oedipus period, the old folks Barnaby work for make him understand that the Gaitlin angels are not the assumed supernatural beings that take shape in front of the Gaitlin men to pass on their messages, but rather the common populace, who bought the Twinforms his great grandfather manufactured and laid the very foundation of the Gaitlin’s fortune. Similarly, the average buying stockholders make the fortune for his brother. The understanding helps Barnaby critically assess his family concept of success and reforms his own life values, adding a perfect finishing touch to his self-reconstruction.

From the heterotopia of the old folk, Barnaby receives trust, support and wisdom that his mainstream society denies him. The aging heterotopia turns a complete loser from the mainstream society into a saved man of confidence and sound Ego. By stressing that Barnaby’s self-reconstruction is made possible only because of the help from the aging society, especially in contrast to the destructive influence of the mainstream society on young Barnaby, Tyler embeds in a more prominent theme in the story: the old are valuable and their wisdom functions to the advantage of the mainstream society.

4 Conclusion

A Patchwork Planet is a novel of multi-themes, among which the theme of self-reconstruction and the theme of old age are closely interwoven. The paper focuses first on illustrating how the novel is literarily molded on Lacan’s Ego-construction process through the Mirror Stage and the Oedipus period, and then on uncovering interwoven the theme of old age. By emphasizing that Barnaby’s self-reconstruction is made possible only through assistance from the aging heterotopia, Tyler seems to assert that the value of the aging society should be reconsidered, that the typical marginalized and silenced heterotopia should be reevaluated in the American society, just as Eudora Welty states in her article “Must the Novelist Crude”, “...morality as shown through human relationships is the whole heart of fiction, and the serious writer has never lived who dealt with anything else”. (Welty, 2002)

There must be many other ways to appreciate A Patchwork Planet and other Tyler stories for the benefits of our understanding of art and life. The paper is meant to share in the endeavor and invite more discussions.

A Case Study on Teaching Models for Non-English Majors' Intercultural Sensitivity

Hua Min

School of Foreign Languages, Wuhan Textile University, Wuhan, P. R. China, 430073
(E-mail: Rebecca_huamin@126.com)

Abstract: The intercultural sensitivity is an important component in intercultural competence. The relationship between intercultural sensitivity and intercultural competence is a positive correlation. Therefore, it is of great necessity to increase people's intercultural sensitivity in order to cultivate their intercultural competence. The focus of this thesis is to experiment various teaching materials and methods and to find an appropriate and efficient teaching model for intercultural sensitivity teaching in China.

Key words: Intercultural sensitivity; Teaching model; Non-English majors

1 Introduction

With China's opening to the outside world, the interaction between people from different cultures is increasing with each passing day. Culture gradually earns more weight in the society. Many scholars show great interest in it and are dedicated to this cause in the aim of an understanding and effective communication between different cultures. In the field of education, educators are showing concern on how to increase people's intercultural competence in intercultural communication. Intercultural sensitivity/awareness is one of the major components in intercultural competence. Bennett (1993:22) defines intercultural sensitivity as the recognition that "cultures differ fundamentally from one another in the way they maintain patterns of differentiation, or worldviews," and as a person's capacity to "differentiate phenomena in a variety of ways". Moran's (2003) Cultural Experience Model. Also Cushner (1997) tended to evaluate people's intercultural sensitivity in the following aspects: cultural integration, behavior response, intellectual interaction, attitudes and empathy. Various instruments developed by intercultural professionals, for instance, Intercultural Development Inventory (IDI), Inventory of Intercultural Sensitivity, the Intercultural Sensitivity Scale and Intercultural Sensitivity Inventory, are used to measure intercultural sensitivity/awareness. Therefore, in the field of intercultural studies, systematic and scientific ways in measuring intercultural sensitivity have been presented by foreign researchers. By using the scientific instruments, educators can experiment and find effective intercultural teaching methods.

2 Literature Review

2.1 Definition of intercultural sensitivity

The term of intercultural sensitivity has considerable theoretical and practical significance for the study and teaching of intercultural communication. According to Bennett (1993), intercultural sensitivity is the construction of reality as increasingly capable of accommodating cultural difference that constitutes intercultural development. Song (2014) argues that this dimension of intercultural competence includes self-esteem, self-monitoring, empathy, open-mindedness, nonjudgmental and non-evaluative attitude, etc. From the psychological perspective, intercultural sensitivity is how we respond to differences. It consists of three responses, namely, affective response and cognitive response. So the working definition of intercultural sensitivity for this study is the sensitivity to the importance of cultural diversity and cultural similarity in every aspect of culture as well as the ability to accept, appreciate and adapt to other cultures.

2.2 Researches on intercultural sensitivity teaching

The Developmental Model of Intercultural Sensitivity (DMIS) was created by Dr. Milton Bennett in 1993 as a framework in order to explain the reactions of people to cultural difference. Using concepts from cognitive psychology and constructivism, he organized these observations into six stages of increasing sensitivity to cultural difference. Hanvey's (1979: 46-56) model of culture learning interprets this process as one of learners' increasing awareness, culminating in their subjective understanding of the culture from the perspectives of its members. In this model, learners shift their attitudes toward the culture, progressing from "unbelievable" to "believable," each with two distinct feelings attached. For Hanvey, the subjective nature of this awareness is essential. It represents a "felt" understanding, resulting from learners' extended living and working in the culture.

3 Method

This survey employed a combined methodology of quantitative study and qualitative study. Questionnaire was designed to obtain data. In this part, the author not only displayed the research questions, the subjects, the trainer, instruments of the survey, but also gave a detailed description of the research procedures and the intercultural teaching workshop design.

3.1 Research questions

1) Before teaching, what is the students' current level of intercultural sensitivity? Is there any significant difference in intercultural sensitivity between the students who are planning to go abroad and the students who are just to stay at home?

2) Is the current teaching model applicable and effective in intercultural sensitivity teaching?

3) Are the teaching methods employed in intercultural sensitivity teaching applicable and effective? Which one or ones are greatly appreciated by the Chinese university students?

3.2 Information of the subjects and the trainer

The subjects in this special teaching program were all non-English majors who entered Wuhan Textile University (WTU) in the year of 2014. The teaching program was carried out in the first semester of their second year on campus. Forty-one subjects enrolled in the College of Electrical and Electronic Engineering, were involved in the experimental group while the other forty-one subjects, also with 6 females (14.6%) and 35 males (85.4%), enrolled in the Institute of Energy and Power, were involved in the control group. The students have learnt English for at least 7 years.

3.3 Instrument

A total inventory score was obtained by adding the various subscale scores together. Considering the English proficiency of some students, a Chinese version of the questionnaire, which was examined and approved by experts in this field, was also administered to help the participants in order to have a better understanding of all the items stated in the inventory. Before both the pretest and the posttest, students were told by the instructor that their responses to the questionnaire had no influence on their final evaluation for their English course.

3.4 Research procedures

At the beginning of the teaching project, all the participants in experimental group and control group were told to answer the questionnaire as the pretest. After that, only the experimental group participated in the specially designed teaching program in addition to College English courses whereas the control group just had routine English classes. The teaching program lasted six weeks. It consisted of 7 sections. At the conclusion of six weeks, all participants in the experimental group and the control group retook the rearranged inventory to finish the posttest.

3.5 Data collection

Sets of the scores of the questionnaire were collected, two paired (pretest-posttest) sample t-tests were carried out in the control group and the experimental group respectively to see whether the two groups had some progress or not after a period of six weeks. An independent sample t-test was also used to see whether or not there was a significant difference in the posttest between the control group and the experimental group. All the analyses were performed using Statistical Package for Social Sciences (SPSS) version 11.5. The data from the interview were documented and summarized.

4 Findings and Discussion

4.1 Results of the two paired sample t-tests results of the paired sample t-test for the control group

Table 1 Paired Samples Statistics for the Control Group

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	PRETOTAL	133.0976	41	8.85947	1.38362
	POSTTOTAL	149.9024	41	7.62498	1.19082
Pair 2	PREC	39.2683	41	4.08671	.63824
	POSTC	46.6585	41	4.81980	.75273
Pair 3	PREB	23.6585	41	2.89491	.45211
	POSTB	26.2439	41	2.82649	.44142
Pair 4	PREI	25.4146	41	3.66043	.57166
	POSTI	27.7805	41	2.85055	.44518
Pair 5	PREA	22.7317	41	3.47149	.54216
	POSTA	25.0244	41	3.37259	.52671
Pair 6	PREE	22.0244	41	3.65026	.57007
	POSTE	24.1951	41	2.81265	.43926

Note: POSTTOTAL means the total score of the questionnaire

Table 2 Paired Samples Test for the Control Group

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	PRETOTAL - POSTOTAL	-16.8049	5.99675	.93653	-18.6977	-14.9121	-17.944	40	.000
Pair 2	PREC - POSTC	-7.3902	4.81081	.75132	-8.9087	-5.8718	-9.836	40	.000
Pair 3	PREB - POSTB	-2.5854	3.22471	.50362	-3.6032	-1.5675	-5.134	40	.000
Pair 4	PREI - POSTI	-2.3659	4.49864	.70257	-3.7858	-.9459	-3.367	40	.002
Pair 5	PREA - POSTA	-2.2927	4.71828	.73687	-3.7820	-.8034	-3.111	40	.003
Pair 6	PREE - POSTE	-2.1707	4.35260	.67976	-3.5446	-.7969	-3.193	40	.003

In this section, paired sample t-test was conducted to compare the difference before and after the teaching program for the control group. In the table of paired sample of statistics, the mean score was 133.0976 for PRETOTAL and 149.9024 for POSTTOTAL (see table 1). A review of the mean scores of the five sub-scales also indicated that all the posttest mean scores were more or less higher than the ones of the pretest. However, the significances for each item analyzed were 0.000, 0.000, 0.000, 0.002, 0.003, 0.003 (see table 2) which indicating the significant difference between PRETOTAL and POSTTOTAL as well as between all the other sub-scales tested. This revealed that then intercultural sensitivity of the control group had been raised. Results of the Paired Sample T-test for the Experimental Group

Table 3 Paired Samples Statistics for the Experimental Group

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	PRETOTAL	133.3415	41	16.67425	2.60408
	POSTOTAL	167.1707	41	8.19421	1.27972

	POSTE	26.5122	41	2.32510	36312

Table 4 Paired Samples Test for the Experimental Group

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	PRETOTAL - POSTOTAL	-33.8293	10.16834	1.58803	-37.0388	-30.6197	-21.303	40	.000
Pair 2	PREC - POSTC	-13.0244	6.32253	.98741	-15.0200	-11.0288	-13.190	40	.000
Pair 3	PREB - POSTB	-4.1463	3.35828	.52448	-5.2063	-3.0863	-7.906	40	.000
Pair 4	PREI - POSTI	-6.9512	4.54396	.70965	-8.3855	-5.5170	-9.795	40	.000
Pair 5	PREA - POSTA	-5.6585	5.36474	.83783	-7.3519	-3.9652	-6.754	40	.000
Pair 6	PREE - POSTE	-4.0488	3.39817	.53071	-5.1214	-2.9762	-7.629	40	.000

In this section, paired sample t-test was conducted again to compare the difference before and after the teaching program for the experimental group. In table 3, the mean score was 133.3415 for PRETOTAL and 167.1707 for POSTTOTAL. A review of the mean scores of the five sub-scales also indicated that all the posttest mean scores were more or less higher than the ones of the pretest. However, the significances for each item analyzed were all 0.000 (see table 4), which indicating the significant difference between PPRETOTAL and POSTTOTAL as well as between all the other sub-scales examined. This revealed that the intercultural sensitivity of the experimental group had also been increased.

4.2 Major findings and discussion

Based on the results presented in the questionnaire, some major findings as well as discussion were presented below.

4.2.1 Higher levels of intercultural sensitivity for the would-be-abroad group

As it is demonstrated in the results, the would-be-abroad students were more inter-culturally sensitive than the would-be-home students. The former group demonstrated greater strengths in the aspects of cultural integration, behavioral response, intellectual interaction as well as attitude

4.2.2 The effectiveness of the teaching model

The different performances in the posttest between the control group and the experimental group indicated that both the teaching model and the teaching methods or techniques were quite successful and effective in intercultural sensitivity teaching. The teaching model is quite applicable and effective.

4.2.3 The applicability and appreciation of the teaching methods

The teaching methods experimented in the whole teaching program were group discussion, lectures, written materials, films, case studies, computer-based teaching, situation games, intercultural exercises, contrast culture teaching, cross-cultural dialogues, immersion, as well as art and culture. These methods as a whole played an important role in raising trainees' intercultural awareness. From the interview, three methods were greatly appreciated by the trainees, namely, art and culture, film, as well as simulation games.

5 Conclusions

This current research has several major findings. First, before teaching, the students with the intention of going abroad outperformed the students without this intention in intercultural sensitivity test. The would-be-abroad demonstrated higher level of intercultural sensitivity. Secondly, after teaching, the teaching model employed in the experiment was proven to be quite effective in intercultural sensitivity teaching in China. Thirdly, the teaching methods adopted were quite applicable. The methods most appreciated by the trainees were art and culture, films, as well as simulation games. The results of this survey reveal several implications in the setting of English teaching and intercultural teaching in China. This research suffers from two limitations. First, this study is considered to be limited number of subjects. It only has two groups of students gathered together at the same time for training. Second, this study is in the lack of real world experience of interaction and communication with foreigners. Based on the two limitations, further researches are suggested to be carried out among larger groups of Chinese university students coming from all over the country and to be held activities of interaction and communication with foreigners, to verify the results of this study.

A Case Study of Content-Based Instruction Program on EFL

Yu Dongdong

School of Foreign Language, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: stevenydd@126.com)

Abstract: Centered on fostering students' foreign language competence advancing in the knowledge of a subject matter, content-based instruction (CBI) has been widely used in a variety of models in recent years. Three most common ones at post-secondary level are theme-based courses, sheltered courses, and adjunct courses. Based on the theme-based model, this study aims at investigating the effect of CBI on non-English major students' language performance. Semi-structured interview techniques were used to examine students' attitudes and effect of CBI. Results indicate that the application of content-based instruction in foreign language class could enhance students' language proficiency as well as cognitive ability. Interview results also provide in-depth information that further supports the experimental findings. Additionally, several pedagogical implications in content-based instruction programs are provided.

Key words: Content-based instruction; Theme-based model; Intercultural communication course; Foreign language

1 Introduction

As an approach to second and foreign language teaching, content-based instruction (CBI) is relatively a newcomer to the field. It first appeared on the general language teaching scene in the 1980s, and has gained increasing popularity and wider application in the 21st century. CBI is intended to foster the integration of language and content, viewing "language as a medium for learning content and content as a resource for learning and improving language" (Stoller, 2002). According to Met (1991), natural language acquisition occurs in context, which is never learned separated from meaning, and CBI provides a context for meaningful communication to occur.

Since content-based teaching is the teaching of content or information in the language being learned with little or no explicit effort to teach the language itself, courses in CBI programs generally require an integrated rather than a discrete skill approach: instead of "leaning" reading, writing, speaking, and listening skills, learners "use" language to learn about a topic, make presentations, debate related issues and write reports. The rationale is that the students will "learn language through content" as a result of "leaning content through language" (Chapple & Curtis, 2000). Grabe and Stoller (1997) suggest seven rationales for CBI that can be summarized in the following points:

- 1) In content-based classrooms, students are exposed to a substantial amount of language while learning content.
- 2) CBI supports contextualized learning; students are taught useful language that is embedded within relevant discourse contexts rather than as isolated language fragments.
- 3) The use of coherently developed content sources allows students to call on their own prior knowledge to learn additional language and content material.
- 4) In a content-based classroom, students are exposed to complex information and are involved in demanding activities which can lead to intrinsic motivation.
- 5) CBI lends itself well to strategy instruction and practice, as theme units naturally require and recycle important strategies across varying content and learning tasks.
- 6) CBI allows greater flexibility and adaptability to be built into the curriculum and activity sequences.
- 7) CBI lends itself to student-centered classroom activities.

2 Models of CBI

It is in post-secondary education that CBI offers the richest variety of proposals, among which three models are generally considered: theme-based model, sheltered model and adjunct model.

2.1 Theme-based model

Theme-based language course is structured around topics or themes. Such courses typically deal with several topics along its progression and the major curricular units are organized by themes that are chosen to be appropriate to student academic and cognitive interests, educational aims, and institutional demands. Major principles underlying theme-based model contain automaticity, meaningful learning, intrinsic motivation, and communicative competence (Brown, 2001).

A key characteristic of these courses is the interest in the concept of integrated skills. Students are required to make presentations and oral reports, engage in discussions and debates, give oral or

written response to issues related to the topics, or write summaries and commentaries. Their oral passages or written texts also serve as an optimal foundation for further exploring other areas like grammar, vocabulary, language awareness, etc. Different skills and language analysis are therefore integrated around the selected topics in a meaningful, coherent manner. In theme-based model, language instructors are responsible for language and content instruction (Brinton et al., 1989). The theme-based model is mainly employed in adult schools, language institutions, and all other language programs.

2.2 Sheltered model

Sheltered instruction is an approach to use second language acquisition strategies while teaching content area instruction. The term “sheltered” derives from the model’s deliberate separation of second language students from native speakers of the target language for the purpose of content instruction. In the sheltered model, an academic subject matter is taught by content instructors in content areas, such as science, history, literature or business by using language and context to make the information comprehensible. In order to meet the desired result, there has to be an accommodation of the instruction to the students’ level of proficiency in the language.

Characteristics of sheltered instruction include comprehensible inputs, warm and affective environments, high levels of student interaction, student-centered, hands-on tasks, and comprehensive planning (Echevarria & Graves, 2003). It also facilitates the development of language abilities for students to meet the course aims: if properly conducted, sheltered courses can offer a very effective approach for integrating language development and content learning for students whose language abilities are not developed enough

2.3 Adjunct model

Adjunct model constitutes a more sophisticated pattern for the integration of language and content. It aims at connecting a specially designed language course with a regular academic course. In the adjunct model, students enroll in two linked courses simultaneously—a content course and a language course. The content instructor focuses on academic concepts while the language instructor emphasizes language skills using the content-area subject as a background for contextualizing the language learning process (Brinton et al., 1989). Thus, the adjunct courses work as support classes for regular subject matter courses, and offer great opportunities to develop the academic strategies necessary to cope with real academic content. The rationale of this model is that the linked courses can assist students developing academic coping strategies and cognitive skills which can be transferred to other disciplines. In addition, the fact that the course deals with real academic subject matter helps to increase motivation in terms of mastering both the language and the content.

To sum up, although sharing certain features such as using authentic tasks and materials, these three models of CBI differ in several ways, including the course aim and learning objectives, instructor’s roles, students’ proficiency levels, and evaluation approaches. Based on the theme-based model of CBI, the following study was intended to investigate the effect of CBI on non-English major students’ language performance.

3 Methodology

3.1 Subjects

The subjects in this study were 132 freshmen, including 87 male and 45 female non-English majors at Wuhan University of Technology, China. Most of the subjects had received formal English instruction for about nine years before conducting the study. The subjects took Intercultural Communication as a required course in the fall of 2013 academic year.

3.2 Learning contexts

Subjects in the study received a 90-minute instruction per week, lasting for 16 weeks, with Intercultural Communication (by Chang Junyue, Lu Chunmei, and Zhao Yongqing) being used as the teaching material. The curriculum, mainly applying the theme-based model, is elaborated as follows in terms of course aims, course objectives, and teaching approaches.

3.2.1 Course aims

The aims of the reading course were divided into two parts: content and linguistic aims. The content aims included: 1) students could develop a clear mind of the features of communication; 2) students could lay the foundation for appreciating Chinese culture as well as western culture; and 3) students would become interested in intercultural communication and therefore develop their autonomous learning ability. The linguistic aim was mainly to help students use freely the target

language, English in this study, to analyze problems and solve problems. In the meantime, the development of better intercultural communication strategies is also appreciated.

3.2.2 Course objectives

Based on the course aims, course objectives were made including 1) developing background knowledge of content; 2) acquiring key vocabulary of content; 3) identifying intercultural communication elements such as verbal communication, nonverbal communication, cross-cultural communication, culture shock, cultural etiquette, etc. and 4) arousing students' interest in intercultural communication. Linguistic objectives included 1) predicting the possible responses of Chinese people as well as foreigners under certain circumstances; 2) figuring out proper responses so as to avoid misunderstanding in intercultural communication; and 3) acquiring intercultural communication strategies.

3.2.3 Teaching approaches

The researcher adopted the student-centered pedagogy to conduct the course. Students were required to collect adequate information about the subject matter before class and then make presentations about it in class. Related cases were also discussed by the students to figure out the proper communication strategies used in particular situation. Thus the students were given substantial opportunity to use the language to have a better knowledge about the content. The teacher in class mainly demonstrated his instruction in language and content by helping students organize their discussion, offering enough background information to clarify the content being learnt, and making timely comment on students' performances.

3.3 Procedure

As is mentioned above, the purpose of this study was to investigate the effect of CBI on non-English major students' language performance. Three assumptions were made in advance in terms of linguistic ability, cognitive development, motivation, and teachers' role in applying the content-based instruction: 1) The application of content-based instruction can enhance students' language ability of using English. 2) The process of completing the content-related tasks consequently helps the students with their cognitive skill development. 3) Students are motivated to be more interested in intercultural communication through learning English language. Accordingly, the curriculum was carried out with the following procedure:

3.3.1 Pre-learning test and questionnaire survey

A pre-learning test was conducted during the first week of the course. Test items were divided into two parts to figure out 1) the subjects' English proficiency level and 2) the subjects' cognition level including how much they know about culture, communication and intercultural communication strategies before instruction, 50 points respectively. Questionnaire design mainly focused on students' motivation of L2 learning, students' attitude towards CBI courses, and their expectation from the course.

3.3.2 Post-learning test and end-term questionnaire survey

At the end of the 16-week training, a post-learning test was employed to investigate the learning outcomes. The test items were the same as those of the pre-learning test. Questionnaire design mainly focused on students' motivation of L2 learning, students' attitude towards CBI courses, and their evaluation of the course.

3.3.3 Semi-Structured interview

In addition to the tests and surveys, a semi-structured interview was also employed in the study at the end of the course. The researcher randomly selected 20 subjects as the interviewees to answer six predetermined questions with regard to the subjects' past, present learning experiences, and their opinions about CBI course.

4 Results

To examine the effect of CBI on students' general English proficiency, a paired-test was employed to investigate whether there is a significant difference between the pre- and post-learning test administered in this study. The results of language proficiency part show that the mean score of the pre-test was 32.3 while the mean increased to 39.5 after the 16-week instruction, which demonstrates a statistical difference between the two tests. Therefore, we can safely conclude that the CBI course had a prominent effect in increasing students' general English proficiency. As for the cognitive part which is related to the content matter, the mean increased from 29.4 of pre-learning test to 43.6 of post-learning test. The significant difference reveals that the process of completing the content-related tasks such as class presentation provide substantial opportunities for the students to practice language since they have

to decide what kind of information to use and how to attain the information, experiencing a process of information analyzing and synthesizing before presenting the self-collected information. Consequently, such tasks help the students with their cognition development in the content area.

According to the interview results, most participants hold positive attitudes toward the teaching of a specific subject matter. For example, almost all the interviewees, 19 out of 20 (95%) reported that content-based instruction about intercultural communication helped them understand culture differences better. 13 of them (65%) even reported that they had a clearer mind of why Chinese people behave in a particular way under certain circumstances. This suggested that students tended to take Chinese people's behavior for granted so that they used to overlook cultural differences when communicating with foreigners. Moreover, 16 interviewees (80%) expressed they were more confident in adopting proper communicative strategies to avoid misunderstanding, more interested in intercultural communication, and more desired to develop their English level. As for the diverse activities designed for the class, most students agree that through the process of problem solving, they had a clear framework about communication and such activities had lowered their anxiety in using the language since no right answers were offered. At the same time, they also lay emphasis on teacher's feedback and proper instruction in class such as building background knowledge, timely comments on students' presentation, and comprehensible input, etc. However, some of the interviewees complained that the activities were time-consuming (8 out of 20) and felt the course of little use in enhancing their language proficiency (5 out of 20).

5 Conclusion

The findings of this study clearly point out the significant difference the CBI course has made on non-English majors. The findings are related to one content-based instruction program in particular. Still, the result of the study proves that content-based instruction can be utilized as a way of providing a meaningful context for language instruction while at the same time providing a vehicle for reinforcing academic skills. Furthermore, CBI has been regarded as an effective approach to improve students' language skills and develop critical thinking as well (Huang, 2003). The results of the study also confirm that students made great gains in analytical ability and developed their language strategy, showing that students gain cognitive development by involving in a variety of thinking processes in the CBI program. Thus, this particular CBI program is proved to be effective, motivating, and particularly advantageous for language students. Many psychological and pedagogical benefits, including self-confidence, high motivation, low anxiety, cognitive development, and language proficiency, are promoted by the utilization of CBI program.

CBI in China is still at its initial stage, and the approach itself does not guarantee success. In theory, CBI is mixed with other language approaches such as bilingual education and English language for specific purposes. However, an effective CBI program depends heavily on its implementation, that is, the teachers' appropriate use of the approach, which is closely associated with the teachers' understanding of CBI. Although large amount of professional literature argues for the benefits of content-based instruction, little research is done on how it is appropriated and carried out by foreign language teachers in class and how teachers actually weave together foreign language and academic content instruction. It is hoped that the study may offer implications for language teachers as well as syllabus and material designers to further research and practice on some critical issues such as teaching materials, teachers' development and teaching models.

Development and Tendency Analysis of Information Literacy Research Based on Web of ScienceTM

Zhang Yiqing

Library of Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: zhangyiqing@whut.edu.cn)

Abstract: This paper carried out overall analysis on information literacy research using bibliometric method from different angles such as the influence power, author, journal, keywords based on web of scienceTM. It proposed that university and university libraries are the backbones of information literacy research, and the research methods of information literacy are no longer limited to the field of library and information science and social science, inter - science crossing and penetration have become irreversible trends, especially the application of information technology and computer technology attracted much attention. In addition, due to the late start, the research in China has a very big gap compared with foreign countries. The conclusion is that future efforts should be made to build a good scientific research environment and concentrate superior forces to form the research team of three-dimensional knowledge structure so as to improve the quantity and the academic influence of information literacy research in China.

Key words: Information literacy; H-index; Statistical analysis; Coauthor ratio; Bibliometrics

1 Introduction

“information literacy” was first proposed by the chairman of the American Information Industry Association—Paul Zurkowski in 1974. He defined it as “the technology and skills to look for, evaluate and effectively use the information to get answers to the questions utilizing a lot of information and the main source of information.”^[1] We all know that the Information Literacy Meeting of Experts, organized by the US National Commission on Library and Information Science and the National Forum on Information Literacy proposed several Information Literacy principles, the so-called 《THE PRAGUE DECLARATION "TOWARDS AN INFORMATION LITERATE SOCIETY"》 in September, 2003.^[2] In the context, the experts proposed for the urgent consideration on Information Literacy of governments, civil society and the international community. It announced that information literacy was becoming an important social factor as well as the prerequisite for people to join the information society. This caused a wide range of responses in the field of information science and libraries. The amount of literature has obviously increased from then on.

Information literacy has always been a research hotspot in the field of information science in foreign countries since the late 70's. Foreign scholars mainly concerned about the connotation, property, training target, aptitude test, model construction and effective evaluation method of the information literacy in the past 40 years. The aim of their research is to help people improve the level of information literacy and to realize the standardization and popularization of information literacy evaluation. In recent years, the study in foreign countries gradually transformed from the subjective evaluation to the experimental evaluation. However, in general, the quantitative research on the information literacy is still lacking.

The researches in China due to the late start have a very big gap compared with foreign countries. They are focused on the summary of foreign research theories and still in the discussion stage of the research method at present. The specific model of information literacy testing and evaluation has not been constructed yet, therefore, the quantitative study is in serious shortage. Actually, since the introduction of the concept of information literacy from abroad in the mid 90's, the Chinese scholars generally valued theory but ignored practice and lacked innovation in their research work, a lot of their works are translation or reviews of foreign related literature, few of them form their own opinions. In addition, most of the researchers in China did not clarify the specific purpose of their research results, so they need further thinking of the significance of study.

2 Data and Methodology

In order to survey the development of information literacy studies all over the world and forecast the future trend, the writer executed a retrieval in the database “Web of ScienceTM” with “information literacy” as the subject term. Specific retrieval conditions are these: 1) Topic=(information literac*) OR

(information literat*) OR (information qualit*); 2) Indexes: SCI-EXPANDED, SSCI, CPCI-S, CPCI-SSH; 3) Timespan: All years; 4) Research Areas: INFORMATION SCIENCE LIBRARY SCIENCE. The retrieval returns 1128 papers. Then the writer carries out the analysis using bibliometric method from different angles such as the influence power, author, journal, keywords, etc. so as to reveal the inner law of information literacy research and make an accurate judgment of the future research direction.

3 Statistical Analysis and Discovery

3.1 The influence power analysis

Figure 1 Distribution Map of Cited Frequency of Papers

The cited times is the important index of the influence power of a paper. The total cited times of all the 1128 papers is 6984, divided by 1128 is the international average cited times 6.19. The highest average cited times is 29.25 of Holland, followed by Taiwan, 11.73. U.S.A. ranks third, 9.72. The average cited times of Chinese authors is 3, it is below the international average cited times. This indicates that the Chinese scholars are relatively lack in academic influence in this field. Visible by Figure 1, the low cited papers occupy the majority (of which zero cited papers 528), which shows that most of the papers receive little attention. And there are 9 papers of which the cited times is higher than 9. These 9 high cited papers were published between 2002 and 2008. 7 from America, 1 from Holland, 1 from Taiwan. So America obviously has a leading position in the field of information literacy research. The research area of 8 of these papers is “computer science, information system”, the proportion is as high as 89%. This shows that the application of information technology and computer technology is a focus for concern but just relatively scarce in the research field of information literacy, so we can draw a conclusion that the development of new information resources and software is the innovation and breakthrough of this subject.

Among them the highest cited paper is from DeLone, WH^[3] of Kogod Business Administration College of American University published in 2003, it was cited 1207 times in all, the annual mean cited times is up to 101. DeLone (2003) discussed the utility of the updated DeLone and McLean Information Systems (IS) Success Model, focusing especially on research efforts that apply, validate, challenge, and propose enhancements to the original model.

3.2 Author analysis

We can find the high-yield authors and core authors in the research area of information literacy through the analysis of authors. In addition, we can get hold of their background as well as their researching trends so as to tap the potential information and direct the cooperation accordingly.

3.2.1 Nationality of authors

Despite the 79 papers without country information, the top few countries sorted by the number of papers are America (426), England (94), Australia (87), Canada (54) and Spain (44), respectively accounted for 37.8%, 7.7%, 4.8%, 3.9%, 8.3%. China ranks in the 12th (16), accounting for 1.4%. And research in China clearly started late, the earliest paper published in 2007, the subsequent research was not continuous and tended to be stable until 2011 without much promotion. Visible by Figure 2, the research results in China are very few compared with the U.S.A. and other developed countries. This is due in large part to the slow development of information literacy education and poor informationization degree in China.

Figure 2 Comparison of Papers Published in China, USA, Britain, Australia

3.2.2 Co-authorship analysis

Add all the numbers of authors together, divided by the number of papers according to the national classification, we can get the average number of authors in different countries. After calculation, the average numbers of authors of the United States, Britain and Australia are 1.80、1.74、1.84 respectively, the data is very close. China's data is 2.81, significantly higher than the data of above mentioned countries, and also higher than the international average number of authors 1.91. This indicates that co-authors in China are more common. In fact, there are 14 co-author articles in China, the co-authorship ratios as high as 87.5%. 6 articles of them belong to the cooperation within the department, 2 belong to the inter-school cooperation, 3 belong to the intercollegiate cooperation, 3 belong to the cross-border cooperation. This shows that Chinese scholars are good at cooperation, scientific researchers in various fields are deeply influenced by the idea of “two heads are better than one”. And Chinese scholars dare to change and innovate the forms of cooperation, not to stick to one pattern. It is indeed deserving praise.

Figure 3 Average Numbers of Authors

3.2.3 High-yield authors and core authors

After statistical analysis, it is found that the highest yield author was Pinto, Maria in Spain who has published 18 papers. Calculated according to the price law^[4] $N=0.749*\sqrt{x}$ (the number of papers of the highest yield author), the lowest number of papers of core author candidate is 3.18. But I think that only relying on the amount of papers to determine the core author is not scientific, we should integrate that with the study of the cited case of papers. So h-index^[5] (a scientific evaluation index proposed by Professor J.E.Hirsh, an American Statistical physicist in 2005, refers to at most h articles of a writer cited at least h times) is introduced. It is considered that the higher the h index is, the greater the writer's academic influence. According to the statistics, there are 22 people who published more than 4 papers, the total number of papers published by them is 142, accounting for 12.6% of the total number of papers. The distribution range of their h indices is from 0 to 7. The study also finds that with the increase of the h index, the number of core authors decreased sharply. Among them, the h indices of 12 people exceed 3, 7 people exceed 4, but only 3 people exceed 5. Details can be seen below in Table 1.

Table 1 H Index List of Authors with 4 or More Papers

H-index	0	1	2	3	4	5	6	7
Number of people	4	3	3	5	4	1	1	1
Proportion	18.18%	13.64%	13.64%	22.73%	18.18%	4.55%	4.55%	4.55%

The 7 authors whose h indices and published papers amount exceed 4 are identified as the core authors in the field of information literacy research. They are Lloyd, Annemaree in Australia, Julien, Heidi and Badke, William in Canada, Pinto, Maria in Spain, Gross, Melissa, Oakleaf, Megan and Stvilia, Besiki in the U.S.A. They have published 66 papers in total, 9.43 papers per capita. Specific data see Table 2.

Table 2 Core Authors

Core authors	Nationality	H index	Number of papers	Co-author proportion	Total cited times	Cited times per paper
Lloyd, Annemaree	Australia	7	13	23.08%	201	15.46
Julien, Heidi	Canada	6	9	88.89%	101	11.22
Pinto, Maria	Spain	5	18	72.22%	79	4.39
Gross, Melissa	U.S.A.	4	5	100%	86	17.2
Oakleaf, Megan	U.S.A.	4	8	37.5%	44	5.5
Badke, William	Canada	4	9	0	25	2.78
Stvilia, Besiki	U.S.A.	4	4	100%	142	35.5

American authors occupy 3 places in the 7 seats of core authors, Canadian 2, Australian 1, Spanish 1. The highest total cited times belong to Lloyd, Annemaree (201) in Australia, the highest cited times per paper belong to Stvilia, Besiki (35.5) in the U.S.A. From the angle of institutional analysis, these 7 core authors are all from University, moreover, Stvilia, Besiki and Gross, Melissa are both from Florida State Univ, Coll Commun & Informat, Sch Lib & Informat Studies. So we can learn that university and library are still the backbone of the information literacy research. Gross, Melissa's research team has 2 members, Stvilia, Besiki's research team has 7 members. All this information would help us to track the core authors and their teams so as to get the latest research trends and progress in time.

Co-authorship also shows diversification. The highest is 100%, the lowest is 0. The two authors of the 100% co-authorship ratio are Stvilia, Besiki and Gross, Melissa mentioned above, and the highest cited times per paper also belong to them (35.5 and 17.2 respectively). This shows that the sense of teamwork between the United States scholars is strong thus the academic level of their cooperative research results is high. At the same time, the total and per paper cited times of the author of the lowest co-authorship ratio are both the lowest (25 and 2.78). The enlightenment is that in the case of increasing difficulty of the research work, a paper with appropriate partners can be complementary in the knowledge structure and the research methods, so that it can give full play to the collective wisdom and power and achieve a high level of research results. Therefore, in order to improve our country's academic influence in the field of information literacy research, we should give support in scientific research and talents import policies, form multidisciplinary research teams, encourage deep, multidimensional cooperation between authors and various subjects. These are our urgent affairs.

3.3 Journal analysis

3.3.1 Journal discipline distribution

The 71 journals on which 1128 papers were published cover 10 subjects. Horizontal comparison is shown in Figure 4. We can see that discipline distribution is extremely uneven. "information science and Library Science" and "computer science, information systems" are the most important orientations in percentage, which contain 74.5% and 20.9% separately. This shows that the librarians are still the main force in the field of information literacy research, followed by the technicians engaged in the design of information system and the software development who have science and engineering background. Because the promotion of information literacy research is to a large extent dependent on the application of information technology and the development of stable and reliable information system as a support, so technicians occupy a considerable proportion. Other subjects covered include management, law, humanities, communication, artificial intelligence etc., but haven't formed dimensions yet. It reveals that something has been attempted in the interdisciplinary study of information literacy, but it is still not mature and has not formed academic influence. But look to the future, the intersection and infiltration of various disciplines are inevitable trends and necessary methods of scientific research. I believe that the cooperation and innovation based on subject dimension would certainly cause the formation of the new research hotspots in information literacy.

Figure 4 Subject Distribution of Journals

3.3.2 Core journal analysis

As mentioned above, 1128 papers were published in 71 journals, so the average load is 15.89. Using Brad Ford's law^[14] to analyze, we can divide the journals into core areas, related areas and non related areas according to the number of published papers on information literacy in descending order, meanwhile, the number of papers of each partition is roughly equal. The result is that the corresponding number of journals per partition is 6, 11, 54, not completely accord with the distribution law of $1 : n : n^2$ ^[15]. So we can conclude that the periodical collection of information literacy research is still developing, and needs to be optimized and perfected. The following 6 journals are recognized as the core journals of information literacy research.

Table 3 List of Core Journals

Journal	Number of papers	Proportion	Impact factor	Cited times per paper	Place of publication
JOURNAL OF ACADEMIC LIBRARIANSHIP	136	12.06%	0.574	4.51	U.S.A.
PORTAL-LIBRARIES AND THE ACADEMY	65	5.76%	0.651	3.94	U.S.A.
INFORMATION RESEARCH-AN INTERNATIONAL ELECTRONIC JOURNAL	58	5.14%	0.660	0.88	Britain
OLLEGE & RESEARCH LIBRARIES	50	4.43%	1.333	4.38	U.S.A.
JOURNAL OF LIBRARIANSHIP AND INFORMATION SCIENCE	49	4.34%	0.273	4.08	Britain
JOURNAL OF THE AMERICAN SOCIETY FOR INFORMATION SCIENCE AND TECHNOLOGY	46	4.08%	2.230	18.78	U.S.A.

These 6 core journals published a total of 404 papers, accounting for 35.8% of the total number of articles. The first 5 journals are the sources of SSCI, and the sixth one is the source of SCI. The research methods and achievements of information literacy are mainly those of social sciences. And the impact factors of these journals are generally not high. This reflects from another perspective that the impact factors of journals of library science and information science are relatively low. As can be seen from Table 3, the «JOURNAL OF ACADEMIC LIBRARIANSHIP» published the most papers (136), accounting for 12.06% of the total number. And the highest cited times per paper belongs to the «JOURNAL OF THE AMERICAN SOCIETY FOR INFORMATION SCIENCE AND TECHNOLOGY», which reaches 18.78. This shows that although the proportion of the research topics of combining information technology with information literacy theory is not high, but they indeed got

great attention, we have reason to believe they are bound to be the development direction and focus of study on information literacy in the future.

3.4 Keyword analysis

Analyzing all the key words appear in the 1128 documents statistically, removing the “information literacy” 、 “information quality” used as the search words, we get a total of 757 key words. There are 12 key words of which the frequency is more than 10, as shown in Table 4.

Table 4 High Frequency Key Words

Key words	Frequency
Academic libraries	34
higher education	24
University libraries	22
Worldwide web	20
Libraries	20
information retrieval	17
library instruction	15
Librarians	13
Service quality	13
information seeking	10
User satisfaction	10
Web 2.0	10

The above high frequency keywords are divided into three categories. The first category is of education: higher education、 Academic libraries、 University libraries、 library instruction、 Libraries、 Librarians; The second is of technology: Worldwide web、 information retrieval、 Web 2.0、 information seeking; Then the category of evaluation and perception: Service quality、 User satisfaction. So education and technology are the two supporting pillars of information literacy research. Based on technology, serving education (especially higher education) is the inherent law and development track of the information literacy research. At the same time, the user experience and evaluation of information system performance are gaining increasing concern from the researchers.

4 Conclusion

Through the comprehensive statistical analysis of the information literacy literature collected in web of scienceTM, I believe that: ①The publication of the PRAGUE DECLARATION in 2003 greatly contributed to the development of the information literacy research, and then the amount of documents enormously increased; ②Several developed countries such as the United States, Britain and Australia are pioneers in the field of information literacy research, especially the United States, both the number and quality of American papers are remarkable; ③University and university libraries are the backbones of information literacy research, some of the high yield authors and their team's research results are of high academic level, deserving our sustained attention; ④With the rapid development of computer information technology, the research methods of information literacy are no longer limited to the field of library and information science and social science, inter-science crossing and penetration have become irreversible trends, especially the application of information technology and computer technology attracted much attention; ⑤With the rapid development of the network and the need of “lifelong learning” is accepted by more and more people, “people” as the core factor as well as the service object of the information system, their natural attributes (Consciousness and attitude) and social attributes (the ability to exchange information and evaluate information) are obtaining more and more attention. The evaluation of information system performance and assessment on user experience will be the future research directions of the scholars; ⑥Due to the late start, the research in China has a very big gap compared with foreign countries. Both the quantity and the academic influence of it are not high. Future efforts should be made to build a good scientific research environment and concentrate superior forces

to form the research team of three-dimensional knowledge structure. On this basis, increasing the range and depth of the discipline cooperation should be the top priority.

Cross-Border Investment -Culture is a Challenging Factor for the HR Management to the Chinese Enterprises

Abdul Ghafar Khan

School of Management, Wuhan University of Technology, Wuhan, China

(E-mail: kxanhamiya@gmail.com)

Abstract: Most of the companies in china are now extending their business activities from china to the outside countries. Cross-border investment needs comprehensive assessment of cultural environment from various aspects for the better management of human resources. It has added challenges of having to deal with both national and organizational culture differences. In this paper the researchers analyze the cultural dimensions of the Chinese cross border investment using Hofstede cultural dimension theory. The most challenging factor in the cultural changing environment is the proper utilization of human resource management specially to manage their performance. This paper highlighted some cultural differences and links with the human resource management. It is the human resource management which needs more attention while investing outside the country. Otherwise most of the enterprises resources will be wasted due to non-productive conflicts of the human resource management. Although the internal and external factors of the human resource management environment are mostly same, treatment or the function of these variables change from country to country due to the cultural dimensions. The researchers highlighted some cultural dimensions which always vary from country to country which must be clearly understood by those companies interested to invest in cross boarder countries.

Key words: Cultural Dimensions; Environment; Human resource management diversification

1 Introduction

Globalization of firm's operations, or an increased level of firm's involvement in exchanging goods and services, information, personnel across national boundaries create challenging for its human resource management (Rugman & Verbeke, 2004). Due to cultural variances the way of communication is also changed. One of the biggest challenges is language (Marschan-Piekkari, Welch and Welch, 1999b). Poor culture-fit has often been mentioned as one reason why Merger and Acquisition has not produced the outcomes as organizations hope for (Cartwright & Schoenberg, 2006). Day to day booming economic activities turn the world business scenario and it increased level of exchange of goods and services, information, finance and personnel across national borders (Rugman & Verbeke-2004). The worldwide business entities are now moving from one country to another country in search of markets to sell their products as well as to find out cheap labor and low cost raw materials. China is one of those countries whose economy is grooming day by day. Chinese government is now entering into various contracts and agreements with worldwide countries. For example there are a lot of agreements between Sino-African countries. The Chinese government also announced mega project with the name "One Belt One Road". This project will link all central Asian countries through Silk Road- The one Belt and one Road Initiative aims to promote the connectivity of Asian, European and African continents and their adjacent seas, establish and strengthen partnerships among the countries along the Belt and Road, set up all-dimensional, multi-tiered and composite connectivity networks, and realize diversified, independent, balanced and sustainable development in these countries (Issued by the National Development and Reform Commission-March 2015). China is already working on Pak-China Economic Corridor and Asian Infrastructure Investment Bank (AIIB) –International financial institution proposed by the government of China. Many other huge projects are under consideration with various major region of the world. But if you're doing business abroad, you'll quickly realize that not everyone wants to do business the way you do. The modern globalization is influencing the strategic trends of the companies and the biggest challenge for HR executives (Mark E Mendenhall, Robert J. Jansen, 2003). There are other main challenges for the Human Resource Management Executives. According to the research conducted by Mark E Mendenhall, Robert J. Jansen (2003) following five big challenges were identified:

- Enhancing Global business strategy
- Aligning HR issues with the business strategy.
- Designing and leading changed

- Building Global Corporate culture
- Developing Global leaders

There may be further challenges but here we will only focus challenges related to Human Resource Management. It is not an easy task to move human resource personnel from one corporate culture to another corporate culture. According to Thanousorn Vongprasuth(2014), in their article Globalization, foreign direct investment, and urban growth management, the modern globalization has lead not only to the expansion of the boundaries of market and communication but also spread of culture awareness among consumer all over the world. In the first stage of the globalization social, economical and political activities are distributed across boundaries such as events, decisions and activities. These activities and movements have consequences for individual and communities in the distant regions of the globe (McGrew and Held, 2007). So the globalization actually creates an environment where the less develop and developed communities interact with each other (Mazrui, 2001). In addition, the constructed environment of a city, the strong process of a globalization and localization clash (Mahgoub, 2004). When working in the global commercial environment, knowledge of the impact of cultural differences is one of the keys to international business success. (www.WorldBusinessCulture). Sun Jun lee, Joongwha Kim (2014) in their research work regarding the Cultural Clashes in cross border mergers and acquisitions mentioned that whether either national or organizational culture differences in the cross boarder investment lead dysfunctional outcomes. Various researcher in a view that the national cultural differences in cross boarder merger and acquisitions has positive effects as compare to corporate culture has largely negative impact(Larsson & Lubatkin, 2001). While there is a comfort level in staying within your own language and cultural parameters, you may miss some wonderful and profitable opportunities if you do so. In this global economy, opportunities often exist world-wide, even for smaller businesses. But we must be prepared to move beyond the comfortable environment of your known world. Working through an interpreter can be a challenge, but if you choose wisely, a good interpreter can be a business asset, making your “dream” of global expansion a “reality.” (Jennifer Roney, PhD). The explanation above clearly presumes that the national cultural differences in cross-border investment can be successfully managed if we timely and correct post-acquisition strategies are properly implemented. In this case there are lot of areas where the researcher can do lot of research work for the effective implementation of these post-acquisition strategies (Sun-Jan Lee, Joongwha Kim, Byung II Park, 2014.) By keeping above facts now it is very important to Chinese companies to go and thoroughly study the cross-border investment environment in term of cultural variance. As we know that every enterprises always faces two different kind of environment, internal and external environment when it operate a business within the boundaries of their countries. These same variables also exist in the cross boarder but with the different scenario due to cultural variance.

2 Literature Review

2.1 Human Resource

The knowledge, experience and capability of an organization’s workforce is determining factor of success. So becoming the world class level human resource management, the highly regarded companies also face lot of difficulties (Mark E. Mendenhall j.Stewart Black, 2003). According to them the real challenging job to maintain standard HR management at global level is the competent leadership. For this reason, organizations pay particular attention to the recruitment of staff and also to engage in the training of staff and volunteers to build the organization’s capability. In pursuing both recruitment and training strategies organizations are often limited by their financial strength. Jemison & Sitkin (1986) argued that the great cultural differences between the two enterprises are likely to lead to cultural ambiguity. The greater the cultural distance, the more the conflict faced. Nevertheless, training of staff is an essential aspect of good business management, and even in difficult financial circumstances is an achievable strategy. International business deals not only cross borders, they also cross cultures. Culture strongly influences how people think, communicate, and behave. It also affects the kinds of transactions they make and the way they negotiate them. Differences in culture between business executives—for example, between a Chinese public sector plant manager in Shanghai and a Canadian division head of a family company in Toronto— can create barriers that impede or completely stymie the negotiating process (The top ten ways that culture can affect international negotiation-IVEY Business Journal). When you add the issues of a multi-generational workforce and growing cultural diversity, it is no surprise that people management is mentioned to be by far the most considerable challenge facing companies over the next five to ten years. According to a 2013 survey of 636 C-level and senior executives by

The Economist Intelligence Unit, sponsored by the SHRM Foundation the most challenging factor that organization will face in future is people management in the organization. It may be ageing, skill or may be diversified human resource. So the human resource management is core issue while investing in cross border (SHRN Foundation- Shaping the Future of HR). When a company start business outside the country, it need same requirements as we mentioned above but due to cultural variances it need to better understanding of cross boarder culture because the different background cultural people has different attitude towards the organization. For example according to culture of one country the people are giving importance for their individual betterment and they think that if we individually strong then it automatically give benefited to the organization. Because if individual is skilled and knowledgeable he will definitely utilize his skill for the organization. But some other cultural background people give more importance to their organization. So this is the example of the cultural difference. Although both thinking the betterment of the organization but the course of action is different. According to the Bo Xu, Junmin Yang, and Xi Jiang (2003), in their article Effects of Cultural Difference on Cross-border M&A Integration, to succeed internationally, Chinese construction companies should pay attention particularly on the cultural sensitive approach. Furthermore, it is also important to understand the relationship of cultural issues and organizational decisions. According to them the enterprises must focused on those issues which are shared by the different cultural background people rather than individual differences. A particular group reacts in general in the same way to a given stimulus; understanding culture can help to determine or anticipate how team members of a similar cultural background might react in various situations. Subsequently, the study will briefly examine the frame-work of cross-cultural dimensions developed by Hofstede (2001) based from the Chinese construction companies as the conceptual paradigm of the current study.

2.2 How Cultural Differences make difficult to Manage Human resources:

As we know that some conflicts are very useful to the organizations because they lead towards creativity within organizations but some conflicts decrease the effectiveness of the organization. The researchers view that the cultural conflicts decrease the productivity of the organizations. So this kind of issues faced by the organizations which working internationally. Jemison & Sitkin (1986) argued that the great cultural differences between the two enterprises are likely to lead to cultural uncertainty. The greater the cultural space, the more conflict. The investigational results show that investors often hold negative attitude toward obvious cultural differences between acquisitions. The differences in corporate culture (Management style) are likely the main reason for acquisitions not being able to achieve the desired objectives. Some scholars distinguished national culture and corporate culture and asserted that national cultural differences indicate the cross-border M & A performance not being satisfactory. National culture has greater impact because of they are inflexible and not easy to be altered. The lack of coordination and measures of conflicts is the main reason for the poor results of operations caused by mergers and acquisitions.

2.3 How to convert the cultural differences in to opportunities in terms of Human Resource Management through different strategies

Experts say that diversity is the strength. It means that we can boost up our business internationally if we understand the cross-border culture properly. The process of continuous learning and modification strategies further enhance the dynamic capabilities (Teece, 1998). Dynamic capabilities mean the development of global management capabilities. So the diversified human resources increase in the efficiency of the human resource out if the implementation is aligned with the cultural back ground. According to Harvey and Novicevic(2000) , a successful global manager will have to possess a complex amalgamation of technical, functional, cultural and political skills. It means that a skillful human resource executive can drive the effective output from the diver's cultural background human resource. The other main point is that for the better usage of divers HR need coaching. As per HR expert Eliza Hermann (2005), without the knowledge, skills, and inherent curiosity about how to work with different people and get through an organization, the leaders are not going to achieve their full potential. So better understanding of the cultural variance can be achieved. According to Schon Beechler(2009), a global mindset synthesizes the ability to integrate diversity across the culture and market. Think globally and act locally. To minimize the challenges the organization which are operating their business must translate the globalization into the local culture, but one must keep in their mind that sometime this strategy may isolate the organization from its head office so there must be in midway (V.Chiesa, 1996). Many experts view that there is a positive relationship among the level of institutionalization, strategic management and human resource management (Cinar, Fatih, 2013). So for the batter human resource management at global level we must institutionalization the cultural dimensions. Even though we are

considering that the globalization is a big challenge for the organizations but it also provides lot of opportunities in terms of expanding market and diverse culture (L.Stone, Dedrick, 2015.). Most of the theories in HR examine the degree to which individual's culture values influence the acceptance and effectiveness of the HR practices (Aycan, 2000).

2.4 Hofstede cultural dimensions theory

Hofstede ascertain the Chinese culture through the lens of the 6-D Model, we can get a good indication of the deep drivers of Chinese culture relative to other world cultures. In his 6-D Model he focused on six dimensions, power distance, individualism, masculinity, uncertainty, long-term orientation and indulgence

His Findings

Power distance: This dimension deals with the fact that all individuals in societies are not equal –at 80 China sits in the higher rankings of Power Distance Indicators – i.e. a society that believes that inequalities amongst people are acceptable. The subordinate-superior relationship tends to be polarized and there is no defense against power abuse by superiors. Individuals are influenced by formal authority and sanctions and are in general optimistic about people's capacity for leadership and initiative. People should not have aspirations beyond their rank. So in this kind of cultural background Manager will be directive mind and the subordinate always depend himself on the manager. For the effective HR practices, it needs to understand the perception of employees to words the distribution of power because HR will need to understand the pertinent issue and contribute to effective change management through proactive participation in organization (Hertog et al., 2010).

Individualism: The fundamental issue addressed by this dimension is the degree of interdependence a society maintains among its members. At a score of 20 China is a highly collectivist culture where people act in the interests of the group and not necessarily of themselves. In-group considerations affect hiring and promotions with closer in-groups (such as family) are getting preferential treatment. Employee commitment to the organization (but not necessarily to the people in the organization) is low. Whereas relationships with colleagues are cooperative for in-groups they are cold or even hostile to out-groups. Personal relationships prevail over task and company. If we look at this dimension in HR prospective both cultural dimensions are use full to the organization because both directly or indirectly benefit to the organization. If an employee improve his personal skills it automatically positively impact on the organization as well. So while global HR management it is very important to understand the orientation of the HR workforce and according to Ananthram, Christopher Chan (2013) the Global HR must create harmonization of the Global and Local HR policies and procedures. It can be only success full if HR executive understand the different orientation towards their goals of the employees.

Masculinity: The other main dimension is Masculinity. The researcher used two words Masculinity and another is feminine. Masculinity refers more priority to work as compare to freedom or family life. Chinese people ore motivated by achievement and other success. That's way they are committed to their targets. The Researcher himself experience about the students. Chinese students are always struggling for the highest score. The HR executive must consider these kinds of cultural differences while they are designing various global strategies regarding Human Resources

Uncertainty avoidance: The uncertainty and avoidance dimension has to do with the way that a society deals with the fact that the future can never be known: should we try to control the future or just let it happen? This ambiguity brings with it anxiety and different cultures have learnt to deal with this anxiety in different ways. The extent to which the members of a culture feel threatened by ambiguous or unknown situations and have created beliefs and institutions that try to avoid these is reflected in the UAI score. At 30 China has a low score on uncertainty avoidance. Truth may be relative though in the immediate social circles there is concern for Truth with a capital T and rules (but not necessarily laws) abound. Nonetheless, adherence to laws and rules may be flexible to suit the actual situation and pragmatism is a fact of life. The Chinese are comfortable with ambiguity; the Chinese language is full of ambiguous meanings that can be difficult for Western people to follow. Chinese are adaptable and entrepreneurial. At the time of writing the majority (70% -80%) of Chinese businesses tend to be small to medium sized and family owned.

Long Term Orientation: This dimension describes how every society has to maintain some links with its own past while dealing with the challenges of the present and future, and societies priorities these two existential goals differently. Normative societies who score low on this dimension, for example, prefer to maintain time-honored traditions and norms while viewing societal change with suspicion. Those with a culture which scores high, on the other hand, take a more pragmatic approach:

they encourage thrift and efforts in modern education as a way to prepare for the future. China scores 87 in this dimension, which means that it is a very pragmatic culture. In societies with a pragmatic orientation, people believe that truth depends very much on situation, context and time. They show an ability to adapt traditions easily to changed conditions, a strong propensity to save and invest thriftiness, and perseverance in achieving results.

Indulgence: One challenge that confronts humanity, now and in the past, is the degree to which little children are socialized. Without socialization we do not become “human”. This dimension is defined as the extent to which people try to control their desires and impulses, based on the way they were raised. Relatively weak control is called “indulgence” and relatively strong control is called “restraint”. Cultures can, therefore, be described as indulgent or restrained. China is a restrained society as can be seen in its low score of 24 in this dimension. Societies with a low score in this dimension have a tendency to cynicism and pessimism. Also, in contrast to indulgent societies, restrained societies do not put much emphasis on leisure time and control the gratification of their desires. People with this orientation have the perception that their actions are restrained by social norms and feel that indulging themselves is somewhat wrong.

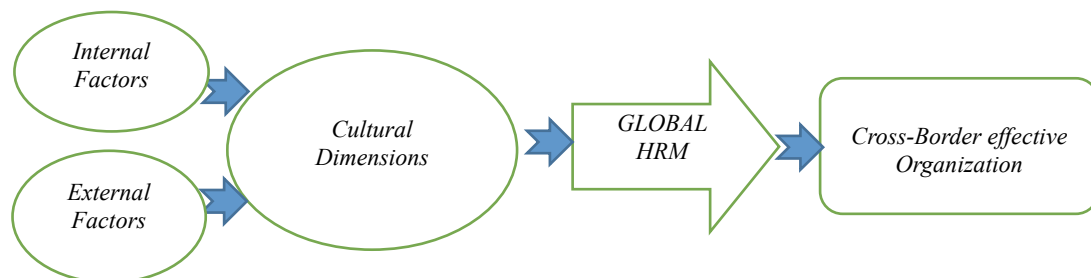

Basically the above dimension is very helpful to understand the cultural aspect and orientation of the HR force. It is proven that the better understanding the cultural aspect of the global HR lead to create knowledge in the organization which later on become the basis for the innovation. By referring the article written by the Lapina, Maurance, Starineca(2014),they mentioned that, the most commonly emerging factors of the human resource management supporting the development of knowledge management is organizational culture. So the organizational culture reflects the motivation of the employees. The employees will be motivated when the organization understands the cultural aspects and orientation of the employees with other factors. As we know for the global implementation of effective HR policies it needs competent leadership also. The better understanding of the global culture leads to better Global leader. Globalization increased the demand to develop competent global leader and puts the significance pressure on the corporate HRM to develop new venues of influence on firm strategic to demonstrate clearly its value – adding contribution to firm performance (Morison, 2000; Wright & Snell, 1998).

In short although the cultural variance at global level is a big challenge for the Human Resource Management, but it provides lot of other chances to grow up speedily. According to the Mei Lu, Chen, Huang, and Chien, (2015), the demographic diversity positively moderates the HRM-store performance relation. The other most aspect in this regard is global communication. Globalization of the firm operation leads to an increase level of the firm involvement in global communication. This creates a challenge for the employees. One such challenge is foreign language at work (Marschan-Piekkari, Welch & Welch 1999b) mention in the article written by (Yamao & Sekiguchi, 2015).

According to the Ping Deng & Monica Yang (2015), in the last two decades, Outward Foreign Direct Investment (OFDI) from emerging economies has grown massively and has become an important engine for the global economic growth. According to the World investment Report (2014), emerging economies accounted for more than one third of Global OFDI flows in 2013. China is the largest source of OFDI among the emerging countries.

So it is now important to understand the cultural dimension for the better management of HR. After the above scholarly discussion the Sung Jun lee, Joongwha Kim, and Byung II park (20150) concluded that to effectively tackle this challenge, it is critical to separate the concept of the culture in to two following subordinate concepts and examine how they are interrelated (1) the concept of culture and (2) the boundaries of the culture.

3 Model Development

After above scholarly discussion an effective Human Resource Management mitigate the Cross – border day functional conflicts if it is battery managed. Another main conclusion is that the global human resource management always effected by various cultural dimension of the work force. Because various cultural background work force has different orientation towards the targets and objectives. So the batter understand of their cultural aspects lead to effective global human resource management. The most important thing is that the internal and external environmental factors also effected by the cultural diversification. In short better understanding of culture is the of the cross – border countries is the one of wise strategic decision to more output from the global human resource and which automatically lead the cross – border effective organization. The great Hofstede done a very great job by giving the five modal dimension theory to understand the cultural dimension of any country. Through this modal the researcher measured and comparison of different south Asia , European and African countries. The future research in this regard is the central Asian countries. There is a need to measure the culture of these countries through this modal. This research work will definitely very useful future investment in these countries through One belt One Road.

4 Conclusion

After above scholarly discussion it is cleared that better understanding of the cross-border culture as well as allying with them within the limitations of once own country is the successful criteria for the Chinese companies which want to invest outside the country.

Students' Behavioral Intention and Acceptance of E-Recruitment System: An Empirical Study in Bangladesh

Liza Khanam, Md. Aftab Uddin, and Mohammad Abdullah Mahfuz
School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: lizakhanam2014@gmail.com, mdaftabuddin@cu.ac.bd, and mahfuz2012.jnu@gmail.com)

Abstract: Internet users in Bangladesh increased day by day. That's the reason most of organization is using e-recruitment system to attract and recruit the best employees. Our study has drawn-out UTAUT model to determine university students' adoption factors and responses to this new technology in Bangladesh. A total of 288 applicants a gain access to and is reviewed on the e-recruitment system adoption factor analysis. This study used convenience sampling method and data analysis Smart PLS 2.0, a PLS software package for model fit. Research findings showed that performance expectancy facilitating conditions, self-efficacy, and have significant influence on behavior intention. Also behavior intention showed positive influence towards using e-recruitment system. Our Trial results showed that the self-efficacy plays a significant role in influencing e-recruitment system usage compared to other external factors.

Key words: E-recruitment; UTAUT model

1 Introduction

Most of the companies face their own unique challenges in recruiting. Wider technology progresses have also begun to disrupt the talent industry, setting the stage for a self-motivated and exciting future for recruiting strategies. That's why more than fifteen years' trend of recruitment shifts towards online resources. But very few scholars conducted survey regarding jobseekers responses to e-recruitment processes because researchers have only begun to notice this topic ^[1-5]. Currently, one of the most leading SBC Internet Services provider conducted survey in Australia on e-recruitment system and acquired findings that 82 % of college graduates will use the Internet to search for job openings or information on careers, and 66 % actually e-mails a résumé to prospective employers. Their major finding was that the Internet is a popular recruiting tool, especially for reaching prospective employees in their twenties and thirties. In Bangladesh number of internet subscribers is increasing day by day and it has reached 37172.05 thousand at the end of 2014 ^[6]. The connectivity through the internet is being served various purposes, including the E-recruiting. The scope of online recruiting is expanding in Bangladesh. However, there is no research conducted on the topic of the adoption of e-recruitment system in Bangladesh. This paper attempts to use UTAUT model introduced by Venkatesh, Morris ^[7] which is most personalized and popular model to draw the framework of why individual acceptance and use of technology. This model is used to identify major factors influencing students' behavioral intention in using E-recruitment system. The findings of the current paper not only provides an awareness for the owner of the organization how they effectively use their recruitment websites, but also providing a theoretical background to reduce the weaknesses relating to former studies in the area of online recruitment technology acceptance. This study was also an attempt to fill the gap by analyzing the issues of behavior intention of university students and acceptance of e-recruitment system in the context of Bangladesh.

2 Literature Review

2.1 E-recruitment

Recently e-recruitment is the use of technology and electronic resources for the process of attracting, selecting and managing the recruitment in a company. It is also known as online recruiting, social recruiting or Internet recruiting, which turns out to be a part of electronic Human Resource Management (e-HRM) ^[4]. Many organizations use internet as a source of recruitment. Avinash S. Kapse ^[8] said that e-recruitment system will conduct all the recruitment activities done by the technology. Their main task is to advertise job vacancies through worldwide web for jobseekers. Applicants send their applications or curriculum vitae through the Internet. According to Darrag, Mohamed ^[9], e-recruitment facilitated HR activities by linking pin between the potential candidates and the vacant positions in an organization through the internet. Barber ^[10] researches and provides significant information about the benefit of firms to use this system and familiarize a more theory-driven explanation of e-recruitment

adoption and factors influencing jobseekers' behavioral intentions to use organizations' recruitment websites.

2.2 Unified theory of acceptance and use of technology (UTAUT)

The latest and most utilized theory development by Venkatesh, Morris [7] in the field of individual technology acceptance concept that is 'The Unified Theory of Acceptance and Use of Technology (UTAUT).' The UTAUT model combination of eight models based on information system include the Theory of Reasoned Action (TRA), Technology Acceptance Model (TAM), Motivational Model (MM), Theory of Planned Behavior (TPB), Model Combining the Technology Acceptance Model and Theory of Planned Behavior (C-TAM-TPB), Model of PC Utilization (MPCU), Innovation Diffusion Theory (IDT), and Social Cognitive Theory (SCT). They each attempt to predict and explain user behavior using a variety of independent variables.

2.3 Proposed research model and hypothesis

The present study attempts to address this issue by applying the highly validated The Unified Theory of Acceptance and Use of Technology (UTAUT) as the research framework to analyze and understand students' behavioral intention towards E-recruitment system. The extended UTAUT encompasses external variable "Self-Efficacy"^[11].

Table 1 Operational Definitions of Proposed Factor Affecting E-recruitment system

Variable	Description
1. Performance Expectancy (PE)	The degree to which a student believes that using e-recruitment system will help him or her attain gains in job performance [7].
2. Effort Expectancy (EE)	The degree of comfort associated with the use of e-recruitment system for a student [7].
3. Facilitating conditions (FC)	The degree to which a student believes that an organizational and technical infrastructure exists to support the use of e-recruitment system [7].
4. Social Influence (SI)	The degree to which a student perceives that important others believe that they should use the e-recruitment system [7].
5. Behavioral intention to use the system (BI)	Students' intention to adopt the e- recruitment technology for job seeking [7].
6. User adoption on E-recruitment system (ATUT)	Student Attitude toward using e- recruitment technology [7].
7. Self-Efficacy (SE)	Student's beliefs about their abilities to produce selected levels of performance that exercise influence over events that affect their work performance [7, 11, 12].

Table 2 Proposed Hypothesis

Hypothesis	Number	Internet and technology/e- recruitment system adoption Supporting studies
Performance expectancy (PE), Effort expectancy (EE), Social influence (SI), and Self-Efficacy (SE) will have a positive and significant influence behavioral intention to use e -recruitment system.	Hypothesis(1-4)	Davis [13], Lee and Chung [14], Venkatesh, Morris [7].
Facilitating conditions (FC) have a positive and significant influence on user adoption of e-recruitment system.	Hypothesis 5	Moore and Benbasat [15], Venkatesh, Morris [7].
Usage behavioral intention will have a positive and significant influence on user adoption (ATUT) on e-recruitment system.	Hypothesis 6	Davis [13], Venkatesh, Morris [7].

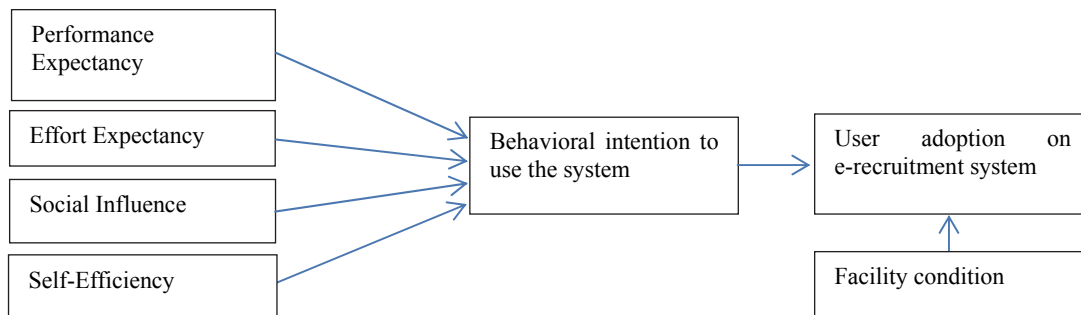

Figure 1 Proposed Research Model

3 Methods and Data Management

Convenience sampling method has been used which appears to be appropriate and cost effective^[16]. The targeted respondents were university students in Bangladesh. The survey instrument is a 7-point Likert scale questionnaire survey, divided into three sections. It has adopted 11 constructs from different studies on internet, technology and recruitment adoption from different countries. They are performance expectancy by Davis^[13] & Venkatesh, Morris^[7], effort expectancy by Davis^[13] & Venkatesh, Morris^[7], facilitating conditions, social influence and behavioral intention to use the system by Venkatesh, Morris^[7], perceived benefit by Lee and Chung^[14]. For data analysis, SPSS (Statistical Package for Social Science) 20 and Smart PLS 2.0 were used.

4 Result and Analysis

The demographic information of the respondents (N=288) has been reported below the table (3):

Table 3 Demographic Profile of the Respondents

Aspects	Frequency	%	Aspects	Frequency	%	Aspects	Frequency	%
Education			Marital Status			Occupation		
Secondary	2	1	Married	19	6	Employed	11	4
Bachelor	178	62	Single	267	3	Unemployed	88	30
Master	106	36	Widowed	2	1	Housewife	3	1
Others	2	1				Others	186	65

4.1 Analysis of the measurement model

Smart PLS 2.0, a PLS software packages this software was used to calculate path coefficients and to determine the paths' significance in the model using the bootstrapping function Hansmann^[17]. Ahlemann^[18] illustrated that internal consistency reliability shown by composite reliability (CR) value should be at least 0.7, and convergent validity measured by Average Variance Extracted (AVE) that should be at least 0.5. For validity, Table 4 (Discriminant Validity) and Table 5 (Convergent Validity Reports) report that all constructs pass through the validity tests. Discriminant validity analysis (Table 4) reports a very good result which shows that the square root of the average variance extracted (AVE) of each construct is higher than the construct's highest correlation with any other construct in this study. Table 5 reports the convergent validity and it shows that the factor loadings (all > 0.50), average variance extracted (AVE > 0.50) and composite reliability (>0.919) are within the rule of thumb. Therefore, both validity and reliability analyses suggest that these constructs are valid and reliable for further advance^[19].

4.2 Path (Structural) diagram

Standardized coefficient (β), percentage of variance explained (R^2), and significance levels of the path model relationships have been mentioned in Figure (2). Hair Jr., Hult^[19] mentioned the rule of thumb that for sample sizes of up to about 1,000 observations, path coefficients with standardized values above 0.20 are usually significant and those with values below 0.10 are usually not significant. Path coefficients (β s) are above 0.10 which is above the minimum threshold. Findings have shown that Standardized coefficients (β s) of BI→ATUT is 0.540 ($p<.01$), EE→BI ($p<.10$) is 0.144, FC→ATUT is 0.198 ($p<.10$), PE→BI is 0.260 ($p<.10$), SI→BI is 0.173 (not significant), and SE→BI is 0.174 ($p<.10$) which are found significant at different levels. Therefore, all but one (effect of social influence on behavior intension) have been proved in this analysis. As a matter of fact, EE, PE, SI, and SE are describing 33.30% variance (R^2) in BI while BI and FC explain 39.9% variance (R^2) in ATUT.

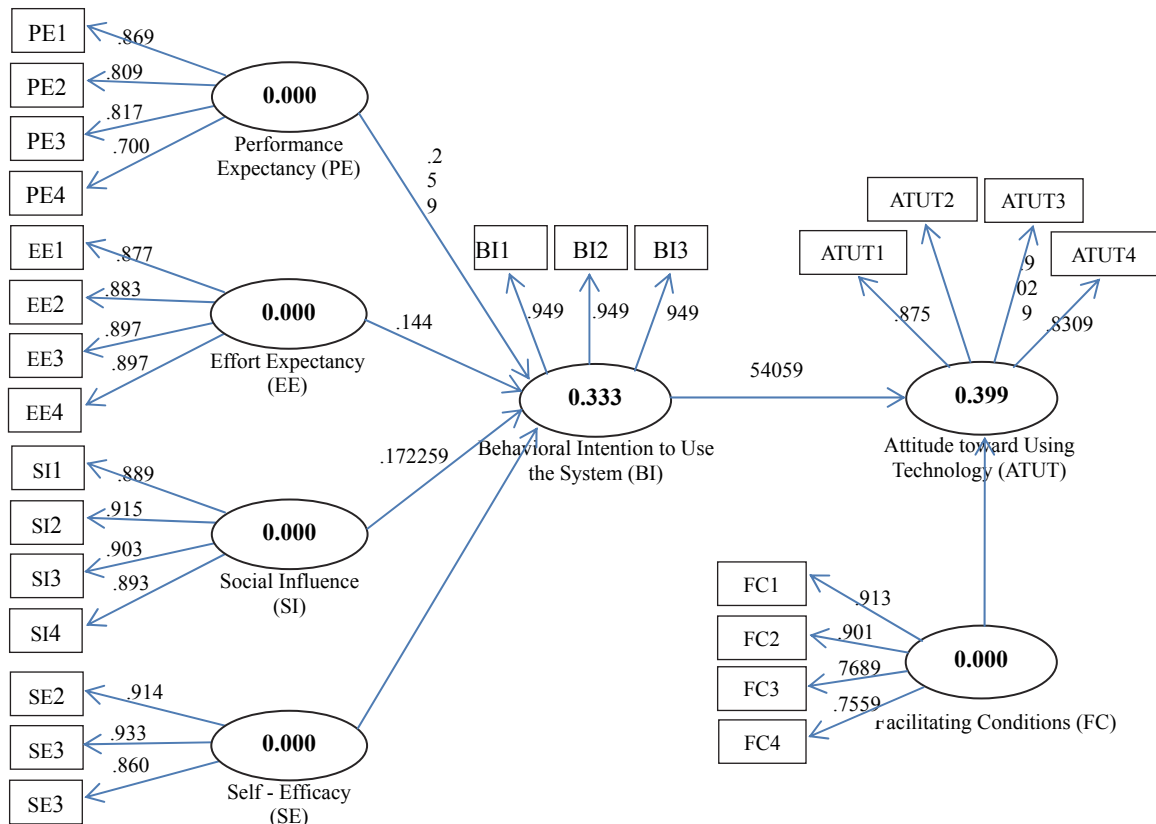

Figure 2 Path Model of the R-Recruitment System Adoption.

5 Discussion and Findings

This section will discuss the results of our proposed research model by extending UTAUT model. Findings of the study describe relationship Independent variable with the dependent variable use UTAUT model. Our tested hypotheses results are summarized in following table.

Table 6 Summary of Tested Results

	IV → DV	This result was consistent with previous researches findings	comments
H ₁	Performance Expectancy → Behavioral Intention	Akbar ^[20] , Alwahaishi and Snásel ^[21] , Davis ^[13] , Jong and Wang ^[22] , Venkatesh, Morris ^[7] .	This result highlights that performance expectancy create strong impression on student behavior for using e-recruitment system.
H ₂	Effort Expectancy → Behavioral Intention	AlAwadhi and Morris ^[23] , Al - Mamari, Corbitt ^[24] , Martins, Oliveira ^[25] , Moore and Benbasat ^[15] , Venkatesh and Bala ^[26] .	This result emphasizes that effort expectancy make strong effect on student behavior for using this e-recruitment system.
H ₃	Social Influence → Behavioral Intention	Alshehri ^[27] .	This result emphasizes that social influence was not considered to be a significant predictor in this model.
H ₄	Self-Efficacy → Usage Behavior	Gefen, Karahanna ^[11] , Lee and Chung ^[14] , Martins, Oliveira ^[25] , Yu ^[28] .	This result highlights that self-efficacy creates strong effect on student behavior for using this e-recruitment system.
H ₅	Facilitating Conditions → Usage Behavior	A Iahad, Rahim ^[29] , Martins, Oliveira ^[25] , Moore and Benbasat ^[15] , Venkatesh and Bala ^[26] , Venkatesh, Morris ^[7] .	This result highlights that Facilitating conditions create strong effect on student attitude towards for using this e-recruitment system.
H ₆	Behavioral Intention → Usage Behavior	A Iahad, Rahim ^[29] , Martins, Oliveira ^[25] , Venkatesh and Bala ^[26] , Venkatesh, Morris ^[7] .	This result gives emphasis to that usage behavioral intention creates strong effect on student attitude towards for using this e-recruitment system.

IV. Independent Variable; DV. Dependent Variable

6 Conclusion, Implications, and Limitations

This study checks the widespread applicability of the e-recruitment system with the help of Venkatesh, Morris ^[7] UTAUT model. This study finds the positive effects of three direct constructs among four constructs advised in UTAUT model on e-recruitment system adoption behavior on Bangladeshi student. Six hypotheses in this study are supported by the data except Social influence on behavioral intention for use e-recruitment system. The study has contributed towards an understanding of how self-efficacy (SE) factor impact on e-recruitment system for job-seeking specially university students in Bangladesh. It has provided a basis for similar studies to be conducted in other countries. With increased levels of technology diffusion and flow of skills across borders, an understanding of job-seeking behaviors and self-efficacy (SE) highly relevant to adopt technology ^[28, 30]. So adopt e-recruitment system self-efficacy play very important role for the student. The finding obtained from the research is beneficial to organization policy makers. It is suggested that all students in universities must undertake training and retraining on ICT program ^[23]. This will be helping them with practical and functional knowledge of computer; internet and associated area of ICT which inspire them for easily adoption on e-recruitment system. One of the limitations of this study was that the respondents were university student only who will be potential job seeker but existing employees who are working in an organization also use of e-recruitment system and may not represent the population in Bangladesh. On the other hand, the effect of moderators on UTAUT model constructs was not discussed in the paper.

Therefore, future research should consider the responses from this population and explore the influence of gender, age experience and voluntariness of use e- recruitment system. Researchers can compare the results and look the gap in order to further investigate on employee who will be looking for another new job. This will permit a stronger and a more reasonable standpoint on the research issues in future according to Bangladesh perspective.

Online Resource Development and Utilization of Ideological and Political Education*

Lu Xiao

Wuhan University of Science and Technology, Wuhan ,P.R.China, 441000
Shanghai for University of Science and Technology, Shanghai,P.R.China, 200093
(E-mail: edithlu@126.com)

Abstract: Online ideological and political education is based upon daily life and social practices. The key to this educational process lies in the effective development and utilization of network resources. The analysis of successful cases in network ideological and political education resources is conducive to revealing the features of network ideological and political education's subject, object, media, and environment, so as to construct the practicable principles of network ideological and political education resources development and utilization.

Key words: Online resources; Ideological and political education; Development and utilization; Case analysis

1 Introduction

China's access to international Internet in 1994 marks the beginning of online ideological and political education. This access revolutionizes the unilateral cramming mode of traditional ideological and political education, helping it transform from an instructor-centered into a learner-oriented education system, and thus liberating traditional moral education from its dull preaching and abstract inefficacy. The Internet, so to speak, brings abundance, diversity and vigor to ideological and political education. This new mode of education substantially expands its coverage, increases its contents and promotes its effectiveness.

As defined by Dr. Chen Huazhou in his monograph ^[1], the resources of ideological and political education refer to "the sum total of key factors on the Internet that can be used by educators to achieve ideological and political goals". These resources comprise of the data information transmitted through computer systems and managed by cyber applications, mainly in the form of cyber medium and cyber content. The latter further represents itself in instant messaging, online socializing, online trading, cloud services, resource sharing, objectified service, among others. Thus, online ideological and political education resources take various forms and fall in diverse categories, but what connects them is not the simple lump sum of them, but the interconnecting and dynamic dialectical relationship between them. Proper development and utilization of these online resources will help ideological and political education to realize its educational function and social function.

2 Online Resources of Ideological and Political Education: Categories and Characteristics

According to its functions at different levels, online resources of ideological and political education can be divided into four categories: subject resources, object resources, medium resources and environmental resources. Subject resources mainly refer to the browsing, non-interactive data obtained by the cyber subjects. As for the universities, the portal sites, news sites and Red Sites belong to this type. They must show themselves as the medium of ideological and political function, with certain amount of such contents and information as to convey the right messages that embody the subjects' political understanding and visions.

Object resources refer to interactive browsing websites, instant messaging and mobile client applications. At universities, object resources emphasizes the participation of the students, some portal sites, BBS, Baidu Tieba, Weibo, WeChat, QQ groups all belong to this category. As for the effect of object resources, its educational function works in a more concealed manner. As is pointed out by American scholar Herbert Marcuse, "The products indoctrinate and manipulate; they promote a false consciousness which is immune against its falsehood. And as these beneficial products become available to more individuals in more social classes, the indoctrination they carry ceases to be publicity; it

* This paper is funded by Shanghai Moral Education Practice Research Projects (2014-D-118), and Hujiang Social Sciences Projects (14HJ-DSDG-00-XXX).

becomes a way of life.”^[3] Effective development and use of object resources can help integrate ideological and political work with modern life, especially into the fluid, fragmented sections of social realities, and attract the general attention, spread the mainstream ideology and values.

Online medium resources refer mainly to the establishment and development of websites. University websites are usually built on the platforms of established social networks. Since the late 1950s, the world has been moving away from a Second Wave Society into a Third Wave Society. American futurologist Alvin Toffler once comments, whoever has command over information and the Internet will have the whole world. To achieve control over back-end databases of power sites can not only guide students study on the educator’s proposed tracks, but also provide the cyber political instructors with a platform to exert effective influence over students. The life and soul of online ideological and political education hinges upon whether the medium resources are effectively mastered by the educators.

In *The German Ideology*, Karl Marx says that human beings create their surroundings while the surroundings create the man in the same manner. Environmental resources of online ideological and political education can be understood as the *status quo* of the Internet, which is an important bank for the education. University students have their liberty in handling information, but they cannot get away from the cyber environment. Healthy cyber space usually includes the establishment of related working mechanism to guarantee the timely maintenance, and realization of ideological and education functions of the platform. Faced up with the fragmentation and decentralization tendency of We Media, the traditional, prim-looking online platform has more worries to deal with. Against the backdrop of big data and Cloud era, very little information can go far without ideal loading points or incidence matrices.

3 Development and Utilization of Online IPE Resources: Guiding Principles

The development and utilization of online ideological and political resources must respect the living laws of the Internet and information technology so as to maximize its integration with education, data and entertainment and realize the maximal benefits of the Internet Plus Initiative. Because there are many ways for online resources to change into educational resources, the proper way to achieve the goal not only depends on the educator’s vision, but also on the moral functions after these resources have been transformed.

First and foremost, the students-oriented conception should be highlighted in online ideological and political education. Resources development cannot live without the daily realities of university life. Both pure ideological propaganda and moral breakdown are running against the “people first” intention. Online ideological and political education on university campuses should be oriented toward the students and faculties, with their actual needs, personal benefits and well-beings in mind, and as a consequence, under proper thoughts orientation, the goal of “let me choose; I feel like choosing” can be achieved on many important stages.

Secondly, tradition and innovation should be integrated. Effective interfacing between traditional and new media brings forward new opportunities for the development and utilization of online educational resources. As commented by Chinese scholar Huan Kuan, “it is wise to change with the times, and sensible to manage differently in different cases”. Constant changes in cyber media require the ideological and political education at universities to change and innovate accordingly, so as to adapt to the latest development of the educational trend. Ideological and political education, as a social activity, is to face up with real life squarely and to improve the living quality through the life experience itself. With its “people first” orientation, this education is surely the most humane and humanistic one among all human activities.^[4]

Thirdly, borrowing and adhering are to be combined together. As part of the public services, online resources of ideological and political education can help extend the horizon, enrich the body of knowledge and tap the intellectual potentials. However, resource sharing does not mean copying foreign experience indiscriminately. Borrowing should be carried out on the basis of national conditions. When in China, telling Chinese stories in a Chinese voice is the best policy. Lu Xun once observed that only the national elements can be truly regarded as international. The development and utilization of online resources is after all a representation of national styles and traits featured specifically in its culture. Only by sticking to the combination of borrowing and adhering to national elements can the university students learn to cultivate their “cultural self-awareness” of traditional Chinese culture.

Fourthly, with “education for all” in mind, a macro cyber education map is to be designed. Online resources of ideological and political education should be fully made use of, and its consultative,

informational, cultural and socializing functions should be joined seamlessly with its educational function. Through its back feeding function, ideological and political education can realize its grand education blueprint in the foreseeable future.

4 Case Studies: Online Resources of Ideological and Political Education at Several Universities in Shanghai

From the ideological and political education resources, the ideological and political education resources are public goods, which has public goods non-competitive and non-exclusive character, is any one of the consumer products are not subjected to the same reduction in its consumption of others goods and services.

4.1 Subject resource development and utilization: characteristics and approaches

According to a feature of the main resources, strengthen the construction of the main resources is an effective way to develop the theme of resource utilization. Ideological and political education initiative innovation and broaden the channels resources to achieve good management, good development, make good use of network objectives. Shanghai University in branch construction and easy class success stories can have both fish and bear's paw of evidence. Shanghai University web site content more breakthroughs branch limitations gave lectures on college students time and space. In addition, the university hopes to enter the Party School of the large number of people, but limited by resource constraints teachers, places, and many colleges and universities, even rolling classes SCHOOL far can not meet the needs of students. Increase Shanghai University Online Party participants will neither reduce consumption of any consumer, it will not increase the cost of the network of educational resources consumption, the lectures moved on the network can not only solve the problem of teachers, number of students, school location, etc., also greatly expanded the coverage of the Party School.

4.2 Object resource development and utilization: data provision dynamics and resource potential

Interactive pages for interactive browsing, instant messaging tools, to achieve dynamic resource supply, mining network object resource potential. The new media will inevitably be replaced by the new media, always with a passion for college students and a fresh carrier coming in and out. Opening a new message channel for students to speak in public space is important, but it is hard to preach the policies by simply bland propaganda, or advertisement-like publicity. In this case, only a calm, professional voice, can help maintain the public speech in its correct order. Shanghai Polytechnic University, for instance, through its timely, immediate construction of the new media, not only tolerates the disorderly form of noisy voices, but also accepts moderate speculative reasoning in its Microblogging Circles. In addition to the official microblogging, micro-channel and other related services, Shanghai Polytechnic University officially registered in the record of 174 two new media, the formation of micro-blog, microblogging two micro one microarray, microarray innovative media technology to provide a variety of presentation and dissemination carrier, through the text data visualization, combined with video and audio visual presentation, increased information dissemination power.

4.3 E-class: an effective expansion and extension of online resources medium

In July 2014, the Central Publicity Department proposed five new requirements on media convergence, one of which is to have a business model. Propaganda proposed product design to fully consider the market dynamics issues with the product profitable conditions really have development potential. It emphasizes business model is not to make money but to make money, but rather to expand market share and disseminate coverage, enhance capacity for sustainable development. If the network platform content deletion viscous attract students to ideological and political education on empty talk. Shanghai to promote the education of the first to develop easy to classes is a successful network of ideological and political education resources support case, easy to shift the construction of Shanghai Ocean University has been particularly successful, Shanghai Marine University to build a data network behavior based on the platform of the acquisition system is easy to shift, according to established fixed network behavior model to achieve a user-friendly data collection school class behavior and the behavior of the data storage and management. Secondly, on the basis of data collected on the establishment of network behavior data analysis system, through the Internet using a network behavior data groups and the adoption of "Entropy Cooperative Network Behavior Analysis System" provides data analysis, dynamic analysis dynamic discovery and ideas of students and the focus of attention.

4.4 A virtuous circle: improved cyber environment under cyber ecology construction

In April 2015, through a network of 62 colleges and universities in Shanghai research found that current development build Shanghai University Network Environment maturing, gradually formed a

virtuous circle of ecological environment. Through the Shanghai Party Committee Propaganda Department 62 research universities learned Shanghai all universities have Chinese portal, and the other has a 3514 two Chinese websites, teacher groups, the number of student groups to reach the construction site 770, occupying the entire Secondary College site twenty two%. In addition to foreign language portals, Shanghai universities have 210 secondary foreign language websites. Wherein the number of 985, 211 class university foreign language secondary site to 175, accounting for 83.3%. The construction of secondary sites in foreign language for most universities, colleges, and private institutions is still in its infancy. Research shows that the opening of the school micro-channel platform of the school a total of 37 universities, the total number of secondary school official micro-channel currently in the record of 754. Faced with such a large network of resources, only the formation of a unified network management can ensure a virtuous cycle network environment. Research shows that Shanghai all universities have a clear site management and filing system. Website administration is centralized propaganda department or school to participate in the Propaganda Department has 37, accounting for about 60%, centralized department is run and Information Office or other departments has 25, accounting for about 40%. Universities website management modes include teacher management, student participation and teacher credentials management types. Visit website students fully managed just one school, accounts for less than 1.5%. From the management system of University of Shanghai website construction, administration, management point of view the current Shanghai universities in the construction site all have there is the text to be investigated, have to follow the law, enforcement of the law can be unified management rules and regulations, management practices website ensure the reliability and information security Web site operators, orderly and secure network operations for the network of ideological and political education work possible.

5 Conclusion

The Internet has brought a culture shock, college students the opportunity to come into contact with more and more knowledge outside school, and thus values are becoming increasingly diverse. Ideological and political education in a more open attitude turned to Students subtle daily life, with the spirit of the desire to mend debris scattered everywhere, guide students to explore the real life, the real pursuit, really good, really quality. Website is under network environment support interaction between subject and object of education, lack of sufficiently attractive site if and influence the effectiveness of the ideological and political education to speak of; the process of college students receive information in a way, thinking activities, personality psychology, behavior and even morphology of online discourse, have emerged new situations and different from the previous law. Only the effective development and use of the network subject, object, vector, ring resources to build overall comprehensive and dynamic living, full independent quality complex way of thinking, in order to effectively improve the effectiveness of ideological and political education.

Study on Integration Mechanism of Multimodal Metaphor of Brand Names

Wang Lei

1 The Glorious Sun School of Business and Management, Donghua University, Shanghai, P.R.China, 201620

2 School of Foreign Language, Donghua University, Shanghai, P.R.China, 201620
(E-mail: akizawa@163.com)

Abstract: This paper applies some research findings about linguistics and brand science, bases on metaphorical thinking, introduces conceptual integration, multimodal paths and some other cognitive theories and approaches to present and interpret the online dynamic meaning construction processes of brand names. The paper builds a Conceptual Integration Model of Multimodal Metaphor Construction of Brand Names under a cognitive angle and draws a conclusion that brand companies should pay attention to the influence resulted from relevance space of communication between brands and consumers. Besides, they can contribute to the control of brand effect and establishment of brand equity by a three-mode brand naming strategy, including visual sense, auditory sense and phonation.

Key words: Multimodal metaphor; Conceptual blending; Brand name; Brand equity

1 Introduction

Brand equity exists in consumers' minds. To establish brand equity is namely to cultivate a deep and wide awareness as well as a strong, special and favorable association (Keller, 2009). The choice of brand elements plays an important role in this process. Brand name is the basic core of those brand elements, the basis for both awareness and communication efforts (Aaker, 1991; Keller, 2009). It boasts a main advantage—to express the core theme of a brand in a simple and economical way as well as to arouse key association.

2 Literature Review

In essence, brand name are based on languages. Linguistic methods including phonetics, semantics, morphology, notation, etc. are the fundamental methods to assess brand names.

Most of the earlier researches related to brand name are produced by western researchers who focus more on the application of lexeme, phonetics, semantics, spelling rules and syntactic devices as well as the discussion about brand strategy of corporation on how to establish an inviting brand name. For instance, among 129 world top brands, 65% names of them begin with “A, B, C, K, M, P, S, T”, among which 4 (“B, K, P, T”) are plosive. Therefore, they have achieved some research findings such as the conclusion that western consumers prefer a plosive beginning and the influence of plosive on consumers' memory (Schloss, 1981). Besides, the application of phonetic symbolism in brand name is another popular subject. It is mainly embodied by two opposite principles of brand naming: Juliet principle and Joyce principle. Most western scholars who expertise in brand naming are in favor of the later one, which claims that phonetic elements tend to express its own meaning—a “feeling” of the meaning, which is different from the meaning of a word itself (Schloss, 1981; Klink, 2000; Yorkston and Menon, 2004; Lowrey and Shrum, 2007). With the rapid development of market segmentation, the number of brands is continuously increasing while the proper words which are suitable as brand names are becoming scarcer. The growth trend of some creative brand names which consist of alphabets and numbers has once gained the attention from some brand researchers, too (Boyd, 1985; Pavia and Costa, 1993; Collins, 1977).

Furthermore, Jean-Claude Usunier and Janet Shaner adopt a macroscopic angle of view and put forward a comprehensive framework for assessing the linguistic value of a brand which covers vision, sound, text and meaning (Jean-Claude Usunier & Janet Shaner, 2002). They point out that brand name, which is made up of various characters, is definitely the priority of a brand. It should be understood by its consumers and make a difference in spreading brand spirit. As shown in figure 1 (Jean-Claude Usunier & Janet Shaner, 2002), the language content of a brand name can influence the verbal communication, auditory sensation, understanding and interpretation of its consumers. The first step to assess a brand name is to put it into original language environment and inspect its language content, taking all aspects into consideration such as the connotative meaning of text, sound, vision, etc. Meanwhile, a brand name possesses both textual elements and visual factors. It is related to other language code, for example, the

artistic design of a brand name (including fonts and colors), brand logo and so on. A brand name is a complicated compound symbol which is constituted of characters (ideographic characters, alphabetic characters, etc.), phonetic elements according to original spelling (based on different specific language environments) as well as visual elements (including signs, figures, etc.).

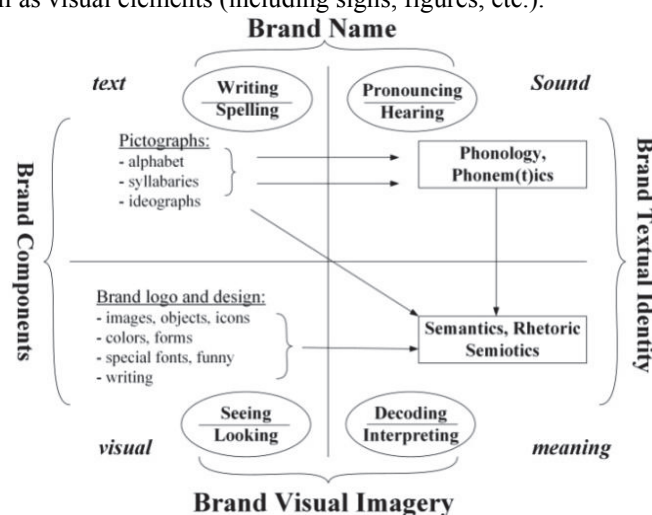

Figure 1 A Comprehensive Framework for Assessing the Linguistic Value of a Brand

The western research findings trigger the studies of brand naming. Those researchers start from a single linguistic element and conduct some elaborate studies on brand names which are based on languages in essence. At the same time, they develop a series of discussions about the standards of excellent brand naming (Collins, 1977; McNeal and Zeren, 1981; Perreault and McCarthy, 2004; Kotler and Armstrong, 2001; Keller, 2009) and expand their studies to some deeper aspects—how the linguistic value of a brand name makes contribution to the value of a brand.

Researches on Chinese brand names derive from the model of Chinese linguistic brand naming standards which is established based on linguistic elements. It is also applied to analyze different sorts of brand names corpus and a series of studies concentrating on the standards and features of Chinese brand naming (Chan and Huang, 1997; Chan and Huang, 2001a, Chan and Huang, 2001b). Subsequent researchers also conduct a wealth of profounder studies on more extensive product categories, the improvement of research framework, the comparison between Chinese and foreign brand names, etc. (Ian Wilson and Yuelu Huang, 2003; Tong Yimim, Ma Ningning, 2009; Zheng Lifang, 2010; Wang Lei, 2013; etc.). Besides, in the aspect of quantitative analysis of brand naming corpus, Li Fei, Wu Shuilong, etc. use linguistic elements and achieve two fundamental brand naming modes of the Chinese name of world-famous valuable brand (LI Fei, LI Xiang, 2004) as well as the naming features and modes of Chinese traditional brands (WU Shuilong, LU Taihong, SU Wen, 2010).

3 Methodology

Brand is a compound symbol which consists of name, trademark, slogan, advertising image, commercial song, packaging and other elements, among which only name has “sound”, “form” and “meaning”. The name of a brand has so many characteristics that it can contribute to build brand awareness as well as brand image. Hence, it becomes the core of a brand and is reputed as a generalist of establishing brand equity (Onzo and Kamei, 2002). We can witness the development history of foreign and Chinese researches about brand name according to the previous studies mentioned above. In early stages, brand names were studied in a microscopic angle of view. Researchers focused on a single linguistic element. However, researchers study them in an integrated perspective now, considering all related linguistic elements. Research methods vary from descriptive studies to empirical studies such as corpus learning and quantitative researches. Whereas, these researches all use real existing brand names as objects and are developed on the premise that those brand names are successful cases. As a result, they can be considered as an enterprise-oriented, analysis of brand naming consequences -focused, static research approach. Since brand equity exists in consumers’ minds, the standard used to assess whether a brand name has contribution to its brand should be based on consumer cognition effects of the brand name—brand naming activities should aim to achieve positive communication effect between a brand

name and consumers. Consequently, consumer cognition and effective communication between brand names and consumers, become the hot issue of further studies on brand names. In this respect, Jean-Claude Usunier and Janet Shaner have provided a preliminary framework. They put forward a comprehensive framework for assessing the linguistic value of a brand which covers characters, writing, spelling, pronunciation, audition, phonology, phonetics and other linguistic elements alike. They also expand their study domain from linguistic framework to other branches like semantics, rhetoric, semiology, etc. and introduce consumer cognitive and perceptual elements, assessing brand-consumer communication quality in a comprehensive way; thus providing a dynamic research perspective of brand name assessment. However, its limitations are also very obvious. For instance, the object of study is obscure. Apart from the brand name itself, there are also brand logo, font, color and other artistic designs. So there are flaws in disturbing factors control. Besides, the framework cannot describe the online dynamic process of consumers forming cognitive and perceptual effects toward brand names and it is too general because it doesn't take cultural, political, social and economic elements which have big influence on the linguistic value of a brand into account. Furthermore, the study is based on western language environment. Although that framework also considers visual effects, it only emphasizes the visual effects of brand logo and design while ignore the effects of Chinese, Japanese and other eastern languages' meaning, form and notation on consumers. Compared with other relevant researches, it has already stepped forward to introduce consumer cognition but it is still limited in the field of linguistics.

To sum up, researches about brand name have gone through an evolution. Researching approach changes from study of single angle to study of multi-angle, from static to dynamic. Given that previous studies still have limitations, taking advantages of theoretical achievements of different subjects to do interdisciplinary researches on brand naming has become a new study trend. This paper embraces the conviction that it is necessary to conduct a deep, online, dynamic study on consumers' awareness and perception of brand names. Considering the characteristic of "generalist" of a brand name and the trait of mass media focused on brand marketing, we can deduce that a brand name is not a pure textual content. Rather, it takes effect through cognitive and perceptual multi-paths, such as vision, hearing, sound, etc. which influence consumers' preferences, attitudes and purchasing behaviors. Studying the cognitive and perceptive process in consumers' mind about brand names enable us to realize fundamentally how a brand name influences its consumers, infuses meaning into consumers' minds and contributes to brand equity. Then it is a more objective research approach. In this study, we spare no effort to adopt cognitive semiotics and brand-related researches and introduce conceptual blending theory, multimodal approaches and other advanced cognitive theories based on metaphorical thinking to establish a model of brand names' value construction under the cognitive perspective, thus making an online dynamic demonstration of the process of brand names' meaning construction.

4 The Construction of Integration Model of Multimodal Metaphor of Brand Names Studied in a Dynamic Perspective

The metaphorical thinking and "Mapping Theory" raised by Lakoff and his fellows as well as "Blending Theory" raised by Fauconnier and other scholars, have laid a solid foundation for cognitive theory of metaphor. Forceville and some other researchers expand the scope of metaphor study to images and other non-linguistic modal study and elevate it to conceptual level thus forming the concept of "Multimodal Metaphor".

4.1 Metaphor as a cognitive thinking

Scholars embrace different understandings toward metaphor in different period of time. Studied from rhetoric point of view, metaphor is only considered as a figure of speech. Nevertheless, contemporary cognitive science believes that metaphor, in essence, is a human way of thinking, a cognitive device, an indispensable pattern of human cognition. Lakoff, the founder of metaphor cognition study pointed out in his *Metaphors We Live By* that metaphor is the most fundamental feature of human conceptual system. It is the basis of human cognition, thinking, experience, languages and actions. Metaphor exists everywhere in our daily life and it decides the way we think and experience things. It constitutes human cognitive conceptual system. We can claim that metaphor is actually something related to conceptual relations and consider it as a way human think and act. Yet, thinking is recessive. We get accustomed to all kinds of metaphors in our daily, which means people get used to juxtaposing two kinds of things when thinking. Human use metaphors almost all the time unconsciously. The way of thinking of an information sender is reflected by metaphorical language and symbols alike, which enables the information receiver to understand and interpret. However, in the "Conceptual

Metaphor Theory”(CMT)raised by Lakoff and Johnson, they are convinced that metaphor shows the mapping from source domain to target domain and describes the working mechanism of concept system of thinking. When humans are to learn and describe the unknown during the cognitive process, we usually rely on the concepts or expressions that are already known, proceeding from the known to the unknown, from the exterior to the interior with imagination. The core of metaphor is to juxtapose something familiar with the unfamiliar and enhance human cognition of unfamiliar things through the mapping from the acquainted fields to unacquainted fields.

Metaphor theory, as a cognitive thinking, provides a consumer-oriented perspective of objective cognition process to studies of brand names. The first challenge of new products with which consumers are not familiar is to attract consumers as soon as possible—to be remembered, liked and purchased. A brand name is the main force in brand establishment. Its target is to contribute and it should have such influence. The brand naming strategy lies on how to use metaphorical elements which are easy for consumers to cognize and perceive, and spread its brand spirit to target consumers while the mission of a brand name is to establish the brand image which the brand owner want to infuse in consumers’ minds. Metaphor theory of cognitive thinking provides a strong research angle and a solid framework for researchers to figure out the mechanism of consumer cognition toward brand names. How the implicit metaphors embraced in explicit brand names influence consumers’ way of thinking and how they make contribution to brand equity are the crucial issue of effective brand establishments.

4.2 The development and main ideas of the conceptual blending theory

Fauconnier and other scholars put forward “the Conceptual Blending Theory” about construction of mental space based on “Conceptual Metaphor”. It claims that metaphor come from the mapping across mental spaces. Mental spaces are the conceptual packets set up based on partial understanding and action goals people achieve when communicating and thinking (Fauconnier&Turner 1996). They can be interpreted as an online dynamic concept contemporarily built during verbal communication. Blending Theory is namely a systematic illustration of all the mappings and the interactions of different mental spaces. In Fauconnier’s masterpiece, *Mental Spaces*, he focuses on the emergence of mental spaces, the blending of mental spaces caused by interactions as well as online meaning construction in natural language. In the fundamental work of this theory, *Mappings in Thought and Language*, he raises Conceptual Blending Theory systematically. As shown in figure 2(Fauconnier&Turner 1997), they demonstrate the relationships and interactions of different mental spaces and establish a four-dimension modal of meaning construction in natural language. They also reveal the online meaning construction in natural language and the mappings of different mental spaces. Fauconnier(1997) pointed out that the mappings between domains are at the heart of the unique human cognitive faculty of producing, transferring and processing meaning, while deals with the evidence for mapping and underlying domains offered by language structure and use. However, visible language is only the tip of the iceberg of invisible meaning construction..Meaning construction refers to the high-level, complex mental operations that apply within and across domains when we think, act, or communicate..Fauconnier and Turner also point out in their masterpiece, *The Way We Think* (Fauconnier & Turner 2002), that the dynamic constitutive principles of conceptual blending are partially the cross-space mappings concentrated on fractional and selective blends and emergent structures will occur in blending spaces.

Figure 2 Working Mechanism of Conceptual Blending Theory

Conceptual Blending Theory provides a theoretical tool of “online meaning construction” of linguistic symbol for studies on brand name. According to this theory, we can deeply discuss the concept forming process of brand names in consumers’ minds and analyze the formation of consumers’ mental spaces and selective mappings which take shape during the brand name cognizing course based on metaphorical thinking. Thereby, we can make contributions to brand equity through controlling the brand effect resulted from brand name strategies.

4.3 Multimodal metaphor

Forceville(2009) defines “mode” as “a sign system interpretable because of a specific perception process”, and acceptance of this approach would link modes one-on-one to the five senses. There are different modes, at least, the following: pictorial signs, written signs, spoken signs, gestures, sounds, music, smells, tastes and touch. They define monomodal metaphors as metaphors whose target domain and source domain are exclusively or predominantly rendered in one mode. In contrast multimodal metaphors are metaphors whose target domain and source domain are each represented exclusively or predominantly in different modes. More scholars think that multimodal symbol should be an open system rather than the way Forceville defines it. It should cover different kinds of media symbols so mode can be broadly defined as “communication media systems which rely on senses”, and multimodal metaphors are metaphors which are transferred/relied on synergy between two or more modal signs (Peng 2011; Zhao 2013). According to the way brand names spread, we can find that the delivery of the meanings of brand name and its influence on consumers often rely on the synergistic effect of communication signs based on one or several senses in the midst of brand name-consumer as well as consumer-consumer communications. Nowadays, studies on multimodal metaphor are conducted in a variety of genres, such as advertisements, comics, strip pictures, animations, sign language, music, films and so on. But can interdisciplinary studies on multimodal metaphor be also applied to further studies on brand names? Given the comprehensive framework for assessing the linguistic value of a brand by Jean-Claude Usunier, we can learn that the linguistic value of a brand name is beyond the textual meaning. Instead, it derives from the comprehensive meaning formed by text, vision, sound. In this sense, a brand name has at least three modal features including textural, visual and audial features. Besides, if seen from the cognitive point of view, the situation is also obvious. Generally, a brand name has sensorial functions to stimulate consumers’ visual sense through the eye view, auditory sense by hearing, and the spread of a brand name depends on oral transmission, namely phonation. Although the sensorial functions of vocal organs are relatively private and not easy to perceive, we are accustomed to using “easy to pronounce” and “hard to pronounce” to assess the pronunciation of a brand name. In fact, consumers are very sensitive and concern much about the fact whether a brand name is easy to pronounce and whether it is easy to spread. All in all, cognition and perception of a brand name are related to at least three kinds of modes. Hence, theoretically multimodal metaphor theory can be applicable to the analysis of brand names.

The motivations of multimodal metaphor studies can be classified into three aspects. Firstly, in the fields of cognitive linguistics, people realize the shortage of pure linguistic metaphor studies. Secondly, the popularity of communicative means of multimodal metaphor has shifted the focus of scholars to multimodal discourse research. Thirdly, the humanities have advantages in interdisciplinary studies (Zhao, 2011). These three aspects exactly coincide well with the development of studies on brand names. Even though the main force of a brand name is language, people not only need text, voice, image, but also need multi-media information with the rapid development of multi-media and increase of spreading approaches. Brand companies have to pay more attention to the balance of visual and sound effect of brand names. On the other hand, vocabulary with real meanings can be used in brand naming is limited, the topic shifts to naming strategy of new brands. The meaning construction of a brand name in consumers’ minds by the synergistic effect of sound, form and meaning, goes beyond the real meaning of a word itself. Instead, meanings take shape in the deeper layer of consumer cognition. Besides, with the process of economic globalization and market segmentation and influenced by language, culture, politics, society, and consumer ethnography, etc., the meanings of brand names for different consumer markets as well as the process of meaning construction are not the same. Whether to adopt a standardized or a localized strategy aimed at consumer markets in different areas remains an important subject on brand naming in the era of globalization. We can make a conclusion that the development tendency of brand naming studies corresponds to that of studies on multimodal metaphor. Classifying brand names as multimodal discourse, applying interdisciplinary theoretical approaches, starting from cognitive metaphor perspective and inspecting the effect of consumer cognition through multimedia approaches are totally significant to further studies on brand names and brand equity.

4.4 The conceptual integration model of multimodal metaphor construction of brand names

Zhao(2013) puts forward the conceptual integration model of multimodal metaphor construction

based on the conceptual integration model of cognitive poetics imagery interpretation and the conceptual integration model of Fauconnier & Turner(2002) and applies it to metaphor analysis of political cartoons. As shown in figure 3(Zhao, 2013), the model adds multimodal representation space and relevance space based on context to the dynamic integrating process. Furthermore, it also takes the features of multimodal metaphor discourse and the interaction of metonymy and metaphor into consideration. This research relies on the model mentioned above and real communication mode between brand names and consumers, applies brand-related theories, and put forward the conceptual integration model of multimodal metaphor construction of brand names.

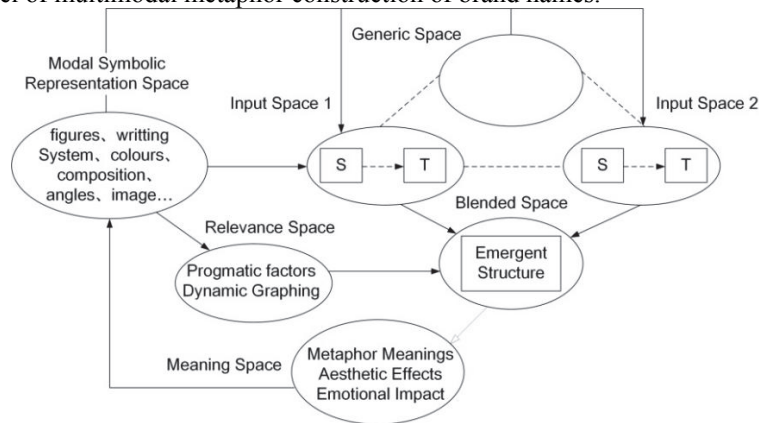

Figure 3 Conceptual Integration Model of Multimodal Metaphor

As shown in figure 4, this research believes that brand names are multimodal discourses which include visual sense (written signs), auditory sense (hearing), and Phonation (pronunciation). During the integrating process, linear unidimensional characteristics of language symbols and nonlinear characteristics of non-linguistic symbols, enable multimodal symbols to evolve into multi-dimensional and multi-directional ones. So the order of the perception, the paths of attention diversion, and the combination and change of modal symbols, can lead to the adjustment of the activated route directly.

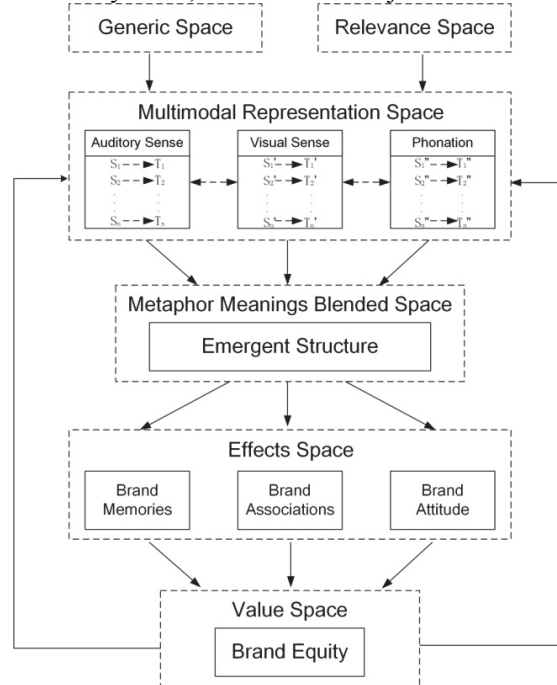

Figure 4 Integration Model of Multimodal Metaphor Construction of Brand Names

Influenced by cognitive elements, interpreters should also adjust the interpretation of multimodal symbolic representations for several times(Zhao, 2013). S and T represent the source domain and target domain of fundamental metaphor or metonymy while dashed arrows indicate the previous basic

mappings inside each multimodal input space of brand names as well as alternative mappings across spaces. All information led by generic spaces and relevance spaces, after basic mapping and trans-spaces, enter meaning blends alternatively and form emergent structure. The main points of Zhao's (2013) study about relevance spaces based on context are communicative subjects, medium, social cognition, cultural value, genre schema, aesthetic orientation and other varieties of pragmatic information. Nevertheless, the aim of this research is to study the interactions and communications between brand names and consumers, so the study pay more attention to language, culture, politics, economy, demography, nationalism and other factors which are closely related to the characteristics of consumers. Beside, this study believes that relevance spaces function not only in the stage of meaning integration, letting conceptual meanings and emotions, aesthetic meanings enter the meaning spaces together to demonstrate the real purpose of producers' artistic creation of multimodal metaphor, but also in the stage of basic mapping and metonymy in fact. In this sense, generic space and relevance space are members of up-class spaces which play a leading role during the meaning integrating process. According to Zhao (2013), the meaning space formed at last also has effect on or restrains the producers' choices and construction of multimodal signs in turn, and form a complete model based on meaning production and interpretation. Generally, the communication of metaphorical meanings of genres like literature and comics comes to an end in this course. Brand names are seemingly the same. The metaphorical meanings of them have taken shape in consumers' mind so far. However, according to Keller's theory (2009) the differences is that the standard of brand name selection lies in two dimensions: brand awareness (to recognition and recall) and brand association (perception). Moreover, however impressive a brand name is to a consumer, however abundant the brand association is, if that brand itself or all sorts of associations related to it cannot achieve consumers' appreciation and favor, it can never make positive contribution to brand equity. Thus, attitude toward brand names is the third dimension of brand names' devotion to brand equity. To conclude, this research proposes to consider three dimensions—cognition, perception and attitude as the expansion of the conceptual integration model of multimodal metaphor construction of brand names because they are the indispensable parts needed to assess the final formation of brand equity. As shown in the model of brand equity construction, the mission is to discuss the cognitive and perceptive effect of metaphorical meanings of brand names on consumers' inside world further; thus embodying the contribution of a brand name to brand equity from the model; to encourage the circulation of the interaction of the creator of a brand name and the brand name's target customers; to establish a unique conceptual integration model of multimodal metaphor construction of brand names and to provide a beneficial reference for brand value assessment.

5 Conclusion

This paper bases on researches related to brand names while put forwards the opinion that although a brand name is language in essence, researches on it should not be limited in the field of linguistics. Instead, researchers can set up an online dynamic perspective by integrating multidisciplinary research findings. This article bases on some research findings about linguistics and brand science, introduces metaphorical thinking, conceptual integration, multimodal paths and some other cognitive theory and approaches, and establishes a Integration Model of Multimodal Metaphor Construction of Brand Names under a cognitive angle. Furthermore, it presents and interprets the online dynamic meaning construction processes of brand names. Basing on fitting-analysis of researches about multimodal metaphor theory and brand names, it draws a conclusion that brand companies should pay attention to the influence resulted from relevance space of communication between brands and consumers. Besides, they can contribute to the control of brand effect and establishment of brand equity by making an appropriate brand naming strategy according to a three-mode path through visual sense, auditory sense and phonation. However, this research is still limited in the stage of theoretical framework establishment. It remains to be manifested and improved by case study, empirical investigations and experiments. Practical applications based on this theoretical framework need more studies and developments.

Reflections on the Discussion about Co-Leading Program of CPC, Government and People of Basic Level

Hou Yi, Zhu Zhe

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 55485311@qq.com, 1697832169@qq.com)

Abstract: The Co-leading Program of CPC, Government and People of Basic Level is a comprehensive innovation for the basic level CPC organization to explore the construction of democracy and society governance mode of integrated innovation under the new situation, which was lead by the need of residents, organized by CPC committee on basic level, resourced by government and the society, and motivates resident to participate, to form a working mode that gathers CPC, government and people to negotiate, participate and regulate together. This, the way of “decided by government and accepted by resident” could be gradually transferred into “bilaterally agreed by both government and people”. we should consolidate and expand the achievements on the education practice of party's mass line, with the new requirements of Four Comprehensives Factors and the basic direction of localization, service-orientation and being open-ended to strengthen the construction of the primary Party organizations, deepen the co-leading program of CPC, government and people of basic level, to make construction of the primary Party organizations more vitality.

Key words: CPC organization; Co-leading program; The primary party

1 Introduction

The primary Party organizations is responsible for the connection with the masses, propaganda among the masses, organizing the masses, unite with the masses; it is mainly responsible for the implementation of the policies of the Party; and also it is the basic of the whole work and fighting capacity of the Party. The 18th CPC Central Committee drew up an important deployment for strengthening the organization construction of the primary Party organization, the third & fourth plenary session of the 18th CPC Central Committee raised new requirements about the primary Party organization to deep the further reform and comprehensively promote managing the country by law as a battle fortress.

Recently, China is in the final stages of building moderately prosperous society. Facing the new situation in the reform and opening up process about the interest redressal, the new changes between the Old and new contradictions of society, and the new situation of ideological diversity under the market economy, the construction of the primary Party organizations is facing many new challenges. Without a firm foundation, the earth trembled and the mountains swayed. How to consolidate and expand the achievements on the education practice of party's mass line, to strengthen the construction of the primary Party organizations, to make construction of the primary Party organizations more vitality, that is an important task for democratic political construction and political structure reform in our country. In the last few years, Beijing Chaoyang District closely around the target-“building a learning, service-oriented and innovative Marxist political Party”, to implement the co-leading program of CPC, government and people of basic level, give full play to the central role that the Party commands the overall situation and coordinates the efforts of all quarters, to improve the party's leadership and ruling ability, and then explore some useful experience.

2 The Genesis of the Co-Leading Program of CPC, Government and People of Basic level: Pay Attention to the Grass-Roots Level, Services for Residents

Over the past few years, the construction of grass-roots social in China has been vigorously promoted and standing in a new historical starting point, is also facing new development opportunities and favorable conditions. This is the important background for us to carry out the co-leading program of CPC, government and people of basic level.

1.1 The basic level's work is being noticed unprecedentedly

It is the first time for the community governance has been written in the report of the 18th CPC Central Committee. The third plenary session of the 18th CPC Central Committee further pointed out: “establish and improve the supervision mechanism about residents and villagers, promote the people help with self-management, self-service, self- education, self -supervision in community management,

public affairs at the grass-roots level and public welfare which is based on laws.” Mr. Xi Jinping - CPC Secretary General emphasized several times, to put more manpower, material and financial resources into the grass-root, put resources, service and management into the grass-roots as far as possible, make the grassroots could offer a better service and effective management for the masses.

1.2 The community construction is playing an unprecedented role

With the rapid development of the economic society, the community has become the aggregation point of social groups and supporting point of social life increasingly, has become the resource of stabilization, the support of guaranteeing the Peoples livelihood, the basic of promoting the development, the function of the community, “to meet people’s basic living needs, to provide last resort for people to fall back on in case of special difficulty”, has become more obvious.

1.3 The negotiations with the basic level were referred to an unprecedented height

Deliberative democracy of socialism is a great creation of Chinese Communist Party and the Chinese people. Deliberative democracy in China has a profound cultural foundation, theoretical basis, practical basis, system basis. In February 2015, the central committee of the communist party of China issued *Suggestions on Strengthening the Construction of Socialist Deliberative Democracy*, which explicitly put forward to push forward the grassroots consultation steadily, to improve it to the same height as negotiate with party consultation, negotiation with National People's Congress, with government, with Chinese people's political consultative conference (CPPCC) or people's organizations. A lot of decisions and work which are affinitive to the public interest mainly occurs at the grassroots. In accordance with the requirements of the consultation with people, negotiation for people, to establish and improve the construction about the coordination linkage mechanism of deliberative democracy at the grass-roots level, to carry out consultations at the grass-roots level steadily, to solve people's real difficulties and problems preferably, to resolve disputes on time, to promote social harmony and stability. Adhere to the broad participation, multiple layers, to guarantee people's right to know, to participate, to express and supervise preferably. The document also specifically mentioned that, the important decision among different administrative villages or communities, should be negotiated and organized by according to the need by villages, streets, and even the county (city, district, flag).

3 The Core of the Co-Leading Program of CPC, Government and People of Basic Level: Lead By CPC Committee, Develop Diversity

This program was first launched on “ask the politics” meeting of ChaoYang District in year 2011, and was developed to 24 basic organizations in 2012 to solve the problems of the residents. In 2013, the program was launched district-wildly, based on the past experience.

This program was lead by the need of residents, organized by CPC committee on basic level, resourced by government and the society, and motivates resident to participate, to form a working mode that gathers CPC, government and people to negotiate, participate and regulate together. This, the way of “decided by government and accepted by resident” could be gradually transferred into “bilaterally agreed by both government and people”. Before government makes the decision, opinions of people should be first relieved. The focus should be on aspects in living environment, social security, public service and so on, especially on small but critical problems. In this way, residents' ability of management could be cultivated, basic level of democratic environment could be built and residents could be better involved.

In daily work, below methods could be taken: utilize diverse way to develop people's need, plan and thoughts, and form related regulations or plans; launch door-to-door investigation by community team leaders and online communication; Organize experts, NPC member and residents to form independent evaluation system and launch performance evaluation. Residents' opinion should be asked and residents should be evolved in the process of decision making and supervising in the entire public service area. Community resident could launch independent research and voting, and experience compromise and negotiation by co-operation and competition. Thus, resident’s management ability and basic democratic environment could be improved. Platforms were built like ChaoWai residents online, CBD column on co-regulating, TuanJieHu online mailbox, 13 communities Twitter, XiangHeYuan Garden online message forum, YaYunCun QQ Chatgroup, etc. A total of 1479 cases were collected within 24 communities, including 6 aspects and 12 points, for instance, going-out, parking, elderly care, public order, environment, management, and even including community laundry and maintainence.

As result of long time practice, the program is a useful and effective method, which successfully coordinate the relationship of our three goals. With this projection, we could effectively safeguard the

democratic rights of the people as masters of the country and ensure we run the country according to law by adhere to the party's leadership. Because of this work's good effect and innovation, Chaoyang district get the prize of "Top ten innovation results in china Community Governance" by this new mode.

4 Furtherance of the Co-Leading Program of CPC, Government and People of BasicLevel: Integrated Development with Oriented Service

As party building work at community level plays a key role, we shall strengthen systematic building work and work out a mater plan. We shall improve the building work as a Marxist Political Party at community level, in line with the basic requirements of localization, service-orientation and being open-ended. We shall make efforts to advance reform, innovate system and perfect institution. In this process, we shall make use of the Additive Effect and Multiplier Effect of the co-leading program of CPC, government and people of basic level, so as to cultivate more promising projects with bigger success. In this way, we can promote the high-level integration of community and society, improve hard and soft power at the mean time, closely coordinate government guidance and self-governance by community residents. By doing so, we will make community service more reachable, the environment more comfortable, the management better regulated, residents' participation more ordered, the relation between government and people more harmonious and people's behaviors more civilized.

4.1 Incorporate the co-leading program of CPC, government and people of basic level into the planning of the overall societal development, and innovate social governance at community level

The key to improving the new social management pattern of "led by party committee, executed by government, coordinated with society, participated by the public and guaranteed by rule of law" is to improve the ability of social coordination and expand public participation. We shall start with the Co-consultation and Co-Governance Program among Party and Government organizations and the public at community level in the efforts to facilitate party organizations at community level in making use of their advantage in supporting, coordinating and guiding mass organizations, self-governance organizations, economic organizations and social organizations. We shall pace up promoting the restructuring of party organizations at community level, make more efforts to cultivate social organizations that are community-service-oriented, public-benefiting and co-operative. Special attention shall be given to the role of community self-governance party organizations, by extending community party organizations of all sorts to the grass-root, so as to fully cover all people and organizations, gradually elevate the level of organization among residents, enhance their sense of approval and belonging, thus effectively consolidating the attractiveness and integrity of community. We shall constantly intensify social responsibilities of organizations in the community, make more efforts in co-building among different areas and enlarge government-purchased services, give more play to social sectors in public service areas, gradually incorporate "non-governmental" resources into "governmental" resources, which shall play their independent roles under the leadership of party committees and under the guidance of government, so as to bring into being the grand pattern and new system for social building.

4.2 Incorporate the co-leading program of CPC, government and people of basic level into the great strategy of comprehensive reform in execution, and deepen the reform of social management at community level

Each measure for deepening the nation-wide comprehensive reform shall be finally executed and realized by communities. We shall rely on this program in deepening the reform of community management system, in which process full play shall be given to community party organizations in social service and city management, while facilitating community's work in coordinating supportive resources of all sorts in community management. Effective efforts shall be made to ease the community neighborhood committee's administrative burden, to ensure that community-level public service responsibilities are matched by power and funding.

4.3 Execute the co-leading program of CPC, government and people of basic level in the greater backdrop of carrying out in a deep-going way the mass line, and take a further step in safeguarding and improving people's well-being.

Communities are the front line of serving the people, thus the most close-related to the massive and their well-being. We shall take the Co-consultation and Co-Governance Program among Party and Government organizations and the public at community level as the key and rely on real practice in extensively building service-oriented party organizations at community level. In this process, we shall properly place leadership and management in serving the people, enhance community party

organizations' function of connecting the public, serving the public and uniting the public. In this way, we can enable community party organizations and the numerous party members and cadres to take root among the massive, to unite and guide the public in striving together for realizing the goal of building a moderately prosperous society and a harmonious and happy motherland. We shall properly handle the relation between serving people and self-service by the people, cultivate the backbone resources for serving people, organize and mobilize the public in participating in inter-dependent service and service of public interests, making the massive the participants as well as beneficiary of such services. We shall orientate our work at people's demand, promote cadres and practitioners of community committee to further transform their manner of work, further improve the system for serving the people and the platform for connecting demand and supply, so as to effectively handle problems occurring along the last remaining "one mile" on our journey of connecting and serving the people, thus improving the orientation accuracy of community services.

5 Conclusions

The co-leading program of CPC, government and people in Chaoyang district has achieved obvious comprehensive benefit, to promote the construction about democratic politics at the grass-roots level, to strengthen initiative of self-management, self-service through democratic consultation; to guide the various main to participate in social management, and the social governance vitality has been aroused effectively; to get close the relationship between party and masses, and resolve the conflicts between the jurisdictions effectively. Although the program still has some problems, we should summarize and improve it continuously from some aspects as system, procedures, methods, etc. However, the mode - co-leading program of CPC, government and people-can solve the problem involves the vital interests of the people effectively, will perform the strong vitality in democratic construction of and social governance grass-roots party organization democracy construction of the basic level CPC organization and social governance coruscate gives strong vitality.

A Study of Chinese College Non-English Majors' Self-Efficacy in English Learning and Learner Autonomy

Xiang Rong

School of Foreign Languages, Wuhan Textile University, Wuhan, P. R. China, 430073

(E-mail: Lindaxr@126.com)

Abstract: The cultivation of Learner Autonomy (LA) is regarded as the most important aim by the researchers of pedagogy, while researchers of psychology paid much more attention in the factors that influence LA and on the mental mechanism concerning LA. In view of the crucial roles self-efficacy played in learner autonomy, the present study intends to investigate the relationship between the two. In the light of the previous research, the present study proposes some learning strategies to improve college students' self-efficacy and learner autonomy.

Key words: Learner Autonomy; Self-efficacy; Non-English majors

1 Introduction

As Bian Yufang (2004) proposed that Chinese schools generally neglect cultivation of students' self-efficacy due to inadequate studies in China. The study of self-efficacy at home has proved that self-efficacy has correlated relationship with motivation attribution, goal setting and learning strategies, that students with high achievements have generally higher self-efficacy, and more confident in their capabilities in language learning (Ji Yianhong, 2003, Wang Zhenhong, 2000; Li Lijun, 2004). 2) Probing into the constructions of self-efficacy scales (Wang Lei, 1999; Bian Yufang, 2003; Zhang Shenhui, 2002). There is now a large body of researches on self-efficacy and English learning. However, very few study the relationship between self-efficacy and learner autonomy in English context. The purpose of this paper is to investigate Chinese college students' learner autonomy and their beliefs of self-efficacy in English learning and explore the relationship between learners' self-efficacy and learner autonomy in order to provide some practical strategies to improve their learner autonomy.

2 Methodology

2.1 Research questions

As the summary of literature mentioned, the present quantitative study investigates the relationship between college students' self-efficacy in English learning and their learner autonomy. The study addressed following three questions: 1) what is the overall situation of college non-English majors' self-efficacy in English learning? 2) What is the overall situation of college non-English majors' autonomy in English learning? 3) What is the relationship between college non-English majors' self-efficacy in English learning and learner autonomy?

2.2 Subjects

Non-English major undergraduate sophomores in Wuhan Textile University (WTU) are the subjects of this study. All the non-English major undergraduates in WTU are now studying under a three-level system. That is, after a proficiency test, they are divided into three groups in accordance with their scores. The ones with higher scores will study in Level Three (L3), with middle scores in Level Two (L2) and with lower scores in Level One (L1). All the three groups of students have participated in this study as they are sufficiently representative of the overall situation of college students' English learning. 240 questionnaires were distributed to the students in their class time and 220 (71 from L1 students; 94 L2 students; 55 L3 students) of the questionnaires were found to be valid.

2.3 Instruments

The instruments used in this study included the college non-English majors' English Learning Self-efficacy Questionnaire and Non-English Major Undergraduates' Autonomous English Learning Investigation Questionnaire.

2.4 Data analysis

Six intact classes were sampled in WTU. In order to get subjects' cooperation and make the investigation work as reliable as possible, the author of the thesis first made an agreement with their teachers and asked them to act as my survey assistants. 240 questionnaire sheets with both the two questionnaires were handed out in the interval of students' regular English class time. Students were required to do the questionnaires individually and were expected to finish it within 15 minutes.

Fortunately, due to the cooperation of English teachers, students could finish the sheets carefully in accordance with their real situation and 220 pieces of feedback were collected.

3 Results and Discussion

In this part, statistical results will be reported by conducting a series of correlation analyses, One-way ANOVAs, and Independent Samples T-test. One thing that needs our attention is that when presenting the means and standard deviations of the items in the questionnaire, in order to look at the situation more easily, we actually use the raw data, that is, the points before the change is made to certain items. But for other statistical analyses, we follow the rules of statistical analyses and thus use the changed data.

3.1 Overall situation of college students' self-efficacy in English learning

Table 1 The Means and Standard Deviations of All the Items in The General Self-efficacy Section

		N	Mean	Std Deviation	Std Error	Interval for mean		Min	max

Note: SE=Self-efficacy

For the convenience of reading, only the most significant parts of the original one-way ANOVA results are presented here. There is the need to explain the way of interpreting the data got from the one-way ANOVAs and how to decide which level is doing better than another on one item. If the value in the "sig." column is more than 0.05, then we can say there is no significant difference between the

two levels. If it is less than 0.05, then there is. Then we can look at the means for the three levels to judge which level does better on this item.

Table 2 One-way ANOVAS for the Items in The General Self-efficacy Section

Item	Level	Level	Sig.	Statistically Significant Difference
SE1	L1	L2	.550	NO
	L1	L3	.247	NO
	L2	L3	.748	NO
SE2	L1	L2	.064	NO
	L1	L3	.000	YES
	L2	L3	.041	YES
SE3	L1	L2	.318	NO
	L1	L3	.981	NO
	L2	L3	.274	NO
SE4	L1	L2	.717	NO
	L1	L3	.706	NO
	L2	L3	.992	NO
SE5	L1	L2	.524	NO
	L1	L3	.000	YES
	L2	L3	.003	YES
SE6	L1	L2	.498	NO
	L1	L3	.932	NO
	L2	L3	.784	NO
SE7	L1	L2	.533	NO
	L1	L3	.240	NO
	L2	L3	.751	NO

1) Results from item SE1 and corresponding discussion

SE1 stands for “I am confident that I can learn English well.” This is the most general one in all of the 29 self-efficacy items. From the corresponding lines in the above tables, we can see that there is no significant difference between the three groups on this points, and the means of all groups of students are around 1.5, which means “totally or completely agree”. That is to say, all three groups of students are quite confident that they can learn English well.

2) Results from item SE2 and corresponding discussion

SE2 stands for “After the English examination, I always feel the results will not be ideal”. This item tests students’ beliefs on their English achievements. From the above tables we can see that L3 students are inclined to disagree with this statement while L1 students are tend to agree with it. And the multiple comparison between the three groups shows that there is significant difference between L1 and L3, L2 and L3 students, while no significant difference between L1 and L2 students.

3) Results from item SE3 and corresponding discussion

SE3 stands for “I am confident that I can easily accomplish English tasks assigned by my teacher independently”. From the table we can see that there is no significant difference between all of the three groups and all students agree with the statement that they can accomplish English tasks assigned by their teachers independently.

4) Results from item SE4 and corresponding discussion

SE4 stands for “I don’t think I can control the fluctuations of my English achievements”. This is also a statement about students’ beliefs toward their English achievements and the questionnaire is also designed in an opposite way. That is to say, the higher the score the student get, the more efficacious he/she is. From the tables we can see that there is no significant difference between the three groups of students about this point. All students believe that they could control their own English achievement.

5) Results from item SE5 and corresponding discussion

SE5 stands for “I am confident that I will pass it if taking the CET-6 exam”. We can see from the above tables that although the means of L1 students is the highest (2.4366), it is still in the answer of “agree”, which means all groups of students tend to believe that they can pass CET-6. As to what extent they agree with the statement, the differences between L1 and L3, L2 and L3 students are significant, and no significant difference shows between L1 and L2 students.

6) Results from item SE6 and corresponding discussion

SE6 stands for “I am sure that I will never give up when I encounter difficult English tasks”. This statement is related to students’ beliefs toward difficulties, which is a very important sign of self-efficacy. From the above table we can see that no significant difference shows between all the three groups and all students believe that they will never give up when encountering difficult English tasks.

7) Results from item SE7 and corresponding discussion

SE7 stands for “I can stay calm in face of English challenge because I firmly believe in my own problem-solving abilities”. There is also no significant difference shows between all the three groups about this point and the means of all the three groups are around 2, which means they have confidence in their problem-solving abilities.

3.2 The relationship between college students’ self-efficacy in English learning and learner autonomy

This result shares the same points with many researches. Schunk (1990) found self-efficacy has close relationship with autonomous learning. Zimmerman had already pointed out that a learner’s self-efficacy would affect his or her motivation in learning through the processes of autonomous learning (Zimmerman, 2000). Gardner et al (2002:7-8) indicate that “the learner’s lack of confidence on the reliability of self-assessment” may lead to the fact that his “willingness to accept responsibility for assessment of reading has hardly changed.”

4 Conclusions

4.1 Major findings

Through all the above quantitative analyses, we can draw the following conclusions about the overall situation of college students’ English self-efficacy and learner autonomy and the correlation between the two. (1) College students’ self-efficacy in English learning are low as means for all three groups of students in both general and specific sections are around the midpoint, which means “not sure”. As for general self-efficacy, all the students of three levels basically hold a higher self-efficacy in their English learning than specific ones. And for specific self-efficacy, L3 students do better than the other two groups of students in most specific sections and they always hold a positive views on their abilities concerning specific English learning tasks, especially on reading and writing tasks, than L1 and L2 students do. (2) English self-efficacy and English learner autonomy are significantly correlated. Students with higher language self-efficacy are prone to learn autonomously. In turn, students who can learn autonomously tend to have higher language self-efficacy. The result of this study also offers us an additional area that can be addressed to help increase students’ English self-efficacy: learner autonomy. According to this study, English self-efficacy is positively related to English learner autonomy. Self-efficacy is enhanced when students are more autonomous learners. Therefore, it is encouraged to give students training on learner autonomy to help increase their English self-efficacy.

4.2 Limitation

Due to limited time and efforts, we only design and carry out the questionnaire, which intends to explore the relationship between college students’ self-efficacy and learner autonomy. The quantitative study is conducted only. It is suggested that future research can add qualitative methods such as open-ended questionnaire, interview, and then make the result more accurate, scientific and systematic.

Abstract: Taking Wuhan University of Technology (WHUT) library system as an example, this paper illustrates how to fix and complete testing system scientifically and reasonably in library system in meeting the undergraduate teaching level evaluation of ministry of education.. At the same time, this paper explores the problems appeared in the course of testing, and addresses solving methods to these problems. Practice shows that this testing system is preferable reliability, better operability and superior applicability.

Key words: Library system construction; Testing system; Index system; Testing method

1 Introduction

With the further development in the Teaching Assessment by the Ministry of National Higher Education, the library system based on the university teaching and research keeps pace with the time and builds self-evaluation system, which has played a good role in promoting the steady improvement on teaching and research.

In response for the documents “The General principles for University Library (Amendment)”, “Teaching Assessment Program for Undergraduates (Trial)” and “Basic teaching conditions to start universities and colleges (Trial)” issued by the Ministry of Education, Wuhan University of Technology (WHUT) ”encouraged by the goal “improving assessment, promoting construction, protecting quality, “has organized professionals and staff and formulated the” Evaluation Program on the College Branch Library System (College Library Reference Rooms) on the establishment of basic conditions, resource construction, reader service of the university library system.

2 The Build-Up of Evaluation System in College Branch Library System

The establishment of the evaluation system is to guarantee the rules to be implemented, help improve the management and readers service.

Table 1 Different levels of scoring statistics of the evaluation system

First levels	second levels	Score
1.Basic conditions	1.1 attention from leadership	2
	1.2 participation of staffs	2
	1.3 vocational level	3
	1.4 per capita use area of readers	3
	1.5 collection volumes of libraries	4
	1.6 annual fund investment	8
2.Resource construction	2.1 system Maintenance	5
	2.2 database building	2
	2.3 book recommendation	5
	2.4 internal resource construction	10
3.Reader service	3.1 opening hours	7
	3.2 service object	4
	3.3 annual reception of readership	6
	3.4 stack room and reading room Management	9
	3.5 special lecture	4
	3.6 document delivery	3
	3.7 search commissioning	2
	3.8 consulting	5
	3.9 management System	4
	3.10 statistics	7
	3.11 website construction	5

The Evaluation Program includes two levels. The first one refers to three items, such as basic

conditions, resource construction and reader service. The second contains 21 sub-items derived from the three on the first level, which includes six major projects. The program comprises 21 assessment score points, one of the important projects accounted for 47% of the total score 100 points.

3 The Designing Ideas of the Evaluation Library System

3.1 Basic Conditions

3.1.1 Attention from Leadership and the participation of staff

In Evaluation Program on the College Branch Library System, a set of strict rules and testing or assessing details have been figured out in terms of the first and second levels. While on the assessment to the second level “attention from leadership”, there are school leaders responsible for the branch tasks and actively support the work of the library. Meanwhile, on the assessment to the “the participation of staff”, it is qualified that the staff number of the College Branch should be determined and arranged according to the indication of university Personnel department (now tentatively for the staff and students in the ratio of 1:2000).

3.1.2 The reader areas per capita and the collection volumes

In library system construction, College branch libraries or reference rooms have great differences in the layout, building areas, funds, facilities, equipments and so on. The college branch libraries were supplied initially with books mostly on social science under the concept to run a library by self disciplines on laboratory scale, on which the investment of funds and the construction of the reference rooms are emphasized relatively. These factors are considered in comprehensive evaluations and the standards of assessment also have strict distinction.

According to the standards for " Collection volumes of libraries ", the literature accumulated amount in branch libraries should be ≥ 12000 (B 6000)volumes, the annual new volumes per capita should be increased to achieve or exceed this standards; Or 1 volume / reader / year (calculated by the number of teachers and students, with 30 Yuan / per volume for reference). While the literature accumulated amount in reference rooms should be up to 6000 volumes, annual new volumes per capita should reach or exceed to this number; Or 1 volume / reader / year.

3.1.3 Annual fund investment

The construction of university library system is a new tendency in the development of university libraries. The basic condition for its sustainable development is the annual successive investment.

Wuhan University of Technology (WHUT) advocates and offers great support to the construction of the library systems, by investing annually 700000—1000000 Yuan of funds to the college branch libraries (or reference rooms) for the establishment of literature resources, which greatly mobilized the self investing enthusiasm within college branch libraries (reference rooms). Thus, the annual invested funds have been increased to varying degrees. After the guarantee for purchasing books, magazines or electronic resources, the hardware conditions in college branch libraries have been improved every year.

The funds invested by the library of Wuhan University of Technology to its college branch libraries are divided into two parts. One of them is allocated according to the self constructive situations of the central library and according to a certain proportion of fund needs from college branch libraries (or rooms). The other one is self-financing portion. In the assessing process of Evaluation Program on the College Branch Library System, the annual fund investment is one of the critical reference factors. Furthermore, the funds have been detailed to every person's literature resource usage considering the number of undergraduate, graduates and doctoral students, staff of that year, in which 20 Yuan for undergraduates; 50 Yuan for graduates and doctoral students. The assessments are implemented according to the annual budgets and receipts.

3.2 Resources construction

3.2.1 Book recommendation

The quality of the literature resource construction in library systems directly comes from the recommendation information of the school staff and students, which comes from the active cooperation of the staff in college branch libraries and reference rooms. With the development and the application of INTERLIB service management system, the “Books recommendation” is not rigidly limited to the original paper periodicals recommendations. Readers now can log in directly from the library homepage, click on “Reader recommendation” at any time into the recommendation of books and periodicals in different forms, such as by registration, paper or electronic bibliography recommendations, from which they finally get the satisfaction for designed, refined, frontier literature resources.

Some libraries strive to achieve the recommendations on the concept of “Highlighting professional

focuses, collecting extensively advices, organizing scientific recommendations”, and organize periodically the previewing activities about some domestic and foreign recent books in form of window displaying, offer a large amount information about the related magazines, publishing institutions, web site addresses, telephone, e-mail and so on.

A variety of recommendation forms have improved the communications between readers and libraries on the demands for the literature resources and made the exchanges more convenient, fast, and time-saving. And meanwhile, it also makes the construction of the college branch library systems more characterized and more rational.

3.2.2 Internal resource construction

The foundation for the sustainable development of library system constructions is the characteristics. “Internal resource construction” in Evaluation Program on the College Branch Library System is considered to be one of the critical assessing items. The so-called “internal resources”, is “the literature and data related to the teaching and scientific researches , including domestic and international conference papers, conference materials, specifications, standards, the related internal data and collections, or the gifted texts. All these could benefit readers after processing.

3.3 Readers service

3.3.1 opening hours

The construction and development of University library system is inseparable from its original intention, that is readers service. Thus in formulating the Evaluation Program on the College Branch Library System of Wuhan University of Technology, service is highly emphasized. One of the service items “opening hours” has been included in the important assessment items. The qualification of the assessment is based on: The opening hours in college branch libraries are required to be ≥ 70 hours/week, and reference rooms 48 hours / week.

3.3.2 Annual reception of readership

The beneficial results in management have been focused. After formulating the library assessment system, great changes appear, for instance, books and materials previously can only be used by the readers inside this college, but now, after the implement of management regulations, the reading rooms, books, periodicals can face to all the readers in the whole university. The books are lined on shelves clearly in a strict accordance with the “Chinese Library Classification(CLC)”, and the logos of “CLC” 22 categories are put on the reading room walls, in favor of readers to search for literature or data. From then on, the number of readers and the number of borrowing and lending volumes have been greatly increased

3.3.3 Service extension

In the service for readers, the staffs in college branch library act themselves as the links or bridges from the libraries into the college services. The central library initiates many deep-seated services, such as one-hour lecture, document delivery, and some librarian service counterparts. We put this link or some other contacting work into the evaluation system, which plays a very good role in promoting in-depth services.

3.3.4 Website construction

Website is one of the most efficient windows for exchanging information. The website construction of library system is the important means and way of services for readers. In the assessment of Evaluation Program on the College Branch Library System of Wuhan University of Technology, it is required that the information relevant to college branch libraries on the websites should be clear and complete. Furthermore, these websites have the obligations to propagate the literature information for the central library, and guide readers to use those literature resources. With the maintenance and assistance by professionals, the information of reader services keeps always new and update, moreover, with the records of each updating.

4 Conclusion

The formulation and implementation of Evaluation Program on the College Branch Library System of Wuhan University of Technology, is a preliminary discussion on the designs and methods for the construction of the university library evaluation system. The establishment of the evaluation system of university library system makes the goal of the library system development more clear, including the developing goals on the short-term basis as well as the long-term basis. The goal in the near future is to reach the standard of the central library management, such as staff professionization, data, management, service standardization, the extension of library services, etc. The long-term goal contains, stimulating

the innovative ability of the library management, perfecting the multiple services, including, setting up work norms for the librarians of professional subjects, developing characteristic collection plans and service specifications, making further coordination between the center library and college branch libraries (rooms). Thus, a mighty cohesive force can be formed, which will arouse a greater creativity within

The Risk Control and Management for the Grassroots Democracy Development within the Communist Party

Liu Hanfeng, Zhu Zhe

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: Lhf12345678@126.com, zhuzhe65@yeah.net)

Abstract: At present, one of the urgent basic requests in the democracy building research area is how to identify and control risks in the grassroots level within the Chinese Communist Party. This paper utilizes the analytic hierarchy process to analyze the risk system at the grassroots level, locate and categorize risks, investigate the most important systematic risks in the risk system, summarize the systematic risks' characteristics, and finally examine the risk development trends. Building grassroots democracy within the Party is an experiment in democracy politics in China, which demonstrates its values in many aspects. Understanding and controlling risks in this process or experiment is a key strategic issue.

Key words: Risks in democracy construction at the grassroots level; Risk management; Systematic risk

1 Introduction

Grassroots democracy within the Party is a “test” in the Chinese Communist Party’s (“the Party”) democracy building area. Its value is multifaceted. The risks and challenges facing grassroots democracy building is one of the major highly strategic and forward-looking issues to be explored.

Grassroots democracy practice within the Party changes the existing practice of giving and receiving power. In this process of change, if significant interest conflicts or disagreements cannot be fully understood and effectively resolved, the conflicts would be escalated, and risk points would be formed.

With regards to risk theories, the international focus lies within social risk areas. Ulrich Beck (U.Beck) and Anthony Giddens (A.Giddens) represent institutional analysis; Scott Rush (S.Lash) represents cultural analysis; Ott temperature iNTERIOR (O.Renn) and Frank Knight (F.Knight) have made a beneficial exploration in the risk assessment and uncertainty research areas; Rosenthal 's (U.Rosenthal) explanation of the crisis has further deepened the understanding of the risks existence and transformation.

This paper is to explore the risk analysis and management issues within the democracy-building practice in the Party grassroots organizations. The particularity and complexity of the issues mentioned above determines the reference range of literature is mainly limited to the Chinese domestic related research.

In fact, the domestic research in this area is at the early stage, and the research paper and academic work of studying risks of inner-party democracy are rare. At present, the research of the inner-party democracy risk and prevention has focused on two aspects: one is the definition of the inner-party democracy risk; the other is the categorization of the inner-party democracy risk.

For example, the definition of the inner-party democracy risk includes risks from improper activities (THE PARTY scales Bin Zhao 2009) and also includes risks of emphasizing restrictions and influences from single or combined factors (TAN Jian 2013).

With regards to the classification of democracy risks, major classifications include 1) environment related risk classification (THE PARTY Zhao scales Bin 2009); 2) theory, system, organization, quality, and other factors related risk classification; 3) internal and external risk classification (Zhang Aijun, Xing Wenli 2006); 4) endogenous, exogenous, and derivative risk related classification (TAN Jian 2013).

Based on the current research findings, either for the definition or the classification of risk within the Party’s grassroots democracy, a core issue is identified: the precondition of developing democracy within the Party. For the democracy development within the Party during the social transition period, we should not simply focus on democracy itself; rather we should analyze the risk of grassroots democracy within the Party in the system of social transformation.

This article, based on the considerations listed above, mainly analyzes the systemic risk of grassroots democracy within the Party; proposes institutional risk, trending risk, aggregation risk, and interactive risk; raises questions about the identification of the risk sharpness and challenges of risk management.

2 The Role of Risk Management in Grassroots Democracy Building within the Party

The grassroots democracy building within the Party has made huge progresses and achievement in recent years. Meanwhile, in some regions and fields, as the democracy level has been elevated, the democratic atmosphere and environment have been improved, however, under the new democratic environment, a mature operation routine and system of the democracy ecological relationship has not been established. In other words, democracy exists for its appearance, while there is a considerable gap between the democratic development requirements and current democratic development level from the entire social structure and social psychology perspectives. Risks therefore would potentially be developed and accumulated. Additionally, information technology and high-tech wave have spread out to ordinary party members and masses. With the modern information exchange and information platform's help, non-mainstream information flow and exchange would be greatly increased. Traditional grassroots organizations inside the Party would encounter more and greater challenges in achieving and promoting building democracy within the Party. As it requires time and processes to understand risks associated with the construction of the Party grassroots democracy, the requirement of risk management will be profoundly manifested when the democratic process is deepening.

3 The Choice of Risk Management Views and Risk Classification

3.1 It is essential to establish the scientific view of risk management

Building grassroots democracy within the Party is a complicated and systematic project with pioneering and creative characteristics. This systematic project demands a necessary risk analysis and control management system. The virtuous cycle of this systematic project requires a necessary risk analysis and risk control management system. Developing structure and module of this systematic project are closely linked with the degree of managers' understanding risks and risk correlation analysis. As the grassroots democracy construction has been deepening, the complication of risks and correlation of risks would increase; therefore scientific risk management would become an inevitable choice. The above analysis demonstrates the requirement for risk management from a theoretical perspective.

Risk refers to unknown dangers. Most people define risks in building grassroots democracy within and outside the Party as being relatively remote. In a certain sense, risk is relatively small. However, where does relative remote risk come from? How to decide risk is relative small? How to define relative small risk? The above questions are rarely answered. Therefore, it is important to establish risk management concept which can be used to analyze risks and risk factors in practice.

In fact, many cases from building grassroots democracy within the Party have already illustrated the importance and necessity of establishing such a risk management concept. Democratic advancement will change the current system, impact interests and power distribution, and cause confliction. When confliction involving major stakeholders cannot be effectively resolved, it will be escalated and then risk points are formed, and such risk points would be possibly hidden in those pilot units. As such practice from pilot area is extended, these risk points will be revealed, and therefore establishing a risk management system is a necessity of choice.

3.2 Risk management mode selection: the analytic hierarchy process

Risk management by definition is to be able to regulate and resolve potential risks. The key is how to understand risks, analyze risks, and ultimately control and mitigate risks. Through risk management system, managers are able to control risks. Like other risks, risks of grassroots democracy within the Party have linear and nonlinear development characteristics. Single and multiple risk factors could be interacted with each other. Multiple risk factors and the interactions among them need to be analyzed. A comprehensive risk analysis system is critical to mitigate risks.

Risk transformation is a basic issue in grassroots democracy involving power system transformation, the democracy innovation and transformation, political and cultural transformation. Risk transformation is the most valuable risk research module when studying grassroots democracy risks within the Party. The basic thought is to acquire lessons and experiences from the said risk transformation to ensure risk analysis to be more targeted and systematic.

In the transformation of democracy, from the theory perspective, one opinion is that successful political transition is related to "cost calculation". According to the principles of cost calculation, some experts believe that "if powers could be opener to the public" the party could not only align requests from the opposite force and civil society with the operation of the formal political system, but also further deepen the regime's 'legitimacy', then the party could rightfully master subsequent reform

process and direction.”^[1]

From the political parties’ competition perspective, some believe in the one party pluralism from famous French political scientist Duverger. This theory is unique in the western political doctrine. According to this theory, the political democracy could also be achieved within one party via the internal competition not necessarily through multi-party competition.^[2]

From the practice perspective, Russia which has adopted the western model of democracy has been in the democracy transition period, because of its specific transformation characteristics. Russia has established a democracy framework. According to Robert Dahl’s seven basic characteristics of democracy politics: elected government, free and fair elections, universal suffrage, no restrictions on public position competition, freedom of speech, a variety of information sources to choose, freedom of association, Russia has had the basic conditions of democracy. However, based on the way it handled the conflict with Ukraine and how it handled Syria’s situation, Russia has demonstrated strong imprint of Authoritarian Politics. The democracy transition risk is that Russia has not found the democracy model which is aligned with Russian value and its behavior system. In Singapore, the People’s Action Party is inclusive of the existence of other political parties and allows other political parties to put forward their political views, and participate in elections. Despite its form of democracy, Singapore still demonstrates the “authoritarian political” characters in its democracy system. Countries like Singapore and Russia have developed non-endogenous model of democracy, therefore long-term systemic risks in these two countries’ democracy development and transition process still exist, and such risks are the most significant during constructing democracy models in these two countries. Based on the real demand for integrated risk management and relevant experience of democracy development abroad, we start with a simple and effective analytical method, chromatography analysis model, to analyze the risk system of grassroots democracy within the Party.

The analytic hierarchy process (AHP) is a structured technique for organizing and analyzing complex decisions based on mathematics and psychology. It was developed by Thomas L. Saaty in the 1970s and has been extensively studied and refined since then. Hierarchy and system, key parts of the method, are determined and defined through extensive research, discussion, expert interviews and risk classification. Grassroots democracy risks within the Party are classified in this analytical structure, and the classification includes system risk and entity risk. The risks and risk groups were simplified through classification, and then the risk contents and background are analyzed. (Refers to Figure 1)

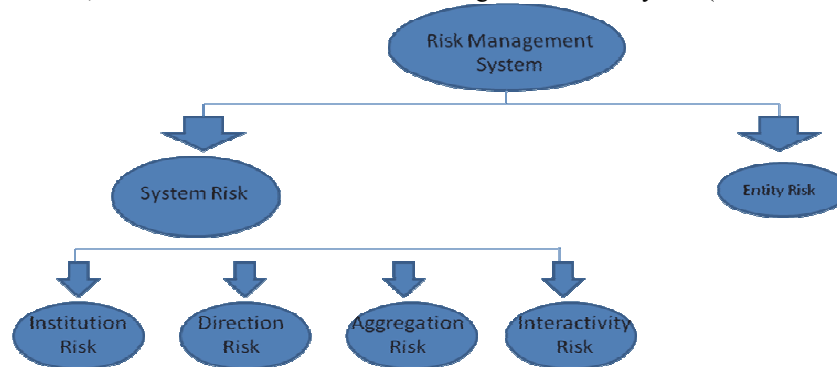

Figure 1 Risk Management System

In the process of survey, we realized that the subject risk/entity risk was broadly discussed and received fair attention; the system risk was not well understood by majority especially in the grassroots party workers.

3.3 Risk induction and identification

According to the analytic hierarchy process model, risks are classified as system risk and entity risk. System risk refers to risk review and analysis of the grassroots democracy development across the whole country; entity risk means risks when developing grassroots democracy within the Party. System risk dominates entity risk as system risk determines basic direction.

System risk of the grassroots democracy within the Party is an overall risk related to the overall economic and social development situation. System risk can include the following risk: Institution Risk, Direction Risk, Aggregation Risk and Interactivity Risk.

3.3.1 Institution Risk

This risk is the core risk in the grassroots democracy within the Party. Its manifestations are as

follows:

The first are constraints and conflicts in democracy design and path selection.

Currently, the overall design is based on the idea to protect the democratic rights of the Party members and build democracy with the basic contents of the “four democracies”. A complete and mature framework has not been established, and the choice of democracy paths and forms has been researched through pilot areas. However, the pilot experience has not demonstrated to be universally applicable.

Pilot grassroots democracy within the Party should be a regional trial in order to assist the major policy measures implemented throughout the county. This pilot trial should not exist in a long term, as long term trial would cause cluster risk which is difficult to mitigate.

A scientific design of democracy is necessary even though path selections could remain flexible. The overall framework and model structure must be clear and directional to guide the process of building grassroots democracy within the Party, to avoid uneven regional development and path dependency risks.

A theoretical issue in the confliction between democracy design and practice must be clarified, and this issue is how to scientifically insist and apply the gradual increment principle which has been well used in the economic reform and development but rarely mentioned in the democracy development by majority of people. The gradual increment method is the basic and core experience from the economic reform and could be well applied to democracy development.

The gradual increment progress is determined by external driving force, and once it is transformed into adaptive process, it will reflect the characteristics of phased development. The phased development is demonstration of leap or forthcoming performance and determined by the rule of inner development. The phased development is an indication of leap forward progress while gradual development comes from phased development. Therefore, balancing the gradual and phased progress is critical and basic to promote grassroots democracy development within the Party.

The second are constraints and conflicts between the democracy development progress and the lag of democracy conditions.

Grassroots democracy development within the Party has gained significant experience in the progress of developing “democracy in four areas” especially in the two areas: democracy management and democracy elections. Grassroots democracy development within the Party has promoted the innovation and development in inner-party democracy. However, grassroots democracy development within the Party is also facing huge challenges.

The first challenge is the contradictions between democracy development and democracy value. In the grassroots organizations, some democratic procedures and regulations have been used in operation; however, democratic value in the cadres has not been set up systematically. A large number of the Party members even don't understand the definition of democracy, nor do they understand how to exercise democratic rights. In this case, the requirement for democracy development and the Party members' democracy value cannot beneficially interact nor promote each other. Without having proper democracy value from the Party members, the democracy development would only linger in the appearance of democracy. Due to different understanding of democracy, democracy-building in many ways has been superficial, and even distorted to use non-democratic way to build democracy. This demonstrates it is urgent to employ a systematic way to cultivate democracy value in the party members. This conflict is a major risk point and it is one of the key aspects of whether the democratic process could leap forward.

The second challenge is the contradiction between the progress of grassroots democracy development within the Party and its related social supporting system. How to asset up a matured grassroots democracy system is important to fully employ the function of democracy. Currently, in many cases, certain aspects in the democracy development perform well, while the rest has yet to keep up. The democracy practice has continued to develop in depth, however, without a unified and clear overall planning and design, different regions and different units cannot be fully synchronized in the democracy development process due to the lack of unified and clear overall planning and design.

3.3.2 Direction Risk

The direction risk in the grassroots democracy development within the Party mainly comes from the following three aspects: democracy direction, total democracy, and democracy formalization.

Democracy direction refers to the guiding thoughts. Democracy has been viewed as a weapon by the Western hostile forces to break through China. Western countries have demonstrated much attention toward China's grassroots democracy development, and some international forces even conducted

in-depth analysis and research. Francis Fukuyama pointed out in his book "The end of history" that "the end of history means human ideological evolution end points and the universal dissemination of the western liberal system as the final form of human government."^[3] Some western countries have used democratization as a weapon to collapse developing countries. The democracy double standards in the United States of America could be used as an example of using democracy as a weapon. Even though the United States of America verbally vigorously propagates democracy, the democracy only serves America's national strategy and interests. The United States of America doesn't care the democracy contents as long as its purposes are achieved. For example, even though there were endless grievances in the Marcos era of the Philippines, Reagan administration still viewed Marcos' government as a good one.^[4] In fact, American politicians always employ democracy as a weapon. China never wanted to be the last abundance of Oasis when dreams come to end; China wanted to help those people living in ignorance, suffering, and tyranny to break those chains. Since 2011, many countries in the areas of Middle East, Northern Africa, and Eastern Europe have experienced political crisis which make people ponder whether America's democracy weapon exists in such areas. Some western democratic powers wanted to employ democracy to confront us; therefore, we have to be on guard toward those words and behaviors of demolishing the Party's policies, methods, and images and on guard towards advocating radical democratization.

Another risk is the total democracy which refers to wishful thinking and worship toward democracy reform. People believe that once democracy is implemented, it will naturally establish operational mechanisms which can cure long-standing illness. In fact, a thorough democratization means anarchism or extreme democracy. Ralf Dahrendorf in his book "History restart: From the fall of the Berlin Wall to the Iraq War," mentioned the society chaos in 1989 and subsequent years in the former Soviet Union and other countries of Eastern Europe come from the extreme democracy reforms. Some people hope to aggressively push democracy progress, and believe democracy can be achieved in one step process in China, because they believe China has multiple year experience in the grassroots democracy development. Endless experience has shown that, society will pay immeasurable costs if radical democracy is employed.

Another risk is democracy formalization. Democracy formalization includes two level contents: the first one is western-oriented democratic model. According to David Held's analysis, democracy models include protection type, development-oriented type, legitimate type, participation type, and negotiation type of democracy. Hayek views democracy as a tool to protect freedom, and freedom and law can counterbalance each other. The liberal tradition of western democracy model is the product of its endogenous development of social and cultural history. Copying the western democracy model to China's society would encourage radical democracy movements. Based on the worldwide experience, copying the western democracy model cannot produce competitiveness and source power while the risks associated with the transformation are eye-catching. The second one is democracy amplification. Is there any boundary for democracy? This is an important question in democracy development. Democracy is not universal medicine; therefore democracy cannot resolve all issues. Democracy can be used to resolve important, key and or core issues, however, democracy should not be blindly idolized, and should not be used without considering specific conditions.

3.3.3 Aggregation Risk

Aggregation risk refers to the risk from risk movement and conversion. Competition, accumulation, and amplification are the main features of this kind of risk which is a necessary complement for static risk analysis. In the process of grassroots democracy development within the Party, the grass-roots Party leadership faces competition, especially in the area of competitive elections. Traditional channels of the Party cadre arrangement have been unprecedentedly challenged. When competition factors are integrated into the process of grassroots democracy within the Party, uncertainty has greatly increased. This uncertainty brings forth the selection risk, which is limited from the perspective of a particular link, however, it can be accumulated and amplified into a regional or even holistic risk. The risk aggregation can be prominent regional, for example, strong competitive factors can be very strong in one region while can be weak in other regions. With the further advancement of democratic development, the risk aggregation gap among regions will contribute to a polarization pattern: some regions strongly demand competition democracy while others reject it. Regions with achievements in the democracy development will require expanding the democratic gain. If the rigid demand for democracy development becomes stronger and stronger, the potential energy of higher level democracy will be formed and will dominate the democracy progress. The result of this potential energy is likely to form a "Forced" democracy rigid demand risk, which is the most worthy of attention and prevention in the holistic risk. As Ulrich Beck

said, like wealth allocation, the risk allocation also follows the grading mode, it is just completely reversed. The wealth is always accumulated at the top of society while the risk is always accumulated at the bottom.[5]

In the formation of aggregation risk, democracy generalization is a key part. Its most direct impact is grassroots overuse the concept of democracy when participating in the democratic process. If democracy is used as a universal medicine, and the superiority of democracy infinitely is magnified, the traditional political structure and operation mode would be highly challenged and potential risk would be accumulated.

3.3.4 Interactivity risk

Throughout the course of the Party grassroots democracy development, the interaction among involved parties is an important part. The favorable interaction is essential to promote the democracy governance ability and construct a harmonious atmosphere in the democracy development progress. Interaction via the internet has become increasingly prominent and developed. Interaction exists in four types: complete contact, radioactive contact, linkage contact and ring contact [6]. (See the Figure 2 below)

Figure 2 The Interaction of the Party Grassroots Democracy Development

Internet can penetrate into various interaction platforms. The interaction process via internet is called “wedge” which can be classified into three styles:

The first one is condition embedment. The network wedge is not unprincipled nor is unsupported; rather it is a platform wedge which is superior to other interaction styles. The internet network platform directly results in general association among internet network participants. The association will cause the interest interaction among involved parties, interaction of trust toward the information shared in the platforms, and finally interaction of value judgments among parties involved.

The second one is dimension embedment. It is multifarious when referring to judge and analysis from network involved parties. This kind of wedge with a general uncertainty is summarized as the dimensions of implementation. The state of the network wedge may be manifested to be multi-dimensional, and particularly the basic issue judgment may be a hybrid of the relative aggregation and absolute discrete distribution. Regardless of problems, the basic existence of the discrete distribution in the two dimensional differentiation and multi-dimensional differentiation in the network creates a broad and difficult analysis space for the network wedge.

The third one is function embedment. The internet network is a tool which might be used to serve certain political purposes. Once the internet network becomes the most familiar and broadly used interaction tool, people who have the strategic power in the internet network can use this tool to serve the political purposes via influencing participants in the internet network. The existence of the embedment strengthens the dependence on information exchange, and the closer relationship, the more influential the exchanged information will be. The uncertainty of controlling the information and the propagation speed will become important risk factors.

We have analyzed and summarized system risks in the grassroots democracy development within the Party. Now we introduce the risk sharpness concept and its identification. The risk sharpness refers to the critical space where the intersection of the rigid and brittle characteristics of risk lies. System risk sharpness is an external manifestation of how much the social contradictions impact on social operating order. The analysis of the risk sharpness is a process of sorting, ranking and arranging related risk factors. The framework of this analysis employs the five kind index systems. The first index refers to the implementing capacity index by political governing bodies; the second index refers to the willingness to participate from the political participants; the third index refers to recognition of democracy value; the forth index refers to the soundness of the mechanism to mediate conflicts and disputes; the fifth index refers to the stress test index of the risk system. Perform aggregative weighting toward the mentioned five indices to get the initial identification of the risk sharpness, then conduct integrating qualitative

analysis based on the quantitative and qualitative analysis and the data dimensional monitoring and control, eventually execute the final experience integration.

Risk sharpness identification to determine the form and level of risks has high practical value. The categorization and identification of risk sharpness provide a strong support to understand risk nature.

In addition to the system risk, ontological risk with low level ranking but strong technical nature exists in the grassroots democracy within the Party. Such risks include for example, programming risk and cost risk etc.

Since the ontological risk has less significant social and strategic impacts than the system risk, and the ontological risk has minimum impact on changing the progress of building democracy, we are not going to elaborate it.

4 Development and Challenges of Risks in Grassroots Democracy within the Party

4.1 The risk development mode of grassroots democracy within the Party

The grassroots democracy development within the Party has the characteristic of phase, so does the risk associated with it. The democracy development within the Party has different historical stages. Different stages with different historical tasks demonstrate its historical phases. We have gained a deeper knowledge of the grassroots democracy risk through different historical periods. The risk becomes more diverse and complicated as the grassroots democracy development within the Party progresses. Its features of development in different phases are mainly manifested as follows:

First, the concept of overall risk in the grassroots democracy within the Party was not established. Many people believe risks associated with grassroots democracy within the Party are remote, and the uncertainty and hidden factors are often ignored. Because the correlation study on grassroots democracy within the Party is not prominent, understanding associated risks Party is limited. This understanding is a gradual process, which demonstrates the phased nature of the democracy development.

Second, the phased nature of the system risk has not yet been revealed. Currently, because grassroots democracy development within the Party is at the primary stage, a number of significant policy measures are still in pilot stage. Therefore, the expression of ontological risk is relatively strong, and the system risk is not fully revealed. Under this circumstance, the system risk is restrained and it can only be embedded in the ontological risk while it remains cumulative effect with the backwardness resilience. Once the opportunity is ripe, the system risk will enter the appropriate development stage. As the restriction is broken, the system risk will be emerged. Therefore, the understanding of the phase characteristics of grassroots democracy within the Party is the solid foundation.

4.2 The risk sharpness of social conflicts

Grassroots democracy development within and outside the Party are all facing a major historical challenge which is the social contradiction development demonstrates increasingly significant influence over the democracy building process. The current social contradiction is represented by contradictions among various interests and interest stakeholders. The trend of spreading the grassroots democracy development within the Party out to the society has become a major challenge. An important practical issue is to apply democracy to the grassroots level to solve difficult problems. For example, currently Beijing is accelerating the process of integrating urban and rural areas, and the problems arising from the urban and rural fringe such as occupying lands and demolition have increasingly become social conflict-prone issues. How the grass-roots party branch functions in a positive way to guide the grassroots assisting the completion of the integrating urban and rural areas has become a practical requirement to mediate conflicts between cadres and masses, and resolve disputes among various interests. The difficulty to settle current dissensions have indicated the social conflicts' exacerbation.

The index system of the social contradictions sharpness is the risk identification system based on the combination of qualitative and quantitative analysis; it has certain significance for directions. The current degree of the social conflicts sharpness is directly related to efforts and performance to promote grassroots democracy development within the Party and associated effects. In a certain sense, the development of grassroots democracy within the Party and the risk sharpness are objectively correlated.

4.3 The system risk and the social value system

Forming efficient democracy order is basic yet powerful to promote the grassroots democracy development within the Party. For system risks facing grassroots democracy within the Party, the most powerful non institutional factor is the social order with the social value system as its core. With the deepening grassroots democracy development within the Party, the demand for democracy and

democracy promotion require find theoretical support and practical guarantee in the entire social value system. However, in reality, on one hand, a trend to recognize and advance democracy has been gradually formed; on the other hand, the lack of democracy soil and concerns toward democracy regulatory capacity are progressively revealed. This contradiction will be profoundly present during a certain period of the grassroots democracy development within the Party. The emergence of this contradiction will produce significant influence over the whole society value system and the entire social order, and will push the system risk to a higher level of the social order construction. Once the risk path is formed, the social value system needs to respond. Therefore we need to plan ahead in constructing the social order.

5 Conclusion

Risk management in the grassroots democracy development within the Party requires first establish an overall and systematic risk concept; build risk model analysis system; test the analysis results one by one; form a grassroots classification index system for the regulation of party democracy risk; develop a democratic institutional system of risk management in the reference index system. Additionally, "the soft power" has to be established to handle systemic risk and crisis. This is the social value system of democracy development.

These above two aspects being effectively combined and complementary would technically ensure the grassroots democracy development within the Party to be controllable, and to achieve the management effectiveness.

Online Students Emotion Attention Research Between UT and OUC

Xu Gang, Zhu Zhe

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: xjackie@163.com, 1697832169@qq.com)

Abstract: Students at distance education show many distinguishing features in their learning, such as feeling insulation, losing of orientation, non-active, degree of their persistence and passing grade is lowest. The online community forum is very crucial for students to anticipate of time, space, and geographical constraints; to build a communication and interaction among them. In this paper, the quantity, registration ways, topics of discussion and degree of participation at online student community forum are compared between UT(University Tebuka)and OUC(Open University of China), We found that emotion attention online does good to promote online student affair management, and improve students' self-managementability .

Keywords: Student Affair; Online Forum; Student Management; Emotion Attention

1 Introduction

Distance education is a field of education that focuses on teaching methods and technology with the aim of delivering teaching, often on an individual basis, to students who are not physically present in a traditional educational setting such as a classroom. It has been described as "a process to create and provide access to learning when the source of information and the learners are separated by time and distance, or both. This shows one main feature of distance education is the separation of teaching and learning. Students at distance education show many distinguishing features in their learning, such as feeling insulation, losing of orientation, non-active, degree of their persistence and passing grade is lowest; and losing their awareness of sustainable learning communities. David Sewart regards in his paper, Student support services make up the element of distance education most nearly akin to traditional education: it is the interface between the institution and its students. The problem of management relates, therefore, to a subsystem which is apparently carrying out a traditional role and consequently might appear to observe the traditional management practices of education. This is a useful way of highlighting the role of the intermediaries in distance education and can avoid confusion with the traditional roles.

Ormond Simpson thinks that student support service contains all the services and activities apart from the production and delivery of course materials and resources. It has two aspects: academic support service and non-academic support service. non-academic support service means students studying for enjoyment as same as student affair management traditionally, they will be studying without any financial benefit in mind and may withdraw when they feel that they have gained the knowledge and skills they wanted without going forward for the final qualification.

The online community forum is a social relationship network of individuals who interact through specific media, potentially crossing geographical and political boundaries in order to pursue mutual interests or goals. Boetcher regards that in many cases the online community forum is also has equality of characteristic with the real community. Both have common interests, frequent interaction, and identification. Porter defines the online community forum as an aggregation of individuals interacting with same enthusiasm and giving support each other by partial or mediated by technology and guided by some norms or protocols.

2 Comparative Research

An online student community is a group of students with common interests who use the Internet (web sites, email, instant messaging, etc) to communicate, study together and share their resources over time. Online student communities have the power to create lasting and productive relationships where none existed before. It as a social relationship network has become to an interested study area for social researchers. the existence of the online community forum is very important and crucial for students to anticipate of time, space, and geographical constraints; to build a communication and interaction among them; to share their opinions, ideas, problems, or to build a friendship among them. in order to conduct the results, the performance of different forums be compared between UT and OUC. Some good disciplines and rules about the strategies and methods of student communications be summarised.

2.1 Quantity of Forums

There are seven online community forums for students at site of UT-Online Learning Center. The Online Forum of Faculty of Education Community, Faculty of Social and Political Science, Faculty of Economy, Faculty of Mathematic and Natural Science, Post Graduate, Computer-Based Examination Forum, and the Comments and UT-Online Community Forum [Figure 1]. First six forums are the courses forums, different programme students discuss academic questions at these forums. UT-Online Community Forum is a public forum for all students to communicate and share their opinions related to non-academic matters.

Figure 1 UT Online Forum

DianDa Online is the learning platform of OUC. The structure and classification of DianDa Online Student Community Forum are different from UT-Online forum. DianDa Online Student Community Forum bedevived into the program forum, the course forum and the public forum [Figure 2]. In the program forum, there are 28 undergraduate program forums and 59 junior college program forums. In the course forum, Every forum link with program forums. There have hundreds of course forum for student’s course learning. As same as UT-Online, there has a public community forum at DianDa Online, four special plates about campus culture, call center, technical support and exam support in this forum.

Figure 2 DianDa Online Forum

2.2 Registration Ways

The UT-Online community forums is not opened for the public. It can be accessed by UT’s students or tutor only[Figure 3]. They can access and participating at the Forum after they conduct “login” for activation by using user account has given by UT Administrator. It’s the same to say, Students must become members of UT-Online and had ID, they can only access the Forum. They must had and sent their e-mail address to be made correspondence and source for the administrator to facilitate problems or difficults they faced when they use the forum.

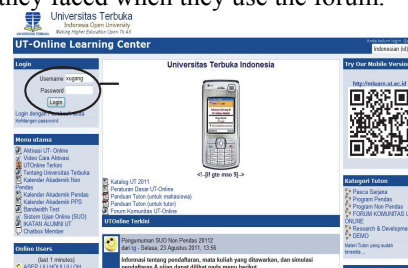

Figure 3 Register in UT-Online Forum

It's Very similar with UT-Online community forum. Dianda Online Student Community Forum is also 'a closed forum', which is not open for the public, and it also can be accessed by OUC's students and tutors only[Figure 4]. They can access and participate in the forum after they log in for activation by use user account given by IT administrator of OUC. The real-time communication panels and the non-real-time communication panels are established in forum. Students can not use the forum to publish anything advertisement, pornography, or anything which against regulations. Student expected do not post the same text-chats in many Forums.

Figure 4 Register in DianDa-Online Forum

2.3 Topics of Discussion

Through the research, I found that followings are main topics of discussion in UT-Online Forum[Figure 5]. About activation , how to login and take part in the discussion at UT-online Forum? About final examination, how prepare the examination? how to get examination exercise? and scope of test items to pass the examination. About acquaintanceships, it is related to students needs to get friends to discuss, to share ideas, experience, to solve their learning problems, to learn together, or to build face-to-face study groups. About non-academic, it is related to holiday and feast day ,online and offline activities, the communications of social problems, hobbies, hot topics in fashion and change things online etc.

Figure 6 Topics in DianDa-Online Forum

2.4 Degree of Participation

An Analysis basic data from forums and questionnaire survey. According to data of forums, the participation Both of UT Online forum and DianDa Online forum are not very high as the figure shows[Figure 7].Students participation rate has been increasing from year to year. Students who participated in forums take more care about academic problems. They are passionate to Online Forum. A survey made for bandung’s UT students shows that 100% students are willing to communicate, interact, and to share their opinions related to academic or non-academic matters, or to build a friendship each other at forum.

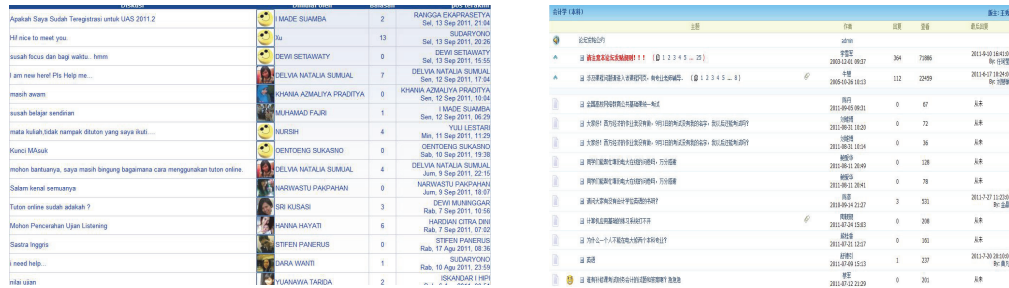

Figure 7 Degree of participation in UT-Online and Dianda On-line Forum

3 Some Strategies

The results of this research shows that the online student community forum is significance for students to build a communication and interaction each others. Students will be able to create or build friendship each other for fluency and efficacy of their study at community forum, and then they create or build a sustainable collective awareness among them to form a common vision and shared goals. There are very important to realize students' self-management. therefore, Some strategies about student's emotion attention must be done by university.

3.1 Analyzing Student Demands

Every student has his/her own hobbies and study habits for age difference and work variability. Some methods should be launched to analysis differences of emotion and study demand of students. What things to make them pay more attention? Unless course discussion, what kinds of topic do they like at the forum? A survey must be done by administrators to analyze the data of survey and understand what's the demands of student, then IT technicians should design more rational edition construction to fit students demands.

3.2 Emotion Guide to Improve students' self-management ability

A psychologice research shows that the happy learning experience and emotional experience will produce positive emotional resonance. Through the actively guide, students' knowledge of the subject and the emotion would be trained. Because distance education is different from general education, most of students don't know how to learn on internet, they lack of learning plans and communicate confidence. Tutors should teach them the internet skill, encourage their cooperating study and communication online, and lead them to develop self-management abilities, which embody the goals of quality-oriented education and suits to distance learning.

3.3 Improve Emotional Communication by Online and Offline Activities

Dispersion and loneliness of students limits the enthusiasm of participation of student community. Online activities which encourage the collaboration can enhance the web-based self-learning and collaborative learning for students such as the web-based contest of debate in forum. Offline activity is also an important way to communicate. Students who is in the same area launch a theme activity on net, such as voluntary work, picnic, visit and exchange goods. The students who interested in this theme activity will take part in at the promissory time and place.

4 Conclusion

Online community forum is one of field of study in sociology, especially in internet sociology, that applying theory and method of sociology to study of internet as an information and communication resource. The main subject of study is social implications of usage of internet technology; such as new social network, virtual community, and the ways of interaction and communication virtually. From the result of research with UT and OUC online community forum, we found that all of students want to

communicate with others. They are interested in social culture, hot issue and study communication. Students who know communicating information can use network tools such as online community forum to connect with each other to enhance students' self-management, helping each other and making friends, and their communication is informative.

On the Innovative Teaching Modes of Listening & Speaking Course in College English*

Gao Xin

School of Foreign Languages, Hubei University of Economics, Wuhan, P.R. China, 430205

School of Marxism, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: wojiaohealthy@163.com)

Abstract: With the accelerating process of globalization, to have good skills of listening & speaking in English is becoming more and more important for college students. This paper expounds the background of listening & speaking teaching in college, then introduces the problems of listening & speaking teaching, then analyzes reasons of ineffective teaching, and proposes the effective teaching techniques of listening & speaking in college. This paper suggests teachers should strive to improve students' ability to listen & speak and further prompt the development of English teaching in China's Higher Education.

Key words: Listening & speaking teaching; College English; Teaching modes

1 Introduction

Since the policy of reform and opening up has been carried out for more than twenty years, we have been improving students' English skill by focusing on reading. It is not until "dumb English" appears that we begin to pay attention to develop the skills of listening & speaking. However, the ability of listening & speaking is actually a natural reflection when our language reaches a certain degree. We can find from the babbling babies, that actually our consciousness appears ahead of language and is expressed through language, movement and so on. Because consciousness is a gradual process, the process of language acquisition is gradual, too.

Nowadays, the biggest problem existing in listening & speaking teaching, is that students' consciousness is divorced from their language ability. When a good idea appears in their mind, they can not express it immediately in proper English because of the restriction of the language ability. In order to make our consciousness keep pace with the language level, we need to take effective methods to establish a direct link between them. We should be careful with choosing a proper method, which should establish on the basis of empirical study and practical investigation.

The main problem that students face in listening & speaking is that they can not express their consciousness with proper ways and good sentence patterns. Moreover, after students complete two years study in listening & speaking classes in university, the situation is still not a big change. It is worthy of our reflection. We have to begin to reflect on whether there exists some problems in listening & speaking teaching methods.

2 Basic Teaching Modes & Difficulties in Listening & Speaking Course

Currently, we take different topics as the main teaching content and interactive way in listening & speaking class in university. In each unit, teaching content is divided into "lead in", "basic listening practice", "further listening practice", "speaking", and "talking". From the entire arrangement of class, students have access to a great deal of information in class, and the practice is also very deep.

However, if we use the above methods to develop students' listening and speaking ability, we gradually realize some problems come out. At first, from the perspective of topics, although some topics are closely related to students' life or hot social issues, students' performance is still not satisfying. For most of the topics, they are able to express their ideas very well in Chinese, but can not do the same thing in English. The biggest difficulty for some students is that they do not know how to express, that is, they even can not speak out a complete sentence in English. Secondly, from the view of the relationship among the various textbooks, it is lack of necessary progressive transition. Although textbooks used in different grades differ from each other in the length of texts and the difficulty level of topics, it is still lack of clear and different ability cultivation goals in English. For the students, they can't feel the

* "On the exploration of general education English courses based on CBI theory---taking teaching reform in Hubei University of Economics as an example" supported by Educational Commission of Hubei Province of China (No. 15Q157)

differences among various grades of textbooks. That is because the basic teaching mode of listening and speaking course has been set down in the first volume of textbooks, that is, preparing topic, lecture, and group discussion and so on. As for how to gradually improve students' listening and speaking ability, the writers of the textbooks have no ideas about it. They may believe that through a lot and repeated practice can improve students' ability naturally. But they don't realize that it is difficult to improve students' ability with only different topics.

In fact, the reason that students feel difficult to express ideas in English is nothing to do with the topic itself. But there is something to do with an ability that can make consciousness convert into language quickly. If we realize this, we should make the students focus on converting awareness into language ability. But the current teaching of listening & speaking is mainly based on students' poor speaking & listening skills. Just imagine, for infants with only drinking milk, how can we teach him how to eat meat? Most of teaching contents of listening and speaking course are just like audio-visual feast, which not only can not play a tonic effect, but also may ruin the appetite.

In China, due to the impact of exam-oriented education system, students put little emphasis on the ability of speaking & listening before they go to university. For basic life English, they can deal with it in exams, but they can't deal with it in real life. Form the content of the current textbooks used, in the first volume, it is positioned college students, white-collar businesses and intellectuals as main roles. What's more, the listening & speaking training also bases on business, economics, politics, culture, etc. But this kind of formal, professional language is separating from the language we use in our daily life. Textbook is not designed mainly on the life or emotion of ordinary persons, so it leads to a gap between consciousness and language.

3 Teaching Techniques Improving the Ability of Listening & Speaking

Nowadays, the listening & speaking textbooks are lack of scientific standards in the content. Most textbooks are only different in the length of topics or the degree of difficulty about words. This distinction is the lack of rationality. It was not based on students' life and learning experience at different stages, which is based on some social phenomena. Such methods combining language teaching and culture may shift the student's attention to culture or phenomenon behind language. Students put little attention to practical usage of language. Therefore, only scientific, rational textbooks can improve students' listening and speaking ability.

3.1 The Language Teaching with Local Characteristics

The design of college English textbooks should combine with the characteristic of Chinese. It should focus on the need of communication in English in different fields. For textbooks at the market, the students not only need to learn language, but culture. In fact, this is not necessary and also limits the realization of good teaching effectiveness to a large extent. So, it is easy for us to understand why some students not only change tone of voice, but change their communication content after they study abroad for a few years. Language can change the way of thinking. For a person who is studying in a foreign county, the best way to integrate into the lives of the local people is learning a foreign language. However, for those people who use English as a communication tool, they need to know cultural practice in some foreign countries to avoid the embarrassment when communicating with foreigners. But if we excessively use the other's language and culture, we will lose the characteristic of our language and culture. So Foreigners can not understand our true ideas.

3.2 The Language Teaching with Different Levels

"Requirements of College English Curriculum" proposes students' progress in their oral English should follow the process from simplicity to difficulty. In the current teaching of listening & speaking, this requirement is not completely followed. When students are preparing a variety of topics, they pay more attention to the content rather than accurate usage of language. When they are preparing a topic, they also pay attention to the usage of language. But these topics are rarely appeared in their daily lives, so even some well-prepared topics will not leave a deep impression in the minds of students.

To solve this problem, we need to set up scientifically the teaching content of listening & speaking course. And different requirements are put forward for students at different stages of the ability. In the first year of university, we should focus on students' language awareness training, that is, students can reflect their thought and idea instantly with the ability of 'copy' language. When we teach students how to express their ideas, we should follow a procedure from simplicity to difficulty. For students who can not speak out a complete English sentence at once, we can help them begin from the words and simple sentences. In some cases, we can even express our ideas with body language to help students to learn

English. In the arrangement of teaching content, we should try to select topics close to the students' daily life, and dig different ways of expressions for the same topic in different situations. In this way students not only can strengthen the usage of specific expressions, but also increase their language awareness and sense. And then in the second year, we should focus on students' way of thinking in English, that is, they have a kind of ability that can 'create' language. Teachers should encourage students to think independently and learn different ways of expressions in English. By mastering diversity of language, students can enhance their quality of language.

3.3 The Language Textbooks with Scientific System

The content of listening & speaking textbooks should be strictly distinguished from that of reading textbooks. The subject of reading material is usually very wide. It is very necessary to improve the students' reading ability by all kinds of themes and topics. However, if the audiovisual textbook is designed according to style of reading textbooks, it will be beyond the level of students' oral English. For Some English material in a certain professional field, it is difficult for students to master professional knowledge in Chinese. So it is almost impossible for students to express professional knowledge in English.

Audiovisual teaching should be focus on the training of "language awareness" and "Language thinking". The key is scientific textbook system. The agreement on the teaching goals of audio-visual textbooks has reached, but how to achieve these goals by arrangement of courses is still have no a clear conclusion.

Therefore, the writer proposes that it should pay more attention to the form and content of audiovisual textbooks when textbooks are revised. Before the textbook is revised, it should encourage the education sector to undertake wide research on popular English and make a good choice. We should teach the basic language skills to students, rather than a way of mechanically practicing oral English with example sentence and model essay. Compared with writing, speaking and listening is difficult to maintain through the approach to "copy". But the biggest problem existing in the listening and speaking teaching in our country is to use the "copy" approach to teach English.

4 Studying Techniques Improving the Ability of Listening & Speaking

For students, they should not only depend on English class to improve their listening & speaking skills. Some students feel good by participate in some training institutions. In these training schools, many students make great progress in English. Why? It is not because that training school adopts modern teaching concept and method, but it is because students themselves pay more attention to English learning. So the key to improve listening & speaking skill is to lie in students themselves.

Lack of language environment is an important factor of influencing Chinese people's listening & speaking ability. Students who don't major in English can only speak out a few English sentences in class. In their daily life, they can communicate with each other in very easy English. In view of this situation, we can only take other measures to make up shortage in the language environment in terms of listening & speaking practice. As for the basic sequence of language acquisition, the ability to speak & listen is earlier to be acquired than that of reading and writing. In the 19th century, the French scholar Marcel, in his book 'Language as a Means of Mental Culture and International Communication' proposed four links of language acquisition, that is listening, speaking, reading and speaking. He proposed speaking should be put in the first place. He then concludes that "you can't speak if you don't listen, you can't read if you don't speak, and you can not write if you do not read". Lack of a good language environment, students still can improve their ability of oral English by repeatedly reading aloud articles that are close to their life. It is undeniable that four skills connect with each others. If any of four skills is strengthened, the other three can be improved.

In order to improve oral English, many students try to look for a partner to communicate in English. This is an effective way that may bring positive effect to their oral English, if they can insist for a long time. However, most students will give up because they can't bear the complex eyesight of others or overcome themselves. Moreover, English Corner is a place where lots of college students are willing to go and practice their oral English. However, in many universities, the English corner is organized only one or two times every week. In English corner, students who can speak English well or have a strong desire to show themselves always occupy the dominant position, while others can only raise a few questions in "appropriate" time or just be listeners. But, either English corner or speaking partners are very good way to practice oral English. As long as students can persevere, their comprehensive language

skills will improve.

5 Conclusion

With the accelerating process of globalization, to have good skills of listening & speaking in English is becoming more and more important for college students. In view of Chinese college students' relatively poor listening and speaking abilities, it is rational that college English teaching aims to mainly develop students' ability to listen and speak. There is a long way to go in order to improve college students' skills of listening and speaking. Both teacher and students should undertake this challenging task. We should realize there will be setbacks and failures during advancing process. But if we can summarize the gains and losses in practice, we can explore the most effective method that improves students' listening and speaking abilities.

Analysis on the Commercial Characteristics of Publications Fleet Sales

Yin Jie

Press, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 357821726@qq.com)

Abstract: According to international standard, internal publications market can be divided into general publications, educational publications and academic publications. Aiming at these three kinds of publications market, our publications fleet sales has conspicuous commercial characteristics and market differences in the fields of pricing mechanisms, profitability and distribution channels.

Key words: Publications Market; Publications Fleet Sales; Distribution Channels; Pricing

1 Introduction

Publications, which are both reading materials and general goods, have the duality of the material and the spiritual. Serving as what are circulating in the form of wholesaling and retailing, publications are the same with general goods. As to reading materials, publications are in the same category and have no differences in regions and countries. According to the differences of product features and public readers, the classification for international publications market is also appropriate for internal markets. In the below sections, on the basis of international classification, I will analyse the commercial characteristic of Publications Fleet Sales in the fields of pricing mechanisms, profitability and distribution channels.

2 The Classification of Publications Market

Internationally, publications market is classified as “general publications”, “educational publications” and “academic publications”. According to this kind of international classification, the publications in our country land area can be corresponded to what in the following form:

Table 1 The Corresponding Instance of Internal Publications Market under the International Classification

International Classification	Internal Classification
General Publications	Philosophy, Social Sciences; Literature, Art; Culture, Education;
Educational Publications	The College and Technical Secondary School Teaching Materials; The Primary and Middle School Textbooks and Guides; Children’s Books; A Part of Literature and Education;
Academic Publications	Natural Sciences, Technology; A Part of Literature and Education; Financial and Legal Publications in Philosophy and Social Sciences.

Annotation: There isn’t Other Publications in the table above.

3 The Commercial Characteristic of Publications Fleet Sales

The variety of publications’ contents determines the pluralism of Publications Fleet Sales’ characteristic. In order to analyse its commercial characteristic, we must rely on the classification of Publications Market. In the following parts, I will analyse the characteristic in the aspects of pricing mechanisms, profitability and distribution channels.

3.1 Pricing Mechanisms and Profitability

With low market entry barriers and resource requirements, there are a large amount of General Publications merchants and substitutes. Single merchant can not be outstanding, forming its stable competitive advantages. All of these result in a big elasticity of General Publications’ price, which means that price changes lead to great changes in quantity demanded. Intense competition determines the meager profit and low market profitability of General Publications.

Compare to General Publications, Educational publications have high entry barriers, and to some extent exist administrative admittance restriction. Under the basic situation of present regional market division, educational publications’ substitutability is weak and have formed the situation that the regional market is managed by one single leader. Administrative barriers and monopoly in some measure make

educational publishers powerful in pricing, which determines that educational publications have high profits and strong profitability. Certainly, educational publications' market has its own characteristics. There is no publication like educational publications that will be weeded out and lose the whole regional market if it is not used. Therefore, there is a close relationship between the situation of educational publications market and the process of publishing.

Academic publications market is between general publications' and educational publications'. The production of academic publications also has high entry barriers. However, these barriers are not from administrative admittance restriction but from their own professional contents, which makes academic publishers powerful in pricing. It is publications market's division that brings academic publications market into being. Compare to general publications market and educational market, the scale of academic publications' is much smaller. Therefore, its high pricing and small scale determine that academic publications market has higher profitability and less risk. And its profitability is higher than general publications' market's, while it is hard to exceed the profitability of educational publications market whose scale is enormous.

The above analyses can be partly proved by the following picture 1, which shows the dynamic situations that how much our internal eight kinds of publications' sales amounts account for since 2002.

Figure 1 The Dynamic Situations That How Much our Internal Eight kinds of Publications' Sales Amounts Account for Since 2002

(Data Sources: The State Administration of Press, Publication, Radio, Film and Television of the People's Republic of China)

Figure 2 The Static Cross-Section Data That How Much Our Internal Eight kinds of Publications' Sales Amounts Account for in 2013

(Data Sources: The State Administration of Press, Publication, Radio, Film and Television of the People's Republic of China.)

As what we can see in the picture 1, in the eight kinds of publications, primary and middle school textbooks and guides which belong to educational publications are always at the top two. Thanks to being included in cultural and educational publications, educational assistant publications are always

comfortably in second, and once over primary and middle school textbooks and guides, becoming the best-selling one in 2010 and 2011. Before 2009, the college and technical secondary school teaching materials were in the third place. However, due to the influence exerted by the use of high-class monographs in colleges and universities, its selling amounts have decreased obviously since 2009. In our country, academic publications are mainly distributed in philosophy, social sciences publications and natural sciences, technology publications, so these two kind of publications' selling amounts are always at the top 4 and 5.

Besides, picture 2, the static cross-section data that how much our internal eight kinds of publications' sales amounts account for in 2013, can also support my analyses above. In the picture 2, we can see that cultural and educational publications which include educational assistant publications are in the first place, which are followed by primary and middle school textbooks and guides.

3.2 Distribution Channels

Recreational contents, numerous categories, low professionalism and complicated consumer groups are the main characteristics of general publications, which makes it difficult to let consumers show great loyalty to the single channel. Different customers have different demands to experiencing consumption, so the competitions among general publications distributors have always been fierce. As to traditional significance, the main channel is retail business based on shopping places and sales promotion. Traditionally, therefore, hard on shopping places is essential for general publications market. Besides its own qualities, the qualities of shopping places, such as internal settings and displays, are also the key factors to determine the sales status of general publications. Once the consumers develop consumption habits in one specific store, this store can bargain with its publishers in some measure.

The bases of educational publications are educational assistant textbooks and guides that provide learning aids, and not involve professional technology reference books for exams. Breaking the nationwide standards to form a lot of regional standards in the educational field leads to the diversification of educational publications. And the integrate of publications market also makes traditional educational publications fleet sales face more pressure. At present, educational publications market gradually becomes diversified, professional and has single consumer group. Under the basic pattern of total access restrictions, the special channels have been formed in the regional market. So educational publications market doesn't rely on shopping places too much from the tradition view. Although the future is uncertain, present educational publishers still have strong bargaining power.

Figure 3 Total sales Volumes and Sales Amounts in Xinhua Bookstore System and All Kinds of Distribution Units in Our Country from 2005 to 2012

(Data Sources: The State Administration of Press, Publication, Radio, Film and Television of the People's Republic of China.)

Academic publications mostly contain the books about majors and professions and have fewer categories, highest professionalism and most single consumer group. Because of the small market, academic publications are sold directly through target marketing generally. It means that academic publications market can easily form stable direct channels with high loyalty from the consumers if the publications have good qualities. Nowadays, of course, the identifications of professional technology and occupational requirements are both in the charge of the administrative responsible organization which contains professional publishers and magazine publishers. So the publication and distribution of many professional technology and occupational requirements reference books for exams may all be in

the charge of the subordinate publishers that are empowered by the administrative responsible organization, carrying a very strong administrative color. So we can predict that in the future our academic publications market doesn't rely much on shopping places and still has strong bargaining power. It is also important to note that finance and economics, laws and medical science publications also belong to academic publications. Compared to the books about majors and professions, they are more diversified and highly competitive, and rely on shopping places much highly, which is partly the same as general publications.

From the changes of total sales volumes and sales amounts in Xinhua Bookstore System and all kinds of distribution units in our country from 2005 to 2012, we can see that the increase of sales volumes and sales amounts in Xinhua Bookstore System are basically flat, while other distribution units' sales amounts rise much more than their sales volumes rise. These means that some publications with high price and additional value, such as academic publications, have formed their own independent and mature marketing channels.(Picture 3)

4 Conclusion

4.1 The Aspect of Pricing Mechanisms and Profitability

General publications' price changes much flexible and its profitability is poor. Educational publications exist some administrative admittance restrictions and have high pricing ability and profitability. Academic publications have very strong pricing power owing to its professionalism, but due to the small market scale, its profitability is between general publications' and educational publications.

4.2 The Aspect of Distribution Channels

To general publications market, internal settings and displays is essential, and the competitions of its channels are strongest. Due to the integrate of market and the diversification of editions, educational publications face the pressure from single consumer group but diversified distribution channels. Having stable direct channels with high loyalty from the consumers to conduct precision marketing and terminal marketing, academic publications don't rely on shopping places and channels too much.

Abstract: Network English writing teaching and learning mode is a kind of automatic online composition correcting service software based on constructivism. It has powerful language database and can effectively assist English teachers to review English compositions of different grades and levels. Thus it can greatly improve the composition correction work efficiency and reduce teachers' burden. This paper probes into a new running mode of network English writing teaching and learning based on constructivism in order to realize the English writing teaching and learning reform and improve the self-construction of students' English writing knowledge and writing level.

Keywords: Running mode; Network English writing teaching and learning; Constructivism

1 Introduction

In recent years, writing has become one of the heaviest burdens for the English teachers. Writing correcting system based on computer and network is a kind of automatic online composition correcting service software based on corpus and cloud computing technology. It has powerful language database as the basis and can effectively assist English teachers to review English compositions of different grades and levels. Thus it can greatly improve the composition correction work efficiency and reduce teachers' burden. For students, it can help students achieve writing real-time correction. Based on the scoring, students can obtain the corresponding comments and guidance of languages and methods. This system can effectively improve the depth and accuracy of the writing correction. Therefore, building network English writing teaching and learning operation mode has the extremely widespread application and promotion value and significance.

2 Constructivism and Network English Writing Teaching

Constructivism, also translated as structuralism, is an important branch of cognitive psychology. The theory of constructivism is rich in contents, but its core can be summarized with one sentence: To be Student centered, emphasize on students' active exploration, discovery and Constructivism (constructivism) also translated as structuralism, is an important branch of cognitive psychology. The theory of constructivism is rich in content, but its core with a word can be summarized: Student centered, emphasizing to students' active exploration, discovery and the knowledge of active construction of meaning (unlike the traditional teaching, is to transfer knowledge from teacher to student's notebook in the mind).actively construct knowledge (not like the traditional teaching and learning, just transferring knowledge from the teacher to the student's notebook).

Constructivism learning theory advocates learners to actively participate in teaching activities. Teachers' role transforms from the traditional knowledge authority to students' learning tutor, the senior partner or cooperator. The teachers should become the students' active helper and guider of knowledge construction. They should arouse the students' learning interest, initiate and maintain students' learning motivation. By establishing links between the teaching context fulfilling the requirements of teaching contents and prompt clues of communication between the old and new knowledge, teachers should help the students construct the meaning of the current knowledge. Interaction is an important means to construct meaning. Constructivism emphasizes on a two-way interactive relationship between teachers and students. The most valuable activity in the classroom is that students form a group, make mutual exchanges, and build joint construction. Cooperation and communication between teachers and students, students and students is the key to accelerate knowledge significance construction.

* This paper is supported by the Project "On the Mode of the of English Talents Cultivation Based on ESP Theory" (20151h0139)".

Constructivist learning theory is an important theoretical basis for network English writing. Through the Internet collaborative cooperation learning is one of the signs of the constructivism learning view, and it is also the development trend of the future. The Internet is an effective tool to encourage and promote student’s learning. The biggest advantage is that it provides an open and interactive and cooperative constructivism learning environment. Network breaks the communication constraints of time and space and opens up a broader social communication environment, providing spaces to display new knowledge and new ability. The multimedia network can create an active construction of knowledge and solve practical problems for the students. It can arouse the students’ learning interest and initiative, and thus cultivate the independent, cooperative and creative talents.

3 Design of the Network Writing Teaching and Learning Mode under Self-learning Environment

From the user’s point of view, the “English Writing Teaching Based on Network Intelligent System” includes “teacher”, “students” and “Administrator” three modules, as showed in Fig.1:

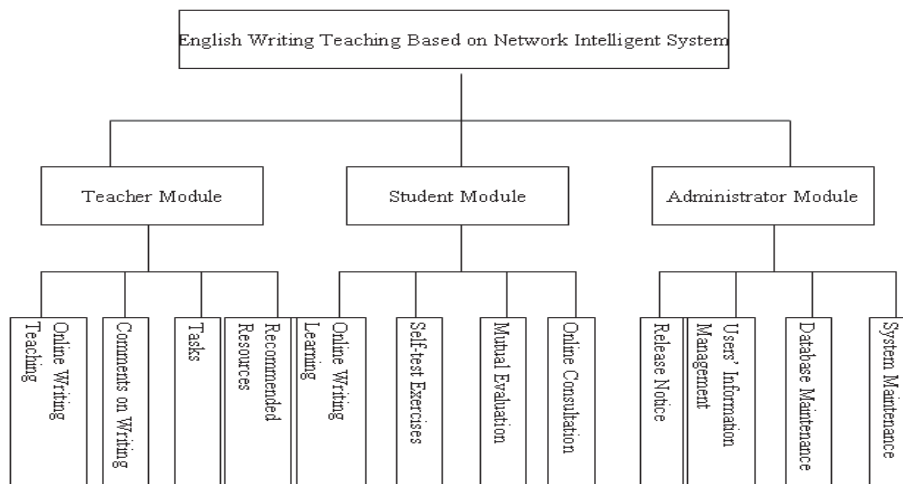

Figure 1 English Writing Teaching Based on Network Intelligent System

4 The Running Mode of Network Writing Teaching and Learning

The mode of network writing teaching and learning we have designed applies Process Teaching Approach, Genre Teaching Approach, Process Evaluating Approach and combines them together. It is a new mode of network-based college English writing teaching and learning which is open, sharing and interactive, as showed in Fig.2:

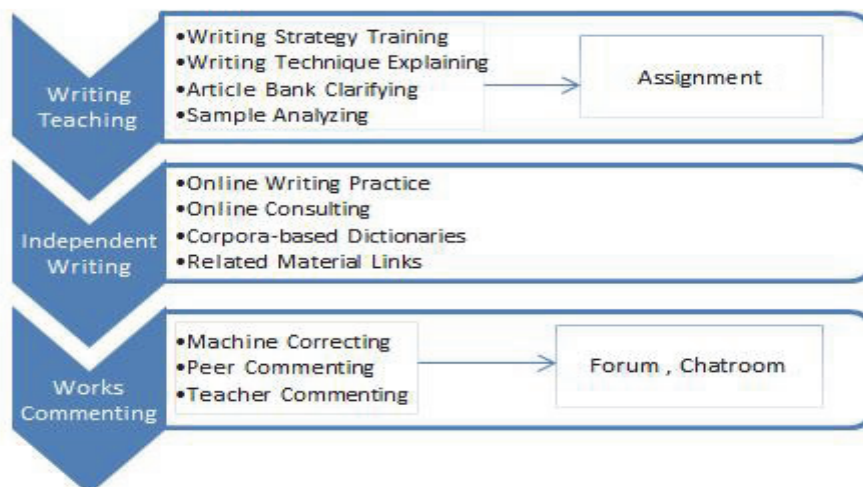

Figure 2 New Mode of Network-Based College English Writing Teaching and Learning

Thus, the whole mode of network writing teaching and learning runs in following steps:

Teachers make writing training strategies for students, explaining writing theory, writing techniques of different types of literature, and clarifying the way of understanding the essay requirements of the article bank and thinking in the form of online courses, to provide necessary knowledge construction.

Through creating circumstances which meet teaching content requirement and inferring clues of relations between the old and new knowledge, teachers can help students construct the meaning of what they are learning. Teachers can irregularly release writing-related materials (documents, audio/video materials, etc) and share network materials, to encourage independent learning, guide exploratory discovery in writing main points and simulate writing and creative writing. It can not only enhance students' understanding of characteristics and patterns of writing, but can also benefit the construction of their cognition of writing. And this is attached to great importance by Constructivism-- the interactive relationship between teachers and students. To make students' construction of meaning become more effective, teachers are supposed to make every effort to organize cooperative studying by assigning the discussion, and guide the process of it to mostly benefit the construction.

In the process of writing, except for expanding materials given by related links, students can also seek help from corpora-based dictionaries. The function of sharing corpora can help solve the problems in words and grammar, and can help students choose the most appropriate and authentic expressions of their thoughts. The process of learning does not consist simply of input, storage and drawing of information. It includes both transformation in concepts and reformation in structure owing to the conflicts between the old and new habits. It is a two-way process in which old and new habits affect each other. In forms of dialogue and discussion, by cooperating in the process of collecting and analyzing materials, making and checking assumptions, evaluating results, ultimate constructing meaning, etc. to enlighten each other, this mode allows the thoughts of every student shared by the whole class, and promotes the all-round construction of contents and meaning of new knowledge.

In the mode, we adopt a process assessment system which requires 3 drafts for 1 assignment, and we combine machine correcting, peer commenting and teacher's commenting together. First, a student completes his first draft and uploads it in peer commenting section. After that, the writer hands in a second draft with revision. In this whole process, the machine correcting always works to help correct, revise and promote their drafts. At last, teachers comment and correct the second drafts, and give them back to the writers. The writers make the final revision, and come with the final drafts.

As the drafts are handed to teachers after several revisions, the work load of teachers will be greatly reduced. It saves teachers' energy to give more targeted comments. Teachers instruct students to receive, understand, handle and process information, and apply them in writing and self-examination of writing skills. In addition, in the process of commenting on drafts of each other, students' writing skills and motivation can be greatly improved. The cooperation, sharing of materials and views on an open platform benefit their construction of writing cognition a lot. This active way of constructing students' knowledge structure has several advantages: The structure students build will be firm, and students are given chances of independent learning which can cultivate their creative thinking.

Students can post their qualified works on forum for other students to read. They can also post their experiences, feelings and problems in writing, and enhance their understanding of problems through communication and discussion. Teachers can appreciate and comment on the qualified works as samples in online courses. Through reading and comparison, students can find their own shortcomings and learn from others' works. Besides, sharing of thoughts in the whole class helps cultivate students who are independent, cooperative and creative.

5 Conclusion

Due to technical reasons, the network writing teaching and learning patterns still need many improvements. For example, the network grading principle is to test the gap between the composition and corpus. When the corresponding statements cannot be found in the corpus, the database server will automatically check the validity of their grammar rules. Therefore, the network writing system can only point out and correct students' English writing errors to a certain extent. Expect the complete network mode to replace the manual mode for giving an accurate evaluation is still not mature because of lacking in technology. The new operation mode of network English writing teaching and learning based on constructivism can improve the students' comprehensive abilities in using English to express ideas and views, but there are also some problems to be solved, such as students' abuse of cyber source prevention, cyber source optimization, operation and maintenance of the teaching and learning platform, teacher training and teacher idea transformation etc. In addition, because such kind mode of English writing

teaching and learning has higher demands on the human, material and financial resources, the promotion is still difficult. However, use the computer network corpus in college English writing teaching and learning will become the trend of future English writing teaching and learning.

Abstract: The research displays developmental features of discourse organization in Chinese English majors' L2 writings. Tendency was found from variety to oneness, and then to variety from freshmen to higher grades in terms of Discourse Pattern. The tendency for Thesis Statement developed more closely to the preferred English pattern. In addition, with the development of their English language proficiency, students preferred to write summary in their writings. Based on the comparisons among three proficiency levels—low, intermediate and high level group, significant differences were found. Good writers tended to apply less discourse patterns, and had the tendency to add summary to their writings. On location of Thesis Statement, they were more skillful and developing more and more toward stating thesis not simply initially. These findings can help promote the understanding of the development of L2 writing of Chinese EFL learners and provide insights into the role of discourse organization in L2 writing.

Keywords: Discourse Organization; Writing proficiency; Writing development

1 Introduction

Discourse organization, the construction of an article, one of the key discourse features that writing presents, assumes overall responsibility from beginning to ending in writing. It confirms selection of materials, connects each piece of language sections, and thus makes the association of every part in good order.

The interlanguage system is of variability, which is changing all the time in terms of inter-individual and intra-individual. From the 1970s, the variability has been paying attention to by researchers in linguistic, sociolinguistic and psycholinguistic fields. Developmental study aims to discover these dynamic features of learners' performance which has been neglected by most of linguistic researchers.

Since 1960s, Hunt (1965) had done the first developmental study on children's L1 learning, which had deep impact on the later similar researches. Crowhurst (1987; 1990) examined the developmental features of learner's language proficiency levels with writing collected from different grade levels. However, the early studies for developmental features are mainly case study or with limitedly small subjects. By the end of last century, more samples have been collected. Such as the research of Shaw & Liu (1998), Storch & Tapper (2009), and Üstünel (2014), they collected the samples of the L2 learners in colleges, universities and kindergarten. However, in China, the studies aiming to investigate the development of discourse organization in Chinese L2 learners' written production are relatively few due to the difficulties in data collection and analysis. For this reason, this cross-sectional study was undertaken attempting to examine the developmental features of discourse organization in L2 learner's argumentative writings among larger samples in the college of China, with the hope to reveal some developmental features of discourse organization in L2 learners' writings.

Based on the data collected from text analyses and Jacob's scoring, the study first investigated the development tendency of discourse organizational patterns in the argumentative writings written by undergraduate English majors at three different grade levels, and then examined the developmental features among different proficiency levels.

2 Classification of Discourse Organization

Meyer (1983) applied a proposition tree to analyze the organization of argumentations with three components: microproposition, macroproposition and top-level structure. Microproposition is the subordinate viewpoint of argumentation, which is the extension of macroproposition. Microproposition

* This research is supported by Fundamental Research for the Central Universities (Grant NO. 2015-VI-042)

with macroproposition together forms the main idea of articles. Top-level structure is the principle discourse organization of argumentation, which incarnates the logical relation within an article.

Based on the classification of Meyer, Carrell (1984) set forth the logical relationship of top-level structure. She divided it into 4 categories: (a) Description (including chronological relationship); (b) Cause-effect; (c) Problem—Solution Pattern; (d) Matching Pattern.

Kubota (1998), in his research, made a more brief and practicable classification: (a) the location of main idea(s): Initial (stated in the introduction), Middle (in the middle section), Final (in the conclusion), or Obscure (not clearly stated). (b) The macro-level rhetorical pattern: Explanation (the writer's opinion precedes a supporting reason), Specification (the writer's opinion and a preview statement of a supporting reason are followed by the reason), or Induction (a supporting reason precedes the writer's opinion). (c) Presence or absence of a summary statement.

In Kubota's classification, the macro-level rhetorical pattern was just classified into two categories, which the researcher thinks too broad and too limited. In order to find out more specific features in Chinese English majors' argumentations, the present study adapted four categories of the macro-structure patterns as follow: (a) Location of Thesis Statement: Initial, Middle, Final and Obscure; (b) Discourse Pattern: Problem-Solution pattern, Hypothetical-Real pattern, General-Particular pattern, Matching pattern and Obscure; (c) Summary Statement: Presence or Absence.

3 Methodology

3.1 Participants

All participants were randomly selected undergraduate English majors at three different grade levels (freshmen, sophomores, and juniors) from a top university in China, with 43 freshmen, 46 sophomores and 40 juniors.

3.2 Instruments

Compositions were collected. All participants were required to write an argumentation on the same topic. The topic chosen were acquainted by all the participants, with the purpose to minimize differences in subjects' prior knowledge when writing the text.

3.3 Data collection

The students were required to write composition within a class period (45 minutes) independently when they were attending English courses, with no dictionaries or references being allowed in either writing session. The number of words should not be less than 200. In order to guarantee that they finish writing the essays carefully and seriously, they were told that the scores of the essays would be included in the final score of the course.

4 Results and Findings

4.1 Descriptive data of all participants

Most (41.9%) participants had the tendency to state thesis initially. Nevertheless, according to Rinner and Kobayashi (2001), the English essays "tend to contain a thesis statement toward or at the end". The placement of the thesis at the outset may not represent a preferred English pattern. The finding can be interpreted as follow. First, the participants used their learned knowledge of stating the thesis initially. They might have over-generalized the "rule" about placing the thesis in the initial position (Rinnert & Kobayashi, 2001). Or, even if they know the preferred English pattern, it must not have been easy to apply the pattern to the task, especially within the limited time. Within the constrained time, it must have been easier for them to place the thesis statement at the beginning, rather than near or at the end.

Table 1 Frequency, Percentage Of Measures For All Participants

		F	Percentage (%)	M	MD
Discourse Pattern	Problems-solution	27	20.9	2.51	1.04
	Hypothetical-real	27	20.9		
	General-particular	65	4350.7.2		
	Matching	2	4.71.5		
	Obscure	8	6.2		
Thesis Statement	Initial	54	41.9	1.94	.96
	Middle	38	29.5		
	Final	28	21.7		
	Obscure	9	7.0		
Summary	Present	101	78.3	1.22	.41
	Absent	28	21.7		

Furthermore, except 8 compositions with obscure discourse patterns, most of the participants (50.4%) preferred to use General-Particular discourse pattern in their writing. Dominant use of General-Particular discourse pattern would be one of the features in Chinese English majors' writings. The dominance can be explained as follow. First, because the participants have had some experiences in writing in both Chinese and English, they have presumably acquired the General-Particular discourse pattern through such experiences. Second, as some students mentioned, they consciously applied their learned patterns from English courses (thesis-stating in the introduction—supporting with reasons—restate summary in the conclusion) to their writing task. Third, all the participants in the present study wrote under timed conditions in class, the rest discourse patterns require more detailed planning before writing.

4.2 Descriptive data for each grade level

To find out the developmental features of discourse organization presented in learners' writing, data was drawn for different grade levels.

Referring to Discourse Pattern of three different group levels, the numbers of Problem-solution pattern and Obscure pattern applied in three groups' writings were linearly decreasing from freshmen to Juniors; while Hypothetical-real pattern applied dropped slightly from freshmen to sophomores, and then climbed up to some extent from sophomores to juniors; General-particular pattern had a dramatic rise from freshmen to sophomores, and dripped a little at junior; Matching pattern had been only used by freshmen.

For Thesis Statement, the results show that the number of thesis stated initially and in the middle had a climb up from freshmen to sophomores and then dropped at the highest-grade level; however, the number of thesis stated finally first slashed from freshmen to sophomore, then skyrocketed at juniors. And that of obscure thesis in the composition linearly tumbled from freshmen to the higher-grade levels.

As for Summary, the number of compositions with summary presented went up steadily from freshmen to the higher two grade levels. On the contrary, that of compositions without dropped constantly.

These findings suggest that with the accumulation of knowledge, the tendency for Thesis Statement develops more closely to the preferred English pattern, namely, from the focus on simply stating initially to diversity—initially and finally, although there are still problems existing for juniors' Thesis Statement. Furthermore, with the rise of grade levels, participants showed a trend to state thesis clearly during writing.

Table 2 Frequency, Percentage of Measures for 3 Grades

		Freshmen		Sophomores		Juniors	
		F	Percentage (%)	F	Percentage (%)	F	Percentage (%)
Discourse Pattern	Problems-solution	14	32.6	8	17.4	5	12.5
	Hypothetical-real	8	18.6	8	17.4	11	27.5
	General-particular	16	37.2	28	60.9	22	55.0
	Matching	2	4.7	0	0	0	0
	Obscure	3	7.0	2	4.3	1	2.0
Thesis Statement	Initial	14	32.6	26	56.5	14	35
	Middle	13	30.2	14	30.4	11	27.5
	Final	10	23.3	4	8.7	14	35.0
	Obscure	6	14.0	2	4.3	1	2.5
Summary	Present	32	74.4	36	78.3	33	82.5
	Absent	11	25.6	10	21.7	7	17.5

4.3 Data for different proficiency levels

The scores of the compositions were first sorted and grouped into three groups according to different proficiency levels, i.e. low, intermediate and high score groups.

For Discourse Pattern measure, all the three groups had a tendency to choose General-particular pattern. While for Hypothetical-Real pattern, there was a pick-up from low level to intermediate, then a tumble from intermediate to high level. In addition, those with obscure discourse pattern constantly decreased from low level to intermediate and to high level. The results first consist with the features of discourse pattern chosen, namely, more students no matter which level they are belonging to, prefer to adapt General-particular pattern in composition writing. Furthermore, it also shows that learners at higher levels of writing proficiency applied less discourse patterns.

Table 3 Frequency & Percentage Of The Measures for 3 levels

		Low		Intermediate		High	
		F	Percentage (%)	F	Percentage (%)	F	Percentage (%)
Discourse Pattern	Problems-solution	6	14	12	24.5	9	24.3
	Hypothetical-real	9	20.9	12	24.5	6	16.2
	General-particular	21	48.8	24	49.0	20	54.1
	Matching	1	2.3	0	0	1	2.7
	Obscure	6	14.0	1	2.0	1	2.7
Thesis Statement	Initial	16	37.2	22	44.9	16	43.2
	Middle	13	30.2	14	28.6	11	29.7
	Final	6	14.0	12	24.5	10	27.0
	Obscure	8	18.6	1	2.0	0	0
Summary	Present	25	58.1	44	89.8	34	91.9
	Absent	18	41.9	5	10.2	3	8.1

As to Thesis Statement measures, the number of thesis initially stated increased roughly from low level to intermediate level, then slightly slipped from intermediate to high level, while that of thesis finally stated increases linearly from low level to high level. The students in high level group were developing more and more toward preferred English Pattern. They stated thesis not simply initially. In addition, the amount of compositions without thesis statement plunged dramatically from low level to intermediate level, and to zero in high level, which shows that learners at higher levels of writing proficiency were more skillful in Thesis Statement.

For Summary measure, the number of compositions with summary presented shoot up from low level to intermediate level and stood highest at high level. On the contrary, the amount of compositions without summary slashed from low level to intermediate level and then dripped a little from intermediate to high level. With the development of students' writing proficiency, they tended to add summary to their writing.

5 Conclusion

This study presents the features and development tendency based on the textual analysis of Chinese English majors' L2 writings in terms of discourse organization. The findings propose that learners can develop their ability to manage a more or less increasing degree of structural complexity during the school years, which provide evidence for the theory of L2 learning that explicit knowledge can be converted into implicit knowledge by restructuring. Teachers can make use of the findings in relation to the developmental process of discourse organization construction to promote English writing teaching in China.

Documentary Subtitle Translation from the Angle of Narratology*

Zhao Xia, Li Mingfei, Xiong Yanbing, Wang Yingfang

School of Foreign Language, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: sady8788@163.com)

Abstract: With the development of globalization, people urgently need to get some idea about the whole world. As a kind of audiovisual product, the documentary film can directly reflect the economy, politics and culture of a country. Watching a documentary film is a simple and direct way for the audience to obtain the knowledge of other countries. In order to make the audience understand and appreciate the documentary film easily and exactly, it is urgent to do the researches on documentary film translation. In this thesis, the issue is talked from the different points of views by applying narratology. The author sums up the translation strategies according to the aim of the documentary film.

Key words: Documentary Film; Subtitle Translation; Narratology

1 Introduction

With the deepening of the reform and opening-up, the exchange between China and the world become more and more frequent. Many foreign cultural achievements such as documentary films have been introduced to China and have greatly influenced Chinese people's life.

Documentary film differs from the common film not only in content but also in style and shooting technique. It uses its special way to show people the world and the nature of human being. Documentary film breaks the constraint of the space and time and contains a lot of information. It refers to all kinds of fields such as geography, people, big or odd events, animals, astronomy etc. Through these aspects, people know better about human and our world.

In order to use these resources efficiently, these excellent documentary films are introduced to China and shown to our audience through various ways. Though these programs have the sound and the subtitle, they are usually in English. And few Chinese audiences have the ability to understand the English that appears in the documentary film. This situation hinders the cultural diffusion and the conveyance of information. Hence, the translation of documentary film is the problem we have to face. To solve the problem and make more people enjoy the programs and get the information exactly, the documentary film translation becomes necessary.

Contrast to the audience' enthusiasm to the foreign documentary film, academic experts pay little attention to this field, especially its translation. Most of the translators focus on the fiction translation and ignore the documentary film translation. Therefore, a study on the documentary film translation is a necessity and has the profound significance.

2 Documentary Subtitle

2.1 Documentary Film

Documentary Film covers various fields. It is different from the fictional film which is to tell a story. Documentary film shows audience the fact. In the documentary film something real is expressed, or the information is transferred objectively, or something is introduced to the people in scientific way. In a word, in the documentary film, the real world and real person are shown to the audience. Through documentary film, people can get more knowledge and cognize the world and the human beings. Human never gives up exploring the outside world and the inside world---the nature of the human beings and spreading the civilization.

There are four modes of documentary film, like 1) The Expository, 2) The Observational, 3) The Interactive and 4) The Reflective or Reflexive. According to the particular mode the editor would choose the different but the most suitable form to show the activity that he wants to state.

2.2 Definition of Subtitle

“Subtitling as a means of film translation dates back to 1929, when the new sound films reached an international audience. The method of adding scripts of translated dialogue to moving pictures was invented as inexpensive alternative to dubbing” (Gottlieb, 1997: 310). Subtitling translation is the unique translation. It only exists in audiovisual translation or screen translation.

* This paper is supported by Independent Innovation Research Fund Projects, Wuhan University of Technology (IB048)

Subtitling can be defined as the process of providing synchronized captions for film and television dialogue (and more recently for love opera). (Coelh, 2006) Subtitling means translating the spoken source language into the target language in the form of synchronized captions. Gottlieb (2004) defines subtitling as “the rendering in a different language of verbal messages in filmic media, in the shape of one or more lines of written text, presented on the screen in synch with the original verbal message.”

2.3 Features of Subtitle

When talking about documentary, the most disputed word was "true". In fact, truth is the principle established gradually in the process of documentary's self-development. But the word “true” here has the philosophy meaning. What the documentary film shows us is the relative truth. The documentary works are made by man. As a special manner or form to understand truth, as a result living in the author's brain, the documentary film necessarily bases on the retraction of its worker's world view. The documentary worker puts their point of cognitive view in the works and their views influence the whole process of the documentary making. Obviously, the author's idea affects the works. In the process the author is the chooser. The author directs the works. There is no one fixed judging standard for documentary film's “truth”, the truth presented to the audience in film is only the truth apperceived by framer under the given condition.

Documentary film is different from the other literary written works and the other plot film. It is the combination of sound and picture. Documentary film is a kind of movie. The language appearing in the documentary film is visual and audible. The language is always accompanied by the speaker. Sometimes the speaker is the character in the film and sometimes the speaker is the narrator. The language in the documentary film is simpler and more life-like than the written forms, because the characters and the “stories” told in the documentary film are real ones. This situation decides that the language in documentary film is rich and varied in style.

Generally speaking, dialogues and lines in the screenplay are the basics for a picture and they had better be good or everything else will crumble around them. The language should match the picture when the speaker's voice is there. All directors want a good picture with a suitable script. The sound and the picture can be seen as the two types of descriptions. It is the charming of the documentary film. When enjoying the documentary film, the information can be got from two ways—from sense of hearing and sense of sight.

3 Applying Narratology to Documentary Subtitling Translation

3.1 About Narratology

Narratology is a newly developed theory. It is widely used in the literary translation. As the narratology enlarges its field, it regards the whole world as a huge text, and all the things in the world can be seen as the text, from novel to daily life, from literature to media art. As a part of world and a part of the literature, there is no doubt that the documentary is the text. Its translation can be seen as the text translation.

Many scholars have given different definitions of narratology. “Narratology is the study of narrative works concerning the form and function” (Prince, 1982:4); “Narratology is a science of narrative. Narrative is the representation of a system of interrelated signs based on time or cause and effect.”(Cheng Helin, 2001: 56) "Narratology is a scientific study that takes narrative works or narrative elements as objects and intends to explore the nature, structure, method and medium of narration."(Zhou Faxiang, 1997: 135)

3.2 Principles of Documentary Film Subtitling Translation

The subtitling in documentary can be considered as an assistant way to help the audience to understand the documentary picture more deeply and more exactly. The aim of documentary subtitling is to make the audience get the idea of the documentary works. In that case “simplification” is always the best choice.

3.2.1 Faithfulness

Faithfulness is a translational principle put forward by Yan Fu. It is the cornerstone of Chinese translation theory. “Faithfulness” means that the target text should be loyal to the original text. The faithfulness here is the relative loyalty because objectively the differences exist between the target language and original language. The differences mainly appear in the following three aspects. Firstly, the target language differs from the original language in pronunciation, writing, grammar and so on. Secondly, cultural difference includes the traditional cultural notion difference, historical cultural difference and reader cognition difference. Thirdly, different nations have the different psychological

features. When facing the same issue, people from the different nations will have the different reflections. Documentary film is about the fact. What the documentary film talk about is objective. In order to keep the objectivity and to show the truth of the issues, faithfulness is very important for the documentary film translation. It has the profound significance for the documentary translation. So in translation, faithfulness should be followed.

3.2.2 Acceptability

A translation may be acceptable in terms of language but not necessarily acceptable in terms of culture because of the differences between the source culture and the target culture. In the documentary film, a lot of subjects refer to the culture. Sometimes the cultural issue makes the documentary hard to understand because different people have different cultural backgrounds. So the cultural acceptability is very important. Much consideration should be taken into. In that case, the target reader can understand the documentary film more exactly.

Zeng Jianping proposed “the acceptability of a translation should be fudged in terms of the cultural context in which the translation takes place and the communicative purpose of the translating. And as long as the translation is accepted by the target readers or the communicative purpose is achieved by the translation, it can be called a successful piece of translation. Besides, any necessary deletion or adaptation is acceptable as long as they are contributive to the achievement of the communicative purpose or the aesthetic value of the source text.” (Zeng Jianping, 2005:142)

3.2.3 Economy

As a special expression, documentary film translation has to follow the principle of economy. Economy principle is a kind of practicing principle for transferring information. It means during the transferring process, less resource should be used but the quantity of the information cannot be changed. It is better to make the text brief. In that case, time and energy can be saved while encoding the information from one language to another language. It asks for using fewer words and favors for the quick-and-easy way of expression. The key point of economy principle is trying to use simple words and simple sentence style to show the complex information. It follows a human behavior: using less, getting more. The concept of economy may be referred to as “the principle of least effort”, which consists in tending towards the minimum amount of effort that is necessary to achieve the maximum result, so that nothing is wasted. (Vicentini, 2003: 37-38)

Application of economy principle to literary translation means the translated text should be economical and expressive. Economy principle can be made up of three factors: clear, concise, and expressive.

3.2.4 Respecting the Constraints

As mentioned in the previous part, subtitling of documentary film is within constraints. They are space constraint and time constraint. Subtitling must show on the screen. The screen's space is limited. So it is not practical to have too many words in subtitling. The maxim of word in subtitling must be under control. The space that one Chinese character takes is, very often, larger than an English word. In order to meet these constraints, the documentary subtitling translation must focus on economy principle.

Documentary film is a kind of audiovisual expression. It uses both picture and subtitling to express the matters or show the expression. The subtitling of documentary film has to match the picture. Time is the medium to make the word match the rhythm of voice and behavior of documentary film. According to human's reading ability in the finite time, the number of subtitling words that people can read is limited. In order to make the audience understand the documentary film and get the information better through the subtitling, the subtitling must be brief. During the documentary subtitling translation process, controlling the number of words in the target language is the major way to make the translation well.

3.2.5 Being Concise

In economy principle, being concise is the key method. If a text is not concise enough, it cannot be called economical. Achieving the maximal results with the least possible efforts is the aim of the principle. The primary requirement of subtitling translation is to provide, within the constraints of time and space, the most relevant information in the most effective way.

Being concise requires the translator to use the deduction method to do the translation issues. Due to the practical situation, the different method is used to solve the problem to make the information can be transferred accurately. No matter which method used in the documentary subtitling translation, the target is to make the subtitling effective and economical. In order to reach the aim, a lot of translation method as literal translation, domestication and simplification can be used. Which method is the best choice is due to the style of documentary film. Different translation methods suit to different styles of documentary film.

4 Conclusions

Documentary film is a kind of traditional film, which affects both the science and the society deeply. It contains the cream of the human civilization. Learning and sharing the wealth is significant. In order to get to the target, translating documentary film becomes inevitable. But its translation just hasn't been focused on until recent years. So its translation theory is not as formative as a definite classified method and is not adequate to guide all translation activities in documentary translation. Many studies on documentary film translation have been done by applying theories such as communicative theory and relevance. In this thesis, the author undertakes her studies on documentary film translation from the perspective of narratology.

Documentary is different from the fiction film. It has its own features which make its translation different. This thesis deals with the issue from a new approach, narratology. In the recent researches, narratology has become hot, not only in the fiction novel but in the other expressive arts. Subtitling of documentary film can be researched as the text. It has the features of text.

Documentary's translation can be conveyed from different points of view. The theory used in this thesis is just a trivial. More attention should be paid to it. There is no doubt that the thesis has some limitations. We have a long way to go to make the documentary translation better.

Review and Introspection of the Rule of Chinese Labor Law

Xu Zhihua

School of Law, Zhongnan University of Economics and Law, Wuhan, P.R.China, 430070
(E-mail: superxzh@aliyun.com)

Abstract: This paper summed up the accomplishments that the rule of Chinese labor law has achieved in building a harmonious labor relation, using the method of combining the theory and practices. At the same time, this paper also pointed out the social problems it's currently facing. On the basis of reflections on those problems, the paper proposed recommendations for future reform of the labor system and labor legislation. Facing the many problems that exist in current practice, we draw a conclusion that Chinese labor relations will be more harmonious if only we strengthen and improve the current legislation on employment, labor safety and protection of labor rights.

Key words: Labor law; Rule of law; Achievements; Problems

1 Introduction

Under the leadership of the Communist Party of China, the Divine Land, after thirty years' baptism of reformation, has made universally acknowledged and remarkable changes in the economic construction. Although China have ups and downs in the construction of the legal system, but also achieved good gratifying results. And, although China's labor law is slowly established from almost stagnant state, but after more than thirty years of joint efforts of the community, it has also been fruitful. The Third, Fourth Plenary Session of the 18th Central Committee of the Communist Party of China, "The decision of the Central Committee of the CPC on major issues concerning the comprehensive deepening of reform" and "Decision of the CPC Central Committee on major issues concerning comprehensively promoting the rule of law by law" proposed a new idea for the social economy and the development of the rule of law. The stability and harmony of labor relations as one of the most basic social relations directly related to the construction of harmonious society. The harmony of the labor relations needs law to regulate, so it brings higher standards for our labor law. In a new historic era, we need to do some summarize about China's labor law, recognize its achievements, and analyze its problems. In order to achieve better results, we also need to combine with the current new situation to make some reflections.

2 The Accomplishments the Rule of Chinese Labor Law Has Achieved

The achievements China's labor law construction has achieved since the reform and opening up can be summarized as three major changes. That is, the transition from the administrative assignment to a labor contract relationship, transition from the formal equality to the practical equality, transition from controversy to harmony and stability. The three changes will separately discuss below:

2.1 Transition from the administrative assignment to a labor contract relationship

For a very long period of history in China, the relationship between workers and employers is classified into the category of administrative organization relationship. Supply of human resources is not directly facing the employers, but directly to government departments at all levels, and then the government assigns the human resources all at once. This situation is not broken until a new labor contract system – "Optimizing Labor portfolio" pilot in Henan, Hebei, Heilongjiang and other provinces of China in 1984.

"People's Republic of China Labor Law" has come into force since January 1, 1995. The enacting of "Labor Law" marked the full recovery of the basic system of China's labor law. Compared with past labor laws, it emphasizes more about the autonomy between the two parts of labor relations, adds more private law factors, and lays the foundation for labor law under the market economy.

Another milestone law in China's labor legislation is the implementation of the "Labor Contract Law" in 2008. It makes "spirit of freedom of contract labor" more popular, and plays an important role in coordinating labor relations.

2.2 Transition from the formal equality to the practical equality

Labor law gives equal employment right to workers, however, due to the excess of labor resources, the employers have always grasped the initiative, they establish employment requirements arbitrarily, and because of that, after labor resource is allocated by markets, "employment equality" is equivalent to

formal equality, that is to say equality is limited only in employment opportunities. Whereas discrimination in employment is very common, for example, age discrimination, gender discrimination, urban and rural discrimination, health discrimination and height discrimination. The good news is that in August 30, 2007, "Employment Promotion Law" passed by the National People's Congress clearly states the equal employment rights of workers, it stipulates multiple provisions towards equal employment issues. Article 3 lays down the basic principle that "workers enjoy equal rights in employment legally. When people go to employment market, they won't be discriminated because of their different ethnic, racial, gender, religious belief". The enactment of this law plays a deterrent on employment discrimination existing in our society, and also fully reflects the transaction of employment from formal equality to substantive equality.

2.3 Transition from controversy to harmony and stability

Harmonious labor relation is one of the basic relations in building a harmonious society. To promote the construction of harmonious labor relations, China has provided some mechanism for resolving disputes:

1) Strengthen the influence of labor unions in the mediation of labor relationships. China passed "People's Republic of China Trade Union Law" in 1992 and modified it in 2001. Article 8 of "Labor Law" stipulates that workers can participate in democratic management or negotiate with employers through labor union. And it is also clear in the "Labor Contract Law" that labor unions should establish bargaining mechanism with the employers to protect the legal rights of workers.

2) Improve the influence of arbitration institutions in the labor disputes. Because of some defects in "Labor Law" such as: ambiguous stipulations, short timeline application, long operation time in labor arbitration, the National People's Congress passed the "Labor Dispute Mediation and Arbitration Law" on December 29, 2007. The promulgation of the law improved the labor dispute settlement system and provided a great convenience for both employers and employees to resolve labor disputes by legal means.

3 Problems Faced by the Rule of Chinese Labor Law

Since the reform and opening up, the rule of Chinese labor law has made great achievements, which is worth our pride. But in the face of the achievements we have to keep a clear mind, because the actual situation we faced is more severe. At present, we have a lot of focus problems to be solved:

3.1 Employment pressure increases year by year

In recent years, China's employment situation is increasingly serious. According to statistics, by the end of September 2003, the number of registered jobless urbanites was 795 million; the number of laid-off state-owned enterprises is 632 million; laid-off workers of all kinds of urban enterprises and institutions that have not registered are about 700 million. Altogether the urban has more than 20 million unemployed workers, equivalent to about 10% of the urban economically active population. In rural areas, the most conservative labor surplus stock data is currently still around 170 million, and there are a lot of farmers go out to work every year, whose unemployment is not to be counted in the registered urban unemployment rate. The yearly increasing college students' employment problems also grim up. For example, the employment in October 2008 has three new features: 1) Decreased number of new jobs in urban area. 2) The enterprises hired fewer employees. 3) The enterprises' existing jobs decreased. This will undoubtedly make China face even more severe employment situation in the next few years.

3.2 Labor safety issues are still need highly concern

The party and the government of China have always been concerned about the safety and health of workers. After the reform and opening up, the state promulgated a series of laws and regulations, especially the "production safety law" promulgated in 2002. These laws and regulations promulgated made China's initial formation of production safety legal system, emergency system and regulation system, and played an active role in reducing the labor safety accidents. But there is a gap between the reality and the ideal target, such as we can often see dozens of people reported casualties because workers engaged in hazardous work but didn't get related safety training, or enterprises didn't provide the necessary labor protection measures. The prevalence rate of silicosis also increased because coal mining enterprises produce coal dust in the mining process. Production accidents still continued to occur because the safety conditions are not up to standard, etc.

3.3 The rights the laws give workers are hard to implement

Many employers are not completely in accordance with the legal provisions for labor safety protection. Some employers are not in accordance with the law for workers in social insurance and in

paying social insurance premiums, some terminate labor contract arbitrarily. And violations of workers' rights and interests of rest and vacation are common. Another prominent problem is the employment rights of workers, although the number of employment in China has been increasing, but the unemployed base also has been increasing: the number of unemployment was 4.764 million in 1994, 5.95 million in 2000, 7.70 million in 2002, and 8 million in 2003. Especially the problem of youth unemployment, it accounted for 70% of the total unemployment. The implementation of the right to employment is directly related to the employee's survival problem; we must also pay close attention to it.

4 Reflections on the Rule of Chinese Labor Law

Without doubt, thirty years' labor law construction played an indispensable role in promoting human resources contract, constructing the harmonious labor relations and establishing the socialist market economic system in China. Facing the new target of building a harmonious society in the new century, the construction of the rule of labor law will continue to play its due role in the construction of harmonious labor relations. But facing the new national conditions and new targets, in order to set up a more adequate labor legal system and more harmonious labor relations, we have to make some reflections on the regime we have formulated and the measures we have taken in combination with social reality to reflect on the problem combining with social reality.

4.1 Reflection on the current severe employment pressure

At present, the rapid growth of the economic situation does not fundamentally solve the contradiction between labor supply and demand. Some scholars have pointed out that only a non-household registration system, non-identity system, non-hierarchical and non-unit systems which make a free contract type of modern employment system can fundamentally solve the unemployment problem in China. Specifically speaking we have to reform the multiple household employment system in which urban and rural areas are traditionally divided and regions are closed, reform the identity employment system in which personnel is only-in-no-out and the nation takes unlimited responsibilities, reform the traditional hierarchy employment system which use system of ownership and industry as a sign, reform the traditional unit employment system. We can carry out deeper researches into these problems, it may be helpful to solve our employment problems.

4.2 Reflection on China's implementation of "cheap labor" policy

So far, it seems that the long-term maintenance of cheap labor policy which is at the expense of overdrawn labor protection and environmental protection has brought many problems: Domestically, labor rights protection lacks seriously, and fundamental rights of workers income, safety conditions, working hours cannot be fully guaranteed and respected, which made the welfare of workers suffered great sacrifices. Internationally, foreign trade associations, labor unions and governments show consistent fear and hostility toward products "Made in China", official trade protection and civil trade barriers increased dramatically. Moreover, Chinese products got constantly anti-dumping investigations, seriously affected China's foreign trade development. Faced with these problems, we should strive to improve the wages of workers, improve their welfare conditions, and furthermore improve the "Social Insurance Law" and relevant legislation.

4.3 Reflection on the difficult implementation of the legal rights of workers in China

Under China's current situation of excess labor resources, implementation of the rights of workers depends not only upon the workers' enhanced awareness of labor rights and employers conscious law-abiding, but also on the positive actions of law enforcements officers. They have to initiatively correct labor law violations in the society. To ensure effective law enforcement, we need to strengthen our labor inspection team building, improve the quality of labor inspection of law enforcement officers gradually and increase staff and budget. We have to take effective measures to prevent abuse of power by law enforcement officers of the labor inspectorate, at the same time, we also have to ensure that they can fulfill their obligations under the law.

5 Conclusion

The construction of the rule of Chinese labor law is gradually improving in the process of regulating the marketization of Chinese labor market. It has the important and far-reaching influence on the establishment of socialist market economic system and the construction of harmonious labor relations in China. In summary, faced with the problems in current practice, in the new century China

should strengthen and improve legislation on employment, labor safety and labor rights protection. Only in this way can China's labor relationship be more harmonious.

Research on Formation of Ideological and Political Education System for Graduate Students under Current

Hao Guiyan

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 277303571@qq.com)

Abstract: When the international situation comes into alteration and reform and opening delve deeper, ideological and political education of graduate students is too in face of serious challenge. In terms of this, work on ideological and political education of graduate students is not well adapted and has weakness also. In order to strengthen and improve their education and sound development in multiple fields, universities and colleges have to put more efforts on building certain system of knowledge, genre, organization, innovation, service and environment. Research on reform and development of ideological and political education system for graduate students is in par with the demand of society so that the education itself could be fully utilized. This paper fully studies the successful experience of foreign graduate students ideological and political education, to learn from the ideological and political education work patterns and good results, to build our graduate student thought political education system providing rationalization actionable advice.

Key words: New situation; Graduate students; Ideological and political education system; Formation

1 Introduction

In the current new situation, the system of post graduate's ideological and political education needs to strengthen and improve, it is vital to ensure graduate students comprehensive healthy development, how to do a good job in graduate students' ideological and political education is an important subject of the ideological and political education are facing.

At present in our country, the party and state pay special attention to the graduate student's ideological and political education in colleges and universities, on the one hand, they relate policies, on the other hand they gradually strengthen macro management. The file Issued clearly indicate the purpose、significance、ways and the guiding ideology and task of the graduate students' education work in colleges and universities. In addition, through the interpretation of these files, we also know how to carry on the ideological and political education system reformation correctly and comprehensively in the future. Under the unified leadership of the party committee in colleges and universities, we try to realize the construction of teachers' team of professionals and part-time working closely and graduate students self education system. Under the new situation, in order to guarantee a comprehensive post graduate's political and ideological work and let them grow up healthy which makes how to construct graduate students ideological and political education system an important problem to solve.

Most western countries, however, don't use political education this noun. Instead, they use the citizen education or political socialization and so on, such as the United States. The main reason is that western countries education and administrative's separation, these departments are not willing to be tied to the political disputes. Some experts and scholars(Qiu Weiguang , Zhang Yaocan,2002), moreover, think the concept of the political education is a contradictory. They think that education should be a kind of neutrality, with no political tendentiousness. In North American , some experts and scholars think, however, political education and political socialization are in a correlation. They are linked and interchangeable.

2 The Importance and Urgency of Strengthening the Graduate Students' Ideological and Political Education

2.1 The importance of strengthening the graduate students' ideological and political education

Under the new situation, the task of graduate student ideological and political education work is very important, the graduate student's education is our country socialist modernization important way of top creative talents training, also the highest level of higher education personnel training and important part. The development of social economy makes people's value orientation show diversity, colleges must adhere the ideological and political education in the right direction.

The nature task and characteristics of the institutions of higher learning in our country, determines its important position and responsibility. Colleges and universities shoulder the important task of

training builders and successors for the socialist cause, in the implementation of the strategy of developing the country play an important role. Talent quality is good or bad depends on the school for a good education and spiritual civilization. The colleges and universities to promoting socialist spiritual civilization construction has important strategic significance. It also determines the institutions of higher learning is an important base for the construction of socialist spiritual civilization. University graduates is an important part in the development of our country, their study life in university is closely related to social life. Thus it can be seen that the achievements of ideological and political education has extremely broad social significance. Meanwhile it is an important part as the demonstration and leading role of the socialist ideological and ethical construction.

2.2 The urgency of strengthening the graduate students' ideological and political education

To strengthen and improve ideological and political education, we not only need to stick to our previous good methods and good tradition, but also can adapt to the new situation actively to explore new ways and methods. From the macroscopic view, most of the graduate student's ideological and political education situation is positive and optimistic upward, but in a few individual graduates may be more or less there are some problems, such as academic moral anomie, fuzzy ideal, unfaithful and poor teamwork. During the process of the development of the society, the change of social norms, values and the way of behavior influence graduate students' healthy growth, and make some graduate students faced with academic and employment problems, interpersonal relationships and emotional aspects of psychological pressure. Especially in recent years, some of the irrational behavior in colleges and universities caused social attention and strong reaction from all walks of life. In the process of growth and development in colleges and universities, we need to conduct propaganda and ideological and political education for graduate students and guide them correctly. Strengthening and improving ideological and political education of graduate students is the in current situation to comprehensive the construction of graduate students ideological and political education system.

3 Broaden the Ideological and Political Education Environment System of Graduate Students under the New Situation

The surrounding environment by universities (Li Hui,2005) can side affect graduate students' thinking activity, this is what Marx said: "in the process of ideological and political education, the sum of all the external influence factors of ideological and political education".

3.1 Learn from the abroad experience

For ideological and political education, though western countries do not have this concept, they do have "moral education", "political education", "civil education", "political modernization", which actually is equal to our ideological and political education. The ideological and political education exists all the time from a global perspective, and plays an extremely important role today. Scholars abroad have many famous books and thesis, like Education in the Moral Domain by Larry P. Nucci; The Philosophy of Moral Development by Lawrence Kohlberg; Democracy and Education by John Dewey; Moral development and moral education by Peters; A New Introduction to Moral Education by John Wilson and so on. All these works are based on organized and mature theory, and studied carefully in the field of education experience which provide scholars with profound reference materials.

The graduates' ideological and political education abroad is organized under the instruction of education principle, and pays great attention to native culture and spirit and the foster of talented people needed for the development. For graduates, though the concept "creative talents" has not bring out abroad, they only have the concept of critical mind and creative mind which with no extra extension. However, for a very long time, the major developed countries in the world lay great emphasis on the fostering the creative mind of talented people, and pay attention to the free development of personality. For instance, the aim of Harvard is to foster people with comprehensive ability and cultivation, and people who are fully developed both in emotion and wisdom, and people who are comprehensively and profoundly educated, and people with ability of independently thinking, analyzing, criticizing, and resolving problems. In MIT, they make efforts to give students a solid foundation of scientific, technical and humanistic knowledge, cultivate ability of creative development and solve problem.

3.2 Optimize the environment of the society, schools and families to create a harmonious atmosphere

3.2.1 Establish a good social media environment

Positive and healthy social environment plays a huge role in promoting the formation of the graduate student's ideological and moral quality in colleges and universities. On one hand, we should

keep enhancing the influence of national leaders to the college students. On the other hand, we can fully demonstrate the significant meaning of building the Marxism to graduates with the help of public opinion tendency. As comrade Jiang Zemin and Hu Jintao had mentioned many times in new era: "in the great process of building a well-off society, the ideological and political work is of great importance. We need to make the promotion work more creative with the illustrate of time and regularity.

Mass media (Zhan Wansheng, 2005) has a more comprehensive impact on graduates due to its direct, vivid, rich and varied expression pattern. According to the related research, "the structure of factors that influence the teenage moral development has changed from 'family, school, peers, mass media' into 'mass media, peers, school, family'. Mass media has become the crucial information resource and the foremost effect source for teenage". In this way, we can expand the graduates' knowledge field and deepen their social horizon. What's more, under the influence of the media's correct information, graduates can analyze their daily trivial with a right, reasonable, and scientific attitude and gradually build a right outlook of world, life and value.

3.2.2 Create a better campus cultural atmosphere

Campus cultural atmosphere has a far-reaching function meaning and profound impact on the form of graduates' view on world, life and value. On one hand, it has strong appeal and convincing force to people's mental health, moral and political quality for its unique method, literature, and art works. On the other hand, the literature and art works consist the writers' distinguish direction of policy while students are usually looking for their life ideal and belief.

How to make it proper? The system reform of foreign graduates' ideological and political education inspires us: facing to social practice, and combining the ideological and political education system with the country's developing condition and economy, culture and policy. Moreover, we need to develop every ideological and political education system based on the features of our ideological and political education, to achieve the goal of building an education system that fits our country's real condition. We formulate all these rules to make students understand what and how the school wants them to do, the punishment of breaking the code as well. At that time, the administrative staff in college and university have to manage student stuff in conformity with the code, make graduates self-conscious and follow the rules and supervision. Hence, the media market is a huge carrier for effective ideological and political education. We should crack down all these bad and wrong phenomenon resolutely, and try our best to build an intensive campus culture. Promote the spirit of socialism with the infusion of advanced culture into every part of the society.

3.2.3 Build a harmonious family atmosphere

The prerequisite for harmonious family members is to have a stable family. People under this background are inclined to shape a right outlook on world, life and value, foster a healthy, positive attitude towards life and help others coordinate the interpersonal relationship. We are trying to combine the family atmosphere with the recipients' subjective consciousness for the creation of family education environment is aiming at enhancing the recipients' quality. However, the recipients' initiative is indispensable for the development of harmonious environment. Thus, we should work hard on the transition of family education perception. In this aspect, the education environment is unified with the recipient. The building of the education environment and the subjective consciousness of recipients include two parts. Firstly, we need to boost the recipient's ability of identify when it comes to the family environment and the ability of self-control. Second, we must improve the recipients' awareness of taking part in the construction of campus human environment which cultivates and improves the quality of the graduates from harmonious family.

3.3 Strengthen online education

The online ideological and political education is an inevitable requirement of graduates' ideological and political education work. Universities should have access to reliable online ideological and political education. Moreover, we need to work harder to make sure that online education enjoy a proper position which benefits education. Also, we have to pay more attention to campus network and create a better education network with ideology, knowledge and service. We should boost the management of campus network, prevent graduates from all bad and wrong information from Internet. We need to build a new carrier system to promote advanced ideological and political education and offer a comprehensive platform for graduates' healthy growth. We should develop a healthy and interesting ideological and political education work to make it more attractive and convincing to educate and lead the graduates. Internet is an open system with high energy and vitality which can be expanded with no limit. As long as we can communicate, share the common transition signs, we can integrate new joint.

4 Strengthen Postgraduates' Ideological and Political Education Organization

4.1 Boost the building of guidance system

We need to strengthen the guidance of graduates' ideological and political education. Firstly, we should combine the education with Party member's personality. During the work, we should demand all graduate communists to behave as models and pioneers in school which will lead and help all students to learn from each other and improve themselves altogether. Secondly, we should combine the education with hot issues that young communists care about. We can establish "Graduates theory learning group" and "Youth forum" to encourage students to learn political theory learning and discussion by themselves. In addition to that, we can effectively combine the general mission of the Party in new era, domestic and international situation and the goal of graduates, help graduate Party members improve awareness and fulfill their value. Thirdly, we should integrate the education with patriotic education. With the help of vital cases, we can make graduates Party members fully understand the significant achievement our country has made since reform and opening-up and inspire their enthusiasm to our Party and country. Fourth, we should combine the education with the expanding of graduate's ideological quality. We should give a full play of the Party's organization and integrate the education into the cultural activities in universities and colleges. For example, we can organize activities like report meeting, lecture, debate competition, speech contest, theatrical performance and youth volunteer work, which can be meaningful and improve the graduates' ideological quality.

4.2 Enhance the construction of faculty

The scale of graduate is increasing by days which urges universities to adjust and optimize their education faculty to make sure the effectiveness of the education work. First of all, we need to keep working on education. We can improve the quality of ideological and political education faculty with various training based on the new situation and mission. Secondly, we should strengthen the foundation research. There are flaws and deficiencies in graduates' ideological and political education that should be introspected and corrected. Do remember that ideological education is not just words, we should put it into practice. Meanwhile, we should never let the recipients down. With the help of foundation research, we can achieve a more scientific decision-making on ideological and political education. Moreover, we need to establish a whole pack of assessment system of faculty in universities and colleges which can encourages teachers to be more creative.

4.3 Improve the Party construction of graduates

4.3.1 Promote the Party construction of graduates

We have to formulate the details of the Party construction in order to fully develop the graduates' ideological construction. We should stick to the Party construction, and unify graduates Party members through our organization. We should persist in innovation and unify more graduates through graduates Party members. We need to focus on both party branch and classes, pay attention to party construction scientific research, and promote the overall teaching work and fully development of graduates. First of all, we should put an emphasis on recruiting graduates party member, and strengthen training work of activist who want to join the Party. We should lay emphasis on recruiting party members among the elites who are good at learning, technology and creation, and set strict principle for the recruiting procedure and make sure we have both quantity and quality. Secondly, we should establish and refine the basic party organization of graduates, set graduates party ranch according to the principle and code and broaden the function of party branch. We should uphold that party branch should stick to class and improve the professional and standardized management of the party branch. Last but not least, we should actively launch competition among graduates party organization and party members in order to encourage all community and party members and give a full play of their leading role.

4.3.2 Promote the Party and class construction of graduates

First of all, we should have many campus cultural activities according to the management of school and community. Secondly, graduates should put the key work of party organization into the institute's political and party work. Third, we should take full advantages of graduates union, graduates association and class. We can have various meaningful and educational programs aiming at graduates' features, create academic atmosphere, and enrich the campus culture.

We should promote culture construction in universities and colleges, and increase the class cohesion. Here are some specific measures for the promotion of graduates' inner ideological quality. Firstly, we should launch various activities for graduates. We should encourage the participation of graduates and honor merit students. We also should inspire their competitive spirit, and promote their cohesion and sense of honor. Secondly, we should work on the unique cultural style of graduates. The specific

measures is to make use of forum and website alumni record, and boost the understanding of each other and classes based on this kind of information platform and communication bridge. We should arouse their enthusiasm and offer them a stage to show themselves, elaborate their ability and promote the communication and understanding among students. Thirdly, we can establish interest group in order to develop and foster students' comprehensive quality regularly. Fourth, we can set up an information website for graduates, like wechat and QQ group, which can facilitate the communication between mentors and graduates and make their relationship closer.

4.3.3 Give a full play to the enthusiasmandinitiative of graduates' self-education

First of all, we should set a platform for graduates' self-education and offer them advantages to help and guide them to finish their study and improve their ideological and political quality. Secondly, we should focus on the foster of graduate elites. We can improve their quality and ability through quality training, and make use of their leading role in ideological and political education. In addition, we should encourage outstanding graduates to take participate in education work as counselor or head teacher and lead them to enhance their self-education during the teaching. Finally, we should foster and discover the study role model, and use publicity to build up their classic and typical achievement, try our best to create a better environment and atmosphere for graduate's self-education.

5 Conclusion

With the rapid development of knowledge economy, talent cultivation is of great importance. The highest level of higher education is graduates' ideological and political education, whose core is to cultivate talents of high quality of morality, healthy style of study and honesty. Domestic work of graduates in universities has many short comings, such as, relevant laws and regulations are in urgent need of perfecting and construction, to solve the constantly changing problems and contradiction on account of without relevant laws and regulations to follow in the course of education and management. In addition, graduate management and standardization construction of daily management service are still not enough. Therefore, we need to construct graduate work rules and regulations of science, integrity and strong operability as soon as possible. In overseas, the work of the graduates' ideological and political education, has formed a professional trend, leading a road of professional development. At present, graduates' learning content is more complex in most of domestic universities, and the professionalization and specialization division of work of graduates' ideological and political education, and labor in the future have been increasingly sophisticated, which needs effective solution of the ideological and political education. In combination with the current international situation, to strengthen graduates' ideological and political education work in universities is not only an important task of higher education, and also an important task of china education.

Exploration of College Students' Innovative Ability Training Mode

Xie Zhongqing

Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: xiezqwut@163.com)

Abstract: The cultivation of the college students' scientific and technical innovation capability is an important approach to cultivate talents. This paper elaborates on the importance of cultivating innovative capability of college students, analyzes the problems which exist in the college students' scientific and technical innovative capability, and discusses the cultivation mode of college students' scientific and technical innovative capability.

Key words: College student; Innovative capability; Cultivation; Mode

1 Introduction

Comrade Xi said: "We need to vigorously carry forward the spirit of innovation in the whole society, enhance the ability to innovate, to adhere to the road of independent innovation with Chinese characteristics, and lay a solid mass foundation to build an innovation-oriented country." To improve the innovative ability of university students is an urgent task which higher education are facing. In recent years, universities have carried on the positive exploration in college students' scientific and technical innovative ability training, combined with the actual universities operational stronger measures are put forward, and have achieved good results. This article is trying to base on the analysis of practice of cultivating college students' innovative ability, and further points out the time significance to develop the innovative ability of college students, the realistic problems in the process of on college students' science and technology innovative ability training, explore the kind of college students' science and technology innovation ability training mode which can meet the requirements of the age, so as to provide theoretical reference and guide for action in order to better promote college students' innovative spirit and cultivate college students' innovative ability

2 The Significance of College Students' Innovative Ability Training

The 21st century is the era of knowledge-driven economy, innovation is an important internal demand of talent cultivation, and the college students' innovative education conforms to the trend of the times in higher education. The stronger the consciousness of innovation and innovation ability are, the higher the quality of talent is, obviously, whereas the weaker the consciousness of innovation and innovation ability are, the lower the talent quality is, the cultivation of innovative consciousness and innovative ability in higher education in China is yet to be strengthened. Colleges and universities must conform to the requirements of the times' and society's progress and development, to increase China's international competitiveness, and to fully understand the important meaning of developing the innovative ability of college students.

This issue is not a pure educational problem but closely related to social structure and system. The implementation of innovative education calls for a favorable social environment as well as the interaction between the educational system and the whole social system. Fundamentally, innovative education won't do without an overall innovation of social structure and system. Without the atmosphere and environment encouraging innovative talents, there are few teachers with innovative spirits, not to mention cultivating students' innovative abilities. However, the environment for innovation is coming into existence. In August 2002, a seminar on creation and creative education was authorized by Higher Education Department of the Ministry of Education to be held by Southeast University, which attracted over 50 representatives from more than 30 universities. In the first innovative staff training course held in Shanghai in September 2003, over 100 representatives all over the nation were present. In spite of the importance of environment, it is more important to make joint efforts to create favorable environment. Innovation roots from practice, including both practical explorations into theories and practical actions based on them.^[8]

First, cultivate college students' innovation ability is the inevitable choice for enhancing the independent innovation of China's capacity and building powerful socialist modernization. Powerful socialist modernization, first of all, is an innovative country; an innovative country must have a strong capacity for independent innovation. It is generally believed that national index should be high in the main characteristics such as comprehensive innovation, science and technology progress contribution in

national economic development, research and development investment, and very low in the aspect of foreign technology dependence. However, our country is still far away from an innovative country. Insisting on the innovation path of socialism with Chinese characteristics, and constructing an innovative country are the important strategic decision established by the CPC central committee and the state council. The element of talents is on the predominant part of science and technology innovation, and improve the level of science and technology is the core of building an innovative country, thus cultivating innovative talents is the key to build an innovation-oriented country, and higher education needs to regard cultivating innovative ability of college students as an essential task.

Second, to foster college students' innovative ability and promote the comprehensive development of internal requirement, the level of higher education is raising. In the stage of popularization of higher education, not only is the expansion of the scale of higher education, but to improve the quality of teaching should be considered as the key to cultivate students' innovative ability. Cultivating college students' innovation ability can promote the scientific development of higher education, effectively solves the problem faced on the popularization of higher education such as talent mediocre, and low learning enthusiasm. Around the world, as long as the world economic integration, science and technology also present the development trend of globalization, it is the demand to promote college students' innovative ability and comprehensive quality. Talent is the core in the competition of comprehensive national power through the worldwide and the key to the innovative talent competition. At present, compared with the developed countries, our talent reserves and the innovation ability of science and technology level are still in disadvantage, the amount of innovative scientific and technological achievements which can reach the level of the world is less. In order to take a good position in the increasingly fierce world economic integration and globalization of science and technology competition, our country must build an innovation-oriented country; unswervingly implement the strategy of developing the country by relying on science and education. Institutions of higher learning as an important field of the talent training, must vigorously construct innovative talent training system, for transferring our country from the most populous country into reinvigorating it through human resource development and cultivating creative talents.

Third, to foster college students' innovation ability is to promote study style construction of colleges and universities and the effective ways to improve student's entrepreneurial ability. Fostering college students' innovative ability can stimulate the power of university students, mobilize students' learning initiative and enthusiasm, guide students to develop a serious study and in-depth study, good habit of seeking truth from facts, and form a good upward academic discipline. The cultivation of innovative ability will also be able to transform how the college students view the world, broaden their horizon on applying for jobs, and help students seize the opportunities and achieve successes in the entrepreneurial process.

3 The Problems of College Students' Innovative Ability Training

Chinese traditional education emphasizes rotting memorization, inhibiting innovation, and neglecting the cultivation of innovation ability, the result is that students are obsessed with authority and depend on the book knowledge. Although in recent years the university began to pay attention to the training of the students' ability to innovate, to gradually change the educational idea, the integrated innovation ability of college students is still not enough yet; there exist some problems in the education content, practice, guidance, and the research hardware, etc.

(1) Old backward education content and single rigid teaching methods ignore the cultivation of students' innovative ability. Current college teaching still gives great priority for teaching book knowledge, however less practice. The teaching forms are single, students can't think actively, but only passively accept the same book knowledge. This force-feeding education model has greatly hindered the students' development of the ability of independent thinking and innovation, so students can't effectively analyze and solve problems, and the innovative ability is greatly suppressed.

(2) The innovation practice activity is insufficient, which limit the cultivation of students' innovative ability. Over the years, widespread attention was given to the cultivation of students' cognitive ability in university, not to the practical teaching part. Students spend more time on the abstract theoretical knowledge learning, but less in the scientific research project and task, which lead to the result that the students' practical ability is insufficient, and are lack of rigorous scientific attitude and innovative spirit.

(3) The lack of guidance of innovation has affected the achievement of student carrying on the innovation. At present, the guidance on college students' innovative activities has many deficiencies, which make the college students' innovative activities blind, and unable to effectively achieve the goal. Because of the limitation of students' capacity, still there are needs for positive guidance in the professional knowledge, professional skills and other aspects given by the teachers. However, the current students' extracurricular technological innovation activity under the guidance of teachers system is still in the groping state, has not really established, which just stays in spontaneous stage.

(4) Scientific research hardware support is insufficient; restrain students' enthusiasm to participate in scientific and technological innovation. The development of students' science and technology innovation activities can hardly realize without enough money, open Spaces, and support of advanced laboratory equipment, and other important material conditions. However, the current universities are generally in scientific research fund shortage, science and technology activities, backward experiment equipment, the enthusiasm of the students to participate in the activities of science and technology innovation, therefore generally not high. The number of college students who are willing to participate in the activities of science and technology innovation are less and unstable, and scale of the development of science and technology innovation activities and the comprehensive effects is at low levels.

4 The Exploration of College Students' Innovative Ability Training Mode

In order to cultivate students' innovation ability, universities have made lot of attempt and effort in various aspects positively. The author in the Wuhan University of Technology has made unremitting efforts in the aspect of cultivating innovative talents. Now according to their own work practice, school personnel training goal, professional characteristics, with the advantages in the discipline, adhere to the students themselves, they are committed to the cultivation of students' innovative spirit and innovative ability, putting forward certain system of science and technology innovation training mode – “stick to a fundamental, strengthen two functions, pay attention to three combinations, set up four platforms”.

4.1 Firmly grasp a fundamental: education

Innovation is the source of national greatness and national prosperity, conducting scientific research is an important task of colleges and universities. Therefore, colleges and universities must focus on increasing the strength of the top research talent cultivation. To develop students' science and technology innovation activity has importance and far-reaching significance for cultivating innovative talents, colleges and universities need to form consensus in innovation talents training target, to “cultivate people and cultivating what kind of person” as a starting point and the key points of students of science and technology innovation work, and make students work as the center with innovative talent training.

4.2 To strengthen the two functions: cultivating talents and culture

The goal for talent training in Wuhan University of science and technology is to develop excellence talents, so that they have excellent ability, and innovation ability is the important part of the outstanding ability. School's twelfth five-year development planning focus on the cultivation of innovative ability, puts forward the eight major construction projects, two outstanding talent training and university culture construction project closely related to college students' innovation of science and technology work. School has been working to make the college students' science and technology innovation as propellant of cultivating excellent talents, treat cultivate excellent talents as the lifeline of the development of the school science.

4.3 The three links will be implemented: the propaganda launch, organization, implementation and process management

All kinds of science and technology culture festival with subject characteristics is held every year, and use it as platform for the students to work on science and technology innovation; through the act of holding a special activity to discuss the significance of college students' science and technology innovation activity purpose; College student association tend to spread off the technology and innovation information to the students by setting up Science and Technology and Today's Scientific History; through the “discovery channel” form, students who have been awarded in science and technology competition are invited to interact with the other students, sharing suffering and joy on the road of scientific and technological innovation.

The seminar for students' science and technology innovation work was held each year for the overall deployment in the work of scientific and technological innovation to the student, and it will be implemented through the “one festival, one fair and two competitions”. (“one festival” means

technology and culture festival which is “journey of discovery”, “one fair” refers to the fair for the college students’ scientific and technological innovation projects”, and “two “refers to new concept design competition” and “contest of golden idea”). Through holding various forms of science and technology innovation activities, such as the doctoral academic BBS, Wuhan graduate academic BBS, BBS of Ph. D. supervisor and salon of the graduate students, scientific and technological innovation ability are enhanced.

Try to full play the role which the Undergraduates take in guiding the graduate students in science and technology innovation; establish the “team of graduates’ guidance for the undergraduates’ science and technology innovation” by the professional direction; make the preliminary review on undergraduates’ applied project by the graduates; and evaluate and set up the project by the experts’ guidance for the college students’ innovation of science and technology committee. During the process of project implementation, the planned process inspection, quality tracking management are required; subject head are often called to know the progress of the project; and in order to ensure that the research can proceed smoothly, timely resolution and coordination for some practical difficulties and problems from the experimental process are in require.

4.4 Carefully construction of four platforms: system, team, capital and services

Attaches great importance to work of college students of science and technology, and implement a series of rules and regulations and incentives. Participates in college students of science and technology competition who get awarded, school will offer different level of prizes according to different grade.

The professional teachers are widely propagandized to focus on students’ extracurricular science and technology activities and join into the specific guidance, which offers firm technical support to the level of the college students’ innovation of science and technology. At the same time, strengthening the political work cadres of the relevant professional and business training, make everybody is familiar with all kinds of disciplines and elements of science and technology innovation and competition, and to better facilitate management and service work, to provide a powerful guarantee for proceeding smoothly.

Increase investment in scientific research, set up the college students’ science and technology innovation fund and invests some funding to support the college students’ innovation of science and technology work. Professional teachers who guide students scientific and technological innovation will also transfer their own research funding into the students’ science and technology innovation activities, in order to make students have more opportunities to exercise in practice, master a variety of research methods, research methods and advanced technical main point, etc.

To create favorable conditions for the students of science and technology innovation activities, ensure the timely communication, and lesson counseling’s, etc for classmates and teachers absent from class because of the competition. Efforts are made to relieve students from all sorts of difficulties, so that the students can be more freely into college students’ science and technology innovation activities.

5 Results of Cultivating College Students’ Innovation Ability

Guiding by the science and technology innovation training mode: “stick to a fundamental, strengthen two big functions, pay attention to three combination, set up four platforms”, Wuhan university of science and technology has organized and set up a lot of college students’ science and technology innovation activity, and has obtained certain achievement:

(1) The college students’ science and technology innovation activities are extensively developed and created a good atmosphere of advocating science and innovation among college students, which played a positive role to the growth of young students, and cultivate a batch of outstanding college students who are devoted, bold to innovation, and aspire to become distinguished. School has positively set platform of science and technology innovation education for students, and cultivated campus culture of science and technology. School established the student association of science and technology, set up 20 college students’ science and technology innovation base, set up independent innovation research fund for student project, national college students’ innovative experiment and laboratory projects, and investment of 5,000,000 Yuan a year to support students in science and technology innovation.

(2) College students’ science and technology innovation activities tend to lead students to closely connect with the professional and in-depth professional, enhance the professional identity, affinity and self-confidence, and effectively mobilized the enthusiasm and motivation of the students to learn professional, then the learning atmosphere is strong. There are 24 “excellence initiative” pilots in the university, which covers 14 college, and then it has most “excellence initiative” pilots among all the universities. It relies on building construction, transportation, machinery, automobile industry, set up

special funds, increase the financial input in laboratory and base construction, for the pilot professional students to have higher quality teaching resources; all kinds of engineering practice training platform, academic exchange platform and the foreign language training environment are provided, offering special credits for students' innovative activities; Support pilot professional faculty construction and teaching reform; Support students in autonomous learning, research learning, focus on cultivating students' engineering consciousness, engineering quality and engineering practice ability.

(3) The campus cultural activities of science and technology enrich the spare life of students, enrich their spiritual space, broadens the students' mind, develop the talent, edify sentiment, guide the student to the right thoughts, words and deeds, thus shaping the healthy psychology and personality, improving their comprehensive quality. Students in the "challenge cup" competition, mathematical modeling contest, mechanical innovation design competition, such as energy saving and emission reduction technology innovation, has obtained 2000 provincial-level-over award, and 109 provincial-level and 41 state-level awards in "challenge cup" college students' extracurricular academic science and technology works competition and business plan competition; besides, in the sequent three years of 2010, 2011, 2012, we've got first place in team total score, and win the "challenge cup" in Hubei province. Two entrepreneurial teams in 2010 won the national gold award in "challenge cup", a business plan competition.

(4) The activities further enhanced the interaction and communication between teachers and students; the teacher's precept makes students personally felt the teacher profound knowledge, rigorous scholarly research attitude and the spirit of diligence, which exert a subtle influence on education. The righteous teaching attitude can shape the student's studying ways, further stabilize the students' professional thought, and strengthen students' professional autonomous conscience and interest of learning. School each year chooses a batch of outstanding students in the superiority and the characteristic discipline dynamically, equipped with first-class teachers, and provides first-class learning conditions, in order to create first-class academic environment and atmosphere, innovative talent training mode, and cultivating top students. Schools strive to cultivate a batch of excellent graduates with acute, high professional quality, strong practical ability, pioneering spirit and innovation ability; to lay a good foundation for fostering future leaders in the field of related disciplines and top creative talents. Students in pilot class will be selected from the undergraduate students in school, with chief professor (teacher) responsibility system, push forward characteristic cultivation, strengthen international cooperation and exchanges.

6 Conclusion

Science and technology innovation of college students is a systematic project, need to form a good external environment that everyone pay great attention onto it; with support from the college, by the teachers and students work together, to make the scientific and technological innovation work be promoted; and to further push the work of excellence talents cultivation by the college students' innovation of science and technology project, then to build the innovative campus culture.

Abstract: This paper mainly uses the method of documentary and analytical induction to collect a number of relevant documents and study the subject systematically. From the materials that have been collected, we can say that the idea of Confucian Chun-tzu education contains rich connotation with many levels. What's more, it also has huge enlightenment on the quality education in China today. The aim of this paper is to inspire more and more Chinese scholars to apply the idea of Confucian Chun-tzu education to raise the level of quality education.

Key words: Chun-tzu; Confucius; Chun-tzu education; Quality education

1 Introduction

At present, the research on Confucian Chun-tzu education is not abundant. As a matter of fact, studies on the issue of Chun-tzu mostly focus on Chun-tzu's personality.

In China, many scholars have done systematic arguments on the personality of Chun-tzu. For example, Liao Jianping makes a detailed explanation to Chun-tzu's connotation in his book *The Theory of Chun-tzu Personality*. Wang Hongliang carries out a systematic analysis of Chun-tzu's personality, according to its theoretical sources, connotation, building method and historical influence. There are also many other vocational scholars who devote themselves to the studies of Chun-tzu's personality. What's more, more and more young researchers begin to study this issue in their dissertations. For example, Sun Juanni explains relevant concepts in her dissertation *The Idea of Gentlemen personality in The Analects of Confucius and its Inspiration for Developing University Students' moral Personality*. Ding Xiaolu make a study of Chun-tzu's personality in her dissertation *A Research on Confucian Gentleman Personality of Pre-Qin Period*. Besides, some scholars focus on analyzing the modern significance of Chun-tzu's personality. Through the studies of Chun-tzu's personality, it's not hard to find that it has many significance for the modern society, therefore it's necessary to study the modern significance of Chun-tzu's personality. According to the numerous studies on the connotation of Confucian Chun-tzu's personality, we can tell that Chinese scholars agree on the saying Chun-tzu is someone who values justice higher than material gains and advocates righteousness. And the modern significance of Chun-tzu's personality embodies in the development of the socialist market economy and harmonious socialist society.

There are also many foreign scholars who study Confucian traditional culture. Chun-tzu, as an ideal model that Confucian recommends, surely becomes a research object of the western scholars. For example, American scholar Roger T. Ames and Henry Rosemont are inclined to study Chun-tzu who is opposite with villain, instead of studying benevolent. William Theodore De Bary makes a comparison between Chun-tzu and sage-king, he points out the strength source of Chun-tzu and makes a detailed definition of Chun-tzu. In his opinion, Chun-tzu is a kind of people who receive good education and have strong sense of mission and sense of responsibility to serve the public, even if they don't have real power. Canadian academic Daniel A. Bell holds the view that to become a Confucian, one must be a Chun-tzu first. And he also demonstrates how a Chun-tzu should behave in daily life. At least, he should be a good family man, obeying his parents and disciplining children. Furthermore, he should extend caring in the family to the whole society.

Although there are not many scholars study the issue of Confucian Chun-tzu education, abundant written material about Chun-tzu's personality from all over the world provides a wealth of resources for scholars who devote themselves in studying the problem of Confucian Chun-tzu education, such as the connotation of Chun-tzu, the building method of Chun-tzu's personality and so on. By exploring the theory of Confucian Chun-tzu education, we'll try to figure out the connotations and characters of Confucian Chun-tzu education, and finally find a new way to improve the efficiency of quality education in China today.

2 Main Connotations of Confucian Chun-tzu education

2.1 Centering on moral education

Chun-tzu educational school put moral education into the first place. There is no doubt that the ideal character for Confucius is the Chun tzu. The moral standards of “Chun-tzu” consist of moral rules whose content is about “Etiquette” and moral sentiments which go around “Benevolence”. In The Analects of Confucius, it mentioned that Confucius’ school-running concepts are around 4 courses, that’s letters, ethics, devotion of soul, and truthfulness. Letters course refers to knowledge education (or called cultural education) . In addition, courses of ethics, devotion of soul and truthfulness focus on moral education. Moral education which aims at cultivating Chun-tzu has close relationship with “benevolence”, or we can say it takes benevolence as the core. Benevolence is the basic moral principle of Chun-tzu, therefore, benevolence education is a major part of the Chun-tzu education. Benevolence contains affection, filial piety, do one's duty as a younger brother, loyalty and so on. But all of these characters only reflect one side face of benevolence. In fact, benevolence must be a collection of many kinds of virtues, that benevolence is the general term for a variety of virtues. Meanwhile, Confucius values etiquette education as well. He is strict with his students in their dress looks, the way they get along with people and many other aspects. Confucius requires their behaviors conform to etiquette and show Chun-tzu’s demeanor. In brief, benevolence is colloquially known a kind of inner beauty, while etiquette is a kind of outer beauty. Only when the contents of benevolence manifested through etiquette behavior can we cultivate Chun-tzu who have considerate manners and noble moral.

2.2 Aiming at cultivating talents with excellent morals and academic skills

Advocators of Chun-tzu education not only value noble moral, but also pay attention to man’s all-round development. One of their educational goals is cultivating talents with excellent morals and academic skills.

“Six Arts” in the Confucian school include music, archery, mathematics, ritual, chariot-riding and calligraphy. These reflect various demands and training for man. In order to teach “Six Arts” better, Confucius compiled the corresponding textbooks: Odes, History, Changes, Spring and Autumn, Rituals, and Music. Among them, Odes is just like Literature course, History might be equivalent to Political lesson, Changes is similar to philosophy, Spring and Autumn is parallel to History lesson, Rituals mainly shows the same things as ethics classes, and Music is Music art. It is not hard to see that the ranges of Chun-tzu education are extensive, and the teaching content is comprehensive. Confucius deepens and develops predecessors’ idea of Chun-tzu, creating the unique Confucian Chun-tzu education. He emphasizes “Chun-tzu are not vessels”, therefore, Chun-tzu must not only be superior in terms of moral, intellectual and physical, but also be loyal to the state and make contributions for people, and finally being the pillar of society.

3 Chief Characteristics of Confucian Chun-tzu Education

3.1 Attaching importance to collective environment

Confucius values the collective environment for man’s development. First, Confucius breaks the education mode called “study in the government authorities”, and originates the pay school. He insists “Education without Discrimination”, and recruits students widely. The students are from different states and different classes. This not only breaks the borders, but also breaks the political status, which gives more educational opportunities to people. Second, Confucius gives lessons in the collective. His teaching method “teach students in accordance with their aptitude” is commendable, for it admits students’ individual difference. However, this way cannot change Confucius’ purpose which is turning students with individual character into people with the same values. At the same time, Confucius stresses the significance of group order for individuals, and he insists that people should be an absolutely free man, namely, Chun-tzu should be assimilated into the masses. It requires individuals to submit to the the collective will and serve for the collective instead of forming a clique to pursue selfish interest. All of these reflect the collectivism tendency that Chun-tzu educational school has. They insist that group quality and humanity quality should be concerned more than mere individual quality because of concerns for social benefit.

3.2 Following the principle of entering political stratum

Confucian Chun-tzu educational school claims “he who excels in study can follow an official career”, namely, if a man learns well and have leisure time and energy, he’d better entering the official career. In ancient Chinese intellectuals’ life, School is inseparable from politics, learning goes hand in hand with official career. Confucius hopes Chun-tzu who get well education should serve for group,

society and state better, and advertise the idea of benevolence to the public, then complete themselves during this process. In the mean time, Chun-tzu education is influenced by the concept of “study in the government authorities”. “Study in the government authorities” means it is government that sets up schools, educational institutions and government agencies unit as one, and teachers of official school are appointed by the court, what’s more, the rulers’ political personalities are regarded as social role models. In fact, no matter in official schools or private schools, students all see entering political stratum as the highest goal of study. Thus it can be seen, Confucian Chun-tzu education places emphasis on official career education, and it is committed to developing elite Chun-tzu who are closely linked with national rise and fall.

3.3 Emphasizing the importance of introspection

In the concept of Confucian Chun-tzu education, etiquette is gained through self-constraint and introspection. Self-constraint means in interpersonal relationships, Chun-tzu should bind themselves to strict requirements and restrain their words and deeds to make it ethically. Introspection means Chun-tzu should play active ideological activities and supervise their own thoughts consciously instead of being influenced by others, when coping with relationships between the objective standards of behaviors and the subjective emotions. At the time of cultivating Chun-tzu, the self-constraint method should be carried out in all aspects of daily life, and introspection is also a necessary way to improve oneself. That’s also what “self-restraint and restoration of rites are benevolence” means. What Confucian Chun-tzu education cares is the fulfillment of the inner and the consciousness of strengthen- -ing moral cultivation. Only if a man examines himself on three counts every day, can knowledge, virtue and etiquette be internalized.

4 Conclusion

From what has been discussed above, we can make the conclusion that the idea of Confucian Chun-tzu Education has significant inspiration for quality education reformation in China today. Detailed outcomes are as below:

4.1 Strengthening moral education and developing unwavering character

That Confucius Chun-tzu education school values moral education is worth using for reference in China today. Since the reform and opening-up policy, China's economy has crackled with the dynamics of change; social culture has also undergone tremendous changes. Under the influence of multiple values, some people’s morality concept is getting more and more light, and they chase after money unduly. This cruel phenomenon can be found everywhere. For example, some businessmen sell things that past their expiration date just for profit; some people make friends online intentionally, and then use friendship and trust to cheat out of money. And this kind of things happens occasionally. However, as we all know, building a harmonious society needs to put morality stay on the lofty status, therefore, the development of morality must be one of the most important part of quality education.

Strong will and great ambition are essential characters of Chun-tzu. To develop these characters, Confucian school requires people understand the following sentence: if by destiny one was to be burdened with such monumental responsibilities, he must be subjected to intense trials lest he emerges worthy of such. Nowadays, because of the one-child policy, most families only have one child, and parents are used to spoiling the children, so, many children are unable to endure and overcome hardship. However, with the rapid development of the economy in China, people have to face fierce competitions in many aspects of their daily life. Without strong will, they could not survive in the society. As a consequence, it’s necessary for educators to temper the new generation’s willpower so that they can have strong-willed character.

4.2 Boosting all-round education and cultivating talents with comprehensive abilities

Cultivating talents with comprehensive qualification is the core of education in the 21st century, and all-round developed high quality talents are also demanded in the new period of constructing socialism. To achieve this goal, many education methods are being implemented, among all the methods, harmonious education is one of most admired ways. As a new education mode, harmonious education tries to reform the teaching content, according to students’ cognitive characteristics, cognition level of development and demand. In this way, the educational power which various teaching activities make can be adapted to students’ physical and mental development regulation, and finally benefit the cultivation of students’ comprehensive abilities. Therefore, the government should make some policies to push the development of harmonious education. What’s more, schools should also recognize the importance of harmonious education and provide good environment to make it grow well. With the help of harmonious

education, educators can carry out all-round education policy better, and then improve students' physical quality, psychological quality, external quality, cultural quality and professional quality.

In short, Confucian Chun-tzu education is the energetic treasure of Chinese nation and it has been showing the shiny wisdom and the moral ray for thousands of years. Even in this day and age, it is still worthy of studying. Nowadays, the innovation of quality education is becoming a hot issue in China, and through the study of Confucian Chun-tzu education, it is not hard to know that there are many ideas we can use for reference. As for the problem of how to apply these ideas which are learned from Confucian Chun-tzu education to the reformation quality education, it needs further exploration.

Abstract: The need to accelerate the construction of Chinese social organizations is pointed out in 18th National Congress of the Communist Party of China. Since the development of social organizations of the disabled is a part of the career of disabled people, the issue of incubator has become more and more important. The incubation system of Chinese organizations of the disabled person needs to be improved. Based on the pattern of operation of public welfare organizations, the article pays attention to exploration on the pattern of organizations of the disabled. Besides, during the incubating process of organizations of the disabled, factors are followed: the disabled individual leaders, the relationship among government, the disabled persons' federation and social organization, channels into recruiting service objects, social atmosphere and public awareness, regional difference.

Key words: Disabled person; Social organization; Incubator; Influence factors

1 Introduction

Chinese organization of the disabled represents the common interests of the disabled person. It endeavors to protect the legal rights of this group of people. At the same time, as a social organization, it would probably hold various activities to offer different kinds of services for the disabled. The members include disabled people, the relatives of them and professional staffs for disabled people. Regarded as a crucial civilian force, it plays a role which is becoming more and more indispensable. It attempts to meet the diverse requirements of the disabled by experiencing lots of explorations. It also contributes to the career of safeguarding the legitimate rights and interests of them, enhancing the system of the public services for the disabled and promoting the construction of the social organizations. However, from a comprehensive perspective, in view of the limitation of awareness, the imperfection of the macro mechanism, deficiency of supporting and propaganda by the government and lack of administrative skills within the organizations, the social organization of the disabled has many problems. For instance, the number and the scale of social organizations of the disabled may be limited. Meanwhile, they might be facing insufficiency of finance and service offered by the staffs which are dying to be enhanced. As a result, the pressing needs of disabled people contradict the insufficient services provided by the social organizations of the disabled.

Non-profit incubator of social organizations is a new concept in China. It would probably influence its organizations' generating, development and maturity. "Incubator" derives from the processing of incubating of American small business in 1950s. It provided some small business with necessary assistants, including relevant materials and inquiries which were beneficial to their growths.

In China, "incubator" was firstly mentioned by the Institute for Civil Society (ICS) of Sun Yat-sen University in 2005. With the development, Chinese scholars define the concept in different ways. In terms of the function, NPO (Non-profit organizations) refers to the supporting system which is able to supply organizations with places or space, finance, service training, etc. It aims to foster these new-born organizations (Wang Shiqiang, 2012). The pattern of Non-profit organizations' incubator is closely related to theories about supportive organizations. In the guide of this kind of theories, incubator would take the condition and features of the development of Chinese organization into consideration and learn from the mode of incubator of small business. It also cooperates with the government and other civilian forces to help the organizations which are in an initial stage (Wu Jing, Mao Lixiong, 2012). The targets of the incubator are initial public organizations that need to improve the ability to transform. The services consist of financial supporting, facilities, training, guidance, evaluation of development and social propaganda. Incubator acts to promote the growths of the organizations and help them cooperate with others on the purpose to boost the construction of the harmonious society (Pang Yang, 2013).

To sum up, from my own perspective, incubator of the social organizations of the disabled is one of the Non-profit organizations' incubators and the public field's supportive organizations. It attempts to provide new and immature social organizations of the disabled with relevant and various support to make them mature and independent enough to be viable. To some extent, it can reduce the cost of

communication among government, the disabled persons' federation (DPF) and social organizations. As the provider of capital, Chinese government has quite limited experts in this field, so does some organizations of the disabled. Moreover, the staffs in these organizations know little about the politics or relevant policy, which leads to difficult conversation between them and the government. Incubator can fix this issue, acting like a bridge to smooth the communication and reduce the cost. Meanwhile, it promotes the government to be service-oriented and make it contact the social organizations of the disabled indirectly and professionally. As for "incubating", it refers to a process of making an organization becoming mature enough to offer practical services. The phases include applying for entering the incubator, receiving much assistance like space, financial aids and training and getting out of the incubator to run the organization by its own.

2 Chinese Incubator of Social Organizations of the Disabled

2.1 Incubator of NPO

According to the executor of the incubator, the incubator can roughly be divided into two types: government-oriented incubator and nongovernmental incubator. Each of them has both advantages and disadvantages. Besides, social business organizations of the disabled can be a reference for the incubator of social organizations of the disabled. With the ever-increasing pace of development of economy and internet, virtualization of the incubator has been pointed out by some scholars.

2.1.1 Government-oriented incubator

Government-oriented incubator can furnish its targets with policy support, information of correlative items or programs and convenient process of registering as a legal social organization. It ensures the organizations legitimate status to let them enjoy preferential policies and welfare within the system. What's more, it boosts the activities in public field which are beneficial to governmental decision-making and the development of social charity. Nevertheless it simultaneously makes some social organizations reveal fickleness and ignore some aspect, such as practical efficiency. What's worse, the flexibility of the organizations is circumscribed by the government in some way. The organizations have to rely on the government or the disabled persons' federation and lack the freedom to hold activities or dominate its finance in its own way.

To make what's mentioned above more specific, Nanjing Amity NGO Development Center is a typical example of this kind of incubator. It was established by the municipal government and the Amity Foundation in October 2009. It is expected to foster social organizations. Its main source of finance is from the government and Amity Foundation. On the one hand, the government offers financial support by pursuing services, which are the most common method the Chinese government use to provide the disabled with correlative services. On the other hand, Amity Foundation makes full use of its resources which include international assistants to finance the incubator. The center suggests that the government is trying to turn over part of rights and function to social organizations which are produced by the incubator. Because of the political background, the organizations from the incubator have a priority to get legally registered and get programs from the government. They could not only directly contact the community to supply services with the help of the government, but also get necessary resources generated by the foundation. However, because the center is overseen by the government, the autonomy and the independence to hold activities of programs would be inadequate.

2.1.2 Nongovernmental incubator

The prime advantage of nongovernmental incubator is that its flexibility and independence are guaranteed so that the government can't excessively intervene its own affairs. Therefore it provides its unique service to the market. If the foundation takes up the dominant position, the incubator would obtain stabler fund, because the foundation can receive steady member fees from its members. It could also get public attention via communal donation solicitation.

NPI of Shanghai has a mature process of incubating. Before the incubating, it recruits members publicly by receiving application and selecting matched ones. It has specific evaluation teams and committee to evaluate the prospective social organizations. The main consideration contains the organizations' potential social influence, model of operation, the ability of management and suitability to the incubator. After this stage, it signs agreements of incubating with the qualified organizations to give them space, finance, facilities and staff training. When the organizations get hatched, they would continually be tracked and assisted by the incubator until they become viable. In other words, when the process is completed, the organizations must be much mature to own professional ability to provide services, administrate the internal stuffs and rely on itself.

2.1.3 Canyou three-in-one model

The incubator of Canyou is in the guidance of a social business organizations incubating model. It has an obvious feature: its finance is composed completely without the subsidy of the government and loan of banks. Three-in-one model means that it's supported by three forces, Zhengning Charity Foundation, Canyou social organizations and Canyou business organizations. Within the model, foundation controls shareholders to hold fund-raising and integrate resources as a supervisor. It endeavors to maintain nonprofit features of the organizations in the business market. In addition, Canyou social organizations and business organizations complement needed materials to the incubated organizations. The incubator concentrates on employment of the disabled from the whole country. It is looking forward to spreading this model to the whole nation, helping different provinces to establish similar incubator in order to produce more organizations whose aim is to be beneficial to disabled people. The incubator is a body that combines commerce and public good.

2.1.4 Virtual incubator

Virtual incubator represents incubators that are based on internet to use modern information technology to connect diverse resources necessary to the growth of small business organizations. It's a comprehensive system operated by expert group to provide services according to needs of each specific organization. However, this kind of incubator currently is only used in commercial market. There exist two virtual internet environments. One is formal cooperation network, which is established among incubated organizations to set up online conferences, share experiences and promote communication of commerce. Another one is informal network, which focuses on informal communication or daily life experiences to create a comfortable atmosphere for staffs and inspire employees (Wang Xiaodang, 2012).

2.2 Incubator of the disabled

The operation of Chinese social organizations of the disabled is not only related to the government, but also closely to the disabled persons' federation (DPF). Therefore dealing with the relationship among government, incubator and DPF should be an inevitable issue especially for government-oriented incubator. Interpretation of this is critical to promoting various organizational relationships which are oriented by DPF. DPF plays a dominant role by having the rights of distributing resources instead of mastering its subordination members from a political perspective. On the contrary, nongovernmental incubator may act as an agency to organize human resources and projects in order to get freedom to obtain fund and cooperate with other organizations including DPF to maximize its benefit. As for the independence of the incubator, it may be a good method to combine commerce with social good to create positive social impact. Also virtual incubator would be a new channel for incubating disabled people's social organizations. As many factors needed to be taken into consideration, points would be discussed followed.

Firstly, currently many incubators of NGO have been successful in China, which could bring lots of experiences to disabled organizations' incubators, such as NPI mentioned above. For this, incubators of social organizations of the disabled can avoid many mistakes which those incubators have made.

Secondly, the government endeavors to deliver services geared to people's pressing needs, which might give impetus to reset the relationships among incubators, government and DPF. That is how to make the independence of the incubators be guaranteed without losing the support from the DPF and the government. Maybe with the supervision of PDF, incubators play as a platform to constitute an association of disabled persons' social organizations in order to enhance the interaction among organizations. As for funds, it might come from the civilian forces like enterprises or foundations. Consequently the incubator is capable of handling its own rights of choosing, which guarantee the flexibility.

Thirdly, a virtual incubator is meant to provide the organizations which are widespread over all the country with a communication platform. It could rely on DPF to share information with various foundations and social organizations. In addition, the space limitation in physical level could be mitigated to make more resources available to more objects. It could also save money as fewer employees are recruited to operate the incubator than a real one.

Finally, an incubator needs to get more power from the media and internet to promote propaganda, making more people aware of the existence of the incubators and their organizations. Thus corresponding services can be more easily delivered. This broadens the channels of recruiting service objects and makes more attention paid to social organizations of the disabled to reduce the discrimination and enhance the awareness of charity.

3 Influencing Factors for Chinese Social Organizations of the Disabled

Figure 1 The Relationship Among Social Organizations, Incubators and Macro Factors

The figure obviously illustrates the relationship among incubators, their organizations and macro factors. Incubators can't be operated without the influence of macro factors. For instance, social atmosphere and policies for supporting incubators is directly related to growth of incubators. Because social organizations of the disabled are produced by these incubators, whose aim is to regulate the relationship among social organizations, PDF and government, these organizations could probably be effected by the factors, too. At the same time, social organizations' own development within the incubators should never be ignored, such as the skills cultivation of the employees. After they're incubated, the viability is the most essential capacity for them. Their service charge is crucial to revenue. So in order to increase revenue, they must consider how to broaden their channels into getting more clients.

3.1 Capacity and personality of organizations' leaders

For an organization, leaders are quite indispensable. A leader should not only display enough ability to administrate the organization internally, but communicate with the external organizations and forces. When the organization gets into the process of incubating, the leader needs to organize members to receive professional training. When the process is completed, the leader also keeps in touch with the government, DPF, social enterprises and social organizations. Whether the leader's belief about the incubator is constant will, to some extent, influence the incubator's direction. It affects the property of the organization. Whether the leader owns a comprehensive perspective to consolidate what the organization has obtained, such as the improved service delivery ability, is crucial to its viability. Thus capacity and personality of leaders should never be neglected.

3.2 Relationship among government, DPF and social organizations

The government is the predominant object because it owns the rights of policy making. While DPF and its subordinate organizations would carry the policy out together. DPF which has political hinge is subject to every aspect of public disabled persons' affairs. However, it actually can handle only parts of these affairs. Thus the emergence of social organizations of the disabled mitigates this phenomenon. Incubators of the organizations of the disabled act as agencies to smooth the relationship among the three objects. That is beneficial to incubating social organizations of the disabled, democratic policy making, convenient register for organizations and various sources of fund.

So far Chinese policies about the disabled pay main attention to social relief and aid, including assistance with employment and social welfare. These measures belong to traditional modes of welfare and suggest that maintaining the legitimate rights of the disabled is neglected in some way. While the government clearly would support social organizations that can take over the public services previously pertained to the government. Again, these public services contain few legal rights of the disabled. The flaw of the policies suggests that the extent of expression of the social organizations permitted by the government is also an important factor.

3.3 Channels into recruiting service objects

The financial source of a social organization consists of not only policy support and assistance

from DPF but its service charge. In China, the number of the disabled is quite huge and the needs of them are exigent. The channel of recruiting service object nonetheless is relatively narrow, leading to insufficient service objects within the organization and many needs of the disabled being not met. This also contributes to viability of an organization because it threatens the source of revenue. Another thing is that visibility of an organization may be hindered by this in view of few disabled people knowing the services. To solve this problem, social organizations of the disabled might as well make full use of the incubator with the help of government, DPF and media to broaden the channel. The government could introduce more disabled people who need services to organizations by its authority. At the same time, the organizations should actively promote outreach to get more service objects. Public service advertising and media could probably earn a reputation for these organizations to make them known by more people.

3.4 Social atmosphere and public awareness

There are a lot of factors limiting the development of the social organizations of the disabled, such as social bias and discrimination. In China, especially in the past, many activities of these social organizations have been resisted or discriminated by community members or other groups of people. Some even hold the view that works for the disabled are ominous and inferior. All of these can directly negatively influence the growth of career of services for the disabled in the long run. Besides, many people believe that charity only belongs to wealthy people's matters which impede the available fund for the organizations. What's worse, recently years many social issues also contribute to the impediment of career. For instance, in China, if an old man tumbles, a young person would probably hesitate to offer help since maybe he needs to shoulder excessive responsibilities, such as paying for medical charge. Thus, people might not dare to do something good. In summary, social atmosphere and social awareness are closely relevant to organizations' developments. Only through widely being accepted by the public can the organizations get completed integration into the whole social environment and the process of incubating.

3.5 Regional difference

In rural areas, the kinds of the service content of the organizations are not as various as urban areas. The organizations are quite smaller, lacking their own working offices and communication with other social organizations, to say nothing of international communication. Compared with the urban social organizations of the disabled, rural organizations are limited by the location, so the resources are not easily available to them. On the contrary, the urban ones show the superiority in number, scales, systematic communication and shared information and resources.

The difference between urban and rural areas is one aspect. Another important aspect is that there are differences among different provinces. Developed regions like Beijing, Shanghai and Guangzhou own comparatively more mature social organizations of the disabled.

4 Conclusion

First of all, social organizations of the disabled are different from other public commonweal social organizations in many ways. They have to deal with the relationship with DPF, which makes their works more complicated. Relationship among incubators, government and DPF directly influences the incubating organizations. Besides, these organizations would have their own problems distinguished from others' during the process of incubating. Only by analyzing and effectively solving these issues in specific situations can they get promoted. So far Chinese incubators of organizations still have a long way to go, which means that they need to be examined by the practice. In addition, how to guarantee various kinds of social organizations of the disabled being incubated is an inevitable issue. It also accounts for diverse services delivery for the disabled. Another important point which needs to be elaborated upon is that the Internet has become an irreversible trend. In this way, virtual incubators are auspicious. However, insecure factors may threaten the virtual incubators, thus it's necessary to deal with these factors. At the same time, they have to pay more attention to pragmatic works and sharing resources and information rather than shallow propaganda. Finally, how to maintain the incubators' server and how to address the relationships between virtual incubators and real ones are needed to be discussed further.

Important Roles of Young Teachers in Imparting Knowledge and Educating People in Higher Education

Xu Longcai

School of Marxism, Wuhan University of Technology, Wuhan, P.R. China , 430070

(E-mail: 439506167@qq.com)

Abstract: Every teacher has the duty to impart knowledge and educate people. He should not only impart scientific and cultural knowledge to students, but also foster their ideological and political quality. Young teachers are the fresh troop in teachers' group and the backbone of teaching research. Due to their unique advantages, they can play an important role in both the impartment of knowledge and the education of people.

Key words: Young teachers; Impart knowledge and educate people; Advantages

1 Introduction

With the social development and constant surge of talents, the group of young teachers in higher learning is getting bigger and bigger. According to the statistics of National Committee of Educational, Scientific, Cultural, Health and Sports Workers' Union, China now have 11.51 million full-time teachers in total, of which the number of young teachers under 40 reaches 6 million, accounting for over 50%. Young teachers act as the core strength to launch activities in higher learning, and should also play an important role in imparting knowledge and educating people.

2 Correct Understanding of the Significance and Unity of "Imparting Knowledge" and "Educating People"

The Book of Rites mentioned that "A teacher should not only impart knowledge to his students, but also cultivate their moral integrity." In modern times, the distinguished educator Tao Xingzhi also raised that "Whatever a teacher teaches, he should teach his students to seek truth; whatever a student learns, he should learn to be a man of upright integrity." The two views in ancient and modern times both enlighten us with the significance of imparting knowledge and educating people. At present, our socialist development is in urgent need of those high-caliber personnel who have both a wide range of knowledge and a firm stance to socialism. To cultivate such personnel, young teachers should foster students' ideological and political quality while imparting scientific and cultural knowledge to them.

"Imparting knowledge" and "educating people" are a unified integration. Young teachers cannot narrowly treat themselves teaching staff while ignoring the duty to educate students. Of course, they cannot simplify the education either, believing imparting knowledge equals educating people or finishing their class means finishing the instruction. Indeed, they should attach more importance to guiding students in and out of the class to build correct values and outlook on life. As Han Yu, the ancient Chinese literati, said, the task of a teacher was to deliver a sermon, introduce methods, and clear up confusion. This demonstrates that teachers should not only complete their task of introducing methods and clearing up confusion, but also bear the responsibility of delivering a sermon, with the latter preceding the former. Therefore, each young teacher should be aware of the importance of imparting knowledge and educating people, guide students in the class to set up correct and positive concepts, encourage them to foster great vision, and promote their sound development.

3 Psychological and Behavioral Characteristics of Young Teachers

1) Young teachers owe professional expertise in certain fields and comparatively high personal qualities. At present, most young teachers have already got doctor's degree through systematical and professional education, thus they have master certain amount of professional knowledge and skills. Therefore, they have comparatively higher comprehensive personality like learning capability, wide horizon, strong thirst for knowledge and relatively broad knowledge.

2) Young teachers have a strong sense of self-realization. According to hierarchy of needs theory raised by Maslow, the fundamental requirements of human can be divided into five hierarchies, which are physiology, safety, love, respect and self-realization. Young teachers generally have a comparatively higher hierarchy of needs, which lies in their desire to realize their self-competence, to be a better one according to their expectations and to complete everything that matches their capabilities. In this case,

they are ambitious and ready to face the challenges. Also, they have a strong sense to show their Intelligence and realize their self-worth.

3) Young teachers attach importance to achievement motivation and spiritual incentives. Their works are not just simple duplications but the creative works that will continuously promote new innovations and add new contents. Young teachers are very eager and need to see their achievements. Moreover, they pay great attention to the evaluation from others, institutions and the society, and they have a strong desire to be accepted and respected by the society.

4) University teachers have a relatively high autonomy of their own works. University provides a relatively loose environment for teachers. The creativeness of teachers work requires that the working environment to be relative loose. With comparatively high autonomy and freedom, they have little restriction of time and space in their teaching and research work. High-autonomy calls for self-guidance and self-management, thus teachers' work can hardly be monitored or controlled by others. With their professional knowledge and skills, young teachers can stick to their researches. Young teachers always have their own personalities, so they are not willing to go with the tide or fawn upon power.

5) The working achievements of university teachers can hardly be measured or evaluated directly. The achievements of teachers' teaching and research work often reflected in students' improvement or some kind of thoughts, creativities, inventions and innovations, which can't get the immediate results that can be measured or evaluated directly. Talent cultivation and science research program can't be fully completed by individual person. However, teamwork increases the difficulty to give standardized evaluation to individual work.

4 Unique Advantages of Young Teachers in “Imparting Knowledge and Educating People”

A survey conducted by Beijing Education Trade Union on young teachers in some institutions of higher learning shows that most young teachers are qualified in political caliber. They have a fine grasp of Marxism Theory, a firm conviction in socialism, patriotism and the ability to foster students' ideological and political quality. Meanwhile, they constitute the main force of teaching research in every higher learning institution. Therefore, they have the prerequisite to imparting knowledge and educating people. Due to their uniqueness, they have some particular advantages.

4.1 Larger in amount and younger at age

At present, the percentage of young teachers in colleges stands at near or over 50%, even tending to get bigger. These young teachers mostly hold full-time posts or serve as instructors for students, working in the forefront of teaching and education. A large number of young teachers can instruct a lot of students, which is conducive to comprehensively carrying out activities of imparting knowledge and educating people. In the prime of their time, young teachers are energetic, enthusiastic, and aggressive. Due to the small age gap, they have so much in common with their students, almost no generation gap existent between them. This is convenient for young teachers to go deep into the study of students and gradually finish their work to impart knowledge and educate people.

4.2 Grasp of new and wide range of knowledge

Information age leads us to a rapid expansion period in which knowledge is upgraded at such an astonishing speed. Under such background, young teachers, compared with old ones, enjoy more knowledge advantages. Young teachers have just graduated from school, owning the most advanced research literature, and holding the latest core theories. They can impart such worthy knowledge to students, thus broadening their horizon. Eager for new things, young teachers are usually armed with strong proficiency of foreign language and computer application and wide range of knowledge. Therefore, they can easily win admiration and worship from students. With such advantages, they can get better results in performing ideological and political education.

4.3 Stronger logical thinking

Young teachers have received good training of logical thinking for a long time. It is not only the teachers from science, but also those young teachers from liberal arts that receive training of logical thinking during their school time. Therefore, young teachers perform well in pondering and analyzing problems, looking at issues in dialectical ways and considering problems in more detail ways. However, students in higher learning institutions have not had their thinking modes fixed, so they are flexible. A young teacher can, during his class, influence students with his thinking mode, and train students' logical and dialectical thinking, making them more competent to think over and analyze problems.

4.4 Similar thoughts to those of students

Thought confliction is one of the barriers that block teacher-student communication. Middle-aged and old teachers often show loving care for students by seeking advice of their seniority. But students often mistake it for verbose instruction. Patient education of teachers is totally ignored by students, which is fundamentally caused by big differences in thought. Young teachers are of closer age to students. The information they receive and the hobbies and interests they have are very similar to those of students. The generation gap between them is narrow. Therefore, young teachers can communicate with students in a better way, which is convenient for the ideological and political education to students.

4.5 Psychological advantages

In the modernized society, study and work usually make people feel more stressed out. Young teachers in institutions of higher learning are the outstanding ones. They have experienced the test of study pressure and joined the rank of teachers in higher learning institutions. They have a heartfelt understanding of the pressure students face in the study, then, giving more targeted guidance to them, and helping them relieve psychological pressure. Thus, students can foster optimistic mentality, and build good outlook on life and world.

5 Efforts by Young Teachers to “Impart Knowledge and Educate People”

In order to conform to the requirement of imparting knowledge and educating people in the new era, young teachers should shoulder more responsibility and play more important roles.

5.1 Further improvement of self-quality

Although young teachers enjoy many advantages in imparting knowledge and educating people, they still need to improve themselves. Young teachers are lacking in practical teaching experience and do not fully understand conditions about colleges or universities. Therefore, they need to further their understanding and accumulate experience in teaching practice. To improve self-quality is not a short-term task. It cannot be completed merely by teachers' effort. Universities or colleges should also formulate related schemes and objectives of training. Young teachers' study of pedagogy, psychology, and other subjects should be strengthened, and the development law of undergraduate psychology and physiology should be fully grasped. In this way, young teachers' theoretical foundation can be solidier and more targeted in the course of imparting knowledge and educating people, especially educating people.

5.2 Positive participation in student work

Young teachers are in the prime of their time, full of energy and time. They should be encouraged to serve as head teacher or class mentor more positively. Tsinghua University initiated “Double Shoulder Task”, allowing full-time instructors to act as teachers of ideological and political theory course. Young teachers can act in an opposite way. They can act as head teachers of some classes and grades while being full-time teachers. In this way, they can participate in the student work in addition to class teaching. Such a mode is of great significance to leverage advantages of young teachers in imparting knowledge and educate people.

5.3 Enhancement of moral education in class teaching

Not all young teachers will serve as head teachers or get engaged in student work. For them, it is their supreme duty to give class teaching. It is an important link of moral education in higher learning institutions to place “educating people” in “teaching”. In this course, young teachers should bring their advantages into full play, make innovation in education form and take more diversified measures to ensure that students imperceptibly receive moral education and their ideological and political quality is improved.

5.4 Self-discipline and role model for others

As is known to everyone, example is always more efficacious than percept. Due to their unique advantages, young teachers can easily become idols of students, and they can give a lot of instruction to students. A young teacher who is willing and brave to make innovation can more easily cultivate students who have spirit and ability of creation. Therefore, young teachers need to become students' role models in knowledge, moral sentiments, conduct and other respects, so that students can worship and copy them. As Tao Xingzhi said, only those teachers insatiable in learning can teach out students insatiable in learning. Young teachers should set strict demands on themselves, act as role models for students, and lead them to make progress with exemplary force.

6 Conclusion

Young teachers should give full play to their advantages and shoulder more responsibilities and

obligations to ensure they play important roles in imparting knowledge and educating people.

Reflections on the Reform and Development of China's Competitive Sports

Long Bin

Department of Sports Training Research, Wuhan Sports University, Wuhan, P.R.China, 430079
(E-mail: 1097522152@qq.com)

Abstract: Through the methods of literature consultation, specialist interview, mathematical statistics and logic analysis, this paper carried out an overall analysis on China's achievements in eight summer Olympic Games both qualitatively and quantitatively on the basis of the current development of China's competitive sports and relevant data of the eight summer Olympic Games. Meanwhile, From the analysis of the current level of China's competitive sports and development trend after 2012, this paper drew the conclusions of the development of Chinese competitive sports in the 21st century: (1) Strengthen the institutional foundation and ensure the sustainable development of China's competitive sports. (2) Consolidate the team of teachers and coaches. (3) Continue to maintain the absolute advantage in Asia; Expand the chances of winning gold medals and medals; Narrow the gap with the United States in terms of 28 sports and 324 events of the Olympic Games. (4) Give full play to the Bayi army athletes' team in training, competition, logistics and management. (6) Make full use of the Beijing Olympic Games, which has gradually influenced China's competitive sports and gained more social support for its sustainable development. (7) Reflections on the London Olympics and the guiding role of domestic public opinions in order to lay a solid foundation for China's transformation from competitive sports into a world sports power.

Key words: China; Competitive sports; Reform; Reflections; Olympic Games

1 Introduction

Reviewing the past 60 years of development history of China's competitive sports, we can see constant achievements from international competitions such as Olympic Games, World Championship and World Cup Tournament. In the past 60 years, China has formed the development strategy with Olympic Games as the highest level and a nationwide system of competitive sports with Chinese Characteristics.

In 1984, China broke the zero record of the Olympic gold medals in Los Angeles. In Beijing Olympic Games, China won 51 gold medals and 100 medals and topped the gold medal winners list, which was a double winning of sports achievements and cultural progress and therefore created a new glory in the history of China's competitive sports.

During the 20 years from 1959 to 1979, China produced 42 world champions. Since the introduction of Reform and Opening up, China's competitive sports have gained rapid development and made remarkable achievements. During the 20 years from 1980 to 2000, China produced 1284 world champions. And at a new time of 2012, it is necessary to analyze the internal reasons for the achievements of China's competitive sports and come up with solutions for the development in the post-Olympic era.

China's first participation in summer Olympic Games started at the 23rd one in Los Angeles in 1984 and, up to London Olympic Games in 2012, China was in for 8 times. Therefore, China's participation in Olympic Games can be divided into three phases: the first phase includes the 23rd and 24th Olympic Games, the second phase includes the 25th, 26th and 27th Olympic Games and the third phase includes the 28th, 29th and 30th Olympic Games.

In the 23rd Olympic Games of the first phase, China won 15 gold medals, 32 medals and ranked the fourth on the gold medal tally, which was a breakthrough from zero on gold medal record. However, such achievements was made under the background that 16 countries including former Soviet union and the eastern European countries refused or were unable to participate, they cannot be regarded as the full display of China's real capabilities in sports. On one hand, most of the gold medals China had were some of the most competitive events of the former Soviet union and the eastern European countries, such as gymnastics, weightlifting, shooting and swimming. On the other hand, Due to political changes and internal reasons of competitive sports and, in addition, the former Soviet union and eastern European countries'back into the Olympic Games, in 1988, China only received five gold medals in Seoul Olympic games. Very unexpectedly, out of the advantageous events like weightlifting, shooting and swimming in the Los Angeles, China only won one gold medal and fell to the 11th on the ranking list. Therefore, Seoul Olympic games explained the

reality of China's falling from a high starting point in the field of competitive sports.

In the 25th, 26th and 27th Olympic games of the second stage, United States and the Commonwealth of Independent States (Russia) ranked the top two on gold medal tally. Table 1 shows that United States, Russia, Germany were in the absolute advantageous position in the world competition of sports and occupied a significant proportion in terms of all previous total medals, total gold medals and the main events of winning gold medals. The three countries were regarded as the "First Winner Group" in the world competitive sports. Although China were among the top three in the 27th Olympic games, its overall strength still lagged behind compared to the three countries. In some big events like track and field, swimming and ball games, there was a gap between China and the three countries. However, China had indeed made some significant progress in competitive sports and, in addition, these three Olympic games were included into the first ten-year program of striving for Olympic glory. Many experts from sports training field believed that it was not appropriate to say that China belonged to the "First Winner Group" by ranking the third for one time, which can be seen from table 1 and table 2.

Table 1 Top Six Countries in terms of Gold Medals and Total Medals from the 25th to the 27th Olympic Games

Session	Time	Place	Rank	Country	Gold Medals	Total Medals
The 25 th	1992	Barcelona, Spain	1	CIS	45	112

SUM	15	5	16	16	28	32	51	38	201

In the 28th, 29th and 30th Olympic games of the third stage, which were included into the second ten-year program of striving for Olympic glory, China had witnessed a healthy, rapid and sustainable development in competitive sports. In the 29th Olympic Games, which was held by China, China made the full advantage of timing, place and excellent athletes and, as a result, ranked the first in terms of both total gold medals and medals. It was a sign showed that we have established ourselves as a major sports country, yet we still have a long way to go before becoming a world sports power for the total 51 medals we have achieved were merely from 19 events.

Therefore, this paper, through analyzing the above mentioned three stages, carried out a comprehensive research on China's reform and development of competitive sports.

2 Research Methods

The research methods mainly include: literature consultation, specialist interview, mathematical statistics and logic analysis.

3 Results and Analysis

3.1 The successful experiences of China's competitive sports.

(1) The basis is to uphold the guidance of the Communist Party of China and Socialism. China's competitive sports gained its development under the leadership of the Communist Party of China, which enjoys an institutional advantage and provides full support that are absent in other developing countries.

(2) "State-run sports system" is the key for China's competitive sports to make remarkable achievements, which demonstrates the superiority of socialism on competitive sports

(3) Scientific training and innovation is the guarantee for the development of competitive sports. During the 30 years of China's participation in Olympic games, China was able to make major progress and breakthrough in such short time. All these achievements was made under the polices of adhering to the scientific guidance in training, carrying out technological and management innovation and launching anti-doping campaigns throughout the whole process of development.

3.2 Problems in China's competitive sports

Institutional problems of China's competitive sports in the new situation; "State-run sports system" has been the basis for the development of China's competitive sports. Under this system, China has made remarkable achievements and created glory in this aspect. It is safe to say that the development is made thanks to the system.

(1) How to make sure the investment in China's sports; At present, in terms of economic system of sports, there are mainly two types, one is to run sports by society sectors like clubs and sports team from institutions of higher education represented by United States and western countries, the other is to run sports by society sectors represented by eastern Europe and the former Soviet union.

(2) How to adjust the structure of sports; At present, Some problems, such as unbalanced development in the events of sports, weakness in infrastructure, unreasonable setting of structure, the non-Olympic events compete against with the Olympic events for resources and leads to inadequate support for advantageous and potentially advantageous events, restrict the implementation of the Olympic strategy on different levels.

(3) How to coordinate the relationship between the local areas and the army; It is particularly important to coordinate the relationship between Bayi army athletes' team and sports bureaus at all levels in the post-Olympic era.

(4) How to make use of the full influence of Beijing Olympic Games on competitive sports; The significance of the Beijing Olympic Games is not only merely limited to the Olympic movement itself, but also on our country's politics, economy, culture, society. At the same time, the political, economic, cultural and social changes will also lead to the development of competitive sports.

(5) How to define the future development through London Olympic Games. The data from London Olympics once again shows that China is already well on its way of becoming a major sports country

yet still not a major sports power, although in London Olympic Games, China ranked the second in terms of gold medals.

3.3 Strategies in the post-Olympic era

(1) Continue to improve state-run sports system and impart new connotation and denotation and strengthen its fundamental role in developing China's competitive sports.

(2) Strengthen the cultural and capability training of coaches and form the rudimentary, intermediate and high level of coach training system. Institute of Coaches of General Administration of Sport thus can play an integral role in the development.

(3) Explore the rules of scientific training and make use of multidiscipline teamwork and form a system that combined training, education and medical service. In this way, the inter-disciplinary training team can be founded and thus improve the innovative awareness as well as the quality and efficiency.

(4) Make full use of Bayi army athletes' team and promote the coordinated development between local sports and army sports.

(5) Promote innovative development in the post-Olympic era and popularize competitive sports in schools

(6) Analyze and forecast the changes in the setting of Olympic Games and adjust the structure of sports. Take corresponding strategies in expanding the chances of winning medals and transform into a world sports power.

4 Conclusion

1) Adhere to the socialist road with Chinese characteristics, which is the basis for the state-run sports system. Combine the trend of the development of the world competitive sports so as to deepen the reform in sports and ensure the sustainable development of China's competitive sports.

2) Strengthen the foundation of competitive sports. It is necessary to strengthen the construction of teachers and coaches' team. Improve the management of training team and promote the scale and quality of the training teams. Attach great importance to the advantageous programs, latent advantageous programs and basic programs.

3) The aims of competitive sports in China: Maintain the absolute advantage in Asia; Expand the chances of winning gold medals and medals; Narrow the gap with the United States in 28 sports and 324 events of the Olympic Games; In 2016 Brazil Olympic Games, strive to maintain China's overall level of competitive sports and compete with the United States in over two thirds of sports and over one-third of the events, thus lay a foundation for our country to a world sports power.

4) Give full play to the Bayi army athletes' team in training, competition, logistics and management. Promote the coordinated development of the army and local sports.

5) The development of competitive sports should be based on constantly improved three levels training system, i.e. the system from elementary school to middle school to university and then to national team. Explore more development methods and open more doors of schools for competitive sports.

6) Make full use of the Beijing Olympic Games, which has gradually influenced competitive sports and gained more social support for the sustainable development of athletics sports.

7) Reflections on the London Olympics and the guiding role of domestic public opinions. Lay a solid foundation for China's competitive sports transforming into a world sports power.

(E-mail: 510290238@qq.com, liuyixiang_65@sohu.com)

Abstract: Through the methods of literature consultation, specialist interview, mathematical statistics, this paper carried out an overall analysis on the consistency of dance cheerleading and performing aerobics in China's universities and colleges, which will help to understand the relationship between dance cheerleading and performing aerobics, to highlight the characteristics of each event and to provide certain reference and contribution for relevant personnel involved in sports field. The study has come to the conclusions that dance cheerleading and Performing Aerobics have similarities in seven aspects including physical requirements for students, requirement for music, training contents and methods, physical fitness, basic dancing skills, comprehensive capabilities and aesthetic, fitness and social values.

Keywords: Dance cheerleading; Performing aerobics; Colleges and universities; Consistency

1 Introduction

With the progress of the society, College students in China have shown more tendency for the new, interest, knowledge and activities, which has led to the fact that traditional sports events no longer meet their needs. As a result, dance cheerleading and performing aerobics were introduced into Chinese universities under this particular background. They consist of different sets of movements that are full of youthful vigor and vitality and can help enhancing physical fitness, improving artistic tastes and cultivating mentality. In addition, they also enjoy the advantages of having no special requirements for space, place and physical fitness and, as a result, favored by college students and thus gained rapid development in colleges and universities and soon be included in the teaching program of college sports in China. By the study of comparison between dance cheerleading and performing aerobics, it is made possible that the two events learn from each other and promote common development while maintaining the characteristics of each event, which have important significance on promoting a rapid and balanced development of dance cheerleading and performing aerobics in universities of China as well as enriching cultural life in campus.

2 Similarities Between Dance Cheerleading and Performing Aerobics in Requirements For Students' Physical Fitness

Table 1 Common Physical Requirements for Dance Cheerleading and Performing Aerobics

Physical Fitness	Requirements and effects
Basic Postures	Express the beauty of posture, movement and spirit to make the movements more stretching and powerful.
Performance	Represent beautiful post and powerful movements combined with music for the audience and judges and enable the audience to appreciate the beauty of sports.
flexibility	Make the joints more flexible and prevent any damages as well as improve the performer's movements and flexibility.
strength	Fast in movements and strong in control ability, easy to master difficult action and maintain good physical shape.
Muscle Control	Strengthen the control of body and ability to keep balance, improve physical coordination and expression of the movements, enhance muscle elasticity and flexibility, promote the formation of correct posture and physical shape.
coordination	Keep a good coordination between different parts of the body and smooth movements to maintain the movements to be tight but not stiff and relaxing but not loose so as to demonstrate the artistic beauty of the movements.

In the shows of dance cheerleading and performances aerobics, the performers need to express their most dynamic and passionate movements by graceful dancing and personal capabilities to attract the audiences. In order to achieve this, students are required to not only have a good command of body

movements, power, flexibility, strength and performance, but also a strong artistic appeal and physical coordination. Basic postures are guarantee for the basic movements and performance is a manifestation of confidence of the performer; good flexibility is the basis for high standard and high level movements; strength is the physical basis to complete the whole sets of actions; coordination is the premise to show the artistic beauty and command highly difficult and graceful movements. Qualities required and effects are shown in Table 1.

3 Similarities Between Dance Cheerleading and Performing Aerobics in Requirements for Music

Healthy music provides a pleasant feeling and is not only beneficial to people’s mental health, but also affect the physical health. Dance Cheerleading and Performing Aerobics choose music with stronger sense of rhythm and cheerful melody, which can inspire people’s emotions. Performers are required to have strong ability to appreciate music and show in-depth understanding of music and can perform passionate and enthusiastic movements to vividly reproduce the theme of music.

Table 2 Musical Comparison between Dance Cheerleading and Performing Aerobics

events	Time	Music Pace	Score	Music requirements
Dance Cheerleading	2'20"±10"	24 beats per 10 seconds	10 points (out of 50)	Specific theme; complete sets of movements designed in accordance to the music style, beats and style; stable and clear sound.
Performing Aerobics	2'10"±10"	22 to 26 beats per 10 seconds	2 points (out of 10)	Music must be in accordance to the sets of movements; smooth and complete music editing; clear audio

The music duration for dance cheerleading and performing aerobics is generally between 2 minutes to 2 minutes and 30 seconds, Dance cheerleading and performances aerobics have basically the same requirements for music, which is to highlight the theme; music should be edit into a more smooth, natural and complete version; the quality of music should reach a professional level to ensure its clear and stable rhythm; selected music should be coordinated with the sets of movements and the beat style and the theme to demonstrate the capacities and personalities of students. (See Table 2)

4 Similarities Between Dance Cheerleading and Performing Aerobics in Training Contents And Training Methods

Although, in dance cheerleading and performing aerobics, the requirements of slogans, arm movements and pace requirements, bouncing technique and other special movements may vary, most common training contents and training methods are similar. (Table 3)

Table 3 Similarities between Dance Cheerleading and Performing Aerobics in Training Contents

Classification	Training contents	Training purpose
Physical Fitness	Flexibility, strength, explosiveness and coordination	Improve the coordination ability of body parts
Basic Dancing Skills	Physical ballet, Latin dance, modern dance and folk dance	Improve physical expression skills
Comprehensive Capabilities	Performance, psychological quality and music sensibility	Improve professional skills and level

4.1 Similarities in physical fitness and training methods

Good physical fitness is the basis and guarantee for outstanding performance of the entire sets of movements. Drastic jumps and kicks can fully display the students’ flexibility and good flexibility is the basis for high standard and high level movements. In the process of training, stress should be put on the development of flexibility training in shoulder, waist, legs and hip joint. Good coordination can ensure students to express standards, coordinated, bright and graceful performance in the complex and elaborate movements.

All too often, dance cheerleading and performing aerobics require passionate performances with their movements releasing infinite strength and enthusiasm, in which the explosiveness is a very important quality. Different exercises like jumping, deep leap, hopping, pushing down are adopted in the high, medium and low intensity mixed training combined with strong music.

4.2 Similarities in training methods commonly used in basic skills of dance

The performances of dance cheerleading and performing aerobics often involved of Latin, jazz, folk and other styles of dancing to increase the effect of novelty and performances on the stage. Students

are required to practice these basic dancing skills of different style and forms to improve their abilities of physical expression.

Different kinds of dance training should be carried out through different training methods, which can enhance students' abilities of explosiveness, jumping, controlling, endurance and stability, flexibility, coordination and, in addition, effectively improve the students' perception of time, rhythm and beat and judgment, imagination and observation towards space, image, and movements. Different training methods help to improve students to perform different movements in different body parts at the same time while maintaining their body coordination and balance.

4.3 Similarities in training for comprehensive capability

Comprehensive capabilities of dance cheerleading and performing aerobics mainly refer to the capacity of expression and good psychological quality. Personal capability of the athlete not only plays a decisive role in competitions and performances for "artistic quality", but also is a very important factor for the athletes to achieve outstanding results. Therefore, it occupies a leading position in the cheerleading and performing aerobics.

Dance cheerleading and performing aerobics are mainly performed through the body's beauty. In training, athletes are trained through different dances like Latin dance, ballet, modern dance, jazz and folk dance, which can fully exercise the chest, waist and hips.

4.4 Similarities in aesthetic, fitness and social values

Dance cheerleading and performing aerobics are easy to learn with a comparatively low cost. They are favored by people all age and have strong feature of modern times. They can be performed both on stage and as entertainment for gatherings. Therefore, they are suitable for both men and women of different classes from all walks of life to exercise and get improve their health, thus becoming a very popular sport in recent years.

The similarities of dance cheerleading and performing aerobics in values are mainly reflected on aesthetic, fitness and social values. Generally, they are both combined with art, by practicing and watching, improve people's perception towards beauty, ability of appreciation and creativity. What's more, they not only help to form graceful physical appearance, good interpersonal relationship, but also meet people's diversified tastes for arts.

5 Conclusions

1) Similarities between dance cheerleading and performing aerobics in requirements for students' physical fitness, which is the comprehensive capacity.

2) Similarities between dance cheerleading and performing aerobics in requirements for music, which is specially targeted for the performances.

3) Similarities between dance cheerleading and performing aerobics in training contents and methods, which are specially designed for the performances.

4) Similarities between dance cheerleading and performing aerobics in physical fitness and training methods.

5) Similarities between dance cheerleading and performing aerobics in training methods commonly used in basic skills of dance, which are the fundamental basis for the training.

6) Similarities between dance cheerleading and performing aerobics in training for comprehensive capabilities.

7) Similarities between dance cheerleading and performing aerobics in aesthetic, fitness and social values.

Abstract: Computer and internet have caused great innovation in the way of English teaching and learning in the information age, resulting in a brand-new teaching mode. This study investigates the efficacy of college English reform. It is based on a questionnaire survey made among our students about the computer-based and web-based teaching mode. The findings show that the incorporation of computer and web into college English teaching can promote language learning which can be proved by the increasing numbers of prizes won by our students in the National English Contest for College Students and the high pass rate of College English Test Band 4. The limitation is also explored to perfect our teaching mode.

Key words: Teaching mode; Innovation; Efficacy; Computer-based; Web-based

1 Introduction

English teaching and learning have come to a digital era. The multimedia technique prevails in the education of all levels, especially in higher education. The State Education Ministry issued the College English Curriculum Requirements (CECR) in 2004. In CECR, a new English teaching mode with the help of multimedia and network technology is introduced. It says the extensive use of advanced information technology should be encouraged, computer-based and web-based English teaching should be promoted, and students should be provided with favorable environments and facilities for language learning^[1]. Nowadays, in most universities, the computer in the classroom is equipped with an overhead projector but not hooked up to internet. So web-based English teaching is mainly conducted in the web room under teachers' online guidance after class. New technology has indeed been applied in our education while some people doubt its efficacy. To figure out whether the students accept the new computer-based and web-based teaching mode and its efficacy, a small-scale questionnaire survey is conducted among my students. Wang Shouren (2011) and Shu Dingfang (2006) et al discussed and made clear the mission and task in college English teaching; Feng Hui (2007) and Li Xin (2008) et al analyzed the importance of college English teaching reform and the coping strategies. Thus, with ongoing of education reform, the study on the efficacy of the current implementation of reform in college English teaching that is led by listening and speaking is a necessary requirement of at a new period.

2 Advantages of the Innovations of Computer-Based and Web-Based English Teaching

2.1 More accesses to authentic language resources

Students and teachers can have access to lots of authentic language resources which are more attractive and interesting with vivid pictures and pleasant sounds. Teachers can reproduce those downloaded language materials easily in class. English movies and songs can be appreciated which can also contribute to students' language sense. Such sufficient comprehensible language input will definitely lead to language output^[2].

2.2 Less anxiety and more freedom

The interesting and authentic language environment can lessen students' anxiety. Moreover, they will feel less anxiety when they study online in the web room with the absence of their teacher. In such environment, the communication is easy mainly between the students and the computer accompanied by the online communication between students and between them and their teacher which is not face to face. Anxiety will exert a negative effect on language learners^[2]. Students also enjoy more freedom when they study online for they can decide the study pace and schedule largely by themselves.

2.3 A new supplementary way of communication between students and teachers

Compared with the face-to-face communication with teachers, most students are willing to communicate on line with their teachers including asking questions and consulting learning strategy and

even questions irrelevant to language learning which promotes the relationship between teachers and students.

3 Efficacy Study of the Innovation in Our English Teaching

The introduction of computer results in a brand-new teaching mode. In this teaching mode, we have two periods of Integrated Course and one period of Listening& Speaking Course and one period of online study of New Era Interactive English guided by the teacher in the web room. The new computer-based and web-based teaching mode features advanced information technology and is also student-centered, which emphasizes the training of students' language skills and independent learning.

3.1 Students' synthetical assessment of the course of college English

Most of my colleagues agree with me that students are increasingly fond of this compulsory course owing to the innovation of our college English teaching. The synthetical assessment scores of this course given by our students from year 2006 to 2009 are 85, 92, 97 and 98^[3] respectively which mean students are more and more satisfied with the reformed English teaching.

The above assessment is done by all the students in our university online at the end of each semester. To know students' feeling about the innovated teaching, I made a class survey about the three aspects of our teaching among my 104 students with 100 valid questionnaires collected.

3.1.1 In English reading class

These two periods are conducted in multimedia classroom. Owing to the mentioned advantages, students' language output is largely promoted. I am pleased and proud to appreciate students' fabulous presentation with the help of beautiful PPT. During the process of preparing the oral presentation with PPT, students have to search for the useful information via cooperation among the group members. So students' integrative or diverse abilities can be trained.

Table 1 Questionnaire Results of Students' Opinions on Multimedia Teaching

Items	Strongly agree	Agree	Uncertain	Disagree	Strongly disagree
I like the multimedia English teaching very much.	40%	40%	7%	10%	3%
Multimedia teaching can promote my interest in English.	35%	47%	6%	8%	4%
Multimedia teaching can improve my integrative abilities like cooperation, research, etc.	30%	39%	16%	7%	8%

Our survey shows 80% students like multimedia teaching very much and 82% students think it can promote their interest in English. So it is easy to see this kind of teaching is welcomed by the majority of the students.

3.1.2 In the listening and speaking class

In our university, Listening and Speaking Course is taken in language lab or the ordinary classroom or in the multimedia classrooms when they are available. The instruction of this lesson combines listening with oral practice whose topics are usually closely related to the listening material.

Table 2 Questionnaire Results of Students' Opinions on Listening& Speaking Course

Items	Strongly agree	Agree	uncertain	Disagree	Strongly disagree
I like Listening& Speaking Course very much.	40%	44%	6%	8%	2%
This course promotes my interest in English.	37%	46%	7%	7%	3%
This course makes me practice listening and speaking more frequently in and out of class.	31%	50%	2%	11%	6%

Results of our survey reveal that 84% students like this course and 83% students agree it can promote their interest in English. We also find students like this course than Integrated Course because there is less pressure and more activities in class and more students can participate in the class activities. In their words, there is more fun.

3.1.3 In the webroom

CECR says the extensive use of advanced information technology should be encouraged in college English teaching and computer-based and web-based English teaching should be promoted^[1]. Then our one period's online study of New Era Interactive English is the realization of this idea.

Students are free to study online New Era Interactive English in the web room and they can make personal study schedule according to their different abilities and diverse study habits. This is totally individualized and autonomous. It seems the teacher is absent from students' online study. But actually teachers are supervising their learning simultaneously and preparing to answer any question from the students by logging in to Learning Management System.

Table 3 Questionnaire Results of Students' Opinions on Online English Learning

Items	Strongly agree	Agree	uncertain	Disagree	Strongly disagree
I like online English study very much.	45%	46%	6%	2%	1%
This course promotes my interest in English.	39%	46%	9%	5%	1%
This course contributes to my language proficiency.	25%	26%	20%	21%	8%

The results indicate that 91% students like it and 85% students think the online English study promotes their interest in English. But only 51% students think it can improve their proficiency in English, which is out of our expectation and surprises us.

3.2 Achievements of the computer-based and web-based teaching reform

3.2.1 Prizes won in NECCS

As one English teacher, I feel that these years our students' English levels keep being improved as one delightful result of our reform. My feeling may be proven by the increasing number of students who won prize in the National English Contest for College Students (NECCS). The numbers^[3] are shown in the following table.

Table 4 Prizes Won in NECCS

prize year	special	first	second	third
2005	4	4	18	38
2006	4	6	25	49
2007	5	9	38	105
2008	4	20	63	123
2009	20	26	107	199

The above table shows we had 46 special and first prizes in 2009 while we only got 8 in 2005 and 10 in 2006. So we make tremendous achievement in the contest. The second and third prizes we won in the above years can also show the progress our students and teachers made.

We have taken special investigation recent years on the students from School of Automotive Engineering, who also shows the remarkable trends as the above survey. The numbers^[7] are shown in the following table.

Table 5 Prizes won in the NECCS (School of Automotive Engineering)

prize year	Special	First	Second	Third
2012	0	1	7	7
2013	1	2	1	7
2014	1	2	6	12

The above table shows School of Automotive Engineering had 15 students won prizes in the NECCS in 2012 while 21 students have won prizes in 2014. Besides the total increasing number of prizes winners, the number of the special and first prizes won in the recent year can prove our progress made in the teaching reform.

3.2.2 The increasing pass rate of CET4

The satisfactory efficacy of the reformed teaching can also be proven by the increasing single-time pass rates of College English Test Band 4(CET4). The single-time pass rates of CET4 for students of 2002 to those of 2006 are 49%, 63.73%, 62.9%, 73.98%, and 84.42%^[3] respectively which are shown in

the following figure. The statistics show the pass rate of students of 2006 is unbelievably 35% higher than that of students of 2002.

Figure 1 Single-time Pass Rate of CET-4

We have also taken special investigation recent years on the students from School of Automotive Engineering, who also shows the remarkable trends as the above survey. The single-time pass rates of CET4 for students of School of Automotive Engineering in 2011 to those of 2014 are 90.66%, 94.43%, 93.36% and 94.91%^[6] respectively which are shown in the following figure. The average single-time pass rates of CET4 for students of the Wuhan university of Technology in these years are 90.55%, 94.28%, 93.25% and 94.28%^[6] respectively. The statistics show the pass rate of our students is making tremendous progress. What is more satisfactory is that the rate of students from School of Automotive Engineering is incredibly 0.63% higher than that of average students of 2014.

Figure 2 Single-time Pass Rate of CET-4 (School of Automotive Engineering)

4 Conclusion

This paper draws on the data collected from the classroom survey to test students' preference about the reformed new teaching mode which is computer-based and web-based and the efficacy of this reformation. With the questionnaire results and the data about students' achievement, we can proudly say our teaching reform is quite successful. Students become more active and absorbed in class which results in their more proficiency in English. Students' language communicative ability has been largely improved.

Although some researchers say we should also hold this in mind that computers will never substitute teachers for the moment, but they do offer new opportunities for better language practice^[4]. However, we should not exaggerate the merits of computer-based teaching for a few teachers and students in our survey complain that they sometimes suffer a lot from inefficiency owing to the unfamiliarity with the operation of computer. One elderly teacher complains that she spends too much time learning how to design and make PPT. And one teacher complains that her activity is confined by the computer. On the other hand some students complain that it seems the teacher spends more time on computer rather than them. Hence I suggest the future reform should combine the computer technology

with the more and better interaction between students and teachers. Anyway they are the implementers and participants in any kind of foreign language teaching mode and the interaction between them is the key of classroom teaching^[5]. So no matter what the teaching mode is, we should pay much attention to the interaction between the teacher and student.

Research on the Evaluation of the Party Building in Colleges and Universities Based on the Theory of Lawler-Potter*

Tan Cai

“Study on the evaluation system and incentive mechanism of Party Building” Research Group
School of Art and Design, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: tancai10@qq.com)

Abstract: Assessment of Party building in colleges and universities is a major study issue in the present and future. It plays a significant role in the party’s construction in colleges and universities to promote the building of basic party organizations. To establish a systematic, scientific and operable evaluation system and mechanism is an effective way to make full use of the function of the basic Party organization in the construction of high level university. This paper tries to use the synthesizing incentive theory of Lawler-Potter’s model to put forward the building ways and implementation methods of the assessment system of the building of basic Party organization.

Key words: Colleges and universities; Basic party organizations; Party building assessment system; Synthesizing incentive theory

1 Introduction

The report of 18th CPC National Congress stresses that: “to improve the quality of new Party members, pay attention to recruit new party members from among youth workers, farmers, intellectuals to optimize the structure of Party membership”. In the work of Party building, the basic Party organization in colleges and universities is the most closely linked with the majority of teachers and students. It is also the foundation to implement and carry out the Party central policy. Thus, the consensus has been already reached that to focus on construction of the basic party organization is to promote the development of university. The establishment and operation of the evaluation system of the party construction work will be the booster of the Party construction work.

Our country university party building assessment work experience three stages “breeding rise, initial development and accelerate development”. The incentive and promote of the party's construction is the final goal of Party building assessment. This paper tries to construct the “Lawler-Potter’s synthesizing incentive model” to study the construction method of the party building assessment system in colleges and universities.

2 The Realistic Significance of the Incentive Mechanism Used in the Party Building Assessment in Colleges and Universities

The famous American organization behavior experts, the world’s incentive master, Robbins thinks that motivation is able to satisfy the need and achieve organizational goals of certain individuals within organizations. In China, the psychology-management scholars generally consider incentive to be the process to stimulate continuously the motivation. As a kind of self-management and community-management function, the theory of motivation in management must be based on the premise of the internal dynamics of the organization. It is the process of cultivating and motivating people to achieve the goal of enhancing the behavior. Incentive mechanism is applied to the basic party building assessment. It is conducive to enhancing the cohesion and combat effectiveness of basic party organizations, to stimulating creativity of basic Party workers and members, to innovating work methods of basic party building, and to improving the basic party building performance.

* This paper is supported by “the Fundamental Research Funds for the Central Universities (WUT: 444-120010)”

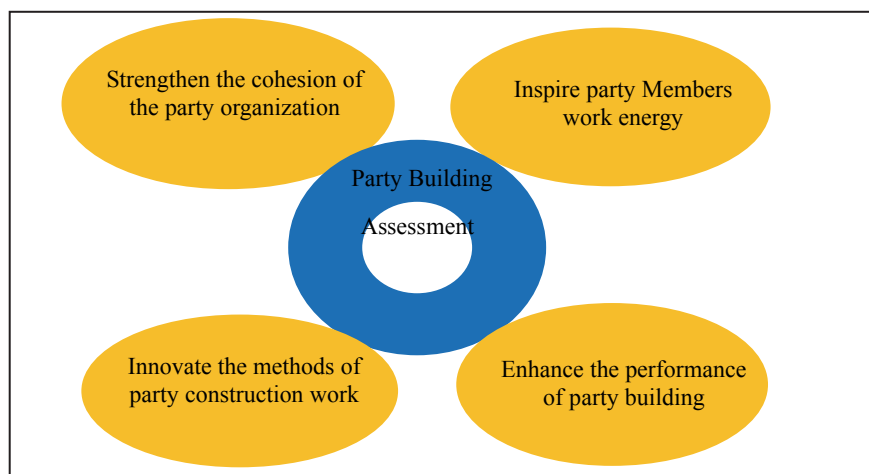

Figure 1 The Significance of the Party Building Incentive Mechanism's Application

2.1 Enhance the cohesion and combat effectiveness

In the new historical period, the Party members have a pursuit to be personalized during the fulfillment of their rights and obligations. Party members in the college are no exception. Each party member not only has its own development vision, but also requires organizations to help them achieve the needs of individual value. Applying the incentive mechanism to the party building assessment in colleges and universities is advantageous for the basic Party organization to pay attention to the individual needs of the party members in the practical work.

2.2 Stimulate work vitality of the basic party members and workers

The psychological factors that affect a person's work efficiency include two aspects: ability and aspiration. The former is the foundation, the latter is the key. Under the condition of certain capacity, the work efficiency is determined by the individual's work aspiration. From the perspective of organization, the work aspiration of individuals is the work motivation stimulated by the policy system, which is derived from the construction and implementation of the incentive mechanism.

University is a place where intellectuals gather. The personal ability of the basic party members, especially the knowledge, experience and intelligence level are generally higher. Thus, the core elements affecting the work efficiency is in fact the work willingness and enthusiasm. From this sense, construction and implementation of incentive effect of the basic Party building assessment system is the key to stimulate the party personnel work willingness and enthusiasm.

2.3 Innovative work methods in basic party building

Lacking of innovation is a common problem in the construction of basic party construction in colleges and universities. The political study and democratic life meeting of many basic organizations almost become formalistic. The reasons for the deficiency and weakening of the party construction work are as follows: firstly, it is not noticed the importance on the ideological level. Secondly, the innovation of the work method is not enough on the operation level. The lack of innovation is not because of the special nature of the party construction work in colleges and universities, but because of the lack of incentives mechanism to encourage innovation. Therefore, the construction and implementation of the evaluation system of party building can really promote the methods reform and innovation to build the basic Party organization.

2.4 Promote the performance of Party Building

The level of the basic party construction work in the performance is not only affected by individual performance level, is also subject to the consistency of personal goals and basic organization goals. An important feature of the evaluation work is to form a harmonious and unified relationship between the individual goals of the grass-roots party building work and the party's basic organization. The construction of the consistency between individual goal and organization goal is the key to improve the performance of the party construction in colleges and universities. Therefore, considering the use of incentive mechanism will be helpful to improve the work performance of the grass-roots party construction in colleges and universities.

3 Construction of the Evaluation System of the Party Building in Colleges and

Universities Based on the Lawler-Potter Theory

3.1 Motivation and motivation theory

Motivation in management is to use the scientific means to stimulate people's inner potential, so that it can make full play to the enthusiasm, initiative and creativity. In the activities of the organization, managers use the elements of various internal and external environment, so that the managers can produce a kind of inner enthusiasm for achieving the organization's goal. The motivation theory is a summary of how to meet the needs of people, and to mobilize the enthusiasm of the people. In order to give full play to the human intelligence effect, and make the greatest achievements. The purpose of the incentive is inspiring people's correct behavior motivation, and mobilizing people's enthusiasm and creativity.

The theory of motivation includes four categories: content based incentive theory, process incentive theory, behavior modification incentive theory and comprehensive incentive theory. Lawler-Potter's theory of comprehensive motivation is an incentive theory, which is proposed by the American behavioral scientist, Lyman Porter and Edward Lawler. They put forward Comprehensive incentive model in 1968. This model is: (1)the incentive makes a person work hard and the extent of their efforts. (2)the actual performance of the work depends on the size of the capacity, the effort level, and the depth of the understanding of the tasks. (3)the award shall be based on the performance of the premise. (4)the rewards and punishments are satisfied depends on whether the reward is fair or not.

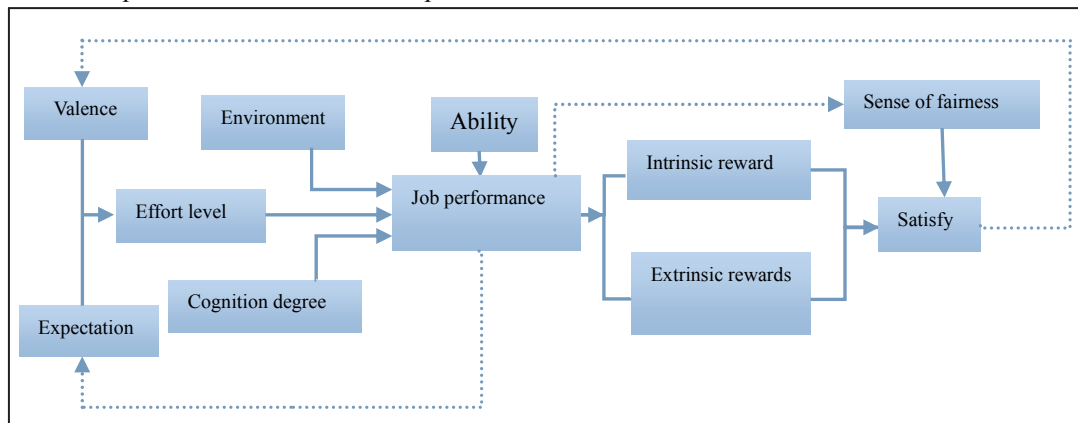

Figure 2 Lawler-Potter Comprehensive Incentive Model

3.2 The application of the comprehensive theory of Lawler-Potter to the party building in colleges and universities

Firstly, the Lawler-Porter theory believes that excitation leads to a person whether the degree of efforts and the efforts. In addition, work and actual performance are determined in ability, effort level and the depth of understanding the task. Therefore, the construction and evaluation of the system should be not only paid attention to, but also finding the problems in the process of evaluation. Party organizations can use the core political position to improve staff capacity of basic party through seminars, training, etc., improving the employee's actual performance through a clear job responsibilities and direction.

Secondly, the Lawler-Porter theory believes that the reward should be on the premise of performance. It is wrong that award after the performance. Therefore, the basic party building assessment focus on the evaluation results that combined with incentives. It can take the evaluation stage for assessment of advanced grassroots organizations and party members to give appropriate spiritual and material rewards.

Thirdly, Lawler-Potter comprehensive incentive theory thinks that the rewards and punishments are satisfied depends on whether the reward is fair or not. The basic idea is that when a man has made his achievements and has been paid, he is not only concerned with the absolute amount of his reward, but also the relative amount of his income. Therefore, the evaluation of the basic party organizations in colleges and universities should pay attention to the evaluation of the results of the publicity. Create a fair, just and open environment to ensure that the assessment of standardized and transparent.

3.3 The construction of the evaluation system of the party building in colleges and universities

Firstly, use the Lawler-Potter comprehensive incentive model as a guide to determine assessment principles scientifically and reasonably. One is guiding principle. It must be conformed to the essential

characteristics and the goals of party building and ideological and political education work. Two is testability principle. Each index in the evaluation system should reflect the individual independence and the concrete. Three is comparable principle. The evaluation index is determined to have a horizontal comparability. It is not only to consider the special nature of party organizations, but also to consider the reflection of the common things between them. Four is overall principle. The weight distribution of the evaluation index should reflect the comprehensiveness, the nature and function of the different options should be given different weights.

Secondly, take “key performance index method” as the theoretical reference and scientific criterion to establish evaluation index. As the theoretical reference, “key performance index method” is consistent with “rewards based on performance” in Lawler-Potter comprehensive incentive. The design of evaluation index system is divided into three steps: one is decomposition of the target of party building. Take the development of the college, the role of the party committee, the construction of the college team and the construction of cadres, the construction of grass-roots party branch and the role play, ideological and political work as the main project. Two is defining the work target of each subject. Then list key performance evaluation two indicators as the basis for quantitative analysis of party building work assessment. Three is identifying the role of each indicator or the role of the basis points, then list the key performance evaluation elements of the performance evaluation.

Thirdly, use “the analytic hierarchy process” as the theoretical reference to determine the weight of the indicators scientifically and reasonably. We can make a quantitative analysis and optimization of the evaluation index system of the grass-roots party building work by using the core idea and method of the analytic hierarchy process. Taking the party building assessment index system of the two grade school as an example, the structure model of the index management hierarchy analysis is established by dividing the mutual relation. Then, calculate the weight of the key performance indicators and the indicators of the index score according to the level of analysis combined with the overall score of two college party building evaluation index system. Take the form of the index system to be presented after the core elements of the evaluation index system are determined.

4 Conclusion

In summary, it is an effective way to establish the system and mechanism of scientific evaluation system to make full use of party organizations in the construction of high level university. And the incentive mechanism which is applied to the grass-roots party building assessment work has enhanced the cohesion and combat effectiveness of grassroots party organizations, stimulate grass-roots party workers and members of the creative, innovative grass-roots party building work methods, improve the grass-roots party construction work performance and other practical significance. This paper use Lawler-Porter model as a guide, determine the evaluation principle scientifically and reasonably from the perspective of incentive theory proposed. Take “key performance index method” as theoretical reference to establish evaluation index. Use “analytic hierarchy process” as the theoretical reference to determine the construction method of the index.

Dynamic Pattern of Figure/Ground in Chinese Classic Poems and Style Translation

Zhu Feifei

School of Foreign Language, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 912673760@163.com)

Abstract: In Cognitive Poetics, background and figure are not static concept, but a transformable equilibrium process. The thesis employs it as theoretical framework to study the dynamic pattern of background/figure in Chinese Classic Poems and proposes that montage, overplay and advance are three typical patterns to guide readers’ aesthetic attention to move in different paths so that resonance can be triggered. Along the transformable process, the thesis finds that study on dynamic patterns can also help the translators to maintain the style of Chinese classic poems and transfer it to readers effectively.

Key words: Figure/Ground; Style translation; Collage; Overplay; Progression

1 Introduction

Figure/ground, originated from Gestalt Psychology, is an important concept in cognitive linguistics. Figure refers to the prominent part in the perception, namely focus of the attention while ground is set by contrast to highlight the figure. Peter Stockwell is rising in the end of the 20th century as the leader of Cognitive Poetics, who tried to apply the cognitive linguistic theory, including figure/ground theory, into literature criticism, so that a new kind of linguistic tool was provided for the poetic study. Cognitive Poetics is promising but in its infancy, and Chinese academicians like to expound it from linguistic perspective instead of aesthetics. In 2009, Stockwell published his second book ‘Texture—A cognitive Aesthetics of Reading’, which typically objected to the traditional dichotomy that views figure/ground as a polar category by proposing figure/ground is a cline of prominence, ranging through degrees of foregrounding into vague, undifferentiated but rich background. Reader’s attention will experience the focus, engagement, fading and extinction with the figure/ground scale, which also represents a cline of resonance, with striking intensity at one end, and decay or echo tailing off into a rich sense of textual resonance towards the other. (seen Figure 1) Scholars in literature have been using impressionistic description for style and resonance for lack of objective method, and now this figure/ground cline mode can provide an workable framework for literary perception.

Figure 1 Cline of Resonance

Two insufficient points in Stockwell’s study are that he only provided a cline mode without specifically demonstrating how figure/ground changes in the texture, and that he just proclaimed the figure/ground cline can affect aesthetic attention without clearly explaining how it happens. Chinese classical poems, being short, rich in context and aesthetic implication, are the typical corpus for cognitive poetics. The style of Chinese poems, like combining emotion with scenery and integrating picture and poem, are said to be only sensed by insight instead of being explained or translated. Since the figure/ground cline mode makes it possible, this thesis will employ the mode as the basic theoretical framework to study different patterns of figure/ground transfer in Chinese poems, the way this transfer affects aesthetic perception and how it can be used for style translation.

2 Figure/Ground Dynamic Patterns

This part will use classical Chinese poetry as examples to explore difference dynamic patterns of figure/ground transfer and further explain reader’s aesthetic perception to the stylish integration of poem and picture.

2.1 Pattern of Collage

Chinese poems often change the scene at every step in the context. The view will be focused and amplified one by one, then gradually fading, reduced to be part of the ground, collaged with other patches to compose a whole picture. Reader’s aesthetic emotion will be intensified in every focus, then

echos with low frequency in the perception domain, and finally resonance happens when all the emotional vector vibrates in the same direction. The process can be formulated as: $f(a)+f(b)>f(a+b)$.

'Autumn Thoughts' (Ma Zhiyuan) is praised in China as the best short lyric of Yuan Dynasty. 'Dry vine, old tree, crows at dusk./Low bridge, stream running, cottages./Ancient road, west wind, lean nag./The sun westering. /And one with breaking heart at the skys' edge.' (Translated by Schleppe) In the perspective of figure/ground, this short lyric has four patches of scene, ten objects and one person, pieced with each other to be a desolate and primitive landscape. The figure of 'crow' with the ground of 'dry vine, old tree and dust' will be moved out of focus, by the shift of attention, to be part of the background with emotional vibration of low frequency. Now the figure of 'cottage' and the ground of 'low bridge, stream' occupy the focus and then fade into background to patch with the first piece, making the emotional echos louder. The third scene comes to the focus with 'lean nag' as figure and 'ancient road, west wind' as the ground and then blocks into the background, to strength the echo once more, and leave the focus to the forth scene. When the man with broken heart at the skys' edge moves into the cognitive domain, the whole picture is completed. As the boundaries between different patches are blurred, the top-down cognitive process is opened so that the pain of homesickness and loneliness can be sensed and aesthetic pleasure comes to the top.

Besides the short lyric analyzed above, there are lots of other poems employing the pattern of collage to sketch the mental picture, such as 'Made in dream'(Ouyang Xiu), 'Four seasons'(Tao Yuanming), 'Joy in countryside'(Wang Wei) and so on. From the Gestalt psychology, the gestalt effect is the capability of our brain to generate whole forms, particularly with respect to the visual recognition of global figures instead of just collections of simpler and unrelated elements. This common cognitive ability makes it possible for people to regenerate the global view by jointing different images in Chinese poems.

2.2 Pattern of Overlay

The second pattern often found in classical Chinese poems is the overlay. The aesthetic attention is firstly dragged to sketch the ground, on which the figure is overlaid then by shifting the focus. Finally, the boundary disappears and the global view is finished. The holistic vision is greater than just adding different parts together, that is $f(a+b)>f(a)+f(b)$. The surplus is actually the wonderful artistic state of the Chinese poem.

Take 'Fishing in Snow', a poem of Liu Zongyuan as an example. The first two lines, 'From hill to hill no bird in flight, from path to path no man in sight' (translated by Xu Yuanchong), depict the mountain ridges with thousands of paths but no bird and man. Different images are matched to compose an expansive mountainous landscape, which is muted by heavy snow. Concerning the last two lines, 'A straw-cloak'd man in a boat, lo! Fishing on river clad in snow', the ground is the snow-covered river and the figure is the old and lonely fisherman. From Gestalt theory, the general cognitive ability can make human beings employ unified method to perceive things as an entirety instead of separate units. So, the ground described before will be pieced with each other as the first pattern of collage described, then the figure 'the old and lonely fisherman' is overlaid on the grand ground. This is actually the 'bottom-up' process, in which images are blurred into the ground, then pieces of ground are collaged to form a grand ground, last the figure is overlaid on the ground, so that a perceptual field of snow-covered mountainous landscape comes into being and readers can feel cold, calm and lonely. When the old fisherman moves into the ground and is highlighted as a figure, readers will automatically open the 'top-down' process by inference, such as 'why does the old fisherman fish in such a freezing day? What does the writer imply by describing the scene?'. After being shaped and collaged, the snow landscape is extended to imply solitude, purity and loneliness in the aesthetic category. The old fisherman fishing in the freezing day indicates a kind of noble and unsullied spirit with pride, principles, and firmness. It is the artistic connotation hidden in the painting drawn by words. Overlay pattern of Figure/ground can help the readers operate the top-down cognition and comprehend the style and aesthetic connotation.

Other typical examples with the pattern of overlay are 'Night Mooring by Maple Bridge'(Zhang Ji), 'On the Stork Tower'(Wang Zhihuan), 'At an Old Palace' (Yuan Zhen) and so on. The pattern of overlay conforming to the cognitive principles can help readers to compose the prospect in the consciousness and taste the tension between picture and text in the classic poems.

2.3 Pattern of Progression

Another pattern of figure/ground is progression, namely a new figure/ground zooms in to push the old figure/ground away from the focus and stay zoomed out in background, echoing the progression. Finally the polyphony will produce the resonance, so the aesthetic feeling rise to the best. The pattern can be formulated as 'replace $f(b)$ with $f(a) > f(b)$ '.

‘Coming Across Li Guinian in Jiangnan’ (Du Fu) is called the best of Du’s poems for its implicative and deep meaning. ‘At the palatial residence we often met, In Courtier’s Hall for many times I heard you sing. The south with flowers is no longer sweet. We chance to meet again in parting spring.’ The first line begins the picture in Qi’s Palace while the figure is a scene that the writer came across Li Guinian. The second line replaces the first picture with the same structure of composition that is a meeting of two friends in Courtier’s Hall. Sorting out the progression pattern, that a new prospect progresses to replace an old prospect, can help the foreign readers understand the intextuality and parallelism. Singing and dancing in the magnificent palace indicate the splendor and prosperity of Tang Dynasty. Du Fu, the writer, who was young and ambitious at that time met Li Guinian who was a young and talented musician, too. The composition of figure/ground is assigned the emotional parameters which means affluence, proud and prosperity. Afterwards, the last two lines advance and push the former picture out of the focus by shifting the time and space to the southern China fourteen years later. A ground that all flowers wither in autumn is depicted in the third line is overlaid with a figure of another meeting fourteen years later in the last line. The falling leaves and withering flowers, plus the homeless and aged friends, convey a kind of sentiment, helplessness and sadness. The poem uses the pattern of progression to push forward three prospects and drive the readers’ attention to finish the bottom-up processing and open the top-down operation. Readers’ attention being suddenly shifted to fourteen years later makes them wonder what happened in these years. The answer is ‘the rebellion of An and Shi’ which shook the prosperous Tang Dynasty into a destitute state. Although no words about turmoil are used, the progression of figure/ground and shift of time and space can enlighten the readers to feel the voiceless weep and deep sorrow.

‘Thinking of My Brothers on Mountain; Climbing Day’(Wang Wei), ‘Seeing Xin Jian Off at Hibiscus Pavilion’(Wang Changlin) and ‘Leaving the White Emperor Town for Jiangling’ (Li Bai) are typical examples using the pattern of progression. The pattern can motivate readers to seek logical correlation automatically, adjust the emotional vector to the same direction and trigger the aesthetic resonance.

3 Dynamic Pattern and Style Translation

The ‘integration of painting and poem’ is the accepted style of classic Chinese poems. But style translation seems to be unworkable or even untranslatable because style is usually regarded as the implication not expressed in words. Otherwise, in cognitive linguistics, the stylish implication is a kind of construal, which refers to man’s ability to understand and describe the same situation from different aspects. Specificity, focus, salience and perspective are four factors of cognition, leading to different construal of the language. Figure/ground can embrace the four factors to describe the prospect in the poem, to find the cognitive relevance between the language and its user and to depict how the style could be recognized and translated in the effective way. The three dynamic patterns of figure/ground, which illustrate the aesthetic mechanism how the style could be recognized in the discourse, can provide a feasible theoretical framework for style translation.

‘Fishing in Snow’ (Liu Zongyuan) is the famous classic poem, handed down hundreds of years ago. More than ten translations can be found according to the literary research. If the dynamic patterns of figure/ground were used to analyze, the way how to effectively translate the style of ‘integration of painting and poem’ could be expected. By comparing different translations of the first two lines, three kinds of methods can be found. The first kind of translation sets ‘not a bird’ and ‘not a man’ as the theme, such as ‘Not a bird o’er the hundreds of peaks, Not a man on the thousands of trails.’ The theme ‘bird’ and ‘man’, as the starting point of the information in the sentence, will be misunderstood as the figure because attention would be firstly focused on the theme. ‘mountains’ and ‘paths’ not highlighted to be the figure are not conducive to the collage of snow-covered landscape, so that it does no help to the construal of stylish implication which means a spacious and perpetual wild land. The second kind of translation uses different structures. For example: ‘O’er mountains and mountains no bird is on the wing; On thousand lines of the path ways there’s no footprint.’ The interpretation will make the readers very hard to recognize the whole ground and form the integrated prospect because human’s cognitive ability is much easier to combine separate objects of similar shapes as a whole according to Gestalt theory. This kind of translation blocks the construal and fails to trigger the aesthetic resonance. The third translation has the reasonable arrangement of figure/ground and uses parallel structure. For example: ‘From hill to hill no bird in flight, From path to path no man in sight.’ The translation uses the static nouns to firstly focus on the ‘Hills and paths’ as the figure, then drags the attention to ‘no bird and no man’ in the end of

sentence. In this way a prospect of soundless mountains covered with heavy snow is completed. Parallel structure used by Xu Yuanchong to translate the first two sentences makes readers easier to identify the patches of ground and piece them together to make out the entire picture so that the emotional vector can vibrate in the same direction to motivate the resonance. Besides Xu Yuanchong, Bynner and Wu Jingxiong employed the similar structure to translate the first two lines. The same cognitive strategy can also be used to compare the last two sentences translated by Mr. Xu and Bynner. (see Table 1).

Table 1 Comparison of Translations

Title	Fishing in Snow	River - Snow
Translator	Xu Yuanchong	Bynner
1 st line	From hill to hill no bird in flight,	A hundred mountains and no bird,
2 nd line	From path to path no man in sight.	A thousand paths without a footprint.
3 rd line	A straw-cloak'd man in a boat, lo!	A little boat, a bamboo cloak,
4 th line	Fishing on river clad in snow.	An old man fishing in the cold river-snow.

Although Bynner's translation is succinct, the images 'little boat' and 'bamboo cloak' which are juxtaposed directly can be mistakenly understood that the bamboo cloak is just put on the boat instead of the old fisherman with the bamboo cloak. The strategy of juxtaposition negatively affects the reader because it is against human's cognitive ability. On the contrary, Xu's work accords to the reader's cognition with 'in' to indicate the spatial relation. Furthermore, the phrase 'in the boat' correlated the former part with the familiar structure helps the reader to overlay the old fisherman as the figure on the grand ground to complete the prospect. When 'fishing on river clad in snow' is finally interpreted, the boundary between figure and ground is blurred to finish a whole picture in reader's mind while the top-down process is operated and the stylish connotation was sensed. The construal of the style; 'integration of poem and painting'; can be effectively transplanted to the reader by reference to the dynamic patterns of figure and ground.

'Integration of poem and painting', one typical style of Chinese classic poems can be effectively presented by the dynamic pattern of figure/ground. If translation employed the right dynamic pattern of figure/ground (such as collage, overlay and progression) to construct the prospect, it would be beneficial to transplant the implicative and transcendental sense of tableau and to make the readers experience the tension of texture. The construal conforming to cognitive principles can facilitate the vibration of emotion in the cognitive field, trigger the top-down processing and ascend the image perception to the aesthetic resonance.

4 Conclusion

The traditional dichotomy of figure and ground puts the emphasis on how to distinguish them, which limits the study within the category of sentence. The dynamic pattern proposed by Peter Stockwell illustrates how the texture is perceived and expands it to the discourse study, and he also put forwards a workable framework to analyze the literary resonance. In view of Stockwell's study, this study specifies three dynamic patterns of figure/ground and utilizes it to explain the stylish integration of poem and painting in Chinese classic poems. Collage, overlay and progression are the typical patterns, each of which can exist in the poem by itself or coexist with others. With reference to the dynamic patterns, translators can help the readers to compose a mental prospect by jointing the ground, overlaying the images, shifting the perspective, highlighting the focus and other cognitive strategies. Changing the prospect with different patterns can drag the aesthetic attention from focus to engagement, from fade to extinction. The emotional vector of the reader is adjusted constantly to gather the momentum and perceive the style until the aesthetic resonance occurs

Abstract: Task-based teaching is more often studied theoretically and its adoption is more confined to Basic English teaching. This paper studies the application of task-based strategy in Advanced English teaching with examples based on real pedagogical practices of this course. The teaching practices reveal that compared with traditional teaching method, task-based teaching strategy can stimulate students' interest and motivation, improve their comprehensive abilities and is a more effective teaching method.

Key words: Task-based strategy; Advanced English; English teaching; Constructivism

1 Introduction

Task-based teaching is one of the most widely-used teaching methods both abroad and in China. However, the present situation is that much more attention is paid to its theoretical study and application in primary and middle school teaching, college English classroom, and Basic English teaching. Its adoption in the teaching for English majors, especially in Advanced English is quite inadequate. Therefore, the article attempts to study its application in Advanced English teaching.

2 Present Situation of Advanced English Teaching

Advanced English is a compulsory course set for junior and senior English majors. According to the latest "Syllabus of English majors" revised by the ministry of education in 2000, "Advanced English is a course designed to cultivate students' comprehensive abilities. By learning this course, students are expected to broaden their horizons, deepen their understanding of life and society, and develop their analytical, logic and independent-thinking abilities."

However, the problem in the present Advanced English teaching is that the dominant teaching method is still the traditional grammar-translation teaching method, in which teachers explain the texts and students receive large amount of input and conduct repeated practices. Its disadvantages include that more time is spent in "analysis" instead of "reading", and the cultivation of students' comprehensive abilities has been ignored. Besides, due to limited time and large amount of language phenomena, the problems that are really solved are far from being enough. Therefore, this article aims to apply task-based teaching strategy in Advanced English course so as to improve its teaching effects.

3 Task-based Teaching and Its Rationale

Task-based teaching was first put forward by N.S.Prabhu in the 1980s. It is characterized by the application of a series of specific tasks to stimulate students' motivation and activity in learning. As a "student-based" teaching model, it originates from constructivism.

According to constructivism, learning, as a social cooperative activity, cannot be taught; knowledge, instead of imparted by others, is constructed through interaction with others. It is thus important to take into consideration the background and culture of the learner throughout the learning process, as this background also helps shape the knowledge and truth that the learner creates, discovers and attains in the learning process. During this learning process, teachers are instructors and facilitators, providing guidelines and creating the environment for the learner to arrive at his or her conclusions.

Task-based teaching comes from the teaching and learning theory of constructivism. Through task-based teaching, students can activate their past experience, understand the present problem better, and generate their own appreciation and ideas through analysis and inference. Through solving tasks, students can acquire knowledge, learn to solve practical problems and develop their self-study abilities.

4 Application of Task-based Teaching in Advanced English

As a compulsory course for English majors, Advanced English aims to widen students' horizon through reading and analyzing articles about different contents and with different styles. Students are expected to cultivate their comprehensive abilities by learning this course. In order to achieve the

above-mentioned objectives, teachers should first select typical passages and design their lessons according to the stylistic features, themes and writing techniques of each passage. Then they should assign inspirational tasks. Students are required to analyze and solve the tasks through searching relevant information and conducting group discussion. Finally they are expected to analyze and understand the passage from different perspectives.

During this process, teachers remain task designers, instructors and facilitators. They will not dominate the class by lecturing and explaining the text for most of the time. Instead, students have become the core of the class and they can achieve the objective of “learning by doing”.

Next, I would like to take Unit Four of *A New English Course* (third edition) to illustrate how task-based teaching method is carried out.

The text in this unit is entitled “A Red Light for Scofflaws” written by Frank Trippet, an American journalist and freelance writer. The article appeared in the *Time* magazine in 1983 and is about the social phenomenon of scofflaws. The author first enumerates different scofflaws in America, their dangers and one specific scofflaw, red-light running, and then he goes into depth by stating the influence of scofflaws on American morals and claiming that scofflawry spirit has become the cause of Americans’ social demoralization.

If the text is approached with the traditional grammar-translation teaching method, then most time will be spent in the explanation of words and phrases, analysis of text structures, development of the theme and so on. Teachers are the center of the whole process; students are the passive receiver of large amount of input. Too much attention has been paid to teachers’ lecturing, little attention is paid to students’ summary of the past experience, integration and application of the old and new knowledge. The cultivation of students’ abilities to analyze problems and put out what they have learnt is largely ignored.

The adoption of task-based strategy can solve the above problems, because it can not only improve students’ ability to put out what they have learnt, but also cultivate their abilities to self-study, analyze and solve practical problems.

As far as the text is concerned, the following procedures can be taken.

The first step is that the teacher designs some tasks concerning the passage to learn in advance. Each task deals with one aspect of the passage, thus the learning process will be purpose-oriented.

According to the teaching objectives and overall planning, three major tasks can be designed concerning the passage. They are as follows.

Task One concerns with features in language, structure and writing techniques etc. What are the features of words (e.g. compound words and features)? How is the text organized? What are the writing techniques in the text? In order to answer these questions, students need to review relevant knowledge and apply it to the analysis of this passage.

Task Two pertains to the main contents and its social meaning. It requires students to analyze the theme conveyed in the passage according to the social context, and know how the author achieves his conclusion with different materials. In order to fulfill this task, students need to research and study large amount of relevant information. For example, they should know quite well the American social background at that time, the common scofflawry behaviors and their influence on society. They should search some background information, such as American law system, traffic regulations in different states of America, Prohibition in American history and so on. They need to use the information they have searched to understand why the author says that scofflawry spirit has become the cause of Americans’ social demoralization.

Task Three is an expanding task deriving from the text contents. It is based on the previous two tasks. Only when students realize that what they have learnt is related to the reality and beneficial to the future development, can they generate strong motivation. Due to students’ different backgrounds and levels, the solutions to this task are quite individual.

After the three tasks are specified, the teacher should design more specific questions related to each task. The questions should be in the order of easiness to difficulty, so that students explore them step by step. As far as the passage is concerned, the first two tasks are basic ones, and students can solve them through searching relevant information and analyzing the text, while the third task is a more challenging one, and they need to relate what they have learnt to the reality, reflect on a realistic problem, and form their own ideas.

The second step is that the teacher divides the whole class into several groups, with three to four students in each group, assign each group a task and provide guidance to each group.

The third step is that the teacher organizes students to have oral reports. All the group members

should answer questions from the teacher and other students. After that, the teacher makes some comments on their performance, and requires each group to hand in an improved plan.

According to the passage “A Red Light for Scofflaws”, some reference questions are listed in the following table concerning the above three tasks. All these questions are for the service of specific teaching aims, and suggestions and assessment methods are also provided. It should be stated that more challenging tasks can be designed according to the students’ real performance.

Table 1 Tasks Concerning Features on Language, Text Structure and Writing Techniques

Questions	1. What are the types and features of English compound words? Use examples to illustrate them.
	2. How is the passage organized? How is it related to its style?
	3. How does the author’s diction serve the theme of the text?
	4. What are the writing techniques of the text?
Approaches	1. Students need to review the formation of English words, compound words in particular. They should use the principles of word formation to analyze compound words in the text and provide more examples.
	2. Students should know the structure features of the text with the same style.
	3. Students should select all the words that can well serve the theme of the text to illustrate how the diction serves the theme.
	4. Students should know the writing techniques adopted in the text.
Suggestions	Each group review what they have learnt and search relevant information and apply them into the analysis of the passage.
Assessment	Each group gives an oral report. The teacher and other students ask questions and give advice for further improvement.

Table 2 Tasks Concerning the Content of the Passage and Its Social Meaning

Questions	1. What are the different forms of scofflaws in America? Which is the most flagrant one?
	2. In most Americans’ opinion, what threatens law-and-order? What is the author’s opinion and why?
	3. Why scofflawry spirit leads to Americans’ social demoralization?
Approaches	1. Students should know all the forms of scofflaws and their influence on society.
	2. Students should know the American law system, social phenomenon of scofflaws, the detriment of scofflaws to the social order and law system.
	3. Students should analyze the relation between scofflawry spirit and Americans’ social demoralization.
Suggestions	Each group review what they have learnt and search relevant information and apply them into the analysis of the passage.
Assessment	Each group gives an oral report. The teacher and other students ask questions and give advice for further improvement.

Table 3 Expanding Tasks

Questions	1. How about scofflawry in China (forms, dangers and reasons)?
	2. Talk about the traditional Chinese merits, the changes of scofflaws and solutions to solve this social problem.
Approaches	1. Students need to use examples to illustrate scofflaws in China.
	2. Students need to review traditional Chinese merits, changes of scofflaws from historical perspective and give some feasible solutions according to the present situation.
Suggestions	Each group review what they have learnt, search relevant information, have group discussion and make summaries.
Assessment	Each student hand in a composition entitled “Scofflawry in China”

The whole teaching arrangement can be finished within six to eight periods of class, and it can be adjusted according to the students’ different conditions.

In the first time, the teacher divides the whole class, specifies tasks for each group, provides some suggestions for them and makes clear the assessment method.

In the second time, each group gives oral report concerning language and structure of the text. The teacher and other students point out some problems and raise some questions according to their report and evaluate whether the objectives are achieved.

In the third time, each group gives oral report on the content of the passage. The teacher and other

students point out the problems and raise some questions and evaluate whether the objectives are achieved.

In the fourth time, the teacher makes a summary of the previous two reports, explains further the points that are not covered and specifies requirements of the expanding tasks.

It has been proved that students' participation in class activities is obviously enhanced under this teaching model. And they also realize that they need to pay attention to all kinds of social problems while learning this course.

The above teaching arrangement is student-centered and the teacher is only an organizer, instructor and facilitator, which conforms with constructivism teaching and learning theory. Students review what they have learnt, acquire new knowledge, and solve practical problems through cooperation with their members and under the instruction of the teacher. Their activity is largely stimulated and their critical thinking is developed and enhanced.

5 Conclusion

Based on real pedagogical practices, the article studies the application of task-based strategy in Advanced English teaching and concludes that it is an effective method to improve teaching effects. However, since the application of task-based strategy in Advanced English teaching is still in the exploratory stage, there exist some problems and challenges. First of all, it brings great challenges to teachers. They should improve their professional abilities and levels so as to better manage and design each class. They should also be creative and adaptive to different situations when they adopt task-based teaching strategy. Secondly, more specific measures are to be taken so as to make sure each student is involved in the tasks after class. And appropriate teaching materials are to be carefully chosen so as to achieve the objectives better. In future, more studies and researches are to be done to explore better ways to implement this novel teaching strategy.

Abstract: Autonomy, as a multidisciplinary concept, has been widely investigated. Based on positive psychology, self-determination theory (SDT) asserts and has proved that autonomy is one of the fundamental psychological needs of human beings and considered to represent the ultimate form of self-regulation-- self-determination. However, could the word autonomy equal the Chinese word Zizhu (Chinese Pinyin, similarly hereinafter)? This study aimed to test the equality between autonomy and Zizhu by open-ended questionnaires conducted on 118 high school students and on-line expert rating. The results showed that, in the sample investigated, adolescences' understanding of autonomy were very similar to what self-determination theory asserts. The most representative words for autonomy in Chinese were Self-independence (Zili,), Self-choice (Zijixuanze), Self-determination (Ziwojueding) and so on. Therefore, the assumptions and findings proposed by SDT could also be applied to explore the relation of Chinese adolescents' autonomy and its function.

Key words: Autonomy; Conceptual analysis; Adolescents

1 Introduction

The word autonomy first appeared in Greece in early 17th century. There are similar definitions such as self-determination, independence, self-independence and self-control. The English word—autonomy came from a Greek word – *autonomia*, the noun form of *autonomos*. *Auto* means self while *nomos* refers to law. The literal meaning of *auto-nomos* is independent, living by one's own laws or one who gives oneself his own law¹. In Chinese, autonomy means *ZiZhu* (Chinese Pinyin, similarly hereinafter). *Zizhu* represents to be self-master, self-independent or to choose and decide one's own behavior or action, not affected by parents' or guardian's discipline and making decision from inner needs instead of outer stimuli (Wang, 1990), free from other's intervention, not rely on others and self-control (Zhu, 1982). According to the Contemporary Chinese Dictionary, *ZiZhu* means making one's own decision. Other dictionary definitions about *ZiZhu* include self-independence and making one's own mind, self-management and having the ability to be independent. Autonomy is often mentioned in classical and modern literatures meaning more similar to self-decision, self-governed and self-control². *Zizhu* is explained in text books referring to a moral concept meaning individual free will and a spiritual state with which one independently behaves according to one's own will and belief³.

It seems that the Chinese word *ZiZhu* is to some extent similar to the word Autonomy. However, comparing the words *ZiZhu* (autonomy), *DuLi* (independent) and *ZiLi* (self-independent), some researchers argued that the conception of *ZiLi* (self-independent) is much more adaptive to traditional Chinese culture. *Zili* appears earlier in Chinese books than *ZiZhu* (Xia, Huang, 2007). However, despite of those similarities and differences, supporters of self-determination theory claim that autonomy exists among the present cultures but only by degrees. The opponent opinions are that autonomy is a typical reflection of individualism which cannot be retested in collective cultures. In addition, autonomy is male-specific while the female have no need for it (Iyengar, DeVoe, 2003). Studies conducted by Xia and Huang (2008) showed that *Zili* (independence) instead of *ZiZhu* (autonomy) of Chinese students included interpersonal independence and individual independence showed as activity, responsibility, flexibility and openness, which is consistent with the characteristics of autonomy assumed by self-determination theory (SDT) such as independence (Deci, Ryan, 2000; Douvan, Adelson, 1966; Koestner, Gingras, Abutaa, Losier, 1999; Ryan, Deci, 2006) and responsibility (Anderson, Worthington, Anderson, Jennings, 1994).

The reason for those debates may be that autonomy can result in many positive outcomes of life in SDT research (Grolnick, Ryan, 1989; Vallerand, 1997). For example, contrasted with controlled atmosphere, autonomous learning condition predicted children's better conceptual learning (Grolnick,

¹ <http://www.etymonline.com/index.php?search=autonomy&searchmode=none>

² <http://www.zdic.net/cd/ci/6/ZdicE8Zdic87ZdicAA195150.htm>

³ <http://gongjushu.cnki.net/refbook/BasicSearch.aspx>

Ryan, 1989; Roth, et al., 2007). Supporting for children's autonomy could promote their psychological well-being (Ryan, 1995), positive feelings and interests for exploration (Roth et al., 2007). Therefore, to clarify the similarities and differences between Chinese and English perspective on autonomy would be very necessary concerning investigations and findings about it. Do ZiZhu and autonomy in SDT have the same connotation? If not, can findings about autonomy conducted based on SDT be applied among Chinese adolescents? How do they see autonomy or ZiZhu? What role does ZiZhu play in adolescents' lives?

2 Data and Methodology

2.1 Participants

118 students of Grade 2 from two high schools in Wuhan participated in this study among who were 43 male students, 71 female students and 4 didn't report gender. Open-ended questionnaires of nomination about autonomy were applied among those students.

2.2 Procedure

Data were collected in 2010 in one session at class. Students were asked to list synonyms of Zizhu (autonomy) on the questionnaire. They were required to discuss with nobody or look at others' answers. A trained psychological major and an assistant were at class for questions and help. Then based on the keywords about autonomy nominated by those students, 17 words such as self-determination, self-control, initiative, self-regulation, self-governance, self-independence, separation and subjectivity were selected to form a list. A week later, the same participants were asked to rate the similarities between those synonyms and autonomy. Those 17 nominated words were randomly arranged on the list to balance the order effect. Synonym list was made as on-line questionnaire to ask psychology-majored graduate students to evaluate those which could represent autonomy most with 1-2 words, in order to see if Zizhu and SDT's autonomy are the same in connotation. Frequency percentages were calculated between autonomy and its synonyms (see Tab. 3).

3 Results

According to the results from open-ended questionnaire, 57 words were screened out with 301 nominations (see Tab. 1). 9 words were nominated more than 9 times. Word like Youzhujian is similar to Zhujian so the two were combined one but nominated twice. Other words include self-control (3 nominated), self-decision (2), self-esteem (1), self-discipline (1), freedom (1) and so on. And for automatic behaviors, participants reported three main behaviors, the self-decided, the self-chosen (such as choose liberal arts or natural science), and those like being committed.

Table 1 Words Nominated in Open-ended Questionnaire

words	Frequency
1. Self-confidence(Zixin)	9
2. Strong-mindedness (Zhujian)	10 (+3)
3. Initiative (Zhudong)	10
4. Self-discipline(Zilv)	10
5. Freedom(Ziyou)	16
6. Self-improvement(Ziqiang)	24 (+2)
7. Self-consciousness(Zijue)	26
8. Independence (Duli)	60
9. Self-independence(Zili)	77

Considering participants' vocabulary limited by age, and perspective from SDT, the above-mentioned words were added two words (self-determination, in Chinese ziwojueding and autonomy, Zizhu) to be a list of 11 words. Online questionnaire was formed. 106 psychology-majored graduate students were asked to select 2 representative words from the 11 words. The results showed that autonomy (Zizhu) was nominated 35 times, self-confidence 34 times, independence 27, self-consciousness 26, self-determination 20, self-improvement 18, freedom 18 and self-reliance 18 times (see Tab. 2). It's a proof that autonomy (Zizhu) is a generalized conception, as SDT asserted, demonstrating the essence of individual's self-determination. Nevertheless, it's found that besides self-determination as essence, autonomy could also be partially characterized by self-confidence and self-consciousness. Self-consciousness in Modern Chinese dictionary means one knows something and

is positively to do something, which indicates that self-consciousness may represent being positively and actively self-reflective.

In the next week, according to the nominated vocabulary of autonomy and literature review, 8 psychology-majored graduates were invited to form a list of 17 words and were required to rate those 17 words by percentile ranking (see Tab. 3).

Table 2 Nominated Words and Frequency of Experts

Words	Frequency
1. Autonomy (Zizhu)	35
2. Self-confidence (Zixin)	34
3. Independence (Duli)	27
4. Self-determination (Ziwojueding)	20
5. Self-improvement (Ziqiang)	18
6. Freedom (Ziyou)	18
7. Self-independence (Zili)	18
8. Strong-mindedness (Zhujian)	17
9. Self-discipline (Zilv)	14
10. Initiative (Zhudong)	8
11. Self-consciousness (Zijue)	3

Table 3 Similarities Between Autonomy and Its Synonyms

	Mean	SD
1. Isolation (Tuoli)	0.202	0.243
2. Separation (Fenli)	0.271	0.237
3. Solitude (Duzi)	0.459	0.304
4. Freedom (Ziyou)	0.531	0.282
5. Self-acknowledgement (Ziworenke)	0.540	0.262
6. Individuality (Getixing)	0.575	0.265
7. Subjectivity (Zhutixing)	0.606	0.263
8. Self-reliance (Ziwoyilai)	0.641	0.252
9. Independence (Duli)	0.670	0.272
10. Self-regulation (Ziwotiaojie)	0.683	0.240
11. Initiative (Zhudongxing)	0.689	0.251
12. Self-reflection (Ziwofansi)	0.692	0.247
13. Self-governance (Ziwozhili)	0.712	0.226
14. Self-control (Ziwokongzhi)	0.726	0.213
15. Self-determination (Ziwojueding)	0.729	0.227
16. Self-choice (Zijixuanze)	0.741	0.204
17. Self-independence(Zili)	0.805	0.181

4 Conclusion

As shown in Tab. 1, compared with other words, dependence, self-regulation, initiative, self-reflection, self-governance, self-control, self-determination, self-decision and self-reliance were more representative for autonomy. Most researchers pointed out that autonomy means, to be one's own, self-dependent, self-chosen on one's action, apart from parents' or guardian's control (Wang, 1990). Autonomous one will be seniorly self-reflective (Dworkin, 1988; Taylor, 2005). In psychology, autonomy indicates self-governance, subjectivity (Deci & Ryan, 2002), self-regulation (Deci & Ryan, 1985) and self-independence (Xia & Huang, 2007). As shown in open-ended questionnaires, Zizhu (autonomy), self-confidence, independence and self-determination could largely overlap. In Tab. 3, self-determination/ self-decision, self-governance and self-control were correlated with Zizhu at 70 percent, which proves that the Chinese word Zizhu is the most similar word to autonomy or self-determination. The above-mentioned results of autonomy found in non-Chinese background were

also reliable in China.

SDT asserts and has proved that autonomy is one of the fundamental psychological needs of human beings and considered to represent the ultimate form of self-regulation-- self-determination which is assumed to predict optimal functioning in life. Autonomy also is considered one of the characteristics in the social progress of adolescences (Beyers et al., 2003). Future study may focus on adolescents' autonomy to help them more positively face challenges in socialization.

A Research on Big Data Prototype System for Monitoring College Students' Mental Health*

Zhang Jiaming, Rui Xiaoli

College of Information Engineering, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: zjiaming@whut.edu.cn, xlrui2015@163.com)

Abstract: With the rapid development of information and data technology, how to obtain and to processing data efficiently has attracted a lot of attention of the society. In the paper, we monitor college students' mental health by big data technology. To obtain the original data completely, web spider technology is adopted. Hadoop and Hbase are used to store data. To using text data mining techniques mining and analyze information efficiently, the repository and model base including massive data is built. The effective system could prevent college students' mental problem at the origin by monitoring and counseling college students' psychological health in a smart and personalized way. This paper has a significant value in realizing the theory of personalized counsel, emergency treatment and information processing technique.

Key words: Big data; Web spider; Hadoop; Text data mining; Mental health monitor

1 Introduction

In recent years, more college students tend to escape, self-harm, and even suicide or murder when they face to the problem of employment, schoolwork and relationships if they are suffering from sub health. Incidents like this would bring the students and their family unrecoverable harm and cause a serious chaos and unrest in the college so that other students can't live and learn as usual. It will also take a negative impact on the society. So it is urgent to concern and solve the college students' mental health problem.

At present, Mental Health Departments of school get the information about special student through their archives. Students' data information such as daily performance, communicate capacity and personalities is obtained from their classmates and parents. Students' individual information was recorded by Student Affair, Academic Management, Campus Cards Centre, such as complete basic information, scores, records or punishments in school, consumption through campus cards, book lending from school library. In addition, massive dynamic information about students' ideological trend, emotional volatility, friendship, employment can be found in microblog, WeChat, or post bar on the Internet. The original data from different area is a large scale of data stream which needs arrangement and analysis through big data analysis technique. The information filtered could reflect college students' mental health accurately which is beneficial to the work of mental health monitoring.

The popularity of big data has driven academia, industry and government to the passion of it. The journal "Nature" and "Science" posted the discussion on the chance and challenge of big data on after another(Meng Xiaofeng and Ci Xiang, 2013). China Computer Federation and China Institute of Communications has set their own big data committee which research on the science and engineering in big data area. Big data technique has been a focal point both in "the special programme of Chinese cloud technology development during the 12th Five-Year Plan" proposed by Ministry of Science and Technology and "the programme of Internet of Things during the Plan" proposed by the Ministry of Industry and Information Technology. Information processing technique was proposed as one of the four key technological innovation project in "the programme of Internet of Things during the Plan". The technique includes large amount of data storage, data mining, intelligent picture and video analysis technology which are all the important components of big data. The other three projects are information cognitive technology, information transportation technology and information society technology. Those are all closely related to big data.

College students are competing fiercely in this serious challenge with the development of economic and technology. Pressure results from employment, interpersonal relationship, emotion

* This paper was supported by the project of research based on Big Data college students psychological crisis warning and suicide prevention strategies of the 2015 Humanities and Social Sciences Research in Hubei Province Department of Education.(No. 15Z052)

out of control leads college students' mental health become a hot project. Other countries have a comparatively perfect system about college students' mental health as they concerned on the problem in advance. There still remains defect at some aspects though domestic academic circles have gotten some results in research of college students' mental health monitoring, for instance, suicide prevention. In fact, before monitoring students' mental health condition, scholars should have a quick respond on the massive information they gathered using information processing technique, then, interact with the students. But scholars focus on psychological health education as well as ideological and political education basic on traditional models so that neglect either society or individual is changing. What is also important but easy to ignore is individual subjectivity.

2 Design and Research on Mental Health System

2.1 System Design Objective

The main objective of the project is to implement the collection, storage, mining, analysis and verify those functions.

Collect public data on the Internet and analysis its integrity base on web spider technique. Then use text data mining to extract feature. We will also set up a knowledge analysis system which based on develop function authentication modules for strategy analysis, for instance, analysis about competitor, environment, users, etc.

Web spider could find ten thousands or even hundred thousand related links from one of them through recursive invocation within a few time. The text data from these links will be extracted and stored in local which offers a data basis for big data analysis.

The dramatic increase made it difficult to support traditional relational database. The distributed storage framework using Hadoop and Hbase in the system could solve the problem and improve system computing power to handle 1 or even 10 billion bytes data.

The text data collected is unstructured data which can be understood by human but not machine. So the text data mining technique will be used in the project to realize "machine reading" and "machine understanding" base on the knowledge pattern algorithm and programs. The structured knowledge base will lay the foundation for behavior analysis.

2.2 System Design Scheme

The system consists of collecting layer, storage layer, analysis layer and man-machine interface. The design scheme is shown as figure 1.

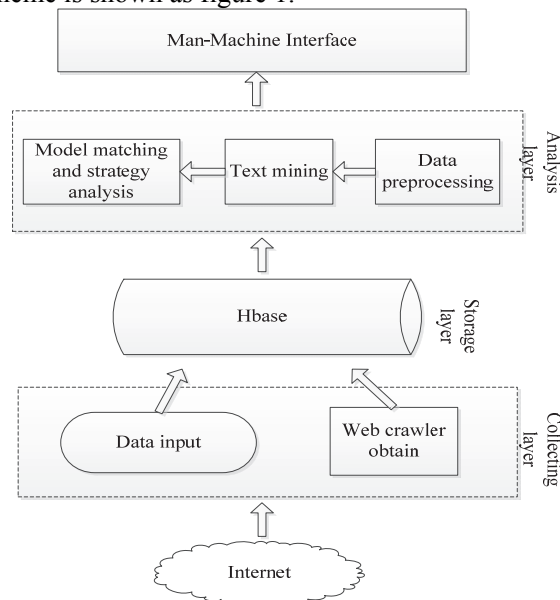

Figure 1 Total Framework Mental Health Monitor System

The collecting layer includes data input and web spider obtain. Web spider use search engine and data spider collect all the text information on the related website into database which could obtain text data about different kinds of keywords, then, store those text data in distributed database

according to the types of monitoring objects. Compared to traditional structured tabular data, big data analysis needs to handle a huge amount of data contains hundreds of thousands of unstructured text. In addition, the data acquired is all public data on the Internet.

The acquired data will be delivered to text mining module after being preprocessed like word segmentation, feature representation and extraction. Unlike structured tabular data, text information is natural language out of unified structure which is hardly understood without the necessary preprocessing before “machine reading”. In order to find the proper model, text mining extracts effective information about different monitored objects. Then the analysis result of the matched model chosen from database will be presented to users through Man-Machine Interface.

2.3 System Data Acquisition Scheme

2.3.1 Data Sources

The required data of the system mainly comes from two approaches, as figure 2 shows. One is the public data about social message got from microblog, circle of friends, post bar by web spider. The employment pressure will also be figured out through industry information. Web spider should penetrate into all fields as comprehensive as possible owing to the value public data has a variety sources and forms. The other one is the students’ external condition in school including scores, rewards, expense through campus card, attendance data. Students’ mental health could be evaluated considering their personality, mood, hobbies analyzed by the above data.

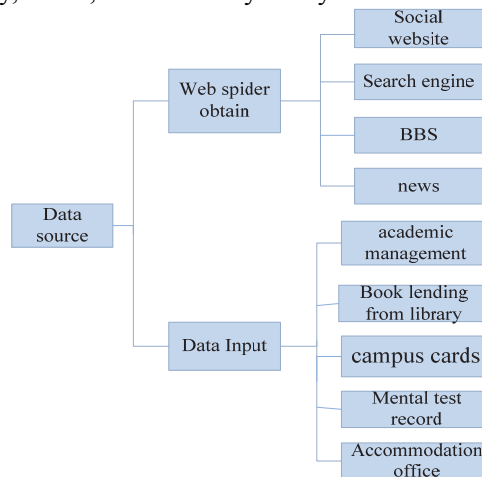

Figure 2 Data Source

2.3.2 Data Acquisition Methods

The system collect information like words, tables, pictures from webs by web spider. The operating principle is as figure 3 shows. The collected information is stored for data processing or analysis.

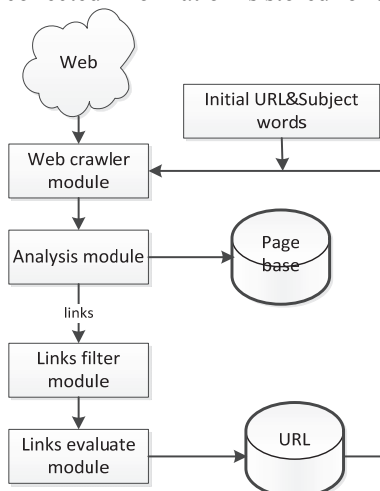

Figure 3 Operating Principle of Web Spider

Web spider(also called web robot) is the program or script which capture information from World Wide Web according to certain regulation. The spider is divided into two kinds, traditional spider and focused spider(Xiao Yi, Zhang Lin and Nie Xiaoyi, 2013). Compared to traditional spider, focused spider need to filter out links irrelevant to the theme as the rest will be put in the URL which is waiting for being captured. Then, it will choose next URL of page to capture following the certain search strategy and repeat the above process until the system fulfill the set condition. At the end, the data captured will be stored in system. The main spider tools are Lucene, Nutch, Heritrix, WebLech, Jspider.

To improve the efficiency of information obtained from social platforms, the system chooses the open source Nutch, based on Lucene. Nutch is a search engine open to JAVA which provides API for text indexing and search. Developer can obtain efficient data source and store them to local database conveniently by using API.

2.3.3 Data storage

The system is distributed storage model based on Hbase. As an important NoSQL storage in Hadoop, Hbase could be combined with distributed computing frame Map/Reduce of Hadoop perfectly to enhance efficiency of the data processing(Qin Xiongpai, Wang Huiju, Du Xiaoyong and Wang Shan, 2012). At the same time of having a large storage capacity, Hbase is also good at reading and write data within a small range of variation of both I/O and retardance. In addition, its column-oriented overcomes the extension difficulty of traditional database.

As the figure 4 shows, Hbase consists of Hbase Master host and several Hbase Region Servers(Feng Xiaopu, 2014). Every Region Server contains thousands of HRegions which having ten to hundreds of thousands HFiles in column. Master is responsible for ensure Region Server could offer an excellent service on data storage, compression, indexing by controlling the load of all Region Servers to a balance and handling faults. HRegions make up a database with billions of bytes in a head-to-tail chain.

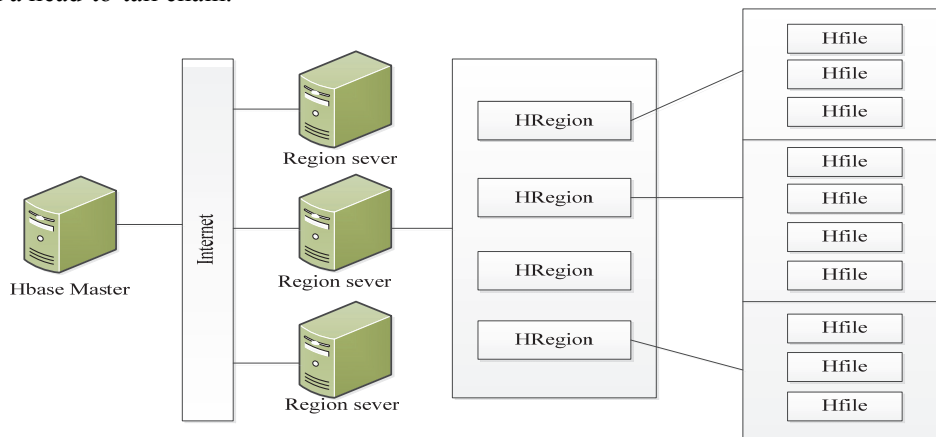

Figure 4 Hbase data Storage

2.4 Data Processing and Analysis Scheme

Text Mining technique is used to process and analyze data in the mental health monitor system. Text Mining is also called Text Data Mining, Knowledge Discovery in Texts. Potential text information is extracted from text library by Text Mining to establish model base and knowledge base(Yen-ChingChang, RichardTzong-HanTsai and Wen-LianHsu, 2010). The text data comes from documents or digital information on the Internet, including social web log, newspaper, e-mail and so on.

The model of text mining is shown as figure 5. Data should be cleansed before being analyzed. The cleansing progress includes checking consistency of the data, removing duplicate values, disposing invalid values and missing values, eliminating noisy data, and at last, expressing the text data in a structured form similar to relational data through feature representation and extraction. After preprocessing, the mental health monitoring knowledge and pattern will be extracted by data mining and pattern recognition. In the end, the result of the assessment according to target system

will be shown to users visible.

Text Mining technique is still in its initial stage because of its complicated techniques. It's important not only to focus on basic theory and system framework, but also to pay attention to Chinese itself when researching on Chinese text mining. Chinese text analysis technique is the premise of knowledge mining. Considering to the particularity of students' mental health analysis, the target of text mining should be formulated referring to index system of strategy analysis.

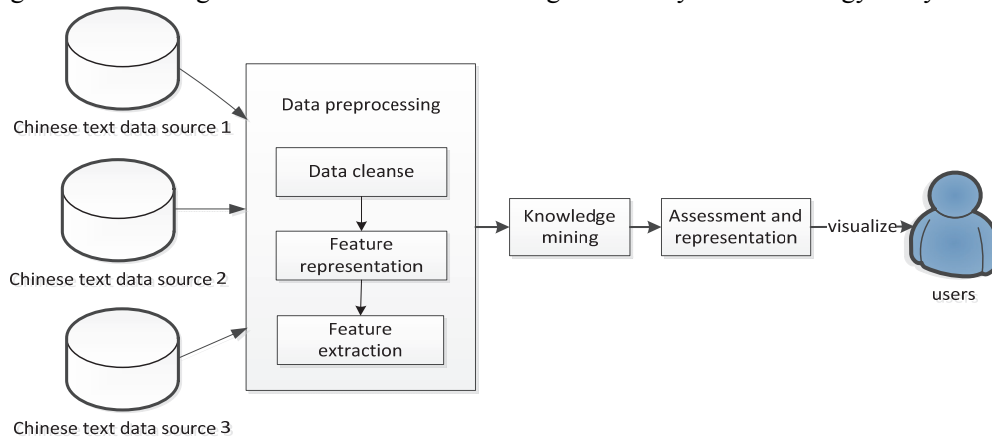

Figure 5 Chinese Text Mining Process

3 Function Module Design for Mental Health Monitor System

The strategy analysis module is designed to verify the function of big data analysis system serving students in this chapter. The system is made up by data acquisition, data processing, model matching and analysis which is implemented by requirements analysis, modeling, programming. Typical character is analyzed as an example to verify system function, feasibility and reliability of big data analysis. The example is used to describe how the public data transformed to knowledge for strategy analysis.

3.1 Data Acquisition

The data acquisition module of mental health monitor system use web spider to collect related data and text information on the Internet as comprehensive as possible. Students' external condition in school recorded by relevant departments is also be quoted, including scores, rewards, daily performance. Students' personality, hobbies reflected in those data will be a strong foundation for following analysis.

The data processing module analyses original data base on efficient arithmetic after feature extraction and representation by text mining. The typical model base and knowledge base is also established in this module which is useful for pattern matching. To ensure the accuracy of model analysis, the integrity and completeness must be paid more attention to when creating the model base.

College students' mental condition is monitored dynamically and the special case will be warned immediately in the model matching and analysis module. The advanced analysis of students' personality is helpful to emergency measures. Students of electronic information major are chosen to be examples in this system. Their information got from relevant departments or web spider is analyzed to get their real mental condition. The corresponding counseling plan is also provided by this system.

3.2 Breakthroughs of the Project

1) Establish a big data analysis system based on students' information. The system presents students' dynamic mental condition to counselors and provides advice for them by monitoring and analyzing students' various information

2) In the background of big data, we try to establish a mental health care system for students. The system provides corresponding plans about relieving, consulting, counseling for certain students who are under heavy pressure of learning or employment. The specific advice improves practicability which serves students in a better way.

4 Conclusion and Outlook

The system mainly adopts big data analysis technique and web spider to collect the public data on the website. The distributed Hbase storage structure and computing framework is established. Text mining technique is also applied to transform data into knowledge needed by upper analysis system. The designed system establishes model base and knowledge base of college students' mental health through collecting data, processing and analysis. Monitoring students' mental health is implemented by pattern recognition and analysis. In the end, the analysis of typical characters is taken as examples to prove feasibility of the system.

The Significance of Professionalism and Probity for the Teaching Professionals in Higher Education*

Zhu Min

the trade union Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 1030845901@qq.com)

Abstract: This paper insists on the position, viewpoint and method of the integrity culture, in order to study the moral construction of our country in an honest way. This paper firstly puts forward the clean from the connotation and the main content of teaching, expounds the connotation of the view of teachers' morality construction of colleges and universities in the construction of a harmonious society, puts forward that teachers clean from teaching is the new era anti-corruption construction in universities is a important task, to promote good social habits, create a delicate gas positive campus culture environment is crucial for.

Key words: Ideological and Political Education; Honest and Clean Culture, Probity Education; Inculpability; College Culture; Higher Education

1 Introduction

All the countries in the world, especially in some developed countries, attaches particular importance to the construction of professional ethics of teachers, has formed the distinctive and reflect the teachers general occupation of teachers' professional ethics, moral norms, the progressive development of systematic theory of teacher's professional ethics, and has achieved fruitful experience. America, Europe and other western countries attach great importance to teachers' professional ethics education, the content of teachers' morality into education, educational psychology, teaching method, school law and other disciplines and teaching practice Permeate in the school and the society of the daily moral education, pay attention to the development of the professional morals habit.

From the beginning of twentieth Century 80, the development of higher education has become a key link in the development of science and technology in China. The teachers' morality of university teachers plays an important role in the development of higher education in our country. Therefore, China began to carry out a new era of scientific and systematic research on Teachers' morality.

2 Connotation and Characteristics of Honest and Clean Teaching

Being honest and clean includes such connotations as probity, integrity, sense of public serving, sense of honor and shame, etc. It requires a man to be ingenuous and openhearted, to be frank and forthright, and to be honest and clear. Such values are actually the intrinsic code of ethics in the Chinese tradition regarding being a man. It was recorded in Chapter The Emperor's Lecture of the Book of the North Qi Dynasty that Yang Xi was highly regarded as the paragon of virtue and learning for others because he considered his moral integrity as his foremost important trait. Similar values could be frequently found in traditional Chinese literatures. For example, according to The Book of Rites, average people esteem the knowledge from scholars of dignity while scholars gain dignity, authority and respects from people by demonstrating gracious moral integrity. Therefore, the foremost premise in constructing an efficient teaching staff is to promote both moral integrity and professional competence, of which morality undoubtedly comes first. It is well known from Chinese sages that capacity is the source of virtues while virtues guide capacity. From this perspective, a man with both moral integrity and professional competence can be regarded as a Saint, a man with neither as a moron, and a man whose moral integrity surpasses his professional competence as a gentleman while the opposite as an immoral person.^[1]

3 The Practical Significance of Honest and Clean Teaching in Colleges and Universities

* This article is a progress report of "Research on Constructing Honest and Clean Teaching in the New Era" (NO. 2013-IB-081), a project funded by the Self-innovation Foundation of Wuhan University of Technology (WUT). This work is also supported by the Fundamental Research Funds for the Central Universities.

Dwight W. Allen, an eminent American scholar of educational reform, pointed out that we are actually jeopardizing our society if we only teach our students to be smart but fail to teach them moral integrity.^[2]

3.1 Honest and clean teaching is an essential part of the professional ethics of teachers and such a notion is widely accepted and followed by the entire society

It was pointed out in the Report of the 18th National People's Congress of CPC (hereinafter referred to as the 18th NPC Report) that it is necessary to improve the ranks of teaching staff, to reinforce their professional ethics and competence, and to strengthen their sense of honor and responsibility in teaching and cultivation. This defined the guideline for the construction and development of the teaching staff in college and universities. Teaching in an honest and clean way is not only the essential demonstration of socialism ideology, but also the base on which the harmonious culture could possibly be constructed. Furthermore, it is the key guarantee that safeguards the carrying out of the national development strategy through science and education and ensures the implementation of the socialist core values.

The CCP Central Committee and the State Council of China jointly published The Outline of the National Plan for Medium and Long-Term Education Reform and Development (2010-2020) (hereinafter referred to as the "Medium and Long-Term Education Plan Outline") on July 29, 2010.^[3] It was explicitly pointed out in the Medium and Long-Term Education Plan Outline that we must strengthen the construction of professional ideals and ethics education and we must reinforce the sense of responsibility and mission among the teaching community. Education is on the basis of an honest and clean environment. We must be good at guiding people to develop excellent quality and to respect and advocate the honest and clean characters through the life philosophy contained in the culture of honesty and incorruptibility. Besides, we must continue to push for the awareness of self-discipline on the basis of all-round development. It is an urgent need to consciously resist unhealthy environment.

3.2 Honest and clean teaching is an important embodiment of cultivating excellent virtues and habits as well as promoting the honest value orientation among teaching professionals

In late 2009, six central government departments, including the Central Commission for Discipline Inspection, the Central Publicity Department, the Ministry of Supervision, the Ministry of Culture, the State Administration of Radio, Film and Television, and the State Administration of Press and Publication jointly issued the Suggestions on Strengthening the Cultural Construction of an Honest and Clean Government (hereinafter referred to as the "Cultural Construction Suggestions"), in which it was pointed out that it is and will still be particularly important and urgent to vigorously strengthen the cultural construction of an honest and clean government^[4], and to establish healthy ideas and cultural atmosphere conducive to the construction of anti-corruption in the range of the entire party and society. It also proposed to combine the ideological and moral construction for teenagers with the ideological and political education for college students. It was reiterated that the probity education for the youth must be regarded as a pivotal part of quality education and must be integrated into the national education system. Teachers must play an exemplary and leading role to the largest capacity in carrying out the honesty education. The professional ethics, attitude to life, communication philosophy and learning styles of teachers will directly affect the moral emotion and spirit world of students. Therefore, teachers should positively influence students with their noble personality and gracious charisma by starting with themselves and starting with trivial matters. It is worth to note that it is important for teachers to constantly remind themselves not to do any evil no matter how insignificant it is and not to miss doing any good no matter how insignificant it is.

3.3 Honest and clean teaching is a practical platform for promoting the socialism core values and for creating the concept of probity

Teachers are the successors of the essence of advanced culture and the pioneers in developing science, technology, and civilization. They are national treasures that play a crucial role in advancement of science and technology, in inheriting the essence of traditions, and in innovation. Through the accumulation of the honest and clean cultural connotation in the traditional culture, honest and clean teaching ought to become the cultural achievements and values accepted and followed by the majority of teachers and students. Teachers should enrich the existing cultural achievements with new ideas and new spirit. Furthermore, the culture of probity is profoundly thoughtful and educational to the general public, and hence should be combined with the traditional campus culture. Teaching professionals play a major role on these efforts, which are of far-reaching significance in improving the quality of college education, enhancing ideological and moral quality of students, and boosting up consciousness of culture and introspection in behavior among the society.

4 Practical Approaches to an Honest and Clean Teaching Staff in Colleges and Universities

As mentioned above, it was proposed in the Medium and Long-Term Education Plan Outline that the teaching community is urged to improve their professional ideals, their professional ethics, and the sense of responsibility and mission in educating future generations. For the rejuvenation and continued development of the Chinese nation, it is crucial to continuously promote honest and clean people as the driving force, including qualified teachers of high moral standards.

4.1 Teachers as role models for promoting the construction of spiritual civilization on campus

Former Russian educator, the teacher of Russian teachers, Konstantin Dmitrievich Ushinsky believed that the quality of education is largely based on teachers' characters because only from the lively steam of teachers' characters and charisma could the power of education originate, take off, and last. The role of personality in education is irreplaceable, regardless of any rules or institutions, however ingeniously conceived and dexterously built they are.

In order to foster a clean environment, to resist degenerate ideologies, and to promote a harmonious culture in schools, it is paramount to strengthen the probity education on college faculties, and to reinforce their responsibility in teaching and their consciousness of being a paragon of virtue and learning. Teaching professionals are meant to be role models and should affect others with noble characters, guide others with civilized words and deeds, educate others with the spirit of dedication, earn respect of others with remarkable erudition, and influence students with concrete actions.

4.2 Construction of a clean and righteous atmosphere in schools based on the psychological mechanism of reverence towards the legal system

The great American professional motivator and inspirator James Robins stated that an employee gains professionalism once he/she takes his/her career respectfully and committed, or even with an attitude of reverence. To move the cause of education onwards healthily, the foremost important factor is to promote the construction of the legal cul

ture on campuses. Probity education on college faculties is not just needed by the advancement of higher education, but also to an even wider extent, needed by the entire society for combating corruption, encouraging honesty, and constructing a harmonious society.

5 Conclusion

The life philosophy behind the incorruptible culture could guide people to foster sterling qualities of admiring honesty and respecting incorruptibility. Adhering to such an attitude serves as an anti-corruption education that will impact the entire society fundamentally and profoundly; and such a practice could even be the permanent cure for rooting out corruption and for building an honest and clean government.

Cultivate Musical Arts Management Talents by Industry-University-Institute Cooperative Education

Wang Qian

School of Art and Design, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: xixi01020 @163.com)

Abstract: With the development of China's cultural industry, the demand for musical arts management talents increasing rapidly, furthermore industry-university-institute cooperative education as a new way of cultivating musical arts management talents becomes more and more important. This paper based on literature research method, pointed out the significance of cultivating musical arts management talents by industry-university-institute cooperative education; and hold that it have advantage to cultivate professionals; further established patterns of industry-university-institute cooperative education. It is concluded that musical arts management major use patterns of industry-university-institute cooperative education has more benefits. It aims to promote the cooperative education and provide useful reference to the build of musical arts management major, further lead to the vigorous development of national musical arts management professional education.

Keywords: Industry-university-institute cooperative education; Musical arts management; Cultivate; Pattern

1 Introduction

Industry-university-institute cooperative education is an education pattern that ordinary university interactive with enterprises, academic institutes, which take advantage their different teaching resources, exploit the talents cultivation advantages, joint training of talents. This pattern combines classroom education and social practice, which consider both knowledge teaching and comprehensive ability exercise, forming complementary knowledge system. It can enhance the comprehensive ability of the students and lay a good foundation for their future to the society.

Art management refers to “thorough planning, organizing, controlling and leading to coordinate and integrated use of manpower, material and financial resources of artistic activities, and to achieve organizational goals”¹, namely, it is manager for certain purpose to organize and coordinate the art creation process and the whole development of art business. Music is an art thorough notes to express feeling of people which reflect the real life². Musical arts management is the management related to musical arts activities. Musical arts management has various names in different university in China, such as art management, cultural industry management, and public administration. This paper use “musical arts management” refer to musicology, art management and public administration major established by school of music, humanities, art in ordinary university.

Herman. Schneider, an professor from university of Cincinnati, is the first to put forward cooperative education. Foreign research emphasizes the connotation and advantage of cooperative education; explore the cooperative mechanism and puts forward variety of education pattern. For instance, < Cooperative education in a New Era > is written by Kenneth. Ryder, this book discussed the influence of cooperative education and provides a lot of practical suggestions for university; Dale Williams's < Learning from working > described that cooperative education enhanced students' confidence by skill training; James R. Davis's < Cooperative Education: Prospects and Pitfalls > explored the concepts, benefits, problems and education pattern of cooperative education; Bill Ferris's < Cooperative Education: Neglected Winner > illustrated the history of cooperative education.

Domestic researches focus on the significance, history, problem and solution, case study and pattern of industry-university-institute cooperative education. For instance, Liu Ping's < Introduction of Industry-University-Institute cooperative education >, which illustrated the history, basic pattern and operation mechanism of industry-university-institute cooperative education; Wang Pei Gen as the chief editor of book < Industry-University-Institute Cooperative Education >, explore the connotation and function, development, basic theory and operation mechanism of industry-university-institute cooperative education; Wang Jianji's < The Exploration and Practice of Industry-University-Institute Cooperative Education >, combined with the cooperative education experience of Henan University of science and technology, showing the content of school teaching and research, the results of the system and so on.

As illustrated above, there are many papers related to industry-university-institute cooperative

education . What's more, there is one paper similar to our topic written by Zhang Xu< The Advantage and Pattern of Innovative Arts Management Talents Cultivation by Industry-University-Institute cooperative Education >, which combine the two concepts of cooperative education and art management and explore the advantage and pattern of cooperative education for innovative arts management talents. Further, Liu Yutong's<The Exploration of Cooperative Pattern of Industry-University-Institute in Musical Department of Ordinary University > and Tang Ruijuan's <The Practice and Exploration of Music Graduate Education Pattern Based on the Integration of Industry-University-Institute in Capital Normal University >, the research object is graduate students of music performance major or music education major. Until now, there is no paper to discuss the cultivation of musical arts management talent based on industry-university-institute cooperative education . Therefore, we put forward this topic which tries to fill the gap in this field.

2 The Significance of Cultivating Musical Arts Management Talents by Industry -University- Institute Cooperative Education

The cultivation of people is the essential feature of education, and talents education cannot separate from social requirements which need to contribute to certain social services. The industry-university-institute cooperative education reflects the essence of education, because it can better educated social talents and educate musical arts management major talents to serve the society, and make them become society needs arts manager. The significance of industry-university-institute cooperative education have the following four points:

2.1 Achieve the goal of talents cultivation

The objective of musical arts management major is to cultivate high quality talent has both musical art ability and management ability. Its purpose is to train some art managers who have certain musical art management theory, basic business knowledge and relatively skilled social practice. It try to maximize realize the market value and social value of musical arts products. Therefore, musical arts management talents requires not only theoretical knowledge, more importantly it need have the ability of social practice, industry-university-institute cooperative education can achieve the musical arts management talents cultivation goal, which combine both theory knowledge and social experience.

2.2 Cultivate innovative talents

Industry-university-institute cooperative education is beneficial to cultivation of innovative talents , which provides favorable conditions for the training of students' creative ability. Innovation is the core element of arts management. Musical arts management talents need to handle a series of innovative practices that including resource use, regulations, organization structure, and organize all kinds of resource to produce benefits and achieve the purpose of arts management. Besides, music companies, music and cultural institute more face to the reality of arts management compare to university. Therefore, integrated these advantages into university which will lead to a qualitative leap for cultivation of innovative talents.

2.3 Improve student's comprehensive ability

There is a disadvantage in ordinary university which cannot good transfer knowledge into real ability. However, musical arts management education is to cultivate students' comprehensive ability. Therefore, it is very hard to achieve the education goal if just rely on classroom teaching. Only if through industry-university-institute cooperative education , which will ensure musical arts management talents gain various comprehensive ability, such as social skills, language express, decision making and planning, organization coordination and management skills. Students of musical arts management major usually lack of practical ability, since their knowledge not verified by actual practice and just have a slight impression. Industry-university-institute cooperative education push the students go out of the campus, change their teaching environment, setting students in the real production environment which enable them to experience various musical activities and increase their knowledge. Besides, it provide the chance to contact and cooperate with musical arts manager at all levels, which will improve students comprehensive ability and lay a solid foundation for their future management work.

2.4 Broaden employment channels

When musical arts management graduates in the job interview, they usually be asked if they have work experience or not? So many graduates are refused since have no work experience. The recruiters are generally prefer to hire people has certain work experience, however students graduate under the traditional education pattern usually lack of practical experience. Industry-university-institute cooperative education narrowed the gap between personal training and social needs and enhance

students' competitiveness. When students of musical arts management major are cultivated by of industry-university-institute cooperative education, then they will gain certain social practical ability which can handle the position in musical arts management fields, such as broker, music editor, music agency manager, etc. In this case, they can go directly to the job market and avoid the unsuited to the management position.

3 The Patterns of Cultivating Musical Arts Management Talents by Industry-University-Institute Cooperative Education

The cultivation of musical arts management talents by industry-university-institute cooperative education need to enhance the cooperation between university, cultural enterprises and scientific research institutes, implement the teaching policy that theory guide the practice , to cultivate students' comprehensive ability. Specifically, it needs to strengthen the link between curriculum and practice, development project teaching method, realize the combination of theory and practice.

3.1 Project teaching

The cultivation of Musical art management talent by industry-university-institute cooperative education needs to change teaching pattern from knowledge cramming education to ability cultivation; push students take part in actual project work extensively. Besides, it can combine the research projects of teachers, under their guidance, student take part in or independent make business copywriter, draw contract, gradually complete information collection and project executive, experience art management process. What's more, student can set up a non-profit music company; develop business projects, strategies and plans. Teachers guide students put forward their own views and understanding of the project, exercise comprehensive ability of knowledge use, learning solve problem from different levels and different point of view. At the same time, they should study the case from the real life, understanding the significance of art management from reality.

3.2 Practice base

Ordinary university is better to set up one or several art management practice base, such as record company, musical culture company, opera troupe. University sign cooperation agreement with these institutes, every year sending some students to these practice bases to take practical experience. The learning content of musical arts management major including two part, one is learning professional course and optional course, the other is take practice in practice base. The university arranges the practice each time no more than one semester, and realizes many times circulation from study to practice which enhance the arts management level of students. Students through planning, coordinating and organizing various art activities, take part in the process of art management, understand the whole picture of art activities. Besides, student has the change to acknowledge the operation process of the company or opera troupe, and gain the knowledge how to do marketing, advertisement and promoting activities. These practices let students to take class teaching knowledge into practice, to design, to implement , and when they return to classroom, their practice result should be discussed ,analyzed and make it into speech. Besides ,encourage students take part in or independently planning concerts or evening part and other activities, after that , it should discussed together , to communicate the experience and the shortage part; then writing practice reports.

3.3 Joint cultivation

Ordinary university should take full advantage of inner or outside resources, improve professional knowledge structure and improve the level of teaching. For instance, university sends musical arts management teachers to related culture firms to take training, or employ outside manager of art institute and also magazine editor, composer, theater managers as practice teacher who responsible for practical course and seminars. Let more and more teachers who have enterprise work background to teach, which facilitate students to master social musical arts management trends and expand student's knowledge source. Teachers from outside integrate the new research result from domestic and abroad, management knowledge from music institute into speech and lecture which create a broad learning environment, develop the perspective of learning. In this case, students under the vast practice space can fully build a knowledge system and fully dig their own potential.

3.4 Combine folk custom

Cultivating musical arts management talents by industry-university- institute cooperative education can also combined with local resource and folk custom culture. For example, musical art management student at comprehensive university in Hubei province can go to Qintai concert hall , chime music hall to give practice, simultaneously understand the character and performance status, Besides, organize

student to listen concerts, performance which can broaden their view and enhance their musical appreciate ability. Otherwise students can go to carry out research at provincial or city song and dancing troupe, understand the different local opera, dancing performance and the arrangement, or visit the artists.

4 Conclusion

In conclusion, cultivating musical arts management talents by industry -university- institute cooperative education is to adapt the demand of social and culture development, to achieve the objective of art management talents cultivation, to broaden the channel of students' employment, and to improve student's comprehensive abilities. Cooperative education of industry -university- institute has great significance to cultivate musical arts managements, which is feasible to promote in ordinary universities. Furthermore, it need take advantage of university, culture firms and institute's teaching resource and set up teaching pattern which combine both theory and practice. We hope to have more ordinary university use cooperative education pattern of industry -university- institute to cultivate musical arts management talents in the future, enable our art management education has vigorous development and has more talented people.

The Research on Internal Quality Guarantee System of Education of Postgraduates in Physical Education in Comprehensive Universities: Taking Wuhan University of Technology as an Example

Yang Ming, Ou Yanghong

P.E. Department, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 5991826@qq.com)

Abstract: Taking the education of physical education postgraduates in Wuhan University of Technology as an example, the paper conducts a systematic theoretical exploration and practical research on internal quality guarantee system in comprehensive universities, using literature, interviews, and empirical study. The study shows that internal quality guarantee system of the education of postgraduates in physical education in comprehensive universities mainly involves three aspects including quality management, quality supervision and quality feedback. Internal quality guarantee system of education of postgraduates in physical education in comprehensive universities can be constructed in source quality of students, quality of lessons, quality of teachers, quality of practice and quality of thesis.

Key words: Comprehensive university; Postgraduates in physical education; Internal quality guarantee system

1 Introduction

Since 2006, Peking University, Tsinghua University, HUST, Wuhan University of Technology and other comprehensive universities has recruited postgraduates in the direction of physical education which provides an opportunity for the reform of physical education and the development branches of physical education. In recent years, the quality of education of postgraduates in physical education in comprehensive universities has more and more obvious deficits compared with sports colleges and normal colleges, such as weak innovative consciousness and innovation ability, lack of high-level research achievements and lack of academic atmosphere^[1-2]. Those problems bring serious influences on the education of postgraduates in physical education in comprehensive universities the mismanagement of which will make the quality of postgraduate education face a decline. After searching the Chinese Journal Net, I find the related research mainly include the following aspects: 1. Research on the current situation of the education of P.E. postgraduates, for example: analysis on the education of full-time P.E. postgraduates in China (Zhang Jianhua, Li Na). 2. Research on the cultivation of P.E. postgraduates, for example: analysis on the cultivation program of P.E. postgraduates in current times in China (Fang Qianhua, Huang Hansheng). 3. Research on the curriculum plan of P.E. postgraduates, for example: Research on the major of P.E. postgraduates and curriculum plan (Jiang Li). 4. Research on the qualities and innovation ability of P.E. postgraduates, for example: On the Improvement of P.E. postgraduates' qualities (Fu Xiyang). 5. Research on the management of P.E. postgraduates' education, for example: Reflection on the construction of P.E. postgraduates' education quality guarantee system (Gong Mingjun). The research of domestic scholars involves a wide range of topics, but researches about education guarantee system of P.E. postgraduates in comprehensive universities are seldom conducted. Therefore, exploring the elements of internal quality guarantee system of education of master in physical education in comprehensive universities, building internal quality guarantee system of postgraduates education conforming to their own features and adopting measures to ensure the quality of postgraduates education soon is one of the urgent problems higher education theory needs to solve.

2 Elements Analysis of Internal Quality Guarantee System of Education of Postgraduates in Physical Education in Comprehensive Universities

The subject of internal quality guarantee system of education of postgraduates in physical education in comprehensive universities is school, and its main content mainly involves quality management, quality supervision and quality feedback.

2.1 Quality management

In the current stage, quality management of postgraduates in physical education in comprehensive universities adopts university-academy-subject management system. University has relatively concentrated powers which carry out administrative guidance in academic aspect and management aspect through graduate school as education authority. It masters education management resources,

makes education quality management documents and supervises quality management process. Academy which has relatively few independent powers is mainly responsible for implementing the teaching management tasks assigned by university, affording partial teaching management affairs and guiding specific teaching quality management work in subject. Currently, with the expansion of students recruitment scope, four-level management system emerges in colleges and universities, namely response management of tutor and tutor as the first person responsible.

2.2 Quality supervision

Quality supervision system is one of the important elements for education quality guarantee system as well as the important foundation and powerful guarantee for the scientization and standardization of education quality of postgraduates in physical education in comprehensive universities. It has encouragement, diagnosis and urging functions in the whole quality management work. Its main tasks are to supervise, check and assess the whole process of postgraduates education according to quality assessment standards in education management rules and regulations made by university, timely feed information back, constantly adjust and optimize teaching process and provide teaching management decision-making for university, academy and teaching management department. Its work is implemented by teaching affairs and teaching management department of university, academy and department, experts supervising group and other departments^[3].

2.3 Quality feedback

Quality feedback plays an important function in education quality guarantee system of postgraduates in physical education in comprehensive universities. On one hand, it finds the problems in teaching, adjusts teaching process, intensifies teaching management and enhances the stable improvement of teaching level. On the other hand, it improves the approval degree of society for university and students, feeds quality back and constantly improves the quality of talents cultivation. Currently, information is mainly fed back from the following three aspects: (1) quality of source of students; (2) symposium; (3) employment track survey of graduates.

3 Case Analysis: Take Wuhan University of Technology as an Example

Wuhan University of Technology, as a comprehensive university of “211 project”, is one of the first batches of units which recruit postgraduates in physical education, which values and actively explores the improvement methods and channels of education quality of postgraduates in physical education and achieves substantial development in postgraduates cultivation. After long-term research and summary, it gradually builds and carries out internal quality guarantee system with the main aim of improving students’ abilities and quality. It mainly includes the following aspects.

3.1 Quality guarantee of source of students

Strict admission system ensures source quality of students. Source quality of students is the starting point of education quality guarantee of postgraduates in physical education, namely the basic guarantee of education quality. Owing to the particularity of cultivation of postgraduates in physical education, the source quality of students of postgraduates in physical education is especially important. Our school ensures the source quality of students of postgraduates in physical education from the following aspects:

1) Highlighting quality consciousness in recruitment philosophy: Mainly assess the science quality, comprehensive abilities, innovation consciousness and innovation ability. The first measure: respect the two-way choice of tutors and students and independent powers of recruitment of universities. The second measure: adhere to scientific selection standards, highlight the assessment of science quality, comprehensive abilities and innovation potentials of examinees and build special selection mechanism for the examinees with athletics specialties or potentials. The third measure: make strict recruitment standards, procedures and disciplines and firmly resist bad working styles to ensure students recruitment work conforms to policies and is fair and just.

2) Highlight confidentiality awareness in propositions. Hire experts outside academy to set questions with major teachers inside academy, expand questions setting channels and build test paper bank of postgraduates in physical education. Adopt random extraction and questions combination to ensure the confidentiality of selected questions.

3) Take academic research level and business quality as the important reference standards for selection in reexamination. Reinforce the assessment of comprehensive qualities in reexamination, assess mainly the depth and width of knowledge examinees master and their abilities of applying professional knowledge to analyze and solve problems, learn about examinees’ research interests in and attitudes to physical education major and the skill level of physical education major and social practical

abilities and learn about examinees' potentials in science research and comprehensive qualities.

3.2 Curriculum quality guarantee

The content of curriculum for postgraduates in physical education is the carrier of achieving objectives of cultivation and the key for guaranteeing and improving cultivation quality of postgraduates^[4]. The research compares and analyzes curriculum setting for postgraduates in physical education of HUST. Our university offers 17 degree courses and optional courses and HUST offers 26 degree courses including 3 practice and skill courses. Such as the running and management of sports event, the development trend of theory of sports pedagogy and training, overview of recreational sports and sport communication. And HUST also offers sports skills courses (such as tract and field, basketball playing skills and sports training and practice). Therefore, according to the experience of HUST, curriculum setting of our university should embody the principle of "science and expansion", be scientific and reasonable and conform to the principles of postgraduates education in physical education. And content of curriculum should be wide and curriculum and research direction should be combined effectively. Consider setting specialized courses and specialized core courses from the directions of research on sports training theories and practice, development and management of human resources of sports and economic development and management of sports, reduce 1-2 class hours of optional courses, increase optional courses, further perfect curriculum setting and refer to table 1 for revised curriculum.

Table 1 Curriculum Setting for Postgraduates in Physical Education of Wuhan University of Technology (Revised Edition)

Course type		Name of course	Remarks
Degree course		First foreign language (English, Japanese and so on); Marxism and social science methodology; social theory with Chinese characteristics and practice; sport economics; athletic training; human resources development and management of sports; sport psychology; sport sociology; sports recovery	Choose 6-7 courses at random
Optional course	Compulsory course	Sport law, database system theory and technology; sport pedagogy; overview of sports design. Sport management; research theory and methods of sports science, sport nutrition; applied sport statistics	
	Independent optional course	Ball sports (basketball, football, table tennis) Gymnastics courses (sports dancing, aerobics) Development trend of theory of sports pedagogy and training	1. Research on training theories and practice of physical education
		Human resources management, technical innovation management; information management	2. Development and management of human resources of sports
		Stadium facilities and management Operation and management of leisure sports club	3. Economic development and management of sports industry
Compulsory link		Practice link; topic selection report; academic activities	

Reasonable curriculum setting can enhance the improvement of cultivation quality of postgraduates. It can be seen from Table 1: optimize curriculum setting. Set independent optional courses according to three different research directions (choose 1-2 courses at random), take full use of the advantage of complete types of comprehensive course to study interdisciplinary courses according to their research directions, subject research and job needs and personal interests and improve the pertinence and effectiveness of courses learning which can help expand the knowledge scope of students. In the newly revised curriculum, professional skills course of sports is also offered for the students in research direction of training theory and practice of physical education. Mastering a certain of sports skills is essential for postgraduates in sports direction to get a job in the society.

3.3 Teacher quality guarantee

The academic morality, science research ability, academic level and work attitude of postgraduate tutors in physical education in comprehensive universities have important influences on the personal development of postgraduates. So building high-level tutor team is very important for improving the quality of postgraduate education. Our university reinforces the construction of tutor team from the following aspects:

1) Highlight the selection and recruitment of tutors. Start selection and employment system of tutors and choose a batch of tutor teams with certain of science and research achievements, high comprehensive qualities and strong business abilities. Weaken status, strengthen post awareness, makes the responsibilities of tutors clear, strengthen responsible system of tutors, further improve tutors'

responsibility sense and prevent the situation where tutor is responsible for overmany postgraduates leads to the decreases of education quality of postgraduates.

2) Strengthen the guidance of tutors. Tutor's rich knowledge and experience not only provide help for students in thesis writing and prevent students from making meaningless efforts but make postgraduates make breakthroughs within their abilities and achieve innovation. Tutor should guide postgraduates rather than instilling in them improving the abilities of independent thinking and problems solution of postgraduates, cultivating postgraduates' deep science research awareness and further improving the initiatives of postgraduates in science research.

3) Try the guidance method of "tutor group". The cultivation of postgraduates in physical education of comprehensive universities adopts single response system of tutors the limits of which are more and more obvious. Therefore, we should select and hire some young teachers with a certain of science research achievements, rich knowledge and Doctor degree to form tutor group and avoid the situation where tutors neglect their guidance for students because of massive administrative affairs and heavy teaching tasks.

3.4 Quality guarantee of social practice

Social practice base is important for improving the cultivation quality of postgraduates in physical education. In practice, students not only can reinforce their theoretical knowledge of sports and improve skill level of sports but improve their organization and management abilities and problems analysis and solution abilities.

The postgraduates of research on physical education training theory and practice major have four channels in practice. First, participate in tutors' teaching. Master teaching skills and methods in teaching assistant work and apply the theoretical knowledge and skills of sports in undergraduate teaching to improve students' sports teaching level. Second, take advantage of the course advantages of theory of sports pedagogy and training of Wuhan University of Technology to build physical training base for national defense students, let students master the training work in high-level sports training base and improve their training management ability. Third, participate with the training work in high-level sports training base (basketball, track and field and martial arts), follow diary training, make training plan and participate with skills and tactics teaching to improve students' comprehensive qualities. Fourth, build practice base in provincial private enterprises, reinforce sports culture construction of enterprises and organize national fitness activities such as basketball, badminton, table tennis and fun games, to animate sports culture atmosphere of enterprises.

3.5 Quality guarantee of academic dissertation

Academic dissertation is the comprehensive reflection of postgraduates' academic abilities and can also check the quality of postgraduate education. Academic dissertation writing of postgraduates in physical education is the important sector in the whole postgraduate education period which is important for postgraduates to improve their theoretical knowledge level, science research qualities and words organization and language expression abilities. Therefore, in order to improve the thesis quality of postgraduates in physical education, our university mainly adopts the following measures:

1) Make evaluation standards for academic dissertation. Obey systematicness and operability principles when assessing thesis quality. Require postgraduates to value subject selection quality and answering process, highlight independent thinking and problems solution abilities, require students to contain independent science research ability and make innovations in the research field of the course and guide postgraduates to write high-quality thesis.

2) Monitor academic dissertation quality. Build good academic atmosphere, guarantee the quality of academic dissertation and build academic dissertation check mechanism. Make a stipulation that all postgraduates applying for thesis answering must first pass through academic dissertation check mechanism before the deadline and the checked repetition rate can't exceed 20% so that plagiarization can be avoided effectively. Besides, only the students whose academic dissertation passes experts' review can attend answering. The above stipulation aims to prevent academic misbehavior and ensure postgraduates receive strict science research training.

3) Strictly control academic dissertation quality. First, control subject choice. On one hand, academic dissertation should be closely associated with reality and based on practice. On the other hand, academic dissertation should be closely associated with tutor's science research tasks or students' research direction if possible and tutor group should exert their guidance function. Second, control thesis proposal. Standardize the content and methods of thesis proposal according to the stipulation of graduate school. Third, control mid-term assessment of thesis. The problems found in mid-term assessment

should be rectified and solved timely to ensure the cultivation quality of postgraduates. Fourth, strictly control thesis evaluation and answering. Hire experts relating to courses to evaluate the scientificity, feasibility and forwardness of thesis and judge whether thesis reaches postgraduate level.

4 Conclusion

1) The subject of internal quality guarantee system of postgraduate education in comprehensive universities is school the content of which involves quality management, quality supervision and quality feedback.

2) Internal quality guarantee system of postgraduate education in comprehensive universities can be constructed in source quality of students, quality of curriculum, quality of teachers, quality of practice and quality of thesis.

3) Increase postgraduate education quality of Wuhan University of Technology and improve students' comprehensive abilities and qualities and enhance the development postgraduate cultivation work through building internal quality guarantee system of postgraduate education in comprehensive universities.

4) Reasonably setting curriculum. Comprehensively integrate curriculum settings, flexibly adjust curriculum content and add optional courses with strong practicability and wide purposes according to the existing teachers conditions, teaching conditions and software and hardware environment. On one hand, offer the courses relating to cultivating science research abilities of postgraduates. On the other hand, offer inter-disciplinary courses according to different research directions. Besides, tutor group can offer 4-8 class hours of special lecture to expand students' vision.

5) Further improve tutors' guidance level. School should strengthen science research style education, set annual science research goal for every tutor and improve tutors' science research consciousness. Tutor should always get familiar with the cutting-edge dynamics of the field and teach the latest knowledge to students. School should encourage tutors to pursue advanced study or receive further education and provide corresponding opportunities for them.

46) Deepen the reform of postgraduate education according to social demands. School needs to further the system and mechanism construction of quality management of postgraduate education, reform modes, types, educational system and management mechanism of postgraduate cultivation and explore the system and mechanism suitable for education management of postgraduates in physical education in comprehensive universities. Further research should be conducted in external quality guarantee system. And build complete and three-dimension quality guarantee system with reasonable structure and effective mechanism.

An Investigation on Fine Arts Majors' English Learning Motivation

Zhou Jiefeng, Liu Jianjun

English Teaching and Research Section, Hubei Institute of Fine Arts, Wuhan, P. R. China, 430060

(E-mail: jeffzhou@gmail.com, 42872274@qq.com)

Abstract: The number of investigations and researches on college English teaching with fine arts majors as the subject has been rather limited. Based on Gardner's theories of second language learning motivation classification, the present study adopts questionnaires to investigate into the English learning motivation of eighty fine arts majors and finds out that, their integrative motivation is insignificant, while instrumental motivation is significant. Thus it is suggested that English teaching reform could be facilitated by making traditional evaluating objectives, evaluating content, teaching approaches, etc. more motivation-oriented.

Key words: Fine arts major; Learning motivation; College English teaching; Teaching reform

1 Introduction

Motivation is a factor of great importance that affects language learning. The nature of learning motivation influences the general objective and the progress one makes, and it also contributes to the learning effect. According to psychology studies, learning effect is generally consistent with learning motivation. Therefore, as a vital factor that affects learning behavior and improves leaning effect, learning motivation is prerequisite for learning process. (Shen Deli, 2006). And in the process of teaching, teachers should attach great importance to factors that can stimulate students' learning motivation.

The definition of learning motivation varies, and the classification criteria are various, too. Gardner (1985) divides learning motivation into integrative motivation and instrumental motivation in his theories of second language learning motivation classification. He Zhaoxiong and Mei Deming (1999) defines the two types of motivation. Learning motivation can be defined as the general leaning objective or tendency of the learner. Instrumental motivation refers to the practical need to communicate (such as for work or to pass exams). Integrative motivation refers to the need for social interaction (such as to become part of community speaking the target language). The importance of second language acquisition motivation has been wide acknowledged. In this process, if the learner is interested in the life and culture of the target language, he or she is more active in language output, then it is more likely for the learner to successfully acquire the language; on the contrary, if the learner tends to take the language for a useful tool, he or she more willing to spend extra time on achieving progress, but by the time the learner finds that the language proficiency is enough to meet the practical needs, then he or she will stop learning.

The author's personal experience of teaching in fine arts institution of higher education, the English writing tests on freshmen at the beginning of their first year in college, students' self-evaluation of their English learning made at the end of each semester and the verbal communication between teacher and students indicate that, in the process of fine arts students learning English, many problems exist. And one of the problems is about motivation: some students have the motivation, but due to weak foundation laid in previous stage, that is, in middle school, as well as the lack of the right strategy and method, they may get daunted, and then they are unwilling to learn, get wearied, or even begin to quit college English classes. Meanwhile, a number of students hold the opinion that art-related careers requires no English proficiency, thus it is useless. Once they have passed the English test which is required as the condition for receiving the diploma in their freshman year, a large number of students' enthusiasm will significantly decline.

From the perspective of teaching, college English teaching practice and theory research have been multi-dimensional and fruitful in recent years. But the progress is seldom made in the field of the English teaching with fine arts majors as the subject. The teaching and teaching reform practices and theories in fine arts colleges are mainly based on those conducted in comprehensive universities or universities of science and engineering, resulting in problems. Thus the investigation is aimed to have a better understanding of the English learning motivation of fine arts majors, to explore ways to conduct and deepen college English teaching reform on the basis of the characteristics of the teaching subject.

2 Investigation

2.1 Subject and method

A total of 80 undergraduates from Hubei Institute of Fine Arts participate in the study. They all have been learning English for at least six years. Of the students, 12 are sophomores majoring in Printing and Graphic Design, 13 are sophomores majoring in Sculpture, 15 are sophomores majoring in Environmental Art and Design and 27 are freshmen majoring in Study of Art Design. Among students, 26 are male, accounting for 38.8% and 41 are female, accounting for 61.2%; 36% of the students are from rural areas, and 64% are from cities.

Questionnaire on the English learning motivation of Hubei Institute of Fine Arts undergraduates is adopted. It consists of two sections. Section One is about background information including age, gender, grade, major, family background, the time when the subject begins to learn English and current English level. Section Two is about thirty English learning objectives. Students respond using a five-degree quantitative method. The questions are from the questionnaire by Gao Yihong (2004) and selected according to the characteristics of fine arts majors.

2.2 Statistical analysis

80 questionnaires are given out and 67 are effective, accounting for 82.5% of the total. Then statistical analysis is conducted. As the questions are mainly concerned about integrative motivation and instrumental motivation, the analysis is made focused on these two aspects.

Table 1 Integrative Motivation Statistics

No.	Statements	Negative number, percentage		Positive number, percentage	
1	I just love English and there is no specific reason.	31	46.3	12	17.9
5	Before college, my passion for English learning was largely determined by whether I like the teacher or not.	35	52.2	18	26.9
7	In college, my passion for English learning is largely determined by whether I like the teacher or not.	39	58.2	14	20.9
8	In college, my passion for English learning is largely determined by the quality of English class.	14	20.9	35	52.2
9	In college, my passion for English learning is largely determined by the textbook.	28	41.8	16	23.9
10	In college, my passion for English learning is largely determined by whether I like my English class or not.	38	56.7	11	16.4
17	I learn English to keep abreast of the development of economy, science and technology worldwide.	20	29.9	22	32.8
18	I learn English because I am interested in English-speaking countries, the people there and their culture.	28	41.8	21	31.3
19	I am particularly fond of language learning.	26	38.8	19	28.4
20	My love for English songs/ movies stimulates my interest in the English language.	16	23.9	29	43.3
21	I learn English because I love this language as it is.	26	38.8	17	25.4
22	I learn English to introduce China to the world.	25	37.3	13	19.4
23	My love for English literature stimulates my interest in the English language.	26	38.8	12	17.9
27	I learn English to go abroad so that I can personally experience the culture of English-speaking countries.	23	34.3	13	19.4
28	I learn English to get prepared for immigration.	41	61.2	7	10.4
30	Being able to speak English well means good education and cultivation.	24	35.8	31	46.3

For more convenient statistical analysis, uncertain factors are eliminated, and only the positive options (agree, disagree) and negative options (strongly disagree, disagree) are kept. Table 1 clearly shows that, over 75% of the students hold negative opinion towards statements related to integrative motivation, and only Statements 8, 17, 20, 30 are responded positively. That's to say, integrative motivation plays a less important role in the English learning process of fine arts students. According to Gardner's theory, integrative motivation is vital in second language acquisition, and to some extent, it determines whether the language is successfully acquired or not. The reason for the difficulty fine arts majors face in English learning results basically from their lack of integrative motivation. However,

Statements 8, 17, 20 and 30 show that they are greatly interested in the English course, the economy and science and technology worldwide, English songs and movies, and they regard English as an indicator of one's cultivation. From this it can be inferred that there is possibility to stimulate their integrative motivation to a new level. This needs the teachers to give proper guidance by cultivating students' interest in the culture of the target language, pay more efforts in cultural introduction and then stir their potential in second language acquisition.

Table 2 Instrumental Motivation Analysis

No.	Statements	Negative number, percentage		Positive number, percentage	
2	I began to learn English because my parents/ the school wanted me to.	20	29.9	40	59.7
3	Before college, I learned English to pass the college Entrance Examination.	6	9.0	52	77.6
4	Before college, my passion for English learning was largely determined by my score.	21	31.3	32	47.8
6	In college, my passion for English learning is largely determined by score.	34	50.7	18	26.9
11	The most important goal of me in English learning is to get graduation diploma.	29	43.3	32	47.8
12	The most direct goal of me in English learning is to get good scores in exams for going abroad, to get higher education or to land a job.	17	25.4	34	50.7
13	To learn English well is very important for me, because it will be a useful communication tool in the present society.	7	10.4	59	88.1
14	A good command of English gives me a sense of achievement.	9	13.4	51	76.1
15	I learn English because it can help me learn other courses better.	4	6.0	37	55.2
16	A good command of English will help me find a good job.	15	22.4	33	49.3
24	By learning English well I can do my bit in the country's development.	20	29.9	26	38.8
25	By learning English well I can live up to my parents' expectations.	12	17.9	41	61.2
26	I learn English so as to go abroad for better education and career development.	19	28.4	20	29.9
29	English is an important stepping stone to success.	15	22.4	41	61.2

Table 2 shows that, more than 93% of the students give positive answers to statements related to instrumental motivation, and negative answers are only made to statement 6. The motivation fine arts students have towards English learning is more about the practical benefits brought about by the course, such as to pass examinations, to land a good job, to have a sense of achievement, to use English as a communication tool, to get a diploma, etc. once such need cannot be met, or they cannot see such benefits in the short run, students are likely to give up English learning. Driven by such instrumental motivation to learn English, once they have realized the goal set by the curriculum and the goal they set for themselves, they may get absent-minded or drowsy in college English class.

3 Suggestions

How to carry out and deepen college English teaching reform? According to the study results, the author suggests that attention be given to the following two aspects:

I. Take the fact that fine arts students show strong instrumental motivation and emphasize English exams in an objective way, revolutionize performance assessment objective and content, give full play to the commanding and positive role the two have been playing, and enable students to set clear and proper English learning goals.

Based on the fact that the English foundation of newly enrolled fine arts students is generally weak, it is advised that students' listening and speaking be strengthened, and the two aspects be given more weight in students' performance assessment system, so that students could attach more importance to improving their ability of solving problems in real situations. The requirement on the reading ability of fine arts students should be differentiated from that on students from comprehensive universities or

universities of science and engineering, and the difficulty coefficient can be lowered to a proper extent, in order to setting goals that are beyond students' ability which may frustrate them and even lead to quitting. The study process should be included in performance assessment system and be given more weight. Teachers should let students practice play the main role and lecturing play the leading role, allot more time for teaching interactions and highlight the participation and practice on the students' part. The passive learning mode which is mainly composed of teachers teaching, breaking the language into words, sentences, texts and students taking notes without real experience of using the language, training, or practice. In terms of teaching procedure, the teaching methods should be enriched, such as having students make speeches or dialogues, read the text, have role play, discuss on certain topics, have interviews, simulate certain activities, practice practical writing and so on, so that students will be encouraged to take part in class activities and language practices. All these activities should be recorded by the teacher and reflected on the final score.

II. Adopt multiple methods to cultivate and stimulate the integrative motivation of fine arts students in English learning.

Right and proper guidance should be given to fine arts students for a good understanding of the ideology and culture of the target-language-speaking countries, cultural input should be strengthened, and students' potential second language acquisition should be fully explored. Specifically speaking, the teacher may allot a certain amount of time for teaching the differences between Chinese and English thinking modes, expressing habits, culture and so on. In teaching methods, modern teaching techniques should be fully explored, such as recording, English movies, TV programs and series, radio broadcasts, computer network and multimedia courseware, so as to offer students the chance to practice and get trained, and to improve teaching quality. In the meanwhile, for fine arts colleges where the English learning climate needs to be enhanced, steps should be taken to create the atmosphere inside and outside the classroom for language learning. In recent years, the English Audio-Visual optional class, English club, English calligraphy competition, campus English broadcasting, Learn English from Movies activity, lectures by foreign artists, morning reading, English corner, spoken English training have gradually helped create a good English leaning atmosphere. In addition, an English Zone has been established at the corner outside English classrooms, showcasing various topics, such as introducing tests at different levels, reporting HIFA English teaching activities, sharing news on original English newspaper, recommending experts' opinion on English learning and presenting English for fines arts. English learning models are also introduced to stimulate students' interest and create a good learning atmosphere by setting special columns showing the notes, assignments, excellent calligraphy works for competition by students.

In conclusion, the English teaching reform is a complicated system covering a wide range of aspects, including the management, teaching, learning, testing and assessing, etc. But as long as we keep updated to the latest development, study the characteristics of fine arts majors and carry out teaching activities with the learner as the center, the teaching quality will keep improving.

4 Conclusion

The survey primarily shows that, during the process of English learning, integrative motivation is not strongly revealed in fine arts students, which means that they lack initiative to actively explore and they learn in a passive way. By contrast, instrumental motivation is dominant, as it is strongly revealed in the process of English learning, which means that they are utilitarian-minded in English learning, with a lack of impetus in fine arts students

Nonetheless, in second language acquisition, integrative motivation plays the leading role and instrumental motivation exerts insignificant influence. "Impetus is a factor of great influence in language acquisition. Not only does impetus affect how fast one learns, but also influences the eventual result of learning" (Mei Deming, 2004). Being highly utilitarian-minded, fine arts students may only pursue short-term benefits and get deprived of the sense of achievement they ought to gain in the process of learning. While learners who pursue the sense of achievement tend to undertake tasks that bring them such fulfillment, keep being high-spirited, and stay unswayable in the face of frustrations. High score itself is a sort of reward, and making the task more demanding and independence-requiring can stir even higher scores in the learner(Steers, 1975). Fine arts students lack such motivation that can improve their score and improve their language proficiency.

The Possibility to Integration of Education Justice and Individual Development and Relevant Implementing Approaches

Zhong Zhenying

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 152256954@qq.com)

Abstract: Education justice is not only an important branch and extension in social fair system, but also an important foundation to create social justice atmosphere and realize more comprehensive and more extensive social justice. In the process of pursuing education justice, individuals' personal development needs have correlation with it. Trying to solve existing problems between them contributes to the realization of dual goals of education justice and individual development. Adjusting public policies, promoting policy fairness and equality of opportunities and adhering to educational idea of differential development are important safeguard measures to realize the integration of education justice and individual development.

Key words: Education justice; Individual development; Educational balance

1 Introduction

American famous educationist Horace once said education was a great instrument to realize human equality^[1]. Functions of education are much greater than any other human inventions. Education is one of the important activities of people's production, life and social practice. In the process of educational development, the problem of education justice is gradually arousing people's attention. If education itself cannot be fair and just, it is unable to play its role to promote social justice. However, individualized talents are much needed in present social development. One of the important embodiments of social civilization is paying attention to personality development. Well, whether paying attention to individualized talents' education affects educational fairness will be a problem to be faced. And the correlation of education justice and individual development makes them coexist in progress. Dealing with existing problems between educational justice and individual development properly contributes to educational development and social progress.

2 Review of Research Status:

In the west, educational justice thought originated from Ancient Greek Platon's principle of justice. In 18th century, western bourgeoisie made a stand against feudal despotism. In order to protect individual interest and realize freedom and equality in real sense, justice idea came into being in modern education field for the first time in struggle. In modern times, about the aspect of researches on educational justice, especially after the appearance of Rawles's Theory of Justice, western developed countries' researches on educational justice turn to the aspect of distribution of education system rapidly, which contains justice of educational right and obligation. Generally speaking, it is justice of education system. Through referring to related document literature, from the overall perspective, we see that researches on justice of education system are mainly researches about western contemporary theory of education justice standard.

Compared with the west, educational justice researches are all comparatively late no matter from content, time or depth. The main reasons still lie in that the rise and development of China's educational ethical are relatively late. After 1980s, status of educational ethics was affirmed in our country and began to appear with researches on educational justice. In the late 1980s, articles about educational ethical began to appear. In researches on educational ethical, it appeared with the vocabulary--educational justice. Summarizing the research process of China's problems of education equality, it could be divided into three phases approximately:

Firstly, in 1980s, educational justice was understood as teachers' justice. Then, in 1990s, based on western justice theory, our country established the concept of educational value which took the idea of educational equity and justice as the core. In China, experts in ethical community were carrying out researches on western justice theory and perfecting justice theory system including social justice and individual justice. At the moment, researchers began to research problems of educational justice. At present, there are few related researches on the integration of individual development from the perspective of equity theory.

3 The Correlation of Education Justice and Individual Development

Education justice is an important embodiment of social justice^[2]. Education fairness is not only a kind of recombination of internal and external fairness of education system, but also the recombination of two implications of belief and system. In essence, the education fair ruler is the justice of individual development^[3]. Thus, education justice and individual development are not two competing topics. In the three aspects of value targets, research objects and realistic standards, education justice and individual development have correlation.

3.1 The correlation of value targets

On account of individual education and educational justice, their value orientations are the same. In order to let education justice be better reflected, we must carry out personalized education against individuals in a larger scope and fully guarantee individual's personality development. In this way, we can realize education justice at the most extent.

Only when individual development value and education justice value achieve coherence, the ultimate significance of education can be fully reflected. Under the premise of social justice, Individuals' potential can be guaranteed and developed; the existence of education has greater probability. Individuals can find a tiny space by virtue of their own competence in society. Personal innovation capability can be exerted furthest in society. This is the most comprehensive embodiment which reaches personalized education for individual differences.

3.2 The correlation of research objects

In the perspective of education justice, the main research object of individual development aims at those groups who don't get fully recognition and respect in the aspect of education rights sharing. In order to let the individuals whose education rights can't get recognition can get respect again in the process of education, it becomes a problem which needs to be concerned by education justice and individual development research. Education justice provides a novel idea for us to study individual development. If we want to make ourselves' rights of being educated be concerned, only the display of personality is the best choice. Personalized education against individual development is to let individual's personality be fully interpreted, which is the question that education justice and individual development must think together.

3.3 The correlation of realistic standards

The realistic standards of education justice mainly contain three aspects: whether education implementation can guarantee reasonable differences among individuals; whether education implementation can generate positive effect to the development of the main body of education; whether education implementation can acknowledge the subjectivity of education groups. The research norm of individual development is to follow the principle that individuals have reasonable differences, exert individuals' subjectivity to the utmost extent and realize harmony and unity of educated individuals' social value and personal value. We can see education justice and individual development have correlation on the realistic standards.

The correlation of education justice and individual development contributes to the integration between them to carry out more scientific and reasonable educational techniques and reach educational aims. The real fair education must be able to deal with the relation between individuals' individuality and commonness in allusion to education implementation ways of individual development. It must be that educated groups can get very good education implementation. Individuals' differences can also be well respected and concerned. It must let all individuals grow and develop according to their own personality in the end.

4 The Existential Problems of Individual Development under the Vision of Education Justice

Seem from our country's current education situation, on the basis of many uncertain factors existing in the process of individual development, we ignore individuals' differences. It shows concretely in three aspects: narrowness of education purpose view, oneness of education mode and literalness of education environment.

4.1 The narrowness of education purpose view

The influence of Chinese traditional culture to education takes advocating goodness as the highest category on educational purpose. Education recognition and teaching methodology pay attention to introspection not searching outside. In individual development aspect, traditional education relatively places particular emphasis on group development and ignores personality development to some extent.

Because people are affected by traditional education concept, it leads that education aims ignore individual value, also ignore the innovative spirit against individuals and cultivation of independent ability, and are partial to social value overmuch. The influence generated from this kind of concept is that in practice, education ignores individuals' interests and hobbies in the progress of development. It fosters individuals to cater for social demand for talents much more, hinders individuals' comprehensive development, doesn't pay attention to individuals' spirit world and results in blocking individuals' personality exertion ultimately. In a sense, this concept denies individuals' existence value fundamentally and generates bad effect to individuals' personality and cultivation of personality. In the process of education implementation, we usually take training individuals' rational capability as the first target and ignore other perceptual factors, including individuals' emotion, intuition and hobbies, etc. This is unilateral.

The development of human individual affects group development. If individual development can't get very good development, well, it will postpone group development and pare down its total development level. And the main body in traditional culture education concept always excludes individuals. What it values is only country and society. Modern social theme is to pay high attention to individuals. The subject of education contains individuals and doesn't only direct at the state and society. Seen from philosophy angle, it reflects the society's fully respect to the subject of being educated. Seen from sociology angle, it reflects people's pursue for education justice. Seen from psychology angle, it reflects individuals' desire for new knowledge learning. In order to push forward different cultural prosperity in today's society and strength the construction of various groups, we must realize that individual body and mind can develop healthily and upwardly and try to safeguard and promote individuals' life quality, which is the ultimate goal of education.

4.2 The oneness of education mode

Education mode is a brief introduction to education process organization way under the guidance of certain education theory. What education needs to do is to foster talents, which is a simple social activity. However, education also has multifarious qualities, which depends on social and individual complexity. If we want to foster an individual with penalization, we must realize that the individual himself is a complex individual. Thus, it determines that the cultivation of individuals is diverse. If the cultivation of individuals adopts single mode, it is unfair to individual development and social development.

However, most of the time, education not only doesn't arouse individuals' wisdom, instead, it encourages individuals to follow some kind of pattern. Thus, it hinders individuals, making him not be able to take himself as a whole process to understand^[4]. In the process of education implementation, most of the time, we follow this kind of mode to foster individuals. The negative consequences are that all individuals become consistent in spirit and thought and are lack of innovative spirit; individuals do not think independently any longer but follow like sheep stubbornly; individuals are used to accepting but not choosing to create independently; education doesn't pay attention to the cultivation of individuals' unique personality. These greatly hinder individuals' development and are disrespect to individual freedom as well.

4.3 The literalness of education environment

We mainly talk about psychological environment in education environment. It contains teaching atmosphere, interpersonal relationship and group norms, etc. It mainly refers to soft environment in education implementation process. The cultivation of individuals' independent innovation ability in education activities can get the best exertion only in good mental environment. The literalness of education environment mainly refers to creating environment for individual development with certain purposiveness, which is quite unfavorable for individual development. Relaxed and free educational environment can create better condition for individuals' development and further encourage individuals develop better and positively.

American psychologist Benny thinks: If the atmosphere of a group is friendly, mutual understanding and support, well, the influence of the group to motive, working performance and achievement will be positive^[5]. It shows that in education implementation process, once it has shaped good and positive teaching atmosphere, we can encourage individuals to learn actively to a greater degree. And the benefits brought by the result will exist all the time and play an impellent effect for individuals' development imperceptibly. But at the same time, we must also notice that learning initiative of the individuals of being educated can be affected by all sorts of environmental factors in teaching process. The consequences brought by these factors have dual character. They may bring positive effect and may bring bad influence as well. They can not only let individuals devote themselves

to learning still more, but also reduce individuals' interest to learning. Therefore, for individuals' better development, we must guarantee good teaching atmosphere, human relationship and group norms in education process.

5 Integration of Education Justice and Individual Development Measures

The just education is tending to be individualized^[6]. Therefore, it is necessary to guarantee the mutual integration between education justice and individual development, which can make both coexist and get development.

5.1 Adjust the public policy; promote the justice of policy and equality of opportunity

The education system and policy of a country decide its backwardness of education justice. Education system stipulate the educator's rights and obligations strictly, if there is a problem existed in the system, the rights and obligations in it will not be implemented smoothly; the correctness and rationality of the education policy with a mandatory feature, will have great influence to learning attitude of educated people, thus influence the implementation of education justice indirectly. Because of this, to realize the education justice, it should pay attention to the three points following.

First is implementing the national education policy resolutely, and promoting the full development of the students. The relevant departments should adjust the curriculum, change the content of course, and improve the learning initiative of students according to the age characteristic of the students. The second is to achieve fair and reasonable when allocating indicators of enrollment as far as possible, people in different regions should enjoy the same right. Third is to realize the "lifelong education" gradually, make the national education resources open to the outside world, people can participants in various forms of education depend on the supplied forms by the country. The country should make the education form diverse and education stage hierarchical, by taken many kinds of measures that can meet the education needs of different people, and build the impeccable education system. Only by ensuring the equality of policy and opportunity, the education justice and the individual development differences can coexist and develop in contradiction, and get integrated.

5.2 Respect individual education rights

It is the inherent requirements and the core meaning of education justice that let individual value of every educator get embodied fully. The education process is to integrate the established objective reality into the systematic knowledge system, let their potency get explore and continuous development, including the personal ability, the cognition attitude, and others. On this, the process of education can also be said to be the progress that internalize objective of the cultural elements into the subject of the subject of the knowledge. In the education union, most educates join this group as the identity of cherishing a good expectation to the future life or based on the role of ignorant job seekers who want to realize a certain goal in life.

Under the receive education progress of educated people who is represented by children, relying on the basic life experience which they accumulated in daily life, they become to establish self-awareness gradually, and began to cognize, identify and judge the practicality of variety of educational content which implanted to them, and try to use the acquired useful educational value realize their own development and constantly improvement. Since there are vary degrees of difference of values and cultural background among every educated people, that makes they get a clear cognition on the problem mentioned on the above really when the results from the material meaning function which brought from education impose the every one of them. It is also on this time, the concept of education justice has the universal and practical influence. Try to achieve and realize educational justice can make assure the subject-position of every educated people when they are in the process of education, it is need to combine the institutionalized, systematic education with reality needs of every individual of educated closely, and let their individual value get fully realization.

5.3 Uphold the concept of differential development Education

5.3.1 Increase education investment, balanced resource allocation

Increasing the input of education mainly refers to the investment of educational resources. Good situation of national education can effectively promote the society development direction into forward, education plays a very important role in social development, so the state should ensure to put the education in first, and this procedure is also the social responsibility which the country should burden it. Because of various reasons, the education resources in various places are under seriously unbalanced, and that cause the imbalance existed in different places among educated people. Specifically to say, the balanced education including student education funding, school buildings, teaching laboratory apparatus

and equipment and others which need to be allocated balanced, the software of education includes teachers, school internal management and other balanced allocation^[7].

From the current situation of our country's education development, the external factors that lead to the education injustice include the serious development difference in different regions, the education resource can't be divided equally, and etc.. For this kind of situation, we must promote social economy develop rapidly and implement the compulsory education to the individual of each region, optimize the allocation of educational resources, finally, let the education justice completely implemented. So "it is needed to increase transfer payment intensity of compulsory education from the center government to provincial finance", and also "it is need to urge to complete the special compulsory education transfer payment system, establish the special supervision and inspection system for the use condition^[8]". In view of this, we need to allocate the educational resources fairly. Education system must guarantee weak schools to achieve leapfrog development^[9]. Taking into account the current national conditions of our country, we should insist to combine the market and plan under the idea of fair to make the allocation of education resources more impeccable. The state should not only pay attention on education investment, but also should to the allocation of educational resources. The central government should formulate effective measures to adjust the imbalance on education resources between different regions, so that can make education resources between different regions tend to be more balanced. It is needed to make the following three points: first is to shrink the economic distance between regions; second is to shrink the school difference between the regions; third is to shrink the gap of knowledge between regions. Only solve the economic distance first, it can help solve the gap in knowledge, and narrowing the regional gap between schools mainly refers to the schools in eastern and western regions of China, it need try to make the equilibrium in the teaching facilities, teaching quality and teaching level among them.

5.3.2 Perfect the compensation system, safeguard the weak group

To realize the education justice, it not only means pay attention to the fair on the allocation of educational resources, but also should implement the national relief system, and formulate some preferential policies, use these to guarantee the development of the society. We usually pay attention to the justice of the form when we get the meaning of the justice of civil rights, but we do not realize justice in real life. The mainly reason of these injustices, is due to the injustice policies which government promulgated. It is also caused injustice of education in vary degrees due to a large number of poor people. And because of the existence of many inequalities in the nowadays society, it is caused the groups of vulnerability.

National departments should pay attention to the education problems on vulnerable groups, mainly including the countryside school located in remote areas, education on poverty family and disabled children, children of floating population. The government should establish a sound financial aid system to formulate the appropriate compensation measures, and focus on the compensation for education. At the same time it needs to develop effective measures to aid needy students, implement the loan system for students from poor areas or family; on the stage of non compulsory education, the state should formulate flexible charging system and guarantee the vulnerable groups get education. In order to encourage enterprises to donate money to schools, it needs to advertise the character of education to the enterprise which has economic strength in society, and improve the funding criteria for vulnerable groups constantly. To guarantee the students in poor families or poor areas accept compulsory education on time and enjoy the same education rights with others, it need implement various forms of financing policies to them.

5.3.3 Improve the quality of the educators, ensure the education behavior justice

Most of the research in education justice is mainly refers to which, whether education resource allocation is equal and individual educational opportunities are fair, both of them ignored the treat situation of implementation process of the education on individuals basically, and if educator fulfill the obligations. Actually, In order to achieve educational justice we must under the premise of guarantee given by society, but also to observe and assess their teaching moral character and behavior, because the injustice in their teaching process of will affect the individual's education rights deeply. Education justice need to rely on the occupation morality of educators to implement that contains four aspects as following.

6 Conclusion

First, it should respect the individual sufficiently, without exception. Because each individual has its own unique personality. Second, it should carry on the fair appraisal the individual. How to judge the

individual level and quality in learning ability is effective or not, is depend on the fair evaluation on learners. Third is getting sufficient understanding to the individual. A lot of injustice in the education process is caused by the reason that teachers do not understand the individual. Fourth, it is necessary to proceed from reality, proceed different education to different individuals in teaching according to the principle of individual differences, so that it can develop a full range of individual's ability let it get development from varies aspects. The understanding of the fair from Aristotle is the equality treats equal, inequality treat unequal. It is not means that the educator should treat individual in discrimination and hold unequal attitude in teaching process, but should be more to follow the principle of individual differences in teaching.

Exploration of the “Output-Driven, Input- Enabled Hypothesis” in College English Listening and Speaking Course*

Yao Jing, Zhang Yan

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 12656859@qq.com, zhangyanwy@whut.edu.cn)

Abstract: Based on the new “Output- Driven, Input-Enabled Hypothesis” put forward by professor Wen Qiufang in language learning, this article explores how a teacher creates a multidimensional input and output system in organizing the class periods to enhance the efficiency of a college English listening and speaking course. In the analysis, it clarifies further that output is not only the motivation, but also the objective of language acquisition; and input is the means for facilitating the output tasks, more than merely fostering comprehension ability or accumulating receptive knowledge.

Key Words: Output-driven; Input-enabled hypothesis; Output; Input; Listening and speaking course

1 Introduction

In the Second Language Acquisition, language input is an implacable basis of language learning, yet it is not the only premise for it. According to De Bot, the output based on full comprehension can realize the transformation from the declarative knowledge into the productive knowledge, thus directly enhancing language fluency. The construction of a massive specialized input knowledge system can significantly improve the effect of output. An comprehensive output enables language learners to create more effective declarative knowledge. Consequently, input can be tested by output and output can promote the realization of effective input. Both input and output are indispensable factors for language competence.

In 2007, professor Wen Qiufang put forward the “Output-Driven Hypothesis” for the English language course reform. This Hypothesis mainly aims at English learners at middle and advanced level. The chief contents include: 1) Output has a more powerful driving force than input for language learning; 2) Output competence as a learning aim responses to the employment demands for the students and allows students to foster one or two expression skills among speaking, writing and translating selectively according to their own demands (Wen Qiufang 2013). The “Output-Driven Hypothesis” put emphasis on the importance of output. However, this hypothesis does not clarify the function of input, which results in the teachers’ failure in dealing with the relation between output and input in their practical teaching process.

Professor Wen Qiufang then adapted the “Output-Driven Hypothesis” into “Output-Driven, Input-Enabled Hypothesis”. The old and the new hypotheses share the same details in terms of target, the impact of output on language learning, and the importance of expression, and differ in the function of input (see Table 1) (Wen Qiufang 2013, 2014).

Table 1 Differences Between the Old Hypothesis and New Hypothesis

Name	Targets	Impact of Output on Language Learning	Importance of Expression	Function of Input
Output-Driven Hypothesis	middle and advanced level	Output has a more powerful driving force than input for language learning.	Output competence responses to the employment demands for the students and allows students to foster one or two expression skills selectively according to their own demands.	-----
Output-Driven, Input-Enabled Hypothesis	the same as above	the same as above	the same as above	Input facilitates the accomplishment of output tasks and provides directly language materials and relevant knowledge for output tasks.

The “Output-Driven Hypothesis” does not illustrate the effect of input, while the “Output-Driven,

* This paper is supported by “The Fundamental Research Funds for the Central Universities”. Grant No. 2014-lb-089

Input-Enabled Hypothesis” clearly indicates that, the desired language forms and encyclopedic knowledge in output tasks result from the input materials provided by teachers or collected by students. In this new hypothesis, output is reckoned not only as the motivation, but also the objective of language acquisition; and input is the means for facilitating the output tasks, more than merely fostering comprehension ability or accumulating receptive knowledge. In other words, students clearly understand that in order to accomplish the output tasks assigned by the teacher, the input materials have to be carefully worked on to obtain necessary assistance (Wen Qiufang 2013). Consequently, teachers and students can tackle the input materials selectively in accordance with the demand of the output tasks. The input that has little or no relevance to the output tasks can be skipped, and then the teacher and students can put their concentration on learning and comprehending the desired language forms and relevant encyclopedic knowledge in output tasks.

2 Application of “Output-Driven, Input- Enabled Hypothesis” in College English Listening and Speaking Course

“Output-Driven, Input- Enabled Hypothesis” mainly challenges the “text-centered” teaching concept, emphasizing that training the students to “act” in English should take the place of merely teaching the textbook materials. In other words, teaching will no longer merely put the focus on texts. A principal criterion for evaluating the students’ study is whether the students can accomplish the output tasks with the aid of textbook input. In order to motivate the students’ initiative in learning and boost the students’ efficiency in mastering the input materials, the input activities should be a multidimensional system with alternate listening, reading and watching. Meanwhile, the output activities can be a combination of speaking, writing and translating. For example:

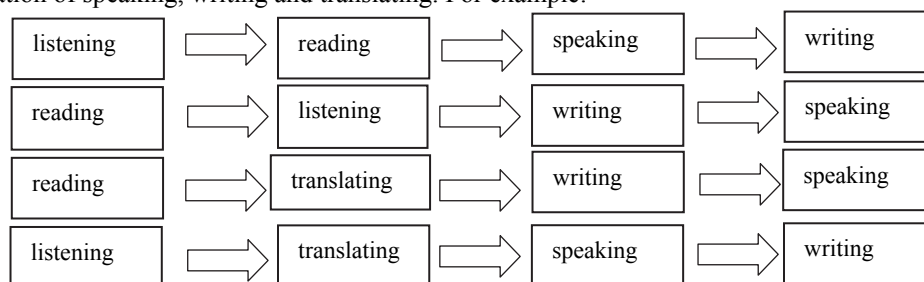

Figure 1 Multidimensional Input and Output System

A highly efficient listening and speaking class needs a teacher’s elaborate design for the class period. There are four requirements for teaching organization based on the “Output-Driven, Input-Enabled Hypothesis”. 1) The teaching process should be in proper sequence; 2) The time for each procedure in the class should be properly allotted; 3) The testing for students’ results in class activities should be implemented; 4) Homework should be assigned properly. In a listening and speaking class, the teacher should not act as an “announcer” or even “language repeater”. The listening and speaking class would otherwise make less sense and hardly arouse the students’ interest if not elaborately organized. On account of this, teachers can adopt the “Output-Driven, Input- Enabled Hypothesis” in their listening and speaking classes, motivating the students to accomplish listening or reading t actively through oral input tasks.

2.1 A teaching process in proper sequence

An orderly teaching process requires that a teacher fully know the principal and difficult points of the output tasks, and hence he analyzes and identifies the input materials, language forms and relevant knowledge that serve for the output. The current listening and speaking classrooms present a deficiency in well-organized teaching process. The mere “listening”, “telling”, and “testing” hardly reflect the leading role of a teacher in the class. Let’s take Unit 4 in “Listening and Speaking Course 2, New College English”, as an example. The listening task for this unit is to listen to a passage: *Background Music* and train the students’ ability to understand the material contextually. When the students feel difficult in doing the exercise, the teacher may play the recording again or even guide the students in checking the script of the recording, which would decrease the students’ interest in learning and frustrate them when the material gets dull and difficult. It is suggested that the passage be divided in several parts and played to the students separately: 1) the first use of background music; 2) the original and present

purposes of background music; 3) the effect of music in shops; 4) the effect of music in restaurants. When listening to one part, the following teaching methods can be adopted: listening while taking notes (noting down the key words); listening while speaking (repeating the sentences); listening while translating (translating some difficult sentences); listening while writing (finishing certain blank filling tasks designed); and listening while summarizing (summing up the main idea for each part). Having fully comprehended the main messages of the passage and grasped sufficient useful expressions, the students can be grouped in pairs and create a dialogue for an oral output exercise. This detailed teaching process decreases the difficulty in output tasks and thus contributes to students' sense of achievements in language learning. Based on the "Output-Driven, Input- Enabled Hypothesis", in the listening and speaking course, "speaking" is the motivation and aim, while "listening" is the driving force for it. They supplement and benefit each other.

2.2 Proper time allotment

How to arrange the time of the class properly? The chief principle is the teachers' consciousness for cherishing the class time, struggling to exert the largest effect for every minute. As a matter of fact, class is the main occasion for the face-to-face interaction between teachers and students, as well as the home field for the teachers to execute their obligations. Apart from a right time value, teachers should master some principles in controlling time: 1) Time allotment should be in accordance with the teaching object. For a listening and speaking class, the listening strategy, pre-listening oral practice, listening task and the relevant oral output task are the focus of a class. Therefore, a 15-20 minutes' "lead-in" should be replaced by a 3-5 minutes' "warm-up" remarks or discussion, which lead the students into the topic effectively and directly and proceed to the specific class activities. 2) The specific time for a single task should be scheduled in advance. As a rule, the listening strategy, pre-listening oral practice, listening task and the relevant oral output task for each unit are supposed to be finished in 90 minutes. A teacher should prearrange the specific time for a single task in an efficient way. For example, if the listening task "background music" takes 30 minutes, each single part, as is clarified above, should be calculated accordingly with certain activities (see Table 2).

Table 2 Time Allotment for a 30 Minutes' Class Period

	Part One	Part Two	Part Three	Part Four
Contents	The first use of background music	The original and present purposes of background music	The effect of music in shops	The effect of music in restaurants
Time	5 minutes	7 minutes	8 minutes	10 minutes
Task	Listen and repeat the sentences	Listen and sum up the key points	Listen and do the blank-filling task	Listen, do the blank-filling task, and translate difficult expressions
Reason	A shorter part	A transitional part with key information	A longer part with useful expressions	A longer part with new expressions

2.3 Implementation of testing for students' class activities

Any task assigned for the students should be tested by the teacher. In so doing, the students can treat the activities more seriously and fulfill them conscientiously. The teacher should design a way to check the students' achievement for a single task. When the students find the teacher is always trying to supervise them in the assignments, they would boost their efficiency of the input actively and then the quality of the output can be improved. Let's take Unit 6 in "Listening and Speaking Course 2, New College English" as an example. The topic of this unit is "business". In the pre-listening activity, some theme-related questions are designed for the students 1) What qualities would an employer like to see in an employee? List at least three points and give your analysis. 2) What are the important qualities of a good supervisor? List at least three points and give your analysis. 3) What are your job prospects? How about your group members? Do you think their ideal jobs suit them well? Why or why not? 4) Describe a small business that you would like to own. You should say: what this business would be; how you would start/ open this business; how you would run this business; why you would like to run this kind of business. These questions are assigned to them in advance of the class with several requirements: 1) There are 8 groups organized. Each group consists of 4-5 students. Every two groups are given the same question. 2) All the students have to write down their own answers to the questions in detail. 3) In the class, they are given 10 minutes to exchange their ideas. 4) For question one and question two, a representative for each group is asked to give an oral presentation by collecting the best answers from the group members. 5) For question 3, a representative for each group should talk about all his group

members. 6) For question 4, 2 representatives are asked to talk about all the group members' business prospects, with one representative describing 2 of them. 7) Each speaker should finish the presentation in no more than 3 minutes.

In the process, through searching the information via electronic media, learning the useful expressions and sentence patterns in the text books and exchanging with the other group members, students gain practical input for the desired oral output. Furthermore, these questions are closely relevant to the passage they are required to listen to and grasp in the "listening task". Designed, assigned, and tested in a specific way, these pre-listening tasks enable the students to know exactly what they are asked to do and fulfill them voluntarily. The input and output tasks supplement each other effectively.

2.4 Proper homework assignment

"Proper homework" include two meanings: advisable amount of homework and appropriate difficulty of it. Since the class time for learning English is extremely limited in college, students are obliged to spend much time beyond the class. However, English is not the only course they learn. In case they have to finish an excess of English homework, the quality can not be guaranteed. Besides, the degree of difficulty should vary from the advanced ones to the week ones. Take the above pre-listening task as an example: questions one and two are assigned to the advanced groups; questions four and five, with more specific outline for the oral presentation, are allocated to the week ones. In addition, the teachers are expected to offer appropriate websites or an explicit requirements for searching the materials to enhance the efficiency of their application in new materials.

3 Strategies for the Implementation of the Course

As is discussed above, an effective listening and speaking course requires a well-organized teaching process. Then how to make sure that the implementation of the course is realized in a theoretical and systematical way? According to Tyler's principles of curriculum and instructions, the four crucial elements in any course, namely, teaching objective, teaching contents, teaching process, and evaluation interact with each other. A well-organized teaching process should coincide with the teaching objective, which determines the direction of teaching. And the evaluation system is a tool in examining the effects of teaching objectives and process. To facilitate study and spot the problems in the process timely, the teaching process relies on a proper evaluation system. Consequently, the implementation of a well-organized listening and speaking course based on the new hypothesis requires the adaptation of teaching objectives and evaluation system.

3.1 Realistic, distinct, and specific teaching objectives

The teaching objectives in each course should be restricted by the general objectives for the college listening and speaking teaching. Furthermore, the "Output-Driven, Input- Enabled Hypothesis" requires a more realistic, distinct, and specific teaching objects. It means that students are able to achieve the objectives through their efforts. Moreover, the objectives can be measured and identified by both teachers and students in detail. Let's take Unit 2 "Food and Drink" in "Listening and Speaking Course 2, New College English" as an example.

Table 3 General Objectives and Specific Objectives

	General Objectives	Specific Objectives
1	Be able to talk about food with the aid of useful expressions.	Be able to 1) introduce to friends how to order food in a Chinese restaurant 2) Choose any Chinese dish you like most and introduce the way of cooking to your international friends
2	Be able to explain the major differences between Chinese and Western food culture.	Be able to explain some differences between Chinese and Western food culture in 1) cooking methods, 2) Attitudes towards eating, 3) Dining etiquette, 4) Table manners

As is mentioned above, the new hypothesis puts emphasis on students' capability in "acting" in English. Accordingly, the teaching objectives should require the students to accomplish some communicative activities through speaking, writing or translating. As is conveyed in Table 3, the specific objectives are derived from the general objectives yet divided into several detailed items. After each unit, every student can test his study in the light of specific objectives and the teacher can figure out promptly whether his teaching has achieved the desired success.

3.2 A specific and diversified evaluation system

Three principles for the listening and speaking course evaluation system should be followed: 1)

The criteria must be specific; 2) The methods must be diversified; 3) If the output task is oral presentation, the audience should be taken into consideration in the evaluation. Understanding the criteria is the premise for the implementation for it. Hence the teachers need to study the cases of criteria for the course. In terms of the time, there are unit evaluation and class evaluation. A semester plan for a unit evaluation must be arranged in advance of each term and informed to the students. Besides, as is discussed in part 2, the evaluation ways must be diversified, especially for the oral presentations.

3 Conclusion

The college English listening and speaking course based on the “Output-Driven, Input- Enabled Hypothesis” adopts an integrative teaching approach and tactfully combines the input and output. In this integrative teaching, with the output as an aim, the input is optimized accordingly. Listening and speaking tasks guided by the “Output-Driven, Input- Enabled Hypothesis” incorporate broadening view into learning English skills and cultivating thinking ability into improving language competence. Students can generate a strong motivation in learning and explore actively the language form needed by the output tasks, which has a certain guiding significance for taking full advantage of limited class time. Facts proved that this hypothesis is highly feasible and practicable. Establishing a sound curriculum system guided by “Output-Driven, Input- Enabled Hypothesis” requires the endless experimentation and energetic innovation of our teachers and educators.

On Implicit Ideological and Political Education Function of Artistic Culture in College*

Tan Cai¹, Yu Feng¹, Qi Shifeng²

1 School of Art And Design, Wuhan University of Technology, Wuhan, P.R.China, 430070

2 National Library of China, Beijing, P.R.China, 100000

(E-mail: tancai10@qq.com, 1988yufeng@sina.com, qsfuc@sina.cn)

Abstract: This paper discusses the connotation of art and artistic culture, trying to analyze the implicit ideological and political education function of art culture in college based on communication studies. This paper proposes to push forward the educational function of artistic culture environment by taking distinctive artistic works as the carrier; strengthen the educational function of artistic culture communication by taking important artistic culture activities as an opportunity; and develop the ways bringing implicit ideological and political education function of art culture in college into play by taking artistic culture practice of students as priorities, such as educational function of artistic culture process.

Key words: Artistic culture; Communication; Ideological and political education

1 Introduction

The National Mid-long Term Education Reform and Development Planning Outline (2010-2020) takes university culture construction as one of the main duties of higher education, pointing out to “play the educational role of culture actively and push forward to combine the university culture construction and talent cultivation”. The 18th CPC National Congress Report points out that “culture is the blood of Chinese nation and the spiritual home of the people. In order to build the moderately prosperous society and realize Chinese nation’s great rejuvenation, it’s necessary to vigorously develop and enrich of the socialist culture..., and play the role of culture to lead fashion, educate people, serve society and promote development.” It’s necessary to give a full play of aesthetic education and morality cultivation function of culture, which will help students to fulfill the socialist core values consciously and help students to possess both political integrity and ability, develop comprehensively, and achieve to the goal of ideological and political education.

Many scholars have done researches on management mechanism, development trend and significance of art education in colleges, only covering the aspects of management science, empirical research, and etc. This paper tries to analyze implicit ideological and political education function of artistic culture in college and puts forward the ways bringing implicit ideological and political education function of art culture in college into play.

2 Connotation of Art and Artistic Culture

“Art” and “artistic culture” are two different concepts. “Art” means “skills” and “artistic techniques” originally and evolves as “Fine Arts” which generally refers to visual arts, plastic arts and even includes non-plastic arts such as poetry, music, etc. The western modern art system refers to the “Fine Arts” system that includes architecture, painting, sculpture, music and poetry. The meaning of art has been updated due to the new artistic phenomena that emerge in an endless stream since the 20th century. Charles Perrault (1628-1703), a poet and fairy tale writer in France in the 17th century, thinks the Fine Arts shall include eight categories, i.e. rhetoric, poetry, music, architecture, painting, sculpture, optics and mechanics; however, rhetoric, optics and mechanics are excluded in the modern arts. With the development of science and technology today, art system has been developed into 14 categories, i.e. 1) plastic arts, including painting, sculpture, architecture, calligraphy and decoration craft; 2) performance art, including music, dance, drama, quyi (Chinese folk art forms) and acrobatics; 3) video art, including photography, film, TV, etc.; 4) language arts, i.e. literature.

“Artistic culture” mainly studies the artistic activities of human from the perspective of culturology, that is to say, “art” not simply shows all connotation and characteristics of “art”, it’s also one of the cultural achievements created by human, which means it’s “art” and “culture” at the same time. “Art” not only refers to form, technique, color or representation, it also covers the sense, sensibility, technology invention achievements, imagination and creation of human. However, “artistic culture”

* This paper is supported by “the Fundamental Research Funds for the Central Universities (WUT: 2014-IB-087)”

shows the culture idea (e.g., ideology, spiritual world, life-style, etc.) through its artistic form, symbol and image. For example, literature expresses the emotional world and value orientation through novel, poetry, drama and essay; music shows the understanding and perception of human on universal order, the secret of emotion and the movement and change law of the nature.

Figure 1 Connotation of Art and Artistic Culture

3 The Implicit Ideological and Political Education Function of Art Culture in College Based on Communication Studies

Artistic culture in college is a vital part of campus culture. It's an effective way to promote implicit ideology and political education through artistic culture by giving full play of its implied and hidden features, which will influence the value orientation, personality shaping and way of thinking of college students imperceptibly.

3.1 The implicit ideological and political education function of art culture in college based on communication contents

In the Shannon-Weaver Model, the information can be transmitted effectively only when P1 (communication subject) and P2 (communication object) share the same code and decode knowledge. Then the standpoint, point of view, interest, experience of P1 can be regarded as the knowledge software set of P1, written as S1; and the standpoint, point of view, interest, experience of P2 can be regarded as the knowledge software set of P2, written as S2. Therefore, composite knowledge software of P1 and that of P2 constitute the set neighborhood of each other. It can be decoded only when two persons share the same knowledge software. It means the necessary condition of successful communication is the intersection of two persons shall be nonempty, i.e. $S1 \cap S2 \neq \emptyset$, which is defined as the effective condition of communication.

Furthermore, the more the knowledge software overlaps, the higher degree of accuracy the information can be transmitted. It's not easy to change the overlapping degree of knowledge software, however, if we adjust the communication contents according to the knowledge software set of the target communication objects during communication and adopt an easy way for the objects to receive, it will enlarge the knowledge software set. Artistic works in college belong to such kind. This kind of work usually shows scenes in social activities via vivid and lively poetry, music, painting, etc. works, which makes college students understand things with appreciation through ways that can be easily accepted by them.

3.2 The implicit ideological and political education function of art culture in college based on communication medium

The American sociologist Paul Lazarsfeld put forward the Two-step Flow of Communication Model for the first time in his book *The People's Choice* in 1944. He thinks ideas always flow to opinion leaders from the radio broadcast and newspapers, and then the majorities who are not so active receive much of their information secondhand from the opinion leaders. Rogers, an American sociologist, develops and improves the Two-step Flow of Communication Model by analyzing the communication flow theory systematically. Rogers thinks information can be transmitted by "one step", which means the media information can get to the receivers directly just by one step without the medium, i.e. opinion leaders; however, the influence of information can be two-step or N-steps (multiple flow). When it comes to the influence flow of information, the influence of information finally gets to the receivers through leaders at all levels, thus, two-step flow is developed as "N-steps flow".

The information receiving group often shows the following psychological activity track during cultural communication: "information provided -- acceptable information -- accepted information -- noteworthy information -- digested information". Artistic culture activities can increase the receiving groups' attention and discussion, as well as the communication steps on the information, so as to enhance the communication effect.

3.3 The implicit ideological and political education function of art culture in college based on communication effect

The complete communication process in the mass communication system shall be the receiving groups gradually change their opinions toward the world under the mass communication imperceptibly. Meanwhile, their changed opinion will in turn influence practice in reality. The feedback mechanism in mass communication system can be defined as follows: various information in mass communication is delivered to receiving groups' brain in different ways, then the receiving groups will have a series of new concepts and consciousnesses after the information being processed and transformed by the brain, which will be externalized and show impact on the outside world under the feedback mechanism, thus, an interactive communication feedback mechanism is formed.

In the process of work creation, activity organization and practice of artistic culture, the process of the young students (the subject) thinking about how to express the contents and create artistic works -- further understanding the finished works -- as well as the process of the young students (the object) appreciating and comprehending the artistic works -- further thinking about the theme of the work will help to arouse students' resonance and lead students to think actively, thus the passive learning mode can be changed to active learning and conscious activities will be formed, which will lead them to realize their value of life.

4 Ways Developing Implicit Ideological and Political Education Function of Art Culture in College

4.1 Push forward the educational function of artistic culture communication by taking distinctive artistic works as the carrier

Artistic works are being done subtly and imperceptibly through various living environments and conditions. Thus people are influenced and edified unconsciously by culture. Cultural education not only means it will influence the external behavior of people in a secret way, but also means to shape one's mentality, which will benefit people for their whole life. The American scholar John Berger, et.al. mentioned in the book *Way of Looking at Things* that "things observed are different from what are known to people. It also will arouse a new interest and even a stronger interest if new ways are applied to perceive things that are already known". The ideological and political education theory can have new ways through artistic works, which can stimulate students' cognitive interest as well as new interests to learn things.

Colleges can carry out regular show, publish serialization and exhibit online by combining poetry, photography, music, painting and many other artistic works with the theme of "Love Country", "Love School", etc., which aims to increase the cultural influence of artistic works among teachers and students, especially the young students who shall be the priority target objects. The vivid, true, novel and direct cultural works are more in line with the law of somatopsychic development of young students and are prone to be approved and accepted by them due to the appetency and appropinquity showed in the works, thus it will be easier to strengthen the ideological and political education function among students.

4.2 Strengthen the educational function of artistic culture environment by taking important artistic culture activities as an opportunity

Various artistic activities with different themes can help the youth to set up correct overlooks on the world, life and values, to combine self-management, self-service and self-education, and to convert their spontaneous activities into autopsychic practice. Colleges shall take opportunities of freshman education, National Day and other memorial days to hold artistic culture activities. Fully respect the subjectivity of the youth and strengthen the educational function of artistic culture environment by innovating forms, enriching contents and increasing participation, attraction and fashion of the theme.

Wuhan University of Technology holds Art Theater periodically based on Mafangshan Art Gallery and University Art Group, covering performances of vocal music, dances, variety show, etc. Excellent artistic works that reflect the campus life and dream catching experience of students in Wuhan University of Technology inspire and moved many students; meanwhile, fixed and moving exhibitions are combined together and held in square, teaching building, dormitory, classroom, etc. by taking chances of important events in university. Therefore, elegant art and culture are popularized among students and teachers in this way.

4.3 Develop the educational function of artistic culture process by taking artistic culture practice of students as priorities

There are two states of growth and development of human, i.e. “spontaneous development and conscious development”, which is also a key contradiction that ideology and political education has to solve. The aim to develop educational function of artistic culture process in college is to convert their spontaneous consciousness into self-consciousness, spontaneous activities into conscious activities and spontaneous appeal into conscious appeal. The process that students experience and express the beauty of art is exactly the process that their spontaneous consciousness changes into self-consciousness and then converts into the outward practical actions. The processes that colleges encourage students to carry out artistic practices and young students think about how to create artistic works and how to hold artistic activities during practice are the processes stimulating their spontaneous consciousness changes into self-consciousness and then convert into the external practical actions.

Outline of Modern Chinese History, a pilot course, has been opened in Academy of Arts & Design, Tsinghua University since 2011. Students in this class have to present what they have learned from history by “professional languages”. This course divides the teaching contents of Modern Chinese History into about 20 special topics and invites the students to conduct art creation by choosing a historic event or figure that they are interested in. The students can create poetry, write the brief history of development of their own major or introduce the leading figures in their field by combining what they’ve learned in the class. Young students further understand and think about history during creation, which actually shows the educational function of artistic culture process.

5 Conclusions

Artistic culture in college is a vital part of campus culture. It’s an effective way to promote implicit ideology and political education through artistic culture by giving full play of its implied and hidden features, which will impact the value orientation, personality shaping and way of thinking of college students imperceptibly. This paper discusses the connotation of art and artistic culture, trying to analyze the implicit ideological and political education function of art culture in college based on communication studies. This paper proposes to push forward the educational function of artistic culture environment by taking distinctive artistic works as the carrier; strengthen the educational function of artistic culture communication by taking important artistic culture activities as an opportunity; and develop the ways bringing implicit ideological and political education function of art culture in college into play by taking artistic culture practice of students as priorities, such as educational function of artistic culture process.

Research on Entrepreneurship Education in College Work-Study Program

Zhu Min

Student Work Department, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: 1135316@qq.com)

Abstract: Currently college students have more and more spare time, and work-study activities becomes a hot topic in their lives. But with the development of college work-study, the current situation is not as optimistic as we have expected. During the process of work-study, the key factor is, on the one hand, how to get the deserved rewards, and on the other hand, how to guarantee their good grades and help their employments and entrepreneurship. On analyzing the current situation of work-study activities, this paper combines the thought of the author and discusses the study of entrepreneurship education in college work-study in details.

Key words: College; Work-study; Entrepreneurship education; Enterprise

1 Introduction

Up to now, college work-study development has gone through 20 years, changes have been made in the form of the idea of "economic aid" to "overall development of students of education". Current college conventional work-study jobs have been difficult to meet the needs of the students. Along with social progress, work-study diversification has become increasingly important. Also, the number of college graduates today in the growing period, the employment pressure increases. Therefore, to implement entrepreneurship education by offering college work-study jobs to students, which is targeted to improve entrepreneurial capacity of college students, can effectively ease the employment pressure.

2 The Classification of Work-Study Programs at Present

Along with the development of the work-study, at present, work-study program can be divided into the following categories in accordance with the general standard in the table:

Table 1 The Classification of Work-Study in Colleges and Universities

Work-study	Proportion	Basic Situation
Tutor	35%	The mainstream project of them is to tutor some middle and primary school students, through their own knowledge to earn some money.
Campus jobs	15%	It provides students with relatively stable jobs inside the school, which is called "Iron rice bowl". This kind of work is not much, basically only meeting the needs of a small fraction of people.
Market research and promotion	25%	This kind of position has a very large demand for talents, and is basically a perennial demand. By participating these activities, students can exercise personal sales ability, communication and coordination ability better. It's very helpful to improve the students' comprehensive ability.
Etiquette anchorperson	5%	Such positions, are not suitable for the average college students to participate. Because student's physical condition requirement to an etiquette host is very high, and it is only suitable for a small number of students.
Catering services	20%	More students are engaged in this kind of student work. Most of them work in some school canteens, restaurants or hotels, but the salary is generally low.

3 The Field Survey and the Results of Work-Study in Colleges and Universities

3.1 The field questionnaire survey;

The way is to make a questionnaire in 8 colleges (Information institute, Automation academy, faculty of science, school of management, school of economics, the institute of electrical and mechanical, civil engineering institute, material and environmental college) in Wuhan University of Technology.

Table 2 Questionnaire Distribution and Recovery Situation

college	Distribution number	Recycling number	Effective number
Information institute	50	41	38
Automation academy	50	38	37
faculty of science	50	43	43
school of management	50	37	36
school of economics	50	42	40
the institute of electrical and mechanical	50	42	42
civil engineering institute	50	45	44
material and environmental college	50	48	48

3.2 Relevant data and conclusions of the questionnaire survey

Figure 1 The Way to Get the Work and Study

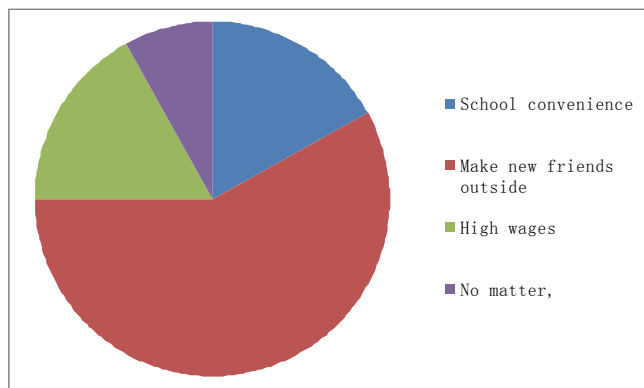

Figure 2 The Location and Reason of the Students Choosing the Work Study

Figure 3 The Tendency of Students to Choose the Work Study

From the above analytic data we can see that the teachers provide some poor students with part-time work. And another part of students are mainly willing to accumulate practical experience and ask the teacher for job. At present, the students have a good information exchange between the supply and demand.

For most students, they are willing to work outside the school, because they can know new friends, and get a higher reward. Most of the students taking a part-time job can rely on their ability to find a regular part-time platform, and sign the agreement for temporary work. At the same time, some marketing positions also need job training. For General campus professional counterpart's jobs, the students will get started quickly, in no need of training. In view of this, campus jobs do not play a better fundamental role in student's future occupation.

Students choosing work, most of them focus on high reward, simple work and close to teachers closely. And the requirements of professional counterparts are less, which is related to the school's professional settings. Generally, a professional counterpart is very difficult for students. There is a big gap between the Universities and the enterprises, which needs the cooperation of school and enterprise to shorten the gap.

4 Analysis on the Problem Appears on the Implement of Current College Work-Study

4.1 Students have some biased cognition on work-study

Many students have one-sided thinking that students participate in work-study just because of economic difficulties, which caused a negative impact on some students. Someone who participates in work-study generally wants to keep it a secret to his classmates and teachers. In addition, the main task of college students is to learn knowledge. As a student, he or she should thoroughly study professional knowledge to get a skill so that he can play to their strengths and make innovation and entrepreneurship after graduation.

4.2 College work-study jobs are in short supply

According to the situation of students work-study job supply in some colleges, the supply is relatively small, but there are many students in need of part-time job, which leads to conflicts. In some classes, if the supply is open positions within the school, there will be a problem because of the uneven distribution among students. According to the organization's work-study jobs on campus open recruitment announcement, the number of jobs and the proportion of students to apply up to 1: 6, and the positions such as librarian are more attractive to students.

4.3 Low levels of work-study jobs

Since students participating in work-study are in the period of learning expertise, their knowledge structure is not sound, and they are lack of practical expertise. Hence, their jobs are in the relatively low level, unchallenged. From a practical point of view, such jobs have limited help on training students' professional skills. Based on this situation, it is better for school to develop work-study jobs by combining profession of students, allowing students to participate in social practices, and giving full play to their own professional advantage.

5 Some Suggestions for Work-Study Promoting College Students Entrepreneurship and Employment

The Work - study needs gradually return to nature, which means training college students' spirit of hard Work and thrift. The qualities are very important for students in the start - up phases of the entrepreneurship. In the process of work – study, the effective exercise of social skills of students can be a certain amount of resources in students' future business.

5.1 Providing attention to the ideological education of the Work-study program

At the time of students' participation in the work-study, the school needs to gradually improve the management mechanism, Also needs to keep the designed work - study regularly checked and analyzed. The students' ideological education should enable the students to understand the real purpose of part - time work. Cause the personal qualities of student plays an important role in their future growth and development.

5.2 Improve the professional of work-study activities

It requires some professional foundations for students to start their own business. And students participating in the work - study activities can not only gain the economic benefits but also test learned knowledge and learn more important professional skills. Therefore, the arrangement on the The Work -

study in school should improve the professional level of the jobs. By certain social practice, students develop a deeper understanding of professional development for the future business direction.

5.3 Provides forceful support for college entrepreneurship

Firstly, to create an entrepreneurial environment. Which is means business environment including atmosphere of entrepreneurship policy, entrepreneurship venture capital etc. In recent years, the country has introduced a number of policies to encourage entrepreneurship. Secondly, to create a business atmosphere. Thirdly, to emphasis on entrepreneurship education and training. At present, the school has offered entrepreneurship courses, and formed a scientific and perfect system of entrepreneurship education and research. But a lot of other University entrepreneurship education has not paid enough attention to it. Which make it impossible for them to provide students with rich and effective nutrients of entrepreneurship. Finally, establishing the whole course pioneering instructions. Entrepreneurial process is full of hardships, students need more help to improve their business success rate.

6 Conclusion

In short, college students' entrepreneurship education requires further exploration. Through the work-study program service, students participate in labor and social practice can improve their self-consciousness and professional skills, train their active enterprising of value orientation and social sense of returning the society. It also provides students enough time to exercise their integrated capacity, which lay a great of based for the future social work, and provide more possibility to employment and entrepreneurship. Its function is bound to get better play.

The Effects of Career Decision-Making Difficulties on the Career Choice Status in College Students *

Liu Zhe

Student Affairs Department, Wuhan University of Technology, Wuhan, P.R.China, 430070

(Email: 802358@qq.com)

Abstracts: There are significantly differences between career decided college students and career undecided college students both on the total level of career decision-making difficulty and 8 types of career decision-making difficulties, and which are studied by controlling the democratic and naturally mature factors. But the further analysis found only lack of motivation for career decision-making and the information about self and information about the career decision-making process have significant effects on the career goal-setting status. Enhancing the motivation for career decision, the knowledge about self and information about career decision-making process can significantly increase the possibility for career decidedness. In the end, the article discussed the result and implication for career education.

Key words: College Students; Career Decidedness; Career Indecision; Career Decision-Making Difficulties

1 Introduction

The goal not only has the function of guidance and motivation, but also the function of behavior optimization (Xiujun Yang,2004).Higher education, which follows the secondary education, is based on social specialized division of labor to launch professional education. The goal is to cultivate advanced specialized talents what the society needs. Therefore, the goal which based on the students' self characteristics and needs of the society can not only help college students to find their new personal goals and eliminate their blindness and the feeling of lost, but also stimulate their original power to study consciously. It will help college students to make learning plans based on college life and to prepare for the future career. However, nowadays lots of students are ignorant and hesitating, and they can't set career development goals for themselves. The lack of career goals influences the enthusiasm and consciousness of our college students badly(Yanqin Chi,2009;Guanjiao Hou, Shumeng Shi,Jianbo Zhang ,2010).Although some scholars think that career indecision is a normal phenomenon through personal career development from the point of personal career development theory, the majority regard it as a career problem needing to be intervened and researched on theoretical interpretation and special causes (Zhiyi Wu,2000;Lifen Wang,2003).At the same time, for the career development, college students' career development is between career exploration period and establishment period. During this period, college students' main development missions are to clear the career development direction gradually and make special career plans through activities of self cognition and work exploration, which is in order to explore their knowledge and skills in work field (Baoguo Xie,Dongmei Li,2011).Consequently, no matter from the point of being beneficial to career development or the point of promoting students' original power to study consciously, choosing and determining a career development goal is a realistic problem for young college students.

There are career indecision and career decidedness according to status of career goals. If one doesn't determine the future career, we call this career indecision. If one has determined the future career, we call this career decidedness. An individual may make decisions based on impulsion, fatalism, obedience, intuition and tendency when talking about the way to make career goals. American scholar Marcia pointed out that the decision makers who accepted the arrangement from their parents or others would not be anxious when faced to decisions, but it would be unavoidable for them to resign themselves to the fate and lack of studying interest and autonomy when they prepared for career decision or schoolwork. The ideal career decidedness is autonomous orientated. The autonomous orientated decision maker can take the ideal decision by integrating all kinds of knowledge, and this

* This paper is supported by National Social Science Fund "Research on the integrated model of career choice of new generation college students" (11CSH011), Humanities and Social Sciences Program of the Ministry of Education "Research on the informal employment model of College Students in Wuhan" (10YJCZH100), Fundamental Research Funds for the Central Universities "Contemporary Social Ideological Trend's Influence on College Teachers and Students and Countermeasures Research" (2013-ib087),

decision model is called the 'ideal model'. However, various difficulties (such as lack of decision motivation, irrational beliefs, self unknown and so on) which occur in the decision process will obstruct personal career goals decision. Although some researchers have studied the relationship between the total level of career decision-making difficulties and the career decision status (Xueping Shen, 2005), but they didn't discuss about how the specific types of career decision-making difficulties influenced the career decision. The fact is that different types of career decision-making difficulties have different effects on college students' career goals.

2 Research Methods

2.1 Research sample

Research was taken on two key universities of the Ministry of Education (one is a liberal arts college, the other is a science and engineering college) with stratified sampling method. Considering the freshmen students have entered the college just for a short time, the research did not involve them into this research samples. The research issued 800 questionnaires and received 721 questionnaires altogether. The rate of recovery was 90.13%. The effective questionnaires were 646, and the rate of effective recovery was 80.75%. The proportion of male was 55.73%, the proportion of female was 43.03% and unknown gender was 1.24%. The average age of the samples was 20.79 ± 1.19 and among which the proportion of sophomore was 36.84%, junior was 37.30%, senior was 25.08%, and unknown grade was 0.77%. Based on the question "the degree of certainty on your career goals" (the answer options are certain and uncertain), the research divided the total samples into career decided college students and career undecided college students. There were 268 career decided students, which accounted for 41.49%, and there are 372 career undecided college students, which accounted for 57.59%. There were 6 students who didn't give the answers, which accounted for 0.93%. The detail information of research sample is as follows the table 1 under below:

Table 1 Detail Information of Sample

Group	Age	Sex		Origin			Grade			Major	
		Male	Female	Cities	Town	Rural	Sophomore	Junior	Senior	Natural Science	Humanities and Social Sciences
Decided	21.10± 1.27	141	124	47	91	116	75	90	103	153	114
Undecided	20.52± 1.07	218	153	66	132	167	163	151	58	265	106
Total	20.76± 1.19	359	278	113	223	283	238	241	161	418	220

2.2 Measuring instrument

Gati(1996) pointed out the measuring instrument mainly based on ideal career decision maker model. According to the model, the ideal career decision makers should be: 1) They realize it is necessary to make career decisions and have the willing to do this. 2) They are able to make decisions consistent with their personal goals based on scientific and systemic steps. Anybody who can not achieve the ideal career choice state is the one who has difficulties to make career decisions. Gate(1996) proposed the widely accepted classification model of career decision-making difficulties with the method combined with experience and theory. And at the same time Gate developed the career decision-making difficulties questionnaire (CDDQ) (Gati et al., 1996). Questionnaire measures the following 10 categories of professional decision-making difficulties: 1) Lack of motivation. High score illustrates the lack of willingness to make career decisions. 2) Hesitation. High score illustrates the difficulties when making any decisions. 3) Irrational beliefs. High score illustrates the distorted understanding of career decision-making. 4) Lack of knowledge about the process of career decision-making. High score illustrates that not knowing how to make wise career decisions. 5) Lack of information about self. High score illustrates the decision makers' not fully understanding themselves. 6) Lack of information about career. High score illustrates the lack of information about existing occupations. 7) Lack of knowledge about how to acquire information. High score illustrates that they not knowing how to acquire the information about themselves and occupations. 8) Unreliable information. High score illustrates that there are contradictions between themselves and the information of occupations which they are considering about. 9) External conflict. High score illustrates that there are conflicts and contradictions between personal preferences of decision makers and preferences of important person.

In 2005, Xueping Shen made a localization amendment about the CDDQ. The research of Xueping

Shen(2005) showed that the Chinese version of CDDQ had good internal consistency, retest reliability, construct validity and criterion validity(Xueping Shen,2005). The Chinese version of CDDQ involves 10 categories of career decision-making difficulties mentioned above, and there are a total of 35 items (3 are identification items). Taking into account the current development of the tool specifically designed to measure the irrational beliefs of life (Mian Xia, Baoguo Xie, 2010), therefore, this study only extracts 31 items from the CDDQ Chinese version to measure 9 kinds of professional decision-making difficulties.

2.3 Data processing

We use Visual FoxPro 6.0 to input and manage the data and analyze the data with SPSS17.0 for windows.

3 Research Results

3.1 Descriptive statistics, relationship and reliability analysis

In order to facilitate the comparison, each type of career decision-making difficulty item is added to the total, and then divided by the number of projects, and the project is divided into the following statistical analysis. We will carry out statistical analysis with the average score of the items.

There is not only a significant positive relationship between different types of career decision-making difficulties, but also with the students' career orientation. That's to say, the higher level of individual career decision-making difficulties, the more difficult to determine the career development goals. "Lack of motivation", "Lack of knowledge about the process of career decision-making", "Lack of information about self" and "Lack of information about career" have the closest relationship with career orientation. At the same time, Table 1 also shows that the internal consistency coefficient of the 9 components of the questionnaire is between 0.617 and 0.876. We can do further analysis with good reliability.

3.2 The analysis of differences between career decided college students and career undecided college students on various career decision-making difficulties

Table 2 Correlation Coefficient Tests

Variables	M	SD	1	2	3	4	5	6	7	8	9
Lack of motivation	4.57	1.814	.627								
Indecision	4.99	1.713	.083 [*]	.624							
Lack of information about decision	4.53	1.919	.141 ^{**}	.382 ^{**}	.876						
Lack of information about self	3.89	1.727	.177 ^{**}	.365 ^{**}	.582 ^{**}	.849					
Lack of information about career	5.09	1.873	.150 ^{**}	.333 ^{**}	.529 ^{**}	.547 ^{**}	.828				
Lack of information about measures	4.65	1.854	.105 ^{**}	.375 ^{**}	.517 ^{**}	.554 ^{**}	.648 ^{**}	.617			
Unreliable information	4.10	1.658	.152 ^{**}	.334 ^{**}	.390 ^{**}	.535 ^{**}	.423 ^{**}	.526 ^{**}	.704		
Internal conflict	4.70	1.506	.188 ^{**}	.359 ^{**}	.367 ^{**}	.423 ^{**}	.452 ^{**}	.459 ^{**}	.563 ^{**}	.769	
External conflict	3.98	1.845	.153 ^{**}	.178 ^{**}	.218 ^{**}	.308 ^{**}	.289 ^{**}	.276 ^{**}	.343 ^{**}	.399 ^{**}	.734
Vocational direction	1.58	.494	.274 ^{**}	.129 ^{**}	.302 ^{**}	.321 ^{**}	.239 ^{**}	.227 ^{**}	.247 ^{**}	.148 ^{**}	.128 ^{**}

Table 2 shows that the scores of career undecided college students are higher than that of decided college students on various career decision-making difficulties. Because there is a notable relationship between each career decision-making difficulties, we can use MANOVA to test the significant differences. At the same time, in order to control the influence of demographic variables and natural maturity factors on career orientation, the factors like gender, origin, discipline, age and grade were used as covariates, and then multivariate analysis was conducted.

From Table 2 we can see that the total level of the career undecided college students is much higher than that of the career decided college students on career decision-making difficulties. The test of between-subjects effects show that, besides the external conflicts, the career undecided college students have more difficulties on other 8 kinds of career decision-making than the career decided ones.

3.3 Logistic regression analysis of occupational orientation on various types of career decision-making difficulties

In order to investigate the influence of various types of career decision-making difficulties on

college students' career orientation and find out the key factors that affect the career orientation of college students, logistic regression analysis was carried out in this study. The results are shown under below in Table 3.

Table 3 Multivariate Tests

Multivariate Tests			
Measures	Value	F	
Wilks' Lambda	.859	8.82**	
Hotelling's Trace	.164	8.82**	
Tests of Between-Subjects Effects			
Dimension	Decided (M±SD)	Undecided (M±SD)	F
Lack of motivation	4.05±1.84	4.96±1.70	22.96**
Indecision	4.75±1.78	5.19±1.62	12.78**
Lack of information about decision	3.87±1.85	5.04±1.82	44.28**
Lack of information about self	3.25±1.51	4.37±1.72	51.01**
Lack of information about career	4.57±1.99	5.48±1.69	22.92**
Lack of information about measures	4.05±1.76	5.09±1.80	23.86**
Unreliable information	3.63±1.52	4.46±1.67	20.48**
Internal conflict	4.45±1.58	4.90±1.42	8.95**
External conflict	3.70±2.01	4.21±1.87	3.46

** P<.01

By MANOVA, although the specific career decision-making difficulties have certain impacts on college students' career orientation, but multivariate logistic regression analysis shows that the size of their influence on College Students' career orientation is not the same. Specifically, after controlling the relationship between each other, only "lack of motivation", "lack of information about self" and "lack of knowledge about the process of career decision-making" three kinds of difficulties have notable influence on college students' career orientation. From the Exp (B) of these three kinds of career decision-making difficulties, we can see that:(1)In the case of other conditions unchanged, if to increase the motivation of a unit, then the career orientation of college students will be increased by 0.232 times.(2)In the case of other conditions remain unchanged, if you increase the knowledge of the professional decision-making process a unit, then the university student career orientation will be increased by 0.228 times.(3)In other conditions of the same situation, if you increase the information about self information a unit, then the university students career orientation will be increased by 0.316 times.

4 Conclusions

This research is under the view of "ideal career decision model" and study on the career decision-making difficulties of college students' career orientation, and we finally get some meaningful findings.

First of all, various kinds of career decision-making difficulties have different impacts on college students' career goals, and the research idea is verified. Multivariate Logistic regression analysis shows that "lack of motivation", "lack of information about self" and "lack of knowledge about the process of career decision-making" are the main factors that affect college students' career orientation. This reminds us that we should grasp the above three factors in the career education of college students, and to improve the ability of college students' career choice. Specifically, first of all is to increase the career awareness of college students, and to stimulate their career decisions. Motivation is the basis of behavior. If there is no strong motivation for career decision, students naturally can not determine the goals of career development. The specific ways include campus culture, subject infiltration, and career course and so on. In addition, students can know about themselves well and master relevant knowledge about the career decision-making process through self-help activities, career courses, career groups, individual counseling and other ways. Only after the students have formed the comprehensive understanding of themselves, will they not be lost in the face of choice, and they will know what they want, what is suitable for. After mastering the knowledge of decision-making process, they can make informed career decisions, and strengthen their own choice.

Although according to the "ideal career decision maker" model, it has a significant influence on the career orientation of college students, but the influence is not very big. From Table 3 we can see that the rate of the contribution of "lack of motivation", "lack of information about self" and "lack of knowledge about the process of career decision-making" to the increasing of career orientation is 16.00%. If we take the other six types of career decision-making difficulties along with the above three kinds of career decision-making difficulties together, we can conclude the overall contribution rate is 23.5%. Thus it can be inferred that, at present, many college students are not fully aware of their own characteristics. So they can't determine the career goals according to the scientific and systematic career decision-making process. The results of this study are consistent with the results of the related studies. In the study of youth groups, the proportion of autonomous orientation is relatively low (Bo Zhao, Jing Ding, 2007). What factors hinder college students to become an ideal decision-maker and how to guide the students to take the scientific and systematic career decision-making process in the face of the career choice are worth further research and discussion in the future.

Research on Long-Term Memory Processing Strategies in English Financial Terms: A Case Study

Liu Rufe

Foreign Language School, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: liurufe2005@qq.com)

Abstract: Research on long-term memory processing strategies of English financial terms is pretty necessary upon the highly development of economy in China. The study intends to explore how do the several long-term memory processing strategies as word formation, categorical clustering and recycling strategies relating to memory theories as encoding, storage and retrieval facilitate memorizing English financial terms. Since repetition strategy is still the most popular one among students even it has been criticized by scholars, 20 students from finance major 1102 in Wuhan University of Technology were selected and divided into two groups, utilizing the above mentioned strategies and repetition strategy together memorize English financial terms. Through the data comparison and analysis, the result proves that the combination of the word-formation, categorical clustering and recycling processing strategies is more effective than repetition strategy in the long-term memory.

Key words: Long -term Memory; Processing strategies; Experiment; English Financial Term

1 Introduction

Vocabulary learning is of paramount importance in foreign language learning. Abroad and home, a lot of attentions have been drawn to the studies on the vocabulary learning strategies. Based on the acoustic similarities, Atkinson insisted that two stages were involved in the strategy (Atkinson, 1975). Politzer and McGroarty (1995) found social interaction strategies are closely related to the outcomes of the test on communicative ability and the other strategies are related to the outcomes of different test. O'Malley and Chamo (2010) declared that it is an important key to increasing motivation, because students are used to attribute their level of achievement to their own efforts rather than to unchangeable innate ability. Domestically, A series of empirical studies have been carried out by Chinese scholars in high schools and universities. Ding Yi (2010) has researched into the comparison of vocabulary learning strategies used by good learners and poor learners. Mao Haoran (2013) aims to study the effect of pleasant mood on memorizing English words. Generally speaking, both Chinese and foreign researchers utilize a large amount of empirical research methods concerning the study of English vocabulary memory strategies. But there are also some problems such as, seldom, the researches are concerned with the discussion of how the short-term memory can be converted into long-term memory in words learning, let alone the long-term memory processing strategies for the English terms used in financial field.

Based on the periodicals and articles from the Internet and empirical researches, sources of difficulties in memorizing English financial terms are as follows. First, scarce of target language input causes the difficulty in their learning, many new English financial terms together with phrases, compounds, abbreviations are rarely repeated in the finance related articles prevent students from acquiring all of them in a short period. Second, English teachers' traditional duck-dumping vocabulary teaching methods deprived their interest of memorizing financial terms. And above all, a large use of repetition strategy among most students only lead to short-term memory, while, few chances to utilize the memory processing strategies in English financial terms contribute to the memorizing difficulties. To solve this problem, we'd better first learn some memory theories and memory strategies relate to them.

2 Memory-Theory- Related Processing Strategies in English Financial Terms

Memory is generally regarded as consisting of three stages: they are encoding, storage, and retrieval. That is, to take in the necessary information, to store it, and to retrieve it at the appropriate time. However, human memory is potentially inclined to lose information at each of these points and forgetting occurs continuously on a massive scale. In this part, some practical long-term memory processing strategies in English financial terms based on memory theories will be presented. With them, learners can learn English financial terms in a scientific and systematic way.

2.1 Encoding and word formation processing strategy

According to the memory theories, the capacity of short-term store is rather limited. Long

information can be available only when the information is encoded into meaningful parts and meaningful parts are beneficial to long-term memory. (Nation, 1990). In fact, English financial terms can be lexically classified as compounding, derivation and acronym. Compounding such as “Floating rate”, derivation such as “dollarization” = dollar + suffix –ize + suffix –tion , Acronyms such as “APR” means “annual percentage rate” while “ARP” means “adjustable rate preferred stock”.

Many **English financial terms** are made up of two or more parts: a basic part or root, and one or more suffixes or prefixes. These meaningful parts can help learners to memorize words efficiently and figure out the meaning of some unfamiliar words. Supposing the learners can grasp affixes and roots well and they can encode the words efficiently into meaningful parts every time consciously, they will undoubtedly speed up their vocabulary learning. For example, a learner wants to memorize a financial term “interchangeable”, If he memorizes the letters separately, that is fifteen parts for him; but if he encodes in this way inter/change/able, the word is only three meaningful parts. In this way, the learners can relieve the burden of memory and learn more new words efficiently with sub-meaningful information.

2.2 Storage and categorical clustering processing strategy

The organization of semantic entities in memory has a powerful influence on memory. Nation stated that the clustering attached to a word affect the way that it is stored in the brain, and this will affect the availability of the word when it is needed (Nation, 1990). Nation suggests that similarities in sound, morphology or etymology can assist word memorization. The function of working memory is to record the association of events. Short-term store does not randomly associate concepts, while in long-term store, associations appear to be made in a logical and organized way.

Therefore, when we memorize the English financial words, we can use different ways to divide them into different groups. For example, we can divide the words into synonyms and antonyms. Synonymy: refers to the clustering of the words with the same or similar meanings. For example, terms, conditions, secret, confidential, rent, charter hire, charter money. Antonym: refers to the clustering of the words with opposite meanings. For example: long position —short position, visibles—invisibles, movables— immovables. In this way, students may not only remember the target words but also the words relating to them. Thus, their words can be stored in a long-term way.

2.3 Retrieval and recycling processing strategy

With regard to forgetting theory, forgetting is due to simple decay that refers to the weakening of the trace with time. Thorne, B., Henley, T. (2005) says Ebbinghaus' forgetting function reveals that rapid forgetting occurs at the first few hours, and then slows down. One effective way that prevents forgetting is review in time. The review can be done continuously within a certain period of time that is called mass review. It is also done in several shorter but regular periods of time within the overall review, which is called space review. In fact, space review is more advantageous than mass review.

As far as English financial terms learning are concerned, the learners should do what they can to shorten the interval between learning and review and spend more time on it. Then learners can increase the interval a longer and may spend less time on it. If learners review much in a certain time, they will feel tired and interfered with. However, the time interval in space review is not long and therefore, the planning of review time will work and long-term memory can be achieved.

3 Case Study: Long-Term Memory Processing Strategies in English Financial Terms

3.1 Research hypotheses

Usually, repetition is regarded as the most popular and efficient way to avoid forgetting, but unfortunately, it won't work unless the short-term memory be efficiently and timely transferred to long-term memory, which is always beyond the monitoring of the students. This study attempts to testify the following hypotheses:

1) Repetition can be considered as low-level of processing and efficiency in memorizing English financial terms..

2) How well people remember English financial terms depends on how deeply they process it with proper long- term memory processing strategies;

The author chooses the word-formation strategy, categorical clustering strategy and recycling strategy which are related to memory theory of encoding, storage and retrieval to test whether they work better for Chinese students who are used to memorizing English financial terms with single repetition strategy. This part provides the detailed analysis of the experiment, which involves the students'

retention of the target words over a month.

3.2 Methodology

Participants :

The 20 subjects were randomly chosen from the finance 1102 in Wuhan University of Technology. Experimental Group (EG) and the other was Control Group (CG). Before this research, they had similar learning experience under the same teaching curriculum. The EG (n=10) learned new words utilizing the above three long-term memory processing strategies and the CG (n=10) in repetition strategy. The 20 students were asked to choose the unknown words from a finance article. The following tables show the scores accessed by the statistical software SPSS.

Instruments:

Pre- and post-experiments were taken to find if there was any changes made by subjects after the experiment. The purpose of this study is to testify the hypothesis mentioned above. The data were collected and analyzed by statistical formula with the help of Excel and Statistical Package for the Social Science (SPSS).

Process of the experiment:

Fifteen target words were chosen from the articles with time limited within 30 minutes. Data collection was carried out between the EG and CG in the following five steps.

Step 1:

A pre-test was made to choose potential unknown target words from a financial article. Finally, 15 target words were chosen by the students. And the 15 words are as follows: “accommodation bill”, “actuarial investigation”, “benchmark yield curve”, “disclaimer of lease”, “inflationary spiral”, “monetary squeeze”, “pecuniary legacy”, “syndicated loan”, “accommodation party”, “synthetic stock”, “accrued expenses”, “pecuniary liability”, “benchmark database”, “disclaimer of property”, “monetized value”.

Step 2:

Both of the two groups of the students were given the 15 target words in a 30-minute period. The students in the Control Group were asked to read and write the words repeatedly. The students in the Experimental Group were asked to analyze and process the words with the above strategies and classify the target words according to their meaning or form basing on the categorical clustering. Such as the prefix as “ac-to act, mone-money-related, dis-against, syn-together”, 15 noun phrases concerning the fields of “rent, charter hire, charter money”. In both situations, the instructional materials were collected at the end of the 30-minute period.

Step 3:

Test 1 was carried out after a 20-minute break following the period of instruction. The test required the students to write down the English words according to the Chinese meaning. And then, both groups were asked to review those words every day, and the Experimental Group was told that they should process the words according to the strategies taught the first time every time in their daily review.

Step 4:

Test 2 was administered one week after test 1. The content and the requirement were the same as those of test 1. The subsequent requirement for both groups this time is the same with the last. Besides, the Experimental Group is told that their reviewing time can be adjusted with the Ebbinghaus' curve theory, mentioning that regular reviewing (such as 10 minutes within first 5 days, then 10 minutes every other day within 10 days and then every two days within another 15 days) can transfer the short-term memory to long-term memory efficiently while the Control Group is required to repeat their words every day.

Step 5:

Test 3 was carried out one month later after test 1. The content and the requirement were the same as those of test 1 and test 2. The subsequent requirements for both groups this time is the same with the last. And the same requirements are given to them respectively.

3.3 Data collection and analysis of the experiment

In scoring, each correct answer was awarded one point. Where partially correct, or a somewhat close but vague, answer was provided, a half point was given. There was no score deduction for an incorrect answer.

Table 1 Result of Test 1

	Time	Percent of retention	Means	Standard Derivation
Experimental Group	3minutes	72%	11.29	1.90
Control Group	3 minutes	69%	9.83	1.74

The result clearly manifests itself that in the immediate test, there are differences between the Experimental Group and the Control Group, but the difference is not very clear. The reason is that the number of the target words is not very large, and the period from memorizing the word to test time is much short. And in the short period, the Control Group can remember the words easily by repetition.

Table 2 Result of Test 2

	Time	Percent of retention	Means	Standard Derivation
Experimental Group	3minutes	67%	10.10	2.07
Control Group	3 minutes	53%	7.63	1.5

The result showed that in the post-test of one week later, there are significant differences between the two groups. By learning words in the above strategies, the Experimental Group experienced a deep level of processing, and can thus achieve a longer memory than the Control Group.

Table 3 Result of Test 3

	Time	Percent of retention	Means	Standard Derivation
Experimental Group	3minutes	58%	9.13	2.16
Control Group	3 minutes	43%	6.689	1.71

The result of the post-test of one month later proved more strongly that there are significant differences between the two groups. The Experimental Group which utilizes those above strategies well can efficiently maintain the long-term memory than the Control Group.

It is evident from the three tables that throughout the three tests, the Experimental Group consistently outperformed the Control Group. Both types of the statistical analysis, the percentage and the means that the scores of the experimental group and of the control group on the three recalls are different, especially in the post-tests, indicating support that the combination of the word-formation, categorical clustering and strategy is more effective than repetition strategy, in terms of both immediate retention and longer-term retention. The result proved the theory that: How well people remember information depends on how deeply they process it. Repeating words as strings of sounds can be considered as low-level of processing and badly remembered; working out the deep relation such as the meaning and form leads to longer memory. Therefore, taking into account both word retention and the facilitation of students' later production, it appears advisable to process and integrate strategies while memorizing English financial terms.

4 Conclusion

No matter how well the student learns grammar, no matter how successfully the sounds of second language are mastered, without words to express a wider range of meanings, communication in a second language just cannot happen in any meaningful way. It is also true when it comes to English financial terms.

The researcher made investigations on the use of long-term memory processing strategies, the result showed that repetition method is popular although it is a mechanical method criticized by most of the scholars and psychologists, and in China rote-learning still plays an important role. At the same time, some long-term memory processing strategies are proposed such as word formation strategy, categorical clustering strategy, recycling strategy to help learners learn vocabulary in a more scientific way and solve vocabulary memorizing problems.

The experiment done by the researcher between the two groups adopting repetition and the above mentioned strategies respectively shows that processing memory strategies facilitate long-term memory. Of course, due to the limitation of samples and time, there is still something to be desired in the further study.

On Conflicts of Family Ethics and Social Norms in the Lottery*

Zhang Ruilin, Wu Yueqin

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 494131105@qq.com, 1339088650@qq.com)

Abstracts: American female author Shirley Jackson's recognized masterpiece, the short story *The Lottery*, has showed her discussions and criticism on people's living conditions and thoughts after World War II. In this novel, conflicts of famous ethics and social norms have been demonstrated thoroughly by the reverse attitudes of the families during the ritual. And those conflicts could be divided into conflicts on conjugal relationship, conflicts on child-parent relationship and conflicts on sibling relationship. Researching on those conflicts in this novel would definitely contribute to conflict resolving in contemporary society.

Key words: The Lottery; Family ethics; Social norms; Conflicts

1 Introduction

The short novel *The Lottery* earns Shirley Jackson numerous compliments along with overwhelming criticism. There are lots of discussions about the theme of this novel.

Though Shirley herself had responded to her readers in *San Francisco Chronicle* about her intentions of writing this story that "Explaining just what I had hoped the story to say is very difficult. I suppose, I hoped, by setting a particularly brutal ancient rite in the present and in my own village to shock the story's readers with a graphic dramatization of the pointless violence and general inhumanity in their own lives." There are still lots of comments and discussions from various aspects.

Scholars have their own distinct views from various perspectives, such as insight into symbolism, allusion to McCarthyism, condemning to massacre, metaphor for the Bible, image of scapegoat. For example, Helen E. Nebeker discussed in the critical essay *The Lottery: Symbolic Tour de Force* that every major name has a special and potential meaning. "She has also hinted at larger meanings through name symbolism. 'Martin', Bobby's surname, derives from a Middle English word signifying ape or monkey. This, juxtaposed with 'Harry Jones' (in all its commonness) and 'Dickie Delacroix' (of-the-Cross) urges us to an awareness of the Hairy Ape within us all, venerated by a Christianity as perverted as 'Delacroix' vulgarized to 'Dellacroy' by the villagers."

Nevertheless, despite that democracy and humanity are thought to be the main topics of this novel, the conflicts of family ethics and social norms dose attract people's attention. Family relationship is recognized as the most intimate relationship comparing with other social ones, let alone blood relationship. So this paper wants to probe into the conflicts of family ethics and social norms in this novel to deeply demonstrate the general thoughts about this topic.

2 Family Ethics and Social Norms

2.1 Family ethics

Family can be normally defined as a group of people affiliated the recognized birth, the marriage in the context of human society. At the same time, family has its own social attribute that people are connected together through separate small families. Men and women, the two groups of persons with opposite genders, are endowed with respective characters and physiological status. Thus, family is created to have more intimate relationship and also mankind can procreate to maintain the continuation of the race and it can be traced back to the very beginning of the history of human.

Family relationships have their own nature ethically significant, which generates the familial obligations. In this sense, family is tightly linked with familial obligations and this ethical nature in family is then highly appreciated. "Since the family is considered a social unit which normally involves an intense and long-term protective, supportive, and cooperative relationship among its members." And this nature of family relationships requires people to make appropriate responses to the family members' needs, interests or problems.

2.2 Social norms

The term "social norm" can be referred to a particular category of action-guiding prescriptions,

* This paper is directed by Professor Wu Yueqin in School of Foreign Languages in Wuhan University of Technology

prohibitions, and permissions, which can be distinguished from other kinds of practical considerations on ontological, epistemic, and normative grounds. In that case, social norms circulate within specific groups, organizations, or societies.

Part of the normalization of social norms is grounded in existing or perceived social practices. Maybe sometimes people have got used to it and will obey it unconsciously. It will never say that social norms do not exist. For most people believe in that, a specific system of one norm will be established to better control the actions and talks of people to reduce the chance of arguing for senseless things. It's better to say that social norms write the standards other than create the standards.

Nevertheless, without correct public concepts, the formulation of social norms would result in escalation of disputes and the whole society would be in turmoil.

2.3 Conflicts of family ethics and social norms

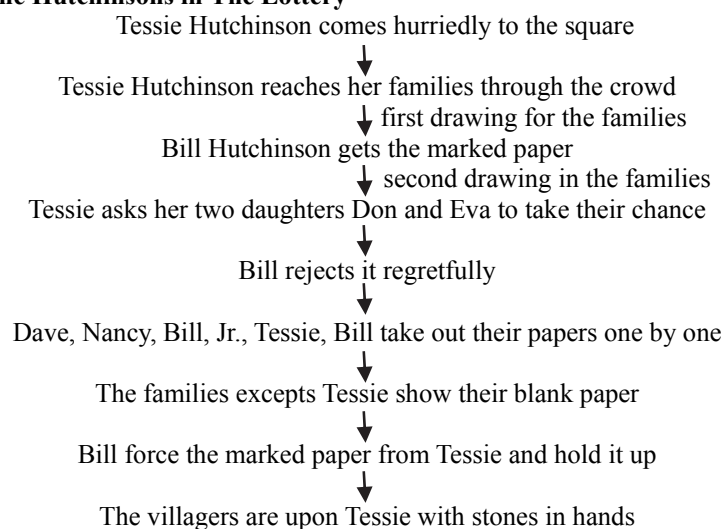

Just like what the sociologist says that these family groups are probably among the oldest and most basic types of groups. Family can be taken as the micro-world of the society. The society's characteristic decides that of the family. Accordingly, the change of the family mainly results from the change of the society. And the family, which plays an important role on the personality of the individuals, is the place for individuals to be directly connected with the society. Well-functioning families' social or political utility can surely provide a justification for the practice of certain family morality within a society, which means it's the key element of a society of stability and integrity. Meanwhile, the atmosphere of the society could easily influence the status of each family member. For example in ancient China, the patriarchal society advocates the three cardinal guides that the ruler guides his subject, the father guides his son and the husband guides his wife. The basic stratum is set up on this social background.

Generally speaking, family ethics and social norms have mutual effects with each other and mutual adaptation exists throughout the whole process of development. Otherwise, some sorts of conflicts can be seen even in our daily life. Family ethics and social norms do not always completely match that a series of slight differences may lead to an enormous divergence.

Families are requested to support and respect each other. However, a number of old ideas like gender discrimination make familial relationship become abnormal and deviate from its original nature. In the story of *The Lottery*, we witness a subversive change of the families' attitudes towards their folks with whom they are living together for the most time of their lives.

3 Conflicts of Family Ethics and Social Norms in the Lottery

3.1 Time line of the Hutchinsons in *The Lottery*

3.2 Conflicts on the characters' personalities of the Hutchinsons in *The Lottery*

3.2.1 Tessie Hutchinson—the protagonist and the victim

Tessie Hutchinson, the protagonist of the story, is absolutely the victim of this traditional ritual.

Mrs. Hutchinson has the contradictory attitudes towards the lottery. At one hand, she doesn't care too much about it that she "clean forgot" about the day and is the last one to appear in this civic activity. At other hand, she tries to follow the general trend and "came hurriedly along the path to the square".

Under the invisible pressure of social groups, everyone will make a concession and attempt to bring into correspondence with the masses to avoid being isolated or condemned. This so-called conformity is extremely displayed on Mrs. Hutchinson.

In that case, when facing the threat of being killed, she argues on letting her two married daughters take part in the second round of lottery. Maternal love is always having a high reputation in the society. Mothers are thought to be willing to give up their own life in order to save their children. But in this story, Mrs. Hutchinson is struggling to reduce her rate of being killed by making her daughters take their chance which is definitely against the rules and against her duty in the family.

When the crowds including Tessie's families are upon Tessie, here comes the end of the story and the end of the relationship of the families which is destroyed by the social norms.

3.2.2 Bill Hutchinson—the host of the family

Bill Hutchinson, who draws the lots as the head of the family, is empowered in the patriarchal society. While exercising power, he is required to undertake the corresponding duty at the same time. In this sense, Mr. Hutchinson violates his responsibility and doesn't stand out for his family. He follows the rules and puts his wife and children in danger and may even kills his wife just as what others.

He does reject Tessie's suggestion but this is an adjective deserving to be researched on—"regretfully". What makes him give up the participation of his two daughters is not because of the paternal love but the social standard rules. In other words, if this is allowed by the norms, he is likely to take Tessie's suggestion. It's obvious that social norms have effected the way they get along with family members. The author has hinted that in two details. One is before the second round of lottery Bill Hutchinson takes one quick glance at his wife and children. The other is when Mr. Summers asks Mr. Hutchinson to show Tessie's paper, He "forced the slip of paper out of her hand" without any hesitancy. It's not until then people find out that Bill is ready to abandon his wife and take his responsibility as a citizen. The family relationship has been totally overturned by the social norms.

3.2.3 Nancy—an elegant young girl

Nancy is only twelve years old, but she is quite calm when recognizing that she may be killed in such a cruel way soon. In addition to this, Nancy seems to be very popular and favorable among her school friends. She is the only one supported by other people.

When she opens up the paper, she "beamed and laughed". It's no doubt that while Nancy finds out her being relieved from being executed from death penalty, she could be as much excited and crazy as she could. But it must occur to her that one of her most intimate family members would become the "lucky" one and be killed for she has been sober all the time. Maybe she just hasn't got enough time to deeply think about or realize this. Or maybe she has already got sufficient mental preparation before the whole ritual.

3.2.4 Bill, Jr.—the heir of the family

Bill, Jr., who is given the same name with his father, is the oldest child in this family. And as the oldest boy in this patriarchal society, he would take over the head of the family along with the patriarch.

"His face red and his feet overlarge, near knocked the box over as he got a paper out." This rough nervous boy seems to be extraordinarily scared when taking his paper. No matter how shy and careless he is, he acts exactly like his sister that they "beamed and laughed, turning around to the crowd and holding their slips of paper above their heads." After he is claimed safe from the execution, he wants to share his happiness with the crowds and also demonstrates the evidence of his not being chosen. Being a normal person just as the masses, nobody can be excluded from mundane emotions and the deep humanity is expressed to the extreme.

3.2.5 Little Dave—an unenlightened baby boy

Little Dave is the youngest child in the Hutchinsons family. He is so young that he couldn't understand what the ritual is about and why he is asked to take a paper out of the box. He is so young that he doesn't know he would lose one of his family members which is decided just on that shit of paper. Dave laughs when puts his hand in the box and feels confused Mr. Graves removes his paper from his hand. This is the only depiction of Dave's action. Young as he is, he is unconsciously involved in this slaughter. He takes part in the final lottery. In addition, he is taught to throw stones at his mother. And those who give him stones are kids alike. Dave is a pure and naive child who has no idea of the adult world. He is not contaminated by the complex relationship and contradiction of the grown-ups.

The author sets Dave who is clean and immaculate as the origins of human beings. But the disputes of the world would affect all the children including little Dave. Love isn't necessarily perfect; the natural affection isn't necessarily eternal; and the friendship isn't necessarily honest. All of these social phenomena have been unfolded before his eyes in one day. It's undoubted a great shock on him though

he may not quite understand the meaning of those. But seeing from what the children do, it's obviously that little Dave would be assimilated into the same person as the adult.

Table 1 Different Personalities before and after The Lottery

Name	Personalities	
	Before	After
Tessie Hutchinson	Humorous, friendly, duteous	Impulsive, selfish, indifferent towards her children
Bill Hutchinson	Responsible, law-abiding	Crucial to his wife
Nancy	Elegant, calm, popular	Indifferent towards her families especially her mother
Bill, Jr.	Rough, careless	Indifferent towards his families especially his mother
Dave	Clean, immaculate	Maybe the same
Don and Eva	No appearing	

3.3 Conflicts on family relationships in The Lottery

3.3.1 Conflicts on conjugal relationship

Conjugal relationship is the relationship between wife and husband. When two persons are getting married, they will be legally committed as a registered couple. It's more than a certificate which confirms this relationship. It's more about the obligations that families should be considerate of each other and they should face the difficulties together.

Considering the duty of the wife and the husband, Tessie and Bill are ought to defend their marriage and be united when one of them is challenged with torment. To the contrary, they hope to sacrifice one of their relatives to survive. Before the lottery, they seem to be a harmonious couple that they have a normal family as other families and Tessie shows her dependence on her husband and children. Due to the rules of the ritual, they are forced to be strangers.

3.3.2 Conflicts on child-parent relationship

Children and parents are direct relatives who are closely tied by blood relationship. Mother love has been praised as the most selfless and great power in the world. No matter how we define this, it's deniable that almost every mother would cherish their children and would rather sacrifice themselves to save their babies.

The Lottery has extremely subverted this acknowledged emotion which deeply riles the readers. As a mother, Tessie intends to sacrifice her two daughters. As the kids, Nancy and Bill, Jr. feel relieved when their mother will be killed instead of them. The social norms determine their performances and make them against the nature of human beings. That's how conflicts work and bring destabilizing factor to the society.

3.3.3 Conflicts on sibling relationship

Sibling relationship refers to the relationship between sisters and brothers of the same generation in the same family. Born and being raised up together do affect people's feelings on their playmates. Though children will have small fractions in daily life, they indeed have great affection and that kind of feeling would burst in certain situations.

In this story, maybe it's because that none of the children gets the paper with a black spot on it, they don't have any concerns about their sister and brothers. But there is not body movement or even an eye contact to express their worries. That is unnatural.

Table 2 Family Relationships Reflected in the Context

Conjugal relationship	Bill	Taking quick glance around at his wife before the second drawing; forcing the marked paper out of Tessie's hand and holding it up
	Tessie	Trying to reach her families when late for the ritual; yelling about the unfairness of the lottery at her husband
Child-parent relationship	Don and Eva	Mrs. Hutchinson asks them to take their chance in the second drawing; Bill rejects Tessie regretfully
	Nancy and Bill, Jr.	Laughing when they are not chosen and showing no sympathy for their mother
	Dave	Knowing nothing about what is happening
Sibling relationship	Don and Eva	No appearing in the whole process
	Nancy and Bill, Jr.	Showing no care about their families
	Dave	Knowing nothing about what is happening

4 Conclusions

Social conflict, the product of social and economic development, is a universally social phenomenon in human society. It's the drastic confrontation form of social contradictions which deeply displays the tension and opposition of different social relationships.

Nevertheless, there are no fundamental conflicts and some of them can be avoided if effective communications are conducted and feasible measures are taken. To face with the conflicts, it's not only about perfecting the social institution and political system, but also about transforming negative side of human beings into the positive one. How people deal with those conflicts matters and how people treat basic social ethics decides whether they are going to fight against the conflicts or barely be indifferent with the conflicts.

Generally speaking, family ethics are one of the most important standard public concepts. A number of conventional principles about family ethics have been rooted in people's minds, such as respecting the elder, taking care of the children, supporting each other in the family and so on. Each country in each time may have a variety of family organization forms along with specific social norms to achieve those principles, but they won't deviate from the most basic one.

How people deal with those conflicts matters and how people treat basic social ethics decides whether they are going to fight against the conflicts or barely be indifferent with the conflicts.

Thus, to resolve the conflicts between family ethics and social norms, everyone is required to stick to the righteous inner faith and the elementary social morality. And the society is supposed to construct rational and reasonable social rules to guarantee the moral and ethical obligation to be carried out effectively and accurately.

Abstract: This paper analyzes the psychological characteristics of contemporary college students' thought and behavior and gives a clear picture of the Reinforcement Theory, which serves as the theoretical framework for the effectiveness discussion of the ideological and political education for college students. It is concluded that it is an effective approach to improve the ideological and political education for college students by guiding their subjectivity development and creating fine behavior by means of stimulating their learning motivation through reinforcement, in accordance with the characteristics of contemporary college students' thought and behavior.

Key words: Reinforcement; Reinforcement Theory; Ideological and political education; Effectiveness

1 Introduction

In behavioral psychology, reinforcement is a consequence that will strengthen an organism's future behavior whenever that behavior is preceded by a specific antecedent stimulus. The concept of reinforcement as well as the Reinforcement Theory has experienced a gradual development and constant breakthrough. The famous Russian physiologist Ivan Pavlov first put forward the concept of reinforcement while Skinner further developed the Reinforcement Theory with changed essence. In the following decades, a large number of psychologist and sociologist in the west such as Thorndike and Bandura have made great contribution in richening and modifying the theory.

The study of the Reinforcement Theory began much later in China, in around 1930s. One of the most significant figures was Pan Shu, who was thought to be the founder of modern psychology in China. From then on, the research and study of psychologist in China gained much attention and development, in which some research findings were gradually applied in education.

In modern psychology, reinforcement refers to the potential events which are conducive to increasing the probability of repeated behaviors. So far, the concept of reinforcement has been a research topic much discussed by the psychologists and physiologists all over the world. A theoretical system has been established. However, the study of ideological and political education for college students based on the Reinforcement Theory is compared to be inadequate, especially with increasing attention of the central government and the college educators on the development of college students' psychological development.

2 Psychological Characteristics of College Students

It is widely accepted that people's psychological characteristics differ with the variation of external factors. Young college students are in rapidly developing stage of growing mature while being not fully mature at the moment. A thorough understanding of the characteristics of college students in different periods can help improve the effectiveness of ideological and political education.

Thus, this group has its unique psychological characteristics, which is reflected in the fact that their intelligence, emotion, will and mode of thinking have moved into a relatively high level. Moreover, the intelligence level of college students has reached a higher stage and is more systematic, comprehensive and accurate than before. However, due to their superficial knowledge of cognition, there is an obvious trend that college students have much higher IQ (intelligence quotient) compared with their EQ (emotion quotient). The thinking mode and thinking capability of college students have entered a more advanced stage, which helps create a good psychological environment for cultivating innovative talents. However, as a result of their imperfect thinking quality, they tend to behave blindly and superficially while advocating personality in daily life. Contemporary college students have clear goals and aspiration, and are willing to make unremitting efforts. But they also have fragile psychological bearing capability. They go easily desperate and are unable to recover once suffering setbacks.

The psychological characteristics of college students can be divided into three stages, namely low stage, medium stage and high stage. The freshmen who just enter the university are in the

“psychological weaning period” They are unfamiliar with and don't take the initiative to adapt to the way of life and study in university. And they feel having lost their superiority in secondary school. As for students of sophomores and juniors whose inadaptability has faded away, they have moved into a relatively steady college life and focus more on the improvement of their competence and knowledge. Senior students are more mature so that their personality can be developed. They know clearly what they should do. However, some of them may grow out of line with the society due to factors such as employment and entrance exams for postgraduate schools.

Therefore, to fully understand the psychological characteristics of college students in different periods can help improve the effectiveness of ideological and political education.

3 Main Points of the Reinforcement Theory

The famous Russian physiologist Ivan Pavlov first put forward the concept of reinforcement. In Pavlov's classical conditioning, reinforcement refers to the presence of unconditioned stimulus accompanying conditioned stimulation.

Later, Skinner further developed the Reinforcement Theory, but the essence changed. In Skinner's operant conditioned reflex, reinforcement refers to events that go after certain behavior and help increase the probability of repeated appearance of that behavior. In Skinner's Reinforcement Theory, behavior can be divided into two categories. One is respondent behavior which is born with. It is instinctive without learning and caused by specific and observable stimulation. The other one is operant behavior which must be obtained through learning. It is the response from the organism itself and has nothing to do with any known stimulus. In correspondence with the two categories of behavior, Skinner also divided reflex into two categories. Respondent reflex corresponds to respondent behavior while reinforcement determines response. Operational reflex corresponds to operational behavior while response determines reinforcement. According to Skinner, human behavior is mainly composed of operational behavior caused by operational reflex. Operational behavior acts on the environment and produces results. Skinner attaches great importance to operant conditioning, because this kind of reflex can shape new behavior, which is especially important in learning process. Education is to shape students' behavior and specific reinforcement measures must be established for successful education and training. He regards reinforcement as a learning process and the key to shaping behavior and maintaining behavior intensity. Therefore, the Reinforcement Theory is the most important part and the basis of Skinner's learning theory.

In Thorndike's Law of Effect, learning is the association of stimulus – response caused by mistake. The main law of learning is the Law of Effect. Changeable association can be formed between stimulus and response. If an association is followed by a satisfying state of affairs it will be strengthened and if it is followed by an annoying state of affairs, it will be weakened. (Chen Qi, Liu Rude: 2001) Reward is the main factor influencing the effect of learning.

As a social psychologist, Bandura further developed the reinforcement theory in his observation study. He divided reinforcement into direct reinforcement, indirect reinforcement and self-reinforcing. Indirect reinforcement means observer or imitators would not be directly affected by external reinforcement in learning. As long as the example he observed or imitated serves as the medium, he will react accordingly with indirect strengthening experience. Self-reinforcing refers to that people can predict the results of their actions spontaneously. They can control their own behavior with self-assessment and adjustment by relying on the feedback. (Lv Jing: 1992)

In the recent years, the concept of reinforcement has been much discussed by psychologists and physiologists all over the world. In modern psychology, reinforcement is a consequence that will strengthen an organism's future behavior whenever that behavior is preceded by a specific antecedent stimulus. (Chen Qi, Liu Rude: 2001) When it comes to student ideological and political education, many operators take punishment as a means of reinforcement applied in education. It will play a negative role in students' development and weaken the education effect seriously. It is necessary to strengthen the on the application research of the reinforcement theory in education, so that the educators can be able to correctly practice this method and avoid its negative effects. Therefore, in ideological and political education for college students, it is of vital importance and necessity to practice the application of reinforcement theory and intensify the efforts to carry out the cultivation of comprehensive quality education according to the psychological characteristics of college students.

4 Role of the Reinforcement Theory in Ideological and Political Education

4.1 Influence of reinforcement on students' learning attitude and learning motivation.

Correct behavior feedback should be appropriately provided to students so that they can conduct self-reflection and self-assessment, which helps further consolidate the development of good learning behavior while correcting inappropriate habits. The information provided to the students should be strengthened so that they can see their progress. The confirmation of their existing learning styles helps stir up higher learning desire and enhance the probability of favorable learning behavior. Also, appropriate evaluation feedback of shortcomings and insufficiency play an important role in enabling the student to understand the gap so that they can be motivated and students' bad behavior can be probably weakened.

4.2 Influence of reinforcement on students' emotion.

Different reinforcement will always result in students' different emotional experience. In general, favorable evaluation such as reward, praise and smile can attract students' positive emotional experience while unfavorable evaluation such as punishment, criticism causes students' unpleasant emotional experience such as being nervous. In addition, the personality of educators themselves also plays a part in reinforcement effect. Factors such as true love, high expectation, serious scholarship and tenacious will of the educators will set up the example for students. This penetrates into concrete reinforcement delivered to the students and adds to strengthening the credibility and influence of reinforcing. Therefore, reinforcement strengthens the emotional exchange and communication between educators and students and deepens students' emotional experience.

4.3 Influence of reinforcement on students' self-reinforcing

Ye Shengtao once said: "Real education is self-education". Self-reinforcing is a part of self education. In reinforcing students' behavior, the educators also pass the evaluation standards of the behavior to them. And the students are able to gradually master the evaluation system of certain behavior that will be internalized into their own evaluation system. In this way, students can constantly practice self-affirmation and self-negation. It is conducive to the formation of students' real inner motivation. The Reinforcement Theory has experienced the transformation from full attention to the behavior results to increasing attention to internal mental process of the organism and the transformation from completely passive external reinforcement to active self-reinforcing. It makes the Reinforcement Theory richer and more colorful with increasing explanatory capability.

5 Application of the Reinforcement Theory in Ideological and Political Education

5.1 Reinforcement applied in the guidance of students' subjectivity development

Autonomy and enthusiasm are the basic characteristics of subjectivity while creativity is the development and sublimation of subjectivity. How to give play to and cultivate students' subjectivity has become an issue that should be considered in the implementation of quality education. First of all, positive external reinforcement should be applied in guiding the students' development of subjectivity. The educators should not only provide external reinforcement, but also actively create conditions and opportunities to enable the students to achieve their expected goal so as to harvest the joy of success. Secondly, self-reinforcing should be applied to promote the development of students' subjectivity. In education, the educators should clear the education goal and hierarchicalize teaching targets as well as establish reference basis for the students for self-reinforcing, so that the students can choose and determine the development goals suitable for their own level, according to their own learning situation.

5.2 Immediate reinforcement appropriately applied in education

Researchers have found that it is important to conduct immediate reinforcement after the performance of individual behavior. It helps the individual to establish direct contact between the result of certain behavior and the behavior itself, so as to promote the probability of the behavior. Otherwise, inappropriate delay of reinforcement would result in the blockage of students' motivation and fails to provide the information necessary to maintain learning behavior. Immediate reinforcement and appropriate method to delay reinforcement in education should be applied flexibly in proper time and place according to specific situation. The learning of general knowledge skill and behaviors of students with poor self-awareness should be reinforced timely. Moreover, the joint and appropriate application of the two kinds of reinforcement can bring about favorable effect. Students are both the object and subject of learning behavior. Thus, it is highly necessary to cultivate their comprehensive ability of self-reinforcing and enhance their consciousness. They should have a good knowledge in the application of self-reinforcement for the benefit of consolidating their learning result.

5.3 Shaping students' fine behavior

Education is the shaping of behavior favorable to both others and students themselves in the near future. Cultivation refers to the gradual change and improvement of reinforced behavior so as to achieve the goal. The stimulating scene usually remains unchanged while the response will develop from the initial one to ultimate goal behavior. Reinforcement is an important method to shape students' behavior. Skinner once said: "Education is shaping behavior". As for how to shape behavior through reinforcement, Skinner applied the method of continuous approach in which response that leads to the goal behavior will be constantly reinforced the new behavior appears.

6 Conclusion

The paper makes a general effectiveness analysis of the ideological and political education for college students based on the Reinforcement Theory. It is proposed that the Reinforcement Theory plays a significant role in ideological and political education, which is an indispensable and fundamental part of high education in China. Reinforcement exerts influence on students' learning attitude and learning motivation, students' emotion as well as students' self-reinforcing. It can be effectively applied in the guidance of students' subjectivity development. Moreover, immediate reinforcement is suggested to be appropriately applied in education. Students' fine behavior should be shaped through reinforcement in education.

In conclusion, the research on the basic concepts of the Reinforcement Theory in education has far-reaching significance in stimulating students' learning motivation and interest, as well as correcting students' inappropriate behavior while shaping good ones. The application of the Reinforcement Theory in education has certain referential meaning to understand students' learning and improve learning efficiency so as to shape new behavior. The ideological and political education for college students should be conducted flexibly and scientifically due to the variation of the characteristics of college students in different periods.

As this paper mainly focuses on the effectiveness analysis of the ideological and political education for college students, the analysis on the whole is far from enough. There is much room for further improvement and exploration. More attention needs to be paid to the research on the ideological and political education for college students from different perspectives.

Research on the Revolution of University Courses Based on Oriented Understanding*

Chen Su

International Business and Economics College, Wuhan Textile University, Wuhan, P. R. China, 430075
(E-mail: susiewh@hotmail.com)

Abstract: Studying for understanding is not an unfamiliar concept, but the practice of applying this concept into one real class has been always one of the hottest debated issues. The current teaching performance in present university is not as plausible and also teaching methods inquired urgently innovation. Both the definition of teachers' function and the status of students needed to be re-orientated. This paper applied comparative discussion on current status of university classes in China and the mode of TFU originate from Harvard University, and then made advanced research on relevant strategies of revolution of university course based on oriented understanding to help improve teaching performance in current universities.

Key words: Teaching for understanding (TFU); University courses; Teaching revolution; Strategies

1 Introduction

To help students to get understanding has always been one of the most important goals of class education, but it is also one of the toughest ones as well. For one course, teaching is not only activities to lead students grasp knowledge, but also the process of developing students' inner personality and enriching their spiritual world. A seemingly simple 45 min's course carries students' desire for knowledge, the expectations from parents, and the hope of the whole nation. Therefore, the university classes are not simple, great significance only could be got resulted in associating lecturing knowledge with expectation of students and social concern. So how can make this happen? "Only understanding could draw a real connection between the knowledge from the courses with students' life experience, but simply a cognitive approach couldn't achieve it."^[1] The relationship between understanding and lecturing has been getting increasingly closer.

2 Current Status of University Classes

Ever since the policy of "Expanding enrollment", higher education is gradually getting into a common educating phase in China. While the number of university students is increasing quickly year by year, which result in the problems of the shortage of teaching resources, poor teaching quality. Ministry of Education, local education organization, and various universities had put efforts on upgrading teaching quality, and resulted in some kind of improvements. However, a real change depends on the improvement of inner teaching circumstances, which is the progress of teaching quality. During the lecturing, teachers are still the core component of higher education as they are the media of spreading knowledge. Consequently, to discover the restrictive factor of university classes is vital to the improvement of teaching performance.

2.1 Rigid teaching methodology and teaching patterns

Currently, college classroom is mainly using the traditional lecture method in China. Although expository method has been applying in teaching practice over the years with its advantages of clear logic and purpose, fundamentally, the premise of this teaching method is the assumption that students' ignorance to knowledge, only to rely on teachers' lecture to instill them a complete system of knowledge. But in today's information age, in addition to traditional classroom, college students have wider access to knowledge and information channels, students are no longer inclined to uncritically accept knowledge from teachers. Moreover, compared with the middle school teaching methods, passive acceptance of knowledge involved in university teaching is more easily to be forgotten, rote learning in college classroom is completely unable to meet, and it is not helpful for cultivating students' independent learning, thinking skills and innovation capacities that particular emphasized on the national stage.

Meanwhile, in the traditional "lecture-style" university classroom, the teacher's classroom task is to lecture knowledge and theoretical principles clearly, which plays the role of knowledge embodiment;

* This paper is supported by Higher Education Researching Projects of Hubei Provincial Department of Education (No.2014448).

and the corresponding student's task is to listen and to accept, plays the role of knowledge slaves. Only the teacher's voice would be focus, while the student response, views, ideas are not on such a timely attention to classroom and guidance, classroom teaching practice has become a one-way transfer of knowledge, lack of teachers and students interaction. "Mouthpiece", "Full tank", "Paraphrased knowledge" make no criticism, creativity or thinking activity atmosphere in monotonous college classroom^[2].

2.2 Unappealing teaching process

In present university classroom, many teachers follow along traditional teaching methods and teaching mode, teaching reform is the lack of awareness and innovation. Some teachers even thoughtlessly imitate majority of teaching content and mode, and internalized into their teaching process, resulting in some obsolete teaching content lag, unattractive, low long-term efficiency of classroom teaching, which seriously affecting the quality of university talents.

Currently, college students are mostly in their 20s, their ideas, acknowledges of professional major and studying needs are very different from teachers. The reality is that most teachers teach almost taken for granted, as the teachers do not know what students want to know and learn. Therefore, some problems involved in university class, such as the theory is always broken from practice, ignoring students' personality and needs, scripted style to teaching materials, read PPT and other serious issues. Students' interest is very low which results in serious skipping phenomenon.

The sense of synchronous development involved in learning and studying during the teaching process and guaranteeing quality of after-teaching is not strong. Currently, the teacher-based classroom has been on focus, stressing memory processes and the process of teaching so-called knowledge, lacking of interactive teaching which result in whether students really understand and digest the knowledge taught is under on consideration. In the latter part of teaching, teachers are rarely concerned about the students at the end of classroom, no feedback are taken after class, not focusing on the lesson before teaching content for review or inspection. So students are only learning in class basically, but they will not seek answers to difficult problems from teachers and then resulting in none previous knowledge have been digested, but also start to learning new knowledge, which lead to teaching results are unsatisfactory, even make students lost interests to learn because of as strange overlap knowledge.

2.3 Biased understanding of classroom learning

There are many college students do not want to walk into the classroom since the misunderstanding the relationship of subject-object in the classroom, which lead to the teacher is the main object of teaching process, but them dispensable, so some of them skipping often. Some students sit in a classroom, yet focus on the outside of the classroom and lack of thinking. In particular, giving up what they do not understand, without asking and communicating with teachers. They think that understanding could be got by just reviewing their own reading notes before the exam, but ignoring the importance of classroom teaching, thus affecting the quality of classroom teaching.

Meanwhile, the modern college students misunderstand the purpose of classroom learning; the sense of utilitarian is too strong. Some students think the university is general for employment, they focused on the examination and employment needs, to understand and grasp knowledge as a means to achieve a certain purpose, access to grades or academic degree, be rewarded or certificates, to seek other work or career. Students on this course with a lot of another textbook, or the use of class time reading the CET or computer proficiency exam grade materials or some other competency exam books, greatly affected the quality of teaching.

In addition, a problem can not be ignored is that the current quality of university student enrollment has been declined. They could not keep up with new courses of study, so that they can not understand the knowledge granted, which lead to studying motivation and interest is poor and complaining on teachers psychologically because of fast progress, and therefore contradict the classroom teacher, and this also affected the improvement of teaching quality.

In summary, above three problems can be summed up as a multi-university teaching part has not clearly understand what to teach, why to teach, how to teach, to learn what, why and how to learn. Accordingly, it is time for college classroom teaching should apply an urgent innovation, which needs to reposition the status of teachers and students, to update teaching philosophy and to build teaching mode adapting the development of era.

3 Mode of TFU

From 1989 to 1996, Graduate School of Education of Harvard University developed a project

called "Teaching for Understanding (referred UFT)" mode, for some students specific understanding of things to explore, and sustained attention response from the students in understanding the development process. After years of research, "Teaching for Understanding" pattern formatted and started to promote in some cities in China in 2005.

TFU is derived from the teaching philosophy of constructivism, namely that learning is a continuous effort by the student how to solve real-life combined with the problems that arise. Only when the learning knowledge could correlate to students' life experience, great significance for the growth of students then could be reached. On the one hand, this model can help teachers design effective teaching programs and teaching objectives to help students develop and deepen their understanding of key concepts; on the other hand, this model emphasizes more active "learning from action" to help students to "show" evolving understanding through their behavior, language and achievement. Thus, in real life, it is possible for students to solve real problems by the way of illustration, discovery, production, useage knowledge and acquired skills have been learned or described by analogy in the face of certain circumstances. And also actively explore how to create new products on the traditional basis, which will help the students' spiritual world growing rich. Design, implementation and reflection to develop students' understanding are core purpose of classroom practice, which is the essence of TFU model [3]. The components of TFU is as following Table 1.

Table 1 The Components of TFU^[4]

Sequence number	Concrete components	Concrete contents
1	Throughlines	Throughout the academic year or the entire curriculum to achieve important overall goal is to understand what?
2	Generative Topic	What teachers should teach - what students need to understand the most important content or philosophy? Why is it worth to learn?
3	Understanding Goals	What students should learn - students need to understand what a unit core concepts, content and skills?
4	Understanding Performance	What students need to do (in order to achieve the purpose of learning & to build their own understanding and prove that they have understood)?
5	Ongoing Assessment	How teachers and students understand knowledges already know? Does his/her master it? How to conduct a deeper understanding?
6	New Technologies	How to strengthen the TFU? How the new technology used in TFU?

4 Strategies for Oriented Understanding Revolution

4.1 "Multiple intelligences" way of thinking to expand traditional heuristic teaching

In the traditional heuristic teaching model, teachers are often in instructional design curriculum planning based on multi-dimensional teaching objectives, such as knowledge, skills, understanding, procedures, methods, emotions, attitudes, values and so on, but difficult to simultaneously achieve these goals. Especially in the regular classroom, teachers often accustomed to a problem or knowledge or difficulties of repeatedly explain, but students still do not understand. While TFU provides an effective way to solve the multi-dimensional classroom teaching to achieve the objective: the design in the classroom, educators no longer solely to consider the implementation of the so-called knowledge points, but to think about the knowledge of the "gold", that is, whether the core knowledge, so knowledge of the classroom is no longer isolated "point", not just a "line", and should be able to guide students to build knowledge generated "Body". Specifically, teachers can design inspired by nature topics, the issue centers around the multivariate design, from students interested in things easily accessible aspects of the phenomenon of life, literature and art of performance, such as multiple forms of expression inspired designed to enhance students' problem positioning of the content of classroom teaching of initial interest and understanding directions.

4.2 Promoting students' thinking involved to ponder and understanding

"Question" is the way to explain a student psychological disharmony between learning content and knowledge, and also an effective channel for the teachers to get students' level of understanding. In the given situation, teachers guide students to think - research - dialogue - discovery - solve the "lack of coordination" to promote students to actively participate in thinking, enhance understanding^[5], to completely change the past type of "full crown", "duck-stuffing" involved in teaching model. In particular, to pay attention to the early understanding of the process of teaching activities, mid and late continuous evaluation and questioning, by continually asking questions and thinking, which stressed both sides, discuss teaching and learning. Understanding the activities in question continue to explore the process, so that the teachers continue teaching the curriculum content creation and conversion,

effectively guide students to discover new problems, analyze and solve new problems, while allowing students to persistent questions and answers for teachers and concern resonance, the real question to ponder which are helpful for understanding and learning^[5].

4.3 “Reflection” through teaching process always

Constant reflection and adjustment of teaching content through a lesson plan, a class, one problem, which help teachers themselves have a clearer understanding of think process of students. Research on helping students gradually deepen understanding by designing progressive activities, designing sustainability assessment and designing progressive targets based on the degree of students’ understanding will let teachers always make reflection of their teaching effect, and also the real problems needed to be solved in teaching could be recognized, and then correct understanding of teaching targets and meanings could be achieved. And this could be applied by the mode of MOOCs which have been a popular research target in China’s college^[6].

4.4 Innovating lesson plans and design templates

Oriented understanding lesson plans should include the following five aspects: Cover (as following Table 2). Through lines: full academic year or the entire course should achieve the important goals of an overall understanding of these goals. Those goals remain unchanged throughout the school year or the entire course.) The expression should be were set in two forms as questions and statements to enable the students to understand.

Table 2 The Cover of Lesson Plan

Teaching unit: _____
 Your name: _____
 Date: _____
 Course: _____
 Grade and class: _____
 Student situation: _____ all are top students; _____ top & poor students; _____ other situation (explain)
 Lecturing time: _____
 Main lecturing materials: _____
 Abstract of unit: _____

Generative topics (a phrase or a concept related to the unit): measurement criteria need to be discussed to help teachers find the point that students interested in learning. Specifically, measurement criteria could come from the centrality (which discipline involve your topic could play central role? Why do you think this topic on the subjects play an important role?), Attractiveness (Why this topic will attract you and your students, or why has the potential to make your students are interested in? How to attract students by using this topic?), the easy availability of resources (please indicate 2-3 related, available to you and specific resources used by students related to this topic), connections (What is the relationship between this topic, other topics in the discipline, and extra-curricular life?).

Challenge and summary reflection. Challenge would describe “difficult place” that the student may encounter, which is the difficulties students would met when understanding this topic, and also the ways to help students overcome these difficulties. Summary reflection refers to brief summary of main arguments above five aspects discussed, and emphatically explained in one or two aspects why this is a good generative topic^[7].

5 Conclusion

Characteristics of classroom teaching reflect the spirit and trait of university organizations to some extent. The traditional classroom teaching unilateral, one-way sexual indoctrination type features have been no longer meet the changing social environment, while oriented understanding involved in university teaching has become a top priority. University classroom always focus on learning value, but more attention paid to TFU, and also be central to appreciated learning, enjoy learning, good at learning. Only in this way, the university was worthy of university, and teachers be worthy teachers. Whether humanities curriculum or social nature curriculum, teacher should actively reform teaching mode and method, applying “multiple intelligences” of thinking to expand the traditional heuristic teaching, promoting the participation of students’ thinking, encouraging students to ponder and question, studying for understanding. And always “Reflection” and innovate lesson reforming plans and to truly improve the quality of classroom teaching.

The Effects of Portfolio Assessment on Writing Performance of EFL Students

Zhao Jing

School of Foreign Language, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: smilequeenn@whut.edu.cn)

Abstract: The primary focus of this study was to determine the effect of portfolio assessment on final examination scores of EFL students' writing skill. To determine the impact of portfolio-based writing assessment 40 university students who are non-English majors were initially selected and divided randomly into two experimental and control groups. A quasi-experimental research design was adopted in this study. In order to appraise the homogeneity of the experimental and control groups Comprehensive English Language Test (CELT) was employed at the beginning of the study. The pre-test was applied to both the experimental group and control group. Later in the study, a post-test of dependent variables was implemented for both groups. Data analysis was carried out by SPSS 16 statistical computer program. The statistical techniques being applied were the Levene statistic of One-Way ANOVA and the Paired-sample T-test. The results of the study revealed that that students whose work was evaluated by a portfolio system (portfolio-based assessment) had improved in their writing and gained higher scores in final examination when compared to those students whose work was evaluated by the more traditional evaluation system (non-portfolio-based assessment). The findings of the present study highlighted the fact that portfolio assessment could be used as a complementary alternative along with traditional assessment to shed new light on the process of writing.

Key words: Portfolio; Portfolio assessment; Writing skill; Portfolio- based instruction

1 Introduction

Within the communicative framework of language teaching, the skill of writing enjoys special status. There is no doubt that writing is the most difficult skill for EFL learners to master. With so many conflicting theories concerning writing, the teaching of writing has undergone a great change in the past quarter century. The paradigm shift in writing theory from a focus on writing products to that of writing processes has also resulted in the popularity of portfolios among the educators as an alternative approach both in EFL and in ESL contexts as an instructional tool for preparation of students for examinations. Due to the fact that the skills involved in writing are highly complex; students have to pay much attention to higher level skills (macro level skills) such as planning, organization as well as lower level skills (micro level skills) such as spelling, punctuation, word choice, and so on. The process of generating ideas, drafting, redrafting and editing are vital elements of writing and these important dimensions are not sufficiently assessed in a one-shot attempt of traditional testing.

As it is reported in the literature writing skill is more challenging for students in EFL context. Johns (1991) claims that it is more difficult to assess ESL students' writing abilities than native speakers' in timed writing assessment. Song and August (2002) point out that having a set time during a writing test, EFL students cannot focus on the skills needed for L2 writing and on culturally related issues in the process of writing at the same time. Hamp-Lyons & Condon (2000) argue that "portfolios provide a broader measure of what students can do, and because they replace the timed writing context, which has long been claimed to be particularly discriminatory against non-native writers". Thus, using portfolio assessment was found to be more suitable than the timed writing assessment.

Johnson (1996) defines portfolios as a cumulative collection of work students have done. In other words portfolios show a student's work from beginning of the term to the end. They give both teacher and students a chance to evaluate how much the students' writing has progressed. In the writing classroom how and when teachers' grade can make an enormous difference in the students' development. In general, students benefit the most when they receive feedback while they are still working on a paper rather than after the paper has been graded. Perfect writing can be possible only when students with feedbacks which are gained from teacher and/or peers in terms of writing system, mechanics of writing (punctuation, capitalization, abbreviation, numbering, and spelling) and grammar to solve the problem in writing effective compositions.

Focusing on writing as a process and using portfolio as a method of assessment of writing give the students the confidence to continue to write and continue to develop their skills and overcome their problems in writing. In order to appraise its usefulness for this purpose this study will document,

analyze, compare and contrast students' performances in the portfolios, the in-course pre-tests and the final examination with those of control group. The results will then be examined in order to reach conclusions regarding how effective writing portfolio is as an instruction method for students who take final examinations. The study, therefore, seeks to answer the following questions:

1) Is portfolio assessment an effective way of preparation for writing text under examination conditions?

2) Would the differences in instructional method (non-portfolio vs. portfolio-based instruction) be reflected in students' final examination scores?

2 Experiments and Data Collection

2.1 Method

This study is intended to determine the effect of writing and assessing portfolios on final examination scores of EFL students' writing. The design for this study is Quasi-experimental in nature, since the classroom groups are already in place and had to be intact. In order to have a strong quasi-experimental design, internal threats to validity were controlled by use of pretesting. To be confident that there were no significant difference among the subjects of the Experimental Group (EG) and Control Group (CG) regarding the variables under investigation, both groups were pre-tested at the beginning of the experiment.

2.2 Subjects

The sample for this study was drawn from the students who were enrolled in second-semester freshman English composition course at School of Information Engineering. Initial enrollment in this course totaled 68 students. Out of 68 examinees, the researcher finally nominated 40 participants and randomly divided them into two experimental and control groups. None of the students have prior experience with portfolios. Both groups involved in this study were taught by the same teacher in order to provide uniformity of instruction. Therefore, the researcher and the instructor were the same.

2.3 Data Collection Procedures

During the second week of the term, students who agreed to take part in the study signed consent forms. After completing the consent forms, all students were administered Comprehensive English Language Test (CELT), and Trinity's ISE (Integrated Skills in English) Writing Test. The instructional methods, textbooks, and assignments in both the experimental and the control groups were identical, and all groups were taught by the same instructor. Students in portfolio-based group were advised of format of portfolio based instructional procedures. The study extended over a timeframe of 16 weeks. Scores obtained on the scale of 1-6 comprised students' course grades. In compliance with the class syllabus, the instructor taught students how to shape their college writings. Instruction followed the writing-as-process approach as far as possible. All students completed six assigned essays, and a post-test timed writing during the 16-week semester.

As is common in a writing class with a traditional (non-portfolio) method of evaluation in place, the control group turned in each essay as it was due, and the instructor marked and commented on each essay and then assigned it a grade. In the experimental group, portfolio evaluation was established. Students turned in their essays and writings on the due date, but no grade was recorded at that time. They submitted one draft each session and received respective feedbacks (evaluation scales) by the next session that the class met. Students were credited for any revisions made. At certain points during the term, the instructor directed revision by focusing students' attention on certain strategies, such as sentence combining, strengthening weak verbs, writing effective introductions, titles, mechanics of writing (punctuation, capitalization, abbreviation, spelling, grammar, and use of numbers). Students could continue to work on previously written papers until the end of the term. At the end of the term, students presented a portfolio of work to the instructor for evaluation and the term grade. The portfolio consisted of two polished papers (final drafts) along with three first, second and third drafts for each paper respectively written during the term, and a meta-analytical cover letter. Students selected the two papers which represented the best of their work of the term. Students were encouraged to extensively revise these papers in the meantime. All prewriting, drafts, and evidences of revision for each of the two papers were included in the portfolio.

2.4 Analysis of Data and Interpretations

In analyzing the data for this study, the SPSS statistical computer program was used. All data were processed using SPSS Version 16. As the first step in the data analysis the sample was homogenized. A preliminary examination for homogeneity of the experimental and control groups was conducted with

68 candidates bearing almost the same background of English proficiency. The test scores obtained from the performance of subjects on the Comprehensive English Language Test (CELT). To have a more homogeneous group of candidates for the main phase of the study, high scorers and low scorers were eliminated from the main framework of the study. Almost +1 and -1 standard deviation from the mean score is the valid and reliable way of selecting homogenous sample population, hence, out of 68 examinees, the researcher finally nominated 40 participants and randomly divided them into two experimental and control groups. See table 1 for descriptive statistics.

Table 1 Descriptive Statistics

	N	Mean	Std. Deviation	Std. Error	Lower Bound	Upper Bound	Minimum	Maximum
Male	34	58.2813	7.0949	1.2542	55.7233	60.8392	47.00	75.00
Female	34	58.7813	8.7279	1.5429	55.6345	61.9280	43.00	75.00
Total	68	58.5313	7.8941	.9868	56.5594	60.5031	43.00	75.00

The researcher conducted a One Way ANOVA including the Levene Test to approve of the homogeneity of both experimental and control groups in terms of their proficiency based on their scores on Comprehensive English Language Test (CELT). Table 2 reveals the results of the Levene statistical test on Comprehensive English Language Test (CELT).

Table 2 The Mean Difference Between The Two Groups

	Sum of Squares	df	Mean Square	F	Sig
between Groups	4.000	1	4.000		
within Groups	3921.938	66	63.257	.063	.802
Total	3925.938	67			

The mean difference between experimental and control group is not significant at all. On the other hand, means plot is totally flat line and there is a sharp and straight line of mean scores, and there exists no significant difference between the means of both groups. Hence, the researcher can conclude that the participants of two groups are homogeneous.

As for the phase of the statistical procedures, the researcher devised the Paired-samples t-test, because the trait to be tested was of the same nature for both groups, say, the writing skill of the ISE exam (Integrated Skills in English) being extracted from the Trinity Website (www.trinitycollege.co.uk). The differences between the pretest and posttest results in both groups indicate a significant difference between the experimental and control groups in writing skill.

The findings of this study evidenced that First, portfolio assessment was an effective way of preparation for writing text under examination conditions(questions1), second, the differences in instructional method (non-portfolio vs. portfolio-based instruction) were reflected in students' final examination scores(question 2).

3 Conclusion

The results of these statistical analyses confirmed the significant effect of writing and assessing portfolios on final examination scores of writing of EFL students. A possible explanation of these results may be linked to efficiency of portfolio-based writing and assessment. It may be that these subjects were benefited from a sufficient time span that the researcher calls it gift of time that enables them to use challenging structures in their written task performance. Findings from this study indicated that writing and assessing portfolios were beneficial to students. Even if they encountered many problems in the process, they learned a lot from solving their problems and shouldering the ownership of responsibility of learning. The students of portfolio-based group benefited from the reflective nature of the task. Reflection was a self-assessment tool, which helped the learner in the experimental group of the current study to look at the strength and weaknesses of a particular learning activity and consider how to improve the weakness.

Using this method, the instructor postpones assigning grades until students have had time to internalize instruction; this technique empowers students by giving them the opportunity to rewrite and polish their papers before selecting their best work for grading.

Since portfolio assessment provides a greater degree of student empowerment, students are able to continually improve previously written papers and select their best papers for final grading, a significant correlation occurred between the portfolio method of writing and assessment (portfolio-based

instruction and evaluation) and their final examination scores. Thus finding of this study corroborated that portfolio assessment is indeed very useful for ESL students.

4 Recommendations and Suggestions for Future Research

The condition is rapidly becoming more favorable for use of the portfolio as an assessment instrument. It sounds instrumental to refrain as much as possible from using grades to evaluate and respond to student writing as it is common in traditional (non-portfolio based) evaluation. It appears that we need to investigate alternative ways of giving students grades in writing courses. With the increasing use of portfolios, however, more research studies with different research designs should be conducted to further examine the effects of portfolio assessment as a practical evaluation process. With the advent of the web technology the electronic portfolios add new dimension to writing assessment by integrating real time interactive feedback that opens new horizons and requires new research agenda into portfolio assessment of writing.

² School of sports, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: lmm1021@163.com)

Abstract: Practice teaching resources integration and utilization, is conducive to improve not only the teaching quality of sports professional teaching, but also the quality of practice teaching resources, in order to form the practice teaching of the resultant force. This paper takes the sports practice teaching resources as the research object, uses the knowledge of sports training, physical education, sports management and so on, exploratory discussed sports practice teaching resources sharing mechanism under the background of collaborative innovation strategy. The conclusions are as follows: physical education practical teaching resources sharing lies in the primary stage by now. There exist some troubles during the sharing process, for example, weak awareness, low sharing level, monotonous content, short of advanced management and long-term stable cooperation platform. Aimed at the existing problems, a variety of suggestions and measures have been put forward. Strengthening the awareness of physical education practical teaching resources exploitation, perfecting the construction of physical education practical teaching resources management system, perfecting physical education practical teaching staff, integrating physical education practical teaching hardware resources are also included.

Key words: Physical Education Practice; Sharing Mechanism; Rational Distribution; Teaching Resources

1 Introduction

At present, on the one hand, the society has a great demand for high skilled sport talents; on the other hand, it's difficult for our national universities physical major graduates to get good employment. Such kind of phenomenon indicates that there is deviation between national universities sport talents cultivation standards and quality and the huge demands for sport talents in society. However, practical teaching is the best way to train high skilled sport talents which is the crucial procedure to foster eligible talents. Meanwhile, it embodies the principle of "Integration of Theory with Practice".

Table 1 Data Statistics of General Higher Education

Time	Enrollment number	Enrollment increase	Student number	Gross enrollment rate
1995	92.59	2.61	290.64	7.2%
1998	108.36	8.32	340.87	9.8%
1999	159.68	51.32	413.42	10.5%
2000	220.61	60.93	556.09	12.5%
2005	504.46	57.12	1561.78	21.0%
2010	661.76	22.27	2231.79	26.5%
2020			3300.00	40%

Zhou Ji(2010)emphasized the following regulations more than once: national universities must strengthen the conscious of practical teaching, reinforce the practical teaching process, formulate the practical teaching plan and perfect the practical teaching system^[1]. Yao Yongcong(2012) advocated the practical instruction is an important part of higher vocational education, and it's an important way to personnel training^[2].Huang Wei(2015)advocated that as the development of national universities, there are an increasing number of sport talent populations every year. Due to the college expansion plan and diversification of education level, a lot of problems emerge. For instance, the shortage and disperse

* This paper is supported by Scientific research project of General administration of sport athlete culture education "subject sports vocational colleges research on practice teaching resources integrated and optimized configuration" (2014 b113); research project of Hubei provincial higher school teaching "research on ports practice teaching resources integration and optimization configuration" (2013444).

usage of practical teaching resources, inefficient teaching effects and so on^[3]. According to the current situation, this paper first analyses the connotation of athletic practical teaching resource reassignment in national universities. Then it points out the necessity of athletic practical teaching resource reassignment rational distribution. At last, the paper gives some methods and suggestions on the athletic practical teaching resource integration which can be used as reference for improving athletic practical teaching quality and innovating talent cultivation mode.

2 The Necessity of Physical Education Practice Teaching Resources

2.1 Improve the efficiency of teaching resources rational distribution

The characteristic of practice and applicability in national university PE major lays great importance in nurturing and training students' practical ability. In the social background of various job bidding employment forms and specialty differentiation in every walks of life, more strict talent fostering requirement are raised. Nevertheless, with the development of educational reform which stresses the subjectivity, personality, and practical ability training of students, it's hard to choose a teaching practical base. And it's harder to find an ideal one. Based on the situation, national universities should make an organic integration on athletic practical teaching resources, optimize each element and reach the goal of improving the intensified efficiency of athletic practical teaching resources.

2.2 Strengthen the core competence of sport talents

The sport and other subjects teaching practice have something in common, but the feature of PE major practicalness itself determines the peculiarity of university students' practical ability training. In the professional specialization view, sports training major aims at cultivating talents who will be occupied in PE teaching, training and competition; social sports major is designed to foster those who work on the organization, management, development and counseling of PE activities in this field; sports health care major is intended for high qualified specialists who are engaged in health promotion, nutrition guidance and sport injury. The PE major has a strong feature of practicalness which will strengthen the core competence of PE students.

2.3 Accelerate the whole promotion of students' comprehensive quality

The optimization of sport practical teaching contributes to nurturing the students' ability of "Integration of Theory with Practice" and promoting the whole quality. Through practical teaching, students are able to adapt the employment market and have a better understanding of the employing unit and occupation. In the next place, practical teaching exercises the professional skills of the college students. Also, it trains their independent working ability which will offer them more chances of better occupation. Finally, it's helpful for students to foster their professional ethics and teamwork. What's more, the social responsibility, adaptation to social environment and perspective of overall situation will provide a solid base for the social survival of students.

3 Influences on Physical Education Practice Teaching Resources Sharing Analysis

3.1 Perception barrier

In essence, national universities athletic practical teaching resources sharing are actuated by benefits. For immediate interests, students could have more opportunities to sport practice and to enhance practical ability. In the long run, the large scale promotion of student ability will gain a high reputation of the universities. Besides, it will make students more competitive and get more athletic resources and benefits. However, people have a sense of self-sufficiency and sealed subconscious in traditional view which is bad for sport practical resources sharing. Universities have already formed its own unique way of teaching. Universities who have different subjects and school levels vary in athletic practical educational concepts. Thus, they have developed their unique working thoughts. Each university has its own administration and relevant management system. If the athletic practical resources sharing among colleges are done, the institutions must be regrouped. New adaptive administrative organizations will be built which leads to the destruction of the original running mode. Therefore, university managers ignore the long-term benefits. Under this circumstance, there will be obstacles during carrying out the resources sharing. In addition, people are not positive about it which results in the difficulty of decision-making.

3.2 Administration cost barrier

In the process of resources sharing, administration cost is significant in preventing the accomplishment of it. For athletic practical teaching resources providers, they must not only consider the wastage and maintenance of resources during use, but also think about adding the labor intensity, workload, working hours of relevant athletic practical teaching resources administrators on the basis of

present occupation arrangement. Even, it will increase the employment cost. Besides the tedious administrative examination and approval procedures, they should take the management pressure and cost caused by coordination of different departments in resources sharing units. However, there aren't such charging standards about athletic practical teaching resources sharing. For example, sport fields, sport facilities, sport equipment and so on. As a result, athletic practical teaching resources providers will weigh the workload and salary which is brought by the sharing. Then, people have little enthusiasm in it.

3.3 Single sharing approach

At present, athletic practical teaching resources sharing among universities focus on colleges, colleges and enterprises. Firstly, the Mode of University League. Universities which depend on its athletic resources use the point-to-point sharing method with others. Generally speaking, this way of resources sharing limits the replacement subject because of the reciprocity principle, complementary principle and proximity principle. So it's hard to fulfill. Secondly, the Mode of School-Enterprise Resources Sharing. With the help of these two disparate teaching environment and resources, it takes advantage of classroom teaching and practical training to cultivate high skilled sport talents who have professional quality and innovational ability. Nevertheless, since universities make interim use of enterprise resources, enterprises need benefit maximization. On this occasion, periodic sharing requirement of universities can hardly get responses from factories.

4 Rational Distributions of Physical Education Practical Teaching Resources

4.1 Raise the awareness of athletic practical teaching resources development

The nature of athletic practical teaching resources development lies in establishing PE curriculum system in teaching practice, changing disparaging attitudes towards it. Meanwhile, guided by social need, we should combine athletic practical teaching resources development with our daily life in order to make sure the successful developing of PE practical training. However, to gain these aims, we need to create an athletic practical teaching environment atmosphere. In addition, we should give commendation to the advanced administrative staffs, gym teachers and counselors who make great contributions to the program development. Still, we should make the most of media to advertise advanced individuals and units. Both of the two ways are effective.

4.2 Perfect the construction of athletic practical teaching resources management system

Athletic practical teaching has the characteristic of covering a wide range, multiple targets and complicated processes. Actually, the management is more difficult than the theory teaching. Relevant functional department should make quality standards and administrative measures of each link in practical teaching on the basis of serious study. Under the circumstance, the practical teaching procedures will progress scientifically and normatively. For instance, physical education practice teaching resources management system related management measures; college sports professional student internship management regulations; college sports teachers credentials the exercise to the enterprise management method. Administrators must formulate regulations for athletic practical teaching tasks. Then, they should take the utter seriousness of teaching plan and curriculum. According to the requirements, teaching contents, teaching aims, teaching hours, teaching venues and teaching progress should be enacted. Someone is put in charge of this work and undertake the responsibility to ensure the implementation of the every athletic practical teaching step as planned.

4.3 Advance the construction of athletic practical teaching site

The exploration and construction of athletic practical teaching site is always a weak link. This phenomenon is manifested by small amount of teaching sites, single classification and service function, insufficient running fund and unsatisfactory practical results. Hence, management innovation in sports enterprises is a must when they fully advance the construction of teaching practice site, curricular resources exploitation and usage site, integrated practice activity site and so on. In this way, normal students can improve their teaching skills, curricular resources exploitation and usage ability, class management, organizing integrated practice activities, teaching management and research ability. Beyond that, it's a good way for school leaders to try to shoulder the responsibility together with external site principals. In the process of the construction, it's necessary to strengthen the sharing mechanism so that both of them can freely enjoy the teachers, material resources, financial resources, administrative resources, public awareness and reputation. In consequence, it will work in practical teaching.

4.4 Perfect athletic practical teaching staff

The construction of athletic practical teaching staff aims at building a professional and part of the teachers and management team which is the assured guarantee of PE major cultivation effects. Nurturing by yourself and multi-channel development are the essential approach to gain the goal. So far, the general phenomenon of low practical teaching level drives administrators to make reward and punishment system and enhance practical teaching ability. What's more, it's significant to employ sophisticated practitioners and teachers as joint education tutors or guest instructors. Thus, the shortage of teachers and inadequate practical experience can be solved at a time. It's also good for communicating with the practical sites.

4.5 Integrate athletic practical teaching hardware resources

It refers to internal and external hardware resources. The internal athletic practical teaching hardware resources include stadiums, sport facilities and sport equipment. The best way to integrate these resources is to reserve, register, approve and open. Teachers and students who major in other subjects should choose the practical resources to exercise. However, external athletic practical teaching hardware resources, school stadiums, sport facilities and sport equipment in other universities. Due to the attribution difference, the practical resources can be available only to paying customers selectively with communication. Then, the integration of athletic practical teaching resources would be realized.

5 Conclusion

With the development of higher education in China, the elite education has gradually transformed to mass education. In consequence, education quality, as the lifeline, gets wide attention day by day. It has been found that education quality in practical teaching steps is one of the bottleneck problems in cultivating high-quality talents. Athletic practical education resources sharing lie in the primary stage by now. There exist some troubles during the sharing process, for example, weak awareness, low sharing level, monotonous content, short of advanced management and long-term stable cooperation platform. Aimed at the existing problems, a variety of suggestions and measures have been put forward. Strengthening the awareness of athletic practical education resources exploitation, perfect the construction of athletic practical teaching resources management system, perfect athletic practical teaching staff, integrate athletic practical teaching hardware resources are included.

(E-mail: 3996@163.com)

Abstract: Chinese art transaction activities are carried out on an unprecedented scale. Many domestic, foreign scholars and critics consider the current art market from the viewpoint of marketing, cultural anthropology, cultural economics, predicting its future trends. While the current academic research places the emphasis on the analysis of art market macroeconomy, law, consumption and investment behaviors, there is no academic research aiming at the analysis of art market auction behavior. On the basis of the existing research, this paper mentions the common intermediate types in Chinese art market and sums up the basic condition of auction market under the current investment market background of art collection, in reference to the actual situation. Through the analysis of the relationship among the supplier, demand side and market intermediary, this paper tries to summarize the status and problems of Chinese art market and puts forward the prospect.

Key words: China artwork; Market; Intermediary; Type; Prospect

1 Introduction

With the rapid growth of national economy and the improvement of populace's cultivation, Chinese artwork market has become the third biggest industry following the stock market and the real estate industry. Supply demand, goods, price and intermediary are the five essential factors to form a market. Artwork market is no exception. Also, the market will take on more positive affection with the improvement of people's cognitive competence. Chinese artwork market has accomplished the continuous enormous transformation from collection primary market to investment intermediary market. Intermediary is not only an important belt between artists and customers, but also the main trade pattern on the sound artwork market. There are three main levels of markets on business intermediary of Chinese artwork market. Primary market includes gallery, painting shop and artwork companies, which makes the artwork ownership transfer by marketing. On the management idea and business pattern of business intermediary, primary market is divided into two parts. Primary pattern also means the dealer can act on behalf of the pianist fully to authentication and exhibition the artwork for a long time. Art exhibition is an activity to show or market artwork by selling booth, inviting artwork operator, art creation institution and other art groups. Such a management pattern is also a complement to the first two levels market.

Chinese artwork has fundamentally changed since 21 century. With the emphasis on income from investment, artwork investment has gradually developed from enlighten consciousness to the common consciousness. Chinese artwork market is turning from scattered collection market to scale, regulation and control investment market. Creation is a procedure which uses the new method to combine the past factors consciously with the precondition of market survey, market strategy and experienced unique mind training.

2 Current Situation of China's Artwork Market Intermediary

With reform and opening-up moving forward, our artwork market now is developing constantly. However, in general, it remains at a primitive stage or initial stage. Because a complete and mature artwork market should be a market where producers, consumers, intermediaries and art critics can interact and promote each other so as to make market coordinated.

The current situation is that producers are over too much. (there are about 1 million painters in the whole country), yet domestic artwork consumption haven not become a trend from

* This paper is supported by 2010 Education Science Planning Project of Jiangxi Province (10YB265), 2013 Social Science Planning Project of Jiangxi Province (13YS09), and 2015 Key Research Base Project of Culture and Art Science of Jiangxi Province.

consciousness and concept to affordability. Hence, the important link in artwork market---artwork intermediary is less-developed. As for the art criticism, it is becoming much weaker, almost as hire criticism. All kinds of problems, even some deformed development have arisen as market economy developed further and under the premise of less developed artwork market at primary stage. There are as follows:

Cultural differences between different regions influence on aesthetic consciousness and consumption.

In the cultural system of the world, the main reason why Chinese culture can make China become the only country with ancient civilization is its great containment. Due to the difference of geographic position, climatic conditions, economy development and living custom, the different culture had been shaped. Under the major premise of unity, different regions and ethnics' colorful culture woven into special, unitive, systematic, and continuous cultural mechanism through collision, signing each other, development, and changes, but still remain their specialty at the same time. This definitely affects the aesthetic consciousness and consumption. In the following, we will give a description about current conditions of several major artwork markets focusing area in China.

Guangdong is located in the south of the five ridges, commonly known as the Lingnan. It is the modern coastal opened earlier in the city, and its transportation is convenient, so it has advantages of absorbing foreign culture. Besides, Guangdong is the origin of the Revolution of 1911. During the process of Chinese bourgeois revolution, the reformists idea of learning western countries on the basis of insisting Chinese tradition value and cultural thoughts of old democratism has a great influence on art business. The artists are to reform the Chinese art market by absorbing the western painting techniques based on the traditional painting. As Guangzhou's economy surged forward, people's qualities and education level improved by a wide margin, artwork market gained its possibility of development for the economic capital surplus. In addition, Guangdong adjacent to Hongkong and Macao, it became an important base for Hongkong and Macao to buy inland artwork. Art dealers and collectors in Hongkong and Macao and overseas are main source for the Guangdong artwork market. For native consumers, partly are hobbyists who have a clear aesthetic tendency and different emphasis on their collections, and partly are emerging entrepreneurs with substantial assets, who have a wide collection but an unclear tendency and their collections are mostly stable and potential. They make an investment on artwork market for improving or building their cultural image or expecting the artworks' appreciation. Both the collectors are common in that they collect Guangdong work of painters, painting of "lingnan school" that popular all the time. Guan shanyue, Li xiongcai are welcome painters in Guangdong artwork market. Lingnan painters are main target of Guangdong artwork collection. Most people hold a wait and see attitude on other styles and advancing works in recent years. Those real art dealers who have a wide but not very much collections have poured the great efforts to launch the youth and middle-aged oil painting works, but have not gained profits as expected in Guangdong, although their propaganda are more concentrated than the local painters in the hype means. Collectors prefer to spend a lot of money on local famous painter's works rather than collecting those artist's works with strong art and rich appreciation potential. Overall, the art market in Guangdong region is relatively stable but conservative.

From the Southern Song Dynasty, as the cultural center southward, Zhejiang became one of the centers of Chinese painting. It has maintained a strong traditional literati. Poem and Painting are still fun to men of literature and writing. Painting and Calligraphy Institute are of great numbers. Art atmosphere prevails, which is similar to Jiangsu but compared with the literati painting of Jiangsu, the painter in Zhejiang is not limited on the description of Chinese water town. In addition, a large number of talent painters educated by China Academy of fine arts make the oil painting, printmaking, sculpture, crafts and arts in Zhejiang show a flourishing prosperity. There are traditional literati painting, and advancing emerging school too. Wu Shanming and Zhang Peili are representative of the two tendencies. In terms of the productivity of painting, Zhejiang is undoubtedly important place of Chinese painting.

Zhejiang's art purchasing power is not as strong as Guangdong's, but with rich cultural heritage. Zhejiang has a group of stable collectors. These collectors do not have enough financial

resources to collect the famous or cultural relics, but they are very keen to collect young painter's works featured by low price but strong art. It is difficult to find some explosive news from media reports about art market in Zhejiang. A picture can reach tens of millions of dollars on the Shenzhen auction house or Jiade auction, while in Zhejiang is incredible. It can be seen that there is a group of middle class art consumer groups in Zhejiang. In contrast, the limitations of Guangdong's art consumers are larger. Except for working-class buying some commodity painting for decorative purpose, most are rich businessman and they put their emphasis on trends and fame rather than art. Thus, their collecting quality is inferior to Zhejiang's. Zhejiang's art market enjoys high popularization, stable price, but the market is lacking in instructive art institutions. Market operation means of the normative agent system have not been established and the whole market is still at primary stage of homegrown.

As China's the earlier international commercial metropolis opening to foreigners, Shanghai is a modern city built by overseas Chinese businessmen and foreign immigrants. The commodity economy is the most important features in this city. The most representatives of the painting in the history--- Shanghai have all kinds of connections with the development of commodity economy. Ren Bonian, Xugu, Wu Changshuo are painters living in Shanghai. The reason why they go to Shanghai may be different, but more or less has direct links with economy. In modern times, Shanghai has organized China's earliest painting and calligraphy society with commercial guild nature of. It has perfect organization and has set up the trading venues in the name of the organization openly. Therefore, shanghai is exposed to extremely strong commercial atmosphere. To meet consumer demands, a large proportion of Shanghai works is the painting of flowers and birds, compared to strong expression of personality and temperament of literati painting. The flower and bird painting at this time pay more attention to the form of innovation, rich colors. Wu Changshuo was the first to introduce gorgeous color like the western red to the flowers and birds painting. Figure painting also take in Western painting techniques boldly, focusing on portrait. Many figures have obvious characteristics of portrait painting, which was apparently answering for the customer's needs. Shanghai artists' innovation to legalistic brushwork, conception and theme indirectly reflect a challenge to the tradition from the emerging bourgeois and economic advantage, bringing in Western civilization after the collision of the new culture.

Shanghai has the unique status of the international metropolis and good quality of the people, which is the basic guarantee for the development of the art market. Shanghai has a number of potential collectors. Because of the imperfection of the art market, nonstandard operation of intermediary organizations, and the impact of fakes and forgeries, the collection team did not erupt out due enthusiasm. The support of Shanghai art market is the private economy, while Beijing's state-owned enterprises are the support of the art market. In contrast, Shanghai consumers are more cautious. Shanghai art lovers are holding wait-and-see attitude and are quite carefully when buying artwork. In the primary stage of the art market, private transactions are mainly miscellaneous pieces and antique, the real art market has not come to its shape. Perhaps it is not enough for the promotion of the art collection, but with the consumers' awareness and awareness strengthen for the collection, the transfer of social public opinion, art consumption should be increased. There are a few large-scale galleries in Shanghai, its art market is not very big, but its market is closely linked to the development of economy. The prospect of art market depends on the economic development of the next few years. Shanghai is now in urgent need of a normal art trading channels. If the interests of art consumers can be effectively protected, Shanghai's art consumption will account for a large proportion of the country.

3 The Development Characters of the Intermediary Type of Chinese Art Market

With the rapid development of China's economy, improvement of people's life and cultural quality, the increasing number of people is involved in the art market and the art market is gradually coming into the market from the original edge. But the art market in China is not mature and it needs a more perfect agency and security mechanism to promote its healthy development. The following passage from gallery prospective gives a detailed introduction about China art market intermediaries -- Gallery of the situation and difficulties. Finally, from the angle of law, the paper describes the legal protection system of China's art market intermediaries.

In the Chinese art market, art can be mainly divided into three categories according to its types: Chinese paintings and calligraphy, porcelain miscellaneous, painting and contemporary art, which is also known as three parts of Chinese art. The total turnover of the three parts broke through 40.935 billion yuan on 2011 spring auction, accounting for 95.55% of the total turnover in this quarter. However, the development of the three parts has their own characteristics, and each is faced with different difficulties and challenges at the same time.

The art market relies on commercial intermediary to contact the art producers and consumers. Intermediary business is also art business operators and is the embodied form of art market operation. Intermediary patterns and operation are important factors on influencing the art market, which makes the ownership of works transfer and give out the artworks' aesthetic function, understanding function, education function, and entertainment function through the exchange of the economy, accomplishing the cultural meaning of artwork itself. There are many forms of art commercial intermediaries, which are divided into primary art market and second art market.

The main management way of the primary market is the ownership or ownership of art, and the way of entering the market again. The management mode of the second art market is mainly to accept the entrusting of art owners through the intermediary activities into the collection. Operators do not have the ownership of art. Primary market is dominated by galleries. The second market is of many forms such as art auction and art fair. Coordinated development of two markets can promote the development of the whole art market. But in our country the two markets are misplaced, even squeeze each other, and did not achieve the purpose of common development, which has brought serious negative benefits to the normal art market.

The operation principle of auction propels up the prosperity of local culture. In a word, regulated management and honesty are the primary reasons for the auction companies to keep growing. The excellent companies focus on learning and taking advanced auction operation system to optimize the service and upgrade the quality of the auction goods. They filtrate the auction goods to guarantee the rate of being auction. Meanwhile they strengthen the marketing, value the catalog and record, and provide the detailed information of works as possible. The collector can master real information and improve the ability of rational choice by detailed materials. It can not only strengthen the confidence of collectors and cultivate the auction and collection group of art auction market, but also make for popularizing the knowledge and enhancing the percipient word wildly. Learning is a process of inter-playing and interaction of many factors among urge stimulant, reminder, reaction, and strengthening.

4 Major Factors of Chinese Artwork Market Intermediary Action

The artwork market relies on intermediary (art operator) to connect the art produce and consumer. By exchanging the economic ways, it can transfer the owner of the works to accomplish the process of reselling and express the functions of appreciation, acquaintance, education and entertainment. The form of artwork market intermediary can be divided into the primary market in which galley leads and the secondary market where the auction and fair lead. The two markets can contribute to the development of artwork by inter working. But in Chinese artwork market, the two are inter-playing with each other, causing serious negative influence.

(1) Low standard. Low standard mainly means that the galley operation standard is very low. Now although there are about 2000 galleries in China, rare of them can be called real galleries. The galleries should implement agent system wildly to focus on the plan of market and the introduction of artists, and their major task is cultivating artists. However, according to the practice result, none of these galleries implement the agent system successfully. These so-called galleries are the commission shops of goods and the basic trade mode in artwork market. The operators buy and sell the paintings in groups, or they sell artworks copy and press works with low price as well. Not very different from the ordinary goods, these galleries are for general consumers not for collectors. Not being the trend of artwork market, they accept ordinary producers rather than the artists.

(2) Disordered competition. Disordered competition mainly means the disordered competition of first-class and second-class market. In recent years, auction companies have developed rapidly, and they also have enough capital and experts to purchase potential and famous paintings. They also invest heavily in advertisement to attract famous buyers. And the middle and low artworks also

find their way in the frequent small auctions. This kind of situation has serious impact on galleries, making their living space smaller. These galleries that really want to be art-standard are hard to take the ability of agents and advertise artists. Therefore, the disordered competition has been the latent rules in the circles. Not willing to collapse, these galleries have to resell with profits. Finally, the original second-class market auctions become the first-class ones. On the other hand, the primary ones become the secondary auctions. The disordered competition becomes worse and worse without leading position.

(3) Low constraining ability. Under the situations above, the galleries attempt to change their fates of broken up and the venality auction companies are also ambitious. Therefore, here come many behaviors which are lack of self-discipline, marking the fakes and rubbish. According to the convention, the galleries and artists will gain 50% of profits for each part after the sale. In this case, the artists think that the galleries take their money without efforts, so they would rather find guests themselves to buy their artists, or they just go to “zouxue” (perform for extra money), but the so-called zouxue can neither make the artworks have a stable price, nor have galleries promise their stable price, and finally, artworks will just be fakes. The auction companies will also operate in black box. In order to expanse the scales and comfort the sellers, they auction everything without distinguishing. The quality of the artworks makes people even more disappointed on the fair in recent years. The art fair will ease the standards of artworks to sell more booths. Millions of the artists in China come in great numbers without cost to take one booth, but the quality of artworks is just out of mind. The low constraining ability auction companies and art fair have made the fakes and rubbish penetrating in every place.

(4) The chaos of trade order, the imbalanced benefit and the defective of gallery system, and the "one hand covers two" status not being established. The artworks sent to the galleries by the artists are with low quality or even fake. Many artists take their artworks directly to the auctions or trade with collectors. And the trading point is the money and interest; even worse, some artists turn their companions from city galleries to town and village officers and collectors. Private transactions will not only lead to tax evasion and smuggling, but also undermine the market order and the rules of the game, resulting in transaction disorder. At this point, the determinant of the art price is artists themselves rather than the gallery. Artists no longer focus on art creation and research, and they are just like a businessman directly involved in the business activities of the intermediary business, considering acts of commercial economy, interest, dividends and other problems associated with the economic interests of their own, and making the optional formulation and stability of the price. So creators become experienced operators. Especially, galleries have become the servants of creators. The auction companies also face the problem of buying painting, while the artists become the biggest beneficiaries. The relationship between the interests of the art market and the chaos of the intermediary organizations in the confusion of the trading order, is of great imbalance, which directly impedes the development of the art market intermediaries.

(5) Insufficient accumulation and low sustainable development support. The galleries operate in low starting point, which fails to accumulate rich experience in the operation, and is unable to grasp the mature operation skills. Therefore, the operation is lack of vision and operation theory is behind. Many small galleries have closed, and big ones also feel powerless. From the auction companies, the number of the artwork auction companies arising in short term is great. In order to compete for the source and supply, most of them take the non-standard operation. Moreover, the auction companies find the small auction requires low investment with good return, so they hold a variety of small auctions. But too many small auctions make too many fake and bad ones, making collectors feel unreal. In fact, small auction has been a kind of promotion without meaning. From the artwork fair, there is no real artwork agent system in China. The artist cannot find the agent, so they have to jump on the bandwagon. Many of the works listed together cut the inherent personality, and also affect the grade of art fair, so the buyers flinch and walk away. These reflect that the Chinese artwork market intermediaries come into shape without enough capital and experience from one side. After the formation, their being short-term speculation and lack of long-term business vision and strategy of sustainable development will lead the collapse of intermediaries.

5 The Leading Position and Trend of Chinese Artwork Market Intermediary

Now, the intermediary walks from the entity to the virtual world. There are many people trying online galleries, online auctions, and TV shopping. Art share trading and fund as a new way is also ready to boom. With the diversification of the intermediary, the artwork market enters into modernization. With the rapid increase of network users, the Internet has become a rapid expansion and potential market, containing unlimited business opportunities. Intermediary should implement marketing activities to promote the individual's organization and trade activities with relevant method and theory.

In China, every year there will be a big artwork fair from the first fair held in Guangzhou in 1993, which were held in Shanghai, Beijing and Guangzhou respectively and seemed to be the symbol of the metropolises thrive in art. But the exhibitors, the lease of the booth or the proportion of the gallery are less than the proportion of the artists in Chinese artwork exhibition. Although the number of individual exhibitions is not the only criterion to measure the standard, it is also a reflection from the other side.

In recent years, the artistic quality and social benefits are not satisfying on the artwork fairs. In order to be able to sell more of the booth, they loose the selection of works. There are millions of artists in China. In order to gain a foothold in the market, they flock regardless of the expense. Those who can represent the real Chinese artists are not willing to be with them. Considering art fair to be a springboard for the primary artist and artwork markets, they do not want to join.

The volume of transaction of art on the exhibition is not high, many individuals exhibitors just rely on the opportunities on the exhibition to seek for regular buyers and agents. They do not want to make a deal directly on the exhibition, so the host cannot obtain a profit from the transaction amount, only focusing on the booth rental. The main cause of the different exhibitions is the non standard artwork market. There is no real art agent mechanism in China. The artist can do nothing but flock without agents. Those who push out agents list great number of artworks resulting in cutting the inherent personality and affecting the customers' desire to buy. So, the low artworks standards are bounded to exclude the high-end buyers, which is a vicious circle. Now, a variety of large and small fairs are also held, but buyers' market is narrow. Those investors and collectors who want to wait and see will go back because of the present situation. Fairs have become the artwork market of middle and low artworks. This kind of trend is not optimistic.

6 Conclusion

The current Chinese artwork market's passion fades away slowly and turns to be rational gradually. The quality of artists, collectors, investors, intermediaries and each group in this market gradually improve. From a macro perspective, the Chinese art auction market has ended its primary stage of development, the legal system, industry norms, are all in the mature market. Under such background, it means that the quality of the artworks is improving, the competition is increasing, and the mechanism is gradually standardized. Market speculation phenomenon will gradually decline and market competition is up to a sustainable development of new situation. First of all, from the request of artwork market, if there is no cultural connotation, the artwork is valueless in the end; for the auctions, if they just pursue volume and rate, rather than focus on the connotation of the auction and the culture, what they get is just the short term benefits. Apart from the standard of the auctions, the auction companies should improve their competitiveness and the value of corporate culture from the enterprise culture, vision and strategy, competition strategy. In recent years, many auction companies are in the efforts to develop the market. Some of them seek for new art auctions to explore and cultivate the plate with appreciation potential. Some auction companies focus on expanding their business scopes to develop different parts of the market. Remote joint auction can integrate local resource advantages and focus on the tastes and preferences of the local collectors to spread the ideas of art and its cultural value. The value is the attitude and opinion of human beings to social life.

Only with intensifying to establish a perfect gallery operation mechanism and agent system, can the artwork intermediaries make a difference in the art market intermediaries; can the artwork fair lead; can the situation of individual and bid scale private trade be changed by representative artworks, and finally the prospect of Chinese artwork market will come into shape.

(E-mail: pengrz@hust.edu.cn, wuweiping@whut.edu.cn)

Abstract: Over the past 30 years, the term Intercultural Competence remains to be lack of unified definition and concepts, and the traditional evaluation method cannot evaluate it comprehensively and systematically. Thus, based on the intercultural competence theory and fuzzy comprehensive evaluation theory, this study constructs one complete, scientific and practical evaluation index system and evaluation model to evaluate engineering students' intercultural competence. Then, the evaluation model is applied to evaluate engineering students' intercultural competence. The findings of the study indicate that the engineering students' intercultural competence is at an average level, which proves that the evaluation model is highly applicable and effective.

Key words: Engineering students; Intercultural competence; Fuzzy comprehensive evaluation

1 Introduction

On the background of economic globalization, the Sino-international intercultural cooperation and communication are increasing, as well as the demand of international talents. Thus, the colleges and universities of China should not only cultivate better professional qualified people, but also international talents with intercultural competence (ICC). At present, it seems to be quite urgent about how to evaluate engineering students' ICC.

Although the foreign scholars in the 80s and 90s had divergence in the conception of intercultural competence, they have formed quite unified definition of it in recent 20 years. For example, Chen and Starosta (1996) define intercultural competence as the ability to effectively and appropriately execute communication behaviors in order to get expected response in a culturally diverse environment". Spitzberg (2000) notes that the judgment of intercultural competence is to consider whether a behavior is effective and appropriate in given environment. Wiseman (2003) suggests that intercultural communication competence is comprised of knowledge, motivation and skills needed to interact effectively and appropriately with persons from different cultures. It is obvious to find that scholars above all mention two factors in their definitions of intercultural competence: intercultural situations, effectiveness and appropriateness. In addition, scholars of different research fields advance their different views towards the components of ICC, which have their own priority. For example, Byram's European Multidimensional Models of Intercultural Competence (1997) notes that intercultural competence requires students to acquire knowledge, skills, attitude and critical intercultural awareness of intercultural communication. Spitzberg (1997) suggests that intercultural competence is made up of three elements: knowledge, motivation and skills, which are interactive and interdependent. Campinha-Bacote (1998) advocates the components of intercultural competence, which include five interdependent parts to develop intercultural communication competence : intercultural awareness, intercultural knowledge, intercultural skills, intercultural collision and intercultural desire. Yong Yun Kim (2001) suggests that intercultural competence is composed of cognitive competence, affective competence and behavioral competence, which are interrelated, interactive and inalienable with each other. Samovar and Porter (2004) clarify intercultural competence into motivation, knowledge and skills. Deardorff (2004, 2006) collects the views and experience of many international well-known intercultural research experts over intercultural competence based on Delphi expert method, and she notes that intercultural competence includes components as knowledge, understanding, skills and attitude with the expected external outcome and internal outcome of the intercultural interaction level. Scheitza (2009) summarizes the core elements of intercultural competence (attitude, knowledge, communication, confidence and social relations) from the previous varied theories. Now, there is a

* This paper is supported by the National Social Science Fund of China(Program Number:12BYY042) and also by "the Fundamental Research Funds for the Central Universities"(WUT: 2013-Ib-071) . Corresponding author: Wu Weiping, E-mail address: wuweiping@whut.edu.cn .

widely shared view among most intercultural research experts abroad, that is, resource factors such as knowledge, skills, awareness and attitude are indispensable in the components of intercultural competence (Chen Starosta,1996; Wiseman,2001; Kim,2001; Byram,1997; Spitzberg,1997; Fantini,2000, 2006; Kim,2001; Samovar& Porter, 2004;Dodd,2006; Deardorf,2004,2006; Martin,2009; Scheitza,2009; Behrnd,2011).

Therefore, based on the research findings of the intercultural experts, this study defines intercultural competence as the comprehensive ability to communicate and interact effectively and appropriately with persons with different languages from different cultures in culturally diverse environments by successfully using personal intercultural resources (e.g. knowledge, attitude, skills, awareness, and see Figure 1) (Chen &Starosta,1996; Wiseman,2001; Byram,1997; Spitzberg,1997; Fantini, 2000,2006; Kim,2001; Samovar& Porter,2004; Deardorf,2004,2006; Behrnd,2011).

Figure 1 Intercultural Competence and Its Components (Fantini, 2000, 2006)

At present, on the evaluation of intercultural competence, most scholars lay their emphasis on the qualitative studies. And there are few quantitative studies having the systematic and complete comprehensive evaluation on ICC. Therefore, this study attempts to apply the fuzzy comprehensive evaluation (FCE) to construct a complete, scientific and practical evaluation index system and fuzzy comprehensive evaluation model to evaluate engineering students' ICC.

2 The Construction of Fuzzy Comprehensive Evaluation Index System of ICC

2.1 Setting principles of fuzzy comprehensive index system

1) The principle of being systematic and comprehensive

The evaluation index system must include indexes that can fully reflect all the aspects of intercultural competence evaluation, and evaluating objective links with evaluating index to form a well-bedded whole.

2) The principle of being concise and scientific

The evaluation must precisely reflect the dominance relationship between objective and index. The scale of the index system should be proper. Namely, the setting of the index system should be scientific. If the index system is too big, it will certainly attract evaluator's attention to trivial problems. While if the index system is too small with fewer levels of index and much too general index, it is impossible to fully disclose the actual condition of engineering students' ICC.

3) The principle of being flexible and practical

Evaluation index system should have enough flexibility and practicability in application, which is convenient for those learners who are not familiar to the construction process of the index system, and meanwhile the evaluators can make corresponding changes in the index system according to their different evaluating objectives.

2.2 The construction of fuzzy evaluation index system of engineering students' ICC

According to the above-mentioned principles and theories of intercultural competence, the questionnaire scale used in this study is a set of engineering students' ICC self-assessment scale (includes 4 main factors, 28 descriptive items), which is based on the multidimensional models of intercultural competence (knowledge, skills, critical cultural awareness, intercultural attitude) proposed by Byram (1997), in reviewing the intercultural competence self-assessment questionnaire (A YOGA FORM) invented by Fantini (2000,2006) and intercultural competence self-assessment questionnaire in federal EIL research project, and combined with the actual condition of the level of engineering students' ICC.

The ICC can eventually be summarized as four main dimensions: knowledge, attitude, skills and awareness. Such division approximately coincides with the views advocated by foreign ICC scholars

Byram (1997), Risager (1997), Fantini (2001, 2006), Deardorff (2004, 2006).

Thus, this study identifies that intercultural competence includes four first-level index dimensions: knowledge, attitude, skills and awareness, and constructs the comprehensive evaluation index system of intercultural competence with three layers indexes (see Table 1). The comprehensive evaluation index of intercultural competence (U) is evaluated from four aspects, that is, the sub-index of *knowledge*(u_1), the sub-index of *attitude*(u_2), the sub-index of *skills*(u_3), the sub-index of *awareness*(u_4). Seen from Table 1, the evaluation index is divided into three layers: goal layer, first-level evaluation index, second-level evaluation index. The contents in the first-level evaluation index and second-level evaluation index are respectively represented by first-level index (with one subscript) and second-level index (with two subscripts). So there is: $U = g(u_1, u_2, u_3, u_4)$, where g refers to comprehensive evaluation function, u_i can be measured by evaluating the second-level evaluation index of intercultural competence. Namely, $u_1 = g'(u_{11}, u_{12}, u_{13}, u_{14}, u_{15}, u_{16}, u_{17}, u_{18}, u_{19}, u_{110})$, similarly, $u_2 = g'(u_{21}, u_{22}, u_{23})$, $u_3 = g'(u_{31}, u_{32}, u_{33}, u_{34}, u_{35}, u_{36}, u_{37}, u_{38}, u_{39}, u_{310}, u_{311}, u_{312})$, $u_4 = g'(u_{41}, u_{42}, u_{43})$ (See Table 1).

Table 1 Evaluation Index System of ICC

Goal layer	first-level evaluation index	Second-level evaluation index
Evaluation index system of ICC(U)	knowledge(u_1)	u_{11} Understand the knowledge of history, geography and social-politics in home culture
		u_{12} Understand the knowledge of social etiquette and religious culture in home culture
		u_{13} Understand the knowledge of lifestyle and values in home culture
		u_{14} Understand the knowledge of history, geography and social-politics in host culture
		u_{15} Understand the knowledge of social etiquette and religious culture in host culture
		u_{16} Understand the knowledge of lifestyle and values in host culture
		u_{17} Understand the knowledge of cultural taboos in host culture
		u_{18} Understand and compare the knowledge of fundamental norms and behavior of different cultures
		u_{19} Understand basic knowledge about culture, intercultural communication and transmission, etc
		u_{110} Understand some strategies and skills for a successful intercultural communication
	attitude(u_2)	u_{21} Willing to learn foreign languages well and understand foreigners
		u_{22} Willing to communicate with and learn from foreigners from different cultures
		u_{23} Willing to try to forgive the different values, eating habits, taboos, etc of foreigners
	skill(u_3)	u_{31} Ability to negotiate with and explain self culture to others when intercultural misunderstandings arise in order to achieve mutually satisfactory
		u_{32} Ability to communicate with body language or other non-verbal ways in a language communication barrier
		u_{33} Ability to try to avoid offending foreigners in language, dress, and behavior when communicating with them
		u_{34} Ability to look at the issue from different cultures and multi-angles when looking at events such as politics, economy, religion, etc taking place in other countries
		u_{35} Ability to try to avoid prejudices and stereotypes of foreigners when communicating with them
		u_{36} Ability to treat foreigners with courtesy when communicating with them
		u_{37} Ability to avoid any reference to the topic about privacy when communicating with foreigners
		u_{38} Ability to successfully communicate in foreign languages with people from different social and cultural backgrounds and areas
		u_{39} Ability to have sensitivity towards intercultural differences
		u_{310} Ability to use a variety of methods, techniques and strategies to help learn foreign language and culture
		u_{311} Ability to reflect and learn, even seek proper settlement when intercultural conflict and misunderstanding arise
		u_{312} Ability to directly obtain related knowledge of intercultural communication by contacting with foreigners
	awareness(u_4)	u_{41} Aware that there are cultural similarities and difference when communicating with foreigners
		u_{42} Aware of different cultural styles and language use, as well as their impact on social and work scenarios
		u_{43} Aware of the differences between self cultural identity and his/her cultural identity when communicating with foreigners

3 The Construction of Fuzzy Comprehensive Evaluation Model of ICC

3.1 First-level fuzzy comprehensive evaluation model

1) Determine factors set to evaluate engineering students' ICC

The factors set of intercultural competence evaluation is designated as $U=(u_1, u_2, \dots, u_n)$, where u_i is the factor that affects the evaluation object. Here in this study $U=(u_1, u_2, u_3, u_4)$. Namely, $U=(knowledge\ u_1, attitude\ u_2, skills\ u_3, awareness\ u_4)$, where $u_1=g^3(u_{11}, u_{12}, u_{13}, u_{14}, u_{15}, u_{16}, u_{17}, u_{18}, u_{19}, u_{110})$, similarly, $u_2=g^3(u_{21}, u_{22}, u_{23})$, $u_3=g^3(u_{31}, u_{32}, u_{33}, u_{34}, u_{35}, u_{36}, u_{37}, u_{38}, u_{39}, u_{310}, u_{311}, u_{312})$, $u_4=g^3(u_{41}, u_{42}, u_{43})$ (see Table 1).

2) Determine comment set to evaluate engineering students' ICC

Suppose the comment set as $V=(v_1, v_2, \dots, v_m)$, where V_j stands for the comment result, $j=1, 2, \dots, m$. Since evaluation grade often ranges from 4 to 9, here suppose $m=5$, there is $V=(v_1, v_2, v_3, v_4, v_5)$, namely, $V=(very\ low/weak, low/weak, average, high/strong, very\ high/strong)$.

3) Determine weight distribution of comment sets

If $A=(a_1, a_2, \dots, a_n)$ is a fuzzy subset of U , it is called weight distribution subset, hereinto, $\sum_{i=1}^n a_i = 1, a_i > 0$, a_i refers to the degree of importance of the i_{th} index in comprehensive evaluation.

The weight in this study can be determined by the use of experts' estimation method, or Delphi expert method, which selects 15 experts engaged in teaching intercultural communication for years, then organizes, calculates and analyzes the weight, and finally determines the weight of each index. In order to determine the weight coefficient of the various indexes, weight coefficient set constituted by first-level index is as follows: $A=(a_1, a_2, a_3, a_4)$, and weight coefficient set constituted by second-level index corresponding with the first-level index: $A_i=(a_{i1}, a_{i2}, \dots, a_{ij})$, $i=1, 2, 3, 4$ $j=1, 2, \dots, n_i$ is the number of second-level index under the i_{th} first-level index. This study collects the evaluation data made by 15 domestic experts over the importance of the indexes in the evaluation of engineering students' intercultural competence in three rounds and conduct statistical processing, thus the following weight coefficient of each index is derived.

The weight of first-level index is:

$$A=(a_1, a_2, a_3, a_4)=(0.35, 0.19, 0.31, 0.15)$$

The weight of second-level index is:

$$A_1=(a_{11}, a_{12}, a_{13}, a_{14}, a_{15}, a_{16}, a_{17}, a_{18}, a_{19}, a_{110})=(0.05, 0.04, 0.06, 0.15, 0.15, 0.16, 0.12, 0.11, 0.05, 0.11),$$

$$A_2=(a_{21}, a_{22}, a_{23})=(0.50, 0.17, 0.33),$$

$$A_3=(a_{31}, a_{32}, a_{33}, a_{34}, a_{35}, a_{36}, a_{37}, a_{38}, a_{39}, a_{310}, a_{311}, a_{312})=(0.09, 0.11, 0.10, 0.10, 0.09, 0.09, 0.09, 0.09, 0.09, 0.05, 0.04, 0.06),$$

$$A_4=(a_{41}, a_{42}, a_{43})=(0.40, 0.20, 0.40).$$

4) Determine fuzzy evaluation judgment matrix

For the i_{th} index, the degree of membership of each comment is the fuzzy subset on V . Judging from each index, the comment rates of them are given, so that a relationship between the evaluation index and comment rate is established, that is the fuzzy relationship matrix from U to V . Thus, the fuzzy evaluation judgment matrix of each index is:

$$R_{(i)} = [\bar{R}_{1(i)}, \bar{R}_{2(i)}, \dots, \bar{R}_{m(i)}] \tag{1}$$

$$R = [r_{kj(i)}]_{n \times m} = \begin{bmatrix} r_{11(i)} & r_{12(i)} & \dots & r_{1m(i)} \\ r_{21(i)} & r_{22(i)} & \dots & r_{2m(i)} \\ \dots & \dots & \dots & \dots \\ r_{n1(i)} & r_{n2(i)} & \dots & r_{nm(i)} \end{bmatrix}, \quad i = 1, 2, \dots, 4 \tag{2}$$

Where “ i ” refers to the number of first-level evaluation index, “ m ” refers to the number of examinees. “ $n(i)$ ” is the number of second-level evaluation index under the i_{th} first-level evaluation index, and “ $r_{kj(i)}$ ” is the degree of membership of the k_{th} second-level evaluation index under the i_{th} first-level evaluation index corresponding with the evaluated Y_j

5) Construct first-level fuzzy comprehensive evaluation model with multifactor

Since the single-factor fuzzy evaluation can only reflect the impact of one single factor on the evaluated, a comprehensive evaluation is expected to be made in order to obtain the comprehensive effects of all the factors on the evaluation object. The following single-level fuzzy comprehensive evaluation model is constructed from the fuzzy set on factor set U and fuzzy evaluation transformation matrix R :

$$B = A \circ R = (a_1, a_2, \dots, a_n) \begin{bmatrix} r_{11(i)} & r_{12(i)} & \dots & r_{1m(i)} \\ r_{21(i)} & r_{22(i)} & \dots & r_{2m(i)} \\ \dots & \dots & \dots & \dots \\ r_{n1(i)} & r_{n2(i)} & \dots & r_{nm(i)} \end{bmatrix}, i = 1, 2, \dots, 4 \tag{3}$$

3.2 Second-level fuzzy comprehensive evaluation model

In a complex system, there is always a multi-level of multifactor since a lot of factors are to be considered. If some sub-factor set u_i still contains many factors, u_i can be subdivided, so there is multistage model. For such multi-level problem, we can respectively make comprehensive evaluation on all the sub-factors and then on the whole, or synthesize the lowest-level factors first and then the high-level factors, sequentially integrated layer by layer until the highest level. This study only needs to build second-level fuzzy comprehensive evaluation model, namely the fuzzy comprehensive evaluation model to evaluate engineering students' ICC:

$$B = A \circ R = (a_1, a_2, a_3, a_4) \circ \begin{bmatrix} B_1 \\ B_2 \\ B_3 \\ \dots \\ B_m \end{bmatrix} = (b_1, b_2, \dots, b_m) \tag{4}$$

Seen from the formula above: A is the weight number of the i_{th} factor u_i in fuzzy comprehensive evaluation ($i = 4$), namely the weight of layer u_i on upper layer; A_i is the weight distribution of the i_{th} factor u_{ij} in $u_i(u_{i1}, u_{i2}, \dots, u_{ij})$, namely the weight distribution of layer u_{ij} on layers u_i ; Respectively, R and R_i are the fuzzy evaluation transformation matrix of the first and the second layer. And B is the comprehensive evaluation result of engineering students' ICC U .

4 Application Analysis

4.1 Subjects

In order to verify the validity and practicality of fuzzy comprehensive evaluation model of ICC, this study randomly selects 310 engineering students as the subjects of ICC evaluation, where 272 are boys and 38 are girls. Their ages range from 19 to 20 and all subjects have intercultural experience at home.

4.2 Instruments

The questionnaire is a set of engineering students' ICC self-assessment scale (includes 4 main factors, 28 descriptive items) and interview items are eleven questions about engineering students' ICC.

4.3 Data processing

4.3.1 Arithmetic mode of fuzzy comprehensive evaluation

In order to obtain a unified standard on data statistics, assignment quantization process is conducted on all the questionnaire results of engineering students before data analysis, namely A, B, C, D, E are unified transformed into interval [0,1] and are assigned respectively. Let A = 0.1, B = 0.3, C = 0.5, D = 0.7, E = 0.9, i.e. from "very low / weak" to "very high / strong". Then, all the calculations are conducted in accordance with this model: $B = A \circ R = (b_1, b_2, \dots, b_m)$. " A " represents the weight coefficient set, " R " represents normalized results of the sample investigation and assignment, and " m " represents the quantity of the subjects. In this study, $m = 310$, $i = 1, 2, \dots, m$; " b_i " is the ICC comprehensive evaluation score of the i_{th} subject.

4.3.2 The results of fuzzy comprehensive evaluation

According to the above-mentioned weighted value of each index and comment set of engineering students' ICC evaluation determined by Delphi method, the data collected from 310 engineering students are processed by the comprehensive evaluation of engineering students' ICC, and the results of the parts and the total of their ICC are as follows:

Table 2 FCE Results of the Engineering Students' ICC

	N	Minimum	Maximum	Mean	Std. Deviation
Knowledge (reference value 0~0.35)	310	.00	.33	.115	.014
Attitudes (reference value 0~0.19)	310	.02	.18	.120	.039

Skills(reference value 0~0.31)	310	.03	.29	.165	.049
Awareness (reference value 0~0.15)	310	.02	.14	.051	.029
ICC Total (reference value 0~1)	310	.25	.87	.451	.097
Valid N (listwise)	310				

As can be seen from Table 2, in *knowledge* within the reference value 0~0.35, the 310 engineering students get the mean value of 0.115, which means most of the engineering students' ICC at *knowledge of self* is at a lower level. In *attitudes* within the reference value 0~0.19, the mean value is 0.120, which means their ICC at *attitudes* is at a higher level. In *skills* within the reference value 0~0.31, the mean value is 0.165, which means their ICC at *skills* is at an average level. In *awareness* within the reference value 0~0.15, the mean value is 0.051, which means their ICC at *awareness* is at a lower level. About the total value of ICC within the reference value 0~1, the mean value is 0.451, which means most of the engineering students' total ICC is at an average level.

Based on the ICC comprehensive evaluation above on 310 engineering students' ICC, it shows that their ICC is generally at an average level.

The results prove that the fuzzy comprehensive evaluation model of engineering students' ICC is practical in actual application and the evaluation indexes are rather systematic and comprehensive.

5 Conclusion

This study constructs a systematic and practical index system and mode of fuzzy comprehensive evaluation on engineering students' ICC based on the fuzzy sets theory and describes its comprehensive evaluation mechanism and evaluation process, and then applies this model in a survey of engineering students, which proves the reliability of index system and evaluation model as well as their effectiveness in practice. In the follow-up studies, empirical study of comprehensive evaluation on other subjects in terms of their ICC will be conducted in the use of this index system and model.

A Research of the Enlightenment to Modern Moral Education by Social Honesty in the Pre-Qin Period

Cui Rui

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 286665263@qq.com)

Abstract: The rapid development of social economy shows the lag-behind of cultural development in modern society. Therefore, influenced by utilitarian concept, moral education nowadays turns to be empty, hollow and with low efficiency, and the social honesty has become an issue in moral education. Whereas, in traditional Chinese Confucian culture, the concept of social honesty is of great importance known as morality first, knowing and doing, honesty in commerce, governing and interpersonal relationships. This paper tries to study the social honesty in the pre-Qin Period and attempts to get some enlightenments for today's moral education by a comparative study of honesty ideas from the originality of words and derived meaning, the moral criteria for individuals and for "social groups".

Key words: Confucian in the Pre-Qin Period; Social honesty; Unity of knowing and doing; Moral construction; Enlightenments

1 Introduction

Since the Reform and Opening-up, the market economy has brought unprecedented prosperity to people's material life, but also instability to the development of society. Money worship, hedonism grow to spread; corruption, fraud and other criminal acts become a common occurrence; academic bubble and corruption meet the eye everywhere. Reasons for these phenomena can be seen as the imperfect legal system, short-sighted education, matchless development between economy and culture. But the main reason is the cultural rupture in moral education. It is said that moral education to some extent even gives way to exam-oriented education. Morality is no longer a unity of "knowing and doing", but becomes an abstract concept, which leads to the dislocation of values. With the economic stimulus, lack of honesty has become a common phenomenon, and has penetrated into all areas of social life with a strong impact on people's morality and it even challenges the majesty of law. Strange phenomena can be seen everywhere as anti-honesty doings: Those who keeps honesty are regarded as "weird"; those who tell truth are considered as "incompetent"; those who are dishonest whereas are known as "smart and flexible". As is known to all, moral construction cannot be achieved only by moral education. It is a comprehensive, multi-faceted construction and renovation, among which the cultural value is the core. Only when cultural utility and slavery are got rid of, can moral education come into action to help shape people's moral mind.

At present, it is not easy to flyback to ancient culture in China's educational development. The purpose of education is the full growing and free upgrade of people, instead of the achievement of practical value but the humane care and experience. What's more, the nature of education has actually appeared on the deviation when Western education is introduced. Even though Confucianism has been influenced by radical moral revolution in the late Qing Dynasty and in the Cultural Reform, it still largely affects people's life ethics and moral psychology (Wan Junren, 2002). So critical assimilation of traditional culture is still very necessary in having moral education with Chinese characteristics. Honesty is the cornerstone of human development and a core element of moral construction. In the long history of China, how people know, regard, develop and implement social honesty and put it to all levels of social life is of great importance in developing good moral education today. This paper attempts to analyze the influence of Confucianism in the pre-Qin Period to social honesty and tries to get useful references to today's moral education.

2 Definition of Honesty

In ancient Chinese language, "honesty" are in two Chinese characters which have nearly the same meaning according to the Analytical Dictionary of Chinese Characters. The Chinese characters also have literal meanings as "what is said is what in one's heart" (Marx K., Engles F., 1956). From this it can be seen that "speech" and "idea" should be the same, make the value of honesty and show the interpersonal relationships (Xu Wenjing, 1998). In "The Book of Yupian", it is said that "honesty" means "sincerity" and "respect", which shows that one should respect others and have humble attitude

in communication with people. Only by doing so can the two sides be fully and sincerely understood. Before the Han Dynasty, people were only honest to people but sincere to “Heaven” or “God”. In the Book of History, it is said that “if people cheat each other, the society will be disordered; if people do not keep promises, the oath can be nothing at all.” From today’s point of view, “honesty” can be regarded from two aspects. It both refers to the real inner attitude and quality of one person with the focus on “I”, and also refers to other’s attitude to “I” with the focus on “others”.

In the Confucianism of the pre-Qin Period, “honesty” more often than not was used to show “sincerity”, and was regarded by Confucius as one of the four creeds and one of the five virtues. From his speech, Confucius considered “honesty” as an important character and moral of people, and it involved all aspects of social life with rich content and important instructive meanings to today’s moral education.

3 “Honesty” as Self-Cultivation

In his education, Confucius ever proposed the idea of “self-constraint and self-revision”, of which the former means one should have strict constraints on himself, restrain his words and deeds and make it in line with moral ethics, the latter means one should often reflect on his doings, have self-supervision in his mind, and make it part of one’s mind and consciousness.

In his book the Analects of Confucius, Confucius said, “I daily examine myself on three points: whether, in transacting business for others, I may have been not faithful; whether, in intercourse with friends, I may have been not sincere; whether I may have not mastered and practiced the instructions of my teacher.” These words convey that Confucius had rigorous daily introspection on his behaviors. He asked whether he had met the requirement of “honesty” in moral aspect and “good teaching” in professional aspect. “Honesty” here means to treat people with sincerity and trust in social intercourses and emphasizes the consciousness of self-revision. What’s more, Confucius required his students to have “soul-searching” to promote skills and virtues according to his saying “a gentleman sets strict demands on himself while petty men sets strict demands on others”. He wanted his students to follow the men who were in good morals and to have self-examination whether they were like the men who were not in good morals. From this it can be said that in Confucius point of view, “to study without reflection makes no progress in one’s learning”. It is in the same meaning of Mencius’ saying “if your efforts all fall flat, you should examine yourself”.

In the Great Learning, “honesty” is also regarded as a necessity in people’s morals. It was important in supporting one’s family, self-cultivation, and governing the country. “Honesty” shapes people’s mind and cultivate one’s moral character. Only when “honesty” and “self-examination” work together, can people’s moral character be promoted.

4 “Honesty” as the Base of Self-Reliance

In the Confucianism of the pre-Qin Period, “honesty” was not only regarded as the goal of self-cultivation in one’s life but also a yardstick to judge people’s moral cultivation and accomplishment. Confucius always required his students to be honest to people and act in good faith.

“Honesty” is the foundation of behaviors. If there was no “honesty” to guide people’s behaviors, then people would lose direction in their doings, so did the principles of moral deeds. So “honesty” helps people to be good at personal relationships, and acts as the principle of personal relationships as well.

Be as good as your words with your friends.

If a man does not keep his word, what is he good for? If a cart has no wheel, what is the cart good for? --- The Analects of Confucius

In Confucius eyes, the interpersonal relationships would not exist if there was no honesty with them. What honesty to men is what wheels to a cart. Therefore, “honesty” is the bond of personal relationships, the footstone of a harmonious society, the base of self-reliance.

5 “Honesty” as the Unity of Knowing and Doing

Morality is a unity of knowing and doing. Here “knowing” can be seen as moral consciousness, “doing” as the behaviors, the moral practice. Only when “knowing” is put into “doing”, can one really be called honest. So Confucius emphasized the result of “doing” which was triggered by “knowing”. He advocated that knowing and doing shall come together, one’s actions must be in keeping with his words.

Promise must be kept and action must be resolute.

A gentleman would rather be quick in action than talk a lot.

I observe what people say and what they do as well.

Young people should be filial to their parents at home and respectful to their elder brothers when they are with them. They should be serious and trustworthy, love the populace extensively and be close to those who are humane. When all this is done and there is time for other things, they should use it for the study of the classics.

A gentleman takes it as a disgrace to let his words outstrip his deeds. --- The Analects of Confucius

Confucius thought a man of noble character should practise what he preaches, match his words with his deeds. He thought “to walk the talk” was the criterion to judge whether a person is a gentleman or a petty man. To see how a person delivers his speech and how he delivers on his speech is a measure to judge his moral ethics.

Enlightenment can be given to us from Confucius: First, both morality and moral education must be achieved by moral practice. Single preaching is hollow, and moral education achieves results through social practice. So classroom teaching for moral ethics acts only as the input of moral consciousness, and it is not the complete moral education. Second, the task of education refers to moral education. Professional education is secondary to moral education. So it is of great significance to handle well the relationship between professional education and moral education, to weaken utilitarian education and highlight humane education.

6 “Honesty” for Statesmen

“Honesty” means to keep one’s promise and be faithful in action. Confucius thought if a person is not honest, then he will not be able to walk. He also warned that even if a person lives in poverty for a long time, he should not forget his promises. A gentleman should first be trusted by people, and then be able to govern them. To statesmen what one says and does is not his own business but the business of his people and country. As it is said that “those in subordinate positions will follow the example set by their superiors”, so the statesmen should set good examples by make their deeds consistent with their words.

Be honest, and the people will be honest to you.

Watch a man’s action after listening to his words.

A gentleman takes it as a disgrace to let his words outstrip his deeds. --- The Analects of Confucius

The statesmen should both try to promote their self-cultivation and to keep their promises. Man can’t do anything without a good credit.

Confucius pointed out, if the statesmen lose trust of people, it would be difficult for them to keep his country stable. He thought “honesty” was more important than “soldiers” and “food”.

To the statesmen, one word is as heavy as nine tripods. What the statesmen says should be out of repeated considerations.

A flaw in a piece of jade can be cleared while a man’s dishonesty can not. --- The Book of Songs

A gentleman does what he says. --- The Commentary of Zuo

A gentleman regards being dishonest as disgrace. --- Xuncius

These ideas to today are still of significance in practice. The statesmen should not only strengthen their own morality, be honest, trustful, but also be fair in their work, loyal for their duty. Therefore, “honesty” is a criterion for moral ethics and a manifestation which shows whether the statesman has fair governance, credibility, and responsibility in his job.

7 “Honesty” in Commercial Business

Commerce transactions are based on the basis of honesty. Authentic products, honest trading process, good after-sales maintenance and service show the honesty between businessmen and the value and loyalty between the producers and consumers. It also shows the concern for the human living environment. It tests whether a businessman makes his profit in a proper way and whether the market runs stably.

The man who sells beef will not ask the price too high; the man who sells pork will not decorate it. --- Family Analects of Confucius

Even a child will not be cheated in the market. --- Sayings of Mencius

Mencius thought the market transactions should be fair, just and honesty. Confucius also had reforms in the market in his day by emphasizing honesty should be what the market based on, the products and transactions.

Modern market and trade involve all aspects of people’s lives nowadays. Even it has changed a lot

in trade patterns, and trade areas. But it is very worrying that fake and shoddy products can be seen everywhere, like “the garlic storm incident”, “excessive packaging incident”, “milk powder incident” and others. That is all because of the loss of honesty, which was resulted from bad moral education and cultural education.

8 Conclusion

In Confucianism, honesty as a fundamental requirement of moral cultivation, runs through all levels of social life. To comply with the ruling class and to adapt the needs of different historical periods, Confucianism has undergone a series of evolutions, reconstructions and developments, many of which have been distorted or different from the original meaning of Confucian and Mencius thought, like “Ban from hundred philosophers, venerate Confucianism” by Dong Zhongshu, “Chengzhu Thought”, “the philosophy of the mind” by Wang Yangming and Neo-Confucianism. Honesty mentioned in the text, does not manifest all the real ideas of Confucianism. There of course exist some ideas which serve for the dominance hierarchy or the feudal class. What people should do now is to choose the advanced and correct ideas, absorb and renew them and pass them to the next generations as excellent traditional cultures. Meanwhile, to promote moral cultivation, what people should do is not only to touch upon honesty in Confucianism, but to really understand and know what honesty in Confucianism really means by learning it in the original context. In the same way, only when people put honesty into Confucian moral education, can people acquaint themselves with honesty as a whole, can moral education become an organic integration of people’s mind.

Innovative Research on Translation Skills for Campus Public Signs in Chinese Universities

Li Hui, Xiang Qingling

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: huili@whut.edu.cn, 2459228741@qq.com)

Abstract: This paper firstly introduces the significance of public signs together with the historical development of related research. In addition, the paper presents the “Interpretive Theory” (also known as “the French School”) in order to better illustrate the current problems existing in the translation of campus public signs which are listed as samples from different campuses of Wuhan University of Technology by surveying and researching. Besides, under the guidance of the theory, the paper also proposes appropriate skills and puts forward innovative ways for the improvement of the English version translations, which aims at a better application in the universities and colleges of China.

Key words: Campus Public Signs; Features and Classifications; Dynamic Equivalence; Translation Skills

1 Introduction

Public signs have been playing important roles in our daily life as well as in the internationalization of large cities in China. Public signs also belong to very special writing style, which usually uses concise and clear language to present the public the information of directing, restricting, prompting, and compelling. For one thing, it's convenient for foreigners who are staying in China, and it's also a better way to make them feel like at home. For another thing, English, as a tool, is very important to Chinese. Bilingual public signs on campuses of colleges can provide a good atmosphere for us to learn English. What's more, standard English versions of campus public signs can contribute greatly to a good image for the universities.

The study on the translation of public signs started in 1989 and later developed rapidly in the following decades with a variety of classifications, including city public signs, tourism public signs, traffic public signs, high-speed railway public signs, campus public signs, etc. The first research group of public signs translation was established in 2002. One year later, a website named “Online Research and Service on Chinese-English Expressions of Public Signs” was established as an important resource for the research on public signs translation. In addition, a dictionary called *A Chinese-English Dictionary on Signs* by Lv Hefa and Shan Liping was published in 2004. Moreover, the Translators Association of China began to pay attention to the translation of public signs. It held two different national seminars on public signs translation respectively in 2005 and 2007, which resulted in an increasing focus on public signs translation. Later from 2010 to 2014, more research on the current situation and mistranslations of campus public signs from different perspectives of theories continued to boost the development of the field. Although the study on translation of campus public signs has made great progress, there still exist various problems, which lead to the bad effects on the international image of China.

2 The Interpretive Theory

The Interpretive Theory is also referred to as “interpretative approach” or “theory of sense”. This theory is mainly adopted by the personnel of the Academy of Translation and Interpretation of Paris, usually known as the “Paris School”. It is a French school that conducts theoretical researching and practical teaching on interpreting and non-literature text, which was born in the 1960s. The Interpretive Theory advocates that translation should be considered as paraphrasing, meaning that a translator should emphasize the equation of the sense or effects of the original text rather than the linguistic units. A number of professors like M. Lederer, D. Seleskovitch, and F. Herbulot, have been strongly supporting the theory, which has helped lay a solid foundation for their teaching careers in the Paris Senior Translation and Interpretation School.

Generally speaking, the Interpretive Theory is built upon four basic points, namely, command of the native language, command of the source language, command of relevant world and background knowledge, and command of interpreting methodology.

To illustrate the first point, it is understandable that translators and interpreters must be able to use

their mother tongues in all kinds of language applications. For the second point, the command of the source language is more difficult to evaluate precisely. To acquire a second language, translators and interpreters have to overcome a variety of difficulties existing in phonological, grammatical and lexical levels, which indicates that the acquisition of the second language is actually a lifelong and open-ended learning process. The same is true of the third point, because both the world and background knowledge also develop and change like everything else. In other words, the accumulation of the knowledge is also a continuous and dynamic process of acquisition. For the command of interpreting methodology, the Interpretive Theory advocates that methodologically the process of translating requires an understanding of sense, known as the combination of language meaning and cognitive complements, as well as a formulation of the translation on the basis of the synecdoche principle.

To better apply the Interpretive Theory, the authors made an empirical study on the translation of campus public signs in Wuhan University of Technology (WUT). The following parts will first present the research on the current situations of WUT campus public signs translation and then probe into the innovative solutions to the existing problems.

3 Empirical Study

3.1 Research methods and process

In order to find out the real situation of campus public signs translation in Wuhan University of Technology, a survey was carried out through the whole campus. Indeed, public signs are everywhere: libraries, restaurants, hotels, classrooms, parks, transport tools, scenic spots and so on. In all, there were three kinds of questionnaire (Li & Xiang, 2015) designed for the research.

The first one was an English version questionnaire. The questionnaire was handed out to foreigners or the English majors, because it was convenient for them to read and understand which could also make the results more accurate.

Another one was a Chinese version questionnaire. It was handed out to the Chinese students, teachers and staff members in WUT, because their mother language was Chinese and only in this way could they fill out the questionnaire efficiently.

The last one was an Internet-based Questionnaire (<http://www.sojump.com/jq/3607714.aspx>). It was handed out through Internet to those who knew about WUT, which was used as a complementary survey. In addition, on the other hand, the authors also went around all three major campuses of WUT to collect public signs by taking photos as many as possible.

3.2 Research results and analysis

Based on the survey, most of the campus public signs in WUT were written in Chinese, bringing great inconvenience to foreigners. In addition, there were some problems with the English version public signs, which could be classified into the category that defied essence of the Interpretive Theory. Many words or expressions were chosen carelessly without fully understanding the meaning of the source and target languages. Therefore misunderstanding appeared. The errors in Chinese-English (C-E translation) translation of public signs are listed as followings.

3.2.1 Grammatical errors

A standard version should at least stick to the grammatical rules of English grammar points, but translators may have a poor command of English, so there are obvious grammatical errors in C-E translation of public signs, which may lead to misunderstanding to readers, for example, “the box for collecting the complaints from students”. It has been translated as “complain box”. It’s right from the surface, because it is translated word by word according to the Chinese meaning. However, from the prospect of English grammar, it’s not proper, because “complain” is a verb, and “box” is a noun. We all know a noun can be followed by adjectives or nouns, instead of verbs. So when translating campus public signs, we are supposed to take grammar rules into our mind. “Complaint Box” is better, because “complaint” is a noun which can be a pre-modification. Grammatical problems in public sign translation are mainly regarded as breaking the coherence rule for the reason that the sign translations with grammatical mistakes are not good in coherence and they become obstacles for English readers, which will also break the fidelity rule, and give the readers wrong information.

3.2.2 Cultural misunderstanding

As is well known to us, people in different cultures have different perspectives, and they think in different ways. Chinese and English have different cultural backgrounds, so there are many differences between these two cultures (Thomas, 1983). When translating public signs, translators are supposed to consider this factor, for example, “the room for teachers to take rests during the intervals of classes”. It

is translated as “Teachers’ Restroom”. As we all know, “Restroom” in the Longman Dictionary of Contemporary English means “ a room with a toilet in a place such as a restaurant or cinema”, so “Teachers’ Lounge” is better, because “Lounge” means “public room in a hotel or other buildings, which is used by many people as a place to relax”. Besides, “the red line” is commonly seen on the roads of college campuses. We may translate it as “Road Red Line” at our first sight. However, foreigners can read the words, but they don’t know the exact meaning, so “ Road Restriction Line” is better, because foreigners can easily know the real meaning of the public signs. Then there is another example, especially for English majors, battery is necessary objects in our study, because two batteries must be placed in a radio receiver in an English listening tests. There was a type of battery in China which was translated into “White Elephant Battery”. However, “White Elephant” means uselessness to foreigners, which may lead to a misunderstanding. Therefore, the same word in different cultures has completely opposed meanings. When translating, it’s a must for translators to bear this factor in mind.

3.2.3 Word-for-word translation

According to my survey, literal translation is common in public signs, which is difficult for readers to understand the true meaning of public signs, and even lead to misunderstanding. Generally speaking, these translators think in a Chinglish way (Chen Jing, 2010). Chinglish refers to spoken or written English language that is influenced by the Chinese language and it is commonly applied to ungrammatical or nonsensical English in Chinese contexts (Nord, 2001). This kind of problems usually occur in the translation which breaks the coherence rule, for the translator’s modes of thinking and expression ways are often influenced by the Chinese culture and language, ignoring differences between English and Chinese.

For example, there is a type of discount for commodities in the supermarkets on campuses which means take 20% off. For this one most of translators may translate it as “80% Discount”, but actually, thinking from the opposite prospect, “20% Off” actually better shows the exact meaning of the Chinese public signs. Besides, for “Green Hand”, if we translate this phrase word-for-word, it will directly lead students to the meaning of “a green hand”, but actually its meaning is “new or fresh in something”. So when we translate public signs, we need to do it based on actual context and language points.

4 Innovative Ways for Solution

4.1 Diction

Diction means the choice of words and phrases to express meaning, and it must be based on the accurate comprehension of the original (Fang, 2011). Care should therefore be taken in translating to determine from the context the exact shade of meaning of a word or an expression in the source text and the choice of an appropriate one to express the meaning in the target version. The translation we have collected about the supermarket that is regarded as the model for other supermarkets is “Excellent Supermarket for Demonstration”. Seeing this sentence at the first sight, foreigners can’t understand its meaning. Thus “Model Supermarket” is better, because “Model” has covered all the good aspects and applied a meaning of something to be learned from or for demonstration, and the latter is simpler and more concise. It is a good example for the application of the Interpretive Theory. Another example is “Do Not Eat”. This translation is grammatically right. In China, it’s acceptable, but in western countries, it is not polite which makes people uncomfortable. Diction is of great importance. There are some words, such as “eat”, “diet”, “dieting” and so on. Since “eat” is a verb, thus it must be followed by objectives. However, “diet” is a noun, and it includes more extensive meaning. For public signs, the first letter should be written in a capitalized way, and “diet” can be used as a noun, so “No Diet” is suggested.

4.2 Adding

By adding, we mean supplying necessary words or phrases on the basis of accurate comprehension of the original meaning (Peter, 2005). For example, there is a sign which means keeping the campus clean is usually translated as “Please Keep Environment Sanitation” on our campuses. This translation has a serious grammatical mistake. In terms of sentence structure, it is obvious that the word “Environment” is the object of the verb “Keep” while the word “Sanitation” is object’s complement. According to the English grammar, there exists a logical subject-predicate relationship between the object and its compliment. However, it is obvious that there is no such a relationship between the words “Environment” and “Sanitation”. In addition, based on the basic Chinese meaning, “Tidy” should be added to the last part. Therefore, “Please Keep Environment Clean and Tidy” is suggested. Here, we add “Tidy” to the translation, which in turn makes the English meaning clearer and more easily to understand. Sometimes adding some words or phrases can be easier for people to understand.

4.3 Omission

Omission and adding are the two sides of one coin. The skill of omitting is not to omit certain content in the original text but the dispensable, repeated, self-evident, and those maintained words which aren't conformed to habits of destination language (Xu Jianping, 2012). Its aim is to make the translation more smooth and faithful.

For example, there is a sign which means to eat in politeness. We usually translate this sentence as "Wait in Line and Obey Rules and Be Polite to Eat". However, we know "Obey Rules" just means "Wait in Line", so the latter part is unnecessary. Considering the formal equivalence, "Wait in Line and Eat in Politeness" is much better. Besides, there is another example, that is, "Park Lot". The verb "Park" and the noun "Park" in English are two different words, and they respectively refer to "bring (a vehicle that one is driving) to a halt and leave it temporarily" and "a large public garden". In fact, the gerund of the verb of park can be used to refer to space for parking a vehicle in. Here "Lot" is not necessary, so the suggested translation is "Parking". For "Information Position", only one word "Information" is better. Omitting unnecessary parts makes the translation much clearer.

4.4 Negation

In translation, negation means the conversion from the affirmative into the negative or vice versa (Peter, 2010). What is affirmative in form in English maybe imply something negative in Chinese. Negation is a useful translation skill, despite of the way of express changes; the meaning is still the same (Xu Peng, 2010). Negative can make the meaning clear, strength the rhetorical effect; make it conform to the idiomatic use of the target language. For example, there is another sign which means "Do not make noise". Actually, it's an affirmative sentence. In English, we usually use negation to translate it as "Keep Quite Please", which better conforms to English language rule and sentence structure.

4.5 Inversion

In English grammar, inversion includes full inversion and partial inversion. In translation, partial inversion is widely used to make the sentence balance and beautiful. Partial inversion means reversal of the subject and the operator only. In translation, it's an important principle that leads to the expressing of idiomatic language. Inversion implies a necessary change of word order to conform to the good usage of the target language. For example, there is a sign which means "When Visiting, Please Register". In China, this is formal, but for foreigners, it's strange because of the word order, thus it can be changed in "Please Register for a Visit" for a better understanding.

4.6 Substitution

Substitution means replacing occurrences of some symbol by a given value. Public signs are easily seen in public places, and there is no deny that some of them have the same functions, so translators can learn them from reference. Professor Lv Hefa suggests that if Chinese signs and English signs are under the same circumstance, we can substitute the existing English ones for those with the same functions (Lv Hefa, 2005), which can avoid Chinglish and in turn make our English versions more understandable.

In translation, this skill is widely used. It may make sentence beautiful with deep cultural background. On our campus there is a sign which has been translated as "Everybody Loves Flowers and Grass, Air and Environment Are Good", actually it is translated word by word in a Chinglish way. However, by substitution, we can translate it as "Love for Flowers, Love for Ourselves", because good air and environment are good for our health, which exactly means "Love Ourselves". This translation is a typical example for substitution, because in English there is a famous saying "Love me, love my dog." Therefore, "Love for flowers, Love for Ourselves" indicates a substituted or borrowed translation from English idiom.

5 Conclusions

Public signs constitute an important part of our daily life, so do campus public signs for our school life. In the same way their English versions contribute a great deal to foreigners staying in China as well as students who want to study English in a good environment. Through the statistical analysis, we have found common problems and translation mistakes and proceeded to come up with innovative solutions to make the English versions of public signs more standard from the perspectives of the Interpretive Theory.

Language is the carrier of culture, and every nationality has a deep profound cultural foundation, so a deep study of English or public signs will be made in the future. In addition, a better cross-cultural awareness for translation will also be developed due to the cultural differences. Secondly, "Practice

makes perfect”. Therefore, more profound knowledge in the Interpretive Theory and translating practice together with application of translation skills will be done for better proficiency. Finally, plans and arrangements in advance according to time and process will be made so that more time will be devoted to the modification and revision of the English versions of campus public signs. Only in this way will campus public signs be more local and understandable in English.

The Research of National Collegiate Social Entrepreneurship's Education and Practice Based on the Pursuit of the Core Values of Volunteer Service: A Case Study of the Growth and Development of the Social Entrepreneurship Team "Easier"

Shi Lin, Dai Meijuan

Computer Science and Technology, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 28944826@qq.com, 493627801@qq.com)

Abstract: As an important content of the entrepreneurship, Social entrepreneurship receive well attention by public depending on its characteristics of social value and economic value. In recent years, the social entrepreneurship examples and public welfare innovation teams emerged from contemporary new youth students are recognized by the China's Communist Youth League and play an import role in promoting social harmonious development and social governance capabilities. giving the example of the "easier", the paper focus on researching of National Collegiate Social Entrepreneurship led by the volunteerism spirit, and make a beneficial exploration to the topic of "education and business endeavor education in college"

Key words: Social entrepreneurship; Volunteer Service; Core value; Innovation and EntrePreneur-ship

1 Introduction

The party's 18 report, mentioned several times on the content about employment, entrepreneurship, innovation; with the students' employment situation is worsening, the college graduates are actively encouraged to get jobs by the way of entrepreneurship; in recent years, the social entrepreneurship education model of the product, study and research integration of "public + Entrepreneurship + employment" was repeatedly raised, the implementation of national collegiate social entrepreneurship's education and practice has become an urgent requirement of knowledge economy era.

2 The "Easier", Acts for Public Good

The "easier" team of Wuhan University of Technology acts for public good, founded in 2012, originally called "Egg in action to support education group", which is a student groups led by the school party, and under the guidance of the Communist Youth League and Student Affairs, and managed by the Associations functions. After three years, the team is expanded to a social entrepreneurship team, which includes the "easier" education supporting group of Wuhan University of Technology and Wuhan Science and Technology Education, Inc.

2.1 Entrepreneurship Content

Wuhan Science and Technology Education, Inc's main business is mobile phone applications and cultural products. On the one hand, the company is based on discipline, and explores the potential of knowledge, independently researches and developments mobile phone APP program about tourism, games, crafts and design, and obtains profit through the promotion of the APPs. On the other hand, the company gives play to students' hard work, introduces of the original micro-film shoot, hand-drawn map of the campus, campus culture produced souvenir design, builds "easier station" (formerly known as "honest man station") which is sought after by the majority of the students in the campus in the reason of unmanned, self-store mode.

2.2 Entrepreneurship Value

2.2.1 The "easier" team is made up of entrepreneurship company and education supporting group. The entrepreneurship company develops to achieve the vision of the company and the value of team effort, and provides some financial support for the education supporting group.

2.2.2 The education supporting group brings the children left behind the camp-style cultural, psychological, quality, common sense and safety education, through carry out a series of socially activities which are mainly based on the summer education supporting to help mountain children.

2.2.3 The "easier" team are from young students, and serves the students and the children left behind mountains. On the one hand, the team contribute to the improvement of social outstanding issues. On the other hand, young students carry forward the spirit of innovation based on social reality, tempered character through charitable activities and business practices, highlighting the responsibility of feelings, play era responsibility, which is a powerful expression of socialist core values.

3 Embodiments of the “Easier” Core Value

The “easier” team from the initiator to grow, experienced only three short years, whose prototype is a regular summer social practice group. 25 players went to support education in rural primary school in Guizhou Province launched a 21-day teaching activities. During the teaching activities, students endured hardship, not afraid of hard, played to their strengths for the left-behind children depicting a colored sky. And this has gotten the attention of online media and young students, aroused strong social repercussions. After continuous exploration, the team gradually developed into a social entrepreneurship project entity. In 2014, the team successfully joined Qingtong plan, settled Wuhan University of Technology Venture Park.

Team members have a high degree of consensus when speaking to the team pursuit: First, acting for teaching; second, acting for action. they also take the innovative ideas into the team pursuit.

1) Acting for teaching, highlights the sense of era mission and responsibility of young students. Taking the point of the team's establishment mind, volunteer tutorial is their first target. Based on the outstanding issues and the status quo behind remote rural left-behind children, college students individually and collectively have shown the courage to act, willing to sacrifice valuable quality, and this is in line with the main theme.

2) Acting for action, highlights the young students' sense of dedication and integrity feelings. The “easier” takes “acting for public”, “acting for love” and “let you love to travel” as the slogan, which gained broad popular support in the name of love. Students have become “Applause” to “action”, consciously added to the ranks of volunteer service. Call from the team on campus volunteer, recruit a new interview process point of view, no one contrary to the original intention of acting for love enthusiastically. In the “honest man station”, the students ordered the station to comply with the agreement, self-discipline, integrity and quality conscious practice.

3) Creativity first, reflects the talent concept of professional consciousness and development. Team members include computer technology, art and design, language classes, management and other related professions' students, who acts from their own professional characteristics departure during volunteer service, shows their talents, enriches the teaching content and form, and are truly accepted and loved by children. In the course of business practice, the students are good at communicating, organic coordination with complementary expertise and mutual assistance, launched a range of disciplines blending, the actual project creative. Entrepreneurial achieved remarkable success, and the students grow significantly.

Social Entrepreneurship Research Center, University of Oxford, said: social entrepreneurship has three characteristics which are the “sociality”, “innovation” and “market-oriented”. First, the main business has a strong public service mission, willing to help others, contributing to society. Second, there is the formation of a dedicated team, a team of like-minded members of a public good. In addition, social entrepreneurship also need to focus on models' innovation, uses limited resources to create more social benefits.

From the summary of core pursuit above, the “easier” team, without doubt, is in line with the three basic elements of social entrepreneurship, which is the root cause of the success of the team.

4 The Relationship of Volunteer Service and National Collegiate Social Entrepreneurship

Volunteer service and social entrepreneurship belong to the category of public welfare, interpreting the corporate social responsibility. From the history of growth and development of the “easier” team, voluntary service is the mind, but also the spirit of philosophy throughout the whole story; the main form of the teams to create business entities and the content are closely linked with the university culture, which aims to support education career services.

1) Volunteer service constitutes a good basis for the development of social entrepreneurship. Broad participation provides the necessary human resources, and the firm pride to the volunteer services to establish solid spiritual resources, and positive identity of the people provides a good social resources they all jointly promote the healthy development of social entrepreneurship.

2) Volunteer Service in large part to enhances the thinking and understanding of the service principal (including the dedication and sense of responsibility, sense of innovation, the concept of talent, etc.), enriches their life experience, exercises their practical ability, which is consistent with the core pursuit of contemporary college students, and is also a key factor in social entrepreneurship's success.

3) National collegiate social entrepreneurship accounts social and economic interests, helps

voluntary service and enhance their own hematopoietic function, promotes volunteer service for the needs of the community, for the talent goal, to achieve sustainable development.

Encouraging students to leave the campus, server the society, and actively carry out youth volunteer service activities with the pursuing of responsibility, the practice content of innovation and entrepreneurship, and self-taught as a behavior-driven, leading the development of national collegiate social entrepreneurship are not only an important part of innovative universities' education in the background of the new times, but also the inherent requirements of the reform and development of socialist core values education.

5 The Practical Guidance of National Collegiate Social Entrepreneurship Which Takes the Volunteer Service as the Spirit

Volunteer Service and national collegiate social entrepreneurship has its commonality in the nature, purpose, operation rules, and the two promote each other under certain conditions, can also realize the transformation, cooperative development.

Volunteer Service can serve as the starting point in guiding national collegiate social entrepreneurship, which promotes contemporary college students' spirit and clusters characteristics of willing to sacrifice, brave to play, good in innovation, and plays an important role in practice.

5.1 Insisting the pursuit of Volunteer Service, building the spiritual position of social entrepreneurship

As the main core of modern public spirit, Volunteer service focus on people's happiness and social development, which reflects the socialist values. Campus is a valuable soil for cultivating the spirit of volunteerism, which promotes college students' pursuit of excellence and outstanding ability to germinate and grow. Carrying out the guidance of national collegiate social entrepreneurship, we should take the pursuit of the important value as the spirit position and improve students' thinking and the pursuit of life, so that the majority of students voluntarily devote into the ranks of volunteer service, and then play in the vast service platform and lift capacity. On the other hand, we want to promote community volunteerism positive energy with the volunteer service, mine the entrepreneurial inspiration which based on demand, adapted to the development, and promote the growth of the real entrepreneurial projects on this basis, growth.

5.2 Adhere to innovation and entrepreneurial university culture and consolidate the construction of basic social entrepreneurship

Innovation and entrepreneurship education is necessary to adapt to the economic and social and national development. To constructe innovation and entrepreneurship education system, it is necessary to take innovation and entrepreneurship into the school education system overall arrangement, whose contents may contain the theoretical study of innovation and entrepreneurship, the foster of college students' technological innovation and entrepreneurship projects and the creating of an innovation and entrepreneurship atmosphere and platform constructions.

(1)Improvint the theoretical research level of innovation and entrepreneurship education and learning from the successful experience of foreign countries on innovative business practices, help students avoid misunderstanding, as there are students using the competing ability values entrepreneurial ability and planning level to values the level of entrepreneurship such problems. There are practical problems to be solved, such as competing with momentary passion, blind imitation, lack of good projects. Innovative education can stimulate students to generate good entrepreneurship inspiration, and entrepreneurship study can improve students' methods of entrepreneurship practices.

(2)Increasing the project applying scope and support efforts of the college graduates' innovation and entrepreneurship helps develop students' awareness of innovation, and enhance their innovation capability. On the one hand, the project which applied successfully can get funding support, enhance social entrepreneurship's hard power. On the other hand, by the contrast of the innovation and entrepreneurship project, college students can be project-specific objectives, stimulate learning and impetus to growth and success.

(3)With taking the campus as the main platform,innovation and entrepreneurship atmosphere can be created.By enhancing ideological guidance and direction, we can promote the formation of benign economic effect and attract social support. While effectively play the educational function of the school, build the integration of a full range of business resources of community, schools, personal and other aspects, the basic protection of social entrepreneurship can be consolidated.

5.3 Implementing entrepreneurship to create jobs and improve the social significance of social

entrepreneurship

Volunteer service for students employment ability, high school's guidance in working, people's livelihood and social stability has a positive effect. Its specific performance can be that it significantly improves students' thinking and human capital, improves the knowledge structure, expands the social resources, adjusts employment psychological. And it can effectively mobilize students to actively participate in students "Village Officer", "three of a help" program, "west plan" and other volunteer service activities. And it can integrate the advantaged resources produced during service and practice. With entrepreneurial incentives, it can promote entrepreneurial projects run successfully and implement entrepreneurship to create jobs.

5.4 Relying business incubator and leading the development direction of social entrepreneurship

Social entrepreneurs in China started late, and social acceptance is low. The inadequate resources, imperfect security system, lack of capacity against the risk and other problems can be a direct result of the failure of social entrepreneurship. From the student's entrepreneurial practice, financial support, equipment, and other venues are outstanding problems to hinder entrepreneurial implementation. We should lead national science and technology business incubator system, and promote college students to create jobs through technological innovation. Relying on existing business resources of Universities (such as Qingtong plan, business park), student entrepreneurs platform can be built and students are encouraged to actively participate in innovative practices and project incubation. Growth cradle is provided for National Collegiate Social Entrepreneurship. At the same time, a sound system and the security system of incubators, contributes to the formation of development trend of the social entrepreneurship project openness, diversity, professional.

Study on Innovative Management in Flipped Classroom of College English Listening and Speaking Course

Chen Tao

Foreign Language School, Wuhan University of Science and Technology, Wuhan, P.R.China, 430081
(E-mail: ivanct@126.com)

Abstract: This paper initially provides an introduction to the flipped classroom model. It then provides the contrast of the flipped classroom and the traditional classroom in the Chinese College English Listening and Speaking Course. This paper also presents how the innovative management is used in the flipped classroom model in the English class with the aid of Lange on-line platform and the reflection of the management. The paper concludes with a discussion of the implications associated with adopting a flipped classroom approach.

Key words: Flipped classroom; Innovative Management; English teaching; On-line platform

1 Introduction

Harvard professor Eric Mazur played a significant role in the development of concepts influencing flipped teaching through the development of an instructional strategy he called peer instruction. Mazur published a book in 1997 outlining the strategy entitled, *Peer Instruction: A User's Manual*. He found that his approach which moved information transfer out of the classroom and information assimilation into the classroom allowed him to coach students in their learning instead of lecture.^[1]

In 1993, Alison King published "From Sage on the Stage to Guide on the Side". King focuses on the importance of the use of class time for the construction of meaning rather than information transmission.

Lage, Platt and Treglia published a paper entitled "Inverting the Classroom: A Gateway to Creating an Inclusive Learning Environment" (2000) which discusses their research on flipped classrooms at the college level. Lage, Platt, and Treglia assert that one can leverage the class time that becomes available from the inversion of the classroom (moving information presentation via lecture out of the classroom to media such as computers or VCRs to meet the needs of students with a wide variety of learning styles.^[2]

Perhaps most recognizable contributor to flipped classroom is Salman Khan. In 2004, Khan began recording videos at the request of a younger cousin he was tutoring because she felt that recorded lessons would let her skip segments she had mastered and replay parts that were troubling her. Salman Khan founded Khan Academy based on this model. For some, Khan Academy has become synonymous with the flipped classroom, however, these videos are only one form of the flipped classroom strategy.

American High school teachers Aaron Sanns and Jonathan Bergman were the first to flip their classrooms. The Flip started when these teachers began supplying absent students with an on-line lecture they could watch from home or from wherever they had access to a computer and the Internet, including school or the local library. They soon realized that if all their students could do this from home, then they wouldn't need to lecture in class. Instead, class time could be used for expanding upon the content through collaborative learning and mastery concept exercises.^[3]

At recently, Flipped Classroom has become increasingly popular at home and broad as a new teaching model, which sets a new direction for the education reform especially for the College English Listening and Speaking Course in China. Compared with some traditional teaching model, Flipped Classroom stresses the idea of "Learner Center" more.

2 The Contrast Between Flipped Classroom and Traditional Classroom Teaching

In the traditional model of College English Listening and Speaking classroom teaching, the English teacher is typically the central focus of a lesson and the primary disseminator of information during the class period. The teacher responds to questions while students defer directly to the teacher for guidance and feedback. In a classroom with a radically traditional style of instruction, individual lessons may be didactic and entirely content oriented. Student engagement in the traditional model may be limited to activities in which students work independently or in small groups on an oral application task designed by the teacher. Class discussions are typically centered on the teacher who controls the flow of listening exercises and the conversation. But this kind of teaching model lacks efficiency. Students usually lose interests in the teacher-centered class.

The flipped classroom intentionally shifts instruction to a learner-centered model in which class time is dedicated to exploring topics in greater depth and creating meaningful practicing opportunities, while educational technology such as on-line videos are employed to deliver content outside of the classroom. In a flipped classroom content delivery may take a variety of forms. Oftentimes video lessons prepared by the teacher or third parties are used as a content delivery mechanism, though on-line collaborative discussions, digital research, or text reading may be utilized as well.^[4]

Flipped classrooms also redefine in-class activities. In Wuhan University of Science of Technology (hereafter referred to WUST), traditional English Listening and Speaking in-class lessons focus on the listening and speaking tasks in textbook. The flipped classroom may include more in-depth lecture or more English oral activity, among other practices, to engage students in the content.

3 Flipping the Classroom with Innovative Management

The need for improved teaching effectiveness and efficiency in College English Listening and Speaking Course drive us to apply the Flipped Classroom teaching model in the 64 English classes of the grade. The students of the class come from different majors.

What we use in the Flipped Classroom is Lange On-line Platform. Lange On-line Platform is the only platform in our university which can be utilized to flip learning. It integrates with current Learning Management System, and uses our existing infrastructure, so we can start flipping with existing computers supplied in the language learning centre. By implementing the flipped learning approach, we are able to save time, build stronger relationships with students, and let students take control of their own learning.

3.1 The management of the flipping the classroom

3.1.1 Record the screen. With the software, we can record whatever is on the screen—presentations, lessons, diagrams, and more—as sharable video for flipped learning.

3.1.2 Host the videos. Lange On-line Platform gives us the place to put the flipped recordings, where students can access them anytime in the language learning centre. Everything is stored in the server.

3.1.3 Check who watched the videos. After we put the videos on the platform, we can easily check which students watched the flipped videos and how much they’ve viewed because for each video we set a pass mark, with real-time analytic in Lange Platform. We can also add check-in points to the videos to make sure students grasp the lesson.

3.1.4 Rewind and replay instruction. Not all students learn at the same pace. We let students rewind and replay lessons as much as they need during the given time, so struggling students have more time to master tough topics. They can pause, jump to a specific section of the video, or even replay it at a faster speed (up to 2x), for quick review.

3.1.5 Adapt the listening tasks in the textbook. Contrary to traditional classroom, all the listening tasks are adapted into quizzes. During the given time, students are required to finish the quiz and get the score of the quiz. The feedback of the quiz is collected and analyzed by the teacher. The teacher can easily know the studies of all the students and which part of listening task should be given more concentration in class.

3.1.6 Lay the oral activities before class. Instead of spending time to prepare for oral activities in class, students can prepare oral activities or give their presentations right after the speaking section begins in class.

3.1.7 Design staged testing. During one semester, I can design several staged listening test. We can check the students’ learning and make adjustment to my teaching.

In order to supervise the students’ learning process, we set up new management system for student achievement.

Table 1 Management System for Student Achievement

Traditional Class			Flipped Class			
Learning record during the course	Attendance	20%	30% of the final grade	Attendance	10%	50% of the final grade
	In-class performance	40%		In-class performance	30%	
	On-line learning	40%		On-line learning	50%	
				Staged test	10%	
Oral Test	30%		70% of the final grade	Oral Test	30%	50% of the final grade
Listening Test	70%			Listening Test	70%	

Unlike the traditional college English listening and speaking classroom model, a Flipped Classroom puts students in charge of their own learning. By providing lectures on-line, we give students the opportunity to learn at their own pace. Once a student passes all the on-line tasks, he can move on. Also, students who need more time to master a concept won't get left behind.^[5] In the Flipped Classroom environment, the teacher becomes the guide off to the side, acting as more of a facilitator, helping and guiding small groups and individuals toward learning success.

4 Reflection of the Flipped Classroom in the English Listening and Speaking Course

The flipped classroom is a pedagogical model in which the typical lecture and homework elements of a course are reversed. Short video lectures are viewed by students at home before the class session, while in-class time is devoted to oral exercises, presentations, or discussions. The video lecture is often seen as the key ingredient in the flipped approach, such lectures being either created by the instructor and posted on-line or selected from an on-line repository. While a prerecorded lecture could certainly be a podcast or other audio format, the ease with which video can be accessed and viewed today has made it so ubiquitous that the flipped model has come to be identified with it. The notion of a flipped classroom draws on such concepts as active learning, student engagement, and hybrid course design. The value of a flipped class is in the repurposing of class time into a workshop where students can inquire about lecture content, test their skills in applying knowledge, and interact with one another in hands-on activities. During class sessions, instructors function as coaches or advisors, encouraging students in individual inquiry and collaborative effort.

The flipped classroom is an easy model to get wrong. Although the idea is straightforward, an effective flip requires careful preparation. Recording lectures requires effort and time on the part of faculty, and out-of-class and in-class elements must be carefully integrated for students to understand the model and be motivated to prepare for class. A questionnaire is conducted with 127 Flipped Class students for collecting data to analyze the management exerted in the model.

Table 2 Questionnaire for Flipped Class

Questions	A. Yes	B. No
Do you like the Flipped Class model?	87.76%	12.24%
Are there too many assignments?	45.91%	54.08%
Is the learning before class difficult?	30.52%	69.47%
Is the Flipped Class time-consuming?	64.58%	35.42%
Is the Flipped Class helpful for you?	65.27%	34.74%
Does the Flipped Class improve your self-study ability?	82.48%	17.52%

Although most students show their satisfaction toward the Flipped Class management, there are still some problems remained. As with any situation, there are always pros and cons.

4.1 The Reflection on a Flipped Classroom

4.1.1 Introducing a flip can mean additional work and may require new skills for the instructor, although this learning curve could be mitigated by entering the model slowly.^[6]

4.1.2 There is no guarantee students will watch the on-line lecture at home and come to class prepared. Even I set a viewing time for every video. Still there are some students don't watch the video within the given time. A Flipped Classroom's success is dependent on student engagement.

4.1.3 Some Chinese students may not like the idea of a Flipped Classroom. They get used to spoon-feed teaching. And they might have been known to complain about the loss of face-to-face lectures, particularly if they feel the assigned video lectures are available to anyone on-line. Students with this perspective may not immediately appreciate the value of the hands-on portion of the model, wondering what their tuition brings them that they could not have gotten by surfing the web.^[7] Teachers will need to be prepared to meet some resistance from the students.

4.1.4 Although allowing each student to work at their own pace may be extremely beneficial for the students, it may lead to a larger workload for the teacher. Having to manage multiple students working on multiple assignments within multiple standards may become time-consuming. And it is also a burden for the teacher to record all their performance on the on-line platform and in class.

4.1.5 Those who see themselves as attending class to hear lectures may feel it is safe to skip a class that

focuses on activities and might miss the real value of the flip.

4.1.6 Standardized testing can become problematic in a Flipped Classroom. Students may not get satisfactory scores in the whole grade examination.

The flipped classroom represents a reversal of traditional teaching where students gain first exposure to new listening material outside of class, usually via watching videos, and then class time is used to explain some difficult language points or listening skills, and also practice the oral activities such as role-play, discussion or debates. The use of video and other prerecorded media puts lectures under the control of the students: they can watch, rewind, and fast-forward as needed. Lectures that can be viewed more than once may also help those for whom English is not so proficient.

4.2 The Suggestion for Innovative Management

Devoting class time to oral activities might give instructors a better opportunity to detect errors in their oral English, particularly those that are widespread in a class. At the same time, collaborative projects can encourage social interaction among students, making it easier for them to learn from one another and for those of varying skill levels to support their peers.^[8]

4.2.1 Set a Date. Set a date of the learning of each unit in advance so that the students can finish their learning before the day.

4.2.2 Get out of the way. By creating an environment where students learn from each other and at their own pace, the teacher becomes a guide, offering more time for individual and small group guidance.

4.2.3 Record each student's learning carefully. In order to supervise their learning, the teacher is supposed to record the performance of every step in their learning both online and in the classroom.

5 Conclusion

The Flipped Classroom constitutes a role change for instructors, who give up their front-of-the-class position in favor of a more collaborative and cooperative contribution to the teaching process especially for the Chinese College English Listening and Speaking Course. There is a sharp change in the role of students, many of whom are used to being lectured as passive participants in the education process, where instruction is served to them. The flipped model puts more of the responsibility for learning on the shoulders of students while giving them greater impetus to experiment. Activities can be student-led, and communication among students can become the determining dynamic of a session devoted to learning through hands-on work. What the flip does particularly well is to bring about a distinctive shift in priorities—from merely covering material to working toward mastery of it. But how to utilize the Flipped Classroom model more efficiently in the teaching process of Chinese College English Listening and Speaking Course remains quite a lot of exploration. We are supposed to explore innovative management methods in the Flipped Class, which will guarantee the effectiveness of the new teaching model in the English Listening and Speaking Course.

2 City College, Zhejiang University, Hangzhou, P.R.China, 310015
(E-mail:hzzxm2020 @163.com)

Abstract: Exhibition industrial belt in Yangtze River Delta zone has achieved a rapid development and maintain a strong growth momentum in recent years relying on a powerful economic foundation and developed regional industry. This paper will analyze the division and role of domestic exhibition industrial belt as well as its basic situation. It will also focus on six characteristics including superior location, prominent industrial economic, advanced venues and equipment, high opening, high-quality exhibition brands as well as sufficient professional talents in exhibition industrial belt. The study on developmental advantages of exhibition industrial belt in Yangtze River Delta zone will be helpful of developing domestic exhibition industry as well as other industrial belts.

Key words: Exhibition economy; Yangtze river delta; Industrial belt; Mice brand; Characteristics

1 Introduction

There are several different understanding and division of exhibition economic industrial zone in China. Therefore, it is undoubtedly necessary to make some comparative thought and research taking characteristics of different regions into account.

The Yangtze River Delta industrial belt of exhibition economy has been put the first place based on its unique geographical advantages and active regional industry. It also owned a strong discourse power. An important reference for a healthy development of other industrial belt of exhibition economy will be given according to the analysis and research on developmental characteristics of the Yangtze River Delta industrial zone of exhibition economy.

2 The Division and Effect of Yangtze River Delta Exhibition Economic Industrial Zone

2.1 The fundamental division of Yangtze River delta exhibition economic industrial zone

The scholars of MICE industry have carried on in-depth study on exhibition industry zone (economic zone, etc.) with the rapid development of exhibition industry. Four main points of view will be list in the following paragraph:

2.1.1 “Four exhibition economy industrial zones and Midwest Convention Center Cities”

Four exhibition economy industrial zones includes “Beijing and Tianjin-North CHINA Exhibition Economic Belt”(Center: Beijing); “Yangtze River Delta-East China Exhibition Economic Belt”(Center: Shanghai); “the Zhujiang River Delta - South China Exhibition Economic Industrial Belt”(center: Guangzhou, and Hong Kong); Northeast border exhibition economy industrial belt (leading cities: Dalian, Harbin, Changchun and Shenyang). Besides, Convention Center Cities in Midwest are consist of Wuhan, Zhengzhou, Chengdu as well as Kunming.^[1]

2.1.2 “Three strategic ecology group of exhibition cities”

It is consist of “Northern Strategic ecology group of exhibition cities” (Center: Beijing); “Yangtze River Delta exhibition cities of strategic ecology group”(Center: Shanghai) and “Zhujiang River Delta strategic ecology group of exhibition cities” (center: Guangzhou).^[2]

2.1.3 “Four industrial zone of Exhibition economy”

It includes “Bohai exhibition economy industrial zone” (center: Beijing); “Yangtze River Delta exhibition economy industrial zone” (Center: Shanghai); “the Zhujiang River Delta exhibition economy industrial zone” (center: Guangzhou, Hong Kong) and “Midwest Exhibition economic belt” (leading

* This paper is supported by three scientific research items. It is consist of “the development prospect of exhibition industry in Hangzhou based industrial ecological”(20150834M30), “Resources integration and the research about ecological development of Hangzhou exhibition industry”(2015JD45), “the research about development route of exhibition industry ecological”(J-15007).

cities: Chengdu, Kunming).^[3]

2.1.4 “Three circles and three zones of exhibition industry

It is consist of “Bohai exhibition Economic Circle” (Center: Beijing); Yangtze River Delta exhibition economic circle (Center: Shanghai);the Zhujiang river Delta exhibition economic circle (Center: Guangzhou); Northeast Asia Exhibition economic zone (core cities: Shenyang, Dalian, Harbin); Midwest Exhibition economic Zone (core cities: Wuhan, Zhengzhou, Xi’an) as well as southwest Exhibition economic Zone (core cities: Chengdu, Chongqing, Kunming).^[4]

It is seen that some consensus has been formed which majority of scholars recognized the presence of exhibition industrial zones of Bohai, Yangtze River and Zhujiang River. They also agreed with the viewpoint of taking Beijing, Shanghai and Guangzhou as central cities. However, scholars have kept the different understandings of exhibition industrial belt. The first difference is the number of industrial belt. The other difference come from the determination of core cities.

2.2 The main effect of Yangtze River delta exhibition economic industrial zone

Beijing, Shanghai and Guangzhou held 1931 exhibitions which accounted for 24.6% of the number of domestic exhibition in total in 2013. The exhibition area in the above mentioned cities (a total of 30.47 million square meters) in 2013 also nearly accounted for one third of total exhibition area in China. (Table1)

Table 1 Statistics of Three Exhibition Economic Circles in 2013

Sector	Yangtze River Delta	Zhujiang River Delta	Bohai Sea
The number of exhibition	3041 (Shanghai 798)	788 (Guangzhou 251)	1597 (Beijing 882)
The area of exhibition (ten thousand square meters)	3982 (Shanghai 1201)	1790(Guangzhou 890)	1808 (Beijing 956)

The main effects of exhibition economic industrial zone could be divided into three aspects.

2.2.1 Reflects the characteristics of the exhibition economic growth pole

The way in which focus on nurturing exhibition economic growth pole could enhance the impact of the regional industry in the exhibition economy around the world. Germany has attracted a lot of attention as a powerful country in the field of exhibition. In contrast, exhibition effects in China is far significant from Germany because the industry started late. Thus, facilities need to be improved, personnel training need to be actively promoted as well as exhibition laws and regulations need to be set up. The division of industrial belt is helpful of constantly refining the brand. It is also an important means of participating in global competition. Take the Yangtze River Delta exhibition industrial zone for example, this zone has become the most important “economic growth pole” in both China and the world relying on its own pillar industry. In recent years, Shanghai has made a great progress on venue construction. The completion of a serial of exhibition complex by the end of 2014 has made Shanghai to dominate the total size of venues in the world. It has changed the global exhibition pattern in a certain sense as well as enhanced radiation of Shanghai for the Yangtze River Delta industrial belt and exhibition industry in the world.

2.2.2 Promote the development of regional exhibition economic and the rise of competitive industry

The development of exhibition industry must rely on large-scale characteristics or competitive industries apart from infrastructure and institution building. For example, Booming regional industries in Jiangsu and Zhejiang Provinces provide a good industrial base for exhibition economy. A developed industry economy in the Yangtze River Delta contributed to the rapid development of exhibition industry in this area. Exhibition industry belt conversely gives a feedback to these supported industries. Moreover, it has become a accelerator for industrial economy. This division allows the regional economy and the development of competitive industries to get better. Therefore, it is necessary to carry out a better planning of exhibition and its related industries so as to take a deeper, wider range of influence on the whole country even the world.

2.2.3 Integrate and use of regional exhibition resources

From an viewpoint of exhibition ecology, creating a consistent exhibition brand should avoid duplicating exhibitions. It requires a integration and the use of the resources in exhibition industry. Meanwhile, it also requires a awareness of brand geographical distribution while nurturing regional specialties as well as focusing on brand exhibition features. For example, many cities in the Zhujiang River Delta have began to imagine to form a large-scale brand furniture exhibition on the basis of a serial of furniture exhibitions separately. Besides, the proposal of exhibition economy industrial zone is also helpful of attracting foreign exhibitors as well as integrating regional resources to participate

exhibition overseas. For example, many world-renowned exhibition companies landed in Shanghai and other cities in the Yangtze River Delta in recent years. It shows a great attraction of the development in the area. It also benefits to promote a bigger and stronger exhibition industry as well as build a globalizational, market-oriented, brand-oriented, specialized and standard exhibition economy.

3 The Overall Condition of Yangtze River Delta Exhibition Economic Industrial Zone

The Yangtze River Delta industrial belt is consist of 15 cities where come from two provinces and one municipalities (Zhejiang Province, Jiangsu Province and Shanghai) according to the viewpoint of geographical space.(Table 2) This industrial belt aggregats 6% of Chinese population. Its gross domestic product accountes for 20% overall.

Table 2 Main Cities in the Yangtze River Delta Exhibition Economic Industrial Zone

Province (Municipalities)	Provincial capital	Sub-provincial city (Municipalities)	Prefecture-level city	New entrants
Shanghai	Shanghai	Shanghai		
Zhejiang	Hangzhou	Hangzhou & Ningbo	Huzhou, Jiaxing, Shaoxing & Zhoushan	Wenzhou, Yiwu & Yongkang
Jiangsu	Nanjing	Nanjing	Suzhou, Wuxi, Changzhou, Zhenjiang, Nantong, Yangzhou & Taizhou	Kunshan
Total	3	4	11	4

The basic pattern of the Yangtze River Delta industrial zone is that Shanghai takes a place of leader while Nanjing, Hangzhou, Ningbo, Suzhou acting actively. (Figure 1)The regional economic foundation of the Yangtze River Delta zone is better then other zones as well as its higher GDP. Nowadays, it has achieved obvious advantages in domestic three exhibition industry zones. Its representative exhibitions includes 9th APEC and 41st World Expo in Shanghai as well as Hangzhou Westlake Expo and Tourism Expo in Ningbo.

Figure 1 The Exhibition Situation of Beijing, Shanghai, Guangzhou in 2013

4 Six Characteristics of Exhibition Industrial Development about Yangtze River Delta Economic Industrial Zone

The characteristics of exhibition industrial development about Yangtze River Delta Economic Industrial Zone could be divided into six aspects.

4.1 Superior: obvious regional advantages

The Yangtze River Delta region is the largest open area and the most promising economic sectors in China. Shanghai is the transportation hub of the Asia-Pacific region. It owns a number of international routes and excellent transportation on both sea and air. Many multinational companies (such as Philip) and well-known companies (such as Shanshan) have moved its headquarters to Shanghai. For now, Shanghai have formed intense radiation to surrounding provinces relying on its capital markets, the automobile industry, the steel industry and the petrochemical industries.

Most cities in the industrial zone are near the coast. Sea Strategy in China provides a good market opportunity to it. Meanwhile, a papid development of highspeed railway makes cooperation more convenient between cities. Rich resource of ports in this area is another advantages to develop economy. Some well-known cities, such as Nanjing and Hangzhou which have precious cultural heritage also play an important role.

4.2 Highlight: a developed industrial economy

Zhejiang and Jiangsu have obvious industrial economic advantages in addition to Shanghai. Zhejiang Province owns a developed private economy. Its regional clusters formed early and nurtured distinctive characteristic of block industrial distribution. On the one hand, massive industry cluster, professional and strong economy is the basis for the development of exhibition industry. On the other hand, they could promote industry influence through vigorously multi-angle exhibition marketing. The comprehensive economic strength of Jiangsu Province has always been in the forefront of our country. It also maintains the leading place in the use of foreign capital. Jiangsu, Zhejiang provinces and Shanghai has always been occupying an important position in China's economic development on the basis of booming industrial development. The annual GDP in China achieved 56.8845 trillion yuan in 2013 while total GDP in the Yangtze River Delta zone achieved 11.833212 trillion yuan (account for 20.8%). Higher economic growth dynamics make this area to become a crossroad in which connects capital flow, personnel flow, flow of goods, technology and information flow. Therefore, the five flows could be used as a great power to promote the rise of the Yangtze River Delta industrial zone.

4.3 Solid: improved venue facilities

Exhibition venues and other facilities are essential elements of the exhibition industry. Venue construction achievement in Shanghai in the past three years is remarkable. Shanghai Hongqiao National Convention Center (predit to complete in the end of 2015) will be the world's largest and best International Exhibition Centre. The volume of the new venue will be equivalent to the scales of three Shanghai New International Expo Centers. The completion of these giant stadiums with international level will ease the prominent contradictions between pavilion utilization and the relatively limited exhibition area in Shanghai exhibition industry (New International Expo Centre's utilization has reached 72 percent compare with 35% of global average utilization). Shanghai will become the city with world's largest scales of venues. Its exhibition economy will undoubtedly enhance competitiveness in further. At the same time, the main cities in the Yangtze River Delta, such as Hangzhou and Nanjing, have achieved great process on modern stadium construction.

4.4 Active: high level of opening

Based on the location along the coast of the characteristics and unique transportation advantages, Cities in the Yangtze River Delta have a higher degree of openness compare with other domestic cities basing on its advantages of location and transportation.

In recent years, the advantage of internationalization in exhibition industry in Shanghai continues to be highlight. Shanghai held 247 international exhibitions (accounted 31% of the number of annual exhibitions in total) with a total exhibition area of 8.745 million square meters (accounted 73% of the overall annual area) in 2013. It is estimated that the proportion of international exhibitions area in Shanghai would reach 80% by 2015.^[6] The number of international exhibition accounted for 18.1% of total annual exhibitions in Zhejiang Province in 2012. In 2013, 5000 local enterprises in Zhejiang Province to participate in exhibitions overseas with exhibition area of 50,000 square meters.^[6] At the same time, Jiangsu Province has also accumulated a wealth of experience in the introduction of international exhibitions as well as brand exhibition cultivation.

4.5 Quality: numerous brand exhibitions

The Yangtze River Delta industrial zone has formed a number of exhibition projects with large-scale and high quality after several years of development. Almost each city has owned one famous brand exhibition at least.

Take Shanghai for example, a serial of well-known exhibitions, such as China International Industry Fair, Shanghai Automobile Exhibition, China International Furniture Fair and China Plastic and Rubber Industry Exhibition have grown. Festivals and special events are also active in Shanghai. Shanghai International Film Festival, Shanghai International Arts Festival, Shanghai International Tourism Festival and Shanghai International Fashion Festival are all scaled. Jiangsu Province has also nurtured lots brand exhibitions, such as Nanjing International Shipbuilding Fair, International New Energy Expo, International Pharmaceutical Expo, which reflecting the strong competitive advantage. Major exhibition cities in Zhejiang Province have formed brand exhibitions with characterisitic industry. Yiwu Expo, International Machine Tool and Mold Exhibition and China Textile Fair are representative exhibitions.

4.6 Sifficient: ordered professional talents training

On the one hand, exhibition education in the Yangtze River Delta has a leading place in China. Universities and colleges in Shanghai, Hangzhou and Nanjing have provide different levels of professionals to exhibition industry. 34 colleges and universities in Shanghai and Zhejiang Province

carries on professional exhibition education.^[7] On the other hand, local Exhibition Industry Association has conducted various fruitful training. For example, Shanghai Exhibition Industry Association has organized several times of professional skills training in exhibition management. 2013 More than 500 people in the industry were given lectures and achieved different levels of qualification by 2013. Additionally, local exhibition industry associations has carried out exhibition planning contest for college students each year and supplied college students with a good platform in which could help them to early adapt community as well as industry competition.

5 Conclusion

The Yangtze River Delta exhibition economic zone has formed a good situation of resources sharing, complementary advantages and win-win cooperation. It has made remarkable achievements. However, the Yangtze River Delta industrial belt of exhibition economy still needs to continue to seize the opportunities and faces positive challenges. Standardization, ecology, brand building should be focused. It is responsible that The Yangtze River Delta exhibition economic zone should improve international competitiveness of regional MICE brand. Therefore, it could make a more positive contribution to the exhibition industry development in China.

Abstract

System dynamics is an approach to analyze the behavior of complex systems, such as the productive chains, strictly considering the inherent characteristics. This approach is based on mathematical concepts of nonlinear processes developed in mathematics and physics and consolidated in engineering. The concepts inherent in this approach assists in creating a mathematical model which represents a production chain by using computer simulation. Thus, the main objective of this paper is to present the formalization of the dynamic model of assessing the sustainability of Brazilian ethanol production, its borders (external environment) and the scenarios needed for a deeper understanding of relation of cause and effect, causal loops and diagrams of flows and stocks as a result of the awareness stage, with regard to understanding the problems involved, according to methodology known as design science.

Keywords: ethanol, system dynamics, sustainability

1. Introduction

1.1. Ethanol Production in Brazil

The Brazilian supply of ethanol grew in the period 1994-1998 when a crisis period began due to high inventory levels and drop in the domestic market. During this period the price of sugar in the international market has increased and consequently the supply of ethanol in the domestic market plummeted. With the fall in demand, the share of ethanol-powered vehicles decreased from 75.5% in 1985 to 0.06% in 1997, with high financial and tax costs. This picture has reversed since 2001, when ethanol engines began to be produced again. This trend has given rise to the emergence of a new ethanol industry since 2003 when entered the scene with flexible fuel engines.

Brazilian sugar and ethanol industry gathered in the biennium 2012/2013, 602 million tons of sugarcane by 8.5 million hectares. Production accounted for 38.8 million tons of sugar and 23.9 billion liters of ethanol. This represents a share of 41.8% in the total world production of ethanol, estimated at 49 billion liters. It is expected that Brazil bend the growing area of sugarcane in the next twenty years reaching a production of 40 billion liters of ethanol.

Despite the picture above, the ethanol produced from sugarcane has turned recently the subject of intense attacks by European authorities. They see the expansion of biofuel production around the world the reason for a rise in food inflation. The United Nations (UN) sentenced the biofuels, with the Special Rapporteur statement to the High Commissioner for Human Rights, that mass production is a crime against humanity for its impact on world food prices. According to Oliveira (2009), through the expansion of biofuels remains follow in question: what are the consequences for food production in Brazil with the expansion of the sugarcane crop in the next 20 years?

Data from the Brazilian Institute of Geography and Statistics (IBGE), between 1990 and 2012, show that the reduction of food production, imposed by the expansion of planted area of sugarcane, grew in this period, more than 2.7 million hectares. Taking the municipalities that had the expansion of more than 500 hectares of sugarcane in that period verify that there was reduction of 261 thousand hectares of

beans and 340 thousand hectares of rice. This reduced area could produce 400,000 tons of beans, ie 12% of national production, and a million tons of rice, equivalent to 9% of the country's total. In addition, in these municipalities the milk production was reduced to 460 million liters and the amount of cattle was reduced by more than 4.5 million.

São Paulo State, in 2006/2007, cultivated 3.8 million hectares of sugar cane, representing 61% of national total sugar cane area. In the same year, it produces 61.5% of ethanol (10.9 billion liters), 65.8% of sugar and 61% of sugar cane from national total production. In 2007/2008, the outlook is a national production of 20.5 billion liters, and São Paulo would participate with 12.7 billion liters, about 62% of the total. In 2015, its participation would decrease to 54.9% due to availability and much lower cost of land in other region. This deconcentration, will depend on mid-west logistics for product transportation, as the Transpetro's ethanol pipe from Senador Canhedo, GO, linking Guararema, and from there, linking São Sebastião harbor, in São Paulo State. Global sugar cane ethanol supply is in expansion as other nations are wakening for this lower cost renewable fuel, while the United States are increasing the production of corn ethanol, with a higher cost. However the drivers of this process of the global supply Market is much more related to the amount of investments in science and technology for the next generations of ethanol production from many other sources of biomass. Therefore, the competitive advantage of countries that rely only in the availability of land and sun light and the actual ethanol technology is not guaranteed in the long run.

Nevertheless, the role of technology transfer for widespread sugar actual cane technology yet has the important argument of creating an ethanol international supply market, decreasing risks for traders and users. However, as history matters, global markets of many other agribusiness commodities have being developed along the last centuries and problems of supply (lack and excess), protectionism, and crises are still happening. But the increase of a renewable source of energy will be inexorable, as the investments in production, from the global agribusiness players: traders, logistic operators, mills corporations, regarding mills acquisition, joint ventures and fusion strategies, obtaining advantages with knowledge, supply, economies of scale, market power, transaction costs reductions and risk management. As a result of this dynamic, the Brazilian domestic consumption for fuel hydrated and dehydrated ethanol, in 2006, was 14 billion, and the 3.6 billion were exported, and the remaining 1.4 billion were for industrial use.

Despite the production of ethanol is being studied in various universities, research institutions, government agencies and the private sector, regional production and distribution characteristics have not been sufficiently addressed in research, but are essential to assess the risks and the consequences of such expansion in the environment and in food production.

The picture above associated with the fact that the simulations make it possible to observe the risk factors more clearly than it is possible in real scale, given the complexity of the production-distribution processes, justifies the development of a dynamic model of production based on dynamic ethanol system. In this simulated microcosm becomes possible to isolate the effects and causes more easily than when engaged by the complexities of the real world. (WARREN, 2008).

1.2. Public Policy Prospective Analysis

The literature of prospective analysis describes applications for science, technology and innovation planning, business strategies and governmental policy. The methodological path discussed in this section describes a broad range framework of techniques, highlighting linkages among them, which were used in the prospective ongoing process that will be described in the end of this section.

Prospective studies aims obtaining information for deciding about future events to anticipate and understand the drivers, potentialities, evolution, characteristics and effects of innovation processes, institutional and technological change (Coelho, 2003; Zackiewicz and Salles-Filho, 2001). Technological prospective exercises and its variety analysis tools can be an important instrument for focalization primary needs and identification of knowledge gaps to be filled by research institutions and therefore their resource allocation.

Foresight is a multidimensional process to understand the long term future drivers that have to be taken into account to policy, strategy, planning and decision formulations (Coates, 2001). It uses qualitative and quantitative methods for monitoring signs and trend indicators of an evolving issue. Coelho (2003) considers intuitive methods based on specialist assessment are more suitable and cover

a broader range of applications in this approach. Although, foresight per se doesn't define policies, it can develop visions about how the future could be built (Santos et al, 2004), and suits better when applied to policy analysis and its implications, helping policies to be more robust and flexible in its implementation according to time line and changing conditions. However, these foresight processes are increasingly complex and new techniques are being applied to decrease complexity in the foresight, by constructing roadmaps (Saritas and Oner, 2004).

Road mapping is a planning framework (Phaal et al, 2004) been used by a broad range of purpose applications including to support strategic and long-range planning intraorganization, inter-organizations (industry), from the private sector science & technology driven to the state-owned companies and governmental policy agencies. It is a systemic approach (Garcia and Bray, (1997) for a live monitoring instrument which provides a tool for linking the environment scanning with scenario planning (Schoemaker, 1995) and other prospective techniques. It also links drivers` evolution and inter-relation on markets, products, technologies, knowledge, resources and policy development and implementation in a time line. A policy road mapping process can deal with different levels of future drivers: macro socio-technical transitions and institutional changes, industrial organization, supply-chain interaction and science organization. A roadmap can link these levels of analysis to business/industry sustainability threats and opportunities and the policy formulation agenda. It also links impact analysis and rank the eligible paths according to the evolving future.

In the case of public policy formulation road mapping process, the knowledge flows are of two types: one "pull" driven process, in which requirements of knowledge and research are identified and resources are allocated for a long term problem solving approach; other is a "push" driven process where knowledge and capabilities are allocated to influence and establish the policy formulation process and content for a short term problem solving approach. Porter et al (1991) classify families of prospective methods that are described according to their refinement, information availability and treatment. Creativity is a technique for knowledge interaction and generation of a great volume of new ideas.

Specialist panel detects tacit knowledge and weak signs, therefore, it brings ambiguities and is used when information can't be quantified or modeled. Monitoring and intelligence systems are sources of pre-organized information for identifying critical trends and events, their relations, opportunities and threats. However, it provides a great quantity of information from several sources, and when poorly managed, it can result in non-systematized, non-analyzed, non-selective information excess. Scenario aims to build alternative future pictures, analyzing dominant trends and disrupting possibilities, in a explorative or normative approach. Evaluation and decision are methods to decrease uncertainty complexity when multiple interests and dimensions are being taken in account.

Participative methods have become the key of prospective processes due to the application of its implicit democratic approach, conferring social legitimacy to results and have the ability to involve a diversity of participants, creating collective arrangements, searching for harmonic decision and implementation process. Other important major aspect is the fact that the knowledge construction has more effectiveness when there is interaction of knowledge dispersed among participants of an innovation process, and strategic information is widespread among key people involved. Due to these characteristics, they have an interesting appeal on methodology management. Impact assessment can be complementary when this activity is based on scenarios built by the prospective phase.

1.3. Application of system dynamics to sustainability studies

The system dynamics is an approach to analyze the behavior of complex systems, such as supply chains, strictly considering the inherent characteristics. This approach is based on mathematical concepts of nonlinear processes developed in mathematics and physics and consolidated in engineering. The concepts inherent to the methodology aid in the creation of mathematical models representing the productive chain may diagnose problematic points in chain structure using computer simulations employing an easy to understand representation.

The discovery that mental models influence the way people see the reality has, without doubt, directed the use of system dynamics more on order of explanation of thinking about reality than obtaining numerical answers for well-structured problems (Davies, 1996). In this sense, the most important in system dynamics of the use of the process is to produce insights during the modeling process, strongly identified idea to the creation of knowledge, which according to De Geus (1994), a former executive of

Shell, constitutions if the central to innovation and to the perception of new opportunities. This fact puts the system dynamics from a different perspective from traditional analytical and econometric methods, placing it in the heart of the practice and theory of organizational learning, as postulated by Senge (1990) in his book "The Fifth Discipline".

Agarwal and Shankar (2008) argue that due to the causal relationship, existing in the production system, the approach of dynamic systems is well suited to capture the impact of the dynamic performance of the variables on the integration and responsiveness of the production system in a given time interval.

Researches on systems dynamic applied to sustainability studies are divided into three major groups:

- i. Researches that contribute to the construction of theories about sustainability;
- ii. Researches using the system dynamics in solving sustainability problems;
- iii. Researches working in the development and improvement of modeling tools in sustainability.

The research of Chichakly and Eberlein (2013) is a typical example of the use of systems dynamic in theory construction. Studying IT service industry Minis et al (2010) proposed a new theory for the virtuous and vicious cycles, using an exploratory causal model to describe the interrelationship of the key success factors.

Morecroft (2007) uses the dynamic systems to solve strategy problems by developing a strategy management model for simulating several scenarios. Cha, Pingry and Thatchen (2008) investigated the amplification of demand in supply chains.

Research on the development and improvement of modeling tools in dynamic systems are an example in the work of Howick and Eden (2004) that studied the nature of discontinuities in system dynamics modelling of disrupted project. Another paper on the line is Arango and Osorio (2009), which considers also the technical, organizational complexity inherent to the system dynamics model for the world coffee market. The System Dynamics offers a suitable framework to accommodate various elements involved and the relationships between them, to integrate them seamlessly in a model that shows in a clear way the weaknesses of current policies and the possibilities of change.

1.4. Research aims

The main aims from this study are to:

1. Identify the main variables, flows and stocks and the causal relationships of sugarcane, sugar and ethanol production processes;
2. Explore how the production of ethanol in Brazil is increasing and how this production is impacting food production;
3. Apply the modeling and simulation in system dynamics in ethanol production system.

The knowledge generated by this study allows for a more thorough discussion of the ethanol production impacts both on the environment and on food production as well as being the basis for the development of the equations that describe the behavior of variables and stocks that are at the root of the simulation process. The study concluded that beginning with the identification and characterized the elements for modeling and working with different scenarios simulation is better to understand the degree of sustainability of ethanol production.

Thus, the main objective of this paper is to present the formalization of the dynamic model of assessing the sustainability of Brazilian ethanol production, its borders (external environment) and the scenarios needed for a deeper understanding of cause and effect, causal loops and diagrams of flows and stocks.

2. Methods

The methodological framework of a research comprise in the selection and justification of a method that is able to respond to the formulated research problem, to be evaluated by the scientific community and demonstrate procedures that make robust research results. These logical steps should not be seen as obstacles to the conduct of research, but as procedures necessary to ensure the

impartiality, accuracy in work driving and the reliability of results. Thus, this research adopts the methodology the science design. As this research seeks to develop an artifact (dynamic model) to design science proved to be an appropriate methodology, not only dealing with the construction of an artifact but also requiring the application of rigorous methods, both in construction and in the evaluation of the artifact design. Accuracy is often measured by the adherence of the research to an appropriate collection of data and the correct technical analysis.

To identify the variables to the model and the causal relationships, was conducted an interview during the months August and September of 2014, with a group of ethanol producers of local productive arrangement of alcohol (APLA) in Piracicaba, SP. The analysis of these interviews has concluded awareness stage with regard to the understanding of the problems involved, according to the design science methodology. Romme and Damen (2007) argue that it may be necessary to understand the issues from a broader perspective, in which systems thinking (Andrade et al., 2006), for example, could bring a significant contribution.

3. Results and Discussion

In this section we discuss the overview of the model, the causal loop diagram, the diagram of stocks and flows of ethanol production and simulation scenarios. It is used to visual system dynamics modeling tool Vensim[®], software provided by the company Ventana System Inc., which enables the analyst to link words with arrows representing relations between the variables as causal relationships. The stock diagram and flow in Vensim[®] consists of auxiliary or constant, cash variables that represent actions or accumulations. This information is used by the equation editor to complete the modeling process.

3.1. Overview of the model

In the model, sugarcane production is considered as the most important production source, while the production of ethanol and sugar is the second level and the generation of solid waste and wastewater is the third level. The figure 1 is a schematic representation of product flows and inventory information associated with ethanol production. The model doesn't include the second-generation ethanol production, from sugarcane bagasse, because the amount of ethanol produced with this technology is small and doesn't influence the data for simulation.

The availability of land for planting is treated as being shared between sugarcane and food production, that is, it is considered a finite availability of land so that an increase in planting sugarcane implies the reduction in food crops. These increases and decreases are influenced by the planted crop productivity level. The amount of ethanol to be produced is influenced by the production of sugar, which competes in the consumption of sugar and productive resources, as well as by the level of consumption of other types of fuel such as gasoline and vehicular natural gas, in addition to suffering influence of investments in production and distribution infrastructure.

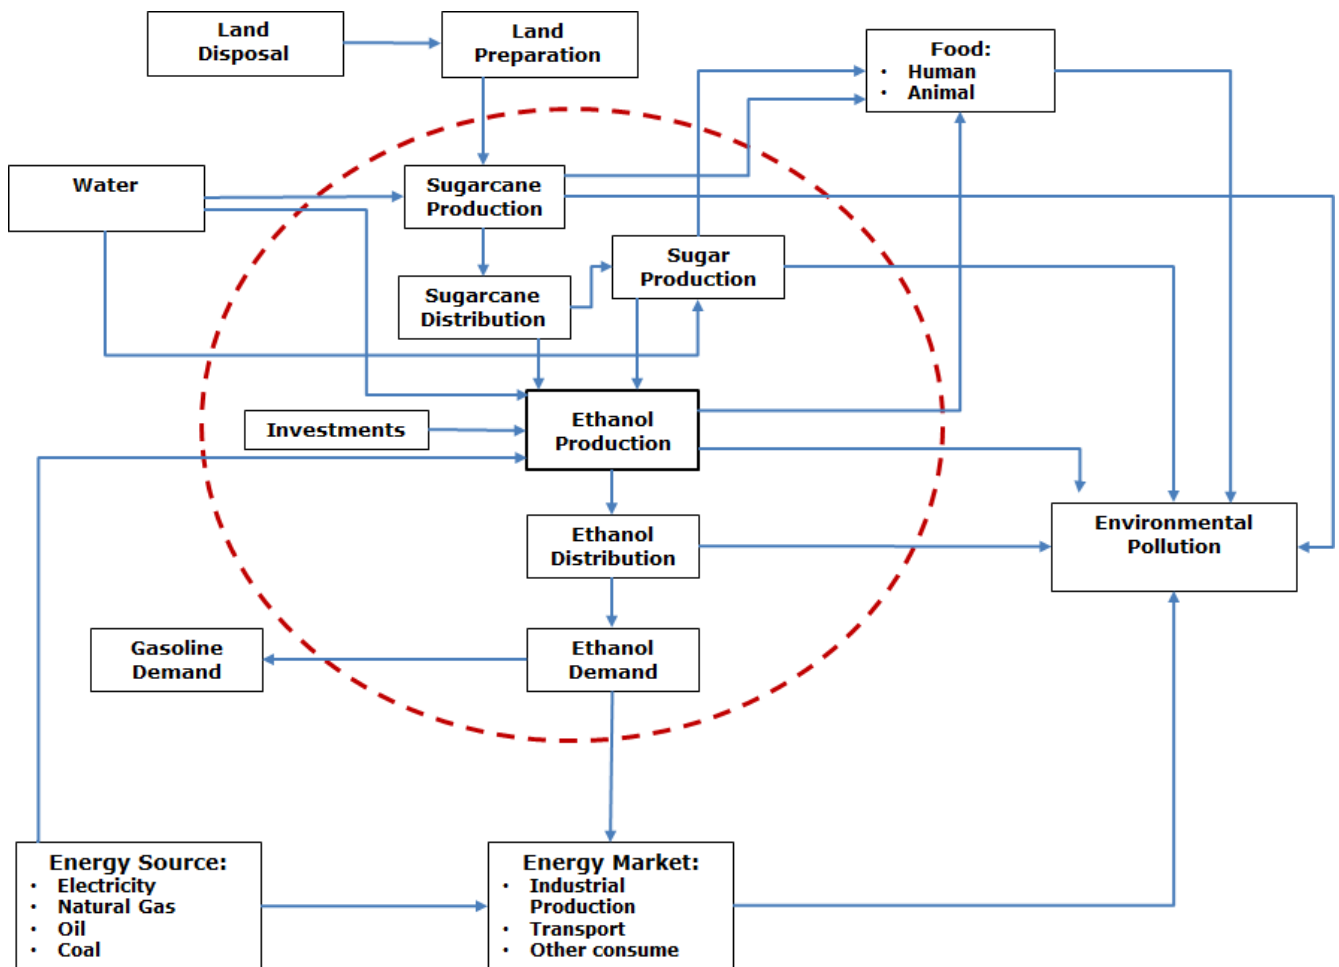

Fig. 1. Overview of the ethanol production model

3.2 Modeling

Modeling a system using the system dynamics is interactive and it's an ongoing process of formulating hypotheses, testing and review of formal mental models. According Sterman (2000), in modeling process a few steps should be considered, such as:

- 1) Problem Articulation - What's the problem? Why this problem? What are the key variables and concepts that should be considered? What time to be considered to the future? What is the historical behavior of the concepts and key variables?
- 2) Formulation Dynamics Hypothesis - Produce initial hypotheses, formulate hypotheses to explain the dynamics and consequences of endogenous feedback structure, develop maps of causal structures based on initial assumptions, key variables and other data available;
- 3) Formulation Simulation Model - Specification of the structure and decision rules, parameter estimation, behavioral relations and initial conditions, tests for stability with objectives and limits;
- 4) Testing – Does the model adequately reproduce the proposed behavior? Does the model behave realistically when subjected to extreme conditions? What is the sensitivity of the model?
- 5) New Policies and Evolution - What environmental conditions may arise? What new decisions, strategies and structures can be experienced in the real world? How can these new scenarios in the model be represented? What is the robustness of the recommended policies for different scenarios, considering the uncertainties? How policies interact? Are there any common actions or compensatory responses?

3.3. Simulation

Simulation is one of the most powerful analysis tools available to people in the design or operation of systems or complex processes. In an increasingly competitive world, simulation has become a powerful tool for planning, design, and system control. Always be remembered as the last resort, the simulation is now seen as an indispensable troubleshooting methodology for engineers, designers and managers. Simulate is to imagine, for the essence of without reality. A better definition for simulation is: the process of designing a model of a real system to conduct experiments with this model, for the purpose of understanding system behavior and / or evaluating various strategies for its operation. It is considered the simulation as the construction of the model and the experimental use with this model is meant to be the representation of a group of objects or ideas in some way than the entity itself. By a model is meant to be the representation of a set or collection of interrelated elements that work together to complete a set goal.

From the perspective of system dynamics, any system natural or artificial, can be described through a language composed of four elements: stocks (levels), which represent accumulations of a resource; flows, which are the activities that produce growth or reduction of inventories; converters that process the information regarding the stocks and flows or represent sources of external information to the system; connectors which are coupling elements of information describing the relationship between stocks, flows and converters. In order to provide a simulation model behavior, it is sufficient to define the relationship and the value of each variable at time zero of the simulation, using for this the features available in the system dynamics software.

According to Agarwal & Shankar (2005), the performance of a supply chain depends on the integration of its trading partners and the ability to respond quickly to market changes. By simulating, the model for assessing sustainability of Brazilian ethanol production wants to evaluate the effect of integration and speed of response to changes in sustainability. The dynamics of interactions between the variables related to the integration of cause and effect and speed should show the importance of the behavior of sustainability in different ethanol production scenarios (represent market changes that require quick responses).

3.4. The causal loop diagram

This diagram shows the interactions and relationships between ethanol production, land use and water consumption, production of sugarcane and sugar. The figure 2 displays the causal loop diagram of the ethanol production system and the factors of influence. The diagram consists of multiple loops that show, for example, the production of sugarcane, sugarcane price, the government tax incentives, demand for ethanol and gasoline prices affect the production of ethanol.

Thus an increase in ethanol production influences reduction in the price which can increase the demand resulting in the increasing of the price. But an increase in the price reduces the demand for ethanol, hence the negative polarity of the link arrow. Once you have a reduction in the price of ethanol, there will be an increased demand for ethanol followed by the gap between the demand and supply of ethanol respectively. This can lead to both an increase of investment in ethanol and more allocation of sugarcane to produce. An arrow closes the cycle of positive polarity since an increase in the allocation of sugarcane to produce ethanol mean an increase in ethanol production. This cycle is an example of a positive self-reinforcing process.

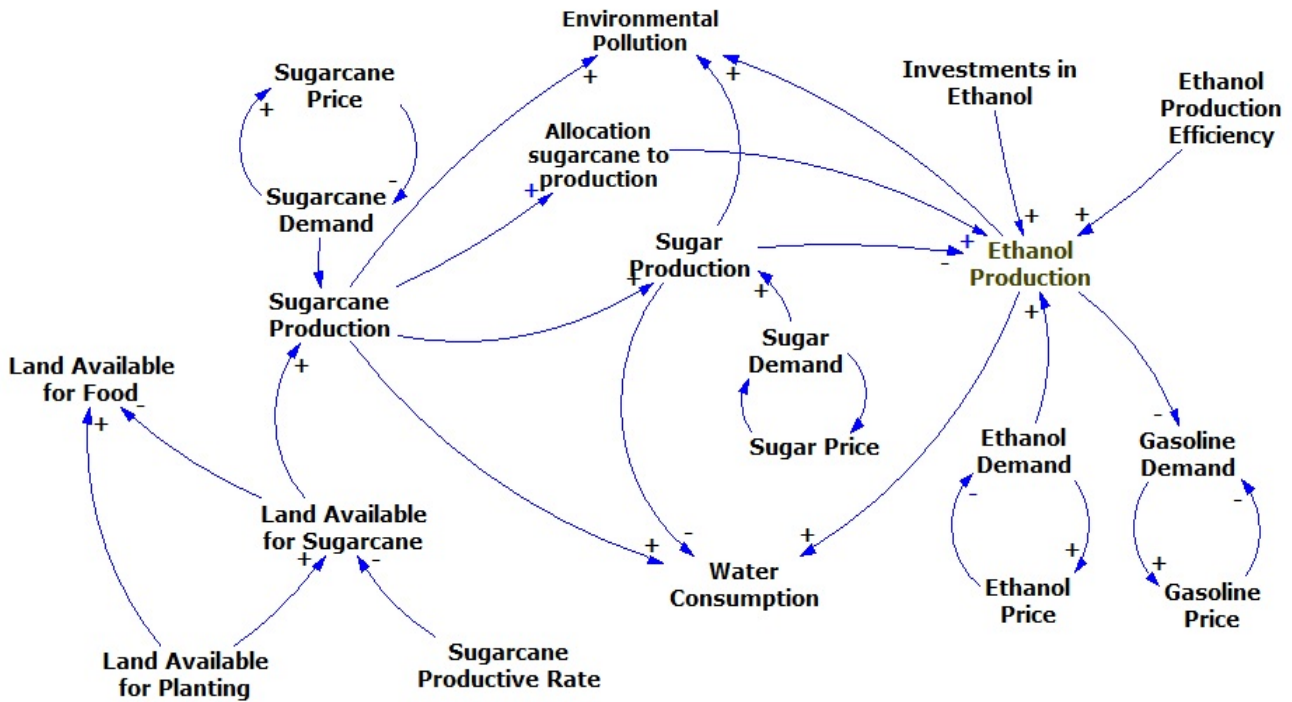

Fig. 2. Conceptual model of ethanol production

However, the cycle would be prevented from increasing the levels of each factor indefinitely because other factors beyond the loop, as the ethanol demand influence the price of ethanol. Gasoline demand also influence the demand for ethanol too.

Another example, an increase in yield obtained with the production and commercialization of ethanol positively affects new investments for the production of ethanol increases and the allocation of sugar for ethanol production. The effect of this is to increase ethanol production and decrease the price of ethanol by the forces of supply and demand. An ethanol lower price may reduce the profitability affecting investment levels. This subsystem tends to be inherently unstable if the acting forces do not take the self-regulation condition.

From the causal loop diagram is noticed that relevant factors for ethanol production level as investments in production, allocation of sugarcane production and profitability has a degree of dependence on production efficiency, the price of ethanol and sugar production, the availability of land for planting that can profoundly affect the needs for food and water production growth becoming unsustainable at expected levels.

3.5. Stocks and flows diagram

The equations that demonstrate the relationship between factors will be built on the basis of production data and investments of sugar and alcohol sector provided by the Department of Agriculture of the State of São Paulo, by the Council of sugarcane producers, sugar and Alcohol of the State of São Paulo and the Ministry of Agriculture.

The model is built considering four steps. The first step is the focal element ethanol and describes the dynamics of supply and demand, or deal with the production, storage and distribution of ethanol. The second stage, additional production, comes from sugar production model as a product substitute for ethanol production. The third step deals with the modeling of water consumption at various stages and land used for the production of sugarcane and food. The fourth step models the dynamics of capital, costs and investments. The forecast period begins from 2016 and extends until 2035. With this information it's possible not only to simulate the dynamic behavior of the production of ethanol, sugar and sugarcane as well as evaluate the impacts on the environment, water consumption and production foods, as illustrated in figure 3.

The flow diagram of inventory threats not only the direct demand for ethanol as well as indirect demand processes resulting mixture of ethanol and gasoline constituting a "pull" system in which the

pulling is demand production. On the other hand, sugarcane harvesting system is modeled as a system "pushed" in which the sugarcane is harvested and destined for processing. In the case of the demand for sugar is less than the expected, there is no formation of a reserve stock for a short period of time to keep it in delaying the harvest field. If demand is greater than expected and the plants have available production capacities, as there is no training of reserve stocks, you can bring sugarcane from other states since the price and shipping cost offset. In this case, the availability of sugar would be the limiting factor for ethanol production.

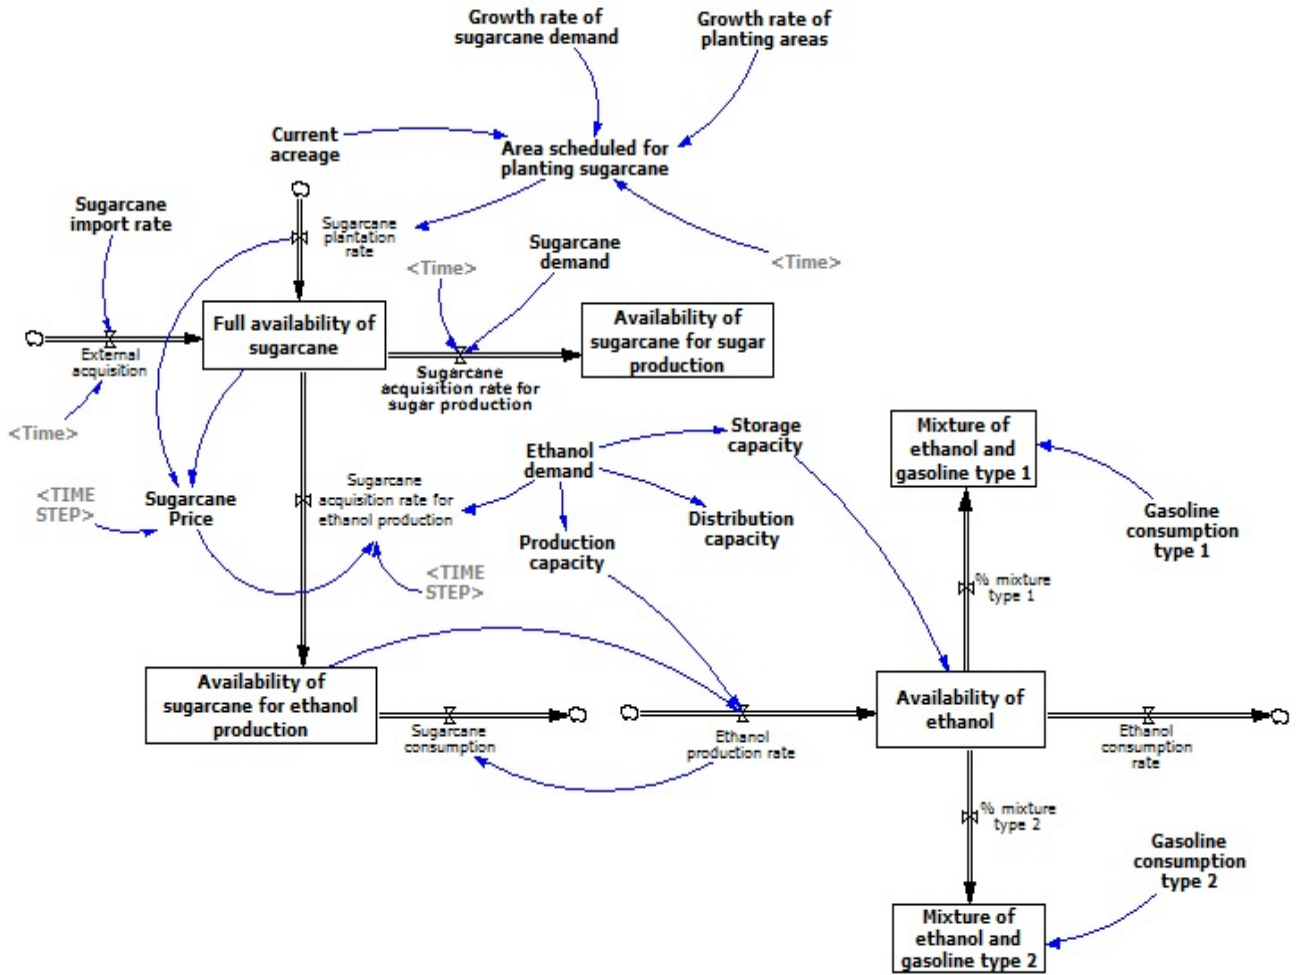

Fig. 3. Stocks and Flow Diagram

The demand of sugarcane for other purposes or sugar production and other industrial applications is shaped according to the projection. The sugarcane allocated to ethanol production depends on the demand, availability and price which in turn depend on the rate of acquisition of sugarcane for ethanol production. If the acquisition rate increases, the price rises and vice versa.

The diagram of stocks and flows also considers demand for ethanol and production capacity increase in the plants in proportion to the amount of sugarcane harvested, increasing the demand of growing areas, occupying spaces before intended for food crops such as rice, beans and corn. Investments in improvements in productivity to obtain the highest percentage of sucrose, exceeding 9% margin, allow the increase of ethanol production without an increase in the same proportion planted areas. This will appear in the diagram as a mitigating factor for consumption land available for planting.

One answer that is expected with this production simulation model is to evaluate how long production remains sustainable in the face of growing demand for ethanol.

3.6. Computational model

Once modeled in Vensim® the causal loop diagrams and charts of stocks and flows, the computer model will require the introduction of the equations that will govern the causal relationships of the

different variables used and the definition of simulation parameters such as unit time to be used and the simulation horizon.

The simulation will work with a set of scenarios to assess the behavior of the variables and the sustainability of production. In the simulation three scenarios apply: an optimist, a pessimist and more likely. In the first scenario, it is assumed that the first period of 120 months, changes in demand and other factors have stable growth rates. In the second scenario, it's introduced changes in production capacity in the plants, oscillating demand for ethanol, water scarcity and fluctuations in the price of the final product, while the other factors remain unchanged. In the third, it's contemplated a scenario in which demand, production capacity, price and production of sugarcane tend to stabilize in the second half of the simulation time.

The computer model allows the interface with other tools such as geographic information systems to display the variations in plantation areas in the form of maps, as well as promote and export data for processing by other computational tools.

4. Limitations of Study

This article discusses the use of system dynamics modeling to model the problem of sustainability of the ethanol production system. The system dynamics modeling appears to be a useful tool for creating scenarios for such problems. However, this article considers some limitations to the use of this specific tool for modeling ethanol production. These limitations are highlighted by the ideas of system theory and by complex science (BOSEL, 2007). There are also fundamental limitations to the correct prediction of the sustainability of ethanol production in the next twenty years, which are made clear by critics from of current production system (DeTOMBE, 1994) and chaos theory (GLEICK, 1987). These restrictions, however, do not set aside the importance of modeling and simulation tools as aid in understanding of dynamic phenomena such as sustainability.

5. Conclusion

As Mendonça (2007) pointed out: "Not long ago, biofuels were feted as an alternative to save the planet from carbon dioxide accumulation and excessive dependence on oil [...] were the synonym of a new era, the era clean and environmentally sound energy [...]". But, with so many contradictions, "[...] the wind shifted radically. Biofuels, almost overnight, is being considered the villain of the planet, responsible for the current food crisis, by soaring prices".

This article presented the step of formalizing the model for assessing the sustainability of ethanol production, its borders (external environment) and satisfactory solutions necessary to study the Brazilian ethanol production, its effects on the environment, food production and water consumption and future trends in three different simulation scenarios. The model considers that the importance of energy independence cannot be overestimated. Oil prices are expected to grow in coming years, as reserves are depleted and the remaining oil extraction process becomes more expensive. Ethanol is a biofuel which has an excellent history of use and relative ease of production as the basic raw material is sugarcane which can be easily cultivated. As a result, sugarcane production is expected to increase and more processing plants to be set up.

Improvements in farming technology are expected to increase productivity per hectare. However this increase can mitigate but not stopping the increase in sugarcane growing areas and hence bring significant reductions in food production with serious implications for the use of sugarcane as an alternative form of energy.

The use of modeling let to work with simulation scenarios and conditions where it is possible, given the initial conditions and the quality of the model, assess what would happen to the ethanol industry if ethanol prices float in response to the availability and supply of alternative energy sources for transportation or what would happen to food prices if ethanol demand continues to grow at an increasing rate. The model should be able to allow the situation of research that changes in planned production of sugarcane, the prices of sugarcane, capacity, demand and other factors relevant to the industry that can become business continuity unsustainable, either by lack of water resources or by the need of production and food for a growing population.

The sugarcane industry has increased sugarcane production due to economic pressures and due to increased demand for ethanol produced from sugarcane, in large part, by the introduction of automobiles that consume ethanol market. On the other hand, the use of intensive technologies in the production units, to increase productivity in the field, creates dependence on external inputs compromising their economic sustainability. Climate change projections indicate that the sugarcane production systems will be affected by rising temperatures and drought, among other extreme weather events.

Increase the responsiveness of the sugarcane production system to adverse weather events is increasing system resiliency. Like resilience is the potential of a particular arrangement of a production system to maintain its structure and function when a disturbance occurs, it became the biggest challenge that the sugar-alcohol sector will face in the coming years. Explore the concept of resilience enables better understand and plan actions towards sustainability of sugarcane production systems. In this scenario, the following problems arise: identify the types of production systems that will supply the growing demand for sugarcane in pressure situations by farmland, high price volatility, high costs and extreme weather events; identifying production technology and cutting sugar cane which contribute to increased resilience of cane production systems to climate changes disorders; identifying relevant to weather disturbances cane production systems.

The models are as useful as the data used in their construction, understanding of the analysts and the inclusion of important and relevant factors. Brazil is the leading producer of large-scale biofuels and, maintaining this leadership depends on largely sustainability of ethanol production. As such, an evaluation model of sustainable production will be useful to explore the changes in market trends, assessment of impacts of new technologies of production and genetic improvement of sugarcane constituting a research instrument for the assessment of the future impacts of production biofuels in Brazil.

Abstract: This study depicts the performance of the winning companies of the National Quality Award, based on the analysis of the performance indicators, the setting of Corporate Governance. Along with the general objective of the performance review of the winning companies and finalists for the national quality award and how Specific objectives to compare the performance of the winning companies and finalists in relation to companies that do not compete for the award, evaluating the progress and efficiency of the two groups of companies, which has its indicators studied. The study is moored in corporate governance that has brought contributions to equip organizations in the strategic decision making and operational controls. Through codes of good practice in corporate governance, implementing risk management and aligning the decisions and processes to principles of transparency, fairness, accountability and corporate responsibility. It is a quantitative study – quality applied with the finalists and winners National Quality Award. Quantitative research, studies the economic and financial performance indicators published in the balance sheet. The rates of liquidity and profitability were objects of study by applying data envelopment analysis tool Data- DEA. The DEA tool, which allowed us to operate with linear progressions able to identify the boundaries of efficiency in performance indicators studied. The qualitative research was applied along the evaluators of the National Quality Award, and sought to know how happens visits, and meet behind the scenes of the evaluation process, asking for experiences, emotions, perceived impressions when the evaluation visit in companies. The expected result with this research is to prove investigating whether the winning companies PNQ stand out in relation to not winning, through the use of data envelopment analysis DEA data, which shows that the winning companies of the prize lie on the efficient frontier.

Keywords: Corporate Governance. Performance. National award Qualities.

1 Introduction

Quality Management Agencies reviewed the big companies in the world and identified the factors that define a world-class company. Thus emerged the Excellence Fundamentals of management for quality, explicit worldwide by international organizations that represent the Quality Management. In Brazil, the National Quality Foundation (FNQ) who plays the role of disseminating and a national representative of this management model, spreading throughout the territory the Fundamentals of Excellence in Quality Management and Excellence Model in Management (MEG). In order to encourage the adoption of quality excellence model, the organization like other entities in the world, offers a prize called the National Quality Award (PNQ), in recognition of the best steps taken by companies using the MEG.

Receive the PNQ puts the company in a prominent position in the market, improving the benefits for sales, competition between competition and the market itself. Thus, companies have stood out positively with the nomination and the award of contemplation.

Adopt best practices has become a strategic marketing condition, to validate the resource management organizations. Corporate Governance (CG) also suggests the use of good practices and, in this sense, is allied to the tactics adopted by the Quality Management (QA). With this alignment, strengthen the image and positioning of institutions.

According to the Brazilian Institute of Corporate Governance - IBGC (2009 p.15) "Corporate Governance is a system used to manage, control and relate the organization to its investors in order to ensure the management" and is based on four principles: transparency, fairness, accountability and

corporate responsibility. Can be used in any size or type of organization, such as business corporations (S / As), third sector, cooperatives, among others. Take advantage of good corporate governance practices guarantee investors and the market return an elaborate and adapted to the needs and market requirements.

Although it is used by business corporations, nothing prevents the model and philosophy of corporate governance can also incorporate the principles of management and can be used strategically to create competitive advantages.

Corporate governance and quality awards can place the featured companies and depending on the segment, innovate and position uniquely. Making thus attractive companies to the market in order to encourage investors to that channel their applications in companies to base their management models of excellence.

A simple model recognized worldwide for excellence, the Model of Excellence in Management (MEG), used by the National Quality Foundation (FNQ) aligns perfectly with the principles of Corporate Governance, proclaimed by the Brazilian Institute of Corporate Governance (IBGC), compromising organization in search results for this segment.

The MEG work with full focus on results, assuming that organizations need to be immersed in knowledge and information that will nourish the relationship with stakeholders, meeting customer needs in the production of goods and services, as well as in relation to society exercising their social role. Underpinning the performance leader that develops plan and strategies, manages processes by applying to these constant improvements. In another instance, develops a team of happy and competent people, ensuring the core competencies of the business (core business) and thus aligning the whole management to experience results that are grounded in strategic philosophy - values, business, vision and mission - and social responsibility, guaranteeing ethics and transparency.

As a general goal, this study analyzes the performance management of the companies awarded the PNQ, evaluating the results after receiving the award. Specifically occasionally checks the award criteria with the indicators of economic and financial performance published in the balance sheet referenced in the Corporate Governance scenario.

Compare the indicators between the two groups of companies (winning and not winning) to identify who has the best performance indicators, investigating whether the winning companies stand out in relation to not winning. To achieve the proposed objectives has been formulated the following research question: "Does the candidate companies to PNQ improve or maintain their organizational performance after the awards?"

The principles of good corporate governance practices, establish performance standards that improve the contents and results of organizations and according to Silveira (2006), in this sense corporate governance is performing a secondary role in management to establish best results, competitiveness and longevity.

Be aligned to best practices and to be recognized with the award can give the company a shield in his career, differentiating yourself from the competition by aligning the strategic guidelines, improving performance and generating competitive advantages.

The contribution of this paper is to demonstrate how the awards linked to quality management stimulating the positive performance of organizations, demystifying the myth that the awards are only for marketing purposes.

2 National Quality Award

Most excellence models (EMs) and (PNQS) were established during the late eighties and early nineties (Talwar, 2009). In this context studies conducted by Miguel (2004) point out that many countries have their national awards quality and recognition programs for excellence.

Study quality management has enabled organizations measure and improves organizational performance and thus worldwide management quality motivated the emergence of awards around the thematic.

Looking at the awards around the world following the notes studied by Silvestre and Mazzochi (2011), quality awards focus on management excellence, processes and relationship with the market as we noted in the characterization about quality awards in Japan, the US, Europe and most relevant, Brazil. The most relevant ones are the Deming award that originated in Japan and was created in honor of Dr. William Deming Eduard focused on the pursuit of quality performance management, the Malcolm Baldrige Award in the United States created in 1987 in order to stimulate the production of

quality products in a systemic evaluation. And in Europe the European Foundation for Quality Management (EFQM) whose award is granted to companies seeking to improve their customer relationships and new business opportunities.

The PNQ – National Quality Award of Brazil appears in the 90's with the establishment of the National Foundation of FNQ quality, whose mission is:

“Encourage and support organizations for the development and evolution of its management, through the dissemination of the foundations and criteria of excellence, to become sustainable, cooperative and create value for society.”(FNQ, 2011, p.1)

At the time the scenario was of world-class competitiveness, globalization was a reality and international transactions requiring Brazilian companies' professionalism, performance and competitiveness. Thus arises with the FNQ the quality of the national premium (PNQ), bringing an incentive to improve organizational performance.

The promise of a better performance of companies, is based on PNQ methodology as this allows a detailed analysis of the organization through performance indicators, on-site evaluation by a management consultant, performance leveling defined by examiners and award best practices of management excellence fundamentals. At the end of the process the organization has in its possession a comprehensive management evaluation report, with analysis and suggestions of various management aspects improvements.

The national award presentation Manual of the quality of FNQ (2014), discusses the benefits for organizations participating in the PNQ award process, citing the application of recognized excellence fundamentals and used worldwide such as: purchasing systems view, to focus on results, internal cooperation, information sharing and learning, identify strengths and opportunities for improvement, and enables organizations to self-assessment, obtain market recognition and society to have to measure their performance against recognized benchmark in the corporate landscape.

2.1 Concept

In competitive times is well known, by scholars that the administrative process is dynamic and that should change soon as the organizational system change (Silva, 2002, p.441). The management of awards has a role to motivate the organization to seek the best performance in the forward market to the competitor, customer, supplier, and adapt to the proposed changes in the environment.

The FNQ, influence on the organization's readiness for change as it is responsible for stimulating the processes and manage quality award stages throughout the national territory. Spread the benefits awarded the prize as the improvement of the company's management and contributing to increased competitiveness. Considers that regardless of the size of the company, its industry, number of employees, "[...] understand organizations as living systems, members of complex ecosystems, with whom they interact and on which they depend" (FNQ, 2011, p.8).

The award encourages continuous improvement, to be coupled to a model of excellence, assists in cultural development political, scientific and economic. The foundation cites in his FNQ manual (2014) other aspects that benefit the winning companies, such as grant public recognition to the world reference organization and makes public good practice in implementing the management model, suggesting benchmarking practices.

Companies applying for PNQ undergo a thorough examination of its management, made by examiners trained by the foundation, guided by a strict code of ethics, getting to the end of the process a broad management assessment report.

The methodology of the awards is divided into eight stages and some sub steps, called excellence criteria. The eight award criteria are divided into twenty-three items, comprising the paragon management (MEG), each with specific requirements, as they are identified and validated, unleash whether a sum that punctuates the organization according to the identified practices. The issue of corporate governance is contained in the leading item is the criterion number 1 to be evaluated by the PNQ.

3 Model of Excellence in Management

"A good management system begins with the formulation of the strategy. It's basically to understand where the company wants to reach "(Campos, 2013).

The management models are tools used by senior management to ensure the efficient conduct in the development of the organization. Anchored in the theory of organizational development, in which Silva (2002, p 400) tells us "be a systematic process, managed and planned in order to improve efficiency in solving problems and in achieving the goals."

Companies using management models have differences in their results and improvement in its processes, obtain greater involvement of its employees, which is more worked looking arouse consciousness of social responsibility, which allows to focus on the sustainable management and thus influence on the continuity of organization.

Excellence models improve the organization's management; its concepts help the leadership to implement the models and also provide competitive conditions to pursue apply to marketing awards of recognition as the PNQ.

In 1990 significant changes arise in the organizational setting and become part of the reality of the corporate market: globalization, integration, Brazilian trade, the government of Fernando Color began a more focused approach to international marketing and Fernando Henrique extended, which brought greater competitiveness for the companies located in Brazil.

The business community realized the need to adopt international standards to guide and evaluate, recognizing the management seeking higher quality and competitiveness, knowledge, improvement and excellence.

In this highly globalized scenario arises the National Quality Foundation (FNQ) and begins to disseminate the Model of Excellence in Management (MEG) as an essential tool for the complexity, sustainability, ethics and innovation in organizations of Brazil, and the foundation initiates management National Quality Award (PNQ).

PNQ is according to the FNQ the most important recognition to Brazilian organizations that stand out for their excellence in management. The award acts by extensive network of partners, study and share knowledge on management excellence, organizes study groups, knowledge niches, training discussions and seeks to generate value by supporting the pursuit of excellence in management.

The FNQ wants to be recognized as the most important promoter agent, articulating and spreading culture and management excellence in Brazil, communicates and disseminates the world its model of excellence that is based on thirteen foundations of excellence and reflects the experience of various organizations International implementing management excellence models, the Brazilian model helps organizations doing the alignment of resources in order to identify strengths and opportunities for improvement, also seeks to improve communication, productivity and effectiveness of its actions reaching the goals and strategies, advancing toward excellence.

3.1 Excellence Foundations

The foundations of excellence reveal interconnected cultural standards in world-class organizations internationally recognized and expressed through their management processes and consequently results.

The basis of excellence criteria are fundamentals that FNQ adopted based on the search information of world-class institutions that research in several countries, observed that some companies were more successes over the other.

Thus, the development of the FNQ excellence model was stimulated from the observation of international bodies and quality management, which examined companies and world-class organizations and identified factors and common standards, this look identified and classified the criteria of excellence present in MEG.

The MEG, "this founded on a set of core concepts and structured criteria and requirements that express the understanding of the Excellence in Management" (FNQ, 2015, p.9). The model has reference and international recognition, which refer to organizational development processes, practices, policies, perceived performance in managing world-class companies, which constantly adapt to business scenarios.

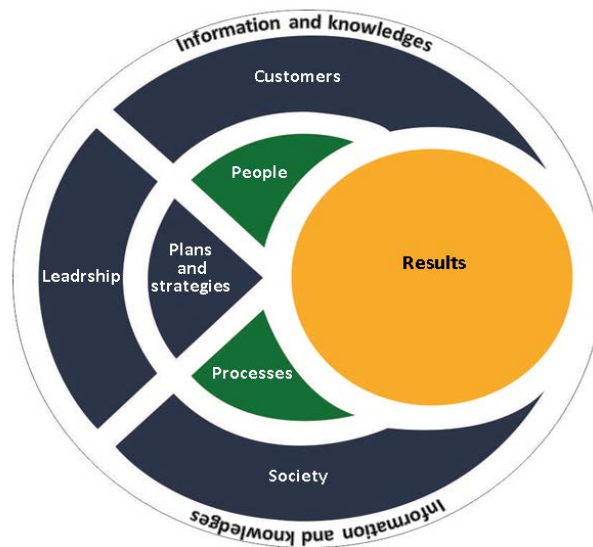

Figure 1: Model of Excellence in Management (MEG). Source: FNQ 2014

For FNQ the thirteen elements underlying the MEG comprise: Systems thinking, networking at work, organizational learning, innovation, agility, transformable leadership, look to the future, knowledge about the customer and the market, social responsibility, valuing people, key decisions, guidance process, value creation.

4 Corporate governance

In the corporate scenario waves of changes brought corporate governance and its good practices, to equip the organization, assisting in the management, to meet the stimuli of the market and their contemporary needs, be attractive to the investor market, profitable for the owners, responsible and complying of their social, economic and environmental role.

Constant and significant changes in the business environment stimulated the incorporation of organizational management models. From the separation of the ownership with the management, Jensen and Meckling (1976) called for as the dilemma of the agency, came the emplacements for the principles of Governance's management model.

Corporate governance for Mota Silveira and Borges (2006) relates to models of internal controls and risk management but keeps the part of the systems leading to strategic decision making of the company. The internal control system ensures visibility of assets and business results, while risk management makes the main alternatives to the uncertainty of events present in the organization of life and corporate governance also concerned with the ethical issue in relations the company with its interest groups.

“A representative model of corporate governance can be developed based on a set of different codes of good corporate governance practices, in order to assess the presence, or compliance with proceeding management in a given organization under review” (Mota, Silveira, & Borges, 2006, p.218).

According to the IBGC, (2009, p.19) "Corporate governance is the system by which organizations are directed, monitored and encouraged, involving the relationship between owners, board of directors, management and control bodies."

Corporate Governance is becoming more popular in the models of management of organizations, as a system whose model is anchored in the organization's results, the commitment to transparency to the market and the search for competitiveness and high performance of corporations.

One of the corporate governance goals mentioned by Martins, Silva and Barros (2005) concerns the protection of the company's value, performance indicators management, the control policies and monitoring the results, therefore the answer is increased accounting reliability meeting the

standards and complying with the rules, understanding and business risk management and the business scenario and its control elements. The governance board has a duty to provide the strategic orientation.

For generating significant contributions in organizational management and increasing access to capital, good corporate governance is respected and is well positioned, which has generated a favorable image in the market adoption of good practices.

“Minimizing the damage caused by the conflicts of interest among decision-makers and resource providers depends on the presence of a set of internal and external mechanisms that align the interests of managers to all shareholders. This set of incentive and control mechanisms of the name of corporate governance” (Silveira, 2006, p.27).

According to Jensen and Meckling (1976) there are two types of conflicts between shareholders and managers, and between creditors and shareholders. Conflicts between shareholders and managers occur because managers fail to capture all the gain generated in the activities that generate value. On the other hand are the administrators who bear the costs of the activity through his work. This inefficiency is reduced to the extent that the trustee holds share capital of the company.

Pillars are supporters of the construction, which give strength to sustained phenomenon is your assignment for the IBGC (2007) its good corporate governance practices is based on four basic pillars: Transparency, Fairness, Accountability and Corporate Responsibility.

“The four principles are present in the area of sustainability for businesses, such as long-term strategy, risk management, consideration of intangibles, the quality of relationships with the various stakeholders and the responsibility for the acts and omissions that sooner or later, may impact the economic value of the company” (IBGC, 2007, p.13).

Figure 2: Pillars of Corporate Governance. Source: IBGC (2008)

The principle of transparency is to the word of action information is the first pillar which aims to address the information, assuring shareholders, market investors and suppliers of goods and services, fast and secure access in relation to the facts of information acts and transactions conducted by the company. Besides showing through reports, all administrative actions, particularly in the annual reports that will go through the inspection of the audit.

The second pillar equity, the focus is the treatment of stakeholders fairly and equally, particularly minority partners. Any relationship Group and partnerships such as employees, suppliers, investors, maintaining equality policies and respect for all stakeholders.

The union of transparency and fairness ensure information necessary for decision-making for all market segments, so that none have inside information, and the opening of institutional information,

in the globalized environment, is considered a major factor (Souza, Lima, Barbosa, Coutinho & Albuquerque, 2015).

Accountability is the third pillar of corporate governance and is linked to responsibility and duties of the organization that uses the good corporate governance practices and should be carried out by the organization's managers to fully answer for acts and facts about their responsibilities.

Corporate Responsibility, the fourth pillar, focuses on sustainability to be one of the goals of this pillar care with long-term actions, which remain very well positioned organization, considering social and environmental issues, respect for the business, corporate values and the impact of decisions on society and the environment. Corporate responsibility is sustaining the strategies linked durability organizations, suggesting sustainable operational practices, which can bring a difference to the corporate environment (Rosini, Roble, & Oliveira, 2014). In this sense actions to its partners and employees are in addition to the definition of corporate strategies.

5 Corporate Governance and Management Model of PNQ

Corporate governance has been seen as a system or management model, by reducing the distance between owners and top management, to develop mechanisms by which resource providers' guarantee to you getting the return on your investment, because it involves a relationship between the organization's managers and their boards, shareholders and other stakeholders. The Governance is structured for the company to achieve the planned objectives and establishes the means of achieving them performing monitoring of indicators and looking for ways to improve performance (Malacryda & Yamamoto, 2006).

The research has revealed the trend that companies with the adoption of best governance practices tend to be well regarded and best positioned, and this reflects on their market value, the impact on ownership structure and performance (Silveira, 2006).

In this context for the PNQ governance is observed in the management process, seeking the establishment of the contribution that contributes to PNQ the organization's commitment to excellence and sustainability, nest evaluation criterion is salutary alignment to the principles that also are considered by the Brazilian Institute Corporate Governance- IBGC of transparency, equity, accountability and corporate responsibility.

Within the management processes, analyzed in the PNQ, corporate governance is investigated from various aspects, regarding the treatment of equity that the organization gives partners, maintainers or founders and how they protect the rights of interested parties, asks whether about controls the actions of the board, and the criteria to be analyzed institution must reply, also notice how the applicant company establishes and updates the values and organizational principles necessary to promote excellence, realize how this company creates value for stakeholders and also sustainable development.

The PNQ, seeking information about the rules of conduct and how the applicant organization for the award, deals with ethical issues, and ensures a committed relationship between its market partners, suppliers, employees, customers. Requests that the company describes codes of conduct, thinking of the principle of transparency and the concept of relationship that corporate governance shall establish and manage, suggests that companies detailing how and how many are the communication channels available to the workforce and society and all stakeholders, to receive complaints, complaints and suggestions.

Risk analysis to corporate governance is a mandatory item, so the evaluation criteria of the award, highlighted how the company manages risk, analyzing and sorting in order to identify the most significant in scope trajectory of goals through strategies, complementing with the IDs from the risks of involvement with partners markets, in market relations, ethical behavior linked this to the principle of corporate responsibility number four Brazilian Institute of Corporate Governance (IBGC, 2009).

Decision-making, is another step ascertained the prize on Corporate Governance, and the criteria that topic talk of alignment with the transparency and organizational responsibility as decisions are made, implemented. The questions take into account whether the company is concerned with all the actors involved in the business, identifies who are the decision makers, the ones who approve, and also the business model established.

The communication of the relevant facts to partners, stakeholders and society is also observed, and seek to understand what are the criteria that the company uses to identify and classify the facts relevant to society and prepare and make the communication to the market.

Another point studied is accountability of the IBGC principles that beacon corporate Governance in the category presenting the results to the market, interested bodies are also referenced.

The PNQ according to the FNQ (2014), want to know how the company ensures authenticity and sufficiency of the information regarding accountability. "As the Director shall report its actions and results achieved, to who elected, nominated or appointed?"

The management process is evaluated from data relevant to the implementation and analysis of the contributions from the operational and strategic performance of the candidates, information such as meeting targets, competitiveness levels achieved in the industry and market, beyond what is in the requirements suggested by the parties Business interests.

"As are identified the needs of comparative benchmarks to analyze the operational and strategic performance of the organization?" (FNQ, 2014, p.34). Organizational performance is an indicator of excellence which is based on various financial and economic rates of the organization, the National Quality Foundation (2014, p.34) "Display criteria used to determine which are the most important data to be compared, relevant comparative benchmarks used by the organization, indicating the main ways of obtaining."

The criteria will observe and map how the company and its board assess the performance from the point of view of sustainable development. Which practices and projects under the theme, as can also be seen is what sets the pillar of corporate responsibility, as under IBGC journals.

Identify the performance communication to the workforce and other stakeholders as well as monitor how the implementation of decisions arising from the performance analysis of companies entered for the PNQ and are part of the content analysis is made.

The theme is contained in the 1-Leadership criterion where it is possible to note the importance that corporate governance has for the award and the model of excellence in management and therefore the improvement in organizational performance.

6 Methodology

The methodology proposed in this study aims to analyze the performance management of the companies awarded the PNQ. The survey assessed the results before the award, in the year of receipt of the award and the year after the PNQ, and presented the criteria on which the award was presented, analyzed the annual development of enterprises and their evolution along the indicators of economic and financial performance published in the Balance Sheet.

The approach of the problem can be classified research as quantitative and qualitative. Godoy (1995) points out that the two approaches to research is characterized as a careful effort to discover new information or relationships and for the verification and expansion of existing knowledge, but the path followed in this quest can have different contours in each of these approaches.

Qualitative Research, according to Godoy (1995), involves obtaining descriptive data about people, places and interactive processes through the direct contact of the researcher with the studied situation. To understand the phenomena according to perspective of the characters involved in the situation.

Qualitative research gave emphasis to collecting information from PNQ evaluators their experiences and impressions perceived throughout the evaluation of questionnaires filled out by the candidate companies for the award, as well as visits in the field in their own organizations to assess and validate the information provided via forms in particular the criterion of the award - one leadership, which contains the elements and inquiries relating to Corporate Governance.

This study also used the Data Envelopment Analysis - DEA as a tool for the realization of quantitative research.

Data envelopment analysis - DEA is a nonparametric mathematical tool used to measure the efficiency with which firms transform one or more inputs on one or more outputs, through a production plan (Oliveira, 2014; Schull, Feitosa, & Hein, 2014; Barbosa & Bastos, 2014; Gonçalves, Lara, Lopes & Locatelli, 2013).

Using the DEA, Data envelopment analysis, in its translation into Portuguese, laced with linear progressions able to identify the boundaries of efficiency in performance indicators studied.

To identify the variables used in the DEA, we rely on data published in the balance sheets of three periods before, during and after the awards. Two groups of companies were investigated: candidate companies to PNQ and no candidate companies. The study object was the year award in 2012,

which analyzed the performance indicators published in the balance sheet relating to liquidity and profitability.

As the output data were checked the contents of current liquidity and overall liquidity. The liquidity ratios relate to how the company behaves in relation to their ability to pay. As inputs the asset profitability ratios and return on equity to analyze economic aspects and investments.

Thus the efficient frontier was calculated in relative terms that are, comparing the units based on actual information on outputs and inputs. This allowed us to a more detailed study in relation to the performance indicators of companies incorporated research.

6.1 Data Collect

Data collection was carried out seeking information to answer the research objectives, analyze the economic and financial performance in the management of companies awarded the PNQ, evaluating the results after receiving the award.

Extensive desk research was conducted in order to understand the methodology adopted by PNQ, his philosophy, application, visitation, interaction with the evaluator and overview of award.

In quantitative research our focus was the economic and financial performance indicators, the finalists for the prize in 2012, for a total of 7 companies made up this group, called group 1 (G1).

Composed the other group, 2 of baptized (G2), other companies were also evaluated in a total of 5 companies, in this case, they do not competed for the National Quality Award. The profile of this group followed the criteria of having relevance of experience in the domestic market, have well-positioned brand in its segment, actions in the bag, and even had their financial and economic indicators published in the balance sheet in the same period of the awarded companies in the G1 by PNQ .

The qualitative research was made in order to make a deeper search on the sidelines of the award, examining the timing of visits by assessors / examiners PNQ. Identifying assessor's perceptions regarding the management and PNQ requirements on corporate governance issue. Sought to understand how the assessor relates to the companies visited and his look of excellence manager, trained to understand and validate management practices reported by the organization in the previous phase, reported data presentation.

7 Results and discussion

In the analysis of data collected about the perception of premium evaluators, it is clear that with regard to the question that dealt with the finding of the data submitted by the participating undertaking of the PNQ in the FNQ issues report, it was clarified that, through reading of the information recorded by the applicant, presented in the same order of Management Excellence Model requirements (MEG), evaluators seek to verify the degree of compliance by the organization's management system, the evaluation factors established by FNQ criteria.

Survey responses presents a remarkable range of issues specified by the award which allows the evaluators involved in the visits have the perception of real engagement in leadership, people and processes.

On one of the aspects that impact the evaluator on visits to candidates for the national quality award, there is talk about the exquisite management practices of some candidates such as: The use of 5S (Quality management tool used to improve environments) and how to use the five forces of Porter: rivalry among competitors, bargaining power of suppliers, bargaining power of customers, threat of new entrants and the threat of substitute products.

When the issue addressed dealt with the best practices by the companies that have corporate governance, we obtained a general result, that the fact that the company have a corporate governance already shows an advanced stage of the organization's management of maturity and then talking about the sufficiency of items ensured for best practice management, adds that the way they are placed the FNQ questions allow the evaluator to see how they are being applied management practices.

When answering on companies which provide high performance and differentiation in the market, it stands out as features mainly the result of the organization, its longevity, and the confidence that their brands and products go to their customers, employees and society.

As for the question of the meaning of the indicators of excellence for FNQ, the responses made mention about the body of work that the organization employs to realize its practices as it applies excellence in their daily lives, highlighting the answer: "The "how", with which practices, the company caters to every requirement of Excellence Criteria, added to each displayed result, form a set of factors

that examined by the appraiser against the criteria, indicate the degree of maturity (excellence) of the management of organization. "

Was highlighted in research that a company has excellence when it presents relevant results, with favorable trends in long, periods longer than three years, exceeding, in these periods, results of comparative references, competitors or similar considered leaders of their activity.

As for the organizational influences that allow a good performance, these are vigorous leadership processes that guide the organization to challenges followed, motivating and charging people and processes to achieve high performance.

With regard to the comments of suggestions and contributions on the PNQ was observed in answers a widespread concept in the sense that the FNQ contributes to the consolidation of organizational results and Brazilian society, as can be seen in this speech: "The evaluation of PNQ serve more to the needs of Brazilian society when they can be applied extensively in government organizations, in its three levels, Federal, State and Municipal". The performance of companies operating in risk markets will always be dependent on the vitality of their leadership processes. It depends on its ability to identify changes and to adapt and live with exogenous aspects such as changes in technology, changes in markets, government policy changes, tax, among many other aspects.

The quantitative research was carried out considering 12 companies. Of which 7 are in group 1 (G1) winning companies of the PNQ in 2012 and five other organizations are part of Group 2 (G2) not winning companies. Chart 1 shows the surveyed companies in 2012.

Chart 1

Companies used for performance **investigation- DEA 2012**

COMPANIES	WINNER	NO WINNER
Cemig Generation and Transmission S/A	GI	
Eletropaulo Metropolitan and Electricity of São Paulo	GI

Source: Elaborated by the authors

We collected data on the economic and financial performance indicators that are observed in the criterion 8- the result of PNQ, aiming to seek alignment between the models of excellence proposed by the awards and among the economic and financial indicators relevant to corporate governance and the issue organizational performance. Thus the liquidity ratios and profitability were treated by the DEA to design the efficient frontier.

The liquidity ratios relate to the organization's ability to meet its commitments to the market and so the point of view of the pillars of governance transparency and accountability demonstrates the organization's commitment to be complying with its obligations.

The profitability ratios are linked strategies of economic and financial management seeking an effective and proper management that generates return on what has been invested, is widely used to attract and retain investors, control target of corporate governance by the breadth of capacity in the market investor.

The job analysis and processing such data was conducted by DEA, Data envelopment analysis, which operates with linear progressions able to identify the boundaries of efficiencies of performance indicators studied.

Performance indicators economic and financial, published in the balance sheets, corresponding to the years 2011, 2012 and 2013 were the analytical basis for the DEA, that from these indicators, using

a linear progression calculations based, has calculated the border efficiency by following calculations between liquidity ratios inputs and outputs levels of profitability.

Figure 3 was arranged on the horizontal axis and vertical organizations the efficient frontier is possible to realize the distribution of performance indicators of the companies in 2012 and their alignments across the border efficiency built by DEA.

Figure 3 - Identification of the efficient frontier PNQ 2012
Source: Research Data

Figure 4 shows the AES company as the organization indicated by the DEA in the best position on the efficient frontier, occupying according to the distribution of its indicators space on the border that had the best performance among the other analyzed, taking into account the inputs liquidity and profitability of output as indicators presented for the DEA studies.

Figure 4 - Most Efficient Company
Source: Research Data

The company whose classification was the farthest from the line of the efficient frontier, according to the alignment presented by the DEA, and therefore would be on our list of valued organizations, the least demonstrates a significant front performance to economic and financial indicators, belongs the group of companies that did not compete to PNQ(G2).

8 Final considerations

The aim of this paper was to verify how is the influence of the National Quality Award in the organizational performance of companies winning the award, referred for corporate governance. The answers are sought to identify if the prize somehow have influence over the management and economic and financial performance of the awarded companies and also if these companies stand out, with better economic and financial results at the expense of not competing for the award and even if the PNQ this aligned with the pillars of Corporate Governance.

In this study it was found that the companies win the award in 2012 have economic and financial indicators that allowed being on the efficient frontier appointed by the DEA, data envelopment analysis.

With regard to financial performance, it was perceived that companies awarded the PNQ, demonstrate positive highlight in relation to the financial and economic aspects, published in the balance sheet at the expense of non-participants PNQ companies.

As to the question of the alignment of topic corporate governance and its pillars: equity, social responsibility, transparency, accountability and the treatment by PNQ's criteria, it was found next to the valued award documents and interviews with evaluators that there is alignment with the assumptions contained in the four pillars of Corporate Governance.

The study allows us to consider to be a company awarded a quality prize, behind a better positioning in the market, providing a shield on the trajectory of the organization, improve management, economic and financial performance and demystify the awards related to quality management as it is the PNQ with the myth that the awards are for marketing purposes.

You may notice in the financial performance indicators investigated, an improvement in management, and may be combined with the model of excellence in corporate management to the winning organizations, established the use of best practices in management suggested by the Excellence Model and referenced by the Corporate Governance, which meets in this case the role of ensuring the longevity of sustainable organizations.

This study has limitations with respect to post-award period surveyed to be only twelve months, suggesting further studies about organizational management excellence awards and models.
