INNOVATION & MANAGEMENT

November 20-22, 2015

Wuhan, China

Chief Editors

Wang Yingming, Xu Hongyi

Associate Editor

Ken Kaminishi, Geert Duysters, Arnolde de Hoyos, Jussi Kantola

Editorial Board

Alessandro Rossini, Aquatias Christine, Ard-Pieter de Man, Deng Mingran, Diego Conti, Erika Zoeller, Irmtraut Mecke, John Rijpma, Josu Takala, Kazuhiro Fukuyo, Kazuya Inaba, Kwai-Sang Chin, Ladislau Dowbor, Motonobu Kubo, Nakio Ohshima, Nguyen Huu Phuc, Nobuo Hirohata, Rosa Alegria, Rosa Rizzi, Ruth Y. Lopez Trigo, Tomohisa Kimura, Walter Mcmanus, Wang Yingming, Wang XianJia, Vitoria C. Dib, Wim Vanhaverbeke, Wei Jiang, Wilfred Dolfsma, Xie Kefan, Xu Hongyi, Ye Jianmu, Yoshiyuki Matsuura

The 12th International Conference on Innovation and Management (ICIM 2015)

Organized and Hosted by

Wuhan University of Technology, China

Co-organized by

Yamaguchi University, Japan

NEF- Pontifical Catholic University of Sao Paulo, Brazil

Eindhoven University of Technology, the Netherlands

Tilburg University, the Netherlands

University of Vaasa, Finland

Technological University of Malaysia, Malaysia

Organizing Committee

Chairman:

Wang Yingming (Wuhan University of Technology, China)

Co-Chairman:

Ken Kaminishi (Yamaguchi University, Japan)

Geert Duysters (Eindhoven University, the Netherlands)

Arnoldo de Hoyos (NEF- Pontifical Catholic University of Sao Paulo, Brazil)

Jussi Kantola (University of Vaasa, Finland)

Nooh Abu Bakar (Technological University of Malaysia, Malaysia)

Members: (In alphabetic order)

Alessandro Marco Rosini, André Furtado, Andyara Santis, Angelo Palmisano, Antonio Vico Mañas, Aquatias Christine, Ard-Pieter de Man, Beatriz Marcos Telles, Christine Syrgiannis, Cláudio Marte, Deng Mingran, Diego Conti, Erika Zoeller Veras, Felipe Borini, Fernando Grisi, Flávia Pereira de Carvalho, Imtraut Mecke, Ivanete Bellucci, John Rijpma, Kazuhiro Fukuyo, Koiti Egoshi, Kwai-Sang Chin, Ladislau Dowbor, Lennon Jardel de Araujo, Luiz Roberto Calado, Ma Ying, Maria Cristina Amorim, Milton Campanário, Mônica Cairrão Rodrigues, Monique Greve, Motonobu Kubo, Nguyen Huu Phuc, Roberto Bernardes, Rosa Alegria, Rosa Rizzi, Ruth Y. Lopez Trigo, Tales Andreassi, Telma Teixeira, Tim de Leeuw, Vinnicius Vieira, Vitoria C. Dib, Walter Mcmanus, Wang Xianjia, Wei Jiang, Wim Vanhaverbeke, Xie Kefan, Xu Hongyi, Nakio Ohshima, Yoshiyuki Matsuura

Executive Committee

Director:

Wang Yingming (Wuhan University of Technology, China)

Members: (In alphabetic order)

Alessandro Marco Rosini, Antonio Vico Mañas, Deng Mingran, Diego Conti, Erika Zoeller Veras, Fernando Grisi, Geert Duysters, Jiang Zhongwei, Josu Takala, Kazuhiro Fukuyo, Kazuya Inaba, Ken Kaminishi, Ladislau Dowbor, Mônica Cairrão Rodrigues, Ma Ying, Motonobu Kubo, Naoki Ohshima, Nguyen Huu Phuc, Rosa Alegria, Rosa Rizzi, Ruth Yamada Lopez, Sakae Kawamura, Shigeyuki Haruyama, Telma Teixeira, Tim de Leeuw, Tomohisa Kimura, Vinnicius Vieira, Wang Yingming, Xie Kefan, Xu Hongyi, Ye Jianmu, Yoko Ishino, Yoshiyuki Matsuura

CONTENTS

Part 1 Organizational, Institutional, and Management Innovation

Fostering Open Collaborative Innovation for Micro and Small Technology: Based Firms in Brazil Paulo Melo, Dr. Bill O' Gorman, Arnaldo José de Hoyos Guevara, Ms Renata Martins Corrêa	1
Development Process Realignment of Final Course Assignment-FCA: Technologist in Human Resource Management Alessandro Rosini, Angelo Palmisano, Arnaldo Jose de Hoyos Guevara, Mauricio Pedro da Silva, Silvia Regina Guberovic.....	7
Reference Form (RF): A Comparative Analysis of Companies Level 1 and Level 2 Versus Code of Best Corporate Governance Practices Marcia Welita da Silva, Alex Rios da Silva, Sergio Roberto da Silva, Angelo Palmisano, Arnaldo Jose de Hoyos Guevara, Alessandro Marco Rosini	17
Research on Contractual Incompleteness and Contractual Governance in Franchise System Bi Lei	27
On Human Resource Management Innovation in Chinese Transnational Enterprises under the New Norm Xiong Chenyu	35
A Study of the Relationship Between the Performance Appraisal Purposes and Employee's Anti-Ethical Behavior Ma Lu, Zhu Shuang, Du Mingfei	40
Enterprise's Operating Performance, Nature of Property Rights and Government Subsidies: A Empirical Study Yang Sunlei, Xu Yiyang, Wang Qianru, Xiang Yue	45
Analysis on the Relationship among Relative Leader-Member Exchange, Organizational Citizenship Behavior and Social Comparison Orientation Zhu Shuang, Ma Lu	51
Theoretical Analysis and Path Exploration on Standardization System Reform from the View of Supply and Demand Relation Liu Hui, Liu Sanjiang.....	55

Improve the Communication Quality by Understanding Switching Behavior	
Salman Ahmad Awan, Muzafar Said, Inger Roos	62
Research on the Mechanism of Business Model Innovation and Enterprises Competitive Advantages	
Yang Jinsong, Zhang Na	74
The Mediating Effect of Technological Innovation Capability on the Relationship Between Organization Learning Capability and Firm Performance	
Gebremichael S. Hailekiros, Hou Rengyong	79
Reform and Construction of Corporate Governance of Broadcasting Organizations in China: Based on Hunan's and Shanghai's Experiences	
Yin Qi	84
Research on Marketing Channel Choice for Offline Physical Stores of Panasonic Based on Customer Resources	
Li Qiong, Peng Yan	89
Aggressive Customer Handling-Antecedents and Outcomes, Implications for Service Professionals	
Haroon Rasheed, Mansoor Ahmed, Shahida Ahmed	94
Study on the Influence of Family Friendly Practice and Employees' Organizational Citizenship Behavior	
Wu Zhenghao, Mu Renyan, Zhao Fuqiang, Ma Yong, Wu Jianhua	100
Marketing Innovation Strategies for Improving Economic Development in Africa: Case Study M-Pesa Vodacom Tanzania	
Richard Allen	104
Analysis of University Personnel Management Innovation in the Era of Big Data	
Feng Chengjin	112
Government Management Innovation in the Age of Big Data	
Que Tianshu	116
Innovation Through Channels of Human Resources Management: Designing of Creative Organizational Culture	
Sanjrani Hameed Akhtar, Hou Rengyong	122
Research on Management Innovation for College Students in Practice under the Background of Mobile Internet	
Fan Huiping	126
Relationship among the Chinese Government, the CDPF and the Civil Organizations for the Disabled	
Qin Qin, Ji Xueting	131
Political Skill and Career Success: A Review and Directions for Future Research	
Muhammad Usman, Luo Fan, Muhammad Anwar-Ul-Haq	139

A Study on Impact of Academic Entrepreneurship on Industrial Innovation and Moderating Effect of Organizational Support, Evidence from Pakistani Private Sector University	
Wang Aimin, Mansoor Ahmed, Haroon Rasheed	144
The Conceptual Innovation of College Students Management	
Li Juan, Fang Qi	153
Study on Business Applications and Profit Model of SaaS	
Xiong Yuanlu	157
Study on Shared Framework Model about the Science and Technology HR Based on Synergic Innovation	
Yu Shu, Bao Xiaona, Zhang Jiangdong	163
Innovation of the Social Organization's Registration Management System in China	
Yin Shuo	169
Managing Cultural Differences in International Business Negotiations	
Mao Fengfan	175
Analysis of the Problem of Junior Staff's Sense of Belonging in Haishang Property Company	
Yuan Ying, Guo Yongsai	180
Stage-Wise Management of Enterprise Culture during Development of Private High-Tech Enterprises: Based on Case Study of Shenzhen Huawei Technologies Co., Ltd.	
Wan Weiwei	188
Research on the Innovation of the Operation and Management of the Public Bicycle System in Universities	
Tu Yao, Tang Jia, Xia Yufang, Chen Ziwei, Yang Yue, Liu Xiao, Hu Yan	194
The Impact of Transformational Leadership Style on Firm Innovation in Manufacturing Organizations in Sri Lanka	
L.W. Amitha Kumara	199
Effects of Organizational Innovation on the Firms Production Performance: With Special Reference to Sri Lanka	
J. Krishanthi Mallika, Zhao Hongzhong	205
Research on the Evaluation Index System of Internal Control Based on Enterprise Ethics	
Xi Xiahui	210
Innovations on Moral Consciousness Education and Its Cultivating Principles	
Fan Chunli	215
Research on Management Innovation of Talents Introduction in Colleges	
Fang Wei	221

Part 2

University-Industry Collaboration and Strategic Alliance

Research on Development Path of High-Tech Industries in University Town Chen Chao	224
Design and Implementation of Large Instrument Platform of Wuhan University of Technology Peng Minhong, Zhang Lijun	228
Study on the Collaborative Innovation of Art-Originated Production Wu Xiaolian	232
Simulation Analysis of the Government-Industry-University-Institute Collaboration Mode Based on System Dynamics: Take Shahe Glass Technology Research Institute for Example Xie Wenfeng, Cheng Jinshu, Xiang Xin	237
Research on the Collaborative Innovation Strategy of Technology-Based Small Micro Enterprises and Research Institutions of Higher Learning Xu Xuanxuan	246
A Study on Value Pursuit and Orientation of Local Colleges and Universities from the Perspective of Industry-University-Research Alliance Tian Jianwei	251
A Study on the Innovation of the Students' Management Work in the Context of the School-Enterprise Cooperation Luo Bin	258

Part 3

Product, Technological, Industrial, and Regional Innovation

Burnout: An Analysis Describing Advances on the Study of the Area in Brazil Ruth Yamada Lopes Trigo, Myrt Thânia de Souza Cruz, Fabrício César Bastos, Fábio Zanin, Arnoldo Jose de Hoyos Guevara	262
Dwelling: A Shelter or Inclusion to Citizenship Arnoldo Jose de Hoyos Guevara, Luciano Ferreira da Silva, Diego de Melo Conti, Paulo Sergio Gonçalves de Oliveira	267
Research on Development Path of Strategic Emerging Industries in the Context of Regional Innovation Dai Lei, Wang Xiuting	272

Study on Brand Positioning in the Perspective of Game Theory	
Li Dahu	278
The Evaluation of Innovation Ability of Wuhan High-Tech Industrial Clusters	
Wang Yan, Cheng Yanxia	282
Evaluation on Wisdom Degree of Enterprise in Smart City Construction: A Case Study of Ningbo Zhongtong Logistics Group	
Zhu Geng, Zhu Zhanfeng, Zhao Jing	286
Empirical Research on the Impact of International Trade:Based on the Panel Data of 9 Provinces in China on the Evolution of Regional Industrial Structure	
Chen Siqi	294
Selection Criteria, Index and Model of Strategic Emerging Industries in the Third Industrial Revolution	
Zhou Xiang, Hou Renyong	298
The Strategy of Rare Earth Value Compensation Based on Trilateral Game	
Yang Limei, Cai Linghui, Zhang Qiyao	304
The Empirical Study on the Effect of Standardization on Export Trade in Zhejiang Province	
Xiao Shuxian, Xie Jingyu, Le Wei	308
Research on the Performance Evaluation of Logistics Service in Private Express Industry Based on AHP	
Liu Yuanyuan, Qin Yuanjian	317
Research on Industrial Technology Innovation Strategic Alliance Life Cycle	
Wu Jingming, Li Chilin	323
On Development Modes and Policies for the Strategic Emerging Industries in China	
Zhu Hanxiong, Xiao Yi, Hou Renyong	327
Impact Formation Factors on Industry Cluster of China's General Aviation	
Chen Da, Qin Yuanjian, Han Zhou	333
Research on the Calculation Indicator System of the Cultural Creative Industry Cluster Degree	
Huang Tianwei, Hilde Van den Bulck	338
Coupling and Optimizing the Development Path and Environmental Policy of Hubei Laser Industry Based on Path Creation Theory	
Wan Xingzi, Yang Qing	342
National Innovation Systems and Developing Countries: A Critical Review of Literature	
Nyambayar Bukhchuluun	348
Developing Innovative Products in China's Consumer Electronics Market: From Customer-Oriented to Value-Driven Marketing	
Allan Gueye Mane	354
Study on the Evaluation of City Innovation Ability in Beijing	
He Yun	360

GMM Model-Based Study on the Impact of Housing Prices on Residents' Consumption in the Yangtze River Delta Region	
Sun Haiyan	366
Total Factor Productivity of Chinese Industry: Based on Färe-Primont Productivity Index	
Wang Wenwen, Meng Lingjie	371
Mode Section of Purchasing New Luxury in China	
Guan Sifan, Xu Hongyi	378
Research on the Model of the Industrial Cluster Synergy Development	
Ye Hui, Wang Zhou	381
An Analysis of Product Development Investments	
Luo Jue, Gong Zhejun	386
The Selection of Strategic Emerging Industries in the Face of the Third Industrial Revolution	
Zhao Wenzhe, Li Xiaoping	390
The Construction of Evaluation Index System of Regional Collaborative Innovation Driven by National Innovation	
Cheng Shiwei, Qin Yuanjian	395
Leading Industry Selection of Modern Service Industry in Wuhan Based on Entropy Method	
Xiang Lu, Hou Renyong	402
Evaluation of Hi-Tech Zone Development Level from Endogenous Function and Collaborative Innovation Ability Dimensions: An Empirical Analysis of National High-Tech Zones	
Sun Qian, Hou Renyong	407
Effects of Culture on Service Encounters & Customers' Satisfaction	
Mansoor Ahmed, Wang Aimin, Asad Ullah	414
Co-Creating Brands across Nations: A Case Study of Leading Chinese Brands Co-Creating Brand Value Experiences in Pakistani Market	
Asad Ullah, Mansoor Ahmed, Wang Aimin	418
System Design Concept of Yacht Product Innovation	
Zheng Gangqiang, Deng Yuwei, Liu Zhitao	422
Research on Agricultural Products O2O Mode of Consumer Participation	
Chen Junying, Cheng Yanxia, Wang Fang	427
Development of Regional Non-Public Economy in China: Historical Review on the Growth of Non-Public Economy in Hubei Province of China since the Reform and Opening-up	
Zhong Xianzhe	432
Research on Model Establishment for Incubation Network of Innovative Cluster	
Wu Na	438

An Empirical Research on the Technology Feedback Effect of China's FDI in the EU Huang Ying, Ding Mengyan.....	443
On Impetus Mechanism for Strategic Emerging Industry in China Fu Yaozhen	449
Ethiopian Coffee Industry Strategy Formulation Ibrahim Ibrahim Ismail.....	454
Study on College Students' Entrepreneurship and Industry Selection Wang Huimei, Li Heng	459
The Role of Brand Experience to Categorize Consumer Behavior: A New Paradigm to Consumer Psychology Rukhsana Gul, Xixiang Sun, Gilal Faheem Gul	463
Research on Market Operation Modes of Chinese Style Paintings Ma Tao.....	468
Necessity and Way of Strategic Transformation of China's Cement Industry Huang Honglei, Diao Zhaofeng, Qi Xinghong	473
Research of Innovative Design of Clothes Storage Space for Elderly People Zhao Huixin	479
Level of Cooperation of Inter-Organizational Networks in New Product Innovations in Sri Lankan Manufacturing Sector SMEs Krishantha Wisenthige	485
Research on the Construction of the Village Organizations from the Perspective of Innovation in Social Governance Luo Zhigang.....	492
Tertiary Industry Output-Value Forecast Shi Xi, Xu Hongyi	497
Research on Effectiveness of Motor Vehicles Seat Belt Reminder Lu Tingting, Ai Yanfang, Wang Zhe	500

Part 4

Environmental Innovation and Sustainable Development

Corporate Governance at the Clinics Medical School Hospital of São Paulo, Brazil Edson Labadessa, Angelo Palmisano, Alessandro Marco Rosini, Arnoldo José de Hoyos Guevara, Aurélio Jose Vitorino	504
---	-----

Discourse and Practice Regarding Sustainable Cities Development: The Case of the City of São Paulo, Brazil	
Regina Maria da Luz Vieira, Joelson Alves do Nascimento,	
Arnoldo Jose de Hoyos Guevara	511
Global Warming: Ratio of CO ₂ Emissions and the Size of Forests	
João Monteiro, Arnoldo Jose de Hoyos Guevara, Luciano Ferreira da Silva	515
The Need of More Conscious Decisions on the Future of Water Production and Consumption	
Luciano Ferreira da Silva, Karina Ribeiro Fernandes,	
Arnoldo Jose de Hoyos Guevara, Diego de Melo Conti	522
Fostering Open Collaborative Innovation for Micro and Small Technology-Based Firms in Brazil	
Paulo Melo, Dr. Bill O' Gorman, Arnoldo José de Hoyos Guevara,	
Ms Renata Martins Corrêa	527
A Dynamic Model for Evaluation of Sustainability of Brazilian Ethanol Production: Elements for Modeling	
Silva. O.R., Guevara.A.J.H., Palmisano.A., Rosini. A.M.	533
Mapping Basic Needs Economic Development, Progress and Sustainable Development at the Iberoamerican Region	
João Almeida Santos, Maria Cristina Sanches Amorim,	
Arnoldo Jose de Hoyos Guevara	541
Renewable Energy Sources in Developing Countries: Challenges and Opportunities for a Sustainable Development Agenda	
Jorge Tenório Fernando, Sergio Ricardo Siani,	
Arnoldo José de Hoyos Guevara	548
The Impact of Decisions Relating to the Production and Consumption, and Future of Water	
Luciano Ferreira da Silva, Karina Ribeiro Fernandes,	
Arnoldo Jose de Hoyos Guevara, Diego de Melo Conti	553
The Role of Governance in Global Risks	
Arnoldo Jose de Hoyos Guevara, Daniela Gasperin,	
Vitoria Catarina Dib, Sandra Parada	558
Empirical Research on the Impact from Export Technology Diffusion to Environment Regulation: Evidence from 2007-2011 Industrial Panel Data of China	
Liu Guoxin, Wang Jin	564
Necessity and Feasibility: A Study on the Redeployment of Chinese Higher Learning Institutions in the Countryside at Present	
Ke Meishu	569

Evaluation Research on the Construction Degree of Urban Ecological Civilization Based on Fractal Theory: A Case Study of Zhangjiakou City in China	
Zhang Tianle, Kong Wei, Wang Shujia, Tang Shuhui	574
Construction of Enterprise Carbon Accounting System under the Low Carbon Economy	
Yao Liqiong, Deng Mingran	581
Measuring the Coordinated Development of Economy, Society, and Environment in Municipalities and Provinces of China	
Ding Yang, Yang Qing	589
Privacy Risk Identification in Social Networks Based on LDA Model	
Zhang Lina, Zhou Yipeng, Fang Deying	595
Path Analysis on Factors of Real Estate Enterprises Low-Carbon Competitiveness	
Liu Wuwei, Yan Jingdong	599
How is It Getting into Chinese Business Culture: A Possible Path for Foreign Enterprises to Venture inside the Country	
Fernando Nelson Villaverde Chavez, Zhao Yulin	603
Performance Appraisal for Innovative Green Supply Chain Based on Fuzzy Comprehensive Evaluation	
Zhang Yu	609
Research on Disability-Prevention Service Chain under Sustainable Perspective	
Hu Shiyong, Zhu Wenjing	615
Research on Dissemination of Guilin International Tourist Destination Image Based on Omni-Media Perspective	
Chen Songqing	622
Research on Current Situation, Cause and Countermeasure of Contemporary College Students' Network Literacy	
Chen Chunying	629
Present Situation and Development of Urban Barrier Free Facilities Construction: Based on an Investigation in Wuhan of China	
Ai Liang, Hu Sumin, Xu Danlu	635
Discussion on Necessity of Construction of the Chinese Accounting Culture from the Perspective of a Harmonious Society	
Li Xinlu	641
Research on the Mechanism of City Grid Management System	
Wang Zhongyang	645
On the Role of Corporate Values in Corporate Development	
Du Chaoju	649

Study on Improving Capacity of the Big Data Application in Grassroots Governments	
Wang Zaixin	652
Study on NGO-Donor Relations in Basic Education Sector: Case of Pakistan	
Warda Gul, Kong Fanbin	657
Analysis of the Current Situation of the Tourism Industry in Henan Province of China from the Perspective of “One Belt and One Road”	
Liu Xiaoyu	661
Analysis of the Social Negotiation Effect in the Process of Public Administration	
Xu Kun, Wang Zhi	666

Part 5

System Engineering, Financial Engineering and Industrial Engineering

Sarbanes Oxley Act - Implementation Process in a Financial Institution in Brazil	
Marcia Welita da Silva, Alessandro Marco Rosini, Angelo Palmisano, Arnoldo Jose de Hoyos Guevara,	672
A Penny for Your Thoughts: A Preference Modelling Case Study in R	
A. Syahid, M. A. Tareq	679
Research With Secondary Data: Different Matching Methods and is There a Difference?	
Tim de Leeuw, Steffen Keijl	689
Exploring Commercial Bank of Ethiopia Clients’ Satisfaction with the CRM System	
Meraf Woldemariam Bechalew	694
Research on the Evaluation System of Enterprise Management Factors Mobility Based on Foreign Direct Investment	
Wang Shuli, Xiang Jiaojiao	701
Research on Relationship Between Corporate Governance and Financial Performance of Port Listed Companies	
Xu Fengju, DuYunchao, Wang Renxiang	705
Financing Constraint, Financial Development and the Growth of Eco-Industry	
Tan Yuhan	710
Correlation Study of Independent Director’s Compensation and Corporate Performance	
Yang Liu, Jiang Yao	715

An Analysis of China’s Electric Power Enterprise Financing Decision in Inflation Environment	
Xie Liping, Shi Jingyang, Gong Junjie	719
“The Belt and Road”: The New Opportunity of RMB Internationalization Development	
Geng Mingying, Zhao Jun	724
Multiple Bank Relationship and Their Impact on Firm’s Performance: Evidence from Pakistan	
Jahanzaib Sultan, Yang Qing, Ammar Abid	729
Correlation Analysis of Money Supply and Economic Growth in China	
Zhang Xuan, Shang Xiuting	734
Impact of Corporate Social Responsibility on Firm’s Financial Performance: The Tanzanian Perspective	
Juliana Isanzu, Xu Fengju	739
On Business Finance Flexibility and Its Influence on Financial Risks: A Case Study of Listed Companies on GEM	
Xi Xiahui	746
The Role of Individuals’ Characteristics in Marketing Information Systems (MIS) Decision Making	
Alowaidi Mahmoud Ghazi A, Wang Hu	752
The Multilateral Relationship: Chinese Yuan and Other ASEAN Currencies	
Alvaro Martin Saavedra Chavez, Miraj Ahmed Bhuiyan, Xu Fengju	756
The Relationship Between Intellectual Capital and Financial Performance of Banks in Tanzania	
Janeth N. Isanzu	761
Countermeasures of Problem Platforms in P2P Net Loan Industry of Hubei Province	
Yan Wensheng, Yang Yihui	768
The Identification and Management of Accounting Fraud	
Wu Min	773
The New Direction of Talents Cultivation in the Context of Accounting Informationization	
Xia Jing, Du Guoliang	777
Determinants of Dividend Policy: Evidence from Banking Industry in Pakistan	
Akhtiar Ali, Xu Fengju	781
The Effect of Innovative Islamic Profit Rate Benchmark on Pricing Islamic Derivatives Securities	
Ra’fat T.M Al-Jallad	786
Analysis of Financing Difficulty and Its Countermeasure for Chinese Enterprises Overseas Merger and Acquisition	
Zhou Jun	790
Empirical Study of Earnings Management by Listed Companies Film and Television Industries	
Zhao Dizhen	795

Real Options Used in the Evaluation of Intangible Assets: Take Mobile Game Rights Evaluation as an Example	
Mu Yao	803
Analysis of SMEs Financing Difficulty Based on Nash Equilibrium	
Xu Jun	808
Foreign Direct Investment (FDI), Trade and Its Contribution to the Mining Sector of Guinea	
Kimberly Racquel Elizabeth Chin	812
A Review on the Importance of E-Commerce for SMEs in Pakistan	
Asadullah Khaskheli, Yun Jun	817
Ship Equipment Repair Cost Forecast Combination Based on Neural Network and GM(1,1)	
Li Fenghuan, Liu Wenjun	821
Gross Domestic Product Growth, Money Growth Exchange Rate and Inflation in Sierra Leone	
Ibrahim Dumbuya, Adam Sheka Kanu, Chukwunonso Onyeibo Ositanwosu	826
An Empirical Study on Regional Differences of Electronic Banking Service Capability	
Liu Mingfei, Zhang Huan, Hu Yue	833
Countermeasures and Suggestions for Students Internet Businesses	
Qiao Yunli, Yang Shanshan	838

Part 6

Operation Innovation and Modern Manufacturing Innovation

Empirical Research on the Affect from Industrial Technology to Ecological Efficiency: Based on SE-DEA and Panel Data	
Wang Jin	842
A Study on Member Satisfaction and Management Strategies in Commercial Fitness Club	
Zhang Xiaobo	848
R&D Talents Flow of Chinese Manufacturing Firms: A Case Study	
Guo Zhaohui	852
Analysis on Technological Innovation Capability of Industrial Robot Industry	
Chen Wenjing, Yan Jingdong	856
A Case Study on Pricing Behavior of User Innovation in Supply Chain	
Chen Yun, Li Bin, Tian Hanmei	861
Analysis on the Mobile Enquiry Service Model of Commodity Information Based on E-Commerce	
Liu Yan	864

Innovation Research of Supply and Demand System Docking of Agricultural Science and Technology Information	
Deng Mingran, Li Huian, Yang Weijiao	870
Research on Factors Influencing Music Products Purchase Intention Based on the Consumer's Perceived Value Framework	
Li Yang	879
Preliminary Works of Art Marketing Model under the Theory of 4V	
Wang Yuanyuan	884
Optimization of Automobile Reverse Logistics System Based on the Internet of Things	
Zhao Lu, Li Shunxi	888
Concerning Government Positive Role in the Development of the Gen Space	
Yang JunJian	893
Vehicle Scheduling Problem Based on Cloud Platform	
Zhou Tao, Li Shunxi	898
Making a Compatibility Match Between Supply Chain Type with Product Type and Product Life Cycle Stage	
Md Afzalul Aftab	903
On Constructing Logistics System for Agricultural Products in Mountainous Areas: A Case Study of Fangxian County in Hubei Province	
Wang Yong, Qiu Yinggui, Ren Liang	907
Research on Reverse Logistics Management Mode Based on the Theory of Traditional Chinese Medicine Five Elements: Study on Economic Benefit	
Cheng Xiao	911
Analysis on the Technological Innovation Dilemma in China's Enterprises	
Yu Hualin, Yu Zipeng	918
The Research on Wuhan Manufacturing Industry Technological Innovation Efficiency Based on Data Envelopment Analysis (DEA) Method	
Su Hua, Liu Huiling	922
Literature Review on the Service Quality in Higher Education for International Students in China Based on Services Marketing	
Dai Fang, Song Ruoyu, Yuan Guohua	928
Study on Information Security Incidents Management in Automobile Manufacturing Enterprise	
Wu Xiaoyan, Wang Bei	934

Part 7

Risk Management and Innovation

Global Risks and Resilience	
Arnoldo Jose de Hoyos Guevara, Daniella Gasperin, Vitoria Catarina Dib, Sandra Parada	938
Risk Management of Assets Dependency Based on Copulas Function	
Cheng Lei, Chen Xiaofang	943
Research on Risk-Oriented Internal Audit in Administrative Institution Projects: A Case Study of Changjiang Maritime Safety Administration	
Zhou Guoqiang, Chen Yunqing	949
Inequality Aversion, Risk and Incentive in Teamwork	
Tu Jing	954
An Analysis of Risk and Supervision of China's Shadow Banking	
Wu Yuejuan	958
Discussion about Influence Factors of the Investment and Management Risks of Japanese Companies in Jiangxi Province	
Katsuhiko Nakajima, Luo Fan, Tang Xinxin	964
Study on the Moral Hazard of P2P Lending Platform in China Based on the Fraud Triangle Theory	
Wei Zhihua, Chen Ruiying	970
Research on Risk Analysis and Countermeasure of Vertical Integration Strategy of Enterprise	
Zhang Jianming	976
Study on Relations and Differences Between Internal Control and Risk Management	
Gao Tiantian	980
Risks and Evading Measures of Overseas Mergers and Acquisitions of Chinese Financial Institutions	
Zhao Jun	984
The Risk Evaluation Management of Open Innovation	
Wang Yuanyuan, Liu Guoxin, Peng Wenting	990
Study on Early Warning of University Mass Emergency Evolution Based on SIR	
Li Chaixin, Cai Chun	995
Research on Information Dissemination and Response Mechanism of University Emergencies in the View of WeChat	
Fang Haining, Zeng Bo	1003
A Conceptual Model for Children's Websites Using E-CRM	
Mahmoud Akbarieh Yazdi	1008

Process Analysis and Implication of 2014 Shanghai Stampede Incident	
Cao Qing, Liu Zimei, Xie Kefan, Yu Jintian	1012
The Research about the Emergency Management Thought of the Fourth Generation of Central Collective Leadership of the Party and State: By the Response to Major Public Health Emergencies as Example	
Zhu Jiangbin, Xu Pengfei, Wang Ting	1016
Exploring Investment Risks for Chinese Manufacturing Industry in Bangladesh	
A.B.M. Munibur Rahman, Zhang Youtang	1021
Guiling New Music and Tian Han During the Anti-Japanese War	
Li Li	1026
The Coupling Mechanism and Decoupling Strategies of Safety Risk in Airport Flight Area	
Luo Fan, Yang Xiaoyu, Zhang Chao, Yang Xiao	1030
Study on Safety Early Warning Management System of Ship Navigation	
Yuan Lingli, Gui Ping	1034

Part 8

S&T Policy, Technological Economy, Intellectual Property and Knowledge Management

Innovative Case of Patent Circumvention Application in Automotive Industry	
A. B. Nooh, A. R. Zulhasni	1039
Policy Value Chain of Making Regulation in ICH S7B/E14	
Yuko Hayashi, Kano Shingo	1044
The Application of Stag Hunt Game to Business Cooperation of Industrial Complexes in Japan	
Kazuya Inaba	1048
Assessment of Services in Higher Education Courses in Brazil	
Alexandre Luzzi Las Casas, Arnaldo de Hoyos Guevara	1051
Challenges of Longevity and Retirement Policies in Brazil	
Ana P. Fraiman, Geraldo A. Borin, Juçara C. Neves, Arnaldo José de Hoyos Guevara	1063
Educational Strategies in Brazilian Colleges Do They Lead to the Treasure Within?	
Arnaldo José de Hoyos Guevara, Maria Luiza Rodrigues Ferreira do Valle, Christine Syrgiannis, Ivani Catarina Arantes Fazenda, Maria Aparecida Fernandes Martin	1069
Security and Peace in Latin American Countries	
Arnaldo Jose de Hoyos Guevara, Nilson Gonçalves Pereira Baptista, Paulo Gustavo da Silva, Lilian Cordeiro Praes	1074

Schools Management in the Complex Thinking Perspective	
Ana Maria Di Grado Hessel, Ivani Catarina Arantes Fazenda,	
Arnoldo José de Hoyos Guevara	1080
Research on Development Trend of Cultural Industry Structure in China Based on ARIMA Model	
Liu Bingfeng, Yan Ningning	1086
Research on the Status Quo of Implementation of Science and Technology Insurance in China	
Liu Zimei, Cao Qing, Xie Kefan	1090
Research in Universities' Patents Transformation in China	
Li Ming, Yu Zongru	1094
Study on the Dynamic Relationship Between Foreign Trade, FDI and the Economic Growth in the New Normal	
Wang Rong	1099
Research on the Relationship Between Differentiation Strategy, Heterogeneous Resources and Performance of HTSME	
Qi Shuyang	1104
The Role of Foreign Direct Investment on Economic Growth	
Antonio Goncalves de Andrade, Yang Qing	1110
Knowledge Management and Intellectual Property Protection in Developing Strategy of High-Tech Enterprises	
Zou Yixuan, Liu Chencan	1115
Technology Life Cycle Forecasting of Chinese Hydraulic Components Based on Patent Analysis	
Zhao Xiuxu, Ke Wei, Zhou Chuanli, Li Benhai	1123
On the Optimization of Chinese Reward System of Science and Technology under the Perspective of System Theory	
Yuan Fangyi, Xia Jiangjing, Wu Kai	1128
The Optimization of Functions and Resources for Library Based on Needs of College Students	
Zhao Fenghua, Yang Bo, Guo Qingrong	1133
Research on Innovation and Development of Student News Associations in Chinese Colleges and Universities	
Tian Shi, Deng Chang	1137
A Policy Research on the Development of Traditional Chinese Medicine International Trade

Abstract: Innovation happens as a combination or a result of various phenomena (i.e. entrepreneurship, business environment, interactions etc.), it is almost impossible to be explained by a single discipline itself. Due to the fact that there are many facets to explore in order to cover all aspects to innovation, the present paper approaches this theme with emphasis on the sociological perspective, considering that innovation is not a solitary, but an interactive phenomenon, which firms develop connections able to reach new innovation sources, new processes and technologies. As a theoretical reference, this paper develops the argument of the importance of the firms' interaction linkages and connections and their influence on the efficiency of the innovation system. So, in this context, the authors decided to adopt the survey method to examine whether or not interaction linkages have an impact on micro and small technology-based firms' innovativeness in Brazil. So, the findings showed that interactions between firms and other innovation agents such as universities, research centers, financial institutions and other partners is very important to the development of open collaborative innovation activities and have direct impact on the level of innovativeness. Finally, this paper seems to conclude that innovation is a result of combination of various interaction linkages and not a solitary phenomenon restricted to the firm itself that may be appropriately fostered.

Key words: Open innovation; Networking-interactions; Business management and sociology

1 Introduction

In the last three decades, globalization has increasingly demanded firms and the whole economy to operate under pressure for new products and services. With the increasing speed of globalization, many scholars such as Freeman (1995), Powell, Kenneth and Laurel (1996), Porter (1998) and Etzkowitz and Leydesdorff (2000) have agreed that only innovative firms can guarantee the long term capability to prosper and gain competitive advantage. In the past, the concept of competitive advantages relied on accessing and controlling of raw materials. Nowadays, it relies on the creation of new technologies. Strategies that may have served firms before, it does not seem to work in the today or future contexts. To be competitive, companies must shift from an isolated organizational strategy to a more open mind-set, able to deal with different economic agents in different environments (local, national and even global).

This new scenario of competition has forced firms to develop products/services involving an increase amount of knowledge-intensive activities. These activities range from product design, management procedures and marketing strategies to new interaction linkages between firms and economic agents such as universities, research centers and government, able to become key elements to this new sustainable innovation mode of production. This premise suggests that technological changes have the power to establish new standards for the transformation of the whole economy (Freeman, 1988).

Despite innovation seems to depend on many factors (i.e. entrepreneurial spirit, local infrastructure, legal and political dimensions and the presence of important innovation agents), one has been highlighted as an important factor: networking. Interaction processes between firms and other economic agents, in large measure, have become an important element of competitive advantage. The creation of competitive advantage through innovation seems to suggest that firms need to reach new sources of innovation in order to develop new technologies. Thus, networking plays a key role at the heart of any discussion on competitiveness and innovativeness; therefore, the current concept of globalization, based on technological development is certainly different from globalization of the past. Innovation seems to be an economic and social phenomenon influenced by internal and external factors, establishing a new paradigm: networking permits to build new technological capability and specialization leading to the improvement of firm's innovativeness.

Overall, there is certainly no recipe to succeed in this so competitive environment, however, successful strategies to facilitate innovation initiatives and to create an environment to foster entrepreneurship and innovation, includes an understanding of the conjunction of some actors working together in a collaborative manner creating an interactive behavior able to build an appropriate innovation environment.

2 Literature Review

2.1 Innovation - Modern history and concepts

Historically, the emphasis on studies of innovation began in early 1930's by economist from the Austrian School of economics mainly. Joseph Schumpeter (the so called "founding father of innovation studies") was the most prominent economist from this school of thought and defended that innovation is as a complex mechanism of the introduction of a new product, process, service, method of production, opening of a new market, new source of raw material or the establishment of new businesses (Schumpeter, 1979). He started arguing that modern capitalism was dynamic and evolutionary, and innovation was behind firms' competitiveness and country economic growth. Since then, some scholars are investigating under what conditions this is allowed to happen.

More recently, authors such as Motta (1989) interpreted innovation as the discovery of a new opportunity. It is the use of uncommon tools or something new, to give creative solution to problems detected and the final outcome of the creative process. To Tidd, Bessant and Pavitt (2001), innovation also is a result of new knowledge, experiences and abilities to create new things (i.e. products, processes and services). It has three phases:

Opportunities detected

Choice of strategies

Introduction of innovation to the market.

At micro-level, within companies, the innovation process combines both internal and external elements organized on a systematic way and always should be based on a landscape of abundant knowledge and cooperation (Chesbrough, 2003). At macro-level, considering the whole economy, innovation can be generated by a wide range of different agents such as universities and research centres; therefore, firms have to acquire new capabilities such as to manage a network of interactions with different actors and to become flexible enough to get information and knowledge retained by a variety of different actors (European Commission, 2004).

Even though the concept of innovation seems to be very broad, for the purpose of this paper, the authors consider the concept of innovation suggested by The Oslo Manual (2005): "*innovation as the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organizational method in business practices, workplace organization or external relations*" (OECD/EUROSTAT, 2005).

2.2 Networking - Concepts and perspectives

According to Castell (1999), the 21st century seems to be characterized by three features: global, informational and networked. In this sense, innovation initiatives are increasing substantially through networks of firms and other innovation agents. The expansion of the social-networked models is directly associated to the increase of innovation initiatives (Rothwell, 1994). This premise suggests that innovation combines both internal and external factors and based on an abundant cooperation and networking environment. So, firms which not co-operate and network limit and reduce their capacity to innovate.

Oliver (1990) argued that networking was a response for the pressure of the globalization phenomenon; so, in order to reduce the pressure of the external environment, firms decided to participate in business networks. The networking approach resulted in competitive gains for firms which could not obtain by individual efforts (Balestrin and Verschoore, 2008).

Networks also involve many definitions. One of these definitions consider that business networks, in general, involve a group of firms, business units, universities, governments, customers or other actors which co-operate on a joint development project or objective in order to overcome common problems, to achieve collective efficiency and to penetrate in new markets (Unido, 2001). Other authors such as Hunt, Doyle, McDermott and McCormack (2005) advocated that business networks are about fostering cooperation, facilitating the transfer of knowledge and information between companies, enhancing the learning process, allowing firms to share costs and risks. Finally, the authors agreed with Cooke (1996) who defined business networks as a formal and informal non-hierarchical organizational arrangement in

which firms make relational contracts with each other through a set of linkages to facilitate the exchange of information and technologies.

In common, most of authors share the idea that business networks is emerging as a relevant tool to promote the development of new innovation initiatives leading to the general improvement of overall firm's performance. So, the increase of firm's innovation activities depends on the increase of the interaction linkages that they maintain (Ahuja, 2000). In the business field, collaboration manifests through collaborative arrangements and are structured according to the following typologies: alliances, joint-ventures, coalitions, consortia, cross-licensing and business network (Tidd, Bessant and Pavitt, 2001). However, there is a tendency for innovation to be associated increasingly with local and non-local interactions; therefore, firms must search for innovation sources regardless of whether they are geographically close or not (Melo, 2011).

Although it is clear that networking is of significant importance to the development of innovation activities, it does not seem to happen by itself. It depends on factors such as cooperation and collaboration. Authors such as Gray (1996) argued that collaboration offers an antidote to turbulence by building a collective capacity to respond to these conditions. This process whereby two or more parties work together for mutual benefits is of immeasurable importance and is at the heart of any discussion about networking.

Porter and Fuller (1996) argued that the main motivation for firms to co-operate is from external factors such as search for economy of scale, reduction of risks response to market pressures or the need for technology or market access. Other authors such as Huxham (1996) advocated that the key motive for firms to engage in collaborative activities is the focus on outputs which results could not be achieved individually and materialized into collaborative advantages. To Hunt et al. (2005) working in collaboration with others, firms are enabled to achieve competitive advantages faster, cheaper and with less risk and disruption to operations. Overall, benefits of collaborative activities are numerous with many cases of success of firms' improvement of competitiveness through engagement in networks. To Huxman (1996), collaboration and co-operation between firms happen due to the perception of mutual gains and it is highly motivated by self-interest, even though, it does not imply that self-interest is at the expense of others.

So in this context, it is reasonable to suggest that successful innovation initiatives are result of successful firms' participation in business networks on a collaborative mode with constant flows of knowledge, information and resources, improving innovativeness collectively.

3 Methodology

This topic outlines the basic methodological premises of this study. The choice of the authors to investigate whether or not interaction linkages have an impact on micro and small technology-based firms' innovativeness in Brazil, was based on the survey strategy under the perspective of the relationship between innovation and interaction. The presumable existence of this relationship (not causality) as well as the effectiveness of the impact on firm's innovativeness and gains in competitive advantages is defended by many other authors such as Ahuja (2000) and Balestrin and Verschoore (2008).

The key methodological points pertaining to this study are as follows:

- Qualitative research;
- Explanatory mainly;
- Cross-sectional study;

Data collection strategy was the use of survey interviews with administration of a structured closed-ended questionnaire (the questionnaire was based on the Oslo Manual (OECD/EUROSTAT, 2005).

To approach this problem, the authors decided to perform this study in Brazil, in particular, the Brazilian micro and small technology-based firms located in the technology pole of Campinas, State of São Paulo and Porto Digital Information and Communication Technology Cluster located in Recife, State of Pernambuco. Both locations are internationally recognized as niches of excellence pole in technology.

4 Findings

In this topic, the authors describe the empirical findings regarding the investigation of firm's interaction behaviour and innovation process. These findings were results of the PhD thesis submitted

by Paulo Melo to Waterford Institute of Technology (WIT) in Ireland. Topics related to interaction behaviour were focused only on those interactions aimed to the development of innovation activities.

The authors of this study summarize the main findings as follow:

- 1) Firms surveyed: 19 firms in Campinas and 13 in Recife;
- 2) Firm's size: Campinas - (74%) predominantly micro sized firms (less than 10 employees)
Recife - (69%) predominantly small sized firms (11- 50 employees);
- 3) Overall firms engaged in innovation activities:
Campinas - 18 firms (95%)
Recife - 13 firms (100%)
- 4) Interaction behaviour

The findings showed that 100% of firms surveyed in both locations had interactions linkages for the development of innovation activities : Campinas - 19 firms and Recife - 13 firms.

Another finding was related to the perception of the importance of interaction linkages to the development of innovative projects. According to Cortrights (2006), to improve firm's innovativeness, they should be engaged in collaborative arrangements. So, one relevant finding derived from this study showed that 94% and 100% of firms surveyed in Campinas and Recife respectively considered interaction linkages of "high" or "medium" importance to innovation activities (see Table 1).

Table 1 Importance of Interactions for Innovation Activities Source: current study

Degrees of importance	Campinas No. of firms	Recife No. of firms
High	10(59%)	09 (69%)
Medium	06 (35%)	04 (31%)
Low	01 (6%)	-
None	-	-
Total	17 (100%)	13(100%)
No answer	02	-

Regarding interaction partners, firms in both locations seemed to interact with different partners (see Figure 1) in order to develop their innovation projects. In Table 2, the study shows types of interaction partners which firms had experienced interaction linkages.

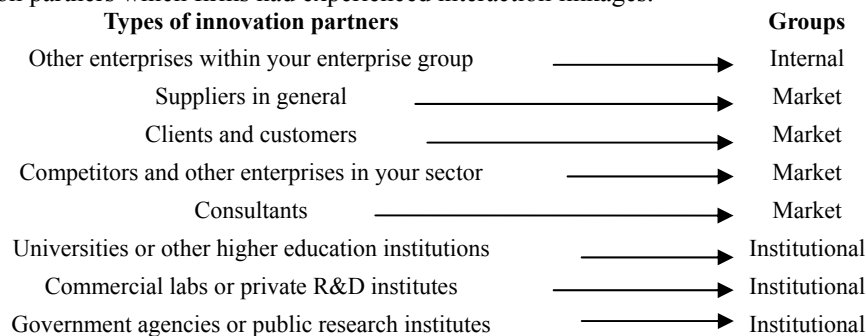

Figure 1 Classification of Types of Innovation Partners Source: current study

Table 2 Classification of Types of Innovation Partners Source: current study

Types of innovation partners	Group	Campinas No. of firms	Recife No. of firms
Other enterprises within your enterprise group	Internal	02 (14%)	04 (31%)
Suppliers in general	Market	05 (36%)	04 (31%)
Clients and customers	Market	06 (43%)	06 (46%)
Competitors and other enterprise in your sector	Market	07 (50%)	12 (92%)
Consultants	Market	08 (57%)	06 (46%)
Universities or other higher education institutions	Institutional	12 (86%)	05 (38%)
Commercial labs or private R&D institutes	Institutional	04(29%)	04 (31%)

Government agencies or public research institutes	Institutional	05(36%)	13 (100%)
No. of firms which answered this question	-	14 (100%)	13(100%)
No answer	-	05	-
Total of firms	-	19	13

At last, in Table 3, the study showed the geographic extent of the network of relationships for the development of innovation projects. The findings showed that 57% of firms located in Campinas and 70% located in Recife have experienced interactions within and outside the cluster and 29% of firms located in Campinas and 15% in Recife reported interaction experienced within the cluster only.

Table 3 Locations of Innovation Partners Source: current study

Locations / No. of firms	Campinas	Recife
Within the cluster only	4 (29%)	2 (15%)
Outside the cluster only	2 (14%)	2 (15%)
Both (within and outside the clusters)	8 (57%)	9 (70%)
Total of firms which answered this question	14 (100%)	13 (100%)
No answer	05	-

5 Conclusions

Overall, the results of this study indicate that apparently innovative firms are also very active as far as networking is concerned. Firms in both locations seem to confirm that their interaction behaviour determine the level of firms' innovativeness. The findings showed that 100% of firms surveyed were engaged in innovation and interaction activities in order to develop their innovation projects.

Another finding revealed that firms interact with different partners in different locations which may lead to the conclusion that the level of interaction is not limited to geographic proximity.

These important findings seemed to be in line with Huxman (1996), Ahuja (2000) and Hunt et al. (2005) who advocated that firm's innovativeness depends on the increase of their interaction linkages, interaction with others enable to achieve competitive advantages faster, cheaper and with less risks and these interaction linkages happen mainly because of the perception of mutual gains respectively.

Finally, this paper seemed to conclude that: i. the level of firm's innovativeness is strongly influenced by their interaction linkages; ii. Interaction linkages are not restricted geographically and iii. despite spatial agglomerations seemed not to be the main locus of innovation partners, it is still relevant to the development of innovation activities, especially for micro and small sized firms; therefore, innovation seemed to be not a solitaire phenomenon restricted to the firm itself that may be appropriately fostered.

Abstract: The education has approached the individual's productive market and technology contributes to this transformation. In this process, the College of Technology ENIAC - FAPI supports productive market with technological education. The case study of the subject is the Final Course Assignment-FCA, called TCC, Technology course in Human Resource Management, developed in the second semester. The methodology was field survey with former students of the course, documentary and bibliographic research. With this data, the process was contextualized proposing the inclusion of one more semester to develop the work, keeping the five-phase structure and further research. The goal was only analyze changes in the expansion of the working period of development, but also in the form of process evaluation considering the active student in the building process and construction of the theoretical and practical knowledge through initiation to scientific research.

Key words: Human resources; Completion of course work; Knowledge

1 Introduction

One of the purposes of education is to approach the individual's productive market, understanding the whole process of transformation to which this has been suffering over the years.

In this process, the technology has greatly contributed to the transformation process. People stop being seen as resources and become part of them, the society of knowledge, and intellectual capital as a competitive advantage factor for organizations to contribute to its portfolio of personal and professional skills.

According to Gil (2001, p. 24):

People management, however, is also a tendency that manifests itself more in academic world than actually in business, as the clearest expression of its existence has been given by works revisions related to Human Resource Management and courses that are being offered by specialized institutions.

The Ministry of Education and Culture focuses on the technological education directed to professionals of all levels of education and economic sectors that become able to enter the business market.

Analyzing the needs of business market and training people, the Technology College Eniac - Fapi, 30 years in the market, offers the degree in Technology in Human Resource Management lasting four semesters, total of 1660 hours.

According to the Education Project Course - PPC (. 2014, p 6) "the course is growing demand for professionals with integrated vision of the human resources subsystems in a metropolitan area of high density industrial and post-industrial".

According to IBGE - Brazilian Institute of Geography and Statistics - Data (2011), Guarulhos is the second city in Sao Paulo in population and wealth creation. According to the IBGE 2010 population is 1,221,979 people and occupies the 8th position among the 100 largest cities in terms of PIB - Gross National Product.

The mission of Technology College Eniac - FAPI in its quality policy is "Educate and Train Citizens to Succeed in Life, being competent in the business market, socially responsible and active in preserving the environment, with reference to ethics, dialogue and respect for future generations" (www.eniac.com.br).

Analyzing the transformation and communion with its mission, the institution, although not being required by the Ministry of Education and Culture, establishing in its pedagogical plan of course producing a final course Assignment - FCA, in order to bring the student to the business market.

Since its beginning in 2008, the work has undergone a series of refinements from the empirical analysis of its processes.

The Active Learning Methodologies has been discussed in the educational daily routine. According

to Araujo & Sastre (2009, p. 7) “Learning Active Methodologies are the core of this perspective and the Problem-Based Learning (PBL) is one of the ways that has been adapting to this new role.”

Mayo et al. (. 1993, p 227) describes:

The Problem-based learning is a teaching strategy that introduces students to significant situations and context in the real world. To the professor, the learning process mediator competes provide resources, guidance and instruction to students as they develop their knowledge and skills in problems solving.

The assignment is done in pairs and not a random choice. It is justified by the context to the real world, so teamwork.

The five phases of research throughout the semester allow for the most often, only the bibliographical research and study the implementation of a subsystems tool of Human Resources in any organization.

The changes take place not only in the development of work which only from one semester will turn for two semesters while maintaining the five-phase structure, allowing the student to further research on the chosen theme, expansion of the development period, but also in form of assessment, which aims to make the student an active agent in the construction of research and knowledge.

Sant’anna (1995a p 27) claims that: “the evaluation will only be efficient and effective if it occurs interactively between professor and student, both going in the same direction, towards the same goals.”

Clarifying the above, the objective of this work is to restructure the development process of final course assignment - TCC making it an empowering tool and construction of theoretical and practical knowledge through initiation to scientific research, by defining research lines that will direct students to specific mentors in their fields of knowledge.

Based on the facts presented, an important question is: how to make the active agent in student scientific research process?

As a secondary objective, approximate the pair scientific approach to the scientific research group of College of Technology Eniac for article publication from work in the scientific initiation magazine called Kaleidoscope.

2 Theoretical Framework

2.1 Current context in which the final course assignment - FCA is developed

The College of Technology ENIAC - FAPI has been in the market for 30 years, located in Guarulhos - São Paulo. IBGE - Brazilian Institute of Geography and Statistics -Data (2011) shows that São Paulo is the second city in population and wealth creation. According to the IBGE 2010 population is 1,221,979 people, and occupies the 8th position among the 100 largest cities in terms of GDP (PIB).

Faced with this population demands, the College of Technology ENIAC - FAPI offers modular graduate courses (Bachelor’s degree and Technology) and Management, Information Technology, Engineering and Industry post-graduation courses.

According to the pedagogical project of a Course- PPC (2014, p.8) “The course of Technology in Human Resource Management at College of Technology - FAPI meets the demand for professionals with integrated vision of the Human Resources subsystems, in a metropolitan region with high industrial density and post-industrial”.

The object of study is the process in which it is inserted the development of Final Course Assignment - FCA of Technology in Human Resources Management higher course, held in the second half of the course according to the course curriculum, presented in Table 1.

Table 1 Curricular Course

Entrepreneurship 1st Semester	Human Relations 2nd Semester
<ul style="list-style-type: none"> · Applied Informatics · Management Models · Mathematics · Organization and management processes · Social and environmental policies · Corporate Communications · Entrepreneurship integration project 	<ul style="list-style-type: none"> · Attractiveness and selection · Organizational Psychology · Compensation and Benefits · People Management Competency · Citizenship and socio environmental responsibility · Project of human relations
Planning and personnel administration 3rd semester	Maintenance and development of talents 4th semester

<ul style="list-style-type: none"> · Personnel department Operations · Labor law and social security · Union relations and labor negotiations · Culture and organizational climate · Health and safety on work · Project planning and personnel administration 	<ul style="list-style-type: none"> · Training and Development · Strategic planning in human resources · Performance Evaluation · Economic News in people management · Corporate education and knowledge management · Final Course Assignment · Maintenance Design and development of talents project
--	---

Source: prepared by the authors in 2015.

The technological course curriculums must be thought considering the actors involved, the student and society. The student belonging to the learning system, immersed in the four pillars of education: learning to live together, learning to learn, learning to do, learning to be. On the other hand, society and the productive system, facing all the changes arising from the competitive global market (Prado, 2006).

The curriculum course has taken into consideration these axes to contextualize and re-contextualize, making it the most suitable for the local institution and mode. In this context, the Final Course Assignment - FCA, called TCC, reports comes to the individual a point sampling with practiced in the labor market.

The Final Course Assignment - FCA is performed in pairs, in five steps over a semester, the first step being soon after the beginning of school year and the fifth stage is in the second to last half semester according to the academic calendar. There is the sixth step, called the representation (recovery), they only be forwarded the pairs which need to make subtle adjustments at assignment.

Students throughout the process did not develop the assignment in accordance with the guidelines, development rules; cultural norms and the ABNT (Brazilian Technical Standards Association) will be submitted to the Banking Examiner. Making oral presentation with visual aids and they are argued by two appointed professors of the institution.

In order to develop it, at the beginning of the semester it is disclosed through the student's portal (www.portaleniac.com.br) and college walls, the final course Assignment - FCA will be started. The students are invited to attend the opening lecture. As a whole, they are held three lectures during the semester that aims to present:

- Overview and the importance of a Final Course Assignment;
- How the assignment should be done throughout the semester;
- Who are and the role of guiding in the development process;
- Present the materials available on the student's portal;
- The phases and content to be posted at each step;
- Methodology and,
- Agreement.

In the student's portal the materials are available:

- Explanatory Manual on the production of final course assignment - FCA;
- Material lectures;
- Instructions for the double composition;
- Calendar with the dates and contents to be posted in each step;
- Framework personal attendance of the final course Assignment - FCA;
- Team of a final course Assignment - FCA;
- Places to insert the steps of final course Assignment - FCA;
- Explanatory video guidance on the production of the final course Assignment - FCA and,
- Explanatory document on "What is Plagiarism".

Students have at their disposal once a week, for three hours, classroom support professor mentor, whose responsibility is to advise on the development of the assignment and clear up any doubts about the online feedback.

Each phase sent by the student through the portal, the guiding evaluate the assignment, verifying that the requested content was sent; the methodological standards are being respected; if the development follows a logical sequence of subjects and if there is plagiarism.

Severino (. 2000, p 18) defines methodology as: an extremely useful and safe instrumental for the pregnancy of a mature attitude towards the scientific, political and philosophical problems that our university education faces; are operational tools. Whether technical or software, through which students

can achieve greater depth in science, the arts or philosophy, which, after all, is the intrinsic goal of teaching and academic learning.

The papers submitted by students through the portal are called posting. The period between the posting and the return from the academic advisor takes about two weeks. The student has approximately seven calendar days to correct and new post. On average, each semester, are assessed sixty works by guiding. Table 2 shows the six stages and the contents to be developed and delivered via the portal at each step.

Table 2 Phases and Posting Content to the FCA

FCA posting phases	Content to be developed
1st step	Introduce the topic and a brief description of the duo's idea for the choice and the development of TCC.
2nd step	Develop: <ul style="list-style-type: none"> · Summary; · Introduction (purpose, context and justification); · Obligatory references. Five books that theme for the research to be developed and a book of Scientific Work Methodology must be reported. Books should be obligatorily of physical or virtual library of Eniac, which may be supplemented by other sources; · Commitment term.
3rd step	Develop Chapters 1 and 2, respecting the cultural norms and ABNT (Brazilian Association of Technical Standards).
4th step	Complementary work; <ul style="list-style-type: none"> · Present references; · Complete the work; · Add the first few pages.
5th step	Present the complete work with all corrections.
6th step	Represent with the corrections indicated.

Source: prepared by the authors in 2015.

All steps have their importance; it is on the fifth step there assignment note. At this stage the guiding will:

- approve assigning grade from 6 to 10;
- disapprove assigning score from 0 to 5;
- indicate for the sixth step correction and assign score from 0 to 5 (deprecated) and from 6 to 7 (approved);
- indicate to the examiner that assigns score from 0 to 5 (deprecated) and from 6 to 7 (approved).

If the pair student has not posted one of the steps, it will be disapproved or recommended for the examination board.

2.2 Opportunities changes that benefit stakeholders

Considering the four pillars of knowledge, it should be noted that the inter-relationship between the work market and the gym, enables the formation of multi specialized professionals. According to Prado (2006, p. 225). " you must acquire certain skills and abilities, capable of prepare future technologists to understand and analyze the process in which they operate criticizing him and, if necessary, improve it. "

The skills and expertise to management are very important and, according to Jones (2010), there are many kinds of work in an organization and the development of specializations in the work division is possible.

Developing the student the final course assignment - FCA was institutionalized in 2008 and since then has undergone series of adjustments to provide the opportunity for better learning.

As Severino says (2007a, p. 25):

The teaching / learning process in college has its differential in the way of dealing with knowledge. Here, knowledge must be acquired not through its products, but its processes. This must occur through the construction of the objects to know and not the representation of these objects. Therefore, the University, knowledge must be built by the student's active experience and not be assimilated passively, as occurs more often in didactic-pedagogic environments of basic education.

Throughout the semester, in addition to classes, students develop: Integration Project; Module Course Assignment (MCM), measuring activities, two essay proofs, a written electronic test and a portfolio. Last semester arises over an academic assignment, which is to develop the final course

assignment - FCA.

When we think of the new active methodologies, we see the Problem-Based Learning (PBL). For Freire (1996, p. 31) “the student inserted into problems will be increasingly prepared for new challenges.”

Berbel (1998, p. 144) emphasizes that "a true methodology is a problematic understood as a set of methods, techniques, procedures, activities or intentionally selected and arranged in each step, in accordance to the nature of problem under study, and the general conditions of the participants”.

This is just a formality curricular for 70% of students, it is not meant as a fortifier in building the knowledge of their academic field. When they face the assignment as a problem they cannot reach the goal in their essence. The other 30% perceive the assignment as an opportunity to articulate and strengthen the training process. Through the presence list and observation from the second speech frequency is approximately 20% of total double, very low rate. Thus, errors are very similar in posts.

For this construction, the guiding role assumes full importance, namely that motivates and guides all students to the development of the phases shown in Table 2: Phases and posting content to the FCA. As Severino says (2007b, p. 202) “but, with a supervisor, the student will also have a personal and direct monitoring in conducting its research activities.”

The time period between the first and fifth step, which goes from the theme definition to the assignment completion, is approximately 90 days.

The situation problem happens in this scenario, as detailed in Figure 1: Composition of the problem situation diagnosis.

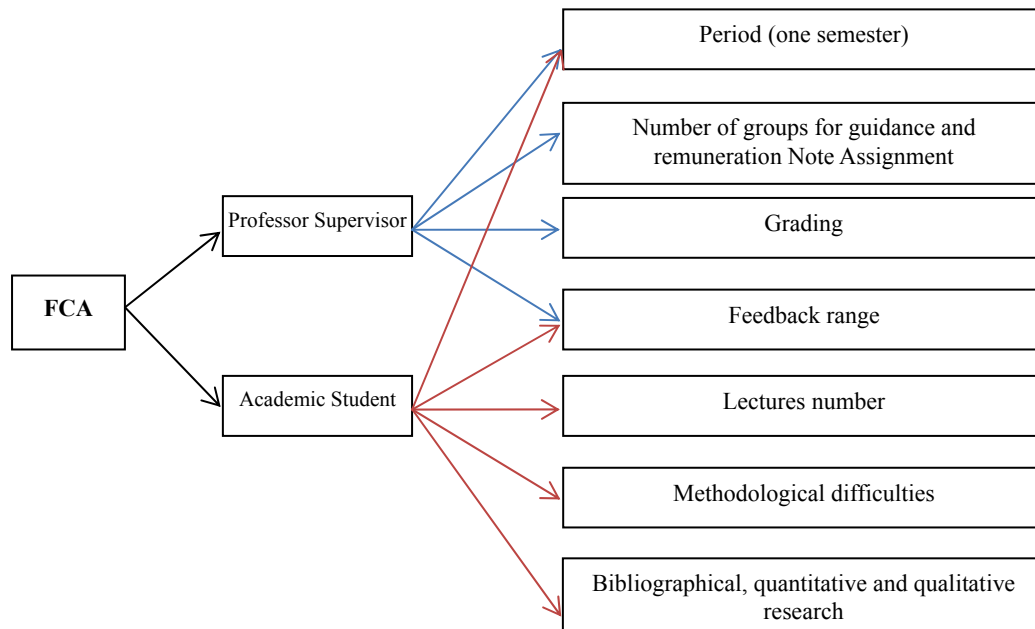

Figure 1 Composition of the Problem Situation Diagnosis

Source: prepared by the authors in 2015

Two actors are the main actors of the process: the supervisors and the students. It is observed that two indicators are common: a period of one semester and feedback range. The other indicators are relevant to each of the actors.

Concerning to the professor supervisor:

Period of one semester and number of groups for guidance: the supervisor has three weekly hours for personal assistance of all pairs assigned to it, but in the period near post date where there is a higher incidence of demand by the students, coming to meet fifteen double on average.

The remuneration corresponds to the contact period of hours. The activity of the advisor is not limited to personal assistance. Every posting phases jobs are thoroughly analyzed and fed back provided fixes needed for the next posting. This activity is held until the end of assignment.

Feedback range: After posting, the supervisor has on average 15 days to make corrections and

provide feedback session to the student via portal. From the second phase, the period for correction is very fair, because to verify the methodological issues, if presented bibliographies are sufficient to sustain the assignment, among others.

Grading: In every stage there is feedback to the student, but in the fifth stage that the supervisor assigns the note. It is identified at that stage a problem: the student, even with all the feedback, we do not always understand whether objectives were achieved. And when the student is sent to the bank or fail there is a big question, because until then for your understanding posting only guarantee approval.

Concerning to the student:

Period of one semester: the student has a semester to understand the purpose of a final course assignment - FCA and within that understanding the mechanisms for formalization of written work.

Feedback interval: after the posting of each step, the student has to wait about fifteen days to the advisor with his inferences as corrections. The student has only an average of seven calendar days to make adjustments and make the next phase of post with the complements for next step. Which period is insufficient because the student has its curricular assignments: portfolio, essay assessments, measurement activities, etc.

Number of lectures: during the semester are offered three lectures, an initial and two others on the same matter, bibliographic references, the ABNT standards structure, plagiarism and its consequences. The number of lectures is insufficient for the amount of work.

Methodological difficulties: even with academic studies over four semesters, students have not yet mastered the ABNT and have the mastery of writing and cultural norms, presenting difficulty in construction work.

Bibliographical, quantitative and qualitative research: to understand the difficulties facing the ABNT, the student has difficulty in researching and developing the work making use of direct and indirect quotes, developing quantitative or qualitative research and preparing the final remarks.

Salomon (1977, p. 136) "scientific work has been renamed the concretion of scientific activity, thus research and treatment in writing of the issues addressed methodically."

3 Methodological Procedures

The research has used the case study method, base on documental research, explanatory research and substantiated by the literature.

The study focus on the process in which it is inserted the development of final course assignment - FCA of university degree in Technology in Human Resources Management, taken during the last semester of this course.

The ISS - (Institute of Superior Studies) - College of Technology ENIAC - FAPI, 30 years in business, is located in Guarulhos city - São Paulo, São Paulo is the second city in population and in wealth generation, according to IBGE (Brazilian Institute of Geography and Statistics) data. Its mission: "Educating and training citizens to succeed in life, being competent in the labor market, socially responsible and active in preserving the environment, with reference to ethics, dialogue and respect for future generations" (www.eniac.com.br).

Faced with this population demand, it has been offered modular courses, Graduate (Bachelor's degree and Technology), postgraduate in Management, and graduation in Information Technology, Engineering and Industry.

The course curriculum contemplates the development of the final course assignment - FCA, although not required by the Ministry of Education and Culture, in order to understand the importance of preparing and approaching the student's productive market for this requirement.

However, the current format of FCA does not allow combining theoretical knowledge to practice through research by the short time for their development.

The authors of the case study are guiding and it enabled the fieldwork. Qualitative research was conducted through unstructured conversations and student complaints about the difficulties in carrying out bibliographic research and the practical application of knowledge.

The analysis phase of work and feedback to students through the college portal and the biggest errors encountered during the correction and the correct application of methodology.

The supervisors experience and the information wealth collected from students have offered the possibility to analyze the case and propose solution which meets the institution objective, technological course and the student with regard to knowledge and the labor market.

For documentary research it has used the pedagogical project of the course (PPC), according to

Cervo, Bervian and Da Silva (2014, p. 62) "documental research: documents are investigated in order to describe and compare practices and habits, trends, differences and other features".

The bibliographic research was based state of the art on the subject.

4 Analysis and Discussion of Results

According to the Political Project Course - PPC of ENIAC College (2014, p. 11).The course aims at training to develop professional skills that will result in people management, creating conditions to articulate, mobilize and put into action knowledge, skills, values and attitudes to respond in unique and creatively, efficiently and effectively, the challenges and the labor market requirements.

Following these precepts, the proposed intervention argues alternatives for the problem solution situation, providing opportunities for changes to redesign of the development and delivery the final course assignment - FCA to reach your goal.

Just as phenomenology, methodology of questioning, the process of awareness is always unfinished. It is a continuous and progressive reality unveiling, and the new reality always becomes the subject of a new critical reflection (Vasconcellos, 1999, p. 44).

The redesign process leads searches and perceptions, and the coexistence of this. The more they the students are involved in such problems, as beings in the world and with the world, the more they feel challenged (Freire, 1987, p. 70).

The course curriculum was divided into three major areas of knowledge, as shown in Table 3 Research areas as pedagogical project of the course (PPC).

Table 3 Research Areas as Pedagogical Project of the Course (PPC)

Knowledge management	Market Place of Work and People	Labor legislation
Corporate education; Training and development; Performance evaluation; Culture and organizational climate; People management competency.	Attractiveness and selection; Selection technologies; Covenants business school.	Administrative practices; Health and safety; Sustainability.

Source: prepared by the authors in 2015.

Every action of the Human Resources area has a direct effect on the organization and people, ranging from the candidate's attraction for the company, development, retention to the voluntary or not shutdown. It is understood that the topics chosen within any of the lines of research will impact on the organization and the employee.

We have chosen defining lines to direct supervised the students to professor supervisors' area. It is proposed the limit of 20 pairs to each supervisor.

Regarding the supervisor's remuneration, as mentioned, the practice is presented in two dimensions: assessment and correction both in person and online, through the educational portal.

Today the remuneration corresponds to the payment of three weekly class hours and the proposal would, besides the hours of classroom attendance, be paid an additional 12 classroom hours for online correction phase. Building and sharing quality education in knowledge society is essential investment in the continuing professor's training in order to, in fact it reaches the goal of being the mediator of the teaching-learning process.

According to the National Education Plan; Planning the Next Decade, Knowing the 20 Goals of the National Education Plan (2014 p. 43):

Target 13: improving the quality of academic education and increasing the proportion of masters and doctors of the college professors in effective exercising throughout the academic education system to 75% (seventy five percent), and of the total, at least 35 % (thirty five percent) doctors.

The quality of academic education is directly related to various aspects, including, teaching, research, extension, and student performance, the management of the institution and the titration of the college, especially in master and doctor courses.

The remuneration is a factor for personal investment in knowledge and sharing it with society.

The period of six months is insufficient for execution / development of a final course assignment - FCA, according to its proposal to fortify the knowledge within the study area, through the initiation of a student in scientific research.

The assignment should be started one semester before the semester called 1and the subsequent semester to semester called 2, thus the duo will have one year to research and develop the final course

assignment - FCA, without conflicting with the academic activities required during the semester.

In the semester 1, the FCA coordinator will make two guidance lectures about the paper. In the second half of school beginning, will take place the inaugural lecture. Students will be invited through the portal and walls. The lecture will address the following topics:

- Overview and the importance of final course assignment;
- The importance of scientific research initiation;
- How the assignment should be conducted in two semesters;
- Present research lines;
- The organization of double;
- Subject choice and presentation of a plan assignment;
- Who are the supervisor professors and the role of development process;
- Unpublished assignment and agreement.
- Present the materials available on the student's portal. The only material that changes is the calendar, from one to two semesters with all specified dates.

The first posting by the pair should take place within fifteen days after the inaugural lecture and includes: theme, references and planning work. The return deadline shall be fifteen days.

The second lecture will take place forty-five days after the beginning classes focusing on the development of TCC.

- Structuring the summary;
- Development of introduction;
- Details of ABNT for direct and indirect quotations;
- Methodology types: field research, case study;
- Opening discussion about the lecture doubts, and
- First chapter theoretical foundation.

The second phase posting will be thirty days after the lecture date two and the supervisor will have twenty days for feedback indicating what should be changed and developed for posting. In the second semester, it will take place three lectures.

The lecture 3 will take place ten days after the classes beginning focusing on development of chapter two, methodology and quantitative or qualitative research, request the company's authorization term researched and open for discussion in case. The post will be the twentieth day following lecture and feedback will be fifteen days after posting.

Lecture 4 will be fifty days after the classes beginning and deal with the discussion of research, graphics presentation, guidance on the conclusions and references. The post will be approximately twenty days to the paper posting and the supervisor will have twenty days for feedback.

The lecture 5 will be seventy-five days after classes beginning and will lead to the final course assignment. At this time, besides guidelines to step 5, students will be advised about sixth step (recovery), arguing by the examiner or fail banks. The supervisors will have twenty days for correction and feedback session.

The sixth stage that makes up small patches will give the student three days for correction and three days supervisor feedback.

The student must be the active agent of development work together with the supervisor. It is observed today that students transfer for guiding the main responsibility for developing work. The culture will change, this time, by assigning grades to each one of the criteria which make the development of final course assignment - FCA.

The final score will be composed by adding the grades from the first to the fifth stage that can be marked from 0 to 10. Exceptions are: if for the sixth stage and the examination board where the student has the opportunity to restate assignment and the maximum score is 7.0.

Sant'Anna. (1995b, p 24) explains that: The evaluation presupposes offer the teacher opportunities to check continuously whether the activities, methods, procedures, objectives, resources, techniques that you use to work with students, are enabling the student to achieve the proposed objectives.

Table 4 shows the possible scores ranges for each one of the components of development process:

Table 4 Criteria for Grading

Activity	Criterion	Range banknotes
Lecture	Presence in all the lectures of at least one member of the pair. The frequency will be computed by biometrics or presence list.	0 to 0,5
Discussion with the supervisor	The pair should talk personally at least once a month with the supervisor. Registration will be done through the presence list.	0 to 0,5
1 ^a stage	The post should be sent with all requested items.	0 to 1,0
2 ^a stage	The post should be sent with all requested items of a stage more correction suggested by the supervisor in the previous stage.	0 to 1,0
3 ^a stage	The post should be sent with all requested items of a stage more correction suggested by the supervisor in the previous stage.	0 to 1,0
4 ^a stage	The post should be sent with all requested items of a stage more correction suggested by the supervisor in the previous stage.	0 to 1,0
5 ^a stage	The post should be sent with all requested items of a stage more correction suggested by the supervisor in the previous stage. At this stage, the supervisor may: assign a final note, indicate to the 6th stage, disapprove, or forward to the examination board.	0 to 5,0
6 ^a stage	Present the corrections indicated in the 5th stage.	0 to 2,0

Source: prepared by the authors in 2015.

At all stages we have the proposal of continuous adjustments and as emphasized by says Sacristan and Gómez (2000, p. 11) “the need to rethink the processes of teaching learning, in order to that the purpose of educating citizens to intervene so relatively autonomous and rational in social exchanges democratic society guide and configure the educational practices.”

Active methodologies provide a construction of knowledge, for this is indicated available online class methodology of scientific work in the student portal.

5 Conclusion

The study has not exhausted all the possibilities for improvement. It is hoped that the changes proposed engage students in the learning process and help them to be more active agents as a committed professional, connecting the academic world and the productive market.

By changing the development process of final course assignment - FCA for two semesters will help the student to bring the epistemological dimension of knowledge perspective; the pedagogical dimension in the context of the student's relationship with learning and social dimension in view of the extent of intervention in society, meeting community needs.

The period of one year for the development of FCA is an important factor, because the student can reflect and search deep into the subject of his interest and make meaningful knowledge. By limiting the number of students, the professor will be able to direct and monitor in depth the themes chosen.

The compensation is an important factor to consider, among others, the importance of investment in continuous development for the education quality in teaching-learning and furtherance research, as well as its projection in career of academic education institution.

Another goal is to bring the student to the research group of Eniac College, this group formed by specialists from several knowledge fields, to transform the final course assignment - FCA in an article referring to submission and presentation at scientific research seminar at Eniac College and publication in Kaleidoscope magazine.

The final course assignment is done for graduated and Technology courses. The FCA of graduated courses has another setting for achievement. The curriculum provides depth in scientific research methodology taught in classes. In addition, there are lessons monitoring FCA, another mentor of the study area.

But only for technological courses are being defined research lines. The research lines will be able to replicate to graduation courses in order to bring closer relations between these courses and the research group, contributing to development of new ideas to community, the institution and the individual.

As innovation indication, the next step is the refinement of research lines showing the seminal books to study.

Abstract: This article aims to assess the information provided in the Reference Form (FRE) by companies listed on Level I and II of the BM & FBovespa referring to the year 2012 and published throughout 2013 in order to investigate the compliance of management and governance processes to practices recommended by the IBGC (Brazilian Institute of Corporate Governance) based on the Code of Best Practice of Corporate Governance (IBGC, 2009).

Key words: Corporate governance; Reference form; Code of best corporate governance practices

1 Introduction

Several corporate scandals in recent decades become the actions of Corporate Governance (CG) more attractive and necessary as a control and management system for organizations that seek to minimize the costs of agency problem (Silveira, 2004) and protection for the minority shareholders. Regulators have also begun to establish new rules of conduct aimed at ensuring greater security to the markets, which forced organizations to adopt some KM practices. Experts in governance theme seeking out and spread the benefits of an excellent CG system, such as greater transparency in the management, better level of control, installed and standing committees, more security for shareholders and boards of directors and tax structured and active.

Silveira (2010) points out that the result obtained with a good KM strategy lacks any difficulty or cost of deployment. A governance system is beneficial, even if it entails costs, as there are beneficial aspects, such as improving cash flow perspective, ease access to capital and improvement of decision making in top management.

Moreover, in line with this approach it is possible to emphasize that the absence of a good CG system has led companies to failures resulting from abuse of power, errors in strategic decisions, lack of internal controls and fraud (DA SILVA, 2010).

Another positive point is that the practices of the GC protect and ensure the interests of investors, minimizing agency conflicts which in turn, prevents the destruction of corporate value because the company's control problems between groups of shareholders (Ribeiro et al, 2012).

In this context, in which the CG actions become more relevant and required by the market itself, this study aims to present a ranking of corporate governance practices based on the information disclosed by the organizations of the BM & FBovespa Level I and II in their form Reference (RF). The article presents the results of comparing the information on the governance process of the organizations with the recommendations made in the Code of Best Practice of Corporate Governance (IBGC, 2009). The study also deals with the profile of professionals working in the governance process (directors, board members and tax).

The choice is justified by its economic and social relevance, the little literature on the subject available for research, as in the non exhaustive survey of the literature, there was a lack of research directed specifically to the use of RES as a governance tool.

It is noteworthy, however, that this article aims to complement the study by KPMG (2014), entitled "Corporate Governance and Capital Markets", which portrays the landscape of open companies based on FRE 2013/2014. The KPMG study presents several indicators extracted from the RF and performs a comparison between the levels of governance: the New Market, Level I, Level II and Traditional.

IBGC, unlike a regulator, does not force companies to adopt its recommendations, however, governance practices suggested by the Institute seeks to enhance the value of organizations, facilitating their access to resources in the market and make them more transparent (Silveira, 2010). The study of the FRE of Level I and II of companies did not claim to interpret or validate the veracity of information provided by organizations, but allowed to generate a governance ranking based on published information and map the profile and professional qualifications of directors, advisors and tax advisors,

professionals responsible for the governance of organizations process.

2 Research Problem and Objective

For better management of companies BOVESPA established two different corporate governance levels of the Level 1 and Level 2. This differentiation aims to define the conduct to the company profile for both levels, aiming to value the shares and any company assets. ((BMF & BOVESPA, 2011. p.4 and Level 2 p.5)

Source: Adapted by the author, Regulamento de Listagem do Nível 1. (BMF&BOVESPA, 2011. p.4 e Nível 2 p.5)

Considering the importance of corporate governance levels and aspects demonstrated. We can research question: Companies Level II have better governance practices in relation to the Tier I companies, or even companies with older registration with the CVM have more adherents governance practices to IBGC's recommendations?

It aims to compare the Tier I companies and Bovespa Level II in their respective FRE and Code recommendations of Best Practice of Corporate Governance (IBGC, 2009).

There were evaluated RF of the New Market organizations, given that the companies listed in this segment have differentiated corporate governance practices in compliance with CVM determinations. the IBGC's recommendations?

3 Literature Review

3.1 Importance of corporate governance and its evolution

The CG has become an important agenda for discussion in academic forums and executive meetings in recent years. Increasingly, the issue is no longer just academic subject and happens to be treated and applied in practice by companies, so that their results are perceived and measured by the market, adopting, including specific indices such as the IGC - Corporate Governance Index and the IGCT - Corporate Governance Trade Index, both accompanied on the Stock Exchange of São Paulo

(BM & FBovespa, 2013).

Most investors prefer to invest in companies that have more robust governance processes. According to Da Silva (2010 p.219), “between 70% and 80% of investors are willing to pay a greater value in the stock market by the organizations involved in governance.” One of the facts demonstrating the relevance of GC nowadays is the growing number of studies and academic publications in recent years. Ribeiro et al (2012, p.89) showed in a bibliometric study from the late 80 there was a considerable increase in resources on “corporate governance”, including associated with the subject “strategy.” It found a substantial increase on the themes from 2003, with an approximate percentage increase of 200% from 2003 to 2010.

Despite the wide debate on the subject, the concept of KM is not dichotomous among authors, as in general GC is a set of practices that aims to make corporate decisions are always taken with focus on generating and / or maximizing long-term value to the business (Silveira, 2010, p.2). The implementation of a KM system can improve the company's performance, protect investors, employees and creditors and facilitate access to capital. (DA SILVA, 2010, p.18).

The Code of Best Practice of Corporate Governance (IBGC, 2009, p.19) provides a complementary setting for GC, highlighting it as a system by which organizations are directed and monitored, involving the relationships between owners, managers, Board of Directors and control bodies.

One of the relevant facts which led the scientific community, businessmen, politicians and society in general to argue with more dedication this subject in recent decades, as well as seek regulations and practices that encourage the generation of a more transparent and reliable market, was the volume of corporate scandals in Brazil and the world from the 90s, such as Barings Bank in 1995 (BERGAMINI JR, 2013), National Bank in 1995, Worldcom and Eron in 2001, Xerox in 2002, Banco Santos in 2004 (DA SILVA, 2010), Shell and Parmalat in 2003, Siemens in 2008, Société Générale in 2008 (Silveira, 2010). These cases certainly encouraged shareholders and controllers to structure control mechanisms, with a view to avoiding financial losses, increase market credibility regarding management models and therefore value companies to submit more compliant practices to governance models.

In the US, in response to corporate financial scandals, the Sarbanes-Oxley Act was created in order to prevent the flight of investment due to insecurity generated market.

The law promoted a series of changes in governance practices. To Da Silva (2010, p.192) the introduction of American law has created numerous and significant duties and responsibilities to be observed by the directors of public companies listed on the US stock market (whether American or not) and promoted the regulation of corporate life, based on good governance practices.

In Brazil, among the main improvement initiatives on the level of corporate governance, cites the creation of the Brazilian Institute of Corporate Governance - IBGC founded in 1995 (IBGC, 2006 p.21), which was officially established as the Brazilian Institute of Directors IBCA of Directors and subsequently renamed the IBGC. Another important step was the publication in 1999 of the Code of Best Practice for Corporate Governance (IBGC, 2009), focusing primarily on issues related to the Board of Directors, which in later editions now covers recommendations for other governance agents such as partners , managers, audit committee and audit committee etc.

Seeking greater clarity to investors and greater confidence in the Brazilian market, Bovespa created different levels of governance of companies (Level I and II) according to the degree of commitment of the company in relation to some corporate practices (Silveira, 2004, p. 58) launching in 2000 the so-called Novo Mercado, which established a pattern of differentiated governance.

In the way of greater transparency to information on public companies, the SEC launched in December 2009 Normative Instruction 480 which, among other obligations, provides that companies report annually on the Reference Form (RF), which includes information demonstrations financial, profit distribution policy, investment policy, and information on the overall remuneration for members of the Board of Directors, Statutory Board and the Supervisory Board and the largest and the smallest individual remuneration of each of these organs. In short, the IN 480 is intended to expand the governance of view of companies and provide investors with greater amount of information and more quality, so they can analyze the performance of the administration in a more transparent way company (BM & FBovespa, 2013).

3.2 Reference Form - RF

The Reference Form (RF) was created by the Brazilian Securities Commission (BSC) on December 7, 2009 by BSC Instruction # 480 in order to be one of the leading journals company documents, since the file brings together information relevant to the evaluation of the organization and securities issued by it. The creation of the RES also aimed to facilitate the work of issuing securities

companies, which now only deal with a standardized set of information (SON SOURCES; LEAL, 2010, p.154). For this reason, they are filled in this form very comprehensive information, which originate in various areas of the organization. It is the Chief Executive Officer and Director of Investor Relations for the company to take care to structure a suitable internal process for drafting and revising the document before its delivery and dissemination to the market, since they are ultimately responsible for the content of information provided on the form.

The RF as well as the Form 20-F that is filed with the SEC aims to establish itself as a permanent and reliable information document, in which the data provided by the companies are standardized, requiring a rigorous preparation, dissemination and updating of its content. The update, when necessary, requires the maximum attention from listed companies, as non-compliance with restatement of rules can lead to the opening of administrative proceedings by the BSC, as well as result in punitive fine, according to the terms set forth in own BSC Instruction 480.

Crafts published after the BSC 480 reinforced the need for integrity and transparency in the disclosure of information, as noted in Circular Letter BSC SEP No. 007/2011, p.8:

[...] the issuer must disclose true, complete, consistent and does not induce the investor to mistake; [...] All the information disclosed by the issuer must be written in simple, clear, objective and concise language. [...] If an information requested in the Program is not applicable to the issuer in terms of its characteristics, it should leave expressed this fact in the form and include a justification explaining why the information requested is not applicable.

Filho and Leal's sources (2010, p.153) point out that the group in a single document relevant information about the issuer of securities the model features a wide convergence with the various codes of best corporate governance practices published in countries with a tradition in CG .

The creation of the RF is relatively recent and perhaps why there are so many detailed studies on its content, as well as its use as a governance tool by society and shareholders. However, KPMG (2014) released a study done specifically on the information disclosed in the RF of the companies listed in the four governance groups: Novo Mercado, Level 2, Level 1 and Traditional. The same study was ever conducted by KPMG own before 2009, but adopting as basis the Annual Reports. The result of the last report by KPMG (2014, p.2) pointed out that:

Over the years we have seen a clear trend by seeking the best corporate governance practices, including transparency, accountability, equity and corporate responsibility, is to comply with new regulatory requirements [...] or by perception 'own managers and investors of the benefits generated by the application of good governance practices [...].

The following items highlight the analysis of the information and results obtained by comparing data from 52 RF published in 2013 by companies in the Level I and Level II with the IBGC's recommendations.

4 Methodology

This research was classified as exploratory with qualitative, the information used were extracted from secondary data, according to Malhotra (2012), secondary data often be easily accessible channels, low cost.

Was used in this study the reference forms of public companies (Level I and Level II), available on the BSC website on the date of 10/28/2013, except the company HI SA, which the version not allowed downloading to perform the analysis. Moreover, it was adopted as base material the Code of Best Practice of Corporate Governance (IBGC, 2009) as well, the study authors as Silveira (2010), Rossetti and Andrade (2001), Da Silva (2010) dealing with property concepts and methods on GC, beyond the rules of the Brazilian Securities Commission (BSC) and the study carried out by KPMG in Brazil (2014).

The study proposed analyze the information provided by the organizations of the Level I and Level II of Bovespa in their respective FRE and compare them with Code recommendations of the Best Practices of Corporate Governance (IBGC, 2009). 52 FRE were analyzed, 31 companies in the Level I and Level II 21 companies. As companies have the possibility to disclose several versions of RES throughout the year, it was adopted as a criterion for study analysis of the latest version and available on the BSC website until 10.28.2013.

The information analyzed was based from the RF and treated in a database for evaluation in order to assign a score for each adherent ou partially adherent item. In addition to the information used to assign a score and generate governance ranking, other qualitative information on the professionals working in

the process of management and governance were extracted and consolidated to study.

4.1 Differences between corporate governance levels

In order to establish a trading environment that stimulates concomitantly, the valuation of companies and investor interest, the former São Paulo Stock Exchange (BOVESPA), created in December 2000 three classes of corporate governance: Level I, Level II and the Novo Mercado, with Tier I with lower requirements and the Novo Mercado, the highest degree of regulation. Through such levels of governance would be possible to classify the companies according to the number of additional obligations on the Brazilian legislation. In this way, organizations began to focus on actions and initiatives, which turn out to be recognized in the market as good corporate governance practices.

In this study we adopted for analysis only the organizations listed on Level I and Level II governance. Basically the Tier I companies are committed to improvements in providing information to the market. It is mandatory for this level disclosure of information in the Quarterly Information (ITR), the DFP (Standard Financial Statements) and the IANs (Annual Information), and the disclosure of other corporate information.

Companies listed on Level II undertake to fulfill the requirements for Level I and additionally adopt a broader set of rules of governance practices, prioritizing the rights of minority shareholders. Some additional requirements for participation at this level are: disclosure of financial statements in international standards, the board with minimum 05 members elected for two years, and 20% of them must be independent, voting rights to preferred shares in some materials, Tag Along 100% to holders of common shares and 80% for holders of preferred shares and adhesion to the Market Arbitration Panel for resolving corporate disputes (BM & FBOVESPA, 2013).

5 Analysis of Results

As the collecting the information in RF is finished and the compilation of data according to their score, the companies analyzed were classified according their score. In addition to creating the ranking, the study allowed us to analyze and highlight other observations about the data available on RES, such as the participation of audit firms in the analyzed organizations, the profile of professionals who work on the board, the boards of directors and fiscal and as the participation of women in these roles. To better organize the results, the following items were divided into (I) grip level of governance information of FRES the code of practice of Best Practice of Corporate Governance (IBGC, 2009); (II) the independent audit companies in the Tier I and Tier II organizations; (III) profile and remuneration of professionals working in the management and boards of directors and fiscal.

5.1 RF information versus code of best corporate governance practices (IBGC, 2009)

The study of **RF** was premised on the comparison of nine highlighted items from the **RF** and allowing compare with the best practices recommended by IBGC, so that the end of analysis has produced a ranking of consolidated adherence to businesses of Level I and II.

To perform the analysis of the items the following assertions were generated: (a) the organization practices assessment of its Board; (b) no variable remuneration for the Board of Directors; (c) the organization discloses the average annual compensation of its directors; (d) the organization discloses the average annual remuneration of directors (e) the organization has IR Director with unique function; (f) the organization practices gender diversity in the Board of Directors (minimum 20%); (g) the organization informed and practices Board Member of the mandate up to 2 years; (h) the organization held rotation of independent auditing firm in the past five years (i) the organization has Supervisory Board and permanent.

After the lifting of the RF extracted information from companies and completed the analysis of the statements, companies were classified based on the level of adherence to assertive. Da Silva (2010, p.107) points out that the new companies in the market has not shown any fear in sharing control of the company and fully open their numbers. In this sense, the first cross-checking has reinforced this statement when assessing that there is no relationship between the time of registration with the BSC and the level of adherence to IBGC's recommendations. Companies with registration in the 60's and 70 showed low level of adherence to the items evaluated and, on the other hand, of the 19 organizations that went public after 2000, 11 of them have higher level of adherence to 65%, and 04 were among the ten most members (up 77% adherence), namely: Taesa, CEEE-D, Banco Indusval and Panamericano.

Shows the final ranking of companies based on the percentage of grip and year of registration with the BSC. Companies with latest registration with the BSC were classified forward, given that there is an expectation that companies with earliest record have a more mature governance process, given the

experience.

5.2 Evaluation of 52 companies (Level I and Level II)

Observing the entire study sample (52 companies), the item with lower overall grip is diversity in the Board of Directors (BD), as only 13% of companies have evaluated the BD composition of a minimum of 20% women. Another item that showed low adherence to best practices IBGC was the implementation of the evaluation process of the board. Of the 52 organizations selected for the study, only 33% reported in their respective FRE having structured process. This result considered as "non-stick" companies that did not report the FRE to have this process. In the KPMG report (2014, p.12), which adopted different criteria, the result for this item was 18% of companies in the Level II and 31% of Level I.

The item with the highest level of adherence was related to the rotation of audit firms, (94% of the evaluated companies released in RF previous contract date to 2008.). Another positive item, in which 90% are adherents was the tenure of the directors up to two years.

5.3 Results of the most Adherent Companies

Among the ten best companies evaluated (grip index greater than 77%), only 03 belong to Level II, recognized segment as more robust than I level in terms of corporate governance. The item with lower adherence in this group was also "gender diversity", according to RF no organization has the participation of women on the board with the sitting member function. It is noteworthy that were not considered the positions of alternates. When evaluated together the functions of director and counselor of administration and fiscal, women's participation improves these ten companies, but is also very small, as only 6% of the seats with those roles are held by women. This point is also observed in the study released by KPMG (2014), which highlights that women have a share of only 7% of board of directors in the companies of Level II and 5% in Level I. The KPMG companies not quoted the study the alternate positions were considered.

Regarding the Fiscal Council (FC), among the top ten, only Banco Indusval reported do not have a Fiscal Council with permanent. The participation of women in CF reaches 15% in this group, but only five companies have women working in this council. It can be seen therefore, that even in organizations with more compliant practices of the Code of Best Practice of Corporate Governance (IBGC, 2009), women's participation is still low in corporate governance functions.

Importantly, the application of methods aimed controls for a more robust management and an effective governance system can mitigate the risk of events that devalue the actions of the organizations, but does not mean, however, that the most adherents to these companies practices are totally free of wrong decisions, failures in the management process or problems that cause financial and image losses. Moreover, it is not possible to say through this study that the information disclosed by organizations in RES are actually practiced in the management process.

An example of this is the company Forges Taurus, which in this study is among the most adherent organizations to the valued items (88.9% of adherence to IBGC's recommendations) and even then, since 2012 has been undergoing investigations and changes in the Board of administration because of problems detected by Ernst & Young external audit on the sale of subsidiary Taurus Machinery - Tools. The case reflected in the media and has generated discussion of the possibility of action for damages against the directors and officers. According to an article published in Valor Econômico (09.22.2014), the price of the company's preferred shares had fallen 80% and was trading in Sep / 14 in the house cents.

5.4 Assessment of less adherent companies

The less adherent organizations also did not reach the minimum of 20% women on the board, however, unlike the ten acceding where women's participation in the AC is still zero, among the ten organizations with less grip, the participation of women in AC as member is 5%. When evaluated together the functions of director and advisor of fiscal management and the participation of women in governance roles in these organizations remains at 5%, but one percentage point lower than the ten most adherents. Regarding the Fiscal Council the participation of women is much lower than the ten most adherents, and a share of only 4%, compared with 15% of the members.

Despite the low level of adherence of these organizations, it is noted however, good management practices, such as the evaluation of the board, played by two of the ten organizations; presentation of the average annual remuneration of directors and officers disclosed by other organizations 2; besides the existence of relations director with exclusive Investors, practiced by a third group of two companies. What is observed in these organizations is that the nine items measured on average only three are practiced in these organizations, which reduced the level of grip on the practices recommended by the

IBGC. Another point with low grip is the “evaluation of the Board of Directors.” Ten less adherent organizations, only half has this practice in its management and governance process.

5.5 Independent audit firms

The item RF presenting information on independent audits contracted by companies listed on the exchange. They were observed in this item the name of the audit firm which acted for the year 2012 and the date of the transaction. The result of this analysis identified that 94% of companies in the Level I and Level II acted with four independent audit companies: PwC, KPMG, Deloitte and Ernst & Young. PwC has 29% of the total market and strong presence in the Tier I segment with presence in 39% of companies of this level of governance. The Level II segment is led by KPMG and Deloitte, each having 33% of companies in this segment.

Despite the best governance practices recommend turnover of the independent audit firm every five years, according to the analysis of contraction dates of audit firms observed in Fresno, 02 companies in the Level II and Level 01 I have the same auditing firm for over 05 years. The other organizations both segments opted for exchange of audit firm in the range of less than 05 years.

However, it highlights the difficulty in assessing this information, since not all companies are properly applying the information in the “period of service”. It was observed that some companies have chosen to maintain the same audit but it effected the rotation of responsible professionals, as recommended by the IBGC (2009), but not make clear that information. Usually the "period of service" is filled with the date of the last contract, and it is unclear whether there has been a renewal, and what is the first signing date. Although the aforementioned rotation of observation in another field, for some companies, it is ideal that were stated in the field “period of service” the actual date of the 1st contract. This can be a point of improvement to be considered by companies in the Level I and Level II that have not yet adopted this practice.

5.6 Profile and remuneration of professionals working in the management and boards of directors and fiscal

All professions of the people who work in the governance process (board, board of directors and supervisory board) were cataloged from the item 12.6 of the FRE of each organization. However, before submitting the results of this analysis, there is a caveat in relation to the profession "bank", since, mainly Banco Bradesco SA, reported on its FRE this profession for most professionals cited in the field 12.6, failing to specify real profession training. This also occurs in other companies, including who are not in the financial sector, but less frequently. Thus, it is emphasized that the study looked at the professions and age of the professionals who make up the governance functions of organizations Level I and Level II always extracting the data submitted by companies in item 12.6, not taking into account whether the information was presented in order different in another form field.

The average age of all professionals working in the governance process of the companies Level I and Level II is 54 years. The youngest professional in office in 2012 was 26 (Tax Advisor Bannisul and Inepar Board Member) and the oldest 87 years (CEMIG's Board Member). The highest average age is in the AC's chairman (Chairman) 63 years, and the youngest was 42 years old (Renova Energia SA) and the oldest in office in 2012 was 86 years (BIC Banco, Banco Bradesco, Bradespar, Klabin SA). On the other hand the lowest average age is in the director's role with 50 years of age, with the youngest 29 years (Banco PINE SA) and the oldest with 81 in (Marcopolo SA).

As for the profession there is a clear preference for companies to hire engineer and administrator to act in governance processes, as they occupy 47% of positions in these functions in the segments Level I and Level II. In addition, 51% of CEOs of these companies are engineers and 35% managers. Another highlight is that 38% of the Presidents Council (Chairman) are also engineers or managers.

Analyzing the Board of Directors (BA) and the Audit Committee (AC), collegiate important to have a proper process of governance in any company, it observed that on average companies operate with seven members in the AC and virtually no differences between segments Level I (mean 7.2 members) and Level II (average of 6.6 members). Only one company (CEMIG) has a woman as Chairman of the Board.

Another point evaluated against the BA was the profession of each member that compose it. The analysis showed that some organizations maintains a technical diversity, but in general there is a concentration of engineers, economists and lawyers composing this important collegial body.

Regarding the CF, the 52 assessed organizations, 40 of them have CF installed, having an average composition of 4.3 members in each company. Proportionally, women's participation is higher in CF than in the AC, as in CF there is a participation of 10% women, being more evident in the Level I with 11% against 7% level II. The occupation with the highest rate of participation in CF is Counter. The

dynamics of action of this collegiate requires its members great knowledge in accounting, since, according to the actual description of the goals of your installation in accordance with the Code of Best Practice of Corporate Governance (IBGC, 2009, p.62) a its functions is “to analyze, at least quarterly the balance sheet and other financial statements prepared periodically by the company and; examine the financial statements of the fiscal year and opine about them”.

In relation to the director’s role, the rule is no different than identified in the professions of the AC, as to isolate the “banking” profession, understood in this study was informed improperly, the most identified professions in the director's function is to engineer and administrator, adding 46% of all professionals working in the function. Specifically this role women’s participation is also low, as between CEO and Director women occupy only 6.5% of the positions.

In general, it is observed that the participation of women in governance functions is still small. In companies of Level I and Level II segment on the base date of RF (year 2012) there were no women in the CEO role.

In assessing the item 13.11 of the RES, which is the average annual remuneration paid to professionals working in the director's role, counselor of administration and tax advisor, it was observed that 32.7% organizations have disclosed the information, taking as a justification decision court that provides legal support for the non-fulfillment of the obligation. Therefore, average earnings were analyzed only the companies that provided the data in that field. In short, the average annual compensation paid by the companies of II level is higher than the remuneration paid by companies in the Level I. For as Officer of Tier II companies pay on average \$ 1.777 million, the largest annual average of Banco Daycoval SA with an average salary of R \$ 3.22 million in 2012. The highest average annual compensation paid to directors of companies II level is of Parana Banco SA R \$ 1.086 million in 2012.

When observed average annual remuneration paid to Board members, companies Level II paid on average \$ 553,000, with the highest average annual compensation also Banco Daycoval (R \$ 2.936 million in 2012). At Level I segment the company with the highest average annual compensation in 2012 was Klabin SA Klabin SA is also the company with the highest annual average for the remuneration of the Supervisory Board. The company reported an average annual salary of £ 347,000 in 2012, compared to R \$ 180 thousand from Marcopolo SA highest average compensation tax advisor Level II on the same date base.

6 Conclusion

The study collected data from 52 level organizations I and II of the BM & FBovespa directly from their respective reference forms (RF) for the year 2012 and compared to nine extracted IBGC the recommendations of the Code of Best Corporate Governance Practices (IBGC, 2009) , generating a ranking of organizations by level of grip, this is a secondary, exploratory study result indicated that even among organizations that had higher adherence to IBGC's recommendations referenced in this study, there are still opportunities for improvement in the governance process as, for example, the practice of board evaluation. Only five of the ten most adherents have that practice.

The work has strengthened the participation of women is still small in management positions and in governance processes in organizations of Level I and II.

It was also found that companies listed on Governance Level II are not necessarily more adherent to IBGC's recommendations in their entirety or follow the best governance practices, as among the ten most adherents in this study only three belong to the segment Level II . Another important point of the search result is that the record date with the BSC is not an advantage for the organization to have a better structured corporate governance, ie the independent governance stage of the company's operating time in the stock market.

The analysis of the respective RF showed that the average annual remuneration of directors and officers is not disclosed by all organizations. Approximately 33% of the evaluated companies did not disclose this fact in 2012, and the Tier I segment had a lower percentage of companies that reported this information, even if a good governance practice and requirement established in BSC Instruction n.480. However, looking at the data of the companies that have reported average annual compensation of its officers and directors it was established that the companies I level has an average annual salary less than the Tier II companies.

As for the profile analysis of professionals working in governance processes of the evaluated companies, it became clear that engineering professionals, business, law and accounting prevail in the

management process compared to other professions. On the average age of governance professionals, it was observed that the average age of Board members is greater than the average age of officers and professionals of the Supervisory Board.

The study identified that the exclusive use of the information disclosed in the RF is not a perfect indicator to conclude that the organization practices, effectively, governance actions. The case of the company Forges Taurus, which figured in the ranking of this study among organizations with higher levels of adherence to IBGC's recommendations, is an example of the practices disclosed in RF are not enough to complete the governance level of the company. The Taurus Forges reached in the study 88.9% of grip, but since 2012 has been undergoing research in management and decisions adopted by the Board of Directors in the fiscal year just used to search the FRE. Thus, the information disclosed by organizations in RES can be used for evaluation, but not as exclusive source to conclude that the company has better or worse corporate governance process.

As limitation of the study, it points out that the information disclosed in RES are not fully standardized which reduced the number of items eligible for the comparison with the IBGC's recommendations. Ideally, businesses, together with the BSC, discuss improvements in RF so that records follow more standard models, including the items that are recognized as "text field."

It is suggested for further study and research, the analysis of other items RF as well as an intersection of financial results versus the level of adherence of companies to IBGC's recommendations, so that you can verify that the governance actions generate financial results more consistent.

Research on Contractual Incompleteness and Contractual Governance in Franchise System*

Bi Lei

International Business Faculty, Beijing Normal University, Zhuhai, P.R. China, 519087
(E-mail: 185128602@qq.com)

Abstract: Management in franchise system is full of chaos. This has been proved by the increasing negative events in franchise system. Lots of scholars have done the research on how to promote franchise system to operate effectively, but few of them analyzed the problems from the perspective of contractual governance. The innovation of this article is to apply the theories of contract to dealing with opportunistic behavior in franchise system. The author uses literature method and comparison method to identify that contractual incompleteness is the primary reason of opportunistic behavior in franchise system. It is believed that contractual governance is an effective way to deal with opportunism.

Key words: Opportunistic behavior; Franchise; Contractual incompleteness; Contractual governance

1 Introduction

Franchise is a kind of special organizational form existing between market and firm, in which franchisors and franchisees are combined together through contracts. From internal perspective, franchise takes market form due to property right difference between franchisors and franchisees; from external perspective, franchise takes firm form due to franchisors and franchisees' sharing of the same trademarks and business modes. Franchise, as a special organizational form, helps to reduce the agency cost and supervision cost, saving the transaction cost.

There have been three main theoretical schools during the development of contract theories: classical contract theory, neoclassical contract theory and modern contract theory.

Classical contract theory attempts to facilitate exchange with the emphasis on discreteness and present in place or time. In classical contract theory, parties involved in a transaction are irrelevant and are ignorant of sustaining mutual relationship. The contract terms and clauses are supposed to be defined carefully. From the beginning, all contingencies are relatively predictable and remedies are narrowly prescribed accordingly. Additionally, third-party participation is discouraged. Classical contract theory endeavors to implement "ideal" contractual relationship.

Neoclassical contract theory is based on the assumption of perfect rationality, symmetry of information and zero transaction costs, regarding contract as complete. Neoclassical notion of contract presents the idea of complete contract. The complete contract theory supposes that the agents involved are perfectly rational and can completely predict all possible events which may happen in future in the term of contract. In the case of the complete contract, agents are willing to comply with signed articles, and the third party such as court can verify and enforce the contract when the signed articles are disputed by the agents. According to the theory of complete contract, the renegotiation will not take place during the performing phase, so the optimal investment can be achieved.

Modern contract theory relaxes the assumption of neoclassical contract theory. R. H. Coase (1937) realized the incompleteness of contract. In the article "The Nature of the Firm", Coase pointed out that "owing to the difficulty of forecasting, the longer the period of the contract is for the supply of the commodity or service, the less possible, and indeed, the less desirable it is for the person purchasing to specify what the other contracting party is expected to do".^[1]

Williamson (1979, 1985), Klein et al (1978) considered that the contract is incomplete with the bounded rationality of agents.

Stiglitz (1999), Schwartz (1999) pointed out that perfect rationality should be replaced by bounded rationality, symmetry of information should be replaced by dissymmetry of information and zero transaction costs should be replaced by positive transaction costs. Modern contract theory firstly distinguishes complete contract and incomplete contract.

Jensen and Meckling (1976) regarded principal-agent relationship as contractual relationship. Mirrlees (1974) classified principal-agent problems to asymmetry information problems. Arrow (1985) believed principal-agent problems consisting of adverse selection problem and moral hazard problem.

* This article belongs to series of achievement of National Natural Science Foundation of China[71272053]: "Quasi-rent Appropriation and Governance on Franchise Contract".

Sun Shulei (2008) supposed double moral hazard problem existing in franchise system of China.

Gaining enlightenment from Williamson's analysis, Grossman and Hart (1986), Hart and Moore (1990) designed GHM model. GHM model demonstrates that vertical integration can alleviate but not eliminate the hold-up problem induced by incomplete contracts and imports the renegotiation mechanism to eliminate it.

Klein (1992) believed self-enforcement of contract superior to court enforcement. Reputation plays vital importance in self-enforcement. Kaufman and Lafontaine (1994) analyzed quasi-rent arrangement between franchisors and franchisees of McDonald. It was found that quasi-rent appropriation did not appear even though special investment of human capital and material capital was involved and quasi-rent arrangement between franchisors and franchisees was negotiable. Huang Qunhui and Li Chunqi (2001) considered reputation mechanism playing the role of long-term incentives.

In incomplete contract theory, due to individual's bounded rationality, information dissymmetry and positive transaction costs, agents concerned and the third party cannot confirm or observe everything, which leads to the incomplete contract articles.

Jean Tirole (1999) attributed the incompleteness of contract to three factors: 1) the agents' rationality is bounded so as not to foresee all future contingencies; 2) even the agents can foresee all future contingencies, but the cost of writing them in the contract is high; 3) some information can be observed by agents, but it cannot be verified by the third party, such as court.^[2]

For the contract, the information of which is neither observable nor verifiable, the economic theorists call it "unavoidable incomplete contract". There are two key factors leading to "unavoidable incomplete contract": information incompleteness and specific investment. Franchise contract belongs to "unavoidable incomplete contract".

In recent years, the problems of franchising are increasing. These problems indicate that the management in China's franchise system is chaotic and various opportunistic and default behaviors between franchisors and franchisees are not uncommon. For better understanding and regulating franchisors and franchisees' behavior, this article explores franchising from the perspective of contract incompleteness and contract governance. 5 main parts are included in this article: Part 2 discusses the incompleteness of franchise contracts, Part 3 analyses performance barriers of franchise contracts, Part 4 gives some suggestions on contractual governance of franchising, and Part 5 makes a conclusion.

2 Unavoidable Incompleteness of Franchise Contract

In the mode of franchising, franchisees operate under a business format structured entirely by the franchisor. Franchisors provide the following items to franchisees: market concept, products ideas and design, operating manuals, quality standards, procedures for delivering products and so on. Franchisees are under the control of the franchisors and must follow the franchisors' guide. Franchisors and franchisees are connected together mainly through franchise contracts. Franchise contracts create neither an employment relation nor an independent contractual relationship.

2.1 Information incompleteness in franchising

The term "incomplete" suggests that term gaps exist in a contract and these term gaps will leave some contract content undefined unless the law supplements it with some gap-filling rules, such as a default rule or a maxim of interpretation.

The incompleteness of contracts does not signal inefficiency; rather often contracts are necessarily and intentionally made incomplete. Agents prefer incomplete contract to complete contract because of the transaction costs of contracting. Among various categories of transaction costs of contracting, the most salient one is information costs. Contracting is separated into two stages: front-end stage and back-end stage. At the front-end stage, ex ante transaction costs are incurred, including the costs of anticipating future contingencies and writing a contract which specifies the outcomes for these contingencies. At the back-end stage, ex post enforcement costs are incurred, including the costs of observing and verifying the relevant facts after uncertainty has been resolved. Both ex ante and ex post contracting costs make it impossible for the agents to write complete contracts. Meanwhile, franchisors and franchisees have to face the problems aroused by incomplete contracts.

In franchise system, such a fact must be recognized that franchisees are incapable of considering all relevant information before signing a franchise contract and making a well-informed choice. Two reasons can be used to explain the fact. Firstly, new franchisees joining a franchise system normally lack prior business ownership experience. It is not surprising that they know little about how to manage franchise unit ownership. The new franchisees are attracted to the franchise business format because the

franchisors provide them with the following: 1) an opportunity to join an already established business system; 2) site selection assistance; 3) initial and ongoing training; 4) detailed operational manuals.^[3] What the franchisors provide gives lots of confidence to the new franchisees whose business ownership experience is limited. What's more, when selecting new franchisees, many franchisors tend to prefer those who lack prior business experience. After all, comparing with experienced franchisees, inexperienced ones are easier to be controlled. Inexperienced franchisees are typically unaware of all the business and legal risks involved in owning a franchise unit. Furthermore, inexperienced franchisees may be unaware of where to look for the most accurate and qualified information on franchise business format. In addition to the awareness problem, franchisees may find it challenging to comprehend and evaluate the complicated legal and business data available for signing franchise contract. Owing to their inexperience, new franchisees generally lack adequate knowledge of franchise ownership terminology, the attributes of a franchise owned unit, criteria for evaluating a franchise system, and criteria for comparing different franchise systems. Secondly, novice franchisees have to deal with the difficulty of screening information. Optimal franchise investment decision requires franchisees to examine an overwhelming amount of complex information before signing franchise contracts. In details, the following screening tasks should be involved at a preliminary stage: reading complex franchise directories, reading articles in franchise business publications, attending business trade shows and expositions, and conducting related research on the internet. Following the preliminary stage, franchisees should acquire detailed business and legal information from franchisors. Then a massive amount of material will be received and this material will include lengthy promotional items, operational items, and complex legal items. Upon receiving this material, franchisees may take the following steps: interview potential franchisors and existing franchisees, examine lengthy and complex franchise contracts, review audited financial statements, and conduct trade-area surveys. It is challenging, to some extent impossible, for franchisees to fulfill all above-mentioned tasks.

Given the unawareness, comprehension limitation and screening difficulty faced by novice franchisees at the pre-contractual stage, they frequently discount important information, eliminate data and make decision based on the information obtained easily and quickly. For franchisors, the same situation exists as well. All of franchisors desire to find the most qualified franchisees, but it is very hard for them to get the complete information disclosing franchisees' exact truth of experience, identity, qualification and so on. All these lead franchise contract unavoidably incomplete.

2.2 Asset specificity in franchising

Four specialized forms are involved in asset specificity: specialized physical assets, specialized human assets, specialized site specificity and dedicated assets. All of these four specialized assets can be found in franchise system.

Franchisees have to make a large investment in physical assets, including constructing specialized building, purchasing special-purpose equipment and so on. In franchise system, investment in specialized human assets occurs as well. The way of investing in specialized human assets is less obvious than that in specialized physical assets. Through special investment in human assets, franchisees provide their employees specialized training and opportunities of learning-by-doing. As a result, employees' personal knowledge and specialized language are advanced. Personal knowledge helps to analyze scientifically the established industrial arts. In modern industry, personal knowledge is the essential part of technology. Specialized language composed of specialized code words or expressions leads to employees' further understanding and communication in the same industry.^[4]

In franchise system, though it is very necessary for franchisees to do special investments in physical assets, human assets and so on, these investments also give franchisors the chance to threaten the franchisees. After all, the value of specialized assets in their next-best alternative use is much lower, and this information is symmetrical to both franchisors and franchisees. Generally speaking, with special investment, franchisees can be effectively "locked into" the transaction to a significant degree. In turn, franchisees may reduce, sometimes significantly, their special investment, and the optimal investment cannot be achieved.

3 Performance Barriers of Franchise Contracts

3.1 Moral hazard problem in franchise system

As there exist such a fact in corporate world that an agent's effort level may not be fully observable, and consequently moral hazard problem arises. In principal-agent theory, moral hazard is one-sided problem. The principal is fixed and the agents are variable. For the moral hazard problem, only the

agents' actions matter. Take a firm and its manager as an example. The firm is fixed and its shareholders do not have to take efforts, so the firm is regarded as the principal. Meanwhile, the manager is variable and should do contribution to the firm's performance. The manager is regarded as the agent. Such a fact should be aware that the manager's self-interest is not always in accordance with the interest of the firm and sometimes the manager's effort does not benefit the firm's performance. As the manager's efforts cannot be fully observable by the firm, the manager is the subject of the moral hazard problem in principal-agent theory.

Double moral hazard is a little different from moral hazard. In a moral hazard problem, only one side matters, but in a double moral hazard problem, both sides matter because both sides need to take efforts for the value proposition of the relationship. Take an entrepreneur borrowing funds as an example. If an entrepreneur borrows funds from a traditional bank, only the entrepreneur may be involved in a moral hazard problem as the traditional bank need to do nothing after the loan is dispersed. The situation is different if an entrepreneur borrows funds from a venture capitalist. Double moral hazard problems may be unavoided because both entrepreneur and venture capitalist need to take efforts for maximizing the combined value.

The success of franchise system depends on the joint efforts of franchisors and franchisees. For franchisors, they treasure their reputation and brand value. For maintaining and improving their reputation and brand value, franchisors need to exert efforts in diminishing the learning curve of franchisees by providing detailed guidance and assistance of production. Meanwhile, franchisees also need to exert effort in maintaining and improving the reputation and brand value of franchise system, which in turn meet the franchisees' requirement of self-interest. In franchise system, joint efforts from franchisors and franchisees are critical. Therefore, double moral hazard problems are very prevalent in franchise system.

In franchise system, double moral hazard problems are classified into two categories: hidden behavior and hidden information.

3.2 Adverse selection problem in franchise system

In agency theory, adverse selection problem is aroused because the principal does not know well the agent's ability.^[5] Adverse selection problem seems to be unavoided under the condition that the principal cannot ascertain if the agent is capable of doing the work deserving his pay. It is accepted that the agent with higher level of competence should be paid more than that with lower level of competence. In franchise system, the franchisees' ability of operating business is not perfectly known by the franchisors. Though the franchisees' prior experience and the interview between two parties can present the franchisees' ability to some extent, it is still hard for the franchisors to thoroughly observe the franchisees' real ability. In summary, in franchise system, franchisees know better their ability of operating business comparing with franchisors. As a result, franchisors may take the risks of choosing some incompetent franchisees instead of competent ones, and the performance of franchise system will be affected. Similarly, the truth of franchisors' qualification of running business cannot be totally grasped by franchisees. Under the conditions of incomplete information and uncertainty, adverse selection is the problem which has to be faced by franchisors and franchisees.

3.3 Hold-up problem in franchise system

It is known that franchisees in franchise system need to make relationship-specific investment. Relationship-specific investment, combined with incompleteness of franchise contract, gives franchisors the opportunity to expropriate franchisees' investment revenue. Because of the expropriation franchisees are short of incentive of investing and optimal investment cannot be achieved. In Klein's opinions, after the relationship-specific investment, appropriate specialized quasi rents will take place and the opportunistic behavior will come into being. Generally speaking, in franchise system hold-up problem arises under these circumstances: firstly franchisees make high special investment, then special investment produces appropriate specialized quasi rents, and finally appropriate specialized quasi rents can be expropriated by franchisors with opportunistic behavior.

It should be aware that the reasons of hold up problem are not the same with those of moral hazard and adverse selection problems. For the moral hazard and adverse selection problems, it is asymmetric information that leads to opportunistic behavior. Yet for hold up problem, the information is symmetric to both franchisors and franchisees. It is contractual incompleteness that leads to ex post opportunistic behavior. In addition, in moral hazard and adverse selection models, franchisors are believed risk neutral and franchisees are believed risk adverse. In hold up model, the assumption is different. Both franchisors and franchisees are supposed to be risk neutral in hold up model.

How to motivate franchisees to achieve optimal investment is the topic attracting scholars to

consider for dealing with hold up problems. It is accepted that optimal investment cannot be achieved only depending on market and some other mechanism should be adopted.

4 Contractual Governance in Franchise System

In franchise system, franchisors and franchisees have to cope with the problems of moral hazard, adverse selection and hold-up. Because of bounded rationality, asymmetric information and high transaction costs, it is impossible for the parties in franchise system to create complete and legally enforceable contracts. Self-enforcing contracts are the considerable substitutes. There are three reasons: first, legally enforceable contracts are more costly than self-enforcing contracts. Second, for increasing joint surplus, franchisors and franchisees in franchise system tend to make credible promise over performance which is usually nonverifiable. Third, self-enforcing contracts helps to solve the multitasking problems in franchise system when verifiable and nonverifiable tasks exist simultaneously. In self-enforcing contracts, various self-enforcing mechanisms can be found, such as incentives, repeated interactions, reciprocity and so on.

4.1 Ensuring incentives in franchise contracts

In franchise system, the principle goal of franchisors is to induce more effort of franchisees. Two ways are generally used - monitoring and incentives. Monitoring entails keeping watch on franchisees and making sure that franchisees are exerting their full effort. However, high transaction cost is needed in the process of monitoring. Therefore, designing an incentive mechanism is a better choice.

What kinds of contracts may create incentives for reducing the common problems in franchise system? Fixed revenue contract is not the optimal way of dealing with the problems of moral hazard and adverse selection in franchise system. On the contrary, fixed revenue contract might motivate franchisees to shirk because the revenue will be the same regardless of work quality and levels of effort.

When franchisees have the tendency of shirking, fixed revenue contract should be replaced with the contract allowing residual claimancy on the profit of franchise system. A number of scholars have shown that the contracts including the provision of residual claimancy on the profits give the franchisees a strong motivation not to engage in the problems of moral hazard and adverse selection.

For turning franchisees into residual claimants on the profit of franchise system, franchisees should be owner-operators. Ownership is one of important incentives in franchise system.^[6] If the franchisees do not have ownership, they only take the roles of managers. Then franchisors must impose more cost of managing the agency relationship. Moreover, if the franchised unit is operated by franchisees who have not ownership, moral hazard and adverse selection will be the problems hard to avoid.

When designing incentive franchise contracts, a royalty rate is often the critical element. The role of royalty rate in motivating franchisees is shown in the literature. The franchisors should consider a royalty rate carefully. The size of royalty rate gives totally different effects on franchisors and franchisees. For the franchisors, the higher is the royalty rate, the greater is the franchisors' contribution to franchise system. But for the franchisees, the lower is the royalty rate, the greater is the franchisees' level of efforts. For motivating both franchisors and franchisees and then enhancing attractiveness of franchise system, an appropriate royalty rate should be adopted.

4.2 Extending contract duration

Longer contract duration plays a role in reducing opportunistic problems in franchise system.^[7] Longer contract duration induces more efforts of both parties in franchise system for three reasons. First, with longer contract duration, franchisors are provided with more incentives to engage in collecting more information of franchisees' operation. The increased information shows more details about the franchisees' identity and ability, and thereby reduces the adverse selection problems in franchise system. What's more, the increased information demotivates franchisees to shirk. Second, with longer contract duration, franchisors are able to differentiate precisely the effect of exogenous environment on performance from that of franchisees' shirking behavior. Therefore, moral hazard problems might be reduced. Third, with longer contract duration, what the franchisors gain by proper behavior may exceed what they get by opportunistic behavior. The problems of moral hazard and hold up in franchise system might be solved. Moreover, longer contract duration might make franchisees believe that the net present value of future earnings from not shirking exceeds any gains from shirking. Moral hazard problems could be reduced as well. Generally speaking, longer contract duration encourages franchisees to cooperate better with franchisors, the process of which is shown in Figure 1.

Figure 1 Game Tree of Franchisors and Franchisees

In Figure 1, A represents franchisors and B represents franchisees. At the first stage, if franchisors do not trust franchisees, the game will be over and the revenue of both sides is zero. If franchisors trust franchisees, the game will enter the second stage. At the second stage, franchisees might have two opposite choice. If franchisees choose to cooperate with franchisors, franchisors and franchisees will get 5-unit revenue respectively; if franchisees do not choose to cooperate with franchisors, franchisors will lose 5-unit revenue, but franchisees will get 10-unit revenue. With rationality economic participant assumption, franchisees will not cooperate with franchisors in the statistic and short-term environment in which one-time-only transaction happens. In such an environment, rational franchisors are able to predict franchisees' behavior in advance, so franchisors do not trust franchisees at the beginning. However, in the dynamic and long-term environment in which repetitive transaction happens, the behavior of franchisors and franchisees is different. Assume that every game structure is the same and the possibility for both franchisors and franchisees to enter next game is r , namely franchisees have the possibility of r to get 5-unit revenue in the next game process, and have the possibility of r^2 to get 5-unit revenue in next next game process. The expected total revenue of franchisees can be shown in this formula:

$$5 + 5r + 5r^2 + 5r^3 \dots = 5 / (1 - r) \tag{1}$$

When $5 / (1 - r) > 10$, $r > 0.5$, franchisees' optimal choice is to cooperate with franchisors.

4.3 Showing signals in franchise contracts

For dealing with opportunism in franchise system, some signals should be assigned positive weight in contracts.^[8] Performance measure can be contained in franchise contracts as an effective signal. Some other factors such as ability, private information and self-identity can play the part of effective signals in franchise contracts as well. There are two reasons explaining why signals should be assigned positive weight in franchise contracts. First, some sensitive and precise signals help franchisors to better evaluate the level of franchisees' effort. When noticing these signals, franchisees are encouraged to exert more effort. Thus, the moral hazard problem in franchise system might be eased. Second, with some signals in franchise contracts, such as performance measure and rewards based on ability, franchisees are provided with the incentive to disclose their hidden information and hidden behavior. More truth about franchisees will be discovered. As a result, the adverse selection problem in franchise system might be resolved. To summarize, signals in franchise contracts deliver more information about franchisors and franchisees, which help to cope with moral hazard and adverse selection problems.

4.4 Constituting implicit bonding in franchise contracts

Besides the problems of moral hazard and adverse selection, hold-up problem is also one of common problems in franchise system. We have known that hold-up problem appears due to contradiction involved in contracts. In franchise system, one side, franchisees need to do necessary specific investment for preparing for the future business and it is better to make the investment contractible for ensuring the revenue of investment; another side, because of bounded rationality and high transaction cost, parties in franchise system cannot regulate all possible contingencies in contracts. These two sides are contrary. The first side indicates that franchise contracts should be rigid for protecting ex ante specific investment. The second side indicates that franchise contracts should be flexible for finding the best business fashion after the states are confirmed.

According to the above analysis, both written items and unwritten items should be included in franchise contracts. Written items and unwritten items are also called explicit bonding and implicit bonding. Written items eliminate the incompleteness of franchise contracts and strengthen their rigidity. It is the third party, such as court, that is responsible for enforcing written items or explicit bonding. And it is parties themselves that are responsible for enforce unwritten items or implicit bonding.

Implicit bonding plays an important role in promoting self-enforcement of franchise contracts.^[9] In resolving hold-up problem, implicit bonding is more effective than explicit bonding. Implicit bonding stimulates parties of franchise system to compare the revenue of hold up with the loss of private sanction. When the loss of private sanction is more than the revenue of hold up, hold up problem will not happen even the franchise contracts are incomplete. Effective implicit bonding makes the owners of specific assets be clearly aware that they will be terminated from franchise system if their performance is poor. As going out of business, the specific assets will be sold off at a loss. The threat of termination for poor performance forces the owners of specific assets to give more contribution to franchise system. From this perspective, implicit bonding acts as incentive mechanism and reduces the chance of hold up. The more specific are franchise assets, the higher is the implicit bonding and thus the greater is franchise efforts.

5 Conclusion

Franchise activities started in the USA in the 1850s, and now have expanded world-widely. In 1987, it landed China with the opening of KFC's first franchise store in Beijing. By 2011, the franchise system of China has exceeded 5,000, and the total number of franchise stores has reached to more than 1,000,000, covering over 70 industries.^[10]

In China, franchise is developing rapidly and violently, but meanwhile many related problems cannot be ignored. Although Chinese government has promulgated a series of laws and regulations of franchising, the legislation in franchise protection is still a bit lagging. There exist various fraud behaviors between franchisors and franchisees. On the one hand, franchisors may be involved in squeezing franchise fee, free riding in advertising and so on; on the other hand, franchisees may be involved in divulging business secret, reducing product or service quality and so on.

With the rapid development of franchising in China, various problems in franchise system have aroused people's attention. In 2012, some of U.B.C. Coffee's franchisees decided to close down their stores, which resulted in their consumers losing the remaining money in consumer cards. Confronted with these issues, U.B.C. Coffee's franchisors announced that these franchise stores are independently owned by franchisees and their behavior has nothing to do with the franchisors. The U.B.C. Coffee's franchisors refused to take the responsibilities for these franchisees and the consumers did not retrieve their money finally. The case of U.B.C Coffee is not exceptional in franchise system of China, indicating that reasons of opportunistic behavior must be explored and various governance mechanisms must be found out.

In theories of contract, contractual incompleteness is the primary cause of opportunistic behavior in franchise system. There are several factors leading to incompleteness of franchise contracts: bounded rationality, asymmetry information and asset specificity. Because of these factors, both franchisors and franchisees are encountered with performance barriers during the period of fulfilling contracts. The common performance barriers of franchise contracts are moral hazard, adverse selection and hold up, which finally result in the occurrence of the following unexpected behavior: (1) neither franchisors nor franchisees exert the most effort in maintaining and improving the reputation and brand value of franchise system; (2) franchisors cannot find the most qualified franchisees and vice versa; (3) optimal investment cannot be achieved. It is worthy of considering this question: what governance mechanisms should be adopted to reduce the opportunistic behavior in franchise system? Contractual governance is a new but potential research area. This article analyses the positive function of incentives, contract duration, signals and implicit bonding in motivating contractual performance of franchisors and franchisees. In today's academia, research on contractual governance of franchising is still very limited. The author of this article is engaged in applying the existing achievement of contract theories to the resolution of opportunistic behavior in franchise system. The shortcomings of this article are that the author only focuses on the theoretical discussion, lacking necessary support of empirical research method. The future research on this area will try to make up for this deficiency. Based on the current theories, the research will be continued to explore such a series of questions: (1) among the variables promoting contractual performance in franchise system, what are the ones play the most important roles? (2) what's the relationship like between the most effective variables and the performance of franchise contracts? (3) Implicit bonding is an area worthy of doing more research. What is the essence of implicit bonding? Further research on these questions requires comprehensive application of qualitative and quantitative methods.

On Human Resource Management Innovation in Chinese Transnational Enterprises under the New Norm

Xiong Chenyu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: xiongbing@whut.edu.cn)

Abstract: China's economy has stepped into the New Norm, which will inevitably have a profound influence on the operation of the transnational enterprises. From mistakes exist in correct cognition of the concept of human resource management, scientific and rational employment system, incentive mechanism and measures of the talents and in enterprise culture management, this paper analyzes problems exist in human resource management in Chinese transnational enterprises under the New Normal, and put forward corresponding countermeasures in human resource management innovation under the New Normal: formulating human resource development strategies and constructing an internationalized human resource system; completing talent introduction mechanism in enterprises and deepening human resource management reform; establishing an people-oriented innovative talents incentive mechanism; respecting cultural differences and achieving an cross-cultural talent integrating management; respecting the value of knowledge and setting up learning organization.

Key words: The new norm; Transnational enterprises; Human resource management

1 Introduction

So far, researches on human resource development and management in transnational enterprises in western countries mainly focus on various modes, for example the American mode, the Japanese mode, the German mode and the British-Holland mode. Human resource management is influenced by different cultural and legal backgrounds, values, and education and training systems, and formed in the practice of transnational enterprises in different countries in operation. For these reasons, human resource management entails certain degree of regionalism, and thus is not entirely applicable in China's transnational enterprises.

Researches in our country on human resource management have a rather late start and are still premature. According to related researches in our country, most researches on human resource management in transnational enterprises are based on the perspectives of culture, economy and organization, which are, to some extent, unrealistic. Even if there are researches on the nature of human resource management, they can hardly be in line with the international management modes due to traditional management modes in our country. At present, with our economy development steps into the New Normal, the production and operation of the transnational enterprises are faced with another new economical situation. Thus, human resource management which is closely related to the economical benefit output must be adjusted and optimized. Therefore, the research in this paper on human resource management in transnational enterprises under the New Normal has certain theoretical and practical significance.

2 Features of Human Resource Management in Transnational Enterprises under the New Norm

The Central Economic Working Conference has made the judgment that our country has stepped into the New Normal, and the transnational operation will be faced with a more complex environment. According to current situation of human resource management in western transnational enterprises, human resource management in transnational enterprises present five features as follows.

The first feature is the globalization of human resource distribution. With the intensified competition between economic globalization and internationalization, human resource distribution in transnational enterprises has developed from the original colonization to localization, regionalization and globalization. And globalization strategy is the most fundamental and common strategy for transnational enterprises to select talents in the whole world. The second feature is the strategic human resource management. The so-called strategic human resource management is to treat human resource as a kind of strategic resource which is in coordination with the total strategy of the company development, and to raise the level of human resource management from an accessory and businesslike tactic level to the strategic height concerning the strength and competitive edge of the company. The third feature is

human resource management cross-culture. A stubborn challenge confronting the development of transnational enterprise is the cultural differences of human resources and the management of different cultures. On the basis of acknowledging, understanding and respecting such cultural differences and cultural diversity, human resource management in transnational enterprise conducts cultural exchanges, communications, penetration and blending to reach the integration of diverse cultures so as to achieve innovations in the culture and human resource management of transnational enterprises. The fourth feature is the diversification of incentive of human resource. As peoples' needs are transforming from the rather lower level to a higher level, the incentive mechanism or incentive measures must be changed too. The fifth feature is the flattening of human resource management organizations. In order to cut down the process of information communication, to reduce the information distortion, to ensure the effective use of information, and to achieve scientification of human resource management in transnational enterprises, they flatten their organizations by cutting down vertical organizations while reinforcing contact, communication, coordination and cooperation of horizontal organizations.

3 Problems in Human Resource Management in Chinese Transnational Enterprises under the New Norm

3.1 Lack of correct cognition of the concept of human resource management

The development and management of human resource is centered on people. It pursues the integration of people and work, and organically connect the development of people with that of the enterprises. The returning of humanity in management is one of the most prominent features of modernized personal management. But for a long time, there is no human resource management in Chinese transnational enterprises, there is only personal management which is centered on work. It requires people to adapt to works. The working performance assessments depend on the work requirements, and the salary allocation criterions depend on work characteristics, such as duty and level. By doing so, it restrains the initiation and creativity of people and severely influences the improvement of work quality and efficiency.

Chinese transnational enterprises do not have a long time learning of the concept of human resource management, and still there are many cases of work-centered human resource management. And even if there is such a concept, it usually ends up with no one include human resource management in the range of enterprise strategic management. Such kind of human resource management does not have a uniform plan of staffs including managers according to the needs of enterprise's development strategy, nor does it have a plan for regulations that confirm to the national policies concerning selection, employment and incentive, to make full use of people's creativity to increase the wealth of the enterprise and society. As a result, the personal management usually focuses on transactional operations while ignoring the development of people's potential. The misunderstandings in the concept directly lead to the misplacing of the position management system, which is the basis of the human resource management system. Other human resource managements such as recruitment, salary management and performance management are all formed on the basis of a sound position management system. The misplacing of the system further leads to the contradiction between the common position management system and the indefinable positions.

3.2 Lack of scientific and rational employment system and mechanism

Mistakes exist in talent introduction. At present, talent introduction in most transnational enterprises are biased. Some put great emphasis on education backgrounds while despising abilities, and worship higher education background. They pay much attention to education backgrounds while ignoring the qualities and practical abilities of the candidates when selecting talents, which causes a waste of talents. Some emphasize abilities and neglect cultivations. They only attach importance to technical abilities and management abilities while overlooking the moral cultivation of the talents, which results in disorders in operation management and losses in economy. Still, others value management and despise development. Human resource development in western countries gives priority to the development of managers, and then the development of staffs. While in our country, it is just the reversed case. Trainings on professional and technical personnel are insufficient.

Mistakes exist in talent appointment. In appointing talents, transnational enterprises emphasize grade differential and unified leadership and focus on internal training while ignoring work efficiency. And in performance assessment, they emphasize harmony. The group assessment tends to be empirical and the assessment process is not aboveboard. They do not have a sufficient acknowledgement of individual contribution, and this will affect the working enthusiasm and can easily lead to tremendous

talents outflows. Some enterprises do not have a balanced evaluation of talents. They attach great importance to the contributions of talents while neglecting the needs of individual development, which discourages their enthusiasms. Investment in talent development is insufficient, and staff trainings as well as daily training systems are far from enough. Even if there are related trainings, investment in the training and education of transnational talents is still low. Obstacles in talent flow will enormously reduce the attraction and vitality of enterprises, which in turn, would lead to greater talent overflow.

Mistakes exist in incentive mechanism and measures of the talents. Transnational enterprise is faced with international market. Driven by international market economy, staffs are not likely to offer their labor forces and auto excitation without gaining economic benefits. What's more, many enterprises do not allocate and distribute human as resources, and they do not have effective incentive measures. Due to lack of human resources and mature human resource development policies and laws, most transnational enterprises adopt the salary management mechanism in our country, that is, salary is closely related to staffs' education backgrounds and working ages, and in bonus allocation, the primary bonus is the group bonus. Not being related to the practices of other countries, such a mechanism will cause staff's salary to be below local standard, and result in overflow of expatriates. Usually, enterprises give staffs material rewards by raising salary and improving welfares, which will take effects in a short term. But no salary is too high to make people satisfied.

Mistakes exist in cultural management. A transnational enterprise will inevitably meet different faiths, concepts, values, working styles, working atmospheres and behavioral habits of other countries. Therefore, they must pay attention to cross-cultural and multi-cultural management, and gradually integrate their enterprise cultures with the local cultures. But since the managers hired in the operation sites have different management methods and skills, it is difficult for them to reach an agreement in management. Cultures in transnational enterprises present a conflict between the local culture and the enterprise culture. The enterprise lacks its own unique culture, and its culture construction is out of pace with human resource management. At present, most enterprises lay great emphasis on economic benefits with little emphasis on culture construction. Some even depart their cultures from human resource management for economic benefits. As a consequence, they end up calling on blind and useless slogans and it is hard for them to stimulate the sense of belongings and positive initiatives of their staffs.

4 Countermeasures for Human Resource Management Innovation under the New Norm

4.1 Formulating human resource development strategies and constructing an internationalized human resource system

The importance of human resource management is gradually showing in the daily management in transnational enterprises, and the overall significance and functions of human resource strategies have been highlighted. Our enterprises should shift their values as soon as possible and have a clear idea about the strategic positions of human resource, of human resource management and of human resource management departments. On the basis of a sufficient research on problems in enterprise management, enterprises need to set up their development strategies and operation objectives for the coming years, and then determine the corresponding organization frameworks and functional modes to formulate human resource development strategies. Meanwhile, they have to develop rapidly and take over the commanding heights in international competitions. They must study the globalized concepts of talents, basing upon our country and recruit, select and employ talents at the range of the whole world, especially those highly qualified research and development talents in science and technology and those top-ranking decision-making talents in the world, to construct the internationalized human resource system of world first class.

Taking Petroleum Group A, the listed state-owned enterprises, as an example, parts of its core business are enforced in overseas operation bases. Thus, it is a need to cultivate internationalized employees as well as to invite local employees to support operations. Company A insists on treating internationalization of talents as one of its development strategies, focusing on training skills in various aspects like language communication skills and abilities of translating technical materials. It was highly applauded by its owners for selecting mariners with prominent integrated ability and top level drilling engineers to engage in oversea operations, which in turn give a strong impetus to company's internationalized progress.

4.2 Completing talent introduction mechanism and deepening human resource management reform

Whether the staffs are valued and respected, the salary level, and whether the human resource management is humanized are all the information related to the reputation of an enterprise, and will eventually affect the recruitment. To truly solve the problems in human resource management, the enterprise have to be guided by the modern human resource management concept, based on sufficient study of the features, scales, organization structures, staff structures and development strategies of the enterprise operation and major problems in human resource management according to the principles of opening, marketizing and internationalizing and the characteristics of human resource management, to redesign the human resource management system on the whole, to achieve the essential revolution of human resource management mode and to establish the position management system, performance management system and salary management system according to the development strategies. It is also important to set up a scientific and fair selection mechanism, value the principle of allocation according to ability, gradually introduce and enhance competition system and implement the institution of competition, performance and employment; at the same time, lay emphasis on a proper proportion of person in technology, management and comprehensive aspects, and a proper structure of abilities; the age structure should be a mixture of the old, the middle aged and the young, bring in talents to optimize the structure and promote competition inside the enterprise.

Mariner is an important force in tens of thousands of staffs in Company A and is responsible for operating hundreds of offshore support vessels of the company. According to regulations and training rules of IMO (International Maritime Organization), it normally spends a substantial amount of time, usually three to over eight years, on training executive mariner (like the Second Engineer), which apparently fails to meet the growing business requirements. Therefore, Company A treat the strategy of talent introduction as a supplement. Business development requirements of the company are fully satisfied by establishing sound salary system and recruiting experienced and mature talents from other companies. The technical management team of the company is also strengthened which further enhanced the competitiveness of the company.

4.3 Establishing an people-oriented innovative talents incentive mechanism

One of the basic standpoints of human resource management in transnational enterprises is emphasizing and enhancing the people-oriented concept in order to further improve the incentive mechanism. The enterprises should value the careers of their staffs and strengthen the training of staffs. They should insist on putting training at an important place that concerns the survivor and development of the enterprise; put emphasis on completing regulations and building up training organizations, and make out a complete training plan, content, capital and system to build up a comprehensive training system and promote the carrying out of training. One of the characteristics of human resource management in transnational enterprises is emphasizing the career design of the staffs of different levels and types, and reinforcing the trainings and development of staffs. In the age of knowledge economy, staffs pay more attention to self-development and the promotion of self-value. Human resource management in our country should follow this trend and value the career design of the staffs, and make it scientific and feasible. When increasing investment, the enterprises also have to make full use of the training resources they have, and strictly regulate management, increase the efficiency of training expenditure, set up scientific and formal training expenditure management system, reinforce supervision over the use of education expenditure, regulate training expenditure and increase the efficiency of the expenditures. In doing so, it not only helps the staffs to achieve certain self-development and certain promotion of self-value, but it also exploits the staffs as a kind of resource, making them increase in value, and make effective use of such resource.

There are a number of junior staffs introduced by agents in Company A, the promotion and salary systems of whom existing distinct differences with that of senior staffs. To constantly motivate the growth of staffs in junior rank, Company A innovate human resource system by opening green promotion channel for excellent employees. To those junior employees who successively win the municipal prizes of Tianjin, the company will open up special promotional channels and help staff settle down in Tianjin. The system highly encourage junior staffs to be dedicate and responsible for their works.

4.4 Respecting cultural differences and achieving an cross-cultural talent integrating management

Management of human resource culture in transnational enterprises so far has become an important method. Respecting and acknowledging the objective cultural differences in cultural management, and extending the range of human resource management by implementing trans-cultural management. Transnational enterprises in our country are also faced with differences in humanities and cultures. Thus, it is required that they enhance effective analysis on these objective differences, and reinforce the effects

of cross-cultural management by creatively adopting various human resource management methods and by taking advantages of mainstream cultures on the basis of respecting cultural differences. More effectively promoting cohesion of the staffs thought efficient trans-cultural management. Strengthening cultural exchanges, penetrations and integrations by establishing unified values to realize the harmonious situation cross culture; hiding the special cultures of different countries and regions, and seeking similarity in specials to enable staffs from different cultures to get along with each other thought trans-cultural human resource management.

For this purpose, Company A regularly organizes cross-culture saloon, questionnaire survey, cross-cultural interviews, sporting competitions and the like. And it also actively builds up long-term mechanism and form big family of integrated culture, so as to foster friendly atmosphere for performing their abilities.

4.5 Respecting the value of knowledge and setting up learning organization

In the age of knowledge economy, innovation of knowledge is the start point or origin of economic growth. Talents working on knowledge innovation, especially talents in science and technology are the leading forces in knowledge economic growth. Therefore, in contemporary, human resource management in our country, on the one hand, should form the concept of respecting knowledge, respecting knowledge innovation, respecting talents working on knowledge innovation and respecting their roles in economic growth. On the other hand, they should emphasize and enhance knowledge management, make knowledge innovation, storage and application as well as its evaluation and stimulation an important part of human resource management, and realize the sharing of knowledge resources, and in so doing, turning the enterprise into a real learning organization.

Technical capability is the core competitiveness of Company A. The company launches activities like selecting academic papers and engaging in research projects of scientific innovation. It sets up coordination mechanism with Tianjin Association for Science and Technology, encouraging constructing study group to steadily strengthen employee's consciousness of business learning and on-the-job training, with the aim of further improving talent competitiveness.

5 Conclusion

Thought summarizing the current situation of human resource management in transnational enterprises in our country, the paper finds out that human resource management in contemporary transnational enterprises presents the characteristics of globalization, being strategic, diversification and flattening. And by analyzing the New Normal of our economy, the paper notices that there are mistakes in correct cognition of the concept of human resource management, scientific and rational employment system, incentive mechanism and measures of the talents and in enterprise culture management.

On this basis, the paper puts forward corresponding countermeasures for human resource management innovation under the New Normal: formulating human resource development strategies and constructing an internationalized human resource system; completing talent introduction mechanism in enterprises and deepening human resource management reform; establishing an people-oriented innovative talents incentive mechanism; respecting cultural differences and achieving an cross-cultural talent integrating management; respecting the value of knowledge and setting up learning organization.

Abstract: The influence factors of employee's anti-ethical behavior have always been the hot spot of the academic attention and discussion. The related researches paid little attention on the influence factors at organizational level, but mostly focused on the individual factors. Therefore, in view of this, the present paper explored effects of performance appraisal purposes and organizational ethical climate on employee's anti-ethical behavior. The result of empirical analysis from a sample of 245 employees indicated that, the evaluative performance appraisal purpose has significant positive influence on it; the developmental appraisal purpose has a significant negative effect on it.

Key words: Performance appraisal purposes; Employee's Anti-ethical behavior; Regression analysis

1 Introduction

With the economic globalization and market competition intensifying, managers increase employees' performance appraisal in intensity and frequency, but the results managers expected did not appear, on the contrary without reason absenteeism, cynicism's ethical behaviors have been happening. Research and practice show that employee's anti-ethical behavior would be a negative impact on organization, which hinder the organization development. Therefore, how to avoid the employees' anti-ethical behavior become one of the focuses of the researchers and practitioners. Based on this, the scholars began to explore the factors that influence the anti-ethical behavior of employees, expecting to clear the important reasons of staff's anti-ethical behavior through the related study, which can reduce and control the loss to organizations caused by the ethical behavior of employees through the corresponding measures. Previous research suggests that individual employee characteristics and cognitive have significant influence on the anti-ethical behavior of employees, but ignores the influence factors of organizational level. Therefore, this paper discusses influence of different types of performance appraisal purpose on employee's ethical behavior, to enrich the study of the theory of the employees' anti-ethical behavior influence factors, and in practice for managers to reduce and avoid the ethical conduct staff for reference.

2 Definition and Theoretical Assumptions

2.1 Employee's anti-ethical behavior

Employees' anti-ethical behavior is based on the will of employees' own, or a kind of ethical behavior that cause the recessive or dominant loss to the lawful rights and interests of the organization and other members. Robinson and Bennett (1995) study have shown that the staff's being late, absenteeism such negative work behaviors in the working process are employees' anti-ethical behaviors^[1]. Bordia (2008), and other studies suggest that with the progress of information technology, employees' anti-ethical behavior has become more secluded and make managers difficult to detect in time, the consequences are harder to predict and measure, but their behaviors still exist the following common characteristics: the first is the behavior obviously does not meet the organizational expectations and ethical behavior norm; The second is its behavior is intended, not employees' unintentional mistakes; The third is the result of its behavior is difficult to use financial data for quantitative assessment, but to organization a lasting and negative effect^[2]. Chinese scholars Liu Yuxin (2011) and Zhang Yongjun (2012) study found that the employee's anti-ethical behavior is from the employee's intention, but at the same time, the influence factors of the outside world also cannot be ignored, and this kind of behavior in the organization's rules and regulations is not banned, managers can't make convincing punishment basis^[3-4].

2.2 Performance appraisal purposes

* This paper is supported by the national natural science fund project (71162026) and innovation project of Guangxi graduate education (YCSZ2015209).

On the basis of Cleveland (1989) and others, the definition of performance appraisal purpose refers to the ways and methods organization used for performance appraisal information^[5]. The purpose of performance appraisal can be subdivided into different types. As Douglas (1959) the purpose of performance appraisal is divided into three categories: management and incentive purpose, information purposes^[6]. Subsequently, Meyer (1965) through field investigation, found that there are two main types of organization performance appraisal purpose: one is evaluative performance appraisal purpose, namely the performance appraisal as an employee compensation, promotion and punishment basis; Secondly, developmental performance appraisal purpose, that is, performance appraisal mainly to feedback the defects of employees at work, and accordingly put forward the improvement opinion or suggestion. Performance appraisal becomes a kind of important employee incentive methods for organization^[7]. Kuvaas (2007) study also pointed out that the performance appraisal is not only the means of measuring the level of employee performance, is also a potential means and way to motivate employees^[8]. On the basis of the dichotomy that widely adopted by many scholars, this paper divides the purpose of performance appraisal purpose into evaluative and developmental performance appraisal purpose, and then discusses effect of the two different types of performance appraisal purpose on employee's anti-ethical behavior.

2.3 Research hypothesis

2.3.1 Evaluative performance appraisal purpose affects on employee's anti-ethical behavior

According to social exchange theory, the staff and organization in essence is a kind of exchange relationship. When employees are rewarded by organization, employees will show the positive initiative at work; when employees in an organization get unjust punishment, or employees feel pressure from organizations more than their bearing ability, the employees will appear negative emotions, and may produce malicious revenge towards the organization. The main effect of evaluative performance appraisal is intended to reflect the work level of employees, but as the intensity and frequency of assessment increase, employees may largely show resistance and negative emotions. Boswell and Boudreau (2002) research indicates that when organizations take administrative measures to control employees' behavior, only focusing on employees' behavior results through human resource management, the professional training and professional development the employee get is the least, the staff's work enthusiasm will be greatly reduced, the negative emotion is easy to appear in the work, and the possibility of employees' anti-ethical behavior will increase^[9]. This suggests that the evaluative performance appraisal purpose which views performance information as evaluation tool of employees' behavior results may play a positive role in promoting employees' anti-ethical behavior. Based on the above analysis, this paper puts forward the following hypothesis:

Hypothesis 1: Evaluative performance appraisal purpose and employees' anti-ethical behavior is positively related.

2.3.2 Developmental performance appraisal purpose affects on employee's anti-ethical behavior

Although very few scholars in the existing empirical research directly explore the relationship between developmental purpose of performance appraisal and employees' anti-ethical behavior, there are still some research indirectly prove the relationship between the two. Spector and Fox (2005) in its pressure source -- emotion theory, points out that employees' anti-ethical behavior is mainly transformed by their emotions, and the generation of emotions may be affected by environmental pressure^[10]. Purpose of performance appraisal, as an important source of organizational environment pressure, may affect employees' emotions, which may affect employees' behavior. Subsequently, the bank staff as the research object, Kuvaas (2007) study found that developmental performance appraisal purpose has a certain degree of influence on employees' job performance level^[8]. The staff in the hotel industry in Hong Kong as the research object, Andrew (1998) study results confirmed that high performance human resource management practices has a positive effect on reducing staff turnover intention and increasing their job satisfaction^[11]. Human resource management of high performance on the contents includes the developmental performance appraisal purpose, which means that the developmental performance appraisal has a certain effect for the employee satisfaction and turnover intention. Under the condition of high employee satisfaction and low turnover intention, the possibility of employees' anti-ethical behavior is reduced, which from the side reflects the developmental performance appraisal purpose may have a reverse effect on employees' anti-ethical behavior. Based on the above analysis, this paper puts forward the following hypothesis:

Hypothesis 2: Developmental performance appraisal purpose is negatively related to the employees' anti-ethical behavior.

3 The Empirical Analysis

3.1 Sample and data collection

Domestic enterprises in our country as the background, this study uses the existing mature scale questionnaire as prediction. On-the-job graduate students of enterprise management in a university in southwest chosen as the pre-test study object, 50 effective questionnaires are obtained. According to the principle of exploratory factor analysis, the data is analyzed and processed, and a formal questionnaire is formed. To conduct a formal investigation, we mainly choose private manufacturing industry where the employees' ethical behavior phenomenon is outstanding, more than 10 representative home scale manufacturing companies in central and southern China areas as the research object, enterprise grass-roots employees as the research sample. The formal questionnaire takes paper and Internet questionnaires two forms. A total of 300 questionnaires are distributed, 267 questionnaires recycled, recovery rate 89%, effective questionnaires 245, effective questionnaire recovery rate 92%. Questionnaire recovery time is February 2015 to May 2015. The demographic characteristics of the sample is as follows: gender, men accounted for 43.7%, women accounted for 56.3%; Age, under the age of 25 (33.9%), 25 to 30 years old (50.2%), 31-40 accounted for 13.9%, over 40 accounted for 2.0%; Education background, high school, technical secondary school and the following accounted for 7.8%, college accounted for 45.7%, all bachelor degree and above accounted for 46.5%.

3.2 Variable measurement

This questionnaire has three parts, the independent variable performance appraisal purpose, the dependent variable employees' anti-ethical behavior, and control variables. The five point scale of likert evaluation is adopted.

Boswell and Boudreau (2000) study found that the staff individual perception can more effectively reflect the organization's performance appraisal purpose^[12]. In view of this, we used the Cleveland scale (1995), the performance evaluation purpose, and we has made the exploratory factor analysis on the basis of our country enterprise situation, further testing whether scale item meets the experiment requirement. Eventually scale of performance appraisal purpose which contains nine items is formed^[5]. In this study, in the scale of evaluative and developmental performance appraisal purpose, the Cronbach coefficients of internal consistency are 0.83 and 0.81.

Fox (2007) study found that the colleague's anti-ethical behavior description can reflect in a certain extent the real situation of anti-ethical behavior of employees tested^[13]. Cole (2008) study also confirmed that colleagues' anti-ethical behavior will affect other employees' anti-ethical behavior^[14]. Stewart (2009) and O'Boyle (2011) on the basis of the projection theory, adopted the form of reference point shift, asking the tested employees to answer the anti-ethical behavior of colleagues, which indirectly reflected their own anti-ethical behavior^[15-16]. We used Stewart (2009) scale for reference, and combined with the situation in our country; deleted entries such as racial discrimination which obviously didn't according with the reality of our country, then made an exploratory factor analysis, and finally formed the employees' anti-ethical behavior of the six items^[15]. In this study, in the employees' anti-ethical behavior scale the Cronbach internal consistency coefficient is 0.79.

3.3 Empirical results analysis

3.3.1 The reliability analysis of scale

This research adopts the mature scale, in order to ensure the reliability of questionnaire we estimate its reliability through Cronbach's Alpha coefficient and factor load. The results show that Cronbach's Alpha coefficients of each scale are all between 0.70 and 0.85, each factor loading above 0.5, which shows good reliability of the scale.

3.3.2 Correction analysis

Correlation analysis results from employee's anti-ethical behavior with evaluative and developmental performance appraisal purpose show that the coefficient correlation: 0.401 and -0.197, the significance level is less than 0.001, shows that employee's anti-ethical behavior and developmental performance appraisal purpose negative correlation, and the evaluative performance appraisal purpose has significantly positive correlation.

Table 1 Hierarchical Linear Regression Analysis

Steps/Variable	Model 1 β	Model 2 β	Co linearity Statistics			
			Model 1		Model 2	
			Tolerance	VIF	Tolerance	VIF
Control variable						
1 Gender	0.041	0.084	0.992	1.004	0.981	1.013
2 Age	0.059	0.071 ⁺	0.928	1.042	0.907	1.068
3 Degree	0.253	-0.047	0.928	1.042	0.902	1.135

3.3.3 Regression analysis

The multiple regression model analysis results of the independent variable on the dependent variable are shown in table 1. The data in the table shows that VIF values of evaluative and developmental performance appraisal purpose and the employees' anti-ethical behavior are all less than 5, which shows no co linearity problem between the two. In model 2, the regression coefficient of evaluative and developmental performance appraisal purpose and the dependent variable are respectively, 0.403 and -0.202, significant at a 0.001 significant level, the evaluative performance appraisal purpose has significant positive effects on employees' anti-ethical behavior, and developmental performance appraisal purpose has significant negative impact. This study of H1 and H2 hypothesis is verified.

4 Conclusion

Although this study provides an important theoretical promotion and practice reference to promote the management of employees' anti-ethical behavior, there is no denying that this research also has certain shortcomings. Limitations of this study are mainly manifested in the following aspects: first, this study explores the influence factors of employees' anti-ethical behavior from performance appraisal purpose in organizational level and organizational ethical climate the two aspects by cross-sectional study design. Due to the limitation of cross-sectional design, causality is difficult to determine. Therefore, a longitudinal study design in the future can be used, namely after a certain period of time in measuring organizational performance appraisal purpose and organizational ethical atmosphere, to measure employees' anti-ethical behavior to more clear causal relationship between them. Second, this study data is from the employee's individual presentation, although the statistical tests do not exist significant homology error, the future research can try to collect data from multiple sources, to further test research conclusion of this article; Third, this research only discusses the effect of the performance appraisal purpose on employees' anti-ethical behavior. It helps to expand the defects of the previous studies which only explore employees' individual factors, and contributes to a more comprehensive understanding of the influence factors of employees' anti-ethical behavior. However, other factors in organizational level, as well as the mechanism of the organization level and individual level factors in affecting employees' anti-ethical behavior, are not clear.

The future research can further discuss this area. In general, how to effectively avoid employees' anti-ethical behavior is a long-term and arduous theoretical and practical subject. In the future, under the background of China's enterprises, this subject should be explored, to provide a more comprehensive understanding of employees' anti-ethical behavior, so as to help further promote the theory research of employees' anti-ethical behavior, and provide more valuable guidance and reference for the organization and management practices.

Enterprise's Operating Performance, Nature of Property Rights and Government Subsidies: A Empirical Study

Yang Sunlei, Xu Yiyang, Wang Qianru, Xiang Yue

School of Accounting, Wuhan Textile University, Wuhan, P.R.China, 430200

(E-mail: 50495815@qq.com, 923901143@qq.com, 641579490@qq.com, 2933588035@qq.com)

Abstract: This paper examines that enterprise business performance as well as nature of property right influence on government subsidies with method of multivariate regression analysis, by using data of listed companies in Chinese textile industry in 2007-2012. The conclusion shows that the better enterprise performance is, the greater possibility of the enterprise to obtain government subsidy is and the higher degree of the enterprise to get government subsidies is. Compared with the non state-owned enterprises, state-owned enterprises obtain higher degree of government subsidies, and state-owned enterprises operating performance and the degree of government subsidies obtained by enterprises have the stronger positive relationship.

Key words: Object of government subsidies; Level of government subsidies; Business performance; Nature of property rights

1 Introduction

China is the world's largest producer and exporter of textile and garment, textile industry's growth plays a vital role in Chinese foreign exchange reserves, the balance of international payments, the RMB exchange rate stability, the solution of the social employment and the textile industry's sustainable development. In recent years, the textile industry is facing with rising prices for raw materials, labor costs rising, the pressure of RMB appreciation, technical barriers of international trade, trade friction and other real pressure. Government subsidies to textile enterprises can not only reflect the government's behavior motivation, but also can reflect the relationship between the government and textile enterprises. For the motivation of government subsidies is to support the strong or protect the weak, academic circles don't reach an agreement now. Tang Qingquan and Luo Danglun (2007)^[1] find that the public company which is at the edge of keeping the honor "Listed Company" and rationing shares will get more government subsidies. Shao Min (2011)^[2] points out that local government prefer to choose export company or the company with strong new product development or the company with higher total factor productivity as subsidy object, the subsidy object's decision of local government reflect "support the strong". But the subsidies' degree decision of local government reflects "protect the weak". Geng Qiang and Hu Ruixin (2013)^[3] show, the probability and degree that enterprises obtain subsidies is not only influenced by own endowment and the nature, and are closely related with facing the unfavorable situation in the process of production and operation. The enterprises which are facing loss and are at the low degree of financing constraints are more likely to receive government subsidies, the degree of its subsidies is relatively high, namely whether government subsidy object or the degree of government subsidies, embodying the characteristics of "protect the weak".

This paper use data of government subsidies of textile listed companies in 2007-2012, to discuss the influence of enterprise business performance as well as the nature of the property right on objects and degree of enterprise's government subsidies. The innovation of this paper is, based on the China's traditional textile industry, discussing the motivation of government subsidy object and the influence factors of government subsidies, which is not only added to relevant literature about government subsidies, also provide a certain basis for regulators about how to develop the textile industry policies.

2 Theory Analyses and Research Hypothesis

From the perspective of government subsidy policy in China, the connotation given by China's government subsidies are "support the strong" and industry guiding principles, which is, government subsidies have priority to support enterprises to exploit market, expand exports, support enterprise technology innovation, equipment updating and industrial upgrading. From this perspective, the textile industry as the traditional important industry in China, whether government subsidy object or degree of government subsidies, seems that should reflect the characteristics of "support the strong". for this, this paper proposes two groups opposing assumptions:

H1a: textile enterprises which have worse operating conditions are more likely to receive

government subsidies and the higher degree to get government subsidies.

H1b: textile enterprises which have better operating conditions are more likely to receive government subsidies and the higher degree to get government subsidies.

Yifu Lin, Zhiyun Li (2004)^[4] point out that state-owned enterprises maintain local employment, providing local public goods and other social burden, so the government provide subsidies and policy loans, etc., thus enterprise is facing soft constraint of budget. Shleifer et al (2012)^[5] prove that low efficiency of state-owned enterprises is for the reason that politicians encourage to hire redundant workers, and the government will grant subsidies to state-owned enterprises for the inefficiency caused by employment burden. On the other hand, State-owned enterprises may be a pillar and dominant industry in some regions, enterprise's contribution to the local total output is larger, the ability to absorb employment is also strong, which influences on the local economy. Local government is to maintain regional economic image and to improve its performance, which is often in different cases that enterprise oneself have circumstance differences, the state-owned enterprises may enjoy more government subsidies than non-state-owned enterprises or give more degree subsidies to state-owned enterprises. for this, this paper puts forward hypothesis 2:

H2: Compared with non-state-owned textile enterprises, state-owned textile enterprises are more likely to receive government subsidies, getting higher degree of government subsidies.

From the angle of enterprise property rights, China's capital markets germinates in state-owned enterprises reform, the original intention of establishment is for state-owned enterprises to bail out and solve financing problem. So far, the listed companies still have a large part of the enterprise which is composed of state-owned enterprise restructuring, while China has basically completed shareholding reform, the state-owned enterprises and private enterprises still may be treated differently in the securities market, when facing business performance, state-owned enterprises are often more likely to get more government subsidies than private enterprises. For this, this paper puts forward hypothesis 3:

H3: Compared with the non state-owned enterprises, corporate performance of state-owned enterprises and the possibility of government subsidies as well as the relationship between the degree of government subsidies significantly strengthened.

3 Research Design

3.1 Sample selection and data sources

To examine the research hypothesis, this paper choose data of A-share listed company in Chinese textile industry from 2007 to 2012, the sample distribution is: 53 in 2007, 56 in 2008, 58 in 2009, 61 in 2010, 70 in 2011, 73 in 2012, A total of 371 samples, which have been rejecting the data of missing samples. The data of government subsidies is collected in the annual report which is in hand, other data from CSMAR database. The data processing use Excel and stata11.0 for processing.

3.2 The definition of research variables

3.2.1 Explained variable

Explained Variable we study is the government subsidies, that is, a member of the government or any public institutions provide some enterprise financial donations as well as the price or income support for some enterprises to directly or indirectly increase the output of a product or reduce the input of a product within its territory, or the government measures which will damage other member's interest. Government subsidies should contain object and degree of subsidies, explained variable includes the subsidy object and the level of subsidy in this paper. Subsidy object is set to the dummy variable, if receiving the government subsidies is 1 and not receiving is 0. In order to eliminate the influence of the enterprise's scale, the degree of government subsidies choose the amount of government subsidies divided by the final total assets.

3.2.2 Explanatory variables

Explanatory Variables are enterprise performance and nature of property rights. Due to the amount of government subsidies accounted for as non-operating income, which will affect the total profits. In order to eliminate the influence, the business performance of enterprise is represented in the operating profit divided by the final total assets, the nature of property rights is set as the dummy variable, enterprises which belongs to state-owned property is set to 1, otherwise it is 0.

3.2.3 Control variables

Reference to previous research, this paper will also take enterprise scale, enterprise growth, asset-liability ratio, and the year as control variables. The main variables and their connotation can be summarized as shown in Table 1.

Table 1 Variables Defined Table

Variable name	The definition of a variable
zfbt1	object of Government subsidy , dummy variable, 1 represent the obtaining of the government subsidies, otherwise it is 0
zfbt2	The degree of government subsidies, the government subsidy amount / total assets
yeji	Enterprise performance, operating profit / total assets
state	The nature of property right, dummy variables, 1 represents state-owned enterprises; 0 represents the non state owned enterprises
Size	Scale of the enterprise, at the end of the logarithm of the total amount of assets
Lev	Asset liability ratio, total debt / total assets at the end of the end of the year
Growth	Company growth, the growth rate of sales income relative to the previous year

3.3 The design of research model

In the study of practical problems, the change of the dependent variable is often influenced by several important factors; multivariate regression is the method that two or more than two factors explain the changes of independent variables as dependent variables. When there is a linear relationship between multiple independent variables and dependent variable, regression analysis is a multiple regression method. In order to test the hypothesis in this paper, this paper uses multivariate regression method, and the basic model of the empirical test is set to:

$$X \in R_{+}^{m \times n} \tag{1}$$

4 Empirical Tests and Analysis

4.1 Descriptive statistical analysis

Table 2 Variable Descriptive Statistics Table

Variable	Obs	Mean	Std. Dev.	Min	Max
zfbt1	371	.9057	.2927	0	1
yeji	371	0.0579	0.3595	-0.3192	3.4240
state	371	0.531	0.4997	0	1
size	371	20.9714	3.3053	-9.2103	24.4594
growth	371	0.2107	1.1122	-0.8889	10.2176
lev	371	0.4572	0.2209	0.0535	1.1412
zfbt2	336	178.5714	1884.173	1.34e-09	20000

Note: the continuous variables in the table on the top and bottom 1% points have been winsorized shrinkage end processing.

Table 2 is descriptive statistical analysis of the main variables of textile listed companies in 2007-2012. Table 2 can be found: 90.57% of the sample companies receive government subsidies, which shows that the textile industry is one of which the government subsidies is main. The average government subsidies of sample companies are 178.5714 times of its total assets. The minimum value for the government subsidies is 1.34e-09 times of its total assets, the maximum for government subsidies is 20000 times of its total assets, which proves Chinese listed companies of textile industry generally receive more government subsidies , but there is a big gap in the government subsidies among different listed companies, the government subsidies that some enterprises have obtained is almost negligible, but some enterprises get 20000 times government subsidies than its total assets . The average of the profit margin of total assets is 0.057937, the minimum value is -0.31919, the maximum value is 3.424017, which shows that the textile industry’s business performance are not very good overall, the minimum of profit margin of total assets is -0.31919, the maximum of profit margin of total assets is 3.424017, the gap of the company operating conditions are not particularly large. In addition, the state-owned enterprises accounted for 53%, the average asset-liability ratio is 45.72%, and the average asset’s growth rate is 21%, which belongs to the situation of high debts and low growth. Overall, the distribution of the main variables of the sample is uniform, so we can carry out regression analysis.

4.2 Correlation analysis

To test object and degree of government subsidies, and the relationship between the other control

variables and corporate performance, the nature of property rights, we carry out the correlation coefficient analysis to main variables, as shown in table 3.

Table 3 Variables with Correlation Coefficient Table

Var.	zfbt2	zfbt1	yeji	state	size	growth	lev
zfbt2	-	0.46 ***	-0.06	-0.09 *	-0.48 ***	-0.07	-0.06
zfbt1	-0.06	-	0.07	0.01	0.19 ***	0.15 ***	0.1*
yeji	0.71 ***	0.06	-	0.16***	0.23 ***	0.33 ***	-0.36***
state	0.1*	0.01	0.07	-	0.12**	0.09*	0.04
size	-0.96***	0.13**	-0.66***	-0.04	-	0.24***	0.22***
growth	-0.02	-0.02	0.24 ***	0.03	0.02	-	0.04
lev	0.26 ***	0.07	0.1*	0.07	-0.17***	0.01	-

Note: the upper part is the Spearman test, the lower part is the Pearson inspection - statistics in parentheses ($p < 0.01$, *** $p < 0.05$, $p < 0.1$).

It can be seen from Table 3, the object and the degree of government subsidies have a significant correlation with corporate performance, the nature of property rights, which shows the object and the degree of government subsidies are affected by corporate performance and the nature of property rights, but whether the effect is stable still need regression test, in addition, the most of correlation coefficient between the other explanatory variables is below 0.5, we can preliminary estimate that there is no co linearity of research.

4.3 Regression test and analysis

Through stata11.0 it has carried on the regression analysis to type 1, regression results are shown in Table 4.

Table 4 Regression Analysis Table of Government Subsidy

VARIABLES	Panel A	Panel B	Panel C	Panel D
Constant	-8.957 ***	-5.846	8,649.532 ***	3,278.251 ***
	(-2.717)	(-1.392)	(5.714)	(10.966)
yeji	4.653 ***	9.323 ***	1,497.051 **	101.812 **
	(3.424)	(2.762)	(2.083)	(2.132)

growth	-0.106	-0.087	-163.249*	-30.16**
	(-0.400)	(-0.341)	(-1.774)	(-2.563)
lev	1.36	1.259	860.243***	676.264***
	(1.458)	(1.306)	(6.674)	(11.555)
Year	control	control	control	control
Robust	control	control	control	control
Observations	371	371	336	336
Adj R2 / Pseudo R2	0.1362	0.1444	0.942	0.988

Note: Robust t-statistics in parentheses, *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$

In the Table 4, Panel A and Panel B report the results of regression testing of the object of government subsidies. From Panel A we can see, the performance of enterprises was positively related to the possibility of access to government subsidies (coefficient is 4.6527), which is significant

in the 1% conditions, namely, the better enterprise operating performance is, the bigger possibility of the enterprise to obtain government subsidy is, so the results of test partially confirm the H1b. The results show that China's local governments choose subsidies object according to characteristics of "support the strong". the nature of property right of enterprises is negatively related to the possibility of obtaining government subsidies (the coefficient is -0.278), but which is not significant, so the results of test failed to confirm the H2. The results show that China's local governments choose subsidy object, mainly based on operating performance, whether state-owned enterprise or not. The interaction term coefficients of the nature of property rights and corporate performance is -6.0337, which is also not significant in the statistics. Therefore it also failed to confirm partly H3. Panel C and Panel D report the results of regression testing of the degree of government subsidies. From Panel C we can see, enterprise's performance and the degree of obtaining government subsidies are positively correlated (the coefficient is 1497051), which is significant under the condition of 5%, namely, the better the enterprise business performance is, the higher the degree of government subsidies to be obtained, so the results confirm the H1b. The nature of property right and the degree of obtaining government subsidies are positively correlated (coefficient is 135.0930), which is significant under the condition of 5%, that is, compared with state-owned enterprises, the degree of government subsidies for state-owned enterprises is greater, so the result confirm part H2. From Panel D we can see, after models are added in the nature of property rights and corporate performance's interaction, the coefficient of nature of property right is 75.6558 which is significant under the condition of 1%. Putting the two influence together, it shows that compared with state-owned enterprises, there is a stronger positive correlation between operating performance and the degree of obtaining government subsidies in state-owned enterprises, and therefore the result confirmed part the H3. Although when China's local governments choose subsidize object there is no significant difference for state-owned enterprise and non-state-owned enterprise, however, when considering the intensity of subsidies there is significant difference for state-owned enterprise and non-state-owned enterprise. In addition, the scale of enterprise and the possibility of obtaining government subsidies have significantly positive correlation, which shows that the bigger the scale of enterprises is, the more likely the enterprises to receive government subsidies, the scale of enterprise and the degree of obtaining government subsidies has significantly negative correlation, that is, on the contrary, in the enterprises of obtaining government subsidies, the larger the scale of enterprises is, the smaller of the degree of obtaining government subsidies is. Asset-liability ratio and the degree of government subsidies have significant positive correlation, namely, the greater the asset-liability ratio is, the higher the degree of obtaining government subsidies is.

4.4 Robustness test

In order to test the robustness of conclusions, this paper use Qiang Geng and Ruixin Hu (2013)^[3] approach for reference, using the ratio of amount of government subsidies and the average government subsidies level in those year as alternative variable of the degree of government subsidies, using the difference between gross profits of enterprises and subsidies as the alternative variables of business performance, the test's results are basically same with the original results.

5 Conclusion

This paper is based on this unique angle view of textile industry, using Chinese textile listed companies' government subsidies of sample data from 2007 to 2012, discussing enterprise operating performance as well as the nature of property right of enterprise influencing the objects and degree of government subsidies. Results show that: Firstly, the better enterprise business performance is, the greater the chance of government subsidies is, the higher the degree of obtaining government subsidies is, which shows the characteristics of "support the strong". Secondly, compared with non-state-owned enterprises, state-owned enterprises get more government subsidies. However, different nature of property rights of enterprises was no significant difference in statistic on the possibility of receiving government subsidies. Thirdly, compared with non-state-owned enterprises, operating performance of state-owned enterprises has stronger positive correlation with the degree of receiving government subsidies, but the strengthening effect did not reflect on the possibility of receiving government subsidies. In addition, the scale of enterprise has significantly positively relation to the possibility of receiving government subsidies, showing that the bigger scale of enterprise more likely to receive government subsidies, the scale of enterprise has negative correlation with the degree of receiving government subsidies, proving that among the enterprises that obtain the government subsidies, the larger the scale is, the smaller extent to get government subsidies is. Asset-liability ratio

has significantly positively relation with the degree of receiving government subsidies, namely the higher the asset-liability ratio is, the higher degree to receive government subsidies is.

We can learn that, to a great extent, the government subsidies of textile industry shows the effect of “support the strong”, which conforms to the “winners” connotation and industry oriented principle of China's government subsidies. In addition, government subsidies do exist state-owned preference and scale preference, but the state preference only exists on the degree of government subsidies, and don't reflected on the object of government subsidies. The existence of this preference also means that these enterprises have more policy burden, such as the maintenance of employment, these practices are unfavorable to improve the enterprise's own efficiency of resource allocation and competitiveness, so in the process of government intervention in the economy, government should use market mechanism as the principle to promote enterprises independent development and fully competitive.

Analysis on the Relationship among Relative Leader-Member Exchange, Organizational Citizenship Behavior and Social Comparison Orientation*

Zhu Shuang, Ma Lu

School of Management, Guangxi University of Science and Technology, Liuzhou, P.R.China, 545006
(E-mail: 357983647@qq.com, malu6655@163.com)

Abstract: Existing research shows that the employee's relative position in the team is an important factor to influence employees' organizational citizenship behavior. This research investigates the relationship between relative leader-member exchange (RLMX) and organizational citizenship behavior (OCB) in sample of 533 employees from 79 groups. By using the multi-layer linear regression method, the results show that RLMX has a significant and positive impact on OCB. Moreover, high social comparison orientation (SCO) has a negative influence on this relationship. Under the moderating effect of SCO, the impacts of RLMX on OCBO are greater than that on OCBI.

Key words: Relative leader-member exchange (RLMX); Relative position; Organizational citizenship behavior (OCB); Social comparison orientation (SCO)

1 Introduction

Due to the team leader keeps different quality of exchange relationship with different members, the differentiation is likely to cause social comparison between staff, thus everyone in team will form their own relative leader-member exchange (RLMX), and this impact will be reflected in the employee behavior. Therefore, discussing how to balance the relationship between RLMX and employee performance has a realistic significance.

In terms of the present empirical study, RLMX closely linked with organizational citizenship behavior (OCB) has received theoretical and empirical supports, but these conclusions have some contradictions. Vidyarthi et al. (2010) showed there is a positive correlation between RLMX and OCB; While Li et al. (2014) found that the correlation between RLMX and OCB is not significant. Therefore, this paper believes that it is necessary to dig deeper into the possible boundary conditions, to explore the circumstance when high RLMX will bring more/less OCB.

Employees always evaluate their relative positions after a series of social comparison, and in the process of comparison, the level of individual social comparison orientation (SCO) have a major impact on people's perception and behavior. As a result, the question that different SCO will moderate the effect of RLMX on OCB or not is the main problem the paper trying to discuss.

2 Literature Review

2.1 RLMX and OCB

RLMX refers to the value that the individual LMX minus the team average of LMX, reflects a employee' relative position in the team, and thus may affect his/her behavior and performance in the workplace (Vidyarthi, 2010).

RLMX derived from the social comparison theory, and thus how individuals respond to RLMX based on how they understand the social comparison process. Tse (2012) put forward that high RLMX may make employees feel a higher social status than other members feel. When employees think that they are important members in the team, the success of the team will be regarded as their own personal success, and are willing to make more efforts benefit to the organization. Based on the principle of reciprocity, when keep a relatively high quality of exchange relationship with leader, employees will feel it is necessary to show valuable behavior for leaders. In addition, High RLMX means the target members can be received with special care and trust, these benefits will promote employees to better identify them. Having confidence in their ability, individuals are more likely to participate in those behavior beyond the formal contract, such as OCB (McAllister et al,2007).In addition, the related empirical studies have shown that RLMX not only has direct positive effect on job performance and OCB(Vidyarthi et al,2010; Tse et al, 2012), but also indirectly encourage employees to make more OCB by influencing the employees' job satisfaction, LMXSC. Therefore, this paper puts forward the

* This paper is supported by graduate student education innovation projects in Guangxi (YCSZ2015209)

following hypothesis:

Hypothesis 1: Relative leader-member exchange (RLMX) has a positive influence on organizational citizenship behavior (OCB).

2.2 The moderating effect of SCO

RLMX reflects the objective quality of exchange relationship between leader and employee, and employee compares with others according to the objective reality or not depends on individual difference—the level of social comparison orientation (SCO), the difference in social comparison process may bring awareness deviation, so as to produce a significant influence on behavior (Gibbons & Buunk, 1999), and therefore need to pay more attention to.

Gibbons and Buunk(1999) indicated that high SCO individuals was sensitive to others, had large uncertainty to oneself, and was eager to reduce the uncertainty by comparison. Given the high SCO employees with these characteristics, they are more likely to make an extensive social comparison than people in self-affirmation. When making an upward comparison, high SCO employees will be very sensitive to detect others' better relative position even if their own RLMX quality is higher. Due to lacking confidence, high SCO individuals easy to feel the better position is out of their reach in the process of upward comparison. Therefore, they may make up the inner balance through reducing OCB. On the contrary, the low SCO employees don't have too much uncertainty, and tend to make comparison with those who have similar views and in similar condition, and provide deterministic information for self assessment. Therefore, no matter the RLMX quality is high or not, low SCO employees are less affected by social comparison, so are less likely to change their behavior.

In addition, Wu and Wu (2005) also believe that OCB can be seen as a kind of employee's behavior based on reciprocity. But traditional reciprocity only involves the current returns, namely employee's effort is a return for leader's special favors in the past and currently. Actually reciprocity is also likely to involve a return for their future evaluation. Studies have found that high SCO employees are different from other individuals; they will get empathy with other members among the bad situation in the process of downward comparison, then expect their future and exchange relationship may become very bad(Buunk et al., 2001), therefore, have a low assessment for future returns. That may inhibit employees' will to contribute to the organization, which further leads to reduction of OCB. Therefore, this paper puts forward the following hypothesis:

Hypothesis 2: High social comparison orientation (SCO) has a negative moderating effect on the positive relationship between relative leader-member exchange (RLMX) and organizational citizenship behavior (OCB).

3 Data and Methodology

3.1 The sample

Research objects of this study are from Beijing, Shanghai, Hunan, and other places. Work areas involve research, production, sales and development, etc. We recycled 533 valid questionnaires come from 79 groups; the effective questionnaire recovery rate was 85.24%.

3.2 Measuring tools

3.2.1 Relative leader-member exchange (RLMX)

This study adopts the scale of LMX compiled by Graen and Uhl-bien (1995), which includes seven projects, such as "How would you characterize your working relationship with your leader". In the study, its Cronbach's α value is 0.837.

3.2.2 Organizational citizenship behavior (OCB)

This study adopts the scale compiled by Lee and Allen (2002), the scale divided into two parts--OCB that benefit specific individuals (OCBI) and OCB that benefit the organization (OCBO), respectively includes eight projects. In the study, their Cronbach's α value are 0.892 and 0.911.

3.2.3 Social comparison orientation (SCO)

This study adopts the scale compiled by Gibbons and Buunk(1999), which includes eleven projects, such as "I often like to talk with others about mutual opinions and experiences". In the study, its Cronbach's α value is 0.762.

4 Results

4.1 Confirmatory factor analysis

By using Amos22.0, this paper does confirmatory factor analysis on measurement data, to compare the four factors model (LMX, OCBI, OCBO and SCO) with the three factors model (OCBI and OCBO

belong to one factor), the double factors model (LMX and SCO belong to one factor) and the single factor model (all belong to one factor). Results show that all fit indexes of the four factors model have reached the standard, CFI, IFI, NFI are higher than 0.90, the ratio of chi-square and degrees of freedom is less than 4, and RMSEA below 0.08. Therefore, the questionnaire has good structure validity and the next analysis can be performed.

4.2 Descriptive statistical analysis

Table 1 The Mean, Standard Deviation and Correlation of Variables (N = 533)

Variables	Mean	SD	1	2	3	4
1 RLMX	0.002	0.548	(0.837)			
2 OCBI	3.727	0.647	0.368**	(0.892)		
3 OCBO	3.772	0.705	0.384**	0.708**	(0.911)	
4 SCO	3.279	0.539	0.225**	0.379**	0.409**	(0.762)

Note: * p < 0. 05, ** p < 0. 01, ***p<0.001, the same below. The consistency coefficients are shown in brackets.

The mean, standard deviation (SD), coefficient of internal consistency and correlation coefficient of variables in the study are shown in table 1. RLMX and OCBI, OCBO have significant correlation. Among them, there is significantly positive correlation ($r=0.368, p<0.01$) between RLMX and OCBI , and also a kind of positive correlation ($r=0.384, p<0.01$) between RLMX and OCBO, which lay the foundations for subsequent inspection.

4.3 Hypothesis test

The direct effect is first inspected. Regression analysis results (see table 2) show that there is a significant positive correlation relationship between RLMX and OCBI ($\beta=0.367, p<0.001$); in addition, the regression between RLMX and OCBO shows that there is also significant correlation between them ($\beta=0.382, p<0.001$).Therefore, hypothesis 1 is supported.

Then, the moderating effect is tested. Results show that the interaction of SCO and RLMX exerts negative influences on OCBI and OCBO, whose coefficients are -0.093 and -0.111 respectively, and their significant below the level of 0.01.

Table 2 Regression Analysis (N =533)

Variables	OCBI			OCBO		
	Model1	Model2	Model3	Model4	Model5	Model6
Gender	-0.012	-0.053	-0.058	0.070	0.027	0.021
Age	0.117**	0.107**	0.102**	0.095*	0.085*	0.079*
RLMX	0.367***	0.295***	0.276***	0.382***	0.305***	0.282***
SCO		0.321***	0.318***		0.343***	0.341***
RLMX×SCO			-0.093**			-0.111**
R^2	0.149	0.244	0.252	0.159	0.268	0.279
ΔR^2	0.134***	0.095***	0.008**	0.145***	0.109***	0.012**

In order to better explain the effect of SCO, this paper draws the interaction chart between RLMX and SCO (see figure 1). When SCO is low, employees' RLMX tend to have no significant relationship with OCB; while it is high, the positive relationship between RLMX and OCB become negative correlation.

Figure 1 The Moderating Effect of SCO

Comparing the figure (a) and (b) can be found that the impacts of RLMX on OCBO are greater than that on OCBI when the impacts under the moderating effect of SCO. In other words, comparing with the low SCO, the high SCO's negative moderating effect on relationship between RLMX and OCB is more apparent. In summary, hypothesis 2 is supported.

5 Conclusion

Previous research on RLMX always regarded OCB as a whole. Staw (1983) proposed that only consider OCBI and OCBO at the same time can get a comprehensive understanding of OCB. This research focused on the different influences of relative leader-member exchange (RLMX) on organizational citizenship behavior that benefit specific individuals (OCBI) and that benefit the organization (OCBO), was a supplement of past researches.

In addition, the study found that higher relative position in team did not necessarily lead to more OCB. As a kind of temperament, SCO plays an important negative regulatory role in the influence of RLMX on OCB, namely the stronger the employees' SCO is, high RLMX employees show less OCB. It stems mainly from high SCO employees make extensive comparison and have uncertainty characteristics, they will think of others' high RLMX is out of their reach in the upward comparison, and in the downward comparison, high RLMX employee easy to get an empathy with people in poor exchange relationship. Therefore, in the process of upward and downward comparison, employees are prone to negative emotions, weakening its own higher advantage brought by the relative position.

Finally, there are certain limitations in this paper due to limited conditions: 1) this study mainly discusses the moderating effect of SCO effect on the relationships between RLMX and OCB; future research can explore the influence of other variables. 2) Questionnaires were filled out by employees themselves, although the inspection showed that the results did not contain too much homologous deviation, but subsequent research can consider taking supervisor matched data, and using the longitudinal data analysis to improve the defects of the present study.

Abstract: The standardization system reform is an important part of China's political and economic reform, and the linkage level between the macro and micro management. At present, a core problem of China's standardization system reform is the supply system of standards. China's current government-based standard supply mode cannot well meet the needs of the rapid economic and social development. We should make full use of social and market resources, give play to social and market vitality, widen the channel of the standard supply. Starting from the problems of China standardization system reform, this paper puts forward framework and basic path of standardization system reform based on the supply and demand theory of economics. This study provides the theoretical support and reference for China standardization system reform.

Keywords: Standardization system Reform; Analysis of supply and demand; Government standards; Organization standards

1 Introduction

The standardization system is the collective name of organization mode, management mode and operation mode for standardization activity implementation (Luo Hailin, Yang Xiuqing, 2010). The core problem of the standardization system is orientation of the developing and publishing body of standards. On the whole, standardization system is divided into two types by developing and publishing body of the standards internationally. The first type is the direct management pattern of the government, in which the government directly develops and publishes standards. The second type is a non-governmental institution mode pattern under authorization of the government or laws, in which the government does not develop and publish standards and the non-governmental organizations prepare and publish standards. The developed countries mainly adopt the second pattern. Most developing countries adopt the first pattern. The developed countries in Asia such as Japan and Korea also adopt the first pattern, which is closely associated with the after-war economy development pattern and development path of these countries.

The American scholar Ernst thinks that the market-guided decentralized and autonomous system is the highlighted feature of the standardization management system in America. This system can make the American standardization system consider interests of all parties in standardization and protect competition to most extent, so it becomes the important source for successful business innovation in America (Dieter Ernst, 2012). Blind, K. and Gauch, S. (2005) think that the most highlighted change in the standardization system is growth of informal standardization process, especially ICT industry, private associate, club and union have become very important compared to the formal standardization process. Quick growth of the associates has led to great change of the governance schedule for the standards. Some "fixed organizations" will not accept new members. Some "village clubs" accept qualified new members. more open "health club" pattern is also available, namely non-arbitrary member qualification is permitted (West, Joel, 2007). Dong Geun Choi introduces in detail the standardization management institution in Korea (Dong Geun Choi, 2013). The national standards in Korea include voluntary standard and mandatory technical standards. In order to transferring standard development from governments to the non-governmental organizations, Korean government formulated the regulations on the non-governmental standards and strengthened finance support. Voluntary standard system, government-supported standardization activities, committee standardization administration

organization and standard “commodity management” pattern are the features of the standardization management system in market economy countries (Zhao Chaoyi, 2004).

In fact, the “government-dominated” standardization management system cannot adapt the requirements of the market economy in China due to pattern under the planned economic system (Xu Jingyue, 2001). Now the technology regulations and standard systems have many problems to solve (Wei Mian, 2003). Although standardization advances much in China from 21st century, the standardization cannot better meet the requirements of quick development in economy and society compared to pressure from the foreign and domestic environment change. Standardization cannot better meet quick development requirements of the economy and society, e.g. standard deficiency, ageing and lag are severe and the standard supply channel is singular. These problems stem from the standardization system.

2 Re-Understanding on Standard Essence

2.1 Standard is a technical regime

Besides distinct technology nature, the regime nature of standards is very highlighted. In a word, the standard is a technology regime. The concept of the technology regime is defined and use via different modes in the systematic method of the department innovation. Nelson and Winter defines the technology regime as the industry technology environment in enterprise operation (Nelson, Winter, 1982). Rip and Kemp define the technology regime as the rules embedded in a complicated engineering practice, production process technology, product feature, skills and programs, the modes for processing related productions and persons, and the method for identifying problems. They are embedded into the institution and infrastructure (Rip A, Kemp R, 1998). In fact, the technology regime is a system to reflect technology essence feature (He Mao, Li Fei, 2005). Malerba and Orsenigo think that the technology regimes combine the opportunity condition, appropriability condition, cumulateness condition and knowledge feature (sometimes knowledge base features are included). Three elements compose the basic framework of the technology regime theory (Malerba, F., Orsenigo, L., 1993, 1996). The technology regime is not only support the country economy and society in the technology field, but also supplement the political regime and economic regime, even replace them (Zheng Weihua, 2005).

As the technology regime, the standard includes technology meaning and regime meaning. The technology nature is highlighted in the past, but the institution nature of the standard is not fully recognized. With increasing development of the economy, society, technology and international trade, the “rule and regulation” role of the standard is increasing. The standard becomes one more important “governance” means.

2.2 The standard is a public product

From the essence, the public products meet the common requirements of the society, namely the public products are from the common requirements of the social public. Endler thinks that the essential nature of the public products is “society and individual living and possibility conditions for pursuing economy activities”^[15]. The non-competition and non-exclusiveness are two most important features of the public products, so Marmolo thinks that the public products should be supplied by the government and the private products are supplied by the market (Marmolo, E, 1999).

Use of standards has the feature of non-competitiveness and non-exclusiveness, namely when one person uses standard, it will not reduce supply to others. One person is not excluded from use of the standard. It meets the classical definition of the public products in the economy. From the view of the cost and benefit analysis, the developing cost of one standard is limited. After the standard is developed, the maintenance cost in a cycle is limited. Although the standards are extensively used and the experiences, knowledge and technologies in the standards are extensively propagated, copied and shared, the users pay the cost close to zero. Compared to other development and maintenance cost, the brought benefits can not be precisely computed, but it is limitless in theory. When one user is added, his marginal cost is close to zero.

3 Research on Basic Theory of Supply and Demand

3.1 Standard demand—supply concept model

Based on the history track and future trend of standardization development in China, we propose a standard demand—supply concept model (see the figure 1). The key points are defined as follows in the figure:

- The vertical axis I_{std} represents the development level of standardization and should include comprehensive indexes such as standard quantity, coverage degree, quality and technology level and implementation benefits. For feasibility, the development level can be roughly represented by the standard quantity temporarily.
- The transverse axis I_d represents the development level of the economy and society and can be temporarily represented by the time sequence or GDP level in different periods.
- D is the standard requirement curve and S is the standard supply curve.
- Point P: the socialist planning economic system was established in 1952.
- Point C: the planned commodity economy was identified in Third Plenary Session of the Twelfth Central Committee.
- Point M: the socialist market economy was identified in Fourteenth Party Congress in 1992.
- Point L: Standardization law was issued in 1988.
- L: Before *standardization law* was issued, all standards are mandatory in China.
- LR: After *Standardization law* is issued, the standards are divided into the mandatory and recommended standards in China.

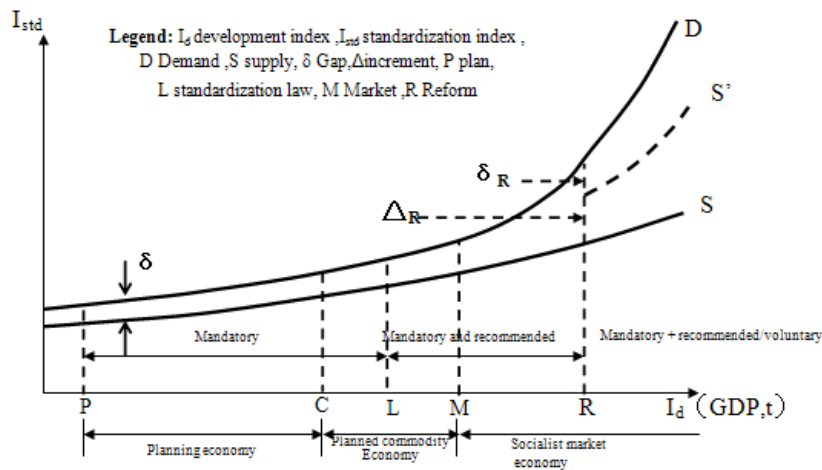

Figure 1 Demand and Supply Concept Model of Standard

3.2 Analysis on transition history of standard demand and supply relation in China

The standards are the summary of the practice experiences and technology achievements. On the whole, the standards lag behind development of the economy, society and technology. It is difficult for the standard supply to fully meet the society requirements for standards, namely the standard supply lags behind the standard requirements on the whole. The figure 1 shows that the supply curve S is under the curve D. A gap exists between two curves, which is represented with δ .

From 1952 to 1984 (PC interval in the figure 1), China is in the planning economy period in which the industrialization development level is low, GDP is small and the directive planning economic system restricts economy development. On the whole, the standard demand and supply is under the low level and slow growth status (D and S curve is relatively slow and the slope is very small in the figure 1). The standard supply relation mainly meets the Say's Law in the economy in the planning economy period, namely supply determines the demand. The gap between standard supply and demand is small (δ is smaller in the figure 1).

From 1984 to 1992 (CM interval in the figure 1), China enters the socialist planned commodity economy period. After reform and openness, the society demand for standards increases obviously (The slope of the curve D becomes large in the figure 1). The standardization law was issued in 1988 (point L in the figure 1), singular mandatory standard system changes to the mandatory standard and recommended standard system in China. The standard supply capability increases (the slope of the supply curve S increases in the figure 1), but it can not meet the quick

growth demand of the society for standards on the whole (δ becomes big in the figure 1). Certainly this gap is within the acceptable scope.

Since Fourteenth Party Congress of the party in 1992 (right area of the point M in the figure 1), the socialist market economic system was established in China. The society demand for the standards increase quickly under the market economy conditions (the slope of the curve D increases obviously in the figure 1) and the standard deficiency, ageing and lag problems are highlighted. To meet quick growth of the standard requirement and solve standard deficiency, ageing and lag problem under the government-dominated standard supply institution, the supply capability should be further improved. The government increases the investment to the technology standard system construction during “10th five-year plan” and “11th five-year plan” in China. Total investment is 1 billion during 2006-2008. The quantity of standardization technology committees increases from 664 in 2006 to 1148 in 2010. Massive new technology standards are developed in a short period (the slope of the curve S obviously becomes big in the figure 1), so the standard supply and demand confliction is alleviated to some extent. The standard supply is dominated by the government and is restrained by the government capability due to quick growth of the standard demand. On the whole, the slope growth of the supply curve S lags behind it of the demand curve D. The gap between standard supply and demand will expand (δ will become big in the figure 1). E.g. The doubts on standard deficiency, especially standard lagging and low quality in the society become more and more, which objectively reflect this problem.

3.3 Selection of opportunity and key points of standardization system reform

Now China is at the key reform time (point R in the figure 1). In theory, the standard supply and demand conflictions can be alleviated in two manners. The first manner is to restraint the standard demand (δ becomes small). However, the standard demand exists objectively, so this mode is not feasible. The second manner is to increase the standard supply to most extent (the supply curve S moves up to S' to get the supply increment ΔR in the figure 1). To get supply increment ΔR , if the standard supply mode is not reformed and existing standardization system is still kept, namely government-dominated or monopolized standard supply, the government will further increase investment and supply capability, but the government's rationality, capability and resources are limited, the supply increment ΔR , which is obtained by changing the constraint conditions of the government supply standard to some extent, is very limited.

First, the governmental rationality is limited. E.g. the government is not qualified to recognize and grasp different standard requirements and determine standards to be set and published due to complicated economy and society, quick technology development, instantaneous change of market demand, complicated standard competitions.

Secondly, the governmental capability is limited. E.g. the governmental standardization management persons can not deeply know and grasp standardization problems in different field and industries and make correct decisions due to limited professional knowledge when facing to development diversity, change and uncertainty.

Thirdly, the governmental resources are limited. The government continuously increases fund to standard developing, e.g. the revisal fee for the national standards is 73 million yuan in 2010, is 77 million yuan in 2011 and is 85 million yuan in 2012. However, the average fee of each standard is only about 50000 yuan. The effect of appropriately increasing investment is not obvious.

In a word, the government-dominated or monopolized standard supply system can not meet quick growth of the actual standard demand. The standardization system must be reformed. The key is to reform the standard supply mode, change the standard supply curve from current S to S', get the bigger supply increment ΔR , shorten the standard supply and demand gap to δR and keep within the acceptable scope.

4 Basic Path of Standard System Reform in China

4.1 Basic idea

Perform politics simplification and power re-assignment, management innovation, common governance, exert strengths of governments, society and market and cooperate with each other in standardization. The governments should focus on institution, plan whole situation, manage macro

situation, control great events, gradually discards functions which can be undertaken and adjusted by the society and market, excite innovation vitality of the social organization and market body, further arrange relations between standards, laws and regulations, concept system and orientations of mandatory standards, recommended standards and voluntary standards, and adjust and optimize standard setup, strengthen uniform management of the government to the mandatory standards, integrate the mandatory national standards and industry standards into the mandatory national standard, improve the level of publishing body, adjust scope, structure, contents and form, compress quantity much, improve authority and seriousness and “ensure bottom line” via the mandatory standards. Reserve, adjust and optimize current national, industry and local recommended standard system, mainly develop commonweal, foundational, general, common and strategic standards, reinforce coordination and fitting mechanism with the mandatory standards, reinforce standardization public service responsibilities of the government and “ensure foundation” via the recommendation standard. Gradually develop the organization recommended standards (called as organization standards), focus on development of production and service standards, reflect change and requirement of the market and technology in time, establish competition and cooperation, incentive and restraint tolerance mechanism, fully exert the foundational role of the market in the resource configuration and “promote development” by using the organization standards. Process the relation of above three standards, establish inherent association mechanism, form the China characteristic standard system to meet the development demand of economy and society, and enhance whole function of the standardization system in China.

4.2 Reform key

In the above idea, it is the kernel contents of “minimal whole reform scheme” to reform and perfect mandatory standard and cultivate and develop the organization standards. The innovation and key points of this reform scheme is to establish the organization standards. The organization standards should be developed by public organizations such as non-profit organizations to keep consistent with the public product nature of standards. e.g. association, industry union and technology organization. Any organization can develop the organization standard, realize full autonomy, independently perform development, issuing, publishing, implementation and certification of the organization standards, fully utilize society and market resources, exert the society and market vitality and increase standard supply much. The standards of different organization compete with each other. An enterprise can voluntarily select them and the standards will be eliminated and reserved via market, which meets the trend for the state to reform the social organization management regulations, explore multiple societies for one industry and introduce the competition mechanism. The government will perform macro management and supervise law enforcement for the organization standards. E.g. the Standardization Administration of P.R. China develops the good behavior specification for standardization organizations and authorizes third-party organizations to evaluate, certify and publicize standards. The organization standards developed by the certified and correct behavior standardization organizations can be transformed or adopted as the recommended national standards. The Standardization Administration of P.R. China can assign the recommended national standards to the organizations with good standardization behaviors for preparation via trust and purchase, so it can establish the incentive and restraint mechanism for the standard developing organizations(SDOs) .

The governments should encourage social organizations to offset the blank points which are not covered by the governmental standards or develop the organization standards superior to the governmental standards in the highly competitive technology fields. When the social organizations develop and become enough powerful and orderly, the governments will exit from the left area of the transverse axis, fully “assign power” to the market, and exert the vitality and strengths of the market competition.

4.3 Basic path--- progressive reform

The key for successful reform and so-called “China pattern” in China is that one progressive reform path is explored, instead of “shock treatment method”. It is obvious that the progressive reform should be taken in the standardization system reform under the restraint of reform development idea, pattern and path. First, focus on “minimal whole” reform, seize those extensively involving, highly global, highly associated, complicated and crossing key problems.

E.g. reform and perfect mandatory standard, cultivate and develop the organization standards, centrally and fully tackle key problems, and do not focus on all problems. Secondly, focus on the increment instead of the stock reform, comply with “Pareto improvement” and finally drive stock adjustment change via increment. E.g. when the industry recommended standards are not cancelled, cultivate and develop the organization standards, integrate the mandatory industry standards, ensure that the departments have enough speaking right in preparation of future mandatory national standards, and get understanding and support of related parties. Thirdly, stick the progressive reform, comply with “inductive transition” instead of “mandatory transition”, first try and explore and then stably and progressively transit. E.g. cultivate and develop the organization standards in the fields, which are not covered by the existing industry recommended standards or do not conflict with them. For some qualified national or local industry association, first try and explore and realize differential mutual supplementary and development. Their development and growth will progressively lead to adjustment and transition of existing recommended standards.

During research and discussion of standards, especially the mandatory standard management system and mechanism reform in the past, review the standard system reasonability, crossing and repetition confusions at different levels, standard implementation and insufficient supervision and analyze reform necessity and measures from the view of technology regulation nature of the mandatory standard. On the whole, research and analysis focus on micro and phenomena. The reasonability and persuasiveness are not sufficient. We focus regime nature of the standards and answer why the standardization system should be reformed and what should be reformed from the history evolution of the standard demand and supply relation as the macro and essence level.

5 Conclusion

In a word, the reform can remarkably improve the capability of standard supply compliance to the standard demand. First, solve the quantity problem. Fully utilize social resources and market mechanism. Different standard organizations for development, certification and technology service will surely develop quickly, which can offset the insufficient standard supply capability of the government, especially alleviate the insufficient standardization public service for the medium-size and small-size enterprises. Secondly, solve speed problem. The organization standards are close to the actual industry conditions, can track the technology advance, and quickly reflect market demand in the rising industry field, especially high-tech field. Thirdly, solve quality problem. The organization standards can accurately grasp the market demand in time, improve capability of the SDOs via the market elimination mechanism, and enhance the quality level of the standard. Fourthly, solve efficiency problem. Reasonable identification of the boundary among government, society and market can effectively call and fully utilize the society and market resources, massively save and effectively use public resources, consider and prevent against “market failure” and “government failure” and prevent “lease” caused by monopoly.

The main risk of the reform is to impact the existing interests, so the reform can not get powerful support from the related parties. Impact to standard system and occurrence of organization standards will surely lead to crossing, repetition and conflict between multiple standards for one product and standards. If it is not well controlled, it will lead to chaos, especially impact to the standardization management department, especially rejection from industry and local standardization authority. The applicable standardization law system will be impacted. Over 40 laws, 70 administrative regulations and hundreds of department and local governments give regulations on standardization. They will be changed and adjusted and the task is very huge. On the whole, this reform idea complies with direction, rule and requirements of the national institution reform and functionality transformation, which is consistent with the radical interests of whole society, including the government standardization management department, so the reform will be supported by a majority. The reform should be promoted actively, stably and progressive to realize the gradual and stable transition under the scientific and reasonable top design.

Abstract: Instant paper aims to analyze telecom customer relationship by delving into customer switching behavior and identifying preferred communication type to help companies in designing appropriate communication in order to prevent the customer switching and enhancing customer loyalty. Two staged qualitative research has been conducted by interviewing 13 telecom customers who had experienced telecom service provider switching and data is analyzed by coding technique. Findings reveal that telecom customers chose distinctive sources of information while making switching decision. Active customers chose newsletter based on rich content including innovative services information whereas passive customers chose newsletter primarily based on competitive prices. Managers can communicate active and passive customers according to the respective communication preferences. Moreover, marketers can study switching determinants, triggers and sources of information in order to design the customized communication so as to prevent triggers from happening in the first place, thereby enhancing customer loyalty. This paper synthesizes insights from the extant literature on relationship marketing, customer switching behavior and contemporary communication channels to develop comprehensive customer-driven loyalty enhancing communication.

Key words: Customer switching behavior; Telecom customer loyalty and relationship marketing communication; Newsletters; Situational; Influential and reactional triggers; Switching determinants

1 Introduction

Telecom companies world over are striving to build, maintain and improve the relationships with profitable customers in order to optimize their profits (Ferguson and Brohaugh, 2008). Communications are integral part of this whole process from beginning till the end and onwards. Customers are increasingly getting aware of the service offers and consequently it has become significant for the companies to effectively communicate their offers to the different types of customers in customized fashion simultaneously using the available written communication resources. It has already been proved that communication efficacy is thought to be imperative in the customer clubs because it can clearly impact the telecom customer understandings' key elements such as price and experience. (Gustafsson et al., 2004) Duncan and Moriarty (1998) portray that the most crucial catalyst of the customers' perception regarding their rapport with the service provider was the communication lucidity such as employing flawless sentences, without repetition, and genuine tendency. Ball et al. (2004) advanced this concept even further by arguing that well-structured and valuable communication massively impacts the customer perception regarding loyalty, trust and satisfaction.

In instant paper, researchers have focused on exploring two different types of telecom customers which have already been discovered in prior research; moreover their switching behavior from one service provider to other has also been researched with the aim to identify preferred communication types by both types of customers so as to help companies design customized communications that could influence customers' respective behavior in order to stay with the same service provider for longer span of time. Furthermore, a company can positively influence customers' switching behavior through effective written communication using various mechanisms. One challenge that lies in this approach is that when it comes to perceiving company's promotional communication, two types of customers have been identified based on their respective characteristics. According to Roos and Gustafsson (2011), these two types are active and passive customers. Therefore, companies need to overcome the challenge. Nowadays consumer is moving away from the old-fashioned means of advertising for instance television, radio, magazines, and newspapers, for the reason that they demand improved mechanism beyond their media consumption, (Rashtchy et al., 2007; Vollmer and Precourt, 2008). Lempert (2006) supported this opinion that customers are switching more often to numerous types of social media to pursue required information and determine their purchasing choices. Primarily, the written communication has proven to be the most important facet of the overall communication for customers as

currently, customers are typically communicated via emails, postal mails and social network updates. Communications in relationship marketing have been transformed due to the innovative revolutions in information technology (Honeycutt et al., 1998; Duncan and Moriarty, 1998).

The telecom industry has matured, along with the continuing expansion of the scope of its market and a rapid growth in the number of customers. High brand assets define the success rate of the operating companies in this sector. Due to the augmented demand for communication facilities in emerging markets such as China, Africa, Latin America, South Asia, and the Middle East, opportunities thrive to grow the business more than ever (Wallsten, 2001). In the past, telecom service providers' brands could depend on strong brand assets and loyal customers. However, the entrance of numerous telecom brands into the market, followed by fierce competition, has made the companies' survival difficult without taking necessary measures. They must concentrate on improving quality, value, and reliable customer relationships in order to succeed. That is exactly where this study would help companies in detecting the customer switching behavior by testing on any of the three triggers i.e., influential, situational and reactional triggers and later on designing the customized communication for each of the two customer groups, namely, active and passive customers, according to their respective attitude and behavior.

2 Literature Review

2.1 Customer switching behavior

Roos and Gustafsson (2011) discussed that customers experience a deliberate decision-making process when buying a service/product from a service provider. This notion has been illustrated in the "theory of reasoned action" (Fishbein and Ajzen, 1975) which describes that if a customer intends to act in a certain way then it signifies that he eventually will act in that specific planned manner. Ajzen and Fishbein (2000) explained it further in the "expectancy-value model" which claimed that customers normally perform on the basis of their subconscious memories and events to decide about the future purchases as opposed to considering only the currently offered information; which could further be segregated as active (conscious decision making by customer) or passive (any outside company influences particular customer reaction). Misinformation, prejudice and misjudgment are inextricably interlinked concepts that could bring about grave consequences for telecom companies' customer relationship management department. Prejudice was characterized by Vickery and Morris (1948) as "misjudgment" which is said to be stimulated against companies and/or their offerings. It works as when customer, lacking the substantial amount of information to make right decision, resultantly evaluates the service on the basis of incomplete information already construed by his mind, it ensues in misjudgment. (Roos and Gustafsson, 2007) Latent or hidden factors can also sway customers' thought process by contributing towards the prejudice and thus lead to switching behavior. For instance, according to Danes and Lindsey-Mullikin (2012), consumer's price expectation and willingness to pay could be changed on the basis of offering's value expectation.

Switching decision is made on the basis of incomplete information already based in the subconscious of the customer's mind, and this misjudgment coupled with any of the three triggers causes the switch. In this article, communication design is focused so that companies could overcome the problem of customer's decision-making process based on the prejudice or misjudgment. Misjudgment associated with trigger acts decisive for current service provider as Roos (1999) illustrated that triggers can shift customers' insight concerning relationship between customer and service provider and this thought process causes service provider switch in the future (Roos and Gustafsson, 2011). These triggers are buttressed by critical incidents (Keaveney, 1995).

2.2 Two different types of telecom customers

Consumer behavior can predict their future actions (Roos et al., 2011). There are two types of customers: active customers and passive customers. Active customers proactively seek information about service provider's offerings. This is the reason why the service providers could easily communicate active customers. On the contrary, passive customers are lethargic in terms of proactively seeking the information about various offering by service providers. Cioffi and Garner (1996) illustrated that the primary pretext of such behavior from passive customer is paucity of the capacity to deliberate in quantifiable modus and deficiency of the capability to choose among different available service providers by prudently comparing the competitors' attractive promotions. In such circumstances, prejudice overcomes the conscientiousness of the passive customer's decision-making adeptness.

2.3 Communication in contemporary telecom customer relationships

Duncan and Moriarty (1998) and Andersen (2001) characterized the communication as the social action of conveying a message to others and building its awareness in a meaningful manner. Anderson and Narus (1990) emphasized on meaningfulness in communication design due to its high potential impact on the customer perception. For instance key customers are persuaded more effectively by communication styles and proclaim higher hopes vis-à-vis communication from service providers (Sun et al., 2008). In the earlier literature, customer switching behavior has been applied so as to design appropriate communication. Such as in a relationship mapping technique SPAT (Roos, 1999), customers' expressions in the relationships are found to be linked with customer's tangible behavior. As Morris and Jeanne (1988) indicated that basis of customer loyalty must be trailed to induce the genuine progress. Sharma and Patterson (1999) acknowledged that coherent communication can produce a sense of warmness along with cultivating customer-to-business ties. It could benefit the service providers in instituting unwavering relationships with customers through growing marketing proficiency, dwindled proportion of customer defection and guaranteeing delivery of customer desires which sequentially can upsurge the customer satisfaction and loyalty (Tohidinia and Haghighi, 2011).

2.4 Written communication

Raciti and Dagger (2010) describe that aesthetical aspects of written communication should be contemplated while designing written communication such as writing style, paper quality, color, font, selection of the font style and use of the bold and italics. To enhance customer loyalty, company can effectively employ these aesthetical factors of written communication into the instruments as letters, brochures, newsletters and emails and successfully demonstrate the perceived customer positioning through company's written communication.

2.5 Newsletters

Merisavo and Raulas (2004) elucidate that newsletter communication has the basic objective to stimulate brand loyalty and it has already been employed in direct marketing for long time to foster strong brand image. In this regard, newsletters, consumer magazines and brand website are the tools which could help companies by showcasing its offerings to customerson monthly, weekly as well as on daily basis. (Muller et al., 2008) Newsletters are primarily the communicating instruments that enable companies to design tremendously customized information including updates and entertainment (Brondmo, 2000). Merisavo and Raulas (2004) described that email is prevailing mode for communication in modern era. Primary uses for email in marketing are to circulate promotional information regarding brands, products and services and to increase website traffic. Furthermore consistent email communication underpins customer loyalty.

3 Data and Methodolog

3.1 Research design

In this study, researchers have used explorative research design with qualitative approach. As described by Aaker et al. (2004)explorative research probes such a problem that has not been previously investigated in detail therefore the hypothesis is inadequately defined; moreover this research is extremely flexible and qualitative in approach.Creswell (2009) elucidates that qualitative method enables researcher to primarily gather qualitative data via interviews in the form of words instead of numerical data.Patton (1991) validates that qualitative methods construct an exhaustive data set based on modest number of entities. In addition, qualitative approach helps researcher in finding the answers of essential how, why and which phenomenon (Bryman and Bell, 2007).

3.2 Research process

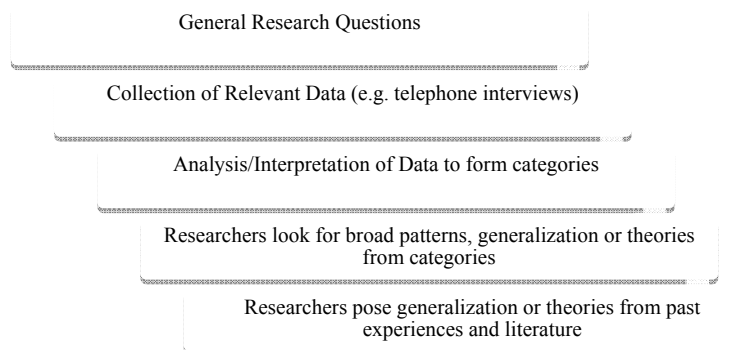

Figure 1 Research Process (Drawn from Creswell (2009) and Bryman and Bell (2007))

Researchers designed broad-spectrum research questions by means of a resourceful and well formulated interview guide in Roos (1999) that was revised rendering to the specific requirements. Subsequently data was gathered via interviews, primarily conducted face to face as well as through phone. After data collection, various categories were formed by interpreting and analyzing the data, in order to locate the broad patterns of generalizations, so that researchers could analyze the data in the light of relevant literature in the final step.

Research process is divided into two parts: primary research and secondary research.

Primary research is further divided into three separate stages:

Stage 1: Through interviewing 13 telecom customers, researchers observed the ways in which customers relate their relationship to the actual behavior.

Stage 2: On the basis of these observations, researchers designed two distinct types of communications for active and passive customers; mainly comprising newsletters.

Stage 3: These two types of newsletters were then presented to the same 13 customers as stage 1 and their choices were recorded.

While in secondary research, researchers related the conclusions from primary research to the literature framework and consequently discovered the patterns of effective communication for active and passive customers according to their respective switching behavior and communication preference.

3.3 Data collection

As per specific requirements of this exploratory qualitative study, an apposite instrument of qualitative interviews was adopted in order to map and identify customer switching behavior and relative communication preferences. Question guides were made alike (Jacobsen, 1993). Interviews via face to face and telephone were conducted with 13 students, who had experienced at least one switch of telecom service provider. Reason for conducting face to face and telephone interviews was that according to Creswell (2009), this method can enable interviewee to give comprehensive answers and follow up question could also be posed which are not the options in survey via email.

These 3 stages comprised two separate interviews with each customer. In first part, general customer switching behavior was inquired through open-end questions from interviewees whereas in the second part, two types of communication were presented to customers and their choices were recorded. Open-ended qualitative questioning process included spontaneous questions as well and resulted in unimagined yet valuable information from interviewees (Bryman and Bell, 2007). Aaker et al. (2004) rightly illustrated that some of the practical problems of explorative research also include that preplanned questions in the questionnaire lose their significance in the course of interview as researcher's priorities shift. All interviews were recorded with the prior permission of interviewees as various studies have preferred recording of interviews on note taking due to advantages such as less time consumption, more time to think for follow up questions (Kvale, 2009), and possibility to verify the answers (Jacobsen, 2002). Respondents' anonymity was ensured. Interviews were conducted at the convenience of the respondents as the time chosen was after two o'clock in the afternoon in the weekdays and on weekends due to easy accessibility. All interviews were transcribed before analysis.

3.4 Coding

Hague et al. (2004) described coding as creating code frame which comprises categories of information grouped together under separate heads; in order to analyze the information fetched via interviews. Categories in the code frame were created by delineating significant aspects from theory and also by information gathered through interviews for instance switching determinants were ranked before the relevant trigger distribution.

3.5 Reliability and validity

Reliability of the current research means that even if data collection method is repeated, same results would be generated, thereby ensuring its long-term trustworthiness (Jacobsen, 2002). Data correctness was also confirmed by fetching the originally intended information from respondents, in this regard, if any respondent found some part of the interview difficult to answer, then question were rephrased in more conceivable manner. A standard questionnaire was used in order to conduct all the interviews. Interviews were recorded and transcribed in order to document and analyze the data by ensuring complete reliability (Shenton, 2004). Only willing and qualified respondents were chosen for the interviews as those students who had switched telecom service at least once in their life, and qualified the research criteria were interviewed, moreover interviewer also asked respondents to be candid.

4 Findings

4.1 Stage 1: switching behavior study and analysis

Table 1 contains the empirical data collected through interviews. Through coding, each interview and response was assigned to the applicable category. Qualitative analysis has been done hereunder through comprehensively discussing the customers’ responses in the light of literature framework. As already mentioned, results are presented in 3 stages following the 3 respective stages of primary research process.

Table 1 Empirical Data from Interviews

Industry	Sample size	Competitive situation		Trigger Distribution		Switching determinants		Source of information		Switching behavior		Attitude towards previous operator	
Telecom	13	Comviq	5	Influential	12	Price	11	Advertisement	5	Passive	9	Already switched back	0
		Telia	3			Suggested	4					Friends & Family	8
		Halebop	2			Competitor action	1	Own Activity	2				
		Parlino	1	Situational	1	Other or Better Service	2			Will consider to switch back	2		
		Telenor	1			Reactional	0	Unfeasible treatment	2				
		Tre	1	Total	13			Total	20	Total	15	Total	13
		Total number of competitors	13										

In this table, switching determinants are shown as 20 in number instead of being equivalent to the total number of interviews that were 13, owing to possibility of customers mentioning more than one switching determinant in each interview irrespective of the relevant trigger distribution or switching behavior. 2 out of 13 are active customers while other 11 are passive customers.

Figure 2 Frequency of Active and Passive Customers

Total companies, from which customers switched, were 4. Active and passive customers were 4 and 9 in numbers respectively. Furthermore, 12 influential, 1 situational and no reactional trigger were observed. 3 types of triggers and 5 types of switching determinants altogether drive customers towards switching process therefore it is essential to analyze these two factors in connection with each other. Following are the classifications of the active and passive triggers found in interviews:

4.1.1 Influential Triggers

Active

- 1)The customer’s increased demand to talk to friends and family.
- 2)Customer desired to get free phone along with possible shift in payment method from billing system to account recharge.
- 3)Customers’ friends convinced him to switch the company.
- 4)Customer desired to exploit the opportunity of acquiring a handset with contract.
- 5)Customer switched to avail the low-priced option in response to the increased need of calling abroad.

Passive

- 6)Customer could no more afford the current provider and friends also owned different operator.

7)Customer’s friends observed that it was more expensive to call to previous operator.

4.1.2 Situational Triggers

Active

1)Previous service provider’s poor signal strength caused customer to switch

4.1.3 Switching Determinants

Most significantly influencing element towards switching was discovered as “price” as 11 customers mentioned it as decisive factor due to lower purchasing power thus it is featured as influential passive trigger.

“My need to talk often and higher cost made me think about switching.”

“Suggested” switching determinant caused by friends and family was noticed to be outstanding as well due to the higher conversation frequency among social circle; 4 customers considered it as the most influential aspect. This determinant is part of influential active trigger because customer actively researched various available alternatives after getting suggestion from social circle.

“Main reason for my switching was an inexpensive package for friends and family including free texts.”

Promotional marketing activities of competitors influenced 1 customer who were swayed by influential passive trigger owing to their lack of active research involvement and immediate switching action based on promotional activities of competitor.

Inappropriate response from company personnel and inconvenience caused while calling to customer service desk influenced 2 customers to switch.

Other/better services attracted 2 customers’ attention that encompassed a switching determinant of sole functioning service in the workplace area that is situational active trigger owing to customer’s active search for the alternatives.

“I switched to Telia due to unavailability of other companies’ services at my remote work site.”

Figure 3 Frequency of Switching Determinants

Source of information describes customer’s path towards switching in the process of trigger happening thereby increasing its importance in the switching behavior. Customers have found to get the information primarily by advertisement, friends & family and/or own activity.

Eight customers received the information underpinning the switching through family and friends.

“I did not consider price while switching because my friends had Telia which they used while communicating with each other and it was main reason of influence.”

On the other hand, advertisement caused triggers in 5 customers’ minds.

“I saw the commercial which provided me with necessary information and influenced my switching decision.”

Just two customers mentioned the reason of trigger as their own activity.

“I conducted my own research before switching, which resulted in choosing cheaper price option regarding free texts.”

One important aspect of the questionnaire obtained information from customers if they compared different available alternatives or not because it signifies their behavior as active and passive. During the interviews, majority of customers negated the practice of comparative analysis before decision-making. For instance one customer responded:

“My switch was based on the decision made by my parents, who chose Comviq Amigos for me as I was abroad and I had to make international calls frequently.”

In the interview part regarding reflections about present service provider, two types of responses were recorded. First type of customers declared their satisfaction after switching mainly due to better value proposition such as:

“Better services and relatively inexpensive services convinced me and for now, I am satisfied.”

Second type of customers did not seem contented with current company due to reasons like bad reception, for instance:

“Bad signal coverage and expensive services have lessened my attraction towards current company.”

Moreover, both these kinds of customers replied differently about conducting comparative analysis of various service providers available in the market in the present situation. Most of the satisfied customers said that they currently do not engage in the said practice owing to higher satisfaction level with current service provider.

“I do not think about switching the company because Comviq is providing satisfactory services until now, however if in future this does not remain the case then I would think about switching the company.”

Relative fewer respondents said that they currently compare different alternatives regularly, either due to dissatisfaction with current company or desire for better value proposition.

“I have planned to switch back to Halebop in beginning of the coming year, due to the availability of prepaid services which suit my low money consumption needs in order to call and use internet rather economically.”

When asked about potential future prospects of switching back to the previous or other service provider then as many as nine customers replied that they will not switch back, two customers said that they have already decided to switch back, two customers said that they will think about it only in case of better services being offered whereas no customer had already switched back.

4.2 Stage 2: communication design

In this step, researchers designed two types of newsletters based on the results found in first stage of primary research (switching determinants and triggers) coupled with the concepts mentioned in the theoretical framework (active and passive customers). These switching determinants and triggers constitute the active and passive behavior of customers, which are in turn used in this section to design active and passive newsletters in order to woo the respective types of customers. Roos and Gustafsson (2011) describe that communicating effectively to both of these types of customers was made possible only after the discovery of the relative differences between active and passive customers. According to Ajzen and Fishbein (2000), customers, who normally base their decisions on the subconscious memory, are either active (those customers who decide after thorough deliberation process) or passive (those customers whose decision is mainly influenced by outside company).

4.2.1 Active newsletters

As theory (Roos et al., 2011; Cioffi and Garner, 1996) suggests that active customers actively seek detailed and up-to-date information regarding various offerings, and later on as proved in the interviews that these customers are more attracted to rich information, comprising price as well as better quality service plus several additional services to choose from, coupled with basic services. Consequently, “Active newsletter” was conceived based on the characteristics of active customers, containing information about price and rich services. Hereunder is a selection from the “Active Newsletter”:

“Telia Mobile Small Flex is an innovative adaptable payments bundle that gives you the option to modify your payment plan at your convenience. You have the option to consume the entire months’ package for call, SMS / MMS and internet browsing (plus 0.5 GB limit). Similarly, you can also avail access to super-fast internet browsing areas without any extra cost. And if you would also like, you could expand the package throughout the tenure by one or more of the options Talk (M) (L), Send (M) (L) and internet browsing (M) (L). If you decide to discontinue the package at any time, you could always return to your regular monthly plan. At present also contains Spotify Premium.”

An additional communication statement is exhibited below:

“A cutting edge; Music System. Play and control your music in complete area of your house with your smartphone or smart pad.”

4.2.2 Passive newsletters

Passive newsletter is designed based on the demonstration in theory regarding price’ significance in passive customer’s perception of service’s value proposition, coupled with results generated by interviews. Roos et al. (2009) describe price as potential driving factor of customer’s anger resulting in switching

decision. Cioffi and Garner (1996) portray on customer's inability to base their switching decision on the measureable criteria of judiciously weighing the competitors' attractive promotions. Passive customers neither actively search information nor they pay attention when specific communication is directed towards them by companies (Roos et al., 2011). Gustafsson et al. (2004) declare that communication has proved significant to positively influence customer's perception regarding price and experience. Moreover, data gathered through interviews also depicts almost the same findings that most of the customers are laid back and do not conduct active research, they also prefer price far more than the rich information about various interesting service offerings. Hence "Passive newsletter" was concocted, all-inclusive call and SMS packages centered on competitive prices. For illustration one extract is mentioned in the following:

"If you decide to purchase Tele 2 Kompis, Kompis internet browsing, Kompis International or Kompis Pott for 24 months then you can avail the facility of first 6 months only for half of the regular monthly fee. You could also call routinely for 0 kr per minute and send free SMS / MMS to 3.5 million Tele 2 - and Comviq consumers. Free stands for up to 3000 SMS / MMS per month in Tele 2 Comviq networks."

4.3 Stage 3: communication testing

In this stage, communication designed in stage 2 is presented to the same customers, which were interviewed in stage 1 of the primary research phase. Results are shown are in the table below.

Table 2 Influenced Triggers

Interview number	Trigger	Reasons for changing	Communication Pattern
1	Influential (Passive)	Higher cost and advertisements influenced.	Passive
2	Influential (Active)	Higher cost and friends & family influenced. But actively compared various offers before switching.	Passive
3	Influential (Passive)	Enticed by the deal in advertisement to get free smart phone.	Passive
4	Influential (Passive)	Commercial influenced.	Passive
5	Influential (Passive)	Higher cost and friends & family influenced.	Passive
6	Influential (Passive)	Previous service provider was not up to mark and family influenced to switch.	Passive
7	Situational (Active)	Due to the coverage problem and friends influenced to switch.	Passive
8	Influential (Active)	Friends & family influenced but actively compared various offers before switching.	Passive
9	Influential (Passive)	Higher cost and friends & family influenced.	Passive
10	Influential (Active)	Higher cost and friends & family influenced but actively compared various offers before switching.	Passive
11	Influential (Passive)	Higher cost and friends & family influenced.	Active
12	Influential (Passive)	Higher cost, commercials and friends & family influenced.	Active
13	Influential (Passive)	Higher cost and friends & family influenced.	Active

Column number two and three contain the information regarding triggers and reasons for changing previous service provider (switching determinants) respectively, this information was already available in stage one. Column number four presents the results of third stage, i.e., the respective communication preferences of the same customers from stage number one interviews. Results of stage three reveal that 10 customers found passive newsletter more attractive whereas the other 3 customers chose active newsletters. Pattern of customers' respective choices is especially important in this context as these two types of communications were mainly designed according to these customers' earlier revelations about switching behavior.

Total 12 influential triggers (9 passive and 3 active), 1 situational active trigger whereas no reactional trigger are realized in this research. (Gustafsson et al., 2004) support these results by highlighting the tendency of telecom customers to demonstrate passive behavior by preferring price as a result of increasing competitive marketing strategies. Four active customers from stage one chose passive newsletter in stage three, because despite of their desire to stay informed about latest updates of diverse service offerings through active research, their main focus was on the price factor. Three influential passive customers from stage one chose active newsletter in stage three, because although their leading choice was the price factor along with friends & family, they also preferred to remain informed about latest updates of diverse quality service offerings.

5 Discussion

Following are five, not mutually exclusive and collectively exhaustive reasons, for why customers

preferred passive newsletter and the factors prompting their switching decision. On the top of the list are cheaper offerings that attracted most of the telecom customers, inasmuch as eleven customers considered price the leading influencing factor for switching decision therefore eight out of these eleven customers picked passive newsletter. Santos and Basso (2012) revealed that higher prices in comparison to the competitors' offerings contribute to customers' unfairness perception and lead to negative behavioral consequences. Second most important switching factor was discovered as suggestions by family and friends, cumulatively referred to as social circle interaction, out of total four customers mentioning this influence, three actually chose passive newsletter. Third reason for choosing passive newsletter described by total of four customers has been identified as primary focus only on the basic services such as inexpensive calling and texting instead of rich service offerings. Fourth reason disclosed by four customers is that they felt convenient while browsing through the passive newsletter due to the availability of the prices accompanied by brief detail of service offerings at same place. Fifth reason mentioned by customer choosing passive newsletter was articulated as competitor's persuasive advertisements. Lack of previous service provider's complete range of services including price information was indicated in the interviews as basic point of concern.

Those customers who encountered following switching determinants primarily chose active newsletter. In order to benefit from better service quality, one customer switched the telecom company membership, and subsequently chose active newsletter when asked to choose between active and passive newsletters. Second customer preferred active newsletter because he intended to evaluate several services advertised by various operators. Third customer was perturbed by the time taking procedure of calling to customer service representative in order to get the issues addressed.

As Roos and Gustafsson (2011) described that passive customers do not pay attention to the promotional information directed towards them by their current telecom service providers and they need to be frequently communicated, furthermore this is also supported by the findings of present study as passive customers responded that they were mainly influenced by price factor and suggestion by friends and family to make switching decision; therefore in order to successfully manage relationship with passive customers, companies need to include price related promotional information that should be frequently communicated through customers' social circle, reference group and community, in most appropriate manner. As in the stage 3 of the primary research i.e. communication testing, four customers were initially found active but they chose passive newsletter because they preferred to have the knowledge about different prices because they only wanted to focus on the prices instead of the rich information about other services and better quality therefore their focus was on the feature of lower price depending on their basic need. Roos and Gustafsson (2011) identified that influential trigger with price as switching determinant could herald unstable future customer relationship with current company whereas situational trigger with price as switching determinant would mean a strong future customer relationship. Consumer's price expectation and subsequent inclination to pay could be directly related to the offering's value expectation (Danes and Lindsey-Mullikin, 2012). In addition, for price conscious customers, companies should offer money back guarantees (Voss et al., 1998). Price promotion strategies including price deals can help companies in promoting brand equity as well (Villarejo-Ramos and Sanchez-Franco, 2005). As (Day, 2000) mentions that company pursuing strengthened customer relationship, needs comprehensive knowledge of customer base, thus telecom companies should take above-mentioned information into account while designing communication strategies.

As Kim and Ko (2011) identified that each customer is worth more than what he spends initially because he spreads word of mouth among his social circle therefore as we have witnessed in this study that most of the switches occurred due to family and friends' influence on the customer's decision so a service provider could actually communicate intensively to that specific customer regarding his specific needs and wants and in the process that customer could also spread positive word of mouth and could also potentially bring his friends and family in as new customers.

Active customers have chosen communication based on rich information, including company's numerous innovative and up to date offering and packages, irrespective of high or low prices. They mostly searched for detailed information proactively by themselves, instead of just getting influenced by social circle's opinions or competitors' promotional strategies. Their main reasons for switching were identified as availability of better services and unfeasible treatment by the company's personnel. Therefore, companies need to communicate active customers regarding latest offerings, and ensure best treatment and service.

6 Conclusion

Implications of this study impart the procedure to prevent the triggers from happening in the first place. Secondly, this study gives the opportunity to the telecom companies of increasing the long-term customer loyalty by communicating appropriately after identifying the active and passive customers. Cognitive process of customer switching behavior, based on triggers (Roos and Gustafsson, 2011), bears ominous consequences for telecom customer relationships. In order to control this switching process, telecom companies need to monitor and put a check on the switching determinants discovered through this research, by scrutinizing and exploiting the various sources of information, which are also shown in this study as used by customers to obtain the required information in order to base their switching decision, through customized written communication as chosen by active and passive customers in the third stage of primary research phase. For the first part, companies could use this study to identify the specific factors that particularly influence active and passive customers respectively, thereby controlling those specific factors through appropriate communication. Those factors are as follows: for active customers, most influential aspects are situational and reactional triggers in addition to the switching determinants of other/better service availability, unfeasible treatment by their previous company and availability of opportunity to evaluate several services advertised by various operators whereas for passive customers, most influential factors are influential trigger along with switching determinants of price, suggestion by family and friends, competitor's promotional actions, primary focus only on the basic services and availability of brief offerings details comprising prices as well. Customers switch service operators basing their decision on either active or passive communication through following information sources: advertisement, friends and family, and their own proactive research.

7 Limitations and Future Research

As an initial effort to link triggers and switching determinants with the right type of written communication, researchers faced difficulties in designing research instrument therefore future research should develop refined research instrument to measure the effective communication types and features. Further research also needs to determine the ratio of active and passive customers in order to decide upon directing the respective communication frequency. Moreover research is also required in the domain of specific social media features, which could successfully address the issues of preventing switching determinants from happening. Price factor and friends & family are two outstanding factors identified in this research that also need to be further explored in order to successfully cater the customers' need. And also, research should specify what procedure should be adopted after the trigger has happened to get customer back on track.

Abstract: By breaking the existing rules and make new value added operation, business model innovation leads enterprises to the strategic achievements. Aiming to explore the mechanism of business model innovation and enterprises competitive advantages, this paper summarizes what positive influence exert from business model innovation on enterprises resources and discusses how business model innovation help enterprises to seek sustainable competitive advantages based on both the Michael Porter's value chain model and five forces model.

Key words: Business model innovation; Enterprises' competitive advantages; Resource base value; Michael Porter's value chain; Five forces model

1 Introduction

Innovation is becoming more and more significant to enterprises of all sizes, in all areas and in all industries, since the changes of business environment are accelerating the generation of challenges and opportunities. Innovation in nature can be divided into two major categories: one is scientific and technological innovation which can be call original or source innovation referring to the new findings in the nature, and the other is business model innovation which can be called flow innovation referring to new value creation with the source.

As a type of discontinuous innovation, the main effort of business model innovation is not the creation of new technology, new product or new service, but to create new value, namely through the implementation of the new idea into the valuable activities to meet the customers actual needs and improve the quality of the people daily life and work. Sprouted in the internet industry, business model innovation has helped and supported a series of small and medium-sized enterprises in emerging industries to grow up as the potential business giant in the word, taking Alibaba, Paypal for example, moreover, it is extending to traditional industry and making enterprises striving to achieve the new transformation and many shopping malls have started their sell online is the obvious evidence for the changes. Therefore, investors usually regard business model innovation as one of the most economic potential index in the technology homogeneity competition period of this era. Business model innovation connotation and how business model innovation brings advantages to enterprises in the fierce market competition become the focus of attention, which attaches with great research value.

2 Overview of Business Model Innovation

In the 1980s, the concept of business model first began to appear in the reference texts of the IT industry dynamics, and until the Internet formed and became the enterprise electronic commerce platform in the middle of 1990s, business model soon gained attention in the business corporation word and gradually enjoys popularity in the scholars' field of economy and management. Theory research of business model innovation is the period of its infancy, although many aspects of business model innovation including its definition, influencing factors, realization path and the relative aspects such as the way of technological innovation synergy have been widely discussed by scholars at home and abroad, which means that the scientific theoretical system of business model innovation is not established. When it comes to the relationship between business model innovation and enterprise competitive advantage, the theoretical foundation can be summarized from there perspectives of enterprise strategy, business and market rule and value chain innovation.

2.1 Enterprise strategy perspective

Business model innovation is a kind of strategic innovation, through the whole or partial subversion of the nature of the competition in certain field to reconstruct enterprise existing business model and market, while greatly enhancing customer value and to achieve rapid growth of the enterprise

* This paper is supported by the Fundamental Research Funds for the Central Universities (WHUT 2015-zy-039)

itself ultimately, which leads to an achievement of the enterprise's strategy both in market and of its growth (Schlegelmilch et al, 2003)^[1]. Consisting of enterprise strategy elements analysis, innovation elements utility and income pattern design, business model innovation plays an important role in the investment pattern as a key connection and linkage among the three parts especially guarantee the income of the innovation elements and enterprise strategy (Diao Yuzhu, 2012)^[2]. In addition, from the Business model innovation including enterprise strategy analysis elements using the income pattern design three modules, and points out that the investment model of the important factors to guarantee the sustainable innovation of the enterprise business model, is connected to the revenue model and important link of enterprise strategic innovation elements, business model innovation can bring substantial advantages to an incumbent, which make it prefer to operate in a duopoly market rather than to remain a monopolist (Casadesus Masanell, 2013)^[3].

2.2 Business and market rule perspective

Business model innovation is to introduce profitable business model and break the existing rules of market, that is to say business model innovation upsets the existing business rules, and introduces new rules, through redefining customer segmentation criteria and customer demand, exploring the new way to production and delivery, and developing the new method to realize the new profit (Markides, 1998)^[4]. Starting from the concept of innovation, Tidd & Bessant (2012) proposed that innovation activities can be classified into four types: product innovation, process innovation, position innovation and paradigm innovation^[5]. Unlike other traditional types of innovation of product or process, business model innovation is a new paradigm of innovation, reflecting the impact of enterprise business potential change of thinking mode, from new entrants redefining and refactoring the rules of the business game and the unsolved problems of the market.

2.3 Value chain innovation perspective

From the perspective of value chain innovation, enterprise business model is a function of the value chain, and it can be regarded as a kind of innovation of enterprise value based on value chain activities and the integration to optimize all the stakeholders involved in order to realize enterprise excess profits of the set of institutional arrangements, therefore based on the theory of value chain innovation five basic types of business model and innovation methods: extension type of the value chain, split type of the value chain, extension and splitting type of the value chain and innovative mixed type of the value chain were put forward. Additionally, business model innovation can be regarded as a kind of different form of organizational innovation with the new reform process, which means the process of a new opportunity of development and utilization of enterprise level, and that once the gradual change and product innovation lags behind the exogenous discontinuity, organization management will be the use of business model innovation to face the higher level for a longer challenge (Book, 2010)^[6]. Value is often relates with time-consuming cost, considerable upfront investment, the research and development activities cost and the prize to obtain specialized resources, new plants and equipment and the uncertain future returns, enterprises now choose to implement business model innovation to escape the big bets in the product or process innovation to ensure the profit at a more certain level (Amit & Zott, 2012)^[7].

Business model innovation is based on the traditional innovation and beyond the traditional innovation and redefining and reconstructing the rules of the throughout procedure of the enterprise research and development, resources development, manufacturing, marketing system circulation system as a kind of new paradigm innovation, with the ultimate goal of improving the enterprise long-term competitive advantage and enhancing the long-term profitability of enterprises to make achievement of enterprise strategy in its growth on the basis of optimizing value chain inside and outside the enterprise.

3 Business Model Innovation's Impact from Resource Base View

In the face of new economic development, business model innovation has become a new and powerful weapon for the enterprise to cultivate its own core competencies, reduce cost and obtain sustained competitiveness in complex environment. As a mean of creating sustainable value, business model innovation impact on the enterprise competitiveness advantages are different in the short and long range of opportunities and challenges (Aagaard & Lindgren, 2015)^[8]. However, since the ability and performance is based on the resource in the enterprise, the resource base view can be adopted reasonably to conduct the analysis. In Schumpeter's view, innovation is the result of factor combination, and therefore, the resource is the foundation of the innovation value chain. The innovation of the enterprise business model should take the customer as the center, to adjust the optimize allocation of resources, with the concept of win-win cooperation to build all kinds of contact, constantly thinking of

its own business model system, adopt the appropriate way to adjust the business model innovation, in order to obtain sustainable competitive advantage. The sustainable advantages brought by business model innovation embodies in three dimensions in the resource base view.

3.1 Improvement of the efficiency of resource utilization

A great number of business model innovation are inspired by technology innovation, through interaction with technology innovation, improving the efficiency such as Google's myth is based on internet search technology innovation to build a new business model. Retail business model innovation and technology innovation interaction model of Wal-Mart by means of radio frequency identification (RFID) technology makes the goods out of stock rate was reduced by 16% and added speed is three times faster than with the bar code besides its store artificial order also decreased by 10%, stocks overall declining, thus greatly reducing the cost. On the other hand, through the integration of the value chain, business model innovation improve the utilization efficiency of the resources of the company

3.2 Full use of the idle resources in the enterprise by digging the implicit requirements

For startups or new undertaking startups, business model innovation comes from the grasp of the entrepreneurial opportunities and market opportunities. Through creative resources combination, business model innovation can help enterprises to transmit the possibility of a higher value to meet the market demand, which means opportunity refers to the potential market demand or not by use of the resources or capabilities. Work together with the new market paradigm, enterprises can dig out the dominant factors influencing the potential consumption from aspects of the external environment condition cognition and motivation consumers cultural factors, social factors and redefine the most leading factors to cultivate the different levels of potential demand, promote the potential demand gradually to become explicit, until finally activate the potential demand, which brings the opportunities of new profit margin and the idle resource allocation.

3.3 Positive feedback effect on enterprise resource integration ability

The appearance of business model innovation sometimes results from the promotion of resource integration capability, and through business model innovation strength enhancement, it further improves the ability of resource integration. Built in 1994, relying first on OEM and net fishing, franchise chain operation strategy knocking on the door to the market, Metersbonwe in China is the classical example of how business model innovation exerts positive feedback impact on the ability of resource allocation. Within five years, its assets from millions of rapid expansion to hundreds of millions of yuan, thus it further improves its ability to integrate resource.

4 Mechanism Analysis Based on Michael Porter's Framework

The success of business model innovation lies in the value it created for the customers and internal sources of innovation integrates well for business model innovation to generate sustainable competitive advantages (Souto, 2015)^[9], which establishes a solid foundation for introducing the framework of Michael Porter's value chain model to explore logic system to explain the mechanism of the role of business model innovation in enterprise competitive advantage.

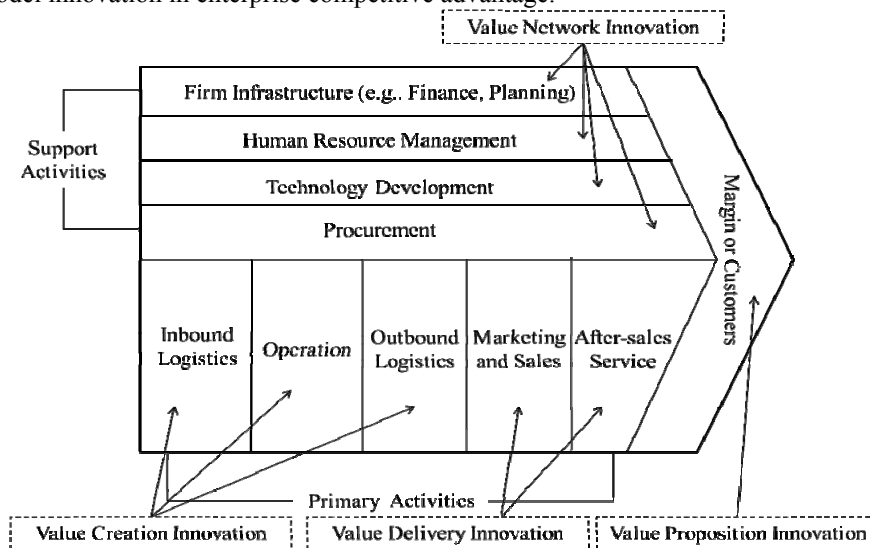

Figure 1 Business Model Innovation Mode under the Value Chain Framework

Based on the logic of primary activities and support activities in the value chain inside the enterprise, setting the meet of customers' demand as the core target and taking the three strategies including cost leadership strategy, differentiation strategy and centralization strategy into account, the business model innovation mode can be divided into four types, including value proposition innovation, value creation innovation, value delivery innovation and value network innovation (see Figure 1). Value proposition innovation mainly focus on the margin and customer and sales links and with the function of defining target customers need and digging the potential and valuable need. Value creation innovation mainly relates with inbound logistics, operations and outbound logistics links and with the function of innovating operation or cooperation mode with upstream and downstream firms and redesigning the cost structure. Value delivery innovation mainly occurs in the marketing and sales and after-sale service links and with the function of innovating distribution channel and service mode. Value network innovation is as the connection and bound inside the enterprise, mainly influencing on support activities links and with the function of defining partnership to innovate the network configuration.

In a more macro point of view, Michael Porter's five forces framework is adopted to make a further discussion of the mechanism of business model innovation and enterprises competitive advantages. Shown as figure 2, value proposition innovation mainly exerts effort on customer value chain from the demand force, value creation innovation mainly exerts effort on suppliers value chain from the supply force and enterprise inner value chain from the competitor force in the same industry, value delivery innovation mainly exerts effort on the sales channel value chain and customers value chain from both the demand force and the competitor force in the same industry, and value network innovation exerts effort on the whole system including the forces of potential entrants and substitutes manufacturers.

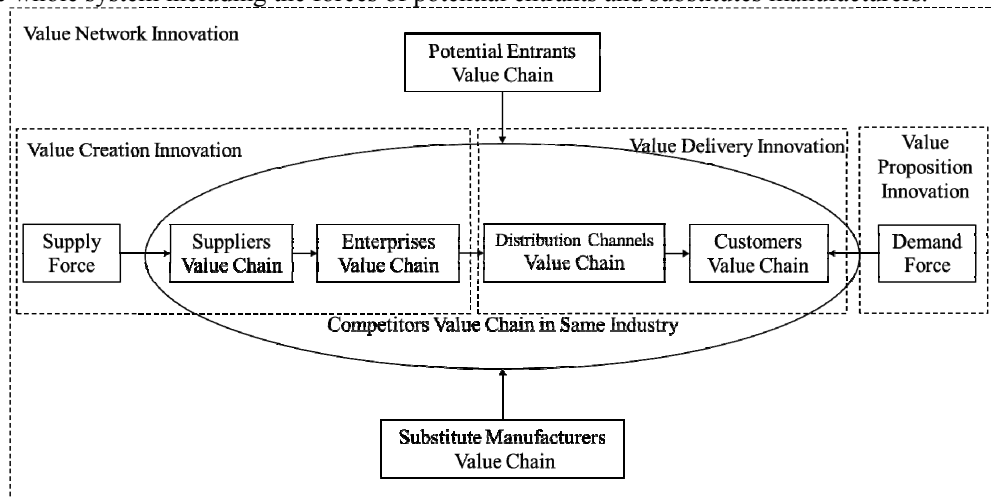

Figure 2 Business Model Innovation Mode under the Five Forces Framework

4.1 Value proposition innovation and advantages

Clear, unique and consistent value proposition is the key to the success of business model innovation, of which the unique value of products and services for consumers is the sum of a series of vested interests customers can perceive. Based on the customers' value chain, enterprises are encouraged to develop strategies on their own core competence and strategic resources, continuously strengthen and maintenance to cultivate and to effectively communicate their core identity and values to customers, which helps to obtain competitive advantages from the demand forces since they regard customer value as the center and create the most enduring value for customers.

4.2 Value creation innovation and advantages

To sustain enterprises advantages in both supply forces and competitors in the same industry, enterprises are supposed to make good and smooth performance in the links of inbound logistics, operations and outbound logistics by value creation innovation mode. Namely, it promotes the activities of business process reengineering, but also to the enterprise external activities to create value for reconstruction. In this part, it reflects the introduction of strategic approach to the history of enterprise strategy and economic interests of the basic value chain positioning play a key role in value creation. Combing with the technical innovation results, cost leadership and differentiation competitive advantage are more likely to cultivate in the value creation innovation process.

4.3 Value delivery innovation and advantages

The 'last mile' logistics is a fishable terms in e-commerce competition, which put the emphasis on the customers value perception. Value delivery innovation is the enterprise product and service innovation patterns of distribution and passed to the target customers' communication activity, the purpose of it is to facilitate the target customer easily to buy and to understand the enterprises' products or services. While the value creation reflects the enterprises' specific value-added ability, the value delivery is the ability to measure enterprise value output, determining the value finally perceived by customers from enterprises. Additionally, it can decrease delivery cost by cutting up the sales chain and increase the customers' perceived value by creating enjoyable utilization experience and after-sales service in order to obtain enterprises advantages.

4.4 Value network innovation and advantages

In the view of value network, the inner value network innovation means to seek a better way to implement all of the support activities from financing management, organization structure, human resource management, IT operation system and so on and the outer value network innovation needs to find a win-win profit mechanism and design a suitable and inclusive partnership mode to guarantee the different enterprises to implement three-dimensional cooperation and multi-dimensional innovation. The network connection provides a dynamic organic system of value breaking the stereotype of competition, but based on win-win idea of close cooperation to achieve complementary advantages, core competence and risks and costs, market share and revenue in the open economic environment, market competition by the enterprise value of direct confrontation to the network's overall.

5 Conclusion

In this fast changeable and competitive era, business model innovation is a suitable way for all kinds of enterprises in all areas to seek sustainable advantages in competition. Based on the resource base view, business model innovation can improve the efficiency of resource utilization, help to make full use of the idle resources in the enterprise by digging the implicit requirements and exert positive feedback effect on enterprise resource integration ability. Through introducing the value chain inside the enterprise and taking the three strategies including cost leadership strategy, differentiation strategy and centralization strategy into account, the business model innovation mode can be divided into four types: value proposition innovation, value creation innovation, value delivery innovation and value network innovation and in the five forces framework the mechanism of business model innovation and enterprise competitive advantages is discussed, which reveals business model is more like a bridge that crosses from the core competence and enterprise competitive advantage. The competitive advantages at the same time bring the achievement of goals of enterprise strategy, enterprise development, in turn, through the adjustment of business model will further speed up the core competence of enterprises.

The Mediating Effect of Technological Innovation Capability on the Relationship Between Organization Learning Capability and Firm Performance

Gebremichael S. Hailekiros, Hou Rengyong

School of Management, Wuhan University of Technology, Wuhan, P.R.China,430070

(E-mail: hailshs@yahoo.com, hourenyong@126.com)

Abstract: Several researchers contemplate that technological innovation capability is the key for building sustained competitive advantages and improving firm performance in the globalized and dynamic business arena. Thus organizations attempt to improve their learning capability to enhance their technological innovativeness. Many prior research findings also reflected that organizational learning capability is the direct determinant of firm performance. However, the significance of technological innovation capability as the mediating variable to improve firm performance is not well investigated. Hence, this paper aims to fill the gap by explaining the mediating role of technological innovation capability on the relationship between organizational learning capability and firm performance. The paper represents a step up in linking organizational learning capability and firm performance by proposing a conceptual model.

Key words: Technological innovation capability; Organizational learning; Firm performance

1 Introduction

While the new competitive landscape's uncertainty, dynamism and volatility is scary environment to some firms, it is bestowed with multiple product-market mix growth opportunities for firms with high degrees of learning and technological innovation capabilities (Barringer & Bluedorn, 1999). The survival and prosperity of firms in this dynamic and complex era thus depends on building capabilities that minimize the negative effects of discontinuities, uncertainty, and ambiguity and simultaneously creating dynamic core competencies to exploit the opportunities (Hitt et al 2000).

When markets shift, technologies proliferate, competitors multiply and products become obsolete almost overnight, successful companies are those that consistently create new knowledge (Hitt et al., 2000) and renew their technological innovativeness (Barney et al., 2001). In line to this point, previous studies showed that both organizational learning capability (Jerez-Gomez et al., 2005; Chiva et al., 2007; Alegre & Chiva, 2008; Kocoglu et al., 2011; Onag et al., 2014) and technological innovation capability (Jonker et al., 2006; Wang et al., 2006; Ortega, 2010; Camison & Villar-Lopez, 2014) have positive effect on firm's performance.

Generally, in literature the organizational learning capability and (Martinez-Costa & Jimenez-Jimenez, 2009) and technological innovation capabilities (Barney et al., 2001) are accepted as the bases to gain sustainable competitive advantages and better firm performance. However, the significance of technological innovation capability as the mediating variable to improve firm performance is not well investigated. Hence, this paper aims to fill the gap by explaining the mediating effect of technological innovation capability on the relationship between organizational learning capability and firm performance.

2 Theoretical Background

2.1 Organizational learning capability

Organizational learning capability (OLC) is defined as the organizational and managerial characteristics, practices, skills or factors that facilitate the learning processes. The processes include generating, acquiring, disseminating and integrating of information/knowledge and modifying its behavior to reflect the new cognitive situation in view of improving its performance (Jerez-Gomez et al., 2005). It is also the ability to assimilate new ideas from others and from past experience and translate these ideas into viable action faster than competitors (Yeung et al., 1999).

Some scholars believe that competition is becoming more knowledge-based and argue that the sources of competitive advantage are shifting from the physical assets view to the intellectual capabilities (Subramaniam & Venkatraman, 1999). Consequently, the ability to develop, nurture and exploit competitive advantages depend on the firm's ability to create, diffuse and utilize knowledge throughout the company (Hitt et al, 2000). Thus learning capability enables firms to develop, maintain

and exploit dynamic core competencies (Hitt et al., 2000).

2.2 Organizational learning capability and technological innovation

In literature the idea that innovation is a competitive instrument for firms' long-term success and survival is widely recognized (Santos-Vijande & Alvarez-Gonzalez, 2007). Organizations fit to the changing conditions of the technology and the market by diversifying, adapting, and even rejuvenating or reinventing through innovation (Santos-Vijande & Alvarez-Gonzalez, 2007). Technological learning provides a base of knowledge upon which innovations can be developed (Zahra et al., 2000).

Furthermore, learning promotes the accumulation of knowledge and its applications (Weihong et al., 2008), creates a medium of communication and interaction for knowledge sharing within the organization (Jerez-Gomez et al., 2005), and enables the collection of timely and accurate information from external sources (Akgun et al., 2013). The organizational learning capability is also considered as an asset that aids firms to transform and exploit their resources towards technological innovations (Amara et al., 2008). Besides, the breadth, depth and speed of technological learning leverage the ability to integrate organization specific technologies and technological skills that equip the firms in the technological learning process to adapt quickly to the changing environment (Lin, 2003).

Additionally, a comprehensive investigation on the relationship between learning and technological innovation capability confirmed that commitment to learning pays a lot. It enhances dedication to innovation, gives the opportunity to own state-of-the-art technology, improves the knowledge and ability to understand and anticipate customer needs, and builds the capability of learning from their success, failure and competitors (Calantone et al., 2002). Studies by (Alegre & Chiva, 2008; Onag et al, 2014) also stated that organizational learning capabilities has a positive impact on firm's technological innovation capability.

2.3 Technological innovation capability and firm performance

The commonly accepted innovation classification by OECD (2005) distinguishes innovation in to product, process, marketing, and organizational innovations. It further groups the product and process innovations under technological innovation and marketing and organizational innovations under non-technological innovation. Product innovation is pertained with the introduction of a new or significantly improved product (Damanpour & Gopalakrishnan, 2001; Wang & Ahmed, 2004; OECD, 2005). On the other hand process innovation involves the introduction of new production methods, new management approaches, and new technology that can be used to improve the production and management processes (Wang & Ahmed, 2004; OECD, 2005; Onag et al 2014). In view of this, technological innovation capability is described as the ability to perform any relevant technical function or volume activity within the firm, including the ability to develop new products and processes, and to operate facilities effectively (Teece et al., 1997).

The objective of product innovativeness is to respond to customers' demand for new products or executives' desire to capture new markets (OECD, 2005; Damanpour, 2010). Inherently, it enables the organization to differentiate its products (Porter, 1985) and modify the offers to the outside world (Bessant et al., 2005) which is difficult to be imitated by other organizations (Gonzalez-Alvarez & Nieto-Antolin, 2005). On the contrary, process innovation is internally focused (Martinez-Ros, 2000) and orientated towards efficiency and reduction of the delivery lead-time and operational costs (Damanpour, 2010). It facilitates firms to follow cost leadership strategies (Porter, 1985). The synergistic interrelationship between these innovation capabilities allows firms to achieve competitive advantage both from differentiation and cost leadership strategy perspectives. Therefore the technological innovation capabilities are core resources to create and sustain the competitive advantages of the firm (Barney, et al., 2001). This in turn results in superior firm performance (Camison & Villar-Lopez, 2014). Research results (Jonker et al., 2006; Wang et al., 2006; Ortega, 2010) furthermore confirmed the positive effect of technological innovation capability on firm performance.

2.4 Organizational learning capability and firm performance

Organizational learning, as the source of knowledge creation and knowledge as the unique, inimitable and infinite resource, is emphasized as an important factor in the achievement of competitive advantage (Kocoglu et al., 2011). In literature the organizational learning is accepted as a base for gaining a sustainable competitive advantage and improved firm performance (Martinez-Costa & Jimenez-Jimenez, 2009). Ellinger et al. (2002) examined the effects of factors like continuous learning, inquiry and dialogue, collaboration and team learning, empowerment of people towards collective vision, connection of organization to its environment and the leadership support on the financial measures of performance. Their research result illustrated a positive association between organizational learning practices and firm's financial performance.

Baker and Sinkula, (1999) stated that knowledge creation through generative learning to create core competency, developing flexible strategy by questioning of ineffective strategy, realization of innovative disruptions as customer satisfaction maximization tool rather than customer feedback are some of direct and positive influences of learning. The positive influence of organizational learning on firm performance is further stated by (Martinez-Costa & Jimenez-Jimenez, 2009). They argued that Organizations better at learning get a better chance of sensing events and trends in marketplace which will in turn lead to better sales and increased market share, build more flexible and responsive structure to respond to new challenges faster than the competitors, and gain fast improvement of market information processing activities. In line with this Chaveerug & Ussahawanitchakit (2008) claimed that the greater commitment to learning, the more likely that firms will achieve higher organizational performance. Moreover studies by (Jerez-Gomez et al., 2005; Chiva et al., 2007; Kocoglu et al., 2011; Onag et al., 2014) showed a strong positive influence of organizational learning on firm performance.

3 Conceptual Model Development

Based on the above discussion, a conceptual framework is developed to show the relationship between Organizational learning capability and firm performance using technological innovation capability as its mediating variable.

Technological innovation capability enables firms to develop inimitable new product (Gonzalez-Alvarez & Nieto-Antolin, 2005) at low cost (Damanpour, 2010) leading to the differentiation and cost leadership strategies. Similarly Organizational learning capability is the source of unique, inimitable and infinite knowledge creation(Kocoglu et al., 2011) enabling firms to develop, maintain and exploit dynamic core competencies (Hitt et al., 2000). Based on the Resource Based view theory both organizational learning capabilities (Hitt et al., 2000) and technological innovation capabilities (Barney et al., 2001) are core resources for sustainable competitive advantages which lead to superior firm performance. On the other hand, Organizational learning capability provides a base of knowledge upon which technological innovations can be developed (Zahra et al., 2000; Calantone et al., 2002; Lin, 2003; Amara et al., 2008). Therefore, organizational learning capability has both direct and indirect effect through the enhancement of technological innovation capability to improve firm performance. Thus considering the concepts that we have analyzed in this paper, the possible relationships between them and the need for further research, we propose the following conceptual model (figure1).

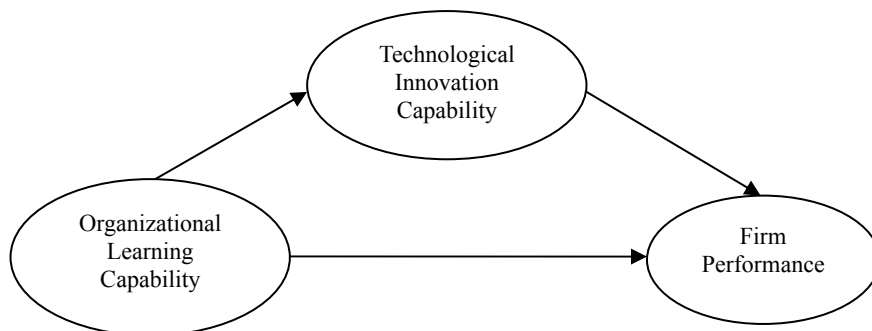

Figure 1 The Mediating Effect of Technological Innovation Capability between Organization Learning Capability and Firm Performance

Based on the description above, the concept develops the relationship between organizational learning capability and firm performance by using technological innovation capability as its mediating variable. Hence our assumption, the direct influence of organizational learning capability towards firm performance can be enhanced through technological innovation capability.

4 Conclusion

Both Organizational learning and technological innovativeness are concepts that are treated extensively in the literature and also concepts over which many different perspectives have been proposed. Through the conceptual model that we have proposed in this paper, we aim to test, through further research and hypotheses regarding the mediating role of technological innovation capability on the relationship between organizational learning capability and firm performance.

Firms create and/or acquire knowledge from both internal and external sources through

organizational learning. Furthermore, Organizational learning capability provides a base of knowledge upon which technological innovations can be developed. It in turn enables firms to develop unique product at reasonable cost. Therefore, based on the resource based view theory organization learning capability is, directly and indirectly by enhancing technological innovation capability, a source of core competencies and ultimately sustained firm's competitive advantages.

Although the relationship between organizational learning capability and firm performance has been developed in this conceptual model, it has some limitations. First, it should be tested to see whether it is valid or not. Second other factors that affect the technological innovation capability need to be also explored. These limitations besides constitute directions for further research.

Reform and Construction of Corporate Governance of Broadcasting Organizations in China: Based on Hunan's and Shanghai's Experiences*

Yin Qi

School of Journalism and Communication, Xiamen University, Xiamen, P.R.China, 361005
(E-mail: yinqi@xmu.edu.cn)

Abstract: Based on cases studies on the GBS/HBS in Hunan and the SMEG/SMG in Shanghai, this article analyzes two different reform models of corporate governance of broadcasting organizations in China under the circumstance of the separation reform of production and broadcasting since 2009, and points out that the choose of reform model is closely related to the development level and resources condition of broadcasting organization. However, after the formal separation reform, broadcasting organizations have not construct modern corporate governance until now, and there still exists no distinction between enterprise management and public institution administration, unclear responsibilities, lack of checks and balances mechanisms, and weak market governance mechanisms. Therefore, this article proposes some solutions of corporate governance problems in broadcasting organizations, including improving state-owned broadcasting assets management system, clearly defining rights and responsibilities among internal governance agencies, developing election, incentive and restraint mechanisms of managers, and establishing healthy market governance mechanisms.

Key words: Separation of production and broadcasting; Broadcasting organization; Corporate governance; Reform model

1 Introduction

Although broadcasting organizations had implemented “public institution, enterprise management” from 1978 to the beginning of the 21st century and have been operated in market economy since the reform and opening up started in 1978 in China, they had been trapped by administrative system because of their identity of public institutions and strong ideological attribute for a long time. As a result of long-time combination of governments, public institutions and enterprises in broadcasting, corporate governance of broadcasting organizations had shown obvious administrative governance features, such as “administrative resources allocation, administrative operation objectives and administrative personnel arrangement”(Li Weian & Wu Lidong,2002), and administrative intervention of governments instead of the internal governance mechanisms in broadcasting organizations. Those are the reasons why broadcasting organizations cannot participate in market competition as independent subjects.

The status has been changed since 2009. In August 2009, the State Administration of Radio, Film, and Television issued “Opinions on promoting the reform of separation of production and broadcasting”. Since then, separation reform was officially launched in China, and broadcasting in China has entered into a new stage.

Actually, “Separation of production and broadcasting” has attracted great attentions since the late 1990s in China, and has been closely related to broadcasting system and mechanisms reform(Zhu Hong & Li Gang,2009), broadcasting industry development (Zeng Xiangmin & He Qin, 2009; Lu Han, 2010) and broadcasting regulation (Gu Yifan,2009). The majority of literatures on separation of production and broadcasting hold a positive and supportive attitude. However, there are still some scholars have queried the prospect of separation of production and broadcasting (Yin Hong,2010; Lu Di,2000). Based on clarifying the connotation and conditions of separation of production and broadcasting (Lu Di, 2000; Gu Yifan,2008) and summarizing some current reform models, these scholars have believed there were numbers of theoretical and practical problems needed to be solved, and then they have proposed some solution ways, such as establishing relevant regulations, developing broadcasting program market and promoting pay TV and specialty channels. Because the separation of production and broadcasting has still stay in the exploratory stage, numbers of articles are mainly focused on industry and policy issues at

macro level, ignoring individual practices and internal mechanisms of broadcasting organizations.

One important goal of current reform of separation of production and broadcasting is “(broadcasting organizations’) transformation to enterprises, and cultivation of market subjects”. Therefore, as the core content of modern enterprise system, corporate governance of broadcasting is critical to the separation reform. Under the background of separation reform, broadcasting organization needs to integrate the broadcasting platforms and propaganda departments to the broadcasting station, and peel program production, advertising and other operating assets to the media companies, and then media companies can participate in market competition as market players. In the process of separation reform, broadcasting organizations in Shanghai, Hunan, Zhejiang, Jiangsu and other provinces have been transformed to media enterprises as well as established corporate governance according to the basic framework of modern enterprise system, and it presents two different reform models of corporate governance.

Based on what discussed above, this article will analyze the processes, reasons and problems of two reform models of corporate governance of broadcasting organizations under the background of separation of production and broadcasting by studying two representative cases as GBS/HBS in Hunan and SMEG/SMG in Shanghai, and expect to put forward some counter-measures.

2 GBS/HBS: Extensive Reform of Corporate Governance

Influenced by the media conglomeration began in 1999, the Golden Eagle Broadcasting System (GBS) was found as the first provincial broadcasting group in China. GBS is located in Changsha, the capital of Hunan province, and was launched on December 27, 2000. Hunan Satellite TV, Hunan Economic TV, Hunan people’s radio station and a number of film and television production companies are all GBS’s branches and subsidiaries.

The corporate governance of GBS under the current separation reform is constructed mainly through extrinsic capital operation. Since 2009, GBS has frequently collaborated with SNDA, Taobao and Qinghai Satellite TV, setting up subsidiary companies by joint contribution to do some cross-media and cross-regional capital operation. While realizing the convergence of traditional media and new media and extending the industrial chain, this reform has also improved ownership structure, financing functions and internal governance structure of GBS through extrinsic capital operation and joint venture companies. Obviously, this reform model is formed through activating the internal mechanisms by external market.

In January 2010, the Hunan Broadcasting System (HBS) was separated from the Radio, Film & TV Bureau of Hunan Province, and GBS which took both broadcasting operation and administrative functions was revoked. Then, in June 2010, the HBS and the Mango Media Ltd. were officially established. HBS is a department-level public institution, managing Hunan Satellite TV, Hunan Economic TV and other provincial radio and television stations which was belong to the former GBS according to “unifying propaganda, unifying personnel arrangement, unifying financial assets, unifying marketing, and unifying technology”. Mango Media which is the wholly-owned enterprise of HBS has independent legal personality, and the operating assets from more than 60 companies which were belong to the former GBS, such as Huaxia Film, Happy Sunshine, EE-Media, Happigo and Mango TV, will enter into Mango Media. However, this round of reform did not show an effective performance, and Mango Media did not enter into substantive stage of operation for a long period as well as did not set up modern corporate governance structure.

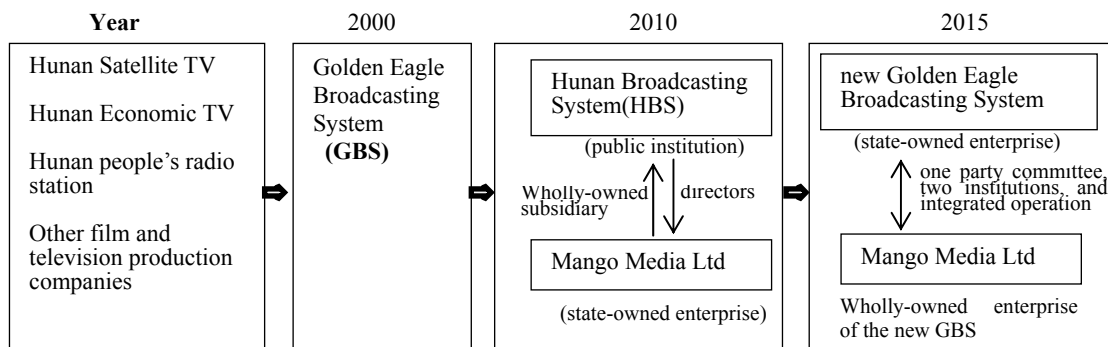

Figure 1 Reform and Construction of Corporate Governance of the GBS/HBS since 2000

Since 2015, HBS has embarked on the road of a new round of reform. In April 2015, HBS announced it completed the transformation to enterprise, and it will be integrated with the Mango Media to establish a new Golden Eagle Broadcasting System, and the new GBS will be listed on June 30, 2015. After the listing, the new GBS will adopt the model of “one party committee, two institutions, and integrated operation”. In this context, how does the new GBS build its corporate governance still remains to be seen.

3 SMEG/ SMG: Self-dependent Reform of Corporate Governance

The Shanghai Media & Entertainment Group (SMEG) was established by integrating Shanghai People’s Broadcasting Station, Shanghai Dongfang Radio Station, Shanghai Television, Dongfang TV, Shanghai Cable Television Station, and other institutions in August 2001. Since then, SMEG has experienced several rounds of reform, and it has become a representative sample of broadcasting reform in China.

In October 2009, approved by the State Administration of Radio, film and Television, SMEG firstly started separation reform in Chinese broadcasting groups, and split the group to two parts: one is the Radio and Television Shanghai, the other is the Shanghai Media Group (SMG). In the reform process, the broadcasting channels and news departments of SMEG had been put into Radio and Television Shanghai which is a public institution led by the Propaganda Department of Shanghai Municipal Party Committee and managed by the Shanghai Municipal Administration of Culture, Radio, Film & TV, and separated operating assets from the public institution and then transfer these assets to SMG which is owned by Radio and Television Shanghai. Therefore, the build of corporate governance of SMEG in the separation reform is realized through internal split.

As a wholly-owned enterprise of the Radio and Television Shanghai, SMG initially construct a corporate governance structure including party committee, board of directors, board of supervisors and managers. Firstly, as the owner of SMG, Radio and Television Shanghai holds decision-making rights on major issues, control rights of assets allocation, appointment and removal rights of managers, editing rights, censorship rights and broadcasting rights of SMG. Secondly, the managers and party committee leaders in SMG and its subsidiaries should be approved and observed by Radio and Television Shanghai and the higher authorities to implement the principle of party’s management of cadres. Thirdly, as to the content management, Radio and Television Shanghai set up a program editorial committee to exercise final censorship to SMG and its subsidiaries, and as the owner and the controlling shareholder of SMG, Radio and Television Shanghai has veto power to major decisions of SMG related to propaganda and cultural security.

In March 2014, the SMG started a new round of system reform. On March 31, 2014, the new Shanghai Media Group(SMG) was established through integrating the former SMEG, Radio and Television Shanghai and the former SMG.

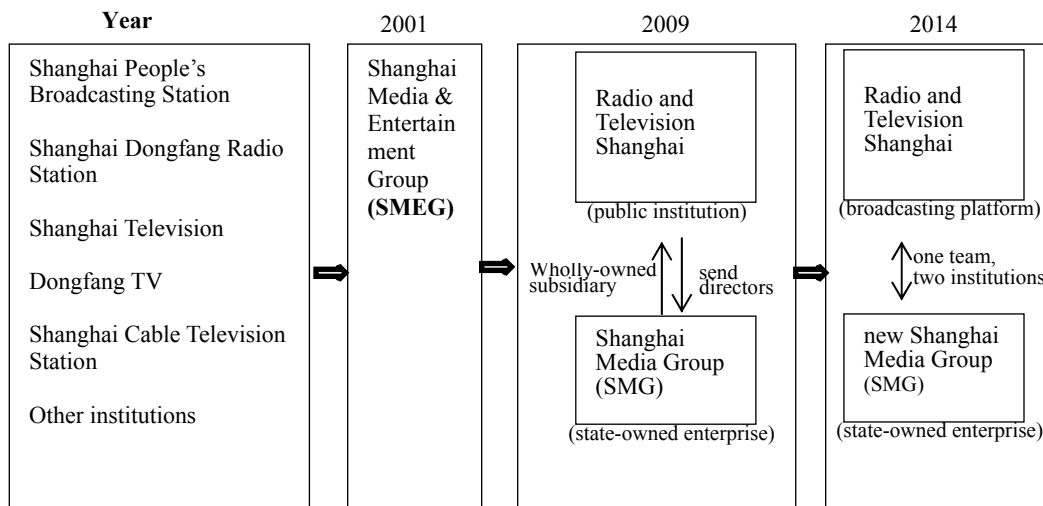

Figure 2 Reform and Construction of Corporate Governance of the SMEG/SMG since 2001

The public institution of the Former SMEG had been revoked and transferred into the state-owned

enterprise SMG. In this process, the corporate governance structure of SMG also needs to be reformed. On the one hand, the most important content in corporate governance reform in SMG is the secretary of the party committee holds a concurrent post of the chairman of the board of Radio and Television Shanghai and the chairman of the new SMG in order to realize the combination of the public opinion's leading and board building; On the other hand, the new SMG has tried to improve corporate governance and promote market-oriented selection and appointment mechanisms of managers, checks and balances mechanisms and incentive mechanisms through the reorganization of its subsidiary listed companies.

4 Reasons and Problems of Corporate Governance Reform Models of Broadcasting Organizations

The formation of two different reform models of SMEG/SMG and GBS/HBS is closely related to the development level and resources condition of these two groups.

For the SMEG/SMG is concerned, it had already completed separation of administrative bureau from the organization, and established an unified management platform for the Group and integrated different departments such as TV drama, news, radio, entertainment, sports before 2005. Therefore, it is an easier way for SMEG/SMG to make an internal split.

As to the GBS/HBS, it had formally completed separating of broadcasting stations from administrative bureau until early 2010. As a result, GBS/HBS was influenced by the Radio, Film & TV Bureau of Hunan Province at the beginning of the separation reform. Moreover, Hunan television stations had launched decentralization reform to increase decision-making autonomy of channels directors in the early years, which brought rapid development as well as serious internal frictions because long-term decentralization had created a new pattern of interests. Although Hunan television stations tried to realize integration in recent years, the effect was not obvious. Therefore, it is more feasible for GBS/HBS to rely on external market forces to realize the separation reform and construct modern corporate governance.

Overall, after the completion of separation of production and broadcasting, either extensive reform model or self-dependent reform model did not build an ideal or good corporate governance structure. One important reason is that the administrative governance tradition still remains strong influence, and lots of broadcasting organizations have encountered many difficulties in their construction of modern corporate governance.

From the perspective of internal organization, the popular and mainstream way of separation reform is to put news departments and broadcasting channels into public institution which is usually called "broadcasting station", and split operating assets to media companies, and "broadcasting station" acts as owner and sponsor of media companies ingenerally. As a result, "broadcasting station" and media company usually have been operated together although looks like separately, and cross-holding, related transactions, cross-use of public facilities happens often, which leads to the concentration of power and the weakening of supervision.

From the perspective of external governance mechanisms, the broadcasting market has usually been administrative monopoly market and reflected in the closed product market, capital market and manager market. More importantly, directors and managers of broadcasting organizations are usually directly appointed by the government but not through market. Therefore, from the practical status of current corporate governance of broadcasting organizations, it is difficult to form constraints and incentives mechanisms to managers in broadcasting organizations through market competition, and the external market governance mechanism seems harder to play a role in corporate governance of broadcasting organizations than the internal governance mechanisms.

5 Conclusion

This article makes a detailed analysis on two reform models of corporate governance of broadcasting organizations in China based on cases studies on the GBS/HBS and the SMEG/SMG. One is GBS/HBS, its corporate governance reform has been constructed through external capital operation; the other one is SMEG/SMG, it tried to promote corporate governance reform through internal split of public institution and enterprise. Nevertheless, there still exists no distinction between public institution and enterprise, lack of checks and balances mechanisms and weak market governance mechanism. This is mainly due to the strong influence from political and administrative system to institutional arrangement of corporate governance of broadcasting organizations in a long time.

In order to resolve these problems, we must explore reform path from both system and mechanisms

dimensions. Firstly, in order to adapt to the socialist market economic system and promotion of the transformation of broadcasting organizations to enterprises, state-owned broadcasting assets management system with clear responsibilities and independent to governments should be established. Secondly, media companies should get rid of the influence from the traditional administrative governance structure, and the party committee, workers' congress, labor union, board of directors, board of supervisors and managers of media companies should perform their own functions and responsibilities in order to make the decision-making agency and the executive agency independent to each other, and make checks and balances mechanisms more effective. Thirdly, media companies should combine party's management of cadres with manager market according to Company Law and State-owned Assets Law, and establish reasonable incentives and punishment mechanisms. Last but not the least, for the sake of getting out of the locking traditional administrative governance, internal reform is not enough and the external forces is necessary to the construction of corporate governance of broadcasting organizations. Therefore, as the basic resource allocation method in the market economy, market mechanisms should receive more attention.

Abstract: The appliance industry, one of pillar industries in national economy, plays an important role in the economic development. As to find key impact factors of marketing channel choice on retail stores of Panasonic and effect degree and put forward countermeasure finally, the paper shows an investigation regarding Panasonic customers for the influence of marketing channel choice for offline physical stores, with data statistics by SPSS and model construction regarding Panasonic customers for the influence of marketing channel choice based on multiple linear regressive model as well as correlation test.

Key words: Household appliances; Electrical appliances; Panasonic customer resources; Marketing channel choice model

1 Introduction

As an important industry of China's second industrial manufacturing industry, the household appliance industry plays an important role in China's socialist market economy. To construct and maintain the efficient marketing channel system is the key to have the sustainable competitive advantage in the current fierce competition and product homogeneity market environment. And these factors during purchasing process, such as the performance of the education level, the purchase frequency and purchase time and habits, are more and more obvious for the channel selection. The behaviors based on customer resources of marketing channel choice behavior of the enterprise entity, can provide guidance for enterprises with developing multi-channel marketing strategy and help enterprises to increase channel coverage, enhance customer satisfaction and maintain a long-term customer relationship. In this paper, Panasonic electric appliances as the research object, in order to build a selection model with suiting the entity marketing channel of Panasonic electric appliances, through the quantitative research on the relationship between the entity marketing channel and the customer resource.

Formarketing channel choice at home and abroad, there is no combination with the household appliance industry, no distinction for the household appliance industry under different scale and marketing environment as well as no research on marketing channel selectionwithout combining with the key factors of custom resources, which are the main point of this article.

2 Model Construction Principle

In this paper, we analyze the influence of customer resources (customer age, gender, income, occupation, purchase performance, etc.) of Panasonic electric appliances for shopping place selection by using multiple linear regression model. A linear regression model will be established following the impact factors of the selection of shopping place, which are customer gender, age, occupation, educational level, family income, purchase frequency, purchase time and consumption expenses: Y said the store selection, X_1 said customer gender, X_2 said customer age, X_3 said the customer occupation X_7 said the customer purchase time and X_8 said customer consumption costs, where $b_1b_2b_3 \dots b_7$ and b_8 said unknown coefficient, a said post fit residuals and $E(a) = 0$,which is independent on the three independent variables.So, establish the model:

$$Y = a + X_1 * b_1 + X_2 * b_2 + X_3 * b_3 + X_4 * b_4 \dots X_8 * b_8$$

3 Data Test

3.1 Reliability test

The greater coefficient of reliability is, the higher internal consistency is, the more reliable test scores, and vice versa. The reliability analysis method of the data of this investigation is the Cronbach's α method. After the questionnaire data were tested for SPSS reliability and draw the following table:

From the above table, we can conclude that the reliability of the questionnaire data is 0.732, which

is more than 0.6. One of the ages, occupations, consumption cost of Cronbach's α is more than 0.6 of the value of the system, the other items of the Cronbach's α are also between 0.4-0.6, which indicates that the internal consistency of data is good.

Table 1 Reliability Statistic

Cronbach's Alpha	Cronbachs Alpha based on standard terms	Number of terms
.614	.732	9

Table 2 Cronbach's

Item	Deleted Cronbach's Alpha values
Gender	.624
Age	.744
Occupation	.734
Educational status	.589
Family income	.519
Purchase frequency	.476
Purchase time	.685
Consumption cost	.870
The store choice	.614

3.2 Validity test

Validity is the ability to reflect the intent of designer---by expressing the intention with the specific problem, and the relevant issues to be expressed by the form of a module---of the questionnaire to be understood by the investigators, that is, whether the questionnaire can effectively measure the variables (as the purpose of identification, evaluation and forecast), and the extent of the problem is accord with the concept of the actual problem to be researched. The validity mainly includes the surface validity, discriminant validity and construct validity.

Table 3 The Test of KMO and Bartlett

Kaiser-Meyer-Olkin measure of sampling		.789
Spherical degree test of Bartlett	Approximate chi square	368.749
	df	36
	Sig.	.000

From the above table, we can see that coefficient is more than 0.7, which indicates that the validity of the questionnaire is good and is suitable for the analysis of the factors.

4 Results

4.1 Preliminary build model

The 8 impact factors were set as independent variables, using $X_1, X_2, X_3, \dots, X_7, X_8$ and the store choice were set Y as dependent variable. A multiple linear regression model was fitted by the least square method, and the regression coefficient was calculated by the mathematical software SPSS.

Table 4 Table of Regression Coefficient

Model	Non standardized coefficient		Standard coefficient	t	Sig.
	B	Standard error	Trial version		
(constant)	6.348	1.045		6.075	.000
Gender	.061	.267	.017	.230	.818
Age	-.096	.125	-.085	-.773	.441
Occupation	.042	.069	.065	.599	.023
1 Educational status	-.378	.160	-.212	-2.364	.020
Family income	.384	.171	.227	2.251	.027
Purchase frequency	-.922	.224	-.565	-4.122	.000
Purchase time	-.342	.231	-.143	-1.479	.143
Consumption Cost	.294	.135	-.262	-2.183	.032

Dependent variable: the store choice

So the Y to the variable equation of the independent variable is obtained.

$$Y = 6.348 + 0.061X_1 - 0.096X_2 + 0.042X_3 - 0.378X_4 + 0.384X_5 - 0.922X_6 - 0.342X_7 + 0.294X_8$$

4.2 Goodness of fit test

The fitting degree of the model is tested by the mathematical software SPSS to calculate the coefficient of determination *R* square and the adjusted coefficient of samples can be determined.

Table 5 Model Summary

Model	<i>R</i>	<i>R</i> party	Adjust <i>R</i> party	The standard estimate error
1	.725 ^a	.526	.484	1.247

Prediction variable: (constant), consumption cost, age, gender, educational status, purchase time, family income, occupation and purchase frequency.

Dependent variable: the store choice

From the above table, we can determine coefficient *R* square is 0.526, adjust *R* party 0.484, which explain its goodness of fit is good.

4.3 The equation of significance test

The model was analyzed with the *F* test.

Table 6 Analysis of Variance table

Model		Square sum	df	Mean square	<i>F</i>	Sig.
1	Regression	156.997	8	19.625	12.612	.000 ^a
	Residual	141.593	91	1.556		
	Total	298.590	99			

Predictive variable: (constant), consumption cost, age, gender, educational status, purchase time, family income, occupation and purchase frequency.

Dependent variable: the store choice

The Sig. in table 4.3 is a significant *P* value. As the value *P* is 0.000 (approximate value), the *P* value is less than 0.05. So the regression equation is significant.

4.4 Regression coefficient significance test

For the significant test of regression coefficient of the model, from table 4.1, we can find that the model not all *X* has significant effect on the dependent variable *Y*. This shows that although the regression equation has passed the significance test, it also appears that some individual variable *X* is not significant on *Y*. Since some of the variables are not significant, the paper adopts the backward method to eliminate the redundant variables. Because of the interaction between the variables, we can not eliminate all the insignificant variables once, so the order is removed in turn. First remove *P* value maximum of a variable, then regression coefficient significance test, if there is insignificant variables, then remove it until the all variables retained has significant effect on *Y*. We first remove *X*₁, and with the remaining variables and *Y* regression coefficient of the significant test.

Table 7 Table of Regression Coefficient

Model	Non standardized coefficient		Standard coefficient	t	Sig.
	B	Standard error	Trial version		
(constant)	6.464	.911		7.093	.000
age	-.097	.124	-.085	-.781	.437
occupation	.041	.069	.064	.589	.026
Educational status	-.378	.159	-.212	-2.379	.019
Family income	.380	.169	.225	2.251	.027
Purchase frequency	-.916	.221	-.561	-4.146	.000
Purchase time	-.340	.230	-.142	-1.480	.142
Consumption cost	-.295	.134	-.263	-2.201	.030

Dependent variable: the store choice

The significance of the remaining variables have changed after excluding *X*₁. There are still some insignificant variables, so continue to remove (due to the culling process is more complicated, only a list

of reserved for the final variables). The final variables are X_3, X_4, X_5, X_6 and X_7 . Regression analysis for the remaining variables and Y , SPSS running results are as follows:

Table 8 Table of Regression Coefficient

Model	Non standardized coefficient		Standard coefficient	t	Sig.
	B	Standard error	Trial version		
1 (constant)	6.248	.866		7.211	.000
Occupation	.016	.061	.025	.261	.794
Educational status	-.413	.152	-.231	-2.707	.008
Family income	.410	.164	.242	2.500	.014
Purchase frequency	-.977	.206	-.599	-4.737	.000
Purchase time	-.357	.228	-.149	-1.564	.121
Consumption cost	-.281	.132	-.251	-2.123	.036

Dependent variable: the store choice

A multiple linear regression model is established by table 4.5:

$$Y = 6.248 + 0.061X_3 - 0.413X_4 + 0.41X_5 - 0.977X_6 - 0.357X_7 + 0.281X_8$$

The fitting degree of the model is tested by using the mathematical software SPSS to calculate the coefficient of determination R square and the adjusted coefficient of samples can be determined.

Table 9 Model Summary

Model	R	R party	Adjust R party	The standard estimate error
1	.723 ^a	.522	.492	1.238

Prediction variable: (constant), consumption cost, occupation, educational status, family income, purchase time and purchase frequency.

From the above table, we can determine coefficient R square is 0.522, adjust R party 0.492, which explain its goodness of fit is better. The model was analyzed with the F test.

Table 10 Analysis of variance table

Model	Square sum	df	Mean square	F	Sig.
1 Regression	155.976	6	25.996	16.952	.000 ^a
Residual	142.614	93	1.533		
Total	298.590	99			

Predictive variable: (constant), consumption cost, occupation, educational status, family income, purchase time and purchase frequency. Conversely, Dependent variable: the store choice

The Sig. in table 4.7 is a significant P value. As the P is 0.000 value (approximate value), the P value is less than 0.05. So the regression equation is significant.

After the above algorithm steps, the new model has been established through the significance test, and the store choice has a positive correlation with the occupation, family income and consumption cost, and a negative correlation with educational status, purchase frequency and purchase time. It has better passed the relevant inspection. It can be seen that the multiple linear regression equation of this paper is good, so the final establishment of the multiple linear regression model is as follows:

$$Y = 6.248 + 0.061X_3 - 0.413X_4 + 0.41X_5 - 0.977X_6 - 0.357X_7 + 0.281X_8$$

5 Conclusion

The situations of customer resource have obvious influence on the construction of offline marketing channel through the analysis. By the research on the offline marketing channel of Panasonic electric appliance, we find customer occupation, family income and expense amount have positive correlation effect on the choice of offline marketing channel. Conversely, education, purchase frequency and purchase time have negative correlation on the choice of offline marketing channel. On basis of the above research, we want to give some inspiration to household electrical appliance enterprises, provide

new ideas on the choice of marketing channel and think more about relevant customer resource factors when we establish effective offline marketing channel.

Abstract: This paper highlights the important factors which are critical in studying and managing aggressive behavior of customers. The winning strategy is not only to deliver excellent services to customers but also to retain aggressive or deviant customers through various techniques which delight them in process. Qualitative analysis with Content Analysis method has been applied to conduct this study. Our research discusses various antecedents and outcomes of handling aggressive customer behavior and derives the relationship of emotional labor with service quality and customer loyalty. Results show the significance of emotional labor in handling dysfunctional customer behavior.

Keywords: Aggressive customers; Emotional labor

1 Introduction

In service organizations, the major theme of business is to sell performance. The outcome of good or bad performance is mostly depending upon service employees. So there is significant role of personal factors other than in services marketing^[1]. In past, services organization focused too much in providing basic standardized services and little focus in designing customized journey of customer. But, now with the changing needs, wants and demand of customers these organizations differentiate themselves on the basis of the response of frontline employee to customers during service encounter. These courteous and friendly responses provide competitive advantage to the organizations which result in retaining customers for a longer period of time.

The purpose of this paper to highlight some core antecedents and outcomes of handling aggressive customer behavior during service encounter. This aggressive behavior occurs by using offensive language, spreading rumor, verbal threat or intense anger shown by customer during service encounter^[2]. So, by understanding and resolving core reason of anger help organization not only in satisfying customers but also making them loyal^[3]. Although all antecedents play vital role in controlling the aggressiveness of customer, but role of emotional labor is significant. It is defined as the form of emotional regulation that creates publicity visible with the support of both facial and bodily display^[4]. Further, this emotional labor is classified as surface acting (Fake feeling) and deep acting (modifying internal feelings). Business dealing in service industry demand sincere behavior more than superficial emotional behavior in dealing face to face with customers in order to provide better service. So, basic theme of emotional labor is all about managing emotional behavior of employee towards customers in providing quality service.

This paper will address the following research questions

- 1: What are the main antecedents and outcomes of handling aggressive customer behavior?
- 2: What is the relationship of emotional labor with service quality and customer loyalty?

To answer these questions this study review literature which highlight different stages of aggressive customer behavior, then we will shed light on antecedents and outcomes of handling aggressive customer behavior. After that we will see how emotional labor impact on service quality and customer loyalty. Then we elaborate our core findings in discussion section. In the last section we will come up with conclusion, limitations and implications for manager in order to deal with these customer behaviors.

2 Literature Review

Organizations need to take care of its customer very well for the sake of their survival. This knowhow of customer will help organization in setting different strategies to fulfill needs and wants of customers. In Service Industry service excellence is determined by customer-frontline employee relationship. This frequent interaction sometimes leads to dissatisfaction when things go wrong. So, it is necessary to dig our certain reasons of such negative emotions so that various measures must be taken to

convert this behavior.

Barron classified three different stages of aggression from customer end with frontline employee. The initial level includes using offensive language and spreading rumor from customer end. During the second stage this offensive language shapes the form of verbal threat and intense arguments. In the third and extreme level physical fights and intense anger is shown up by customer linked with verbal aggression.

So, understanding the root causes of aggression help to manage the negative emotions of customers. Aggressive customer behavior is controlled by number of factors like positive surprise; speed of service, Confidentiality, recognition of customer wants ect. Bacal and Hailu *et.al* argue that customer aggression is the result of lack of assistance from the frontline employee, noisy atmosphere and lack of punctuality^[5]. The major consequences and outcome of Aggressive behavior of customers towards employees results in emotional exhaustion and absences^[6].

There are various terms related to customer aggressive behavior due to increasing interest for both academic and practitioners. Dysfunctional customers damage the goodwill of company by negative word of mouth and harmful to company^[7]. Another term “Aberrant consumer behavior” is a behavior which violates the ethics and conduct. These customers have abusive behavior towards service employees as well as physically and psychologically victimize the service employees^[8]. Jay customer is another related term which is defined as one who acts in abusive way, creates hurdles for company, employee and other customers. These customers are also known as rule breakers, shouts angrily, insults and give threat to service providers^[9]. Another interrelated term is uncooperative customers which place their needs and demands all above other customers, becomes loud and crude to service employees, also shows their superiority to all personals^[10]. Based on these definitions aggressive customers is defined as the customers who shows rudeness towards service employee and use harsh, unethical and abusive language

Muhammad Rizwan *et.al* illustrate that customer complaining behavior helps the company to make its product^[11] and service more customized and it eventually results in customer loyalty. Ray *et.al* demonstrates that there are few positive consequences of aggressive behavior of customers one is manifest function other is latent function. Manifest function is that aggressive behavior of customers creates new positions for employees like security guards, Electronic system ie. CC TV^[12]. On the other side one important latent function help organizations to set certain boundaries of ethical norms, set company core values. Another latent function is it foster positive image of those customers who act calmly during service encounter and improve their self image.

3 Key Antecedents of Handling Aggressive Customers

3.1 Emotional labor

There is common believe that in today’s rational and task oriented environment there is very little role of emotions. S. Mann Points out that in various organizations emotional are managed by number of formal and informal way, we may call as display rules in which some emotions are expressed while majority of them are suppressed^[13]. The first major concept of emotional labor is introduced by renowned sociologist Arlie Hochschild back in 1983. According to (A.R Hochschild, 1983) emotional labor is the form of emotional regulation that creates publicity visible with the support of both facial and bodily display.

The slogan for employees in hospitality industry is “Service with a smile” need to perform emotional labor to achieve organizational goals^[14]. Even when dealing with aggressive and deviant customers employees need to be polite, courteous, and down to earth and must deliver good service. This action increases customer loyalty and satisfaction but at the same time decrease job satisfaction up to some extent. According to (A.R Hochschild, 1983) there are two techniques for managing one’s emotions one is “surface acting” and other is “deep acting”. Observable expressions are managed by surface acting while feelings are managed by deep acting. We can also say that feelings are changed from “outside in” in surface acting (Fake feelings) while feeling are changed from “inside out” in deep acting (modifying inner feelings)^[15].

Watt concluded that jobs of frontline staff in hotel industry (reception, housekeeping, bell desk, reservation) is highly demanding and even selection of service employees depend on their capability to deal with difficult customer with the highly use of emotional labor by using both surface acting and deep acting^[16].

3.2 Altering personal speech

It refers to efforts made by employee to alter or amend his verbal accent and repertoire, with motive to socially bring themselves closer to aggressive customer [17]. It means you have to talk to them in nice way and alter yourself to their level which will make them calm. Organizations need to select right people for that job, provide extensive training of difficult customer handling and provide give good compensation that will motivate employee to perform well during difficult customer handling [18].

3.3 Bribing customers

“It refers as value added offering by employee while handling Aggressive customer in order to get rid of harsh arguments from customers and make customer quite. Bribe may be in the form of offering free good and services during service encounter, or it may be complimentary up gradation of rooms in hotels and the highest level of bribe is refunding all the money to customer in order to avoid any inconvenience

3.4 Observing patrons of customers

This practice is generally used by service employees in pre analyzing and identifying potentially deviant customers. In this scenario they make list of all deviant customers and develop pre plan strategy to handle their irrational behavior by offering more customized services. In the world where service offering creates little difference other factors like studying customer behavior, giving special attention to customers and understanding how to delight them creates competitive edge [19].

4 Outcomes of Handling Aggressive Customer

4.1 Service quality

The most common definition of service quality is the comparison that customers make between their expectations and perceptions of the received service [20]. Sureshchander and Anantharaman define service quality as difference between customer normative expectations of the service and actual perception of the service performance [21]. Both definitions illustrates that the service quality perceived by the customer might be different from the actual service delivered by service people. It also states that critical experience of service quality in cognition of customer not service providers. Afshan *et.al* concluded that service quality creates competitive edge especially in hotel industry and the key element of service quality is courtesy, empathy and element of customized services towards customer and guest [22]. So, even when customer behave rudely and aggressively these three elements can make that customer loyal

4.2 Customer loyalty

Loyalty is the indicator used to evaluate the performance of an organization. Khan defines customer loyalty as preference and demand of customer to repurchase same product and make healthy and profitable relationship with company. In other words we can say continuous buying of customer the same brand and recommend other referral group by positive word of mouth [23]. In customer loyalty there are some attractions in brand which urge customer to buy that product or service again. Guillen *et.al* determine two aspects of customer loyalty one is rational while other is emotional. Mostly loyalty factor depend upon rational analysis [24].

5 Conceptual Model

Following conceptual model has been developed from the literature mentioned above.

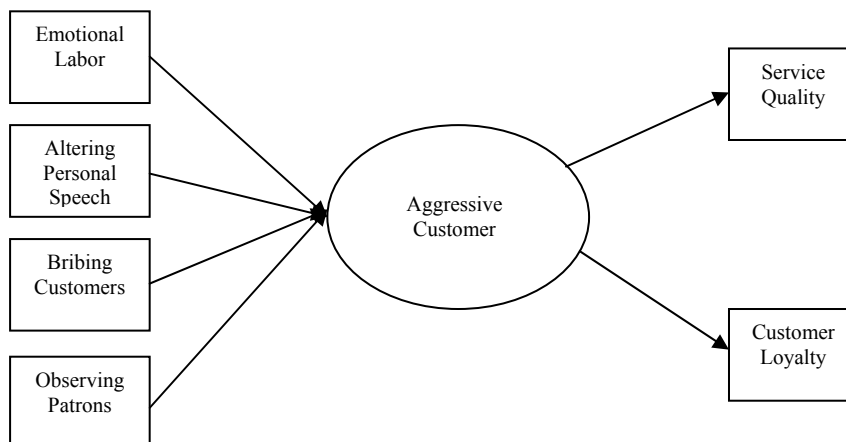

Figure 1 Aggressive Customer Handling-Antecedents and Outcomes

5.1 Proposition 1

There is a positive relationship between Emotional Labor and Service Quality.

There is strong link between the emotion labor and service quality. According to Chaoying *et. al* employee surface acting strategy negatively relates to customer purchase decision and perception about quality because in surface action employee satisfying requirement of his job instead of company and customer need ^[25]. On the other hand deep action positively influences customer purchase decision and its perception about service quality because customer expects real emotions from employee to do something for themselves. Aziz illustrate positive link between service emotion labor and service quality but strongly emphasize that employee empowerment plays a vital role in order to strengthen the relationship. Empowered and motivated employee show positive emotions towards customer which will eventually results in improving service quality ^[26]. In service sectors especially in education institutes emotional labor is significant element that is key which leads towards better service quality, it is considered as the symbol of professionalism ^[27].

5.2 Proposition 2

There is positive relationship between Emotional Labor and Customer Loyalty.

There is a significant relationship between Emotional Labor and Customer Loyalty. In most service sectors “service with a smile” is a basis standards set by most of the organization. Markus *et.al* find that deep acting positively influences customer orientation and service quality which results in customer loyalty and satisfaction ^[28]. On the other hand surface acting do not have positive effect but no negative effects on customers. Secondly, when customer detects employee strategy then surface acting impact is negative and in this case customer appreciates deep acting. The emotional labor is more effective and leads to customer loyalty and satisfaction when employee empowerment plays the mediating role between them. The more empowered the employee, it is easier to handle aggressive customer by the use of emotional labor.

6 Discussions

The current study examined simultaneously both the antecedents and consequences of handling aggressive and irrational customer behavior during service encounter. It extends the literature by adding (1) Key antecedents of handling aggressive customers: (2): Major outcomes derive by handling aggressive customers: (3): Examine the relationship of emotional labor with service quality and customer loyalty.

In the first part we discuss several antecedents of handling difficult and aggressive customers which are emotional labor, altering personal speech, bribing customers, observing patrons of customers. So these pre-requisite helps a lot especially in service sector to calm down challenging and painstaking customers.(Hailu Tekeher Getnet, MD. Rizwan Malik, 2012) comment on it that customer aggression is due to lack of attention from frontline employee especially during service encounter. On the other hand customer aggressive behavior helps organization (with the help of these antecedents) to set new standards, give more customized services to all prestigious customers and eventually improving service quality and customer retention.(Muhammad Rizwan, Syed Hassan Ali,Sonia Akhtar, 2013). Vary from situation to situation service employee use different tactics (collectively and individually) to calm down aggressive and harsh customers which are in the shape of Emotional labor(A.R Hochchild, 1983), Altering personal speech, bribing customers, observing patrons of customers(Kate.L. Reynolds & Lloyd. C. Harris, 2006).

Secondly, there are some major outcomes which we achieve from these outcomes are improving service quality and customer loyalty. It’s mean if the organization knows the art of handling difficult customers then customer becomes more loyal than before. It means moving from one extreme to other.(Ang. L & Buttle.F., 2006)Illustrate that it is ten times more difficult to win new customer than retaining the existing customer. So, organizations must have tools to retain existing one either by hook or by Croke. Service quality one of the outcomes of this study creates competitive edge when dealing with such deviant customers.(Afshan Naseem, Sadia Ejaz & Prof Khusro P. Malik, 2011).Second outcome of handling aggressive customer is customer loyalty, which means customers will utilize the same services again and again and recommend other referral group by positive word of mouth (Khan, 2012).

Finally we find the impact of emotional labor on service quality and customer loyalty. In service sector where employee-customer frequently interact with each other and customer demand service accuracy then and there, emotional labor play major role. There are two categories of emotional labor

and both were having adverse impact on service quality and customer loyalty. (Chaoying Tang, Craig R.Seal,Stefanie E. Naumann, Krystal Miguel, 2013)Emphasize that deep acting (feeling are coming from inside) strengthen the relationship in employee-customer relationship which results in expected service quality and customer loyalty because in crucial situation satisfying and delighting customer results in developing life time relationship with customer. Whereas on the other hand, There is negative impact of surface acting (Based on fake feeling) on service quality and customer loyalty , because in that scenario employees are only protecting their own job and have minimum interest of their organization and customers.

7 Conclusion

The intention of current paper is to present critical evaluation of existing research in handling aggressive behavior of customers. In reviewing literature we found certain pre-requisite which are necessary in handling irrational behavior of customer during service encounter which ultimately results in customer loyalty and service quality. The role and significance of emotional labor also highlighted in this paper. The customer always expects courteous behavior especially from frontline employees and patronizes those organizations which proved them special take care. So employees which use deep acting instead of surface acting create positive impact on customer retention, satisfaction and loyalty.

7.1 Limitations

Although this research expand body of knowledge regarding handling customer aggressiveness during service delivery, but it has certain limitations. First, we need to take employee empowerment as an antecedent and also check the relationship of emotional labor on service quality and customer loyalty taking empowerment as mediator. Secondly, this research is limited to hospitality industry; we need to consider other industries as well to get more generalized result.

7.2 Implication for services manager

(Berry, L.L. and Seiders,K., 2008) suggest that organization must acknowledge the irrational behavior of their customers and manager them efficiently. First of all, service manager's must gives attention to the point of service delivery personally and make physical liaison with challenging customers. This action will certainly remove uncertainly in many aggressive customers and become loyal. In addition to that, service managers must learn the art of using emotional labor effectively at the right time with good results. They need to provide regular trainings to their staff about the effective and efficient use of emotional labor during customer handling.

Study on the Influence of Family Friendly Practice and Employees' Organizational Citizenship Behavior

Wu Zhenghao, Mu Renyan, Zhao Fuqiang, Ma Yong, Wu Jianhua
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 422648533@qq.com, 28968027@qq.com, 1789490772@qq.com, myongdl@126.com, Wujh63@sina.com)

Abstract: The study on the relationship between work and family experience the development from the work-family conflict theory to work-family boundary, and to work-family promotion. The scholars began to attach importance to the study of work-family promotion, and the academic community's attention was led to the family friendly practice. "the influence to family friendly practices on employee's organizational citizenship behavior" was taken as the research subject. By issuing questionnaires and using professional software for statistical analysis, this paper explore the relationship between family friendly practices and organizational citizenship behavior. The results show that: in China, the flexible working arrangements in family friendly practice can improve the organizational citizenship behavior of its organizational level.

Key words: Work family promotion; Family friendly practice; Organizational citizenship behavior; Statistical analysis

1 Introduction

1.1 Work-Family relationships become important social issues

Work and family are two important parts of our life. In Chinese traditional ideas for thousands of years, men assume the main work, while women assume the main family responsibilities. But with the economic development and social change, women gradually take the initiative to assume the work and walking on the job, while men need help women share the responsibility of the family, so the double worker family has become the mainstream of the current society. The family structure, the task of both husband and wife in the family and family values are gradually changing. At the same time, the market competition is becoming increasingly fierce. And in order to deal with these increasingly fierce competition, the expectations of the company are also increasing which led the internal competition of enterprises to intense. In order to gain a competitive advantage, it is necessary for employees to consume more energy and time in the work. The increase of working pressure and the extension of working hours will gradually make the work-family conflict intensified in these double worker families, and it's very easy for the staff to bring the contradictions in the family to work, which makes them gradually lose their enthusiasm in work.

1.2 Family friendly practice was put forward

The study on the relationship between work and family experience the development from the work-family conflict theory to work-family boundary, and to work-family promotion. However, in the previous research, the more is about work-family conflict, and for work-family promotion is relatively less. Therefore, scholars gradually began to focus on this aspect. The research on the work-family promotion has also raised the concern of some advanced enterprises and organizations in the family friendly practice. These enterprises and organizations actively implement the work including flexible working hours, flexible office locations, reimbursement part education expenses of staff and children and other family friendly practice to help their employees to ease the work-family conflict and realize work-family promotion. Family friendly practice can create a supportive organizational climate, employees can be full of spirit to fulfill responsibilities as members of the organization and help employees better integration of their time and resources.

1.3 Organizational citizenship behavior can improve organizational effectiveness

Employee's organizational citizenship behavior was defined as a spontaneous behavior of employees and which is not directly contact with the company's assessment system but can improve the organization efficiency on the whole, every manager wants their employees with this behavior. In theory, the promotion of employee's organizational citizenship behavior can improve the enterprise's system specification, in order to achieve the goal, and promote the development of enterprises. And in the past 20 years, some western countries have made more significant results on organizational citizenship behavior research, they proved employees' organizational citizenship behavior can effectively improve

the operation performance of the whole organization in some ways.

This paper is to explore the influence between family friendly practice and the organizational citizenship behavior. However, there are some problems in the research of family friendly practice at this stage.

2 Present Situation

2.1 The number of related studies is small

In foreign academic circles, the scholars' study on the relationship between work and family mainly experience the development from 70s of 20th century the scholar Greenhouse proposed work-family conflict theory (negative conflict view) to 90s of 20th century the American scholar Clark proposed work-family boundary theory (balance view), and to early years of the 21st century Grzywacz proposed that there was some kind of promotion between work and family (positive effects view), work-family promotion theory came into being and thus enriched the research field of work-family relationship, left a vast space for the follow-up study. And put forward by Neal and other scholars in 1993, as family friendly practice can be used as an important measure to ease the work family conflict, to achieve the work-family promotion. However, in 2005 Eby et al comprehensive analysis of the work-family relationship over the past 20 years of research, the results show that family friendly practice research only accounted for less than three percent of work-family research.

In Chinese academic circles, because of the influence of work-family relationship, the research on this aspect is increasing gradually. But in the previous studies, the most study is still about work-family conflict, and the study of the work-family promotion is still relatively small. And there are few studies focused on family friendly practice in the Chinese research on the work-family promotion.

2.2 Foreign research results are not necessarily applicable to China

Magnus had proposed that family friendly practice can be used to ease the employees' work-family conflict, and Allen divided family friendly practice into two aspects for flexible plans and family caring plans according to the work-family relationship in 2001. But due to the differences in Chinese and western culture, family friendly work practice of the western countries may does not apply to the actual situation of China, such as providing support to the staff to provide work place to take care of their children may not make those employees feel practical.

Professor Farth has pointed out, due to the differences of eastern and western culture values, the Chinese employees' organizational citizenship behavior may different from the west, it should include five aspects such as responsibility consciousness, interpersonal harmony, organizational identification and protecting company resources. To sum up, there is a urgent need for this study to help organizations optimize the allocation of resources, and to achieve the work-family promotion.

3 Data and Methodology

Due to the less relevant research and foreign research conclusion does not necessarily apply in China, this study proposed its own conception model shown in Figure 1, assumed that family friendly practices have a direct impact on the employee's organizational citizenship behavior. Then collect data from Chinese enterprise staff through questionnaire survey and use SPSS software to analyze data, and finally revised the model and came to the conclusion applicable to Chinese enterprises.

Figure 1 Family Friendly Practice Influence Employee's Organizational Citizenship Behavior Model

The questionnaire used in this study with reference to the Allen family friendly work practice scale, and family friendly practice was divided for two sub dimensions as flexible plans and family caring plans. And the questionnaire took the four factors concentric circle model of the Professor Farth, dividing organize citizenship behavior into four sub dimensions of individual level, group level, organizational level and social level.

Sample collection object mainly selected in Hubei Province of China from employees of different types of enterprises, questionnaire survey conducted mainly through the network by Questionnaire Star, based on random sampling and convenient sampling combining principles, issued a total of the 125

electronic questionnaires and recovered a total of 125 copies of questionnaires, 123 effective questionnaires among them. It's very high of the questionnaire recovery rate. There is no limit to the industry and region because of the purpose of this study for searching on the effect of family friendly practice on the Chinese enterprises stuff.

3.1 Reliability and validity of questionnaire

Before data analysis, the reliability and validity of the two scales in questionnaire should be tested separately to ensure that the results of the questionnaire survey were true and reliable.

Analysis by importing data into SPSS software, it is found that the family friendly work practice scale has good reliability, and the coefficient $\alpha=0.834$. The coefficients α of each dimension in the scale are bigger than 0.8, and the specific values are shown in Table 1.

Table 1 Reliability Analysis of Family Friendly Practice Scale

Cronbach's Alpha	Cronbachs Alpha based on standard terms	Number of items
.834	.831	15

Then exploratory factor analysis for its construct validity, selected two main factors, using the maximum variance method of rotation, it shows that family friendly practice scale with good construct validity.

Similarly, the software analysis results show that the organization citizenship behavior scale has good reliability, and the coefficient $\alpha=0.914$. The coefficient α of each dimension in the scale is bigger than 0.9, and the specific values are shown in Table 2.

Table 2 Reliability Analysis of Organization Citizenship Behavior Scale

Cronbach's Alpha	Cronbachs Alpha based on standard terms	Number of items
.914	.928	20

Then exploratory factor analysis for its construct validity, selected four main factors, using the maximum variance method of rotation, the results were satisfactory. Therefore, the questionnaire has good reliability and validity on the whole.

3.2 Data analysis

In this study, factor analysis was used to reduce dimension through the SPSS software. The family friendly practice scale was reduced to two dimensions and the organizational citizenship behavior scale was reduced to four dimensions, taking them as flexible plans, family caring plans, individual level, group level, organizational level and social level these six variables, then this study did the correlation analysis of the six variables, shown in Table 3.

Table 3 Correlation Analysis among Main Variables

		flexible plans	family caring plans	individual level	group level	organizational level	Social level
Flexible plans	Pearson correlation	1					
	Significant (bilateral)						
	N	123					
family caring plans	Pearson correlation	.162	1				
	Significant (bilateral)	.073					
	N	123	123				
individual level	Pearson correlation	.082	.177	1			
	Significant (bilateral)	.366	.050				
	N	123	123	123			
group level	Pearson correlation	.154	.071	.579**	1		
	Significant (bilateral)	.090	.436	.000			
	N	123	123	123	123		
organizational level	Pearson correlation	.181*	.117	.532**	.721**	1	
	Significant (bilateral)	.045	.199	.000	.000		
	N	123	123	123	123	123	
social level	Pearson correlation	.073	.106	.519**	.712**	.832**	1
	Significant (bilateral)	.425	.242	.000	.000	.000	
	N	123	123	123	123	123	123

*. Significant correlation at the 0.05 level (bilateral).

**.. Significant correlation at the 0.01 level (bilateral).

It can be seen from the Table 3 that, the correlation coefficient between the and the organizational level is 0.181, there is a significant positive correlation in it. And other aspects exist certain correlation but not significant, so it can be concluded that, the flexible plans in family friendly practice can improve the organizational level of organizational citizenship behavior.

4 Results

According to the data analysis, this paper draws the research results: (in China), the flexible plans influence the organizational level of organizational citizenship behavior more intuitively. That is to say, flexible work arrangement is advantageous to let the staff have the organizational level of organizational citizenship behavior such as protecting and saving the company resources initiatively, participating in group activities, expressing their own views, etc.

The results of this study have some similarities with the research of Allen, Allen thought that the effect of family friendly practice is different, and the correlation between family caring plans and work-family promotion should be lower than that between flexible plans and work-family promotion. On this analysis, this study argues that in Chinese traditional cognition, filial piety is the obligation of children, taking care of the family is a personal thing, so that staff would rather have the flexible work arrangements given by enterprises to do family activities than enterprise take care of their families.

By the research conclusion, enterprises can according to its actual situation, based on the needs of staff and adopt some system such as flextime, telecommuting, compressed work week, work shift to make employees feel the care, so that employees would produce positive emotions at work and feedback to the enterprises with the organizational level of organization citizenship behavior, so as to realize the work-family promotion.

5 Conclusion

This paper took “family friendly practice influence on employees’ organizational citizenship behavior” as the core research content, using the methods of deduction, questionnaire survey and statistical analysis to study the relationship between family friendly practice and organizational citizenship behavior. Study found that: in China, flexible plans in family friendly practice can improve the organizational level of organizational citizenship behavior.

In practical application significance, this study expected to provide a reference when enterprises implement the family friendly practice, help enterprises develop welfare policy with more suitable for the actual situation of the employees’ work-family relationships. So as to achieve the purpose of promoting actual effect on family friendly practice, promoting employees’ organizational citizenship behaviors, and optimizing the enterprises resource allocation.

In the theoretical sense, this study aims to explore the theory and expand the research field of human resources.

Marketing Innovation Strategies for Improving Economic Development in Africa: Case Study M-Pesa Vodacom Tanzania

Richard Allen

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: richardnt@yahoo.com)

Abstract: An innovation process can be triggered in many ways and not always by a deliberate formulation of a scientific research programme in a laboratory. Bottlenecks in production within a firm, changes in technology, competitive conditions, international rules or domestic regulations, environmental or health crises and even wars have been known to stimulate a process of innovation. Every organization needs clear marketing objectives, and the major route to achieving organizational goals will depend on strategy. Tanzania has four major telecommunications operators - Vodacom, CELTEL, TIGO and Zantel. Vodacom won in the market and it is one which is currently nominating the market in providing mobile telephone services. Therefore, the research seeks to examine the Marketing Innovation Strategies used by Vodacom Tanzania for Improving Economic Development in Africa and compete successfully in a connected world.

Key words: Marketing innovation strategies (MIS); Economic development; M-Pesa vodacom tanzania

1 Introduction

M-pesa (**M** for mobile, **Pesa** is Swahili for Money) is a mobile - phone based money transfer and microfinancing service, launched in 2007 by Vodafone for Safaricom and Vodacom, the largest mobile network operators in Tanzania and Kenya. It has since expanded to Afghanistan, South Africa, India and in 2014 to Eastern Europe. M-Pesa allows users to deposit, withdraw, transfer money and pay for goods and services (Lipa na M-Pesa) easily with a mobile device.

Users are charged a small fee for sending and withdrawing money using the service. M-Pesa is a branchless banking service; M-Pesa customers can deposit and withdraw money from a network of agents that includes airtime resellers and retail outlets acting as banking agents. M-Pesa has spread quickly, and by 2010 had become the most successful mobile phone based financial service in the developing world.

Vodacom has made a number of strategic changes that have resulted in increased subscriber registrations and has enabled a more rapid roll out of the agent network in Tanzania. The changes include a simpler pricing model, a more targeted education-based marketing campaign, and the introduction of an aggregator model to better manage and support its distribution network. Recently the company announced that M-PESA now has more than a million customers transferring USD 12.8 million per month at about 2,000 agent locations since launching in April 2008. Vodacom uses a trust structure that is similar to the operation in Kenya to protect deposits in the service. A holding company has been registered in Tanzania, with independent directors, to act as a trustee of all funds from the M-PESA business.

This paper discusses the original strategic tactics that Vodacom Tanzania employed during the launch of M-PESA in April 2008 and describes how those tactics have evolved since to improve delivery and penetration of the system in Tanzania.

2 Methodology

This study is mainly concerned with exploring the facts behind the success of M-Pesa Vodacom Tanzania. Therefore, the data were classified into two category, primary and secondary data. Primary data were collected by using questionnaires, direct from Vodacom customer care in Arusha district Tanzania. Secondary data were obtained from library, internet, and journals, as well as the Tanzania Communications Regulatory Authority (TCRA)

The study review some theoretical marketing concepts based on telephone service operation in Tanzania, and analysis carried out through critically examining the marketing innovation strategies that Vodacom Company adopts in contrast with its competitors. PR Smith's SOSTAC® Model applied in this study. The data presented in statements and in some few cases tables and figures to enable a quick grasping of the specifics. The comparative approach applied throughout the study in order to establish the reasons for Vodacom's success in the market.

3 Literature Review

3.1 Concepts and definitions

To understand marketing innovation, it would be useful first to establish the meaning of marketing. Marketing is everywhere. It is embedded in everything we do from the clothes we wear, to the websites we click on, to the ads we see. It profoundly affects our day-to-day lives. Hence Kotler and Armstrong define marketing “as the process by which companies create value for its customers and build strong customer relationships in order to capture value from customers in return” (Kotler and Armstrong, 2004, p.5). “Marketing innovation is the implementation of a new marketing method involving significant changes in product design or packaging, product placement, product promotion or pricing”, (OECD, 2005).

3.2 Marketing innovation strategies based on customer satisfaction

As the context of this study is the overall performance of the firm, it is natural to focus on customer satisfaction as an overall evaluation of a firm’s product, rather than a particular individual’s evaluation of a specific transaction (Boulding et al. 1993; Johnson and Fornell 1991, Fornell et al 1996). Overall customer satisfaction should be a more fundamental indicator of the firm’s performance due to its links to behavioral and economic consequences to the firm (Anderson et al. 1994). Therefore the service quality is necessary for the implementation of a new marketing method within the firm to win the possession of the highest profit. But in order to win the possession of the highest profit the company needs to create marketing plans.

Marketing plans can implement the Economic development that is generally understood to mean an increase in national production that result in an increase in average per capita gross national product (GNP). An increase in average per capita GNP alone however is not sufficient to denote the implied or expected meaning of economic development. Besides an increase in average per capita GNP, most interpretations of the concept imply a widespread distribution of income as well. Economic development as commonly defined today, according to Kenen (2000) also tends to mean rapid growth improvement achieved “in decades rather than centuries”. The strategies of economic development among others include industrialization which incidentally, is the fundamental objective of most developing countries. Certainly, most countries see in “economic growth”: the achievement of social as well as economic goals which among others include the following: satisfaction of such non material needs as better education for all, better and more effective government, the elimination of social inequalities; as well as improvements in moral and ethical responsibilities of both the public and private sectors of the economy. In order to achieve the above objectives, naturally, one should be concerned with the basic institutions of industrial society in general and with the management of business enterprise in particular. Definitely, one cannot successfully accomplish such activities without direct concern with marketing.

3.3 Creating marketing innovation strategies for improving economic development in tanzania

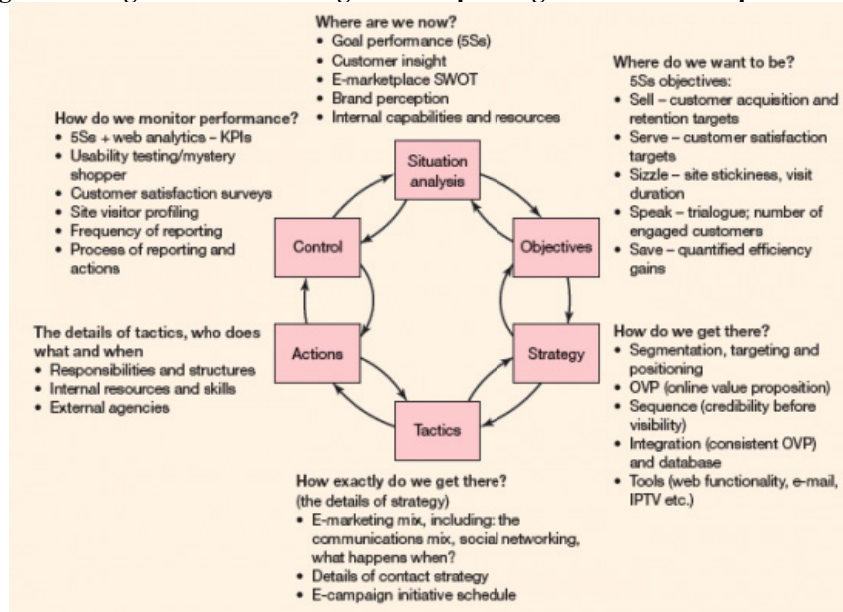

Figure 1 PR Smith's SOSTAC® Model

Marketing innovative strategy model are models focused on strategic marketing problems. The

main purpose of a marketing innovative strategy model is to develop tools and insights for the formulation of marketing strategies. The SOSTAC acronym which stands for Situation, Objectives, Strategy, Tactics, Actions, and Control is a framework used when creating marketing plans according to the competitor’s forces, (see Figure 1).

4 Mobile Foundation Services, Marketing Innovation Strategy and Development in Africa

Vodacom is Tanzania’s leading cellular network and our success comes the responsibility of giving back to our society in a meaningful and sustainable fashion. The Vodacom Foundation was created in July 2006, for this purpose, the Foundation focuses Vodacom’s corporate social investment efforts with the aim of improving the lives of Tanzanians through poverty alleviation and promoting economic development.

The Foundation looks at four key areas namely, Education, Health, Economic empowerment and **Social welfare** which are in line with Tanzania’s National Development priorities. Of late, the foundation has instituted Vodafone Red Alert with the aim of assisting victims of natural disasters in the country. To date the Foundation has carried out over 100 projects in all the regions of the country. These projects have reached and have a direct impact on the lives of thousands of Tanzanians from all walks of life.

Education, the Foundation aims to support development in the education sector by improving physical infrastructure by contributing towards schools, eg building classrooms, dormitories, laboratories etc. improving students access to information and technology resources by providing facilities such as computer centers. Providing educational resources for effective learning such as computers, books and school desks. Health, the Foundation supports initiatives that aims to improve the health care system in Tanzania by providing or improving physical infrastructure, for example by building or renovating wards; providing ICT Resources to improve access to health services eg supplying hospitals or health care centers with computers; facilitating for corrective surgery; supporting community initiative that remedy health problems.

Social Economic Empowerment, the foundation supports initiatives that target the improvement and empowering communities by providing resources and the appropriate technology needed to alleviate poverty; supporting sustainable income generating activities; contributing towards improving the social wellbeing of vulnerable groups; empowering communities by providing resources that relieve hardships; providing communities with sustainable infrastructure that will promote self-reliance.

Table 1

	Vodacom	Airtel	Tigo	Zantel	TTCL	Benson	Sasatel
Subscriber Base	12,317,029	7,664,413	5,613,330	2,347,179	1,048	1,050	1,221
Registered Subscribers	12,301,415	7,289,209	5,509,337	1,203,391	1,048	1,050	1,221
% registered by June 2012	99.87	95	98	51	100	100	100

(Source: TCRA June 2013)

Figure 2 Tanzania Mobile Phone Subscribers by ‘000 (TCRA 2013)

According to Tanzania Communication Regulatory Authority the number of Tanzania phone

subscribers has reached more than 28 million out of 44 million of populations in 2013. Beyond, the four strongest mobile providers leading in Tanzania (Zantel, Tigo, Airtel and Vodacom), there are other three mobile companies namely TTCL, Beason and Sasatel, together they share less than 1% of all subscribers in Tanzania.

M-PESA in Tanzania now uses a pricing scheme that is similar to M-PESA Kenya where a flat fee is charged for person-to-person transfers to registered customers and tiered fees are charged for money transfers to unregistered customers. Cash deposits are free along with cash withdrawals by unregistered users. Registered users pay a withdrawal fee that ranges according to the amount they wish to withdraw. Customers are charged a small fee for balance enquiries and when they wish to change their PIN. A detailed fee structure can be found in Figure 3.

Value Transaction	Value (\$)		Charge (\$)
	From	To	
Cash Deposit	3.70	370.00	Free
Send Money To Registered Customer	0.74	370.00	0.15

Figure 3 SOURCE: Company Information, 2010

5 Findings and Analysis

5.1 Application of the model

Marketing Innovative Strategy is the art of working out how you will win in business and in life. The company implements its different strategies through well planned marketing strategies which help in creating value and retaining good reputation. The marketing plans set by Vodacom Tanzania are creating value to the company since company is still the leading in the market despite adapting different strategies which seem to have highest returns when adapted. The uniqueness of these marketing strategies is what gives the company better way to perform in its overall strategy.

5.2 Tanzania: general mobile phone access and use among adults

Figure 1 present a demand-side view of mobile ownership and use (as well as m-money use) based on the AudienceScapes survey. These numbers cover only the adult population. The data indicate fairly high rates of Africa Development Research mobile phone ownership and use (particularly in urban areas), which bode well for the potential m-money market. That said Tanzanians only need a SIM card, not a handset, to use m-money services.

Tanzania: General Mobile Phone Access and Use Among Adults

Percent of sample who either have that level of access or perform that mobile function

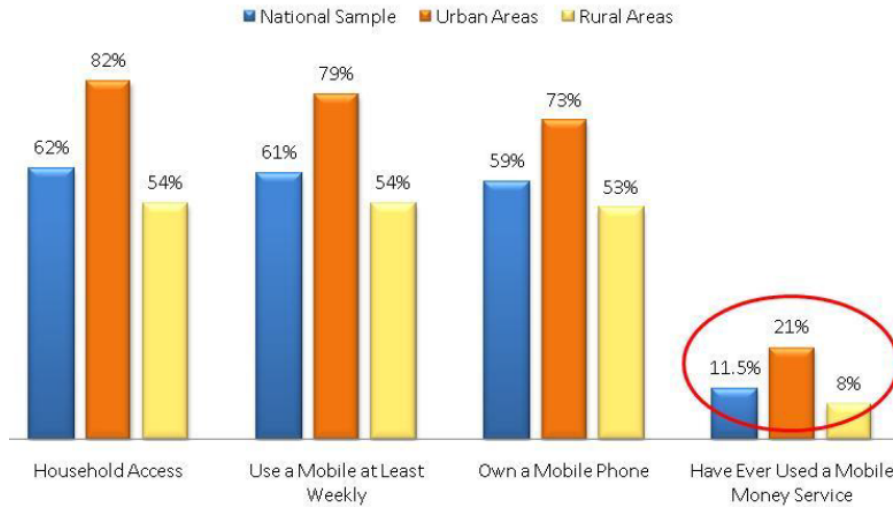

Figure 4 AudienceScapes National Survey of Tanzania 2010: survey of adults (15+) n=2003

5.3 Tanzania: mobile adoption shifts towards the less privileged

Tanzania: Mobile Adoption Shifts Towards the Less Privileged

Daily Income Profile of Mobile Adopters and Sample Population
Percent of that adoption group with that daily income

Figure 5 AudienceScapes National Survey of Tanzania 2010: Survey of Adults (15+) n=2003; Resent Adopted, first acquired mobile phone in past year n=339; Early Adopter first acquired mobile phone five years or longer n=222

The AudienceScapes data also corroborate supply-side statistics showing that Tanzania’s mobile market has seen its strongest growth over the past two years. Twenty-eight percent of mobile phone owners in the survey said they purchased their first phone in just the past year (“recent adopters”). In fact, about 62 percent of owners said they purchased their phone in the past two years.

Parallel to this strong market growth, **there are indications that Tanzania’s disadvantaged populations are increasingly active in the mobile market** (Figure 5). Fifty-two percent of recent mobile adopters reported having a daily household income of less than \$2 (fairly close to this segment’s representation in the general population), compared to only 28 percent of early adopters. Recent adopters also were more likely than early adopters to be women, rural dwellers and unbanked.

5.4 Tanzania: M-PESA leading the way

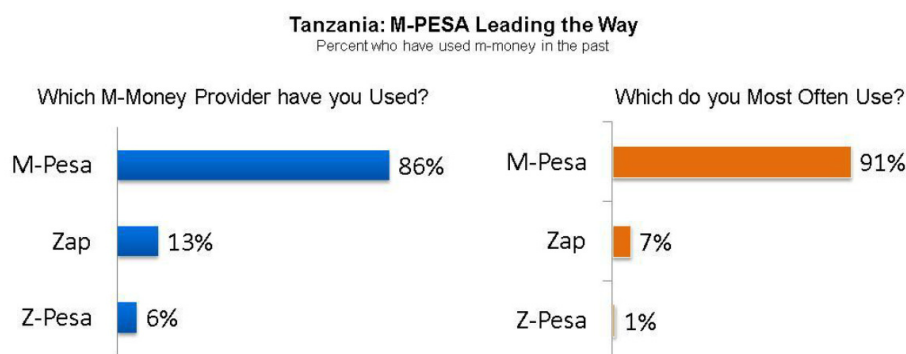

Figure 6 AudienceScope Tanzania 2010 National Survey Of Adult (5+) Who Use a M-Money Service n=250

Vodacom has deployed an innovative new program within its agent network that allows so-called “masteragents” to provide credit to other agents so that they can maintain the proper liquidity to operate effectively. The piloting of this program was partially funded by the GSMA’s Mobile Money for the Unbanked Program. Among M-PESA users in the AudienceScapes Tanzania survey, 75% said they considered the service to be very trustworthy, and another 17% said it is somewhat trustworthy.

The Zap m-money service (rebranded as Airtel Money in November 2010) has chosen to focus less on customer to customer transactions (C2C) and instead leverage its position in what the company sees as a future cash-free “ecosystem”. This includes enabling users to link their e-wallets to bank accounts, eliminating the need to “cash in or cash out” money transfers or bill payments. This strategy is seen as more complex and expensive compared to the efforts of their competitors, who have focused upon C2C and consumer to business (C2B) transactions. From a development perspective, it also may not have the same level of short-term impact among less privileged communities who do not have access to a bank account.

5.5 Tanzania: most popular mobile - based financial transactions

Conventional thinking regarding m-money transfers is that they are often conducted primarily in one direction, with the sender sharing his or her disposable income with a recipient who is in need. In Kenya, there is a dominant urban-rural remittance corridor where senders typically reside in urban areas and “Send Money Home” (an M-PESA slogan) to a rural friend or relative. In Tanzania, while most money transfers originate in urban areas, more than three quarters of both urban and rural recipients reported receiving a transfer from an urban sender. In addition, 57 percent of urban money senders also receive money transfers from others, primarily from other urban senders.

The complexity of Tanzania’s money transfer market has the ability to make marketing m-money products difficult. As a recent GSMA publication highlighted, Vodacom began using M-Pesa Kenya’s slogan “Send Money Home” to advertise its services, but with little effect. Reportedly, Tanzanians were aware of the Vodacom M-PESA brand but not how the service could be used. The main difficulty was Vodacom’s inability to connect their advertising with the sporadic money transfer habits of Tanzanians. By the second half of 2009, coinciding with the SIM card registration period, Vodacom had shifted its marketing strategy towards the presentation of different use cases, explaining to customers how the service works and how to sign up. Despite this shift in strategy, it seems there is still a lack of knowledge among the general population about how m-money services function.

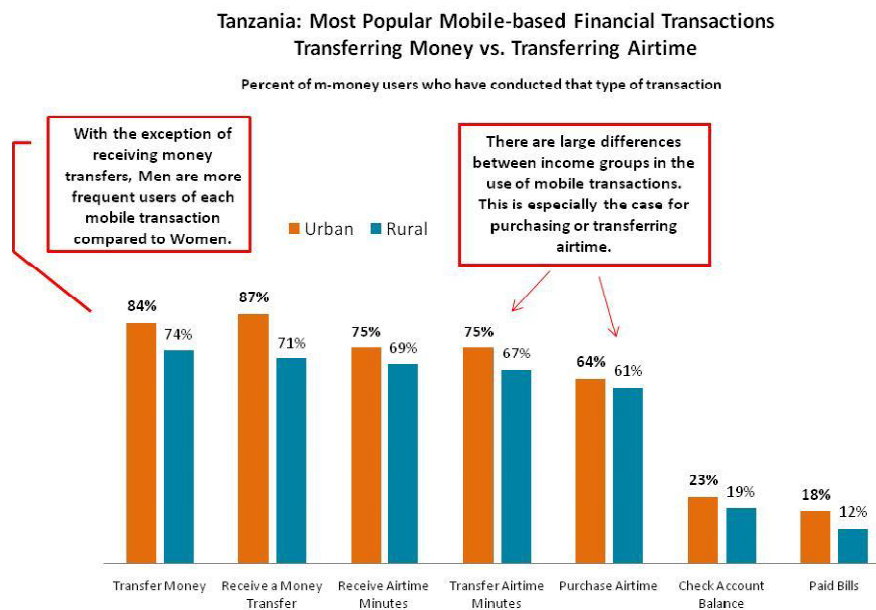

Figure 7 AudienceScapes National Survey of Zambia April 2010: Survey of Adults (15+) Who Have Used M-Money in the Past n=250

6 Conclusion

In view of the above discussion, it is quite clear that as a nation develops, its capacity to produce develops pressure, typically in the distribution structure. Vodacom Tanzania is a leading provider of converged communication solutions that are customer-centric, technology-driven, cost-effective, and innovative but also able to generate sustainable value. Vodacom customers can now access all their desired telecommunication service packages, from mobile telephony through internet access to hosted applications, within a single service provider. Vodacom Tanzania has been a leader in the market for a myriad of reasons. Vodacom stands out for habitually introducing new products and services for the first time in the country.

Even though there are many things that Vodacom Tanzania can celebrate about its accomplishments still a lot of adjustment need to be made. The success that Vodacom has achieved should not blind company to see the future. The company by this time should focus on its pricing strategy and local expert involvement. Since its inception Vodacom Tanzania has been headed by a foreign managing director who has been making the strategic decisions. This concept should be looked at for company to have a balanced pool of ideas for decision making processes. This will help in targeting potential customers especially those who are currently not subscribed to any one telecommunications operator. In future research we will see how M-PESA works and the challenges it brought to the banks' operational activities.

Analysis of University Personnel Management Innovation in the Era of Big Data

Feng Chengjin

Human Resource Department, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 147487387@qq.com)

Abstract: With the advent of the global information age, “big data” concept is gradually integrated into all aspects of society. In the wave of “big data”, how to manage better and make good use of “big data” will undoubtedly become the opportunities and challenges facing the University Personnel Management. From the moment Personnel Management Discussion main problems of starting a profound analysis of the importance of personnel management, information technology and urgency, and made from the changing concepts, improve platform, strengthening cooperation between departments and improve the quality of personnel management and other aspects of strengthening Related University Personnel management information Construction.

Key word: The era of “big data”; Personnel management; Information technology

1 Introduction

With the growing popularity of network information, the mobile Internet, social networking, e-commerce greatly expand the frontiers and applications of the Internet, we are in an era of "Big Data" with explosive growth of data, Big data have a profound impact on social, economic, political, cultural, and life, big data era of human put forward the ability to control data presents to face new challenges and opportunities. In the current personnel management in universities, big data to improve the status of current university personnel management has a good role in the promotion, based on big data, application of modern science and information technology, establish and improve personnel management, information technology and personnel management mechanisms conducive to innovation in the university, enhance the level of university personnel management ^[1].

2 Problems of the University Personnel Management in the Era of Big Data

Currently, the college personnel working in the information age gradually change from the traditional manual office into a paperless office. The main job of personnel management as also by the talent management system, records management system, labor management systems, teacher management system, the year-end appraisal systems and other related electronic systems to achieve. These systems are used in personnel management in the sub-sector to reduce the work of mistakes, improve work efficiency; however, because the data can not be associated with each system and can not be shared, each sub-sector will be repeated some statistics, resulting in data redundancy, greatly reducing efficiency.

2.1 Personnel management concept outdated understanding of information technology is not in place

With the advent of the information age, university personnel management are ongoing reform, but many universities still do not get rid of management under the planned economy, backward management system, management philosophy is obsolete. Many leaders and personnel manager for the university personnel management understanding of information technology is not in place, the information simply understood as the traditional personnel management computer instead, from the purchase of hardware equipment, the purchase of software and databases to establish. They have shown a lot of enthusiasm. But in practice, they rarely used the software, only when they think of the end to make a report or request information management, and not to implement personnel management information, not really play a role ^[2].

2.2 Personnel information management systems are imperfect, information exchange channel is not smooth

The current personnel management system in colleges and universities has been widely used a wide variety of personnel management system. But limited in funds and technology, many systems are developed by an external company to design, in function does not really meet the actual needs of the university personnel management. In addition, a complete set of personnel management system is generally made up of many subsystems, each subsystem almost all relevant sector-specific functions

tailored, with a separate database resources, poor correlation between each other, resource sharing can not be realized^[3]. Moreover, in view of the strong transactional personnel work, frequently updated data, which requires each sub-sector must update their database information. However, the update data between subsystems often can not achieve synchronization update, resulting in repeated the same data in different databases, data redundancy and data generated asymmetric situation, efficiency and impact of the statistical results of personnel work to a certain extent accuracy.

2.3 Personnel management staff lack of capacity information technology, the overall quality have to be improve

To implement personnel management information, the basic quality of staff is demanding. Not only require staff to have knowledge of personnel management side of the business, more skilled master operations information management system. However, the current university personnel managers generally low level of information, mainly in two aspects: First, the old concept, the lack of information literacy, only basic operations, can not do data analysis and management scientifically; Second, in the actual work is not well use of information technology to handle daily affairs, can not maintain information systems and management, resulting in a waste of hardware and software resources, resulting in the operational phase of information systems at a low level, can not be fully functional^[4].

3 The Role of Information Technology in the University Personnel Management

Personnel management, information technology to modernize the help of modern network technology, standardization and network personnel management, making already seemingly isolated useless information through a variety of data integration and analysis of regenerated into a useful source of information will play a very important role in University Personnel Management.

3.1 Easy and fast operation to improve the efficiency of personnel management

College Personnel management is an important and complicated work, which involves a variety of information management faculty, staff, such as changes in wages and benefits, job title changes, staff mobility, recruitment, employee assessment and other. Personnel management must be timely, record information collection accurately, and to promptly update. With the development of university personnel work, the workload increased, the traditional management methods can not meet the needs of modern personnel work. College Personnel Management information by means of the use of science and technology university personnel information data, information processing and handling, will be complicated by the daily affairs of the network, more convenient, more standardized, while saving a lot of time and energy, streamline the personnel work; on the other hand all kinds of information can be easily and quickly statistical analysis, reducing operating costs and improve the efficiency of personnel management^[4].

3.2 Strengthen the unity and cooperation between departments, to achieve a high degree of resource sharing

Traditional personnel management work, although all departments use computers for data processing, but also to establish some simple database, but because of different concepts, scope, and data can not use in a wide range, with a very strong limitations, generally are "fighting each other", sharing of information resources can not be achieved. Strengthen personnel management, information technology, can establish a standardized management system and database, so that information linking the various departments, we operate in an internal system to strengthen the unity and cooperation of various departments, in effectively enhance the personnel department on the basis of cohesion, the ability to collect and update the university faculty personnel information, in order to maintain consistency, standardization and integrity of data in order to achieve a high degree of sharing of resources^[5].

3.3 The information more transparent and open, conducive to deepening service concept of the "people-oriented"

Previous university personnel management system mainly as a fundamental thing, specific to the behavior of personnel management process point of view, often biased the people and ignored to emphasize something. With the continuous development and progress of society, the personnel management system should also follow the development trend, break the shackles, according to people present innovative ideas Personnel Management System. Personnel department is an important part of college, the work is related to the vital interests of the staff, to strengthen information technology personnel management process, you can achieve transparency in faculty-related information, standardization, sharing of resources, improve efficiency^[2]. Meanwhile, the advance of information

technology and digital platforms universities build, one can make of information between departments smooth flow, enhancing the information of openness, transparency, facilitate staff always focus on important information that their closely related, better stimulate their potential; On the other hand it can make development more talent understanding of the school to improve the visibility and competitiveness of the school, in order to attract more talent to join school teachers, promote the healthy development of the school.

4 Concrete Measures to Strengthen the College Personnel Management Information Construction in the Big Data Era

College Personnel management involves a wide range of personnel, with the advent of the era of big data, the amount of data to be processed is more and more, in this context, innovative personnel management, strengthen personnel management, information technology, has been become an important issue of common concern to the university.

4.1 Change of personnel management philosophy, the establishment of large data awareness, attention to information technology

First, to strengthen the emphasis on personnel management, will be "people-centered" philosophy throughout the course of Personnel Management. The traditional personnel management put too much emphasis on work, monotonous and boring, therefore, whether it is leading or the general staff, should strengthen the reflection on personnel management, pay attention to reflect the talent of the dominant position, the coordination of talent personal feelings, self-esteem and value, establish a sense of service, serve personnel work earnestly [6];Second, cultivate awareness of large data, focusing on information technology. As information technology is sweeping all areas of society, universities should fully recognize the importance of personnel management, information technology, combined with the actual school policy and financial support in all aspects of human and financial resources, the establishment of personal electronic records and personnel information management system, give full play to the important role of personnel management, provide quality services to faculty and university departments.

4.2 Establish and improve personnel information management system, build the information management based on platform in big data

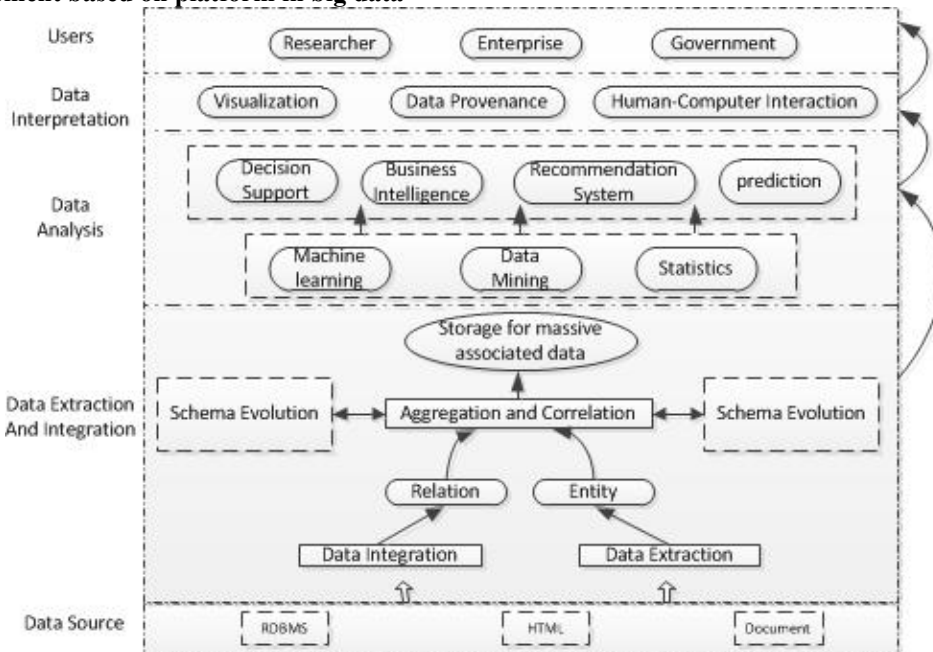

Figure 1 Block Diagram of the Information Management System

Sound personnel information management system needs to integrate data resources of various departments to complete the data collection, analysis, consolidation and application of the work to achieve a unified and standardized management, as figure 1. First, the campus network as a medium to build personnel information management system platform. School campus network is an important platform for information technology, the school may be personnel changes, compensation management,

recruitment information and other personnel information available campus online ,Grading use authority to publish relevant personnel, query, management, etc., enables the exchange and sharing of information resources; secondly, to work to standardize personnel information management: That is in accordance with uniform data standards data, reduce data interface, to establish a unified information platform to standardize management, personnel information and timely updates, regular maintenance of information systems, combined with the actual school personnel information on a unified standardization and institutionalization of management, truly be rules to ensure the authenticity and effectiveness of information resources^[7].

4.3 To strengthen exchanges and cooperation between departments to ensure the smooth flow of information transmission channels

Inter-departmental can enhance working experience through exchange seminars, business salon, forums and other forms of innovative communication and cooperation, continue to strengthen the overall concept, the completion of the work in this sector, based on strengthening awareness of resource sharing. Making information to achieve vertical and horizontal multi-level multi-dimensional sharing to reduce data redundancy and asymmetry, in ensuring the smooth transmission of information under the premise of ensuring the timeliness and accuracy of data.

4.4 To improve personnel management information capabilities, the establishment of high-quality personnel management team

First, to strengthen the business learning and vocational skills training personnel managers, so that they learn the relevant technical knowledge and understanding of relevant national policies and laws, proficiency in information systems, use modern means to handle daily affairs, the real role of information technology efficiency implement; Secondly, personnel training and the introduction of high-quality information system for routine maintenance and management, combined with the actual school system for regular maintenance, upgrading, So that someone special post system maintenance administrator at work to have a pragmatic spirit, keen to discover the problem, and through rigorous investigation to solve the problem; Then, to strengthen ideological education personnel managers and professional ethics education. Managers should possess professional conduct and security awareness, for the more sensitive personnel information to ensure their safety, to protect the confidentiality of personnel management^[8].

5 Conclusion

Information Construction of Personnel Management, Personnel Administration allows colleges and universities to improve efficiency and make the greatest degree of shared resources, which can simplify administrative level, to promote the development of universities. Therefore, we must pay attention to information technology to improve the quality of information management to achieve standardization management, personnel management has leapt to a new level.

Government Management Innovation in the Age of Big Data

Que Tianshu

East China University of Political Science and Law, Shanghai, P.R. China, 201620
(E-mail: redwater123@163.com)

Abstract: “Big data” is a word to be increasingly mentioned, which is used to describe the coming of information explosion. It also defines the related technology development and innovation. Big data triggers a great revolution. This seems to herald the inescapable process of quantization for all professions including academia, business or government. The trend of big data obviously outdated the conventional means of government administration, hence making its innovation the theme of this age. The innovation faces both opportunities and challenges. Opportunities are that it promotes information transparency and policy making based on population subdivision. For challenges, it may increase the risk of “data dictatorship”, privacy, once being abused, may also lead to preemptive punishment; it is also possible to deepen “the digital divide”. Based on pioneering research, this paper puts forward a new mode of government administrative innovation.

Key words: Big data; Government management; Data dictatorship; Information

1 Introduction

With Internet developing; a variety of terminal equipment produced prodigious amounts of data; which means the age of big data coming. International Data Corporation (IDC) research reports: in 2011; the number of global data created and copied is 1.8ZB. IDC predicts; in 2020; the number of data around the world will be 35ZB^[1]; however the edition "Encyclopedia Britannica" printed in 2010 is less than 4G. Wall Street journal treats big data; intelligent manufacturing and wireless network revolution as three grand technological transformations; which may be enough to match the change of last century^[2].

There is no standard definition of big data now. As is usually considered; it is non-structured data in large and diverse forms. Big data is usually associated with Hadoop; NoSQL; data analysis and data mining; data warehouse; business intelligence and cloud computing together. Gaertner's research report suggests large data is information asset of large capacity; high speed and diversification. They need a new approach to improve the decision-making ability; insight and process optimization^[3]. The definition of IBM and IDC is more representative; both of which think big data should meet the "4V"; three of which are Volume; Variety and Velocity. IBM identified the Fourth "V" is Veracity^[4]; but IDC identified the Fourth "V" is Value. Net-App thinks big data include three elements "ABC"; namely Analytic; Bandwidth and Content^[5]. Of course; regardless of various definitions; big data inevitably subverts the traditional way of data management; which brings revolutionary change in the data source; processing method and thinking. Computer Turing Award winner Jim Gray puts forward the fourth model of science research whose main characters are collaboration; networking and data intensive^[8]. Maier Schoen Berg and Kukye think that big data relates to three major changes in thinking and interaction each other: analyze all the data associated with something rather than a small number of data samples; be willing to accept complicated data instead of the pursuit of accuracy; regardless of causality but search for the relationship between things^[7]; big data reshapes our lives; work and the ways of thinking; meaning the "information society" finally be worthy of its name^[8]. Big data indicates that the mankind society is stepping from the information age into the era of intelligence.

Government management innovation in the age of big data has emerged. The data analyzing team behind President Obama plays a crucial role in his re-election campaign; highlighting the new rules of electoral politics in the age of big data. In 2012 March; the federal government announced the launch of American “big data development project”; which is located as an important national strategic. The United Nations launched “Global Pulse” project using big data to promote global economic development. They make "sentiment analysis" for data of social networking sites and text information through natural language decryption software; which helps an area forecast unemployment; spending cuts and disease outbreaks.^[9] In 2010 July; the British Cameron government launched a new agenda in the foundation of the open data movement; which advocated more rights from the central to local; from the local to the community; from politicians to the public so as to establish a bigger; stronger; better society^[10]. Big data will ensure public information open and transparent. At the same time; open data inevitably affects the government management innovation.

2 Three Perspectives on the Study of Government Network Management

2.1 The anarchism in government network management: the utopia of freedom

Restricted by the times; the early Internet researchers pay more attention to the advantages of network. The Internet makes the cultural; politics out of the “center”. The network society is always associated with open; freedom; equality and sharing together; in which the traditional discourse hegemony and centralization are subverted. In the study of bureaucratic rule; Berson and Yazawa Shujiro think that the development of computer technology deepens people for freedom and democracy; making the mass energy burst out^[11]. As a representative of the scholars on the network management; Barlow thinks cyberspace makes a society that is of difference from the reality—freedom but without confusion; management but without government; consensus but without privilege^[12]. Negroponte points out: neither legal nor bomb can make politicians control the network. The message can be sent out by one way or the other^[13]. Yuan Feng also thinks: the Internet gives people the rights of equal communication and expressions; which makes the social culture of a diversified development. Providing free interactive political hegemony; economic benefits for the public; Internet becomes a challenge to the social mainstream culture authority^[14].

2.2 Levitan in social network management

This perspective thinks information filtering; network database; electronic monitoring; site blocked technology can strengthen the control of power so as to create a Levitan of social network management. Both government and large enterprise groups intend to control the internet. As Hiller points out; the Internet is not a new kingdom detached from the real world. On the contrary; the Internet is close to the real world. The Internet in fact is the most wonderful political tool in the age of globalization^[15]. Post believes that; any communication between people and people; people and institutions will leave traces in the database in the age of big data. Private activity becomes a kind of public activities. The database can revise us without eyes but through the cyber space more accurately^[16]. In Fantine’s opinion; in the authoritarian regimes; the Internet is a contradictory existence; which not only threatens but also strengthens government’s control of information and society^[17].

2.3 The interaction between the government behavior in the network society and real social management

The research views the Internet as a neutral tool. Internet is embedded in the concrete structure of the society and the political culture; in which government behavior pattern is strengthened. As Robert Keohane and Nye think; the classical political issues who rules; how to rule and whose benefits not only relates with the traditional physical space but also relates with network space. Information does not flow in a vacuum; but in political space^[18]. Sheldon discussed the meaning of internet political ecological system and the components. He thinks that the internet political ecosystem is an ecological system treating information as the core. Members in the system generate information; through which they communicate each other; ultimately complex self-organizing and self-adjustment function made. The electronic government plays guiding role^[19]. Xiao Bin thinks information technology not only breeds a great opportunity to digital democracy but also face realistic risks sliding into “digital Leviathan”. Only by the way of citizens; civil society and constitutional democracy system can inhibit the single state monitoring system expansion to overcome “digital Leviathan”^[20]. The rise of the network society management is not sudden. But it has accumulated profound theoretical accumulation and practice such as multicenter governance theory; deliberative democratic theory and public governance theory.

The three perspectives above reflect different sides between network technology and public power; which provide the basis for our next research.

3 The mode and Challenge of Realizing Government Management Innovation in the Age of Big Data

3.1 The mode of realizing government management innovation in the age of big data

3.1.1 The transparency of information

Revolution of information creates a new political trust; in which the transparency of information is becoming a kind of right assets^[21]. The data will be a good opportunity for the government to achieve the transparency of information. The data of government departments are easy to get; which can improve their work efficiency. In 2009 March; Obama appointed the first Chief Information Officer in history. Then the federal government open data portal Data. gov appears on line. A “planning the digital future” report in 2010 said “every agency and department of the federal government need to make a data strategy to establish an open and transparent government; in which citizens can participate and

cooperation can be possible^[22].

3.1.2 Forecast public demands

It is the core of big data to apply the mathematical algorithm to the data to predict the possibility of things. The government can analyze the data to response to the public timely. Farrel points out: if the individual activity on the Internet can be systematically captured; we can infer for the first time in history informal communication and opinions between people in the Internet^[23]. Big data reflects the public opinions. Mass data on the Internet record thoughts; behaviors and emotions of the public; which is the combination of the reality and network space; containing rich regular information^[24].

3.1.3 The policy based on population subdivision

The public department should provide equal services for all citizens. But if there is not enough data to understand public demands; the equalization of the service supply would not be possible. The McKinsey study found that; service can be supplied according to the data of individual or a certain group; which can improve the efficiency; effectiveness and citizen satisfaction. Fortunately big data provides an opportunity to realize it^[25]. For example; through analysis of massive historical; the German Labor Bureau adjusts government's welfare for the unemployed; reducing government spending and improving user's satisfaction^[26].

3.2 The challenge of realizing government management innovation in the age of big data

3.2.1 Data dictatorship

Using big data; Amazon checks our shopping habits; Google checks our webpage browsing habits; Twitter hacks our information and Facebook seems to know all; including our social relationship. Government uses big data not less than private enterprises. Washington Post disclosures; in 2010; the number of e-mails; phones and other communication records intercepted by USA NSA every day is up to 1.7 billion^[27]. Big data threatens our privacy and freedom; which are the foundation of modern society. It also aggravated an old threat that we rely too much on data; but the data is not reliable as what we imagine. Digital memory created by big data not only supports the control of hierarchical organization and society but also seeks for their own support so as to consolidate and deepen unequal information power distribution^[28]. In a word; big data may produce "data dictatorship".

3.2.2 Privacy was abused to preemptive punishment

Value of Big data is no longer simple basic use; but is more used twice. A lot of data is not intended for other uses when in the collection; but eventually many innovative uses occur. Big data makes the community lose the ability to forget; and perfect memory instead. Our past as a tattoo inscribed on our digital skin^[29]. In fact; American Department of homeland security is developing a set of future behavior detection technology (FAST) security technology. They can find potential terrorists by monitoring personal characteristic and individual behavior^[30]. In particular; in the transition from small data to big data; data quality may be poor; not objective; misleading or not quantified. We don't have idea inaccurate forecast will damage social system order.

3.2.3 Digital divide

Digital memory deepens the divide between the information rich and the information poor; which further enhances the power tilt. Digital memory has three characteristics: accessibility; persistence; comprehensive. Business or government might use the information to achieve information superiority. We can't see reciprocity information; but the information power from powerless to the power^[31]. The reason of digital divide is the differences among information collection; search and analysis; which will form an accumulative difference.

3.2.4 Institution

In the age of big data; the institution with purpose of protecting privacy policy will fail. It can be seen as a proof of Austrian's word "culture lag"; scientific discovery or invention first; the backward adaptation culture can be often the social organization and ideology^[32]. Risk society theorists Rush thinks: the institution using technology to avoid risks and dangers may involve new risk and lead to a larger scale degree of disorder even complete collapse^[33]. So social risks big data brings are huge.

4 The Ways of Government Management Innovation in the Age of Big Data

4.1 Management based on data: provide the wise public service

In the age of big data; the government will focus on data management; as shown in Figure 1.

Figure 1 Government Management Based on Data

4.1.1 Change from information collector to information analysts

In the age of big data; the collection; management and analysis of data has become the most important. Though data of one year; one area does not see too many tricks; with the cross-regional and year; more and more groups' behavior characteristics will present order; correlation and stability and more rules will appear^[34]. Through the analysis of massive data; government can timely understand the public demands to improve the policy response so as to supply good public services.

4.1.2 Change from information claimants to information offer

In the age of big data; data can be automatically integrated on the internet. Using data technology tools to analyze the public browsing preference; service application; online reviews; the government provides personalized service for the public. The main target of data open website "data.gov" set up by Obama government is to open information to inspire more innovations^[35]. Similarly; in 2010; British Prime Minister Cameron proposed a concept "Right to Data"; which thinks right to data is a basic right in the age of big data. He also promised every citizen had the right. The labor department and business department in Britain announced a new project to implement the data right; My Data; which ensured personal right to data.

4.1.3 The government decision is from the prediction to real and accurate record

First; social management information is published in time. For example; the data pulsation of United Nations emphasizes the real-time data. It makes the prediction by analyzing the real-time data to force the government decision changes from the prediction to real and accurate record. Secondly; more accurate information for decision making is needed. Big data is not random data analysis; but the full data; namely "sample = populations"^[36]. In state of New Jersey; the introduction of INRIX data traffic management system; which is of accuracy and of broad coverage can reduce travel time and cost^[37].

4.2 Construction of the responsible and freed information management system

In the age of big data; it needs to take more responsibility for privacy data management institutions to protect privacy information. Maier Schoen Berg puts forward three strategies; including privacy preserving transformation from individual permission to data users. When using prediction analysis; individual motivation is needed to consider. Fighting against the data monopoly will be the basic of data management effectively^[38]. At the same time; he also puts forward the concept of "Internet forgotten movement" in order to protect the right of privacy and data security^[39]. These measures all emphasis on both responsibility and freedom; which are also social network management development direction in the age of big data.

4.3 Rebalance public power: network citizen society and citizen rights

Since the birth of the network society; there always existed balance-imbalance-balance interaction among public power; network citizen society and citizen rights. Balance between civil society and state is the ideal harmonious society. Civil society is not only an important bridge between the government and the citizen; but also a powerful source and an important factor of influencing the government decision-making and government reform^[40]. Information technology is a kind of social right tools; which reduces the influence of population pressure on the individual. Through interaction; users will choose important problems they think rather than the media think important to become a part of the public agenda^[41]. The collective movements on the internet contributes to overcoming control by the public power. For example; open data movement has penetrated into political; cultural; social and other aspects; creating the motions and the slogans of open political; open government; open media; open city and so on. As a result; 50 governments participate in the "open government union"; whose slogan is "Using format can be reused to publish high quality information; including the original data timely to the whole society"^[42]; which reflects rebalance public power; network citizen society and citizen rights.

5 Conclusion

Based on the theory of government behavior and big data theory; this paper analyzes the mode and

challenge of realizing government management innovation in the age of big data. In the age of big data, the following measures benefit to realize the government administrative innovation: applying the “management based on data” method; constructing the information management system on a responsible and liberal basis; rebalancing the public power; internet civil society and citizen rights. As an exploratory research, it helps us to understand the significance of government management innovation in the age of big data. But what needs to point out are: First, big data technology itself is not mature. The relevant technology and application in the field of social management is relatively less. So the conclusion of the paper needs further inspection and correction. Second, for China, it will be a gradual process to realize government management innovation in the age of big data. It requires government, industry and academia work together, which is our next research direction.

Innovation Through Channels of Human Resources Management: Designing of Creative Organizational Culture

Sanjrani Hameed Akhtar, Hou Renyong

School of Management, Wuhan, University of Technology, Wuhan, P.R. China, 430070

(E-mail: gemnihameed@yahoo.com, hourenyong@163.com)

Abstract: In today's fast-paced volatile Business environment Innovation has been viewed as competitive advantage for successful firms. Innovation can be achieved in an interactive process of creativity, knowledge generation and application. Developing a creative and innovation friendly culture to foster creativity, generate knowledge can facilitate the employees to be more creative sharing of knowledge, and apply the knowledge so that innovation is promoted. The role of Human Resource department has evolved as a strategic player in promoting innovation culture. Many HR practices have positive impact on innovation process. This paper aims to highlight the importance of Designing of Creative Organizational Culture through various HR practices for unleashing the talent of employees to achieve strategic goal of promoting innovation in the organization.

Key words: Innovation; Creativity; HRM practices; Organizational culture; Knowledge sharing

1 Introduction

In today's knowledge based global arena the importance of innovation can hardly be denied. The ever changing business and organizational environment calls for creativity, innovation in all spheres of functional areas in organizational setting. Intensifying global competition has increasingly challenged domestic and multi-national firms to respond to continuous changes in products, markets and technology and best strategy to cope this challenge is to swiftly respond to changing technology and markets through creativity and innovation by establishing creative organizational environment to ensure that employee's creative talent could be managed effectively. For innovative company, the ideas and insights of their employees are of crucial importance (Tang, 1998)^[1]. Not only because innovations start with the initiatives of creative people but also because the commitment of these people is essential to turn an idea into a concrete improvement. There is growing evidence available in the literature to suggest that HR department is an important contributor and predictor to promote organizational innovation. Many studies results indicated that most employees are creative and consider creativity as important in pursuing their performance. If employees are provided the sufficient space for the creativity better performed and adds to innovation.

Innovation can be defined in different ways. According to West and Farr, (1990)^[2] "It is the intentional introduction and application of ideas, processes, products or procedures within an organization, designed to significantly benefit the organization or wider society". Roper and Love (2004)^[3] view innovation as "A continuous, evolutionary process, involving the application and re-application of existing as well as new scientific knowledge". There has been greater debate that how innovation could be achieved within organizational working environment? Paton; McCalman (2000)^[4] suggest that innovation can be achieved by all receptive and responsive members of the organization by ensuring that they have the necessary skills and actively to support the Components of the innovation in the organization. Hence it could be realized that not only R& D specialists but all employees at all levels of the business activity can play an important role in either initiating innovative suggestions for improvements themselves or supporting others who are engaged exclusively in innovation.

Studies investigating HRM and innovation relationships suggest that role of HR department is imperative in creation of innovation oriented organizational environment through specific HR practices, or combination of practices. Laursen and Foss, (2003)^[5] argue that HR practitioners are faced with the challenge of developing and implementing the practices necessary to facilitate innovation process. While there is as yet no commonly agreed frame of reference about exactly what constitutes an HR 'system (Wood, 1999)^[6]. Many scholars such as Dyer & Reeves(1995); Huselid, (1995); Macduffie,(1995); Bae & Lawler (2000); Hutchinson et al(2003), agree that a typical system encompasses HR Planning, training, appraisal/performance management and sophisticated selection and socialization as well as practices designed to promote participation and involvement, such as team-work and reward. Such combinations of sophisticated HR practices have potential to influence organizational innovation, the creation, sharing and implementation of knowledge commonly known as organizational

learning cycle.

2 How HRM Specifically Contributes to Innovation

Historically, there has been abundance of literature on innovation in HRM but shortage of the studies to know how HRM specifically contributes to Innovation? Many research conclude that “there exists a lack of theoretical and empirical understanding of how exactly HRM practices affect innovation performance”. However Recent attempts have been made to draw these two distinct fields together (for further see: Laursen and Foss (2003); de Leede & Looise, 2005; Jorgensen, Hyland, & Koefed, 2008; Jorgensen, Laugen, & Boer, 2007). This calls for enhanced understanding of HRM and successful innovation, to be engaged with in an integrated way. Different HRM practices are seen as valuable to stimulate and support creativity mainly through enable freedom among employees, which hence improve innovation processes (Jiang et al., 2012).^[7] The role of HRM in achieving critical business innovation and success could hardly be denied in variety of HR practices such as in recruiting and retaining skilled employees, increasing customer satisfaction, employing and developing leaders, sustaining a competitive advantage, managing risk, managing change and corporate culture and becoming more innovative. Indeed the single HR function cannot ensure success in innovation but bundle of HR functions and practices could be expected to affect innovation performance much more strongly.” Laursen and Foss (2003)^[5]. Each HR practice has its potential value in promoting innovation but designing of creative organizational environment has critical role in benefitting from employees talent and achieving innovation. In remainder section we discuss this in detail.

3 Designing of Creative Organizational Culture /Environment for Innovation

Creativity is essential factor of innovative capacity, competitiveness and enhancing performance of businesses and organizations. The creativity has its close link to innovation and is perceived as a determinant of socio-economic development of enterprises, cities, regions and countries (Ali Taha, et al (2014) ^[9]. It is commonly accepted that Innovative organizations use knowledge creatively. Creativity is the component that enhances the organizations’ ability to retain their competitive advantage as well as to stay ahead of their competitors.

The majority of the literature on creativity has focused on the individual, yet the organizational environment can influence both the level and frequency of creative behavior of employees. A creativity oriented organizational environment sets a conducive platform where individual creativity can be transformed into collective and collaborative manner that could be benefited in achieving strategic organizational innovation targets. Hence Human Resource function has a crucial duty in stimulating innovation processes by affecting creativity and knowledge sharing (Li, Zhao & Liu, 2006^[8]. HRM practices become crucial to how organizations influence and shape attitude, behavior and skills of individuals, of importance to whether organizations deliver innovations that corresponds with their goals.

3.1 The impact of knowledge sharing, job design, work autonomy, job security and training on creativity and innovation

Only developing ideas and products is insufficient but to move it forward to organizational level becomes necessary to capitalize it fully. Creativity and knowledge sharing combined with opportunity at the work place to be creative and to have an autonomous job design are agreed to be important prerequisites for innovations to occur in the organization. (Marks & Huzzard, 2008)^[9]. The support for knowledge sharing and exchange of ideas in the organization is therefore argued as important for promoting creativity. To support this, a work environment that is tolerant and welcome new ideas, which includes freedom and challenges at work, shared objectives and open relationships between colleagues and managers have been found to be important (Martens, 2001)^[10]. Formal knowledge sharing is institutionalized by management and includes all organized activities that aim to promote knowledge sharing and learning from each other. Knowledge sharing requires a willingness to collaborate with other employees in the organization. A positive relationship was found between HRM practices and knowledge sharing and hence innovation (Chen & Huang, 2009; Tan & Nasurdin, 2011)^[11]. Different studies by Al-Alawi et al; (2007); Casimir et al (2012); Taminiau et al (2009); Suppiah & Sandhu(2011) have concluded that the organizational culture has an important impact on knowledge sharing in the organization. An organizational culture that encourages trust between employees are facilitating knowledge sharing, facilitates a flow of communication, social networking and cross-functional interactions was positively associated with knowledge sharing (Casimir et al., 2012)^[12]. Additionally,

teamwork and a collaborative culture were also argued to affect knowledge sharing positively (Suppiah & Sandhu(2011)^[13]. Employment security and job design is argued to be important for knowledge sharing since it means stability, team orientated, autonomous and internal communication oriented job design, with a flexible organizational structure with broad defined jobs, knowledge sharing behavior was enhanced since it encourages experimentation (Jiménez-Jiménez & Sanz-Valle, 2013)^[14].

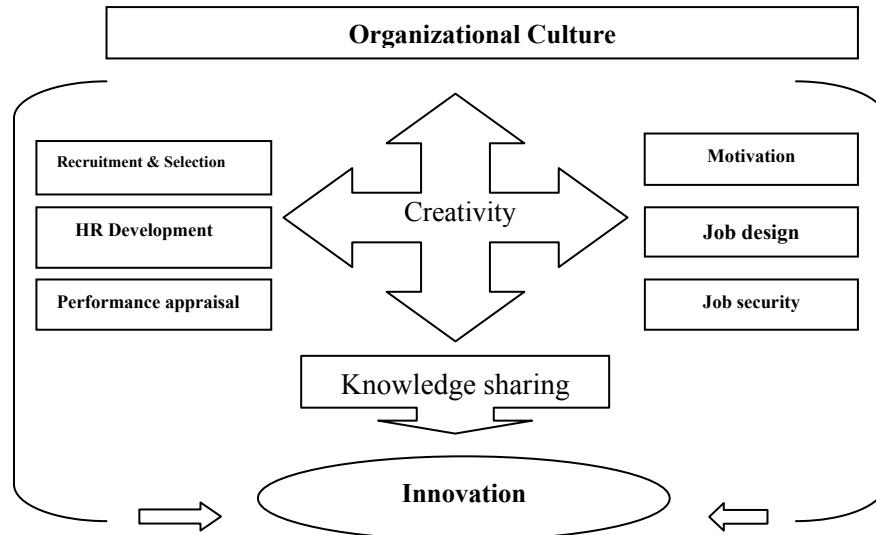

Figure 1 HR Practices Supporting Organizational Culture and Innovation Process

Some previous studies found support for the positive role of training for knowledge sharing, individual capabilities and a learning-oriented culture. By training, culture could be developed and maintained and employee skills could be translated into organizational routines Minbaeva (2005); Jimenez Jimenez & Sanz-Valle, 2013)^[15]. Performance appraisals combined with compensations are argued to potentially enhance employee motivation for knowledge sharing. Performance appraisal and rewards should reflect employees' contribution to knowledge creation and transfer. (ibid.).

4 Conclusion:

Organizations in pursuit of innovation look for HR department to play decisive role in providing creativity and innovation friendly environment through various HR functions. The paradigm shift of HR department from Pay and pay roll has been turned to strategic partner in all aspects of organization. Innovation must be created and sustained through new sets of HR practices. Innovative organizations possess a culture of creativity, engagement, desire to succeed, and empowerment at the employee level. Recruitment, training, performance appraisal, job design and reward system should be carried out in a way that leads to job security, freedom of generating creative ideas and timely sharing of such creative ideas to encourage innovation. Creative and innovative organizational culture can only ensure that talent of employees is transformed into innovation and for competitive advantage.

Research on Management Innovation for College Students in Practice under the Background of Mobile Internet

Fan Huiping

1 College of Marxism, Wuhan University of Technology, Wuhan, P.R. China, 430070

2 College of Politics and Public Administration, Zhengzhou Normal University, Zhengzhou, P.R. China, 450000

(E-mail: 1085783677@qq.com)

Abstract: with the rapid development of mobile Internet, the use rate of mobile network will be higher. This paper fully studies the new background of mobile Internet, and analyzes it according to authorized data recorded in “The 35th Statistics Report on Chinese Internet Development” and other official documents. The result shows that college students are the main force of the mobile Internet users; therefore, it brings new opportunities for the innovation of management of students in practice. The paper further has built a structure of “strengthening awareness of mobile network, improving mobile network skills and improving the effectiveness of the mobile platform” to expand the management path of college students in practice and make the management of students in practice more effective.

Key words: The background of mobile internet; College students in practice; Management; Innovation

1 Introduction

With the rapid development of mobile Internet, China has entered the era of mobile Internet. Among a large number of mobile phone users, college students are main force in the use of mobile Internet. Mobile Internet is gradually influencing and changing their lifestyles, behaviors and ways of thinking. The popularization and extensive use of the mobile Internet not only provides an opportunity for management of the college students in practice, but also brings challenges. We need to fully understand the dual role of mobile Internet in management of college students in practice, change our concepts of education, make full use of the advantages of mobile Internet, and continuously innovate in the contents and methods of management of college students in practice to improve work efficiency and management level. Chen Xiaobo, Teacher of China Nanjing University of Posts and Telecommunications, published an article of “Discussion on Innovation of Management of College Students under the Background of Internet” in 2012. He put forward that “the college student affairs administrators should know the situation clearly, update management philosophies, expand new ideas and actively explore new management methods and mechanisms in order to better meet the need of network era”.^[1] So far, there is no one to study “the innovation of management of college students in practice under the background of mobile internet”.

2 The Environment Analysis under Mobile Internet Mode

In order to make clear the innovation of management of college students in practice under mobile internet mode, most of data in this paper come from “35th Statistics Report of China Internet Development” issued by the China Internet Network Information Center (CNNIC) and other authorized official documents.

2.1 The scale of internet users and mobile phone internet users

According to “The 35th Statistics Report on China Internet Development” (hereinafter referred to as the “report”) issued by the China Internet Network Information Center (CNNIC), “by December 2014, the scale of China’s Internet users had reached 649 million. There are totally 31.17 million new Internet users in the year. The popularizing rate of Internet is 47.9%, increasing 2.1% compared with that at the end of 2013”. “As of December 2014, the scale of the mobile phone users in China has reached 557,000,000, with an increase of 56,720,000 people compared with that of 2013. The proportion of mobile phone internet users increases to 85.8%” from 81.0% in 2013.^[2]

2.2 The usage rate of mobile internet equipment and the quantity of mobile search users

As shown in Figure 1, by the end of 2014 the proportions of desktop and notebook computer access to the Internet were essentially the same with that in 2013, respectively maintaining at around 70% and 43%. However, the proportion of mobile phone access to the Internet increased by 4.8% compared with that at the end of 2013, up to 85.8%. In 2014, the use rate of desktops, notebooks and other traditional internet access devices remained steady, but the use rate of mobile Internet devices further grew. From

Figure 2 we can see, in 2014 and 2013 main device used by new Internet users is mobile phone, with respective use rate of 64.1% in 2013 and 73.3% in 2014, much higher than the use rate of desktop computers and laptops. From Figure 3 we can see that as of December 2014, China's mobile phone search users had reached 429,140,000, with a use rate of 77.1%. The user scale increased to 64,110,000 from 365,030,000 in 2013 with a growth rate of 17.6%.

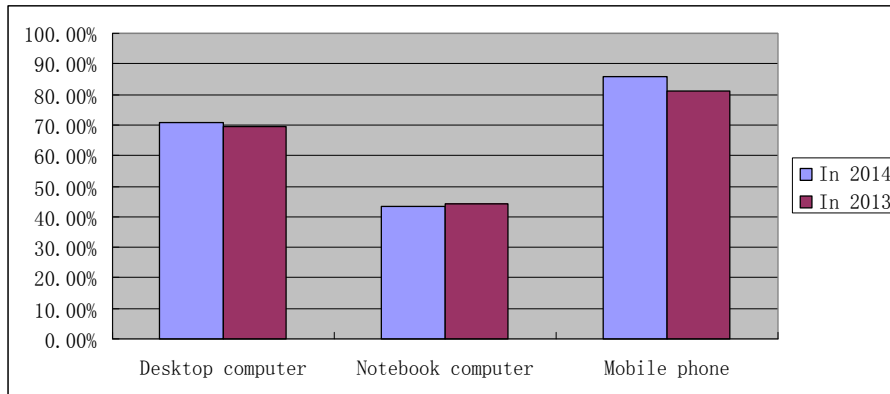

Figure 1 The Use Rate of Desktop Computer, Notebook Computer and Mobile Phone Access to the Internet

Figure 2 The Use Rate of Internet-Access Devices of New Internet Users

Figure 3 Mobile Phone Users Search

2.3 The age structure and education level of internet users

As of December 2014, “China's Internet users aged between 10 and 39 became the main group, with a total proportion of 78.1%. Among them, the proportion of Internet users aged between 20 and 29 was the highest, up to 31.5%”.^[3]As shown in Figure 4, the netizens aged between 10 and 39 was the most internet-dependent group. In the management of college students, counselors are the main force for students’ management. The author has made a survey about the age of counselors in colleges and universities. As shown in Figure 5, there are 131 counselors aged between 20 and 29, accounting for

59.28% of respondents. There are 74 counselors aged between 30 and 39, accounting for 33.48% of respondents. There are 8 counselors aged between 40 and 49, accounting for 3.62% of respondents. There are 8 counselors aged above 50, accounting for 3.62% of respondents. The instructors aged between 20 and 29 are the main group using mobile internet. “The proportion of netizens of bachelor degree or above reached 63.9%. The dependent ratio of netizens to Internet increased with the increase of education level. The proportion of students was 23.8% among netizens, ranking the highest.” [4] It indicates that Internet has become a "basic element" in the work and life of college students and counselors.

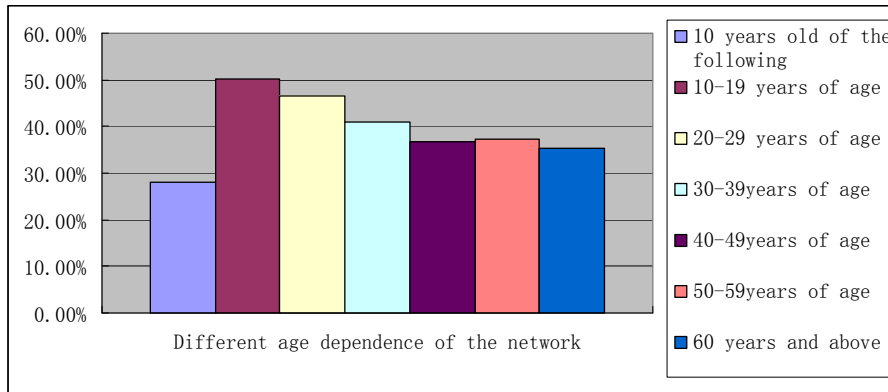

Figure 4 Dependence of the Network in Different Age

Figure 5 The Proportion of Counselors on Different Age

In short, through analysis of the above data, we can draw the following conclusions: 1) from the use of the mobile Internet in China, with the development of network technology, network use rate will be higher and higher. The mobile network environment in modern society requires the innovation of management of college students in practice; 2) from data analysis about the age structure and education level of Internet users, it can be seen that the age and education level of college students and counselors are all in this age group. At present, college students also belong to this group aged between 20 and 29. Therefore, both students and counselors are the main force of mobile Internet users and it brings new opportunities for the innovation of management of college students in practice.

3 The Practice Status of College Students

As we all know, practice is an indispensable key line in teaching. It is also a process for students going from theories learned in classroom to social practice. It provides opportunities to apply theoretical knowledge into practical life, realizing the qualitative leap of professional knowledge. It is undoubted that it can deepen and consolidate professional knowledge learned in class. Due to college expansion of enrollment, there are about 10,000 or 20,000 students in a college, even more in a comprehensive university. However, due to intense staffing quotas, colleges and universities are short of teachers. In addition, it requires students to enlarge the selection of practice, so colleges and universities begin to use the mode combining unified arrangement and independent choice. The school is only responsible for the guidance of practice. Students' practice units vary and are distributed in different places. With different

concepts in practice and employment, some students may change practice unit specially. In the practice process, counselors can not care about every student in dynamic management due to various reasons. For a long time, this large distribution but small concentration and strong flow-ability have greatly increased potential risks to students' safety and brought many difficulties to student management. The overall management ability of colleges and universities are therefore reduced. It is very difficult to resolve problems of student in practice in time. In addition, graduating classes often have a lot of things. It is even more difficult to communicate at times and meet together regularly. It is beyond the reach for school, so it is unable to carry out effective guidance and management. Even though there are supervisors appointed, the guidance often becomes empty. In fact, students are in un-control state. The practice results and achievements can not be evaluated objectively and scientifically, so the practice management is an empty talk.

4 The Innovation Path of Management of College Students in Practice under the Background of Mobile Internet

At present, China's mobile Internet has spread, and information network covers every corner. There is a close relationship between the students' work, study, daily life and network. Network also produces more and more influence on college students' thoughts and behavior. Regulations on Construction of College Counselor Team (hereinafter referred to as "the Regulation") requires counselors pay attention to application of a variety of new work carrier, especially networks and other modern technological means to develop working approach, close to reality, close to life, close to the students, and thus improve the work effectiveness and pertinence and enhance the attraction and appeal of the work". The Regulation stressed that "counselors are organizers, executors and guiders of students' ideological and political education and management". Students' parents and practice units are also the effective components of student practice management. Therefore, under the background of mobile network environment it is particularly important to convert awareness of mobile network of college counselors, parents of students and practice units, and to innovate in practice management by using mobile network.

4.1 Strengthening the awareness of college counselors, students' parents and practice units to use mobile internet

Counselor is the organizer, executor and instructor. Counselors, parents and practice units should be fully aware of the profound impact of mobile network on the educational environment of colleges and universities. It is suggested to "give full play to the network advantage to carry out practical and effective ideological and political education, and actively occupy the commanding heights of the network".^[5] The counselors, parents and practice units should not only keep pace with the times, but more importantly, continue to progress and walk at the forefront of the times. They could use Wechat, QQ, Fetion, Microblog and other mobile networks to obtain information, for they are "fast in speed, wide in domain". They should improve themselves in actual life, work and study by applying Marxist viewpoints, standpoints and methods to strengthen the application of public opinion and the guidance of consciousness. They should not only learn to use mobile network to deal with the daily affairs, but also can construct mobile network to deal with sudden events, master the information technology of mobile network, timely and quickly inform students the truth of the matter to prevent the emergence of blackmail events and avoid unnecessary trouble. In the future, mobile Internet will speed up the development, so counselors, parents of students and practice units should take the initiative to strengthen awareness of mobile network, understand transmission characteristics and rules of Wechat, QQ, Fetion, Microblog and other mobile network, know the profound impact of mobile network on education environment of college students and have the innovative awareness of college students management with mobile Internet.

4.2 Enhancing the skills of college counselors, students' parents and practice units to use mobile networks

Counselors, parents of students and practice units not only have the awareness of mobile network, and it is more important to keep learning, know new technology of mobile network, develop mobile network information literacy, master the operation skill of mobile network, be familiar with the current mobile network system and mobile network language popular in student groups, and constantly enhance the personal ability of information analysis and evaluation, so as to enhance their own mobile network skills. In addition to counselors' self-learning, schools also can carry out targeted training for counselors on the use of mobile network platform, regularly invite internet experts to carry out special lectures in combination with the characteristics of the students, and also can hold a number of mobile

communication network salons for teachers and students. It is suggested to combine information knowledge and mobile network technology and treat the mobile network training as an overall and regular affair to form a system or a kind of culture and thus improve counselors' proficiency in use of mobile network.

4.3 Improving the effectiveness of mobile network platform

Under the mobile network environment, the effectiveness of college counselors is the practical effect obtained in the process of educating, managing and serving students by the application of mobile network platform. [6] "The interactive information among students on the mobile network platform reflects the student's interest, hobbies, behavior characteristics and value orientation. Students' discussion on hot people and topics on mainstream network platform in different times could reflect their concern and ideological trends in certain stage. This information is first-hand data for counselors to understand students as well as the important basis to carry out management work among students". [7] At present, almost all students have their own Wechat, QQ, Fetion and other mobile network. They use these mobile networks to express their feelings, discuss hot topics and do other things, which provide a good opportunity for student management work. Counselors, parents of students and practice units can use Wechat, QQ and Fetion to establish mobile network groups. Wechat, QQ, Fetion and other mobile networks can ease this problem in a large extent, and help to build a communication and exchange bridge among students and counselors. Counselors can timely know students' ideological trends in practice through Wechat, QQ, Fetion and other mobile networks as well as practice units' management mode and operating mode. Counselors can communicate with practice units about the problems students meet to effectively reduce contradictions caused by misunderstanding among "schools, students, parents and practice units" and thus improve students' effectiveness in practice. At same time, through Wechat, QQ, Fetion and other mobile networks, counselors can know students' practice, participate in evaluation of students' practice quality and etc. In the holidays, they are also very good management platforms, for counselors can concern students' dynamics at any time by using them. As long as there is network, counselors can communicate with students through Wechat, QQ and Fetion at all times and places and care about students' study, life and ideological trends. In this way, counselors can master all aspects of the information about students and provide timely service to students.

5 Conclusion

The management of college students in practice is complex system engineering. The practice effectiveness depends not only on the application of mobile Internet, also depends on practice plan and practice content, practice methods and a series of supporting measures. It is recommended to combine school, society and family to care about the practice of students. The author will make unremitting efforts to study it further on the basis of this research, striving for make a breakthrough in the construction of college students practice work system.

(E-mail: qinqin40@163.com, 450409424@qq.com)

Abstract: The new social policies of 2013 break the “Dual Registration Management System” and further release the development of civil society organizations. In the disability field, a large number of civil organizations for the disabled will obtain legal identity and enjoy “Institutional Welfare”. As the intermediary between the state and the society, the CDPF needs to standardize its functions, simplify the organizations and make the work more transparent to keep up with the pace of policy development. The present “Endogenous dependent Relationship”, “Authority Relationship” and “Alienation Relationship” will transfer into the “Mutually Beneficial Relationship”, “Competition and Alliances” and “Subcontractors and Agents”, and eventually become an organizational relationship pattern dominated by the CDPF, in which a variety of relationships coexist.

Key words: Civil society organizations for the disabled; Authority relationship; Mutually beneficial relationship; Subcontractors and agents

1 Introduction

Developing civil society organizations can meet the public service demand effectively. Foreign scholars demonstrate the rationality and necessity of civil society organizations' involvement in providing public goods from the perspectives of market failure, government failure, contract failure, voluntary failure. Related theories have been emphasized by domestic scholars, and affect the continent officials' governance methods.

After the reform and opening up, the party gradually relaxed controls on social area, and civil organizations began to participate in society construction. But by the impact of the disorder revolution in the late 1980s, the official was afraid of the political risks derived from destabilization, therefore it began to take the "dual registration system", namely the civil organizations have to register in the management department and accept the leadership of the competent authorities. In this management mode, the civil organizations are supplementary parts of the government in public service areas, and their developments are extremely restricted. In the 21 century, with the acceleration of market economy and the increase of demand for public services, the shortcomings of the "dual registration system" appear gradually, therefore more and more people call on strengthening the social autonomy reform. In recent years, Guangdong, Shanghai and other places firstly conducted effective social reform, which had a great effect. The 12th National People's Congress Meeting firstly breaks down the identity barriers of the commercial, technological, charitable and urban social organizations on the national level.

Thanks to the adjustment and release of new social policy, social services will start a new period of development. As an important part in the social and public services field - Public Service for the disabled will also develop further. As the connection between the government and the folks, the CDPF plays an important role in safeguarding. However, founded on the basis of immature democracy and not-fully developed market economy, the CDPF with both administrative and service functions has its limitations, which make it becomes increasingly difficult to meet social service demands of the disabled". The civil society organizations for the disabled established by civil powers will play an important role in social security and public service.

With the introduction of a new social policy in 2013, the present service model for the disabled will be challenged, and the traditional pattern of social relationship is likely to change. As an important organization within the disability field, the CDPF also needs to make the appropriate adjustments in the situation. Therefore, this paper will sort out the past patterns of organizational relationships in the disability field based on the combination of new content and orientation of social policy and make reasonable analysis for the CDPF's reform direction and the organizational relationship in the future disability field.

2 The Interpretation of the Relationship among Chinese Government, CDPF and Civil Society Organizations for the Disabled

2.1 The western “government- society” relationship theories and their local usage

The relationship between the government and the civil organizations has been a hot issue at home and abroad academia. Western scholars discuss the relationship between them mainly under the “state-society” dual framework. The typical theories are the pluralism theory and the corporatism theory. Pluralism insists that the society and the state should be separated into two areas. Social power is diverse and decentralized; different social groups express their interest demands and affect the country’s political decision-making through participating in electoral competition (Whyte, Martin K,1992). “Non-profit organization holding the Government” “non-profit organizations against the government” are some kinds of relationship pattern derived from this theory. Corporatism holds the view that the state and the society are not fully differentiated; the state should strengthen its participation and control on the civil society and be committed to building institutionalized channels of communication between the state and the society (Unger, Jonathan&Anita Chan,1995). Under the guidance of the theory, the ideas of “non-profit organizations and government coexist” and “non-profit organizations and government cooperate with each other” are proposed.

Domestic scholars use the western theories to analyze the relationship between the Chinese government and civil organizations after the reform and opening up. The supporters of Corporatism think that although China has emerged a large number of social organizations, the state still controls the establishment and operation of them and given some of them the monopoly position in the industry; there has not been any truly independent social spheres in China.

According to Corporatism theoretical model, China's "state-society" structure model had many features of the corporatism after the 1980's, First, strong state-led force. The state establishes some social groups or determines the monopoly position of some existed social groups and provides them with resources, such as the China Youth Development Foundation and Song Qingling Foundation. Second, restriction on the freedom and movement of interest groups. It means that needs expression, leadership selection and organizational support are controlled by the state. Third, interest groups are integrated as part of the national system. Associations or organizations have the obligation of passing public demand information to the national policy-making departments and assist the state with managing and implementing the allocated tasks (Adams, Paul S,2002). Fourth, limited number, non-competitive, structured, and system differentiated.

Obviously, Chinese social organizations are different from the western non-profit organizations in their nature and structures. The social relationship formed by the Chinese government and social organizations under the Chinese modes has typical characteristics of localization. These characteristics can not match with the theoretical paradigm of the Corporatism, especially in the interpretation of a particular social sphere.

2.2 The characteristics of the “government-society” relationship in the disability field and the limitations of the western theories

There are two vital time points in this paper; they are the establishment of the CDPF in 1988 and the introduction of the new social policy in 2013. The author mainly focuses on the relationship between the state and the society in this period and finds out that the characteristics of the disability field in this period cannot be interpreted by the Corporatism.

2.2.1 Excessive administration of the CDPF does not fully fit the characteristics of corporatism

Corporatism thinks that social organizations are different from the interest groups in the pluralism system and they exist in the corporatism system in the form of functional groups and then they are integrated into the national decision-making process and the state gives some of them the monopoly position. However, the CDPF is both official and public from the inception, and it is exempted from registration and it also has appropriate administrative level and party preparation. But in reality, the CDPF takes too many administrative tasks, and its administrative functions are far more than its service functions. Therefore, many people think that it is a government department. In addition, the CDPF enjoyed monopoly status and this monopoly is not limited to resources but also the administration of other civil organizations. The CDPF is a special unit which is free from registration and being administrated and has the power of controlling other organizations. It has been free from the dual registration system. These kinds of Chinese groups are different from the functional groups under the western Corporatism theory. Obviously, they can not fully fit the characteristics of corporatism tissues.

2.2.2 The country's pre-eminent or excessive integration has clear "national totalism" traces

In the Corporatism theory, there is a “cooperative” relationship based on the differentiation of rights between the state and society. Cooperation means assigning, delegating, exchanging and granting of rights. It is based on parallel relationship between two relatively independent subjects and then social organizations representing the interests of institutions should be incorporated into the institutional structure.

Formally, the relationship between the government and the community has the prototype of “national corporatism”. However, due to China’s social sphere is born out of the original “totalitarian state” control pattern, the social organizations’ development are affected by old ideas and institutional constraints, making it difficult to self-develop. The social organizations rely on the government, willing to become government subsidiaries and showing active-dependent features. These characteristics are clearly contrary to the “cooperative” spirit advocated by the corporatism theory. Some highly organized representatives of the state, such as the CDPF, becoming the true public administration department. Thus, the relationship pattern formed under the excessive consolidation and strong leadership of the state does not have the features of State Corporatism. On the contrary, it shows obvious features of Nationalism or Totalism.

2.2.3 The “both integration and differentiation” pattern in the disability field

In Corporatism, the state and society should be the integrated. And the corporations organizations formed during the integration should be the intermediary of running the society. But China’s social pattern is not a simple corporatist structure; it is a double pattern of “both integration and differentiation”.

In the organizational system of the disability field, there are central or local governments representing for the state and the CDPF possessing the functions of management and service on behalf of the disabled as well as registered civil organizations and unregistered grassroots organizations. The structure style in the disabled field is not a standard “state-society” dual mode; it is a “government-CDPF-civil organizations for the disabled” three-dimensional framework with clear Chinese characteristics. First, the author admits that the service system oriented by the CDPF is indeed the “integration of the state and the society”. Second, there is still an autonomous social field which neither be admitted nor denied by the state outside the so-called corporatism system. China’s social structure has never been a single corporatist structure system, nor is a “civil society” announced by the pluralist, but showing a “both integration and differentiation” dual relationship pattern.

2.3 Endogenous dependent relationship, authority relationship, alienation relationship

The double social relationship pattern of “both integration and differentiation”, is the result of multiple factors, like Chinese traditional culture and political system as well as the western civil society theory. Obviously, it can not be incorporated into the single research framework of corporatism or pluralism. Using the western theory to explain it is inappropriate. This paper introduces the “schema decomposition” method, which dismantles the complex Chinese social relationship structure into several secondary structures and summarizes some simplified and clear relationship portfolios.

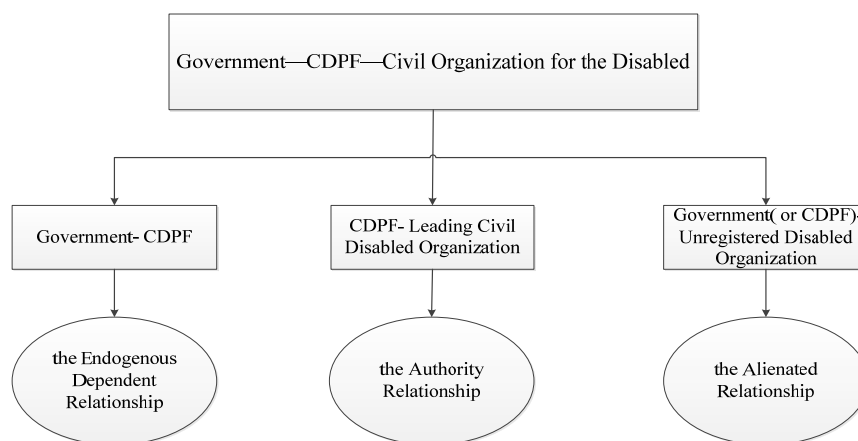

Figure 1 Endogenous Dependent Relationship, Authority Relationship, Alienation Relationship

The relationship between the government and social organizations are classified as “endogenous dependency relationship”, “authority relations” and “alienated relationship” by some scholars. In the three-dimension framework of “government- CDPF-civil organization for the disabled”, the authors

decomposed three relationship portfolios in line with china's national condition, which referred to "government- CDPF" (Portfolio A), "CDPF- Leading civil disabled organization"(Portfolio B) and "government(or CDPF)- unregistered disabled organization"(Portfolio C). And then combined them into the endogenous dependent relationship model (Portfolio A), authority relationship model (Portfolio B) as well as the alienated relationship model(Portfolio C), as shown in the figure1 below.

2.3.1 The endogenous dependent relationship: government and CDPF

The endogenous dependent relationship referred to an interdependent relationship established in the process of the government setting up and providing various resources required for normal operation of the social organizations ruled by it (LIU Chuanming, 2012).

The Endogenous Dependent Relationship between the government and the CDPF is mainly reflected in three aspects. First, the origin and status of the CDPF. The CDPF is a social organization established by the government as well as some associations. The national law endows it with the same political status, and has confirmed its dominance and representative status in the field of disability. Second, the organizational structure and human resource of the CDPF. The office departments of the CDPF are set up referring to the Chinese Communist Party, which includes functional departments and the party organization. Also, its main leaders are controlled by the government. Third, funding and operation mode. The fund of the CDPF is a part of the government budget. Its main responsibility is to manage the social organizations in the field of disability, provide public service to the disabled, give feedback to the government and implement government decisions.

Therefore, in the interaction between the government and the CDPF, the latter is not independent with all the resources controlled by the government, thus forming a typical endogenous relationship. Therefore, the CDPF can be considered as a part of the government.

2.3.2 The authority relationship: the CDPF and registered civil disabled organizations

The so-called authority relationship refers to someone has the right to control others' certain actions (James.S. Coleman, 1999). This "control" is relied on legal power and scarce resources owned. The authority relationship model belongs to "limited control", whose degree of control is weaker than the endogenous dependent relationship. "The authority relationship" originated from the theoretical interpretation of the new authoritarianism (or authority). It has also been involved in "the authority corporatism" proposed by Zhang Jing. As mentioned earlier, the organizational relationship pattern in the disability field is neither fully fit the characteristics of corporatism, but also shares the features of "nationalism" (or authoritarianism). Then integrate the essence of these two theories to interpret the relationship between the CDPF and the civil organizations for the disabled has more advantages over a single theoretical research and can be much easier to sort out the internal relationships.

The government does not involve in the specific activities in the disability field and the CDPF acts as the representative of the country to exercise the power of public administration. The CDPF administrates several registered civil society organizations. It can be concluded from the previous interactions between them that there is an authority relationship between them which has three characteristics, including the limited power, some resources by government monopoly, the two systems based on common values

2.3.3 The alienated relationship: government (or the CDPF) and unregistered civil organizations for the disabled

Due to limitations of the current system, some unregistered civil organizations or industrial and commercial registered institutions for the disabled are separated from the government or the CDPF. This kind of situation is named the Alienated Relationship. Since 1989, China passed a strict access system for social organizations, which made it even harder for the organizations to be registered. Therefore, they have to be engaged in public welfare activities outside the "system" with industrial and commercial registration or without being registered. The fact proved that the party and the government's tolerance and further exposes the drawbacks of the dual registration system. How to integrate these scattered social forces and make them better serve the community, become the major issue. And to some extent, it is a great test for the government's administrative ability.

3 Trend of the Relationship Between the Government, the CDPF and the Civil Organization for the Disabled

The current "both integration and differentiation" relationship pattern in the disability area shows three characters, which can be specified as "Endogenous dependent Relationship(Government-CDPF)", "Authority Relationship(CDPF-Registered Civil Society Organizations)"and "Alienation

Relationship(CDPF-Unregistered Civil Society Organizations)". The dual management system has many negative impacts, such as deficiencies of public service supply, inefficiency service and low degree of civil participation, which has been criticized by academics and the civil society. Accelerating the autonomy reform in the social sphere became a social consensus.

Given the successful experience of local government and the strong consensus between the officials and the folk, the central government has determined to accelerate the dual management system reform.

3.1 Interpretation of the new policies in 2013

On March 10th, 2013, the 12th National People's Congress Meeting, the third plenary meeting declared clearly: "focus on fostering and give priority to develop commercial, technological, charitable and urban social organizations. These organizations can apply for registration directly to the civil affairs department without the permission of administrative units." It means the dual management registration implemented for decades will be abolished conditionally and there will be a great adjustment in social policy. This significant political initiative reflects will certainly cause severe shocks to the old social form. The new social policy indicates that our social management thinking, governance level and citizenship are undergoing positive and beneficial changes, which will contribute to the "strong state and strong community" development model.

Firstly, the new social policy reflects the improvement of social management thinking. It means that the social management thinking has transferred from revolution thinking (1949-1978), mobilization thinking (1978-2003) and construction thinking (2003-2013) to democratic thinking and law governance thinking. The limited opening for civil organizations has two important meanings. On the one hand, it shows that the leaders begin to examine and reflect on the deficiencies of past social management pattern and start to absorb the civil forces to participate in social construction. On the other hand, it also shows that the national leaders are taking a more prudent, gradual and correspondent method. This stable social management method is contradicted with the adventurism, which helps to reduce the reform cost and prevent risks. It also contributes to the transition to the "strong state - strong society" model of development.

Secondly, the new social policy reflects that the level of governance has been improved. Good governance stresses that the state or government should give the rights back to the people, at the same time, they should also retain necessary powers and authority. "On one hand, they weaken the strength of national power, on the other hand they generate needs for another country power, which used to be weak or did not exist in the past" (Francis Fukuyama, 2007). Today, the government officially abolished institutional barriers faced by charitable organizations and greatly promoted the development of civil organizations in response to the officers and the common people. From the list of social policies in each period, we can see that the government is giving the rights back to the people step by step in a planned way. The governance has improved significantly and China's the degree of social autonomy will continue to deepen.

Finally, the new social policy reflects the civic consciousness. Civic consciousness is the citizens' awareness of their social status, rights and responsibilities (Lee Dakun, 2007). The new social policy which breaks the previous dual management system and is in line with the consensus of the whole society and adapts to the development requirements of marketization and socialization is conducive to create the "small government and big society" state mode proposed by the party and the government. Although China is in the primary stage of socialism, the market economy has not yet fully developed and the economic system and social system is not perfect, "strong state - weak society" model will be maintained for a long period of time. However, with the introduction of the new social policy and the amendments of related law as well as the implementation of specific measures, our country will gradually break the traditional mode and transferred to the "strong countries-strong society" target mode. Facing this favorable policy situation, whether the official or social groups or the civil society organizations need to do some adjustments accordingly to adapt to the social development situation and the relationship pattern in the social sphere may suffer from some changes.

Therefore, under the requirements of the new social policy, what kinds of adjustments should the relevant organizations in the disability field do? And what kinds of relationship pattern may occur in this field?

3.2 The reform strategy of the CDPF under the new policy

In the current disabled services system designed by the official, as a link between the state and society, the CDPF is in the core position and plays many important roles, such as interest representatives, the administration department and the service organizations. This kind of organizational form shares the features of historical necessity and practical rationality. In 2013 the introduction of the new social policy

means that the state will change the previous social management pattern, and the CDPF has to make some changes inevitably.

Many scholars have discussed the way of changing social management pattern and improving social management mechanism from the institutional perspective (such as Liu Jitong, 2002). There is no mature experience concerning about social group reform in China, therefore it is a long way to go. Then how does the CDPF carry out the reform under the new situation?

This paper argues that the reform of the CDPF should choose an evolutionary path in line with China's national conditions following the advanced reform experience at home or abroad and the modern management principles of "high efficiency and low consumption". Whether the official adopts the progressive restructuring strategy or the rough shock therapy, it is sure that as the intermediary between the state and the government, the CDPF will exist for a long time. Its reform should be directed toward "normalize function" "simplify institutions" and "work transparency". First, normalize functions. The CDPF need to increase evaluation functions and construct a scientific assessment system to evaluate qualification and effectiveness of social organizations regularly and create the "survival of the fittest" principle, thus regulating the industry and enhancing the public service standard. Second, simplify institutions. The new social policy gets rid of the "restriction of competition" principle, which provides a good chance for the civil organizations competing in the service market for the disabled, thus forming a benign repaying mechanism to improve the service standard continuously. Third, work transparency. In recent years, the frequent occurrence of corruption, dereliction of duty and other phenomena in the charity field causing great public criticisms. Make the work more transparent and improve public oversight system is the requirement of the new social policy. It also meets the expectation of the masses.

With the implementation of specific measures directed by the new social policy, the restructuring of "functional standardization", "institution simplicity" and "Work transparency" will finally become a success. This paper does not agree that the CDPF will be canceled in the future or become a "third-party independent body". China's social autonomy process should adapt to the development of market economy and political system as well as cultural traditions, which should adopt a progressive, conservative and the least risky development path.

3.3 Vision of a harmony relationship

The author believes that after a long time, the organizational relationship pattern in the disability field may be re-shuffled if the specific operational measures designed according to the new social policy can be fully implemented and the state can allocate the institutional resources to civil organizations and protect them by law. However, this "shuffle" is only a small change; it will not have a fundamental impact on the current pattern. Given the strong institutional inertia, the CDPF will exist for a long time and further strengthen its management functions and its monopoly stage. And the "endogenous dependent" relationship between the government and the CDPF will be strengthened in the coming period.

Therefore, the future picture of the society is that the past social structure cracks and three kinds of new relationship patterns which have features of "strong society" will derive from the retained "endogenous dependent" and the "authority relations". Thus form an organizational relationship pattern led by the CDPF. In this pattern, many kinds of relationship coexist together. And the three kinds of new relationship patterns are "Mutually Beneficial Relationship" "competition and alliances" and "Subcontractors and Agents", which will be discussed latter, as shown in the figure2 below.

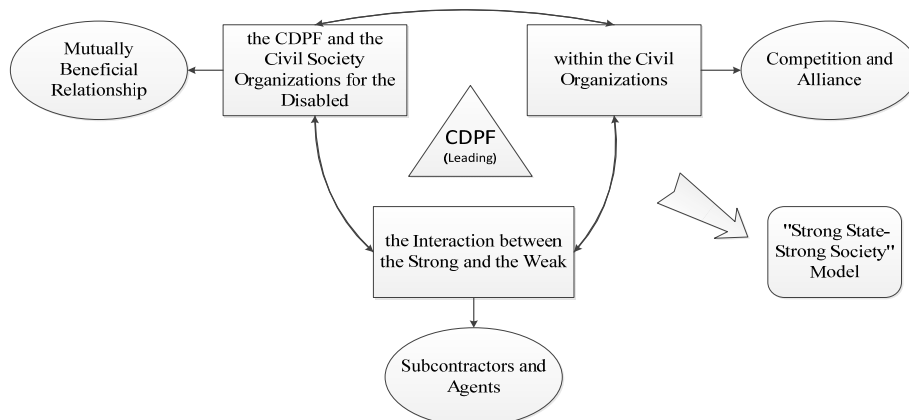

Figure 2 The Future Picture of the Society

3.3.1 Mutually beneficial relationship: the CDPF and the civil society organizations for the disabled

Undeniably, the “authority relationship” will exist for a long time between the CDPF and the majority of civil organizations. But in some areas where the CDPF can not provide service, there will be a “Mutually Beneficial Relationship” between them. This relationship is based on equality and market contract, in which the CDPF is in a dominant position by possessing the rights of resource distribution rather than by administrative affiliation. The Civil society organizations will have great autonomy in organizing human resources and project as well as using activity fund, they will cooperate with the CDPF according to the national service purchase programs and negotiate benefits distribution with each other to achieve maximum benefits.

3.3.2 Competition and alliance: within the civil organizations

Today, as more and more non-government organizations joining the disability service field, it will inevitably lead to a conflict of interest between civil organizations. There will be all-rounded competition in applying for government purchasing service, government incentives, public donations and social prestige, which may be exist between civil organizations serving the same group of people or between some institutions providing similar products or between different interest groups in the same area. On the other hand, in order to survive in the fierce competition, some relatively weak civil organizations may seek for alienation and consolidate with each other to gain official and civil support. The relatively strong non-government organizations may combine together forming a “trust union” to strengthen the project monopoly or increase their capital. Therefore, the “competition” and “Union” will likely be the dominant relationship in the disability field.

3.3.3 Subcontractors and agents: the interaction between the strong and the weak

At present, some grassroots organizations, which do not have the qualifications or are restricted by some attached official provisions, will still be free outside the system. Due to lack of national identity and their weak public influence, such organizations are difficult to raise enough funds and social support, thus facing huge dilemma. In order to survive, some of them may seek for help from those stronger government-run or civil organizations and become their secondary agents. And some social organizations may subcontract all of or part of their projects to those grassroots organizations to save manpower and material resources, and earn difference between profits. These phenomena are inevitable in the early stage. Outsourcing is clearly contrary to the “non-profit” principle and the CDPF must strengthen its supervision.

Therefore, the future relationship pattern in the Chinese disability field will have the features of “a strong society” and it is led by the CDPF with a variety of social relations coexist. With the implementation of the supporting measures of the new social policy and the active response of the civil organizations, the degree of autonomy will further deepen and the traditional development model will transit to the “strong state-strong society” model.

4 Conclusion

The new social policy is a political breakthrough of the past dual registration management system, which has freed up great space for development of civil organizations. In this paper, the promulgation of the new social policy in 2013 is a watershed. The author systematically combed the pattern of organizational relationships in the disability field at this stage (1988-2013), proposed certain strategies for the CDPF reform in the future (after 2013), and also reasonably analyzed the future changes in organizational relationships. The researches provide rational analysis data and new research perspectives for the future development and strategic consideration of social organizations for the disabled, and it is happy to see that the overview of China’s social sphere is given and the readers can think didactically.

The new leaders of China made a series of social policy adjustments, the policy effects of which are reflected not only in the cultivation of civil society organizations as well as the promotion of public service standard, but in the potential effect on China’s future development. First, with the growth of civil society organizations, the political and legal field is expected to open soon. Second, with the progress in social autonomy, the existing “authoritarian” nation governance model is expected to change.

In summary, the promulgation of the new social policy is a milestone after the founding of PRC, an important manifestation of the “scientific decision making” and the “Ruling the country by law” principle. Profound changes will certainly take place in China’s social structure.

Political Skill and Career Success: A Review and Directions for Future Research

Muhammad Usman, Luo Fan, Muhammad Anwar-Ul-Haq
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: mohdusman1@hotmail.com, sailluof@126.com, aayhaq@yahoo.com)

Abstract: The determinants of career success have been widely investigated in the extant literature. This paper aims to review the empirical studies on the role of political skill in determining career success. Major data bases like science direct, emerald insight, sage and springer were searched for finding out the relevant studies. The findings of each empirical study along with the context and brief methodological information have been given. Through this review, it was surfaced that the underlying mechanisms in the political skill-career success relationship need to be explored further, and the dimensional analysis of political skill should be conducted.

Key words: Political skill; Career success; General review

1 Introduction

Mintzberg termed organizations as political arenas^[1] and thus opened a new window of political perspective to look at organizations and individuals' interactions with each other in the working environment. Keeping in view the political and inherently social nature of organizations^[2], it is a sine qua non for organizational members to be socially and politically skilled in order to influence others. Mintzberg had approached the political skill primarily from the perspective of formal power within organizations, however later on it was considered to be an effective influencing skill in informal settings^[3]. Behavioral scientists have defined political skill in different ways which almost convey the same concept. According to Ferris et al, political skill is "an interpersonal style construct that combines interpersonal perceptiveness and astute social awareness with the capacity to adjust one's behavior to different situational demands in a genuine and sincere manner, resulting in the building of social capital and in the effective influence and control of the responses of others"^[4]. The most widely used definition of political skill in the previous studies is "the ability to effectively understand others at work and to use such knowledge to influence others to act in ways that enhance one's personal and/or organizational objectives"^[5,6]. Political skill is considered to be one of the most important social competencies which is reflected through cognitive, affective and behavioral manifestations, and has implications for both individual and group^[7]. Political skill has been investigated in association with stress management, leadership effectiveness, job performance and career success. This article focuses on reviewing the empirical studies on the relationship between political skill and career success, and directions for future research are highlighted.

2 Political Skill and Career Success

Career success is defined as "the positive psychological or work-related outcomes or achievements one accumulates as a result of work experiences"^[8]. Career success has been conceptualized and operationalized from two major perspectives i-e, objective career success and subjective career success. The objective career success concerns with an external perspective or reference point, like salary, promotion etc^[9,10], while subjective career success focuses on the overall reactions of individuals towards their careers. The role of organizational politics in determining career success has been argued in the extant literature^[11-13]. Career success can be perceived as a political campaign characterized by impression management, self-promotion, contact-hunting and reputation building^[14]. Politically skilled individuals are more likely to succeed in such campaigns through their social networks and strong interpersonal skills.

Social capital theory^[15] has been widely used to explain the role of political skill in determining career success. Coleman^[16] has defined social capital as "any aspect of social structure that creates value and facilitates the actions of individuals within that social structure". Social capital is the result of the changes in human relations in a way that leads to favorable outcomes. Borrowing support from social capital theory, Blickel et al^[17] conducted a survey on alumni of German business schools to examine the role of self-initiated mentoring and networking behavior in determining employees' career success. In this longitudinal survey spanning two years, they found that income and hierarchical position were

affected positively by mentoring through networking behavior which was operationalized as networking ability dimension of political skill. The findings also revealed that networking behavior was a strong predictor of career success as compared to mentoring. Similarly, Blickel et al.^[18] in their three year predictive field study found that networking proved to be a strong determinant of objective career success while mentoring proved to be a strong predictor of career satisfaction. Seibert et al.^[19] tested a social capital based model of career success in a sample of 448 employees from diverse organizations. They confirmed that network structure had a positive relationship with social resources, which in turn positively affected career success through access to resources, access to information and career sponsorship. Fugate et al.^[20] introduced the construct of employability and argued that social capital was an important dimension of this construct besides human capital, adaptability and career identity. They further elaborated that, social capital plays a vital role in identifying and realizing employment opportunities at every level of one's career. Wolff and Moser^[21] in their 3 years longitudinal study reported that networking was related to existing salary as well as with the growth rate in salary over time. They also found that networking was positively related to concurrent career satisfaction, thus the positive effect of networking on both objective and subjective career success was substantiated. Wei et al.^[22] probed into the role of political skill in the development and utilization of network resources on a sample of 281 supervisor-subordinate dyads. Their findings established that, political skill assists in improving performance and career growth potential. The moderating role of political skill between network resources and the two career-related outcomes (performance and career growth potential) was also confirmed.

Another theoretical base for explaining the political skill-career success relationship is provided by social exchange theory^[23]. Social exchange theory's main focus is the obligations and reciprocity among social entities. Politically skilled people tries to develop quality relationship with their supervisor and significant others in the workplace. The quality of these relationships and the benefits obtained by supervisors in the form of positive behaviors facilitates individuals in obtaining desirable career related outcomes. Wei et al.^[24] investigated the role of political skill in establishing *guanxi* (indigenous Chinese social effectiveness construct) with supervisors and its impact on career development. The results of the study confirmed that, the strength of subordinate-supervisor *guanxi* depends on subordinate's political skill and the strength of *guanxi* in turn influence supervisor rated career development potential. Sibunruang et al.^[25] in their 2-study investigation examined the moderating role of political skill in the relationship between ingratiation and promotability in a sample from diverse industries like banking, education and hospitality. It was reported that, supervisor rated promotability and ingratiation tactic were strongly related for politically skilled as compared to politically low-skilled. Similarly, shi et al.^[26] carried out a survey by utilizing a sample of 296 subordinates and 53 supervisors in a construction management company in southern china to examine the association between subordinate's political skill and supervisor's reward recommendation. They reported that political skill was positively associated with the frequency of interaction with supervisor, which in turn was strongly associated with supervisor's reward recommendation. Personal reputation is considered to be an important ingredient for career success. Laird et al.^[27] tested the direct and indirect relationship between political skill and personal reputation on sample of 145 triads in a manufacturing firm in Midwestern USA. They reported that political skill had direct positive influence on building reputation, as well as had an indirect influence through citizenship behavior and quality of relations. The main strength of their study was the others reported measure of personal reputation, as in previous studies self-reported measures were widely used.

Generally, the empirical studies have proven a positive relationship between political skill and career success. Based on social influence theory^[28] and model of personal control^[29] Todd et al.^[30], investigated the relationship of political skill with five career outcomes including, career satisfaction, life satisfaction, perceived external mobility, total promotions and total compensation. The findings of their study revealed that political skill was strongly associated with four of the career outcomes except total compensation. They also went for dimensional analysis of the political skill construct and found that, networking ability dimension of it was strongly related with the career outcomes as compared to social astuteness, interpersonal influence, and sincerity/genuineness. On the basis of Holland's theory of work environments^[31], Blickle et al.^[32], studied the relationship between work councilors' political skill and their career success. They found that politically skilled work councilors were ahead in having memberships at different levels of the councils than their politically unskilled counterparts. They mentioned further that, as the work of councilors is primarily political in nature, therefore political skill has much relevance in determining career success in such contexts. Two years later Blickle et al.^[33],

investigated the role of job type as a contextual moderator in the relationship between political skill and job performance. They proved that political skill was a strong determinant of career success in enterprising job context like insurance selling. Ferris et al,^[34] in their two-study investigation reported that political skill was positively associated with job satisfaction and hierarchical position, although the relationship between political skill and gross annual income was insignificant. Participants of a leadership development program were studied by Gentry et al^[35] in order to examine the impact of political skill on promotability assessments from multiple raters. They found that, political skill had a positive relationship on managers' promotability, but the magnitude of the relationship varied with the source of the assessment. The relationship was stronger for boss-rated and peer-rated promotability than self-reported promotability. Munyon et al^[36] in a recent meta-analysis on political skill and career outcomes confirmed the positive association between political skill and various outcomes like career satisfaction, hierarchical position, income and overall career success. Huang et al^[37] in their two-study investigation reported that the chances of managerial promotion were greater for politically skilled than politically unskilled. They also found that, funding for a new venture was positively associated with the fund seeker's political skill. Snell et al^[38] attempted to establish the incremental validity of political skill construct over other managerial skills. They also added impression management as another dimension to the political skill construct and found that, interpersonal influence and impression management were the most important determinants of managerial effectiveness. Drawing from self-determination and self-concept based theories sun et al,^[39] examined the role of political skill in determining subordinate's promotability in a sample of 330 subordinate-supervisor dyads. Their findings revealed that, political skill not only moderated the supervisory mentoring and promotability relationship directly, but as well as the indirect relationship through organizational based self-esteem and psychological empowerment was also moderated. Thus, high politically skilled were more likely to be promoted when provided with supervisory mentoring as compared to low politically skilled individuals. Moeller et al,^[40] in their conceptual study proposed that, in-patriate managers' political skill will mitigate the stigmatization experienced by them from the home country personnel, which will result in increase in the level of acceptance and integration in the headquarter. Liu et al,^[41] tested a model of political behavior through a sample of 283 subordinate-supervisor dyads. It was revealed that political behavior and political skill had interactive effect on career growth potential. Those who were involved in political behavior were having a high career growth potential through enhanced personal power provided, their political skill was also high. The positive relationship between high performance and increased personal power was also confirmed by treadway et al,^[42] for the politically skilled employees only.

Individual level moderators of the political skill-career success relationship have rarely been focused by empirical studies. Grounded in socio-emotional selectivity^[43] theory the study by treadway et al,^[44] examined the interactive effect of political skill and future time perspective on determining career-based and community-based networking behavior. It was revealed that, those politically skilled individuals who had a deep future time perspective were more likely to be involved in career-related networking. On the other hand, those who were politically skilled but had a shallow future time perspective were more likely to be involved in community-related networking. Thus, the political skill and career success relationship depends on the individual's perception about his/her career prospects.

3 Conclusion and Directions for Future Research

The existing studies on the impact of political skill on career success rely on signaling theory, social capital theory and social exchange theory. However, empirical evidences have been provided on the basis of these theories, but the underlying influencing mechanisms are yet to be confirmed. There is a dearth of dimensional and mediational analysis that can add to our comprehension of political skill and its impact on different outcomes like leadership effectiveness and career success. In order to address this issue, we suggest that a range of mediators need to be investigated that how political skill effect career related outcomes. Besides this, the dimensional analysis should be focused in future studies, as all the dimensions are not equally significant for different kinds of outcomes. The potential mediators in the political skill-career success relationship may include quality of relationship, network structure, access to information, high visibility, frequency of interaction with supervisor and reputation. Organizational and individual level moderators can also be explored in order to understand the boundary conditions. For example, future studies can look into the moderating role of career motivation in the relationship between political skill and career success. Most of the empirical studies on political skill-career success

nexus have relied on cross-sectional data, therefore it is suggested that longitudinal data should be used to confirm the causal relationships.

Abstract: This paper presents a study on impact of entrepreneurship in academia on the Industrial Innovation. The moderating effect of organizational support was taken as a moderator and Pakistani private sector universities were taken as the research unit for this study. Recently academic entrepreneurship has succeeded to gain special attention from scholars and management decision makers. Whereas the major focus of research effort was to find out the causes and determinants of academic entrepreneurship but there is still an unattended query about the impact academic entrepreneurship exerts on innovative capabilities of various industries. The study examined the relationship of academic entrepreneurship and industrial innovation with moderating effect of organizational support in context of a Pakistani private sector university. Descriptive statistics, correlation analysis, regression analysis and Anova have been applied to test the relationship.

Key words: Academic entrepreneurship; Industrial innovation; Organizational support; Pakistani private sector university

1 Introduction

Industrial growth is of much importance for any nation, universities being institutions of higher education are nurseries for innovation and advancement of industrial growth. Academic entrepreneurship is of much importance. The role of universities in industrial innovation has been studied all over the world and many nations have shown tremendous results. Academic entrepreneurship is affected by many factors including organizational support and employees characteristics. Private sector universities are playing quite good role in research and academics in Pakistan. The role of researchers from private sector universities can't be ignored while assessing the impacts on industrial innovation. Organizations support is an important aspect that can moderate the relationship

2 Literature Review

2.1 Academic entrepreneurship:

The term academic entrepreneurship refers to revenue driven business development and creation of university startups ^[1]. In some other further elaborated studies, differentiation of organization was explored on the basis of whether those are created by university's research findings or from other sources, formerly known as general academic entrepreneurship and later termed as research based entrepreneurship ^[2]. Some other researchers in a study found the concept as an academic organization's arrangement for utilization of venture capital purpose ^[3], While some others refer to a business originated on premise of intellectual property owned by a university however the actual inventor of that particular IP may be the part of university or not ^[4]. According to another study by ^[5], the bases of academic entrepreneurship is authoritative creation and/or development that might occur either inside or outside the academia by any mean or method for research and innovation commercialization. Thus the Term academic entrepreneurship for the most part been utilized within a centered way to represent academics' engagement in the structuring of startup organizations ^[6-7]. Some other researchers have used the term for an extensive range of knowledge-transfer exercise ^[8]. It is evident from the findings of past studies that academic entrepreneurship creates economic benefits for universities and profits to the overall economy ^[9].

2.2 Nature of academic entrepreneurship

Academic Entrepreneurship is considered as a leadership process and a new way to perform teaching and research activities. According to this concept, a university should assume the responsibility to create value by innovation and commercialize the research produced within or outside the university ^[10]. This provides a new way of looking universities differently by the stake holders involved and interested in academia, expectations from academia are now furthered and extended more than just

teaching, fact finding and creation of premier educated work force but they are now supposed to play a more influential, comprehensive and effective role for society and economy by pursuing academic entrepreneurship thus placing themselves as a strategically significant source of technological advancement leading to the economic growth of society. As a result, university's leadership part is getting multifaceted. Much more than the primary task of to teach individuals however they have to prepare talented human resource at all levels from graduate to post graduate. To establish, develop and strengthen knowledge-based modernization frameworks, it would be required from the universities to expand the supply of useful knowledge like publications, patents and industry collaboration. Another important requirement can be the involvement of academia in critical thinking exercises in the businesses through university industry collaboration, innovation licensing, workforce consulting, and giving access to concentrated instrumentation and supplies, and brooding administrations^[11]. The new knowledge development and innovative economy driven by universities is not only important for their own nation but also for the neighboring countries as well^[12]. This is academic entrepreneurship that converts a university into the executor of industrial innovation, innovative advancement, financial improvement and social advancement particularly in the setting of developing knowledge-based economies. This also results in the emergence of university as financially and societal centered, more into a helping for a culturally improved and matured society, respects its scholarly and social reason for enhancing the personal satisfaction for the entire group, and, gets to be all the more outward-searching and responsible for open stores and its inner workings^[13]. Actual challenge is the transformation of academic research into commercialized product being a tedious activity involving people from both academia and industry. Therefore it is need that academician and industry work joining hands with hands to synergize and maximize the socio-economic pay back of innovative idea. By transferring technology universities share skills, information, technology and facility with industry in order to serve the purpose of research that is benefit of the innovation available to great number of users for further development and enrichment of technology into products, services, processes, applications and methods. Commercialization of university research is found to be an extremely uphill task and includes great issues like types of innovation exchange, business matching between the researcher and firms, the marketability of the university's new research and inventions and the administration of registered innovation like patent and intangible assets. Informal collaboration system with industry enables the value creation activities like knowledge exchange, university-industry joint publications and consultancy^[14]. University industry partnership is inevitable for scholarly achievement of universities, growth of industry and expansion of economy of a country^[15].

This above discussed positive and significant impact of university research on industrial innovation is found in the literature from the work of Lee Mansfield 1995^[16]. Universities are major contributor to innovative processes for small and large firms^[17-18]. Industrial revolution has proved to be the back bone of many developed countries whereas Industrial revolution was the fruit of university-industry linkages. University based research and national industrial structure have developed side by side. Universities are responsible to develop high-Tec industry^[19].

2.3 Role of organizational support for academic entrepreneurship

To achieve the goal of academic entrepreneurship organizational support is very necessary, as a matter of fact in a university as academia a systematic and planned assistance is required for academician from university administration to support and encourage their research work, entrepreneurial activities and university-industry collaboration. Academic entrepreneurship and resultant research commercialization is not an easy task to be performed by a university researcher, carrying it along with routine and required work load like teaching classes, administrative assignments and student supervision. Financial and incubation assistance is needed by researchers to conduct the proposed academic entrepreneurship activities. A researcher due to his primary and core responsibilities is limited to the university premises it is important to have necessary assistance from university administration in the terms of expert advices, training, linkage with industry professionals to support new venture creation and research commercialization. The literature available on the topic primarily considers technology transfer office responsible for creating helpful structural environment that helps out university startups^[20-21]. The increase in the business start ups from Western particularly European universities since 1990 is usually linked to the efficiency and effectiveness of technology transfer office. This technology transfer office is an entity within university which has a mandate to stimulate a range of entrepreneurial activities by academics, spanning invention disclosures to patent applications, the generation of licensing income, and the involvement of academics in the founding of businesses^[22-24]. Increase in the efforts of university in the terms of academician encouragement at department level or a

professional technology transfer office development enhances the probability of academician involvement in entrepreneurial activities ^[25]. Academic entrepreneurship is the focus of researchers in developed countries. A broad range of literature about the subject in the context of USA, Sweden, and Malaysia etc can be found, but with the perspective of Pakistan this phenomenon is new and still evolving at early stages. Pakistan being a developing economy possesses an immense potential of research & technology development in universities, industrious labor force and efficient industrial set up which demands for university industry linkage and collaborative system for better economic growth. Universities in Pakistan are acquiring the role of innovation and research commercialization as their mandate allocated from Higher Education Commission (HEC) along with teaching and research. In Pakistan the regulatory authority for institutions of higher education, the Higher Education Commission of Pakistan has made it mandatory to establish Offices of Research, Innovation and Commercialization (ORIC) and business incubation centers (BIC) in every university operating in the country whether it is a Public sector or Private Sector University. On the basis of these guidelines from many universities has developed their ORIC and BIC departments. The major roles assigned to these offices include research, consultancy, joint ventures, continuing professional development, knowledge transfer partnerships, patenting etc. It is therefore very much important to determine the result and impact of these efforts from universities sides on beneficiary industries must be evaluated for better apprehension of feedback and further improvement of these efforts.

3 Gap in literature

The discussion about the literature of academic entrepreneurship concludes that the major focus of researcher is to find out the causes and determinants of academic entrepreneurship but there is still an unattended query that what impact academic entrepreneurship exerts on innovative capabilities of relevant industry. Therefore it is critical to explore the link between academic entrepreneurship and industrial innovation in the context of private sector universities in Pakistan. More over the study will also discuss the moderating role of organizational support in this relationship.

4 Research Methodology

Due to time constraints, case study methodology was adopted and a Private sector university was selected for this study from Pakistan. A self administered questionnaire was given to 50 teachers from different schools of the university. A five point likert scale questionnaire, consisting of 25 items was adapted and modified from previous studies and same was considered for data collection. In this study, academic entrepreneurship was used as independent variable. Response about this variable was captured using 5-point likert scale. 10 item measures used for this variable were adapted and modified from a study ^[26]. As a moderating variable, Organizational support was used. Response about this variable was taken using 5-point likert scale. Measures used for this variable were adapted and modified by a research conducted by Eisenberg ^[27]. The construct included 8 items. Industrial innovation was dependent variable in this variable. Response about this variable was taken using 5-point likert scale. Measures used for this variable adapted and modified by Polona^[28]. The measure includes 7 items.

All items used for measuring constructs of sub-dimensions were taken on a 5-point Likert scale ranging from “1 = Strongly Disagree” and “5 = Strongly Agree”.

5 Data Analysis

5.1 Descriptive statistics

Following results were calculated for descriptive statistic of this study.

Table 1 Descriptive Statistics (Source: generated)

Variables	N	Minimum	Maximum	Mean	Std. Deviation
Academic Entrepreneurship	50	2.00	4.82	3.8200	.47513
Organizational Support	50	1.74	4.82	3.5750	.56501
Industrial Innovation	50	2.56	5.01	4.1336	.47929
Valid N (list wise)	50				

5.2 Demographics

The study resulted in following demographic characteristics of respondents of the study

Table2 Demographics-Age (Source: generated)

Age	Percentage
Below 25 years	4.1
25-30	18.8
31-35	22.9
36-40	27.6
41-45	11.8
46-50	9.4
51 and above	5.4
Total:	100

Teaching experience of the sample resulted as follows.

Table 3 Teaching Experience (Source-generated)

Teaching Experience	Percent
1-5	23
6-10	26
11-15	24
16-20	15
21 and above	12
Total	100

5.4 Research experience

As for as research experience was concerned, the respondents of survey were found to be in majority with teaching experience of 11-15 years with 21% respondents followed by 16-20 years' experience teachers with 15% of respondents.

Table 4 Research Experience (Source: Generated)

Research Experience	Percent
1-5	29
6-10	23
11-15	21
16-20	15
21 and above	12
Total	100

5.5 Reliability analysis

Cronbach's alpha was found to test the reliability of the instrument and results were quite satisfactory for the study.

Table 5 Reliability Analysis (Source: generated)

Variables	Cronbach's alpha
Academic Entrepreneurship	.762
Organizational Support	.792
Industrial Innovation	.798
Overall α Cronbach	.915

5.6 Correlation analysis

Correlation analysis was applied on the responses from the sample and following correlation matrix was generated. Results of same are shown in table 6 below.

Table 6 Correlation Analysis (source: generated)

Correlations Matrix				
Variables		Academic entrepreneurship	Organizational Support	Industrial Innovation
Academic entrepreneurship	Pearson Correlation		.777**	.839**
	Sig. (2-tailed)		.000	.000
	N	170	170	170
Organizational support	Pearson Correlation	.777**		.823**
	Sig. (2-tailed)	.000		.000
	N	170	170	170
Industrial innovation	Pearson Correlation	.839**	.823**	
	Sig. (2-tailed)	.000	.000	
	N	170	170	170

** Correlation is significant at the 0.01 level (2-tailed).
N=50, *P<0.05, ** P<0.01

The above given table shows the correlations among variables. Correlation shows the relationship among academic entrepreneurship, organizational support and industrial innovation. The results shows that there is positive and significant relationship between Academic entrepreneurship and industrial innovation (r=0.839, p<0.01). Organizational support also shows significant and positive relationship with industrial innovation (r=0.823, p<0.01). This particular finding confirms that there is also a relationship between organizational support and industrial innovation. Finally results shows that academic entrepreneurship has a positive relationship with organizational support (r=0.777, p<0.01).

5.7 Results of moderator regression analysis: organizational support:

Moderation and mediation analyses are widely used in biomedical and psychosocial research^[29]. Upon running regression and testing moderation, we applied hierarchical regression including service academic entrepreneurship as independent variable and industrial innovation as dependent variable. Firstly, we standardized all variables to make interpretations easy and avoid multi-collinearity. The ANOVA results of models were significant and the results below in Table 6.4 show that the amount of variance in Model 2(with interaction term) is considerably more than the Model 1 (without interaction).

Table 7 Anova Results (Source: generated)

ANOVA ^a						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	27.350	1	27.350	400.538	.000 ^b
	Residual	11.472	168	.068		
	Total	38.822	169			
2	Regression	30.194	2	15.097	292.213	.000 ^c
	Residual	8.628	167	.052		
	Total	38.822	169			
3	Regression	30.476	3	10.159	202.047	.000 ^d
	Residual	8.346	166	.050		
	Total	38.822	169			

a. Dependent Variable: Industrial Innovation

b. Predictors: (Constant), Academic Entrepreneurship

a. Excluded Variables

Following table shows the variables that have been excluded due to co-linearity

Table 8 Excluded Variables

Model		Beta In	t	Sig.	Partial Correlation	Co-linearity Statistics
						Tolerance
1	Organizational Support	.430 ^b	7.419	.000	.498	.396
	AExOS	.565 ^b	5.981	.000	.420	.163
2	AExOS	-.649 ^c	-2.367	.019	-.181	.017

a. Dependent Variable: Industrial Innovation.

b. Predictors in the Model: (Constant), Academic Entrepreneurship.

c. Predictors in the Model: (Constant), Academic Entrepreneurship, Organizational Support.

5.8 Regression analysis

Regression is a technique related to statistics for estimation of variables relationship. The focus is on relation between the dependent and independent variables. It tells that how the dependent variable value varies when the independent value is changed. When there is one independent and one dependent variable then linear regression is used which produce the same results as of bivariate Pearson's correlation [30].

5.9 Regression equation

$$Y = a + B1X1 + B2X2 + B3X3 + ei$$

Y= Industrial Innovation

X1= Academic Entrepreneurship

X2= Organizational Support

X3= Interaction Factor

a= Constant

ei = error term

$$Y = -0.212 + 0.799 X1 + 0.700 X2 + 0.087x3$$

R2= 78.5%

(1)

Table 9 Regression Analysis Coefficients^a

Model	Unstandardized Coefficients	Standardized Coefficients	T	Sig.	Collinearity Statistics			
					B	Std. Error	Beta	Tolerance
1	(Constant)	.899	.163		5.522	.000		
	Academic Entrepreneurship	.847	.042	.839	20.013	.000	1.000	1.000

	Academic Entrepreneurship	.509	.059	.505	8.704	.000	.396	2.528
	Organizational Support	.365	.049	.430	7.419	.000	.396	2.528
3	(Constant)	-.212	.483		-.438	.662		
	Academic Entrepreneurship	.799	.135	.792	5.907	.000	.072	13.873
	Organizational Support	.700	.149	.825	4.681	.000	.042	23.963
	AExOS	-.087	.037	-.649	-2.367	.019	.017	58.027

a. Dependent Variable: Industrial Innovation

5.10 Model summary

Following table presents the summary of model applied to the data of this study.

Table 10 Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.839 ^a	.705	.703	.26131	.705	400.538	1	168	.000
2	.882 ^b	.778	.775	.22730	.073	55.042	1	167	.000
3	.886 ^c	.785	.781	.22423	.007	5.604	1	166	.019

a. Predictors: (Constant), Academic Entrepreneurship

b. Predictors: (Constant), Academic Entrepreneurship, Organizational Support

c. Predictors: (Constant), Academic Entrepreneurship, Organizational Support, AExOS

5.11 Main effects hypotheses

Hypothesis 1: There is a positive relationship between Service academic entrepreneurship and industrial innovation.

The Correlation involving Academic entrepreneurship and industrial innovation is $r=0.839$, $p<0.01$ and significant. Academic entrepreneurship has positive relationship with industrial innovation. Whereas R2 shows that among the other variables academic entrepreneurship explain the model by 70.3%. As

proved from previous studies about academic entrepreneurship that academic research and commercialize efforts contribute positively in stimulating industry's effort for innovation^[31]. Hence the results confirm the hypothesis H1, there is a positive relationship between Academic entrepreneurship and industrial innovation.

5.12 Moderating effect hypothesis

Hypothesis 2: Organizational support (OS) moderates between academic entrepreneurship (AE) and Industrial innovation (II)

In hierarchical regression analysis the variable of organization support was used as moderator, the value of un-standardized regression co-efficient beta increases by 0.365 to .700 after the moderation of organizational support, which is significant with $p > 0.05$. Moderating variable strengthens the effect of the predictor's outcome, thus moderates positively.

A moderation effect could be of three types.

By increasing the moderator would enhance the effect of independent variable on dependent variable.

It could be buffering, whereby raising the moderator value would decrease the effect of the predictor on the dependent variable.

The moderator would reverse the effect of the independent variable on the dependent variable^[32].

In this case, increasing magnitude of moderating variable strengthens the effect of the predictor's outcome, thus moderates positively. Therefore, the presence of organizational support activities as a moderator enhances the impact on relationship involving academic entrepreneurship and industrial innovation. Our results are consistent with Cargill, (2006) and Bart Clarysse et al. (2011). Thus we accept hypotheses H2. The analysis found that academic entrepreneurship through cooperation with industry, consulting activities, patent activities, research publications and applied research as significant predictor of industrial innovation. Hence in the context of private sector universities of Pakistan improved academic entrepreneurship activities by academicians shall increase the likely hood that industry which is utilizing this research would develop innovative products. Academic entrepreneurship can be improved by increasing confidence and motivation of teaching staff. Such a motivation can be bring by providing better infrastructure, work environment and training. In addition the results of the study found that as moderator organizational support significantly increases the academic entrepreneurship efforts for industrial innovation. Therefore organization support in terms of technology transfer office and departmental level support increase the possibility that academic entrepreneurial efforts by an academician contribute positively in industrial innovation in the perspective of private universities of Pakistan.

6 Conclusion

Academic entrepreneurship is a concept that still needs more exploration and description. In the literature a gap has been found that the impact of academic entrepreneurship on industrial innovation is yet to be discovered. Focus of previous studies on academic entrepreneurship was to find out the causes and determinants of academic entrepreneurship. This study quantitatively measures the impact of academic entrepreneurship activities comprising of cooperation with industry, consulting activities, patent activities, research publication and applied research on industrial innovation efforts. In addition the research also analyzes the effect of organizational support as moderator among the link of academic entrepreneurship and industry. The study generated the convincing proof that academic entrepreneurship impacts the industrial innovation and growth activities with the perspective of private research universities of Pakistan and academic entrepreneurship activities are instigated by organizational and departmental support. However for organizational support there is still room for improvement, academicians want effective administrative and institutional support from university administration. The situation implies even in present situation researchers are contributing towards industrial innovation through new venture creation, research commercialization, patenting and industrial collaboration successfully. University researchers are concerned about increased teaching load, large numbers of students under supervision and less time for academic research. A well planned and academician focused organizational support shall enhance the researcher's academic entrepreneurship capabilities by many folds. The study has contributed to fill the gap in academic entrepreneurship research keeping in view Pakistani scenario and proposed a model of academic entrepreneurship and industrial innovation. Resultantly we are aware of what impact academic entrepreneurship exerts on industrial innovation and the effect of organizational support to instigate the efforts of technology transfer to industry. This

research is beneficial particularly for higher education commission and university administration as feedback of their effort for promoting entrepreneurial and research commercialization activities in universities.

The Conceptual Innovation of College Students Management

Li Juan, Fang Qi

Wuhan University of Technology, Wuhan, P.R.China,430070

(E-mail: 626500943@qq.com)

Abstract: College students are the guarantee for modernization construction of China. Under the background of the popularization of higher education, the management of college students face with many challenges, and how to innovate college students management is worth being discussed.

This paper uses documentary method and observation method. By analyzing the documents which are related to college students management and combining practical working experience, this paper comes up with the importance of establishing the management idea of “student-oriented” and holds the idea that only adhering to the “student-oriented” management philosophy can we deal with the new challenges facing with school management. Finally, this paper comes to the conclusion that six ways which connect to the “student-oriented” can contribute to university students’ management innovation.

Key words: College student management; Student-oriented; Conceptual innovation; Management approach

1 Introduction

Fist of all, this paper expounds research significance. It has become a goal and responsibility for university at present to cultivate and foster students who have innovation ability, competitiveness and develop synthetically. The education and management in school more focus on tap existing potential and fully mobilize enthusiasm, initiative as well as creativity. New features of modern education and college students in the new era requires that student mangers must establish a student-centered concept, enhance service awareness, put students on an important position and do a great job in education management.

Secondly, this paper summarizes the concepts of student management in the domestic research situation. In *The Book of the School Students Management Operation* which is edited by Gu Mingyuan, students management is defined as the management for students learning and activities Inside and outside the school including Planning, organizing, coordinating and controlling. In recent years, with development of student management work, some scholars apply the concept of “student affairs” and “student management affairs” which are from America to the study of student management in colleges and universities in China. After comparing the differences of universities student management work between China and the United States, Cai Guochun thinks that Management of colleges and universities influences students through nonacademic affairs and extracurricular activities and it is an organization activity which aims to guide and service students as well as enriching the campus life, promoting students. Teng Huaiguo divides the development of student management according to time sequence.

Finally, the innovation points of this paper is combining theory and practice. The author of this paper is a students managers and this paper starts from the present situation of University students’ management and then discuss management innovation as well as comes up with “student-oriented” management philosophy.

2 New Challenges Facing with the Management of College Students

Market economy tests school management system. As the development of socialist market economy and the improvement of university enrollment, the content of college student management increases and the managements of college students face a series of management changes. For example, the general university college graduates have completely independent careers. The financial aid for needy students changed from the original issuance of grants, hardship relief to student loan, national scholarships, state grants, work-study, social aid. However, the mechanisms and methods which adapts not yet fully formed in the colleges. As a result, in order to enhance pertinence and effectiveness of student management work, it requires student managers to reform the original management mode and establishing student-centered management system which is suit for the development of socialist market economic.

Information technology challenges the traditional management approach. As the development of information technology, the Internet has a great influence on the learning, living and even ideological conception of college students. Internet has greatly changed the way of life, the way of learning and the language habits of college students. For student management, the network is a double-edged sword. On

one hand, it provides new positions and areas for student management and new condition for enhancing and improving ideological as well as political work of college students. On the other hand, it brings great impact on student management and makes it difficult for student managers to convey information accumulated in the minds of students. Besides, it has seriously affected the role of ideological and political work. Next, the virtual and stealth of Internet make it become the breeding of harmful information. Therefore, it contaminates the environment of students' ideological education and makes it difficult for college students to distinguish and resist harmful information. Some students are deceived, and some even indulge inextricably bogged down in.

Credit System and the Elastic Credit challenge teaching management. At present, many colleges and universities across the country have generally implemented credit system. Under credit system, students management broke the uniform teaching management mode, and the students' class concept weakened. The multi - metamorphic lecture group formed with the curriculum as the link. Students from different specialties and even different schools can study together and student management is not limited to the school, this class and the students of this profession. Besides, student managers also guide students in course selection, help students to construct a reasonable knowledge structure, ask students change from directed learning to autonomic learning under the guidance of teachers. Student management work changes from prescriptive management to instructive management. Therefore, student management work must seek and build a new platform.

3 Adhere to the “Student-Oriented” Management Concept

As the talent cultivating base, the management object of student affair department in universities is student who is physically mature but whose outlook on life, values, world view of people management has not yet fully formed. The student affair department manages a group of people who haven't been in self-reliance and still in the learning phase. It is necessary to establish the idea of “human-oriented” for the management of this group. Only by adhering to “human-oriented” and “student-oriented” can accelerate students' integrated development and finally realize human's all-round development.

“Student-oriented” is beneficial to realize the training goal of universities. Therefore, universities need to further strengthen the education of student's thought and quality, to guide students to set up correct learning view and talent view, to cultivate students' scientific spirit of studying hard, positive enterprising, exploring bravely. Moreover, it is also important to integrate employ education into the whole education process, to do a good job in graduates employment guidance and propulsion, to raise the employment rate of graduates.

“Student-oriented” is good for students to be socialized and organized. In accordance with the requirements for social morality and individual moral cultivation, the “student-oriented” asks students to get moral education independently and to be a well-rounded person. There are many colorful activities in Wuhan University of Technology like recitation contest, knowledge vies to answer first, basketball game, debate competition etc. They can make students involve in communication and discussion and give some inspiration to them and overcome the trend that managers monopolize the power to say. Under the nurture of “dialogue” concept, the socialization and organization of student management can be effectively realized.

“Student-oriented” benefits traditional universities' transformation in student management. It emphasizes the subject status of students and focuses on students' self-management and all-round development. It changes the Paternalistic management pattern which places students in subordinate place and implemented strict discipline. “Student-oriented” fully mobilizes students to develop themselves and perform themselves actively. The focus of student management work transfers from empty preaching to moral concern, from the drive of fame and wealth to training students' consciousness.

4 Explore “Student-Oriented” Management Approach

Student managers should exert the influence of student subjectivity. Modern education should be quality-oriented education but not test-oriented education. Quality-oriented education requires universities to take student as the main body, which places the development and the demand of students in the core position and positively encourages students to raise self-consciousness. The pertinence of modern education follows the law that teaching students according to their aptitude and reflecting students' subjectivity, truly realizing “all for students, for all students, for all of the students”.

Student managers should change the understanding of students' role in management. The

administrators should realize that student management is not only to manage people but also to cultivate people. Student management work must stick to the combinations of “education, management, service” three principles. The managing process is a process of serving people, educating people. All the management work serves for students’ learning as well as growing and creates a good environment for students to be excellent from various aspects. It can be said that the most important “service” for students is providing an inspiring environment and a good condition for them in order to improve their all-round quality.

Student managers should pay attention to emotional guidance in student management. In my view, in order to strengthen students' emotional guidance, the managers should enlighten students with reasons firstly. According to the specific problems of students, we can improve students’ thinking and understanding by reasoning with students from things into the grounds and from the shallower to the deeper. Student managers should resort to emotion when managing students. Managers need to care about students’ progress as well as life and solve students’ trouble. The relationship between emotions and reason should also be well dealt with. Management should either being sentient without reason or replacing reason with emotions, but striking a good balance between emotions and reason. To sum up, on management, the administrators should be just and meticulous to reflect a kind of “rigidity”; on emotion, we should be lenient and considerate as well as genuine to reflect a kind of “flexibility”.

Student managers should change passive management to self management. In order to do a great job in student management, student manager should pay attention to mobilize the initiative of students to participate in the management, change the subordinate and passive status of students in management work, reduce and even eliminate the reverse psychology of college students and achieve their self-management. Student management should be carried out the management mode which is under the guidance of the science department and regards instructors and students' autonomous managements as the center. In this way, students are both managers and administrators. In the process of such a role reversal, students can greatly improve the enthusiasm of self-management and enhance their ability of self restraint as well as self-control.

Student management should reflect humanistic concern. University student management is the work of people. Man is rational, but also emotional. The need for people is multifaceted and the development of human is also multi-level. So our management should not adopt rigid, unified management mode, but should face the individual difference of the students and create a variety of learning and development opportunities for students. Because the unified and monotonous management mode is not only suppresses the students' nature, but also kills the students’ imagination and creativity. Management should reflect humane care, fully develop students' advantages of scientific quality and realize the integration of scientific quality and humane quality.

Student management should create a harmonious environment. One may learn earlier than others and may specialize in some filed. In the student management work, managers cannot evaluate students according to age, knowledge and ability. And they also cannot use corporal punishment, abuse and other ways to treat students. Teachers and students should communicate with each other and strive for a harmonious management environment in which teachers care for students and students respect teachers. Only in this way can we build a harmonious school environment which is good for teachers to teach and great for students to learn.

5 Conclusion

The histories of Chinese and foreign colleges and universities show that the first-class universities should not only have a first-class teaching scientific research achievements but also have a first-class management levels. The management concepts, management modes and management systems of traditional student management works have lagged behind the actual development of colleges and universities. As a result, University students' management works need to be reformed and innovated. On the basis of existing research results, this paper explicitly proposes and expounds the “student-oriented” creative thinking of student management in colleges and universities, that is ,student-oriented, creating a good environment for the students, exerting students' initiative and enthusiasm, promoting and guiding students to self management.

Study on Business Applications and Profit Model of SaaS

Xiong Yuanlu

Communist Youth League Committee, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: xylyu@whut.edu.cn)

Abstract: As the “cloud computing” technology developed, SaaS has become an important application service mode which realizes the information needs of SMEs and supports the development of e-commerce. This work elaborates the definition and features of SaaS, and on the basis of the construction of network system of SaaS’s core value, combining cases of enterprises’ business applications of SaaS, summarizes two different types of applications with the SaaS mode. Ultimately, this work builds the profit model with SaaS operators as the core according to the charging method and revenue distribution model.

Key words: SaaS; Business applications; Profit model

1 Introduction

SaaS is the abbreviation of Software as a Service (SaaS), a completely innovative software application model based on the Internet to provide software^[1]. Specifically, the provider integrates, unifies and deploys the software or application in the cloud, and builds various software platforms for enterprises to provide information needed. The provider is responsible for the environment layout of the platform in the early stage, service support in mid stage and software maintenance in later stage. User can order application software from supplier based on their specific needs and run the software using the browser, while supplier can charge the user according to the factors such as time of using or quantity of the software ordered.

Compared with traditional software mode, the users do not need to pay a one-time fee to purchase the software and spend a lot of money on building complex IT systems and ongoing maintenance^[2]. The user just pays a small rental fee and may update the software according to user’s need at any time. From this point, SaaS is really the best way to accelerate enterprise’s informatization and improve the penetration of advanced technology. SaaS greatly reduces the risk of enterprise’s investment in software, which is especially important for SMEs in China.

Table 1 Differences Between SaaS Mode and Traditional Software Mode

Way	SaaS Mode	Traditional Software Mode
Fee	Regular rental service fee	One-time purchase fee
Service mode	Supplier providing professional service	Need to train professional service team
Equipment deployment	Simple PC equipment	Need to build complex IT system
Software update	Supplier updating at any time according to need	Updating by enterprise itself, with a long period

According to Forrester Research’s forecast, global cloud computing market will reach \$ 241 billion in 2020. And cloud computing as one of the new strategic industries in 12th Five-Year Plan, its size of the industrial chain is expected to reach 750 billion yuan in 2015 in China. SaaS as the topmost service mode in cloud computing, it also attracts key attention from government, professional software companies, Internet service providers, telecommunications operators and a variety of small and medium enterprises. SaaS has strong policy support and good prospects for development.

2 Features of SaaS

SaaS is one of the service mode of cloud computing, relying on the resiliency service and powerful computing ability of cloud computing. It has unique business advantages and characteristics, mainly in the following three aspects:

1) Feature of service

SaaS has relevant features of information service in online service quality assurance, service contracts signment, and service usage measurement and so on. SaaS service is generally divided into two categories^[3], namely business-oriented service and consumer-oriented service. The former includes online storage management, CRM, ERP, sales management, and application services for the specific needs of business users. The latter includes account management, document management, online

document editing, and calendar management. Relationship between software suppliers and users becomes service relationship, which also marks the formal entry of software industry into the socialized software development phase.

2) Feature of multi-tenancy

SaaS provides services for the users with different needs based on the same system, realizing one-to-many delivery mode, that is, multi-tenancy mode. In the SaaS application mode, the supplier no longer develops new software for specific users or projects^[4,5]. The supplier builds a cloud platform and develops SaaS software according to popular demand. Then the supplier places all these pieces of SaaS software in the cloud for users to lease, supporting isolation of data and configuration between different lessees and ensuring data security and privacy of each lessee.

3) Feature of using on-demand

SaaS provides services based on Web Service or Web 2.0 program, via the Internet browser. It greatly reduces the time and space distance between the user and SaaS supplier. In addition, SaaS software does not limit the user's operating platform. Therefore, the user can always be operational, whether using Windows or Linux system.

3 Business Applications of SaaS

3.1 Construction of core value network of SaaS

SaaS was introduced into China in 2004. But the importance of SaaS was really appreciated by the media, customers, governments and enterprises until 2009. Since then all kinds of professional software companies, telecommunications operators have been offering their own SaaS development modes.

Formation of SaaS requires the support of a whole value chain. Its role participants include: SaaS operators, SaaS application software providers, independent software vendors, hardware providers, platform vendors, competitors, replacement, agents, customers, consultants, telecom operators and other relevant groups. However, the relationships between these groups are not simple as linear relationship. To build the value creation process of SaaS, the following two preconditions must be first defined:

1) Division of product-type SaaS and platform-type SaaS. According to different roles SaaS providers play, SaaS can be divided into product-type SaaS and platform-type SaaS. Table 2 presents the specific division details.

Table 2 SaaS Categories

	Product-type SaaS	Platform-type SaaS
Roles of SaaS providers	SaaS providers directly responsible for the development and design of software	SaaS providers only responsible for operation and service support
Concrete elaboration	Vendors directly provides online software services to customers, without middlemen	Software development companies provide online software services to customers, needing an independent third party to act as an intermediary coordinator
Component of main value chain	Software development companies providing SaaS services , online delivery platform, clients and other related units	ISV(independent software vendors), BSP(service provider), clients and other related units
Example	Kingdee Youshang, Xtools, k.cn, etc.	Salesforce: AppExchange、 Digital China Online: SaaSBB, 800app, etc.

2) If the SaaS operators play the role of provider of SaaS platform at the same time, they must build their own database and website. And they conduct management and update to their own operating platform more directly.

After determining the above two premises, the building of the core value network of SaaS service mode includes a central layer and an auxiliary layer. The central layer forms the core of the value network, of which components interact through competition and cooperation on the value network or other internal coupling modes. And then it creates value for customers. The auxiliary layer provides support in aspects of resources and infrastructure, knowledge flow, technology flow, human resources, information flows and other factors of production for the central layer. The structure is shown in Figure1.

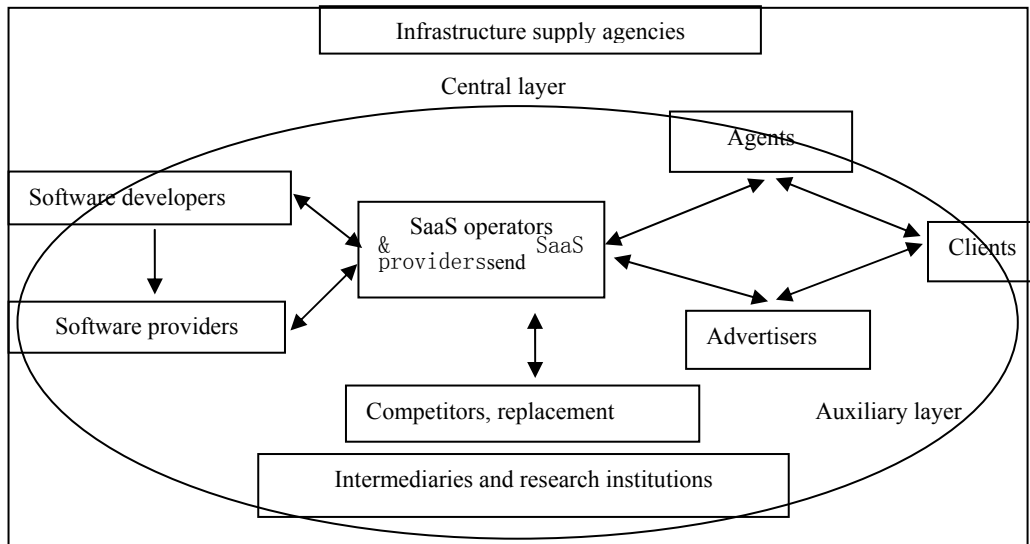

Figure 1 Ecosystem of SaaS Core Value Network

3.2 Business application cases of SaaS

By analyzing different operating modes of product-type SaaS and platform-type SaaS, SaaS modes for different business applications of three typical landing enterprises are cited.

1) XTools.com

Xtools.com mainly provides its self-developed software XtoolsCRM to SMEs worldwide, behind which there are two companies: Warrison and Voli Sender. The former is responsible for design and development of SaaS software, the latter is responsible for post-sale of software. This is a typical product-type SaaS. XtoolsCRM not only has the features and advantages of SaaS software, but also put the model of “Monthly rental payment” into its area, attracting a large number of users. In addition, they use experience-consumption model of “payment after the first trial” in marketing. This type not only greatly reduces the user’s selection risk, implementation risk and financial risk, but also eliminates the user’s burden of pre-development and post maintenance of software. Compared to the purchase of CRM software, its online service can provide a more complete and comprehensive enterprise-customer relationship management.

2) Kingdee YouShang: youshang.com

Compared to Xtools.com, the Kingdee YouShang not only provides services to all types of enterprises, but also provides one-stop integrated services to individuals. It includes online customer management, online agent account platform, online accounting, online ordering platform as well as some other value added application services. And the service software is all developed and provided by Kingdee itself. It is also typical product-type SaaS. This kind of whole-course and comprehensive service can better enable enterprise to exert effectiveness and vitality in aspects of information and innovation. It can gain much larger customer group. According to the judgment of the market research institute "Analysis International", the number of subscribers of Kingdee YouShang will continue to grow rapidly in the next few years. And its proportion in managed SaaS market will reach more than 30%. Thus it is clear that its market prospect is very broad.

3) Digital China Online: SaaSBB.com

SaaSBB.com is a Chinese first online software service operating platform constructed by Beijing Digital China Online Technology Co. Ltd. for the SMEs which have special needs of production on demand. In the operation of the platform, independent software vendors (ISV) provide software resources. SaaSBB is responsible for the integration of resources, services support (IT infrastructure operation and maintenance service, enterprise’s office service, enterprise’s business service and industry application service) and sales channels. Service content of SaaSBB.com almost covers the required various services in the entire development process of SMEs at the present stage. This is a typical platform-type SaaS. The platform generally provides a three-month trial period for at least 5 users and calculates the monthly lease fee of per user. It greatly promotes the information development of SMEs.

Through the above analysis it can be found that the product-type SaaS and platform-type SaaS both have the features of on-demand service, multi-tenancy, using on-demand shared by general SaaS software. But they both have their own outstanding operational focus. For a more intuitive expression,

the basic information of three landing companies and their SaaS software are compared. Their basic operating modes are compared and analyzed. As shown in Table 3.

Table 3 Basic Operation Analysis of Various Types of SaaS Companies

Category	Product-type SaaS		Platform-type SaaS
Service provider	XTools.com(SaaS with a single application)	Kingdee YouShang (whole-course SaaS)	Digital China Online: SaaSBB.com
Software provider	Warrison company of Xtools	Kingdee Software Company	Independent software vendors (ISV)
SaaS software	XtoolsCRM	one-stop integrated services: online accounting, online customer management, online agent account platform, etc.	IT infrastructure operation and maintenance service, enterprise's office service, enterprise's business service and industry application service.
Target customers	SMEs in various sectors	SMEs in various sectors, individual customers	SMEs in various sectors
basic operating model	Monthly rental payment, payment after the first trial, online payment of a third-party online banking	whole-course rent on demand, third-party payment	At least 5 lessees, 3-month trial period, calculating a monthly rental fee of per user

4 Profit Model Construction of SaaS

4.1 Charging methods

SaaS payment model is on-demand and multi-tenancy. It determines the users changing from purchasing to leasing the required software for use. The business income of SaaS is mainly from the users. It has different characteristics according to different types of users, which can be divided into the following five types, as shown in Table 4.

Table 4 Charging Methods of SaaS Service

Charging method	Concrete elaboration	Applicable customer
Charging by solution model	SaaS operators develop personalized large business, government solutions according to user's needs.	Large and medium enterprises, government and public service sectors
Charging by number of user and time	SaaS operators charge according to the number of users or lease time or a combination of both factors.	Small and medium enterprises, individual users
Charging by traffic, CPU, authorization	SaaS operators charge by the traffic used or CPU. This model can better learn about the volume of enterprise's business and control IT cost.	Large, medium and small enterprises
Charging by storage space	SaaS operators do not charge by the software itself, but only charge by the store data provided by the software; applicable to some instant messaging software	Large, medium and small enterprises, individual users
Charging by advertising	SaaS operators provide the software to customers for free, attract advertisers with usage rate, and charge advertising fee	individual users

4.2 Income distribution models

Different SaaS service types are embodied with different models of income distribution. For product-type SaaS, operators will take necessary charge as business income. And they allocate budget for developing SaaS software according to certain standard. While platform-type SaaS is essentially a strategic alliance partnership. Thus there is income distribution between SaaS operators and software providers. The income distribution is not only a discussion on the percentage of income distribution, but also a discussion on the income distribution patterns. After investigating a series statistics and landing enterprises, SaaS has determined the following two income distribution models.

(1) Percentage charge model

This model mainly based on the business content and business traffic when SaaS operators provide service software (business integration, self-owned business/cooperation business, before-sale service, in-sale service and after-sale service) for customers. And it divide and distribute income between SaaS operators and software providers. For example, the distribution model of China Mobile and SI (Business Integrator, Service Integrafor)^[6,7]. With the development of SaaS platform and the diversification of service, this distribution model will gradually be more elaborate and better refined in the distribution of business and the measure of the distribution percentage.

(2) Return charge model

Under this model, SaaS operators provide a platform, while software providers pay necessary membership fee as members and provide the platform with their own software at certain value. At the initial stage, SaaS operators provide customers with SaaS software at a low price or free of charge, which attracts a great number of customers. In this case, the advertising cost can be regarded as the final profit after a certain scale has been developed. For example, the distribution model between Apple Store and software providers. This distribution model not only helps consolidate the cooperation relationship between SaaS operators and software providers, but also facilitates the development and maturity of industrial chain and promotes a virtuous circle of industrial chain.

4.3 Profit model

Opposed to the traditional way of purchasing software, SaaS has built a complete industrial chain which provides an entirely different profit model. The profit model is not only confined to the exchange of service and rent between SaaS operators and customers, but also include software providers, SaaS software developers and SaaS operators in the distribution range. Only in this way can the cost be shared and the win-win situation is achieved. So it promotes a virtuous cycle of development of the whole ind

Through the above analysis of revenue sources, charge system and distribution system of SaaS, the profit model has been built with operators at its core. And it has shown clearly the benefit distribution of stakeholders in the core industrial chain which is showed in Figure 2.

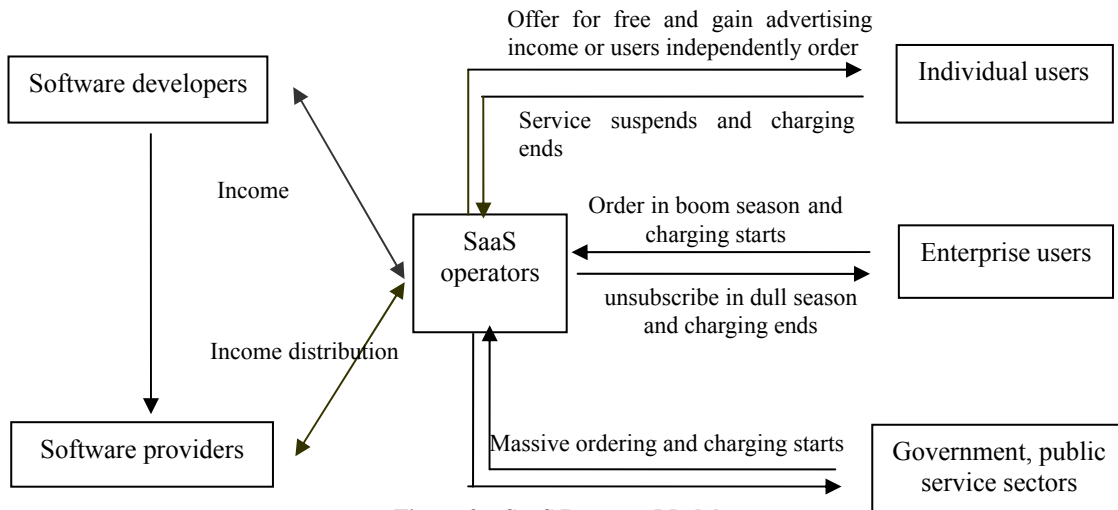

Figure 2 SaaS Revenue Model

5 Conclusion

In this work, a core value network has been build based on the definition, characteristics and the elaboration of SaaS. And two different types of application under SaaS mode are summarized. Ultimately, a profit model with operators at its core is constructed after analyzing some commercial application cases of SaaS. Besides, this work not only makes a summary of the past relevant theories and practice of SaaS, but also sets examples for the business operation of SaaS in China. At present, application of cloud computing in China is at the initial stage of exploration. As the development of information technology and economic environment, the commercial application and the profit model of SaaS will update. It requires further research on the commercial application and the profit model of SaaS.

Study on Shared Framework Model about the Science and Technology HR Based on Synergic Innovation

Yu Shu, Bao Xiaona, Zhang Jiangdong

School of Management, Dalian Polytechnic University, Dalian, P.R.China, 116034

(E-mail: suesunyu@126.com, xnb@126.com, zjd1112@163.com)

Abstract: Human resources of Science and technology are key impetus to innovation of science and technology and important base elements to promote economic development. To establish shared frame model regarding human resource of science and technology, this article is based on the theory of synergistic creation to confirm four subsystems, including principal part, resource, environment and function constituted by frame of share of human resource of science and technology. This article also put forward the share path from communication, synergistic, cooperation, share willing, share capacity to share behavior and relevant assistant mechanism to impel this model with maneuverability.

Key words: Synergistic innovation; Human resources of science and technology; Shared frame model

1 Introduction

Science and technology are primary productive forces, which gradually become key impetus to promote economic development. The human resources of Science and technology are combination of science, technology and human resource, and it is the human resource that actually engaged in or has the potential to engage in the generation, promotion, dissemination and application activity of systematicness science and technical knowledge^[1]. The human resources of science and technology are the leading forces and strategic resources to build an innovation-originated nation. As the core of scientific resources, the human resources of science and technology have become important base element to promote the economic development via promoting human resource structure and accelerating technological progress.^[2]

In order to achieve the goal of building an innovation-originated nation, the state has continually increased the investment in science and technology (Figure 1). Our R & D investment intensity has a leading position in the emerging developing countries in 2012, and the gap with the developed countries is gradually decreased, the status as a great country which huge investment in science and technology has been consolidated.

Figure 1 2000--2012 S & T Funding Invested

However, although the overall R & D input intensity of China reached 1.98% in 2012, there is still a gap compared with about 3% level in developed countries. According to the statistic data in "Science and Technology Statistics Report" (total 466) (Table 1 below), the total staff of R & D in China are likely to exceed the United States and ranks the first in the world in 2009. However the per capita R & D expenditure or the average number of R & D staff in every ten thousand labor force is not higher than the international level. On the other hand, the distributions of scientific and technological personnel are not balanceable. The R & D personnel reached 1271000 persons/year in the eastern area, and 399000 persons/year in the central region, but only 296000 persons/year in the western area in 2008, and the

proportion in the eastern region increases year by year while the proportion in the central region decreases year by year, the gap is enlarging^[3].

Table 1 International Comparison of the R & D Personnel Indicators

State	Year	R&D personnel (10000 personnel per year)	Annual average growth rate of R&D personnel since 2000 (%)	Annual average R&D expense per person (10000 USD per personnel year)	No. of R&D personnel every 10000 labors
china	2008	196.5	9.5	3.4	24.8
Japan	2006	93.5	0.7	18.9	140.5
Russia	2007	91.2	-1.4	2.0	121.5
Germany	2007	49.8	0.4	18.8	119.5
France	2006	36.4	1.8	15.3	132.0
England	2006	33.5	1.9	14.3	111.8
South Korea	2006	23.8	9.5	13.5	99.1
Canada	2005	21.4	5.0	11.5	122.9
Italy	2006	19.2	4.2	12.5	77.9
Australia	2006	12.6	4.7	16.7	116.8
Poland	2006	7.4	-1.2	4.0	43.3
Finland	2007	5.6	1.0	17.4	208.7
Argentina	2007	5.3	5.1	2.8	27.7
South Africa	2005	2.9		10.0	17.2
Czech	2007	4.92	10.7	6.8	94.6
Turkey	2006	5.44	12.4	8.4	21.5

Chinese "labor force" refers to the economically active population.

Source: OECD, Main Science and Technology Indicators 2009-1.

The status and role of science and technology human resources, especially key science and technology human resources in organizations is increasingly prominent. As scientific human resources have initiative and creativity, which has broad shared prospect and strong shared effect.^[4] Cooperative mode of combined learning with research and production is blossoming in China, and the state also encourages this model and the proportion of these kinds of projects is increasing (Table 2). This cooperation model has been becoming trend of development of national science and technology. Therefore, from the perspective of industry-college-institute synergistic innovation, this article tries to analyze and research the shared mechanism of science human resources to build shared frame model of scientific human resource based on synergistic innovation perspective

Table 2 Industry-College-Institute Cooperation Status in National Scientific Plan Projects

	"Ninth Five" stage (1996-2000)	"Tenth Five" Stage(2001-2005)	"Eleventh Five" stage(2006-2008)
Total no. of the five category plan project	19348	30144	26797
Total no. of the cooperative projects	2399	6590	5458
Percentage of the cooperative projects (%)	12.4	21.9	20.4

2 Scientific Human Resources Shared Framework Structure Analysis under Synergistic Innovation Perspective

2.1 Synergistic innovation theoretical foundation

Synergy was firstly suggested in "System theory" by Haken, physicist from German, in 1971. He thinks the synergistic effect of $1+1>2$ can be reached by inter-coordination, cooperation of every sub-system. Synergistic theory treats each system as a complex system which is made up of three layers:

element layer, namely micro level; sub-system layer, also known as meso-level layer; overall system layer, namely the macro layer.

Synergistic innovation represents innovation paradigm or model used in the innovation process of some layer. Throughout the research of domestic and foreign scholars on synergistic innovation: the first to pay attention to synergistic innovation of enterprise internal element in micro-level, such as Zheng Gang, Zhu Ling (2008) put forward a new paradigm, comprehensive synergistic innovation. They believe that the enterprise should view innovation throughout globe understanding to coordinate entirely innovation elements as strategy, technology, production, marketing, culture and organization, not limit the view in some or local several elements^[5]; the second is to concern about regional synergistic innovation, for example, Chen Danyu(2009) using the regional synergistic theory and method to study synergistic development status of the regional innovation systems in Yangtze River Delta region (Jiangsu, Zhejiang and Shanghai)^[6], Shao Chang (2007) put forward to promote the coordinated development of internal innovation element of every province, at the same time as, the innovation system building should be paid attention to after he research science and technology development strategy of six central provinces.^[7]; the third is synergistic innovation from industry-college-institute, for example, He Yu Bing (2012) proposed a new framework of synergistic innovation analysis from industry-college-institute: strategic synergistic level, knowledge collaboration level, organization coordination level, to clarify how enterprises, universities and research institutions accelerate improving efficiency of national and regional innovation systems by using fast interacting, shared and integrating of knowledge and resource between organizations.^[8]

2.2 Technology human resource sharing framework analysis based on synergistic innovation

This article note Synergistic Innovation is to build a Synergistic innovation organic system, and knowledge appreciation are the core, enterprises and government and knowledge production institutions (universities, research institutions) and intermediaries and users create a large span integrated innovative system in order to achieve and carry out scientific and technological innovation system. Of which the key route is to form an interactive network innovation model with the synergistic interaction of multiple subjects that includes the university and research institutions as the core subjects, the government and financial institution and intermediaries' innovation platform and non-profit organizations as the supplemental elements. By the cooperation and integration of the knowledge creation subject and technical innovation subjects, the effect of systems nonlinear superposition is achieved. We can analyze the collaborative innovation from the overall and interactive dimension, and the synergetic innovation could be seen as a process of communication -Coordination -Cooperation -synergy.^[9-11] (As shown in Figure 2)

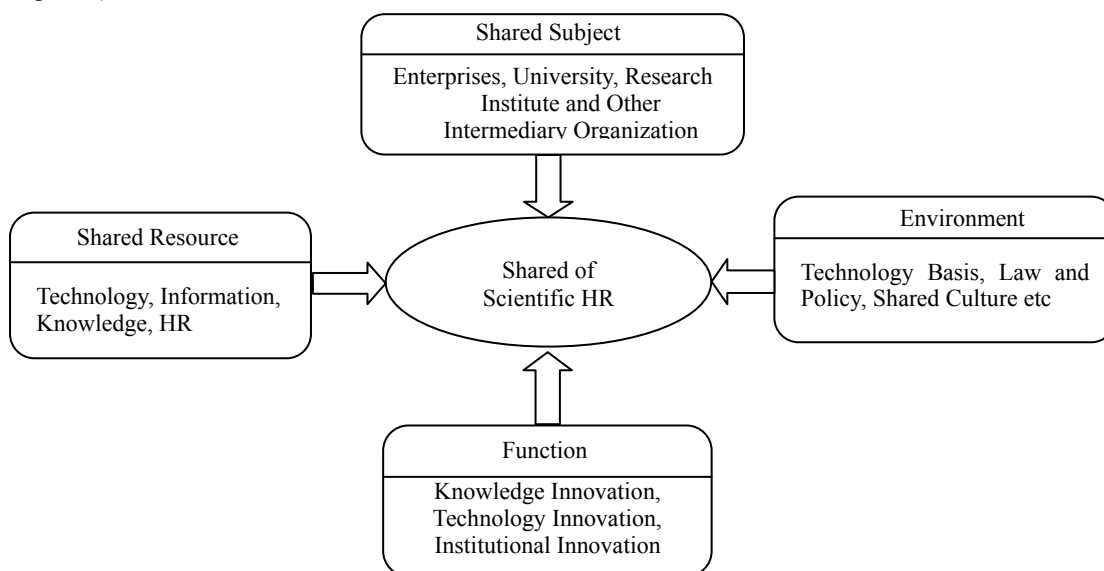

Figure 2 Shared Frameworks of Science and Technology Human Resources under the Perspective of Synergistic Innovation

3 Building of HR Shared Framework Model under the Perspective of Synergistic

Innovation

Based on the previous studies, this article put forward the scientific human resources shared framework, including four subsystems: shared subject, shared resources, environment and function, which clarifies how do enterprises, universities and research institutions make use of the rapid interacting, shared and integration of knowledge and resources to accelerate the efficiency of national and regional innovation system. The shared process is “communication-coordination-synergy-shared aspiration-shared ability-shared behavior”. The supportive layer is the governmental guidance, project-driven and institutional innovation; the auxiliary layer is intermediary organizations, financial institutions and other organizations. They achieved the shared behavior on the basis of contracture of synergistic innovation system. (Shown in Figure 3)

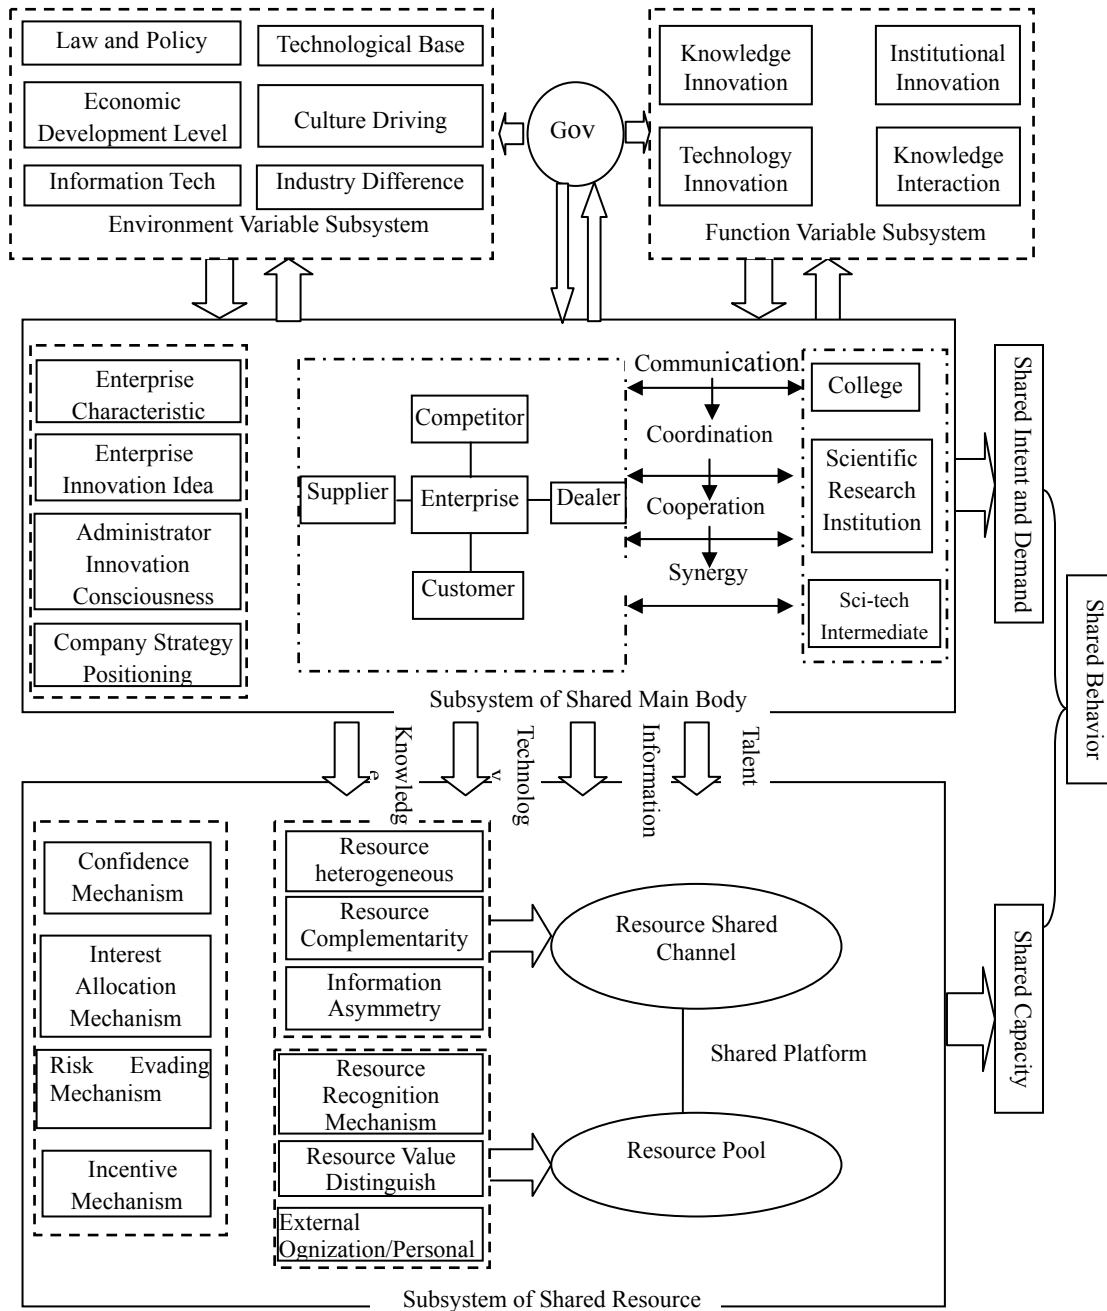

Figure 3 Science and Technology Human Resources Shared Mechanism Frame Model Based on Synergistic Innovation Perspective

3.1 The subsystems of the shared subject

The enterprises, research institutes and universities are not only the subjects of technology innovation, but also the subject of shared mechanism of science and technology human resource. Enterprises are the core subject, universities and research institutions are the subject to create knowledge. The elements of the shared subject are optimized systematically and cooperate to innovate. We can analyze synergistic innovation from two dimensions: integration and interaction. The integration dimension includes the knowledge, resources, action, performance, and interaction dimension mainly refers to the mutual knowledge shared of all innovation subjects, optimization of resources, optimal synchronous of operation and the matching of the system. According to the different positions of two dimensions, synergistic innovation is the process of communication-Coordination-Cooperation-synergy.^[10] On the other hand, the demand of shared resources is affected by the enterprise feature, such as enterprise size, development stage and innovation level, etc. Enterprise innovation development strategy, innovation theory and innovation consciousness of individual managers are the precondition to form shared resource demand.^[12] At the same time, under the action of environment variables and function variables, synergistic innovation of every subject lead to the shared willing and shared demand.

3.2 Shared resource subsystem

The shared resource subsystem includes resource shared channel and resource pool. The shared subject provides knowledge, technology, information and talents to enter into the subsystem. The shared pool is established by resources identifying mechanisms, resources value distinguishing mechanism and external organizations or individuals etc. The shared channel is established through building networking platform, innovative platforms. It is the existence of the complementarily of the need side and the supply side of the science and technology human resource, the resource heterogeneity and information asymmetry that the resource shared channel form. By the establishment of the resource-shared channels and shared pool, the shared subject has the shared ability, and under the stimulation of shared demand and will, the shared behavior is formed. We should also note that it is indispensable for the trust mechanism, interest distribution mechanism, risk avoidance mechanisms and incentive mechanism to form the shared ability.

3.3 Environmental variables subsystem

Shared need and ability of scientific and technological human resources will also be affected by the environment variables. Law and policy, technical base, economic development level, cultural environment, information technology development and inter-industry difference are of environmental variable, which affect the development of shared system. Excellent shared environment includes hard one's and soft one's. Hard environment includes technology infrastructure, technical database and so on. Soft environment includes some aspects as law policy, economic development level and culture driving. We should pay attention to that government is vital for environment establishment of shared mechanism because it can drive the infrastructure construction and draw up relative law and policy with sharing of scientific human resource by its particular legislative authority and administrative power.

3.4 Functional variable subsystem

Science and technology human resources shared system also needs the functional variables to improve itself. Knowledge innovation is the source function, and knowledge, technology and institution are complementary each other. Knowledge Innovation is the creation of new base knowledge, if the new knowledge needs to be transferred into practical productive forces, it will need the enterprise to complete the work internally.

Institution innovation will provide guarantee to the innovation of knowledge and technology. Whether it is the knowledge innovation or technological innovation, ultimately it will be inseparable from the production, transfer and application of knowledge and technology. Therefore there will be transaction costs. It is necessary for proper institution design to reduce the cost need. The goal of institution innovation is to design a rule which is in favor of the innovation of knowledge and technology, in this way we could optimize the knowledge and technology in the system, and lower the transaction costs.^[13]

4 Conclusion

On Synergistic Innovation Perspective we will build a science and technology human resources shared model, which includes four subsystem: the subject, resources, environment and function. The enterprises, universities, research institutions and research intermediary produce synergies through communication, coordination and cooperation, and the sharing intention will occur under the common

effect of the environmental variables and functional variables. Promoted by enterprise characteristics and innovation consciousness, the subjects have formed knowledge, technology, information and human resources as a shared channel by making use of the complementarily and heterogeneity of resources, and then a resource pool is built through opportunity identification and value identification, shared capacity is formed among the subjects, and the effect of the shared ability is also influenced by the following factors: trust mechanism, interest distribution mechanism, risk avoidance mechanisms and incentives mechanism. Only when these mechanisms play a role, and are under the influence of shared intention and shared ability, the shared behavior can be incited. This shared model has the dynamics and complexity, and this model is affected by many factors, and it should be used comprehensively to form synergistic innovation, to achieve shared behavior and to improve the shared performance.

Innovation of the Social Organization's Registration Management System in China

Yin Shuo

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 475366459@qq.com)

Abstract: China's social organizations formed a "centralized registration, dual management, graded responsibility" registration management system in the course of practice. This paper analysis the existing disadvantages of the management system of social organization in China, consider that with the development of socialist market economy and democracy, the system squeezed the living space of social organizations and influenced the overall efficiency in a certain extent. Just because of above-mentioned background, I propose that integrated and unified registration management system should be established instead of the existing system in China.

Key words: Social organization; Registration management system; Innovation; China

1 Introduction

Countries in the world have different titles on "social organization" according to its habit of using word and the definition of it. The usage of "Non-Profit Organization"(abbreviation NPO) is popular in the middle of the twentieth Century. The United Nations often use "Non-Governmental Organization"(abbreviation NGO) in the documents. The non-profit organization management system of USA based on the law, so which called "Tax-exempt organization", UK use "Voluntary Organization" follows its tradition, as well as the commonly usage "Charitable Organization", "civil society" (abbreviation CSO), "Third Sector" and others. The meaning has no unified boundaries, but all refer to the social organizations outside of government department and enterprise sector.

Social organization, refers to the various forms of organization and network configuration with non-profit, non-governmental and social characteristics which formed spontaneously by various social classes of citizens in a society. The concept of "social organization" was put forward in the sixth plenum of the 16th CPC Central Committee in 2006, and was further discussed and confirmed in the report of the 17th National Congress of the CPC.

Throughout the domestic and foreign existing related research materials, we can find that most countries in the world use one-dimensional register management at present. Foreign scholars focus on the study of the means and ways which provide support services for society organization by the government. Such as tax preferences, financial appropriation directly, public service purchase, strategic framework system establishment, government institutional reform and so on.

Domestic scholars mainly concentrated on the reformation of social organization registration management system. On the macro level, they discussed around the overall goal and direction of reform, on the micro level, they analyse and summarize the mode of social organization and management system in local practice. In addition, by comparing the differences between the domestic and international social organizations registration management system, we can sum up the practice and experience of the management system from other countries to enlighten China.

With the development of the socialist market economy and social transformation, the process of democratization in China need legitimate, efficient and standardized social organizations to compensate for the possible failure condition of the market and government, and also provide public goods and public service. Lawfully usually associated with independent, so it needs a reasonable and perfect registration management system as a guarantee.

2 The Evolution of the Social Organization's Registration Management System

After the reform and opening up in China, with the development of economy and the deepening social reform and transformation, social organizations in China present an active situation. In the late 1980s, the government began to establish the standard system of social organizations in the context of political turmoil. In September 1988, the State Council passed the measures for the administration of the foundation, end up the history of that foundation without unified registration. In October 1989, the State Council approved and promulgated the regulations on the registration and administration of social organizations, stipulated clearly that the registration administration department and the competent

business unit are responsible for the registration management and daily management of social organizations. With further implementation of the clean-up of social organizations, in October 1998, the State Council promulgated new “social group registration and management regulations” and “provisional regulations on the registration management of private non-enterprise units”. Since then, social groups, foundations and private non enterprise units unified into the registration management system.

According to the current regulations, the management system of social organizations in China can be summarized as “centralized registration, double responsibility and hierarchical management”. “Centralized registration” refers to, in addition to specific provision exempted from registration of laws, rules and regulations, all non-governmental organizations should have unified registration in the civil affairs department, which registered in other government departments, state organs are not regarded as effective registration; “Double responsibility” refers to, social organizations are managed and supervised by the registration administration organ and the competent business unit; “Hierarchical management” refers to, according to the scale of organization, national non-governmental organizations managed by the State Council’s registration authority and the relevant competent business unit, local non-governmental organizations managed by the local registration authority at all levels and the relevant business unit.

The dual management system of social organization arised at the trend of reform and opening and globalization. With the collapse of the unification and homogeneity of the traditional society, the profit pattern of China occurred significant changes, resulting different social classes. In addition, in the era of globalization, international exchanges become more frequently, the western social thought's impact and penetration increased, the domestic and foreign hostile forces attempting to use of social organizations, through the so-called legal means such as funding, cooperation and communication, to carry on the ideological infiltration to China. In the subsequent rectification, particularly, with the management of the risk of political fluctuations, this management system gradually reflects the advantages and be strengthened gradually. It can avoid the possible political risk by implementing the dual management system, and in the process, supervision and management departments enjoy the power and also should bear the responsibility, so the system is often simplified to a political checks and shared responsibility mechanism of the separation of powers. Social organization and management is a complicated system, unbalanced development, lacking internal management and effective autonomous mechanism of social organizations appeared in its original growth period. In the overall survival environment and development of China's social organizations, the management only by the competent business unit or registration management agency has significant limitations. The dual management system played an important role on guarantee the quality of social organization and the reasonable layout.

3 The Problems Existing in the Dual Management

After entering the 21st century, the dual management system of China’s social organization gradually exposed its drawbacks, and are not adapted to the needs of the development of social organizations increasingly under the new situation. Mainly in following several aspects.

3.1 High standard of access

Under the dual management system, social organizations acquire legitimacy, must first be examined and approved by relevant competent business unit before register in civil administration branch. China's existing three social organization management regulations express that, “the relevant departments of the State Council and local government at all levels above the county level, organization authorized by the state council or the local people's governments above the county level” is the competent business unit. But there is no corresponding implementation details, so that in practice, the social organization is difficult to find a suitable business unit. It also have relatively strict limits on social organizations set up conditions, the social organizations registration management stipulate in article 10 that, “there must be more than 50 individual members or more than 30 unit members; Individual members, mixed with unit members, the members shall not be less than 50;” In terms of assets, “there should have legitimate assets and sources of funds, the national social organizations have 10 million yuan funds for activities, local community groups and cross administrative regional community groups have more than 3 million yuan funds for activities;” To achieve these conditions, the social organization of the community, rural and other smaller scale has certain difficulty. And such a high threshold setting lead to a direct result that the social organization legally establishment been hampered, more and more social organizations instead of taking industrial and commercial registration to obtain legal support, or

just not to be registered, tend to profitable or variable which outside of the system. On the one hand, diaspora social organizations unable to enjoy tax breaks and purchasing service provided by the government, and also not conducive to the effective regulation of the government, on the other hand, they may become endangering social group which is used by illegal forces, that is not conducive to the healthy development of the social organization. In a certain sense, the high threshold of registration is the bottleneck restricting the development of social organizations.

3.2 Subjective consideration of the competent department

Under the dual management system, the social organization, only by getting the examination permission from the business units, it could go to the civil affairs departments for register. To examine and approve the social organization, the competent business unit would consider whether its business scope is related, more important is to see non-governmental organizations are whether under the effective control, and the development of non-governmental organizations will bring too much political risks and responsibilities or not, and it whether increase the departmental interests for competent business unit. In the process of concerning social organizations access, business executives often have subjective factors. Competent departments are lack of driving force on approving the non-profit social organization, they also have their own work, so it requires to bear joint liability reduces the enthusiasm of the competent business unit. The business department in charge of the greater discretion increased the cost of finding a suitable business unit.

3.3 Excessive administrative intervention

Under this management system, business unit in charge of the administrative intervention, the social organizations are lack of independent power of appointment and removal of personnel, financial management, internal autonomy. The methods of manager selection of social organization, there is a survey:

Table 1 Methods of Manager Selection

Democratically elected	28.4%
Dominated and approved by the competent department	23.2%
Dispatch by the competent department	38.5%
No special rules	8.6%

From the above data, the social organization of managers through democratic elections are less than only 30%, and they are mainly from the competent authorities of the dispatch and appointed, the second is nominated by the head of the competent department.

On the source of funding for social organization, for membership social organization, dues and revenue is the main source of the funds; for non-members of social organizations, they need rely more on government procurement of services and corporate donations. The research of social organization's funds over the world shows that social activities of the organization funds mainly come from the government and enterprises. Over reliance on the government on financial, will easily cause social organization lacking of economic independence, financial chaos, corruption, and even affect social autonomy ability and social credibility of the organization.

Business department in charge of social organization's resources is also easy to form affiliation, and this kind of nepotism narrowed the autonomy space of social organization, suppress the rights of themselves. The extension of the administrative power is easy to make social organization alienated as an extension of the government departments or competent authority unit, resulting in a "second government" phenomenon, and directly affect the efficiency of social organization. Some scholars think that "the market-oriented reform gradually abandon the economy plan management system, at the same time, in the field of Chinese society, the planning system are constructed from scratch".

3.4 Legal repetitive supervision and lacking of regulation in practice

The social organizations in China are unified registered by registration and management agency in the legal, as a matter of fact, departments of diplomacy, communication, public security, development and reform, agriculture, taxation also bear certain regulatory functions, the different levels of the various regulatory authorities, hindered the direct coordination between departments, the social organizations in China are faced with multi-department management and repeat regulation. This situation affects the aggregation of supervision and reduces the normative regulation.

In practice, the competent business unit often attaches importance to the early stage of the examination and approval, despise the follow-up management. Failing to establish the perfect

supervision tracing mechanism, the regulatory gaps also led to a large number of registered social organizations in name only. Considering from the reality, due to the limited number of functional departments and the proliferation of social organizations, social organizations accepted by a competent business unit may not in the minority. This situation makes the competent units have no time to give consideration to all social organizations. Moreover, business executives have their own work, the social organization of the regulatory work can be referred to as their additional functions. Facing to the numerous social organizations, the competent business units unable to do what they hope to do, the inaccessibility of supervision aggravated the burden of the competent business unit, it also reduced the supervision efficiency and increased the hidden costs of regulation.

4 Reform and Innovation of Social Organization's Registration Management System

4.1 Reform of social organization's registration management system

Along with the development of socialist market economy and democratic politics, to a certain extent, the registration and management system of China's social organization has squeezed the living space of the social organization, which hindered its effectiveness. On the basis of practice these years, the management system has begun to reform. The "Twelfth Five-Year Plan" pointed out that "improve the management of social organization, establish and improve the social organization and management system which is unified registration, cooperatively, coordination, graded responsibility and supervise according to law." In 2013, "The state council institutional reform and function transformation plan" clearly put forward that focusing on cultivating and giving priority to the development of the social organizations which refer to industry associations, chambers of Commerce, science and technology, charity and public welfare, urban and rural community service. To establish these social organizations, can apply for registration directly to the civil authorities in accordance with law, no longer need the review of business units.

Under the guidance of national policy, the reform of local social organizations registration management system has achieved some results. Jinan, Nanjing and other introduced management interim measures about social organizations at the grass-roots level for the record; Shenzhen explores the registration administration management system directly by the civil affairs department through three "half step" reform; Beijing implemented the policy that "Governing society with society", develop the key-type NGOs as the competent organization of the social organizations.

Shanghai established specialized government agencies as the competent business unit of particular type of social organization. These areas are the leading areas on reforming social organization management system in China. Social organization management system reform is not achieved overnight, it should be innovated actively and steadily form point to surface.

4.2 Innovation of social organization's registration management system

1) Formulate and improve the relevant laws and regulations. In order to strengthen the management of social organizations, the State Council promulgated the "Social group registration and management regulations" and "Provisional regulations on the registration management of private non-enterprise units" and "Regulations on the administration of foundations". However, with the development of social organizations, some policies and regulations can't provide the legal basis for the specific governance issues of social organizations. On October 23, 2014, the 18th Session of the Central Committee of the Fourth Plenary Session of the Communist Party of China, approved of the "Decision of the CPC Central Committee on major issues concerning comprehensively promoting the rule of law" made it clear that should strengthen the social organization legislation, the people's organizations and social organizations could play an active role in the construction of the society.

Establish mechanism and institutionalized channels on helping social organizations participate in social affairs and safeguard the public interest, help difficult masses, admonish special populations and prevention crime. Support social organization such as industry associations, chambers of Commerce to play industry self-regulation and professional services. Social organizations give full play to the behavior guidance, rule constraint, rights and interests maintenance. Strengthen the management of overseas-NGOs in China, guide and supervise their activities in accordance with the law. In addition, we should formulate appropriate management measure for different types of rural, communities social organizations, investigate the disciplinary offence which set up branches, and engage in for-profit business activities in social organizations.

2) Promote the innovation of registration management system gradually. Along with the reform of

the social organization registration management system, the ultimate goal is to achieve the direct registration of all social organizations. Management system will change from dual management to a “unified registration, cooperatively, coordination” comprehensive regulatory. “Unified registration” means that the registration of social organizations by the unified management of a department. In most countries in the world, they implement the one-dimensional register management model. Compared with the current dual management system in China, the one-dimensional register management simplifies the registration procedures, it reduces the discretionary power in the examination and approval links by business unit, facilitate the registration of social organizations, and it can effectively avoid buck-passing between departments, clarify the responsibilities of the administrative authority, which is beneficial to increase the number of social organizations and enhance the independence of its development. But this goal is not achieved overnight, it should be promoted gradually. In the aspect of government supervision and social supervision, it should implement the classified and hierarchical supervisory system including filing, registration and recognition gradually. Provide platform for different categories of social organization the legal status. Implement filing system for small scale and low degree social organizations; Implement strict registration system for the large scale and high political sensitivity social organizations; Implement identification system for social organizations refers to charity, public welfare and social welfare.

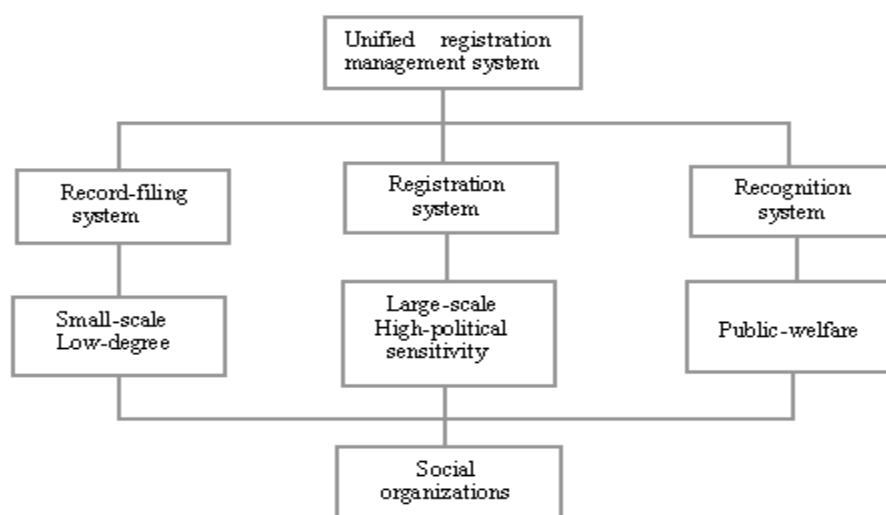

Figure 1 The Social Organization Integrated Management System

3) Innovate the relationship between government and society, change it from “attachment” to “cooperation”. The Eighteen Party Congress Report pointed out that, speed up the modern social organization system which separates government administration from commune management, it has clearly defined rights and responsibilities, and legally autonomous. Relationship between government and social organizations directly affect the independent development and efficiency playing of social organizations. It must break the benefits pattern that social organizations attach themselves to government departments for obtaining resources, and establish a long-term cooperation mechanism between government and social organizations, through projectized operation like “purchasing public service”, to restore equal, efficient and stable interest pattern, and achieve specialization, full coverage of social and public services. For the government, it should achieve the correct guidance and real-time supervision, do not interfere in personnel, finance and other internal affairs of social organization, and strengthen supervision on the social organization’s behavior norms. In terms of social organizations, they should know its position clearly, as information providers and coordinator of interests in a professional field, they ought to create good internal environment for the members and the membership units, reflecting the aspirations of the public opinion, and provide social services, give full play to the role of a bridge and link.

4) Establish an independent and unified regulatory system. In view of the weakness of the dual management system in China, we should establish a third-party regulatory agency independent from the civil affairs departments, competent business departments and other relevant functional departments. It exercise independent regulatory power, implement unified supervision to social organizations, which

can avoid the disordered government affairs and the information failure. On this basis, classified supervision would be the implemented adapt to the reformation of the registration system, the different regulatory measures and standards formulated by different regulators according to different categories, levels of social organizations to achieve the best effect of supervision.

The legal registration of social organization means access to the threshold, it also represents the beginning of the regulatory link. This requires that the social organization regulators must carry on the continuous dynamic supervision and management, instead of letting it go. Social organizations will step into a period which is “wide into but strict control”, supervision departments should establish and improve the power-responsibility mechanism and the interest coordinating mechanism of social organizations. Regulate the daily behavior of social organizations, form a comprehensive and efficient supervision system, to overcome the absence of supervision and improper enforcement, strengthen supervision, make social organizations have healthy and orderly development.

5 Conclusion

The dual management system of social organization in China is a kind of special registration management system, which is not only an important measure, but also a successful model in history. With the deepening of reform and the practice of social organization's development, the reform from dual management system to one-dimensional register management is adapted to the current situation. Giving more space for social organizations to participate in public services is a trend of social reform, and it is inseparably interconnected to the political and administrative reform.

The registration management system of social organization is a gradual process, it needs to be adjusted in practice. In addition, learning the typical practice and experience of social organization supervision management from other countries has important practical significance on constructing China's new social organization management system.

Managing Cultural Differences in International Business Negotiations

Mao Fengfan

Department of Common Required Courses, Hubei Institute of Fine Arts, Wuhan, P.R.China, 430070
(E-mail: 314188414@qq.com)

Abstract: Business negotiation is crucial for the success of business transactions. Based on the belief that the success of international business negotiations not only concerns business factors, but also cultural elements, for one's culture influences his verbal and non-verbal behaviors as well as negotiation styles, conflicts in international business negotiations that may arise because of misunderstanding and misinterpretation in these areas are analyzed. It is suggested that in order to handle cultural differences in business negotiations, negotiators should learn more about their partners' communication rules, communication styles, conflict managerial styles, develop empathy and avoid overgeneralization. So that cultural differences can be minimized, successful negotiation can be gained and the profits of companies can be maximized.

Key words: Cultural differences; International business negotiation; Cross-cultural misunderstanding and misinterpretation; Managerial strategies

1 Introduction

With the rapid development of globalization, international business transactions are increasing at a fast speed all over the world. It has become an important field for many countries' economy. As all human behavior is influenced to some degree by the cultural, social and physical settings in which it occurs, so is international business. When people are doing business with people from their own culture, they unconsciously obey internalized cultural rules and business ethics of their own. But when engaged in international business, things would be different. International business involves different cultures where people's beliefs, values, behavior patterns and the internalized cultural rules would be quite different from each other. The different internalized cultural rules may lead to misunderstandings, misinterpretations and even conflicts for culturally-different business parties. This is especially true for international business negotiations, where parties with different backgrounds gather together, trying to reach an agreement and maximize their own profits. Parties involved in international negotiations come with different goals and maybe conflicting interests; cultural differences that influence communication from all around can make the situation even more complex. Therefore, apart from getting to know business factors, it's important for international negotiators to have cultural sensitivity and cultural awareness for successful, smooth transaction, for cultural differences may lead to conflicts from various aspects.

2 Conflicts Resulting from Cultural Differences

People from different cultures abide by different rules when negotiating in business for their concepts of time, manners, denotation of certain expressions and words, dress and non-verbal behaviors may differ significantly. These different rules and consequently different behaviors in business negotiation may cause misunderstanding and even conflicts in negotiation.

2.1 Misunderstanding and misinterpretation of verbal behaviors

In international business negotiations, information is exchanged mainly through language. Yet, due to the different physical and cultural backgrounds, negotiation parties with different cultures would endow the same expression with different connotations. For instance, Chinese culture is collective culture and in negotiations, they would try to maintain harmonious relationship with their counterparts and save faces for both parties. So when they refuse the other party's requests, they wouldn't give a simple and straightforward "no" for they think it would embarrass their partners and make them lose face. Instead, they would use an indirect speech such as "It would be too difficult", "We'll think about it". While for individualistic cultures such as America, these expressions would be interpreted as "it's actually difficult"; there is still room for discussion and further effort would result in agreement.

Conflict may also rise when a culture endows negative connotation to an expression while the other doesn't. For instance, in English "white elephant" means expensive but useless things, but in China, it doesn't. So we can imagine what would happen if a Chinese negotiator is trying to sell a product named "white elephant" to a British.

2.2 Misunderstanding and misinterpretation of non-verbal behaviors

To become a successful negotiator, in addition to understanding differences in verbal communication, one also has to understand cultural differences in non-verbal communication. Buller and Woodall tell us that between 60 and 65 percent of the information we receive is communicated non-verbally. Non-verbal communication is often beyond our conscious awareness and control. Despite the fact that non-verbal behaviors are often unconscious, when we receive conflicting verbal and non-verbal messages in a communication encounter, it is the non-verbal communication that we believe to be more trustworthy (Houman & Madelyn, 2011).

Non-verbal communication consists of using gestures, facial expressions, body movements, eye contact, touch, adornments, use of space and time, etc. to convey information. Because there are cultural differences among non-verbal communication, there is potential for misunderstanding of non-verbal communications. When we communicate with people from our own culture, we interpret the non-verbal messages unconsciously. For example, the Chinese would naturally beam a warm smile when they meet their partners for the first time and try to shake the hands of their partners. And it's also necessary for them to present their business cards with both hands. While for most westerners they will present their business cards when they believe they will have further communication. And for a deeply-religious Muslim, he may choose to avoid shaking hands with his woman partner. And he wouldn't get the business card with both hands because he would consider the left hand unclean, which is very easily to be perceived as impolite or rude by his Chinese counterpart. When negotiating with North Americans, they expect direct eye contact from their partners for it indicates interest and trust; while for Japanese, it may indicate rudeness and impoliteness and they usually lower their eyes to show respect. While extended facial gazing is typical in France and Brazil, Americans consider it aggressive (Lehman & DuFrene, 2010).

Keeping these differences concerning non-verbal communication in mind can help negotiators understand their partners better and avoid cultural taboos.

2.3 Different negotiation styles

Different cultures have different perceptions for negotiation, i. e. culture will affect negotiators' view of the negotiation process, of their negotiation partners and how they would bargain with their counterparts. For example, negotiators from the United States often view negotiation process as a process of argumentation, debate and persuasion. They try to "win" the negotiation by their eloquence and maximize their own profits. That's why they adopt the direct, straightforward and confrontational approach in negotiation. Establishing a long-term relationship for further cooperation is not their primary consideration. This short-term perspective would cause problems with collective-based cultures such as China and Japan which emphasize long-term harmonious relationships and focus on mutual interests and a "win-win" perspective. This focus will force them to adopt a non-aggressive approach and try to avoid face-to-face confrontation.

The different perceptions of negotiation may well explain Japanese silence and their infrequent use of "no" in negotiation. In order to maintain harmonious relationships, Japanese consider it rude to say "no" and would employ various methods to avoid saying so. During business transactions between an American and a Japanese, it's usual to hear a business person make a sound as if he's sucking air through his teeth, followed by something like "That would be very difficult". It would be wise for the American to shift to another issue and return to the issue under discussion at a later time, for example when they have reached an agreement. Otherwise, the American would be considered as insensitive and pushy, and may cause the meeting end in a negative note (Calero, 2005).

The criteria for choosing negotiation team members are also different from culture to culture. Americans usually choose the most persuasive and efficient members in the company for negotiation meetings, regardless of their age or status; while cultures with long history such as China and Japan tend to choose those with high social or corporate status for important occasions. Therefore, conflicts may arise if those senior Chinese or Japanese negotiators see their American counterparts are just young juniors. They may feel offended and perceive that Americans are not attaching enough importance to the meeting. Conflicts can be solved if they know that this is the American way in doing business negotiation.

3 Strategies for Handling Intercultural Differences in Business Negotiations

The misunderstandings, misinterpretations and conflicts caused by intercultural differences may impede the negotiation process and bring severe loss for both parties involved. Cultural awareness can be raised and cultural sensitivities can be sharpened by learning and accumulated communication

experience. To cope with them, it's necessary for negotiators to develop some strategies.

3.1 Bearing the culturally-different communication rules in mind

Regardless of the context or culture, all communications are influenced by the rules regarding 1) formality and informality; 2). assertiveness and personal harmony; 3). status relationship. These communication rules are culturally different (Samovar, Porter& McDaniel, 2010) and they impose great influence upon business negotiations. Having knowledge of them would aid businessmen greatly in intercultural communications.

The United States is a typical example of informality, openness and directness. They tend to avoid the formal use of conduct, attire, titles, etc. They favors casual attire and would prefer to address people by their first name, which might constitute confusion and misunderstanding for people from more formal cultures such as Japan, Latin American and European societies, where formality is attached to status. The Japanese businessmen are very conscious of their negotiators' appearance and dress. Casual attire, which conveys creative sensitivity in the States, is not accepted by them. So it would be sensible for Americans to leave their jeans in their suitcase when they are going to a business meeting with their Japanese partners.

Some cultures may be assertive, where its people are direct and frank, while some cultures may attach more importance to create and maintain harmonious relationships. For example, the United States is well-known for their assertive communication style. They value frankness, openness and directness in negotiation and seldom mask their emotions, which can be traced to their value and encouragement of individualism, competition and freedom of speech. The assertiveness, frankness and aggressiveness may make people from a culture such as China and Japan that emphasize personal harmony feel uneasy and uncomfortable. They may be perceived as threatening and detrimental to interpersonal relationships by Northeast and Southeast cultures for these cultures value mutual agreement and harmonious relations.

The third variable that influences business communication is a culture's perception of and response to status, which guides interaction of people with varying social positions. Some cultures may have a low level of concern while some may place significant emphasis on status and rank. These two kinds of cultures are classified as egalitarian and hierarchical (Hofstede, 2001). Egalitarian cultures stress informal and open interaction between subordinates and seniors; try to minimize differences caused by social positions; promote equality between superiors and subordinates; individuals with high status and high ranks often downplay their appearance of prestige and power. In hierarchical cultures, differences in status are made obvious by guidelines governing seniors' and juniors' interpersonal interactions. American business executives should adopt those guidelines when dealing business with hierarchical cultures such as Chinese culture. For instance, the person of the Chinese group who leads the way when they enter into the meeting is supposed to be the senior one and should do the main talking; junior members are not supposed to interrupt unless being talked to. And so is expected of the American group.

In business negotiations, to avoid conflicts, participants should have a good knowledge of what kind of cultural rules their negotiation partners would adopt and then develop strategies accordingly.

3.2 Accommodate to different communication styles

To be a successful business negotiator, it is essential to be aware of your own culture's communication styles and how they might differ from the styles of your business partner with whom you are interacting. Dissimilar communication styles that may lead to misunderstanding and conflicts in cross-cultural context include: 1) formality and status; 2) pace and patience; 3) emotional displays; and 4) direct and indirect forms of communication (Samovar, Porter& McDaniel, 2010).

The typical example that is quite informal and disregards status is the US. It contrasts with the European cultures such as German where formality plays a greater role and may lead to uneasiness for some eastern cultures where status is part of a person's identity and people would prefer titles instead of Americans' first names.

Compared with the fast-paced American businessmen who are anxious to get deals done as soon as possible, Japanese and Chinese would seem much more patient because they think establishing good relationships with your partners is a prerequisite for successful business deals for the long-term benefits of both parties. They would spend some time on small talks at the beginning of the negotiation process to minimize the distance in interpersonal relationships, which may be regarded as a waste of time by Americans who would like to get to business as soon as possible. And Japanese are used to spending some time thinking before offers and proposals are stated, and this would make their American counterparts uneasy for they are accustomed to immediate responses.

Cultural differences in emotional displays may also influence the negotiation process and outcome. Americans are taught to display their emotions and feelings such as anger, pleasure, happiness, while in

some eastern cultures such as Japan, China and Korea, public display of feelings and affections may be considered as immature and inappropriate. They would try to conceal their real feelings in official business settings and behave as politely and friendly as possible. Thus, Americans may find their eastern partners stiff and may be inscrutable.

Negotiators' tendency to choose direct or indirect language may also have a bearing for the negotiation outcome. People from collective culture emphasize harmony and would try to avoid open confrontation or conflicts by indirect speech when they disagree with their counterparts. For instance they would not say "no" directly but use expressions such as "That would be difficult", "We'll consider about it" instead to show their negative response. Yet, for those cultures that use explicit and direct language it may give them false illusions and be interpreted in the wrong way, for they may hold the hope that their negotiation counterparts would really think about it later.

3.3 When in Roman, do as Romans do.

In order to minimize conflicts caused by cultural differences and not jeopardize negotiation for cultural reasons, it would be wise for negotiators to emphasize with the host culture.

It's suggested that business executives give greetings according to the customs of the host culture. Americans tend to be informal and friendly. On arriving for a meeting, they would shake hands on meeting and leaving; address people with their first names except on very formal occasions or to very senior people. While when American business executives come to a negotiation with a Chinese group, they should be aware that Chinese culture is more formal and they should greet the most senior person first. When addressing people, it would please their Chinese counterparts to use titles that reflect their cultural emphasis on hierarchy such as manager, chief engineer, etc. When the negotiation process begins, Americans should be aware that head-nod of a Chinese is not a signal of agreement to what is being said but an acknowledgement that "I'm listening"; they should also avoid direct eye-contact, which is considered impolite and disrespectful by the Chinese. While when coming for a meeting with Japanese, an important aspect of greeting each other is to exchange business cards, which contains specific information about people's positions in the company and which means a lot to the Japanese for Japan is a country where hierarchy is very rigid and many interactions are conducted according to people's ranks and status. So the greeting cards of the Japanese should be read carefully and then interact accordingly.

However, when it comes to conflicting ethical principles, it might be difficult to do "as Romans do". Different cultures have different ethical principles that would influence business interactions. For example, some cultures regard the exchange of gifts as a natural part of the business negotiation, such as Mexico, while for others like the United States, it might constitute a bribery crime. The best solution may be to avoid such conflicting principles so that their own principles are not violated.

3.4 Learn about your counterparts' conflict managerial skills

Regardless of the cultural context, the conflict management styles usually include: avoidance style—to avoid the issue in dispute and turn to something else; accommodation/yielding approach—to satisfy the other party's needs in order to seek connections or establish relations; competition style—trying to persuade the other party and win; collaboration style/compromise—working together to resolve conflicts. Yet different cultures' views on conflicts and their approaches to handle them are different. Cultural values exert great impact upon the conflict management styles (Samovar, Porter & McDaniel, 2010).

Americans with its value on individualism and self-achievement, see conflicts as an integral part of competition. For them competition is a fundamental value and they would win at any cost. So it's not surprising to find that competition is the dominant approach to manage conflicts even in business negotiations. While in collective cultures such as Japan and China, where harmonious relationship is sought after with their partners, open and direct conflict is regarded as a threatening factor for cooperation, the avoidance style is often adopted. That's why it's not unusual to see Chinese and Japanese negotiator keeping silent when conflicts occur—they're trying to avoid open conflicts.

When negotiators have a good knowledge of different negotiation styles and put their negotiation partners into the right categories, they would develop appropriate communication strategies accordingly; have a better control of the negotiation process and a greater chance to reach their goals.

3.5 Avoid stereotypes and overgeneralization

Overgeneralization and stereotype in intercultural communication has three characteristics: regarding the most typical features as the overall features; putting all individuals into a certain group without any distinctions; treating different individuals within a group with the same approach. Because overgeneralization simplifies the innately-complex culture and exaggerate some aspects while ignoring

some others, it can easily impede communication in international negotiation. Negotiators should try to learn about partners' culture, but couldn't over depend on the information they have collected. Influenced by their individual personality, the organizational culture they represent and the physical setting of the meeting, negotiators may adopt communication styles that are quite different from what the text books have mentioned. For instance, not all eastern negotiators adopt euphemistic and indirect approach to refuse; not all American negotiators adopt straightforward and confrontational negotiation styles. Therefore, negotiators should overcome overgeneralization and adopt flexible negotiation strategies.

4 Conclusion

International business negotiation is a cross-cultural communication that's closely concerned with the interests of companies and enterprises. Its success concerns the development of companies and enterprises. Cultural differences among companies from different nations will inevitably lead to conflicts in international business negotiations. Negotiators involved should have a good knowledge of their counterparts' culture, the cultural differences, the potential misunderstanding and conflicts in verbal and non-verbal communications. Getting to know and accommodating themselves to the communication styles and managerial skills will greatly promote negotiators' competence to cope with cultural differences and conflicts in international business negotiations and increase their chances of success.

(E-mail: 369891835@qq.com, guo_yongsai@yeah.net)

Abstract: With the development of economy and the improving of people's living standard, the property companies, as a new service industry, are developing fast. The essay, takes the specific company as example, bases on large amount of reference researches and research results, by means of questionnaire and on-the-spot interviews to collect data, brings out five factors affect the staff's sense of belonging and conclude problems exist in the staff's sense of belong. Most employees are not clear about the situation of property companies, employees are not easy to be activated by the present welfare system, there is no smooth communication, and companies do not pay much attention to the employee's work ability and self-development, which result in the weak sense of belonging. According to the above problems, the essay proposes solution so as to increase employees' sense of belonging, helps the company in HR solutions, provides example to companies with similar problems.

Key words: Employee's sense of belonging; Property company; Loss of employee; Solutions

1 Introduction

1.1 Research background

Employees pay more attention to the realization of their own development and self value, which result from the influence of lifelong education and social learning values. If a company can not satisfy its employees or establish its employees' sense of belonging, it will bring a certain loss of its sustainable management. Whether a company can own and retain talents it needs for the development is the key of success in the fierce marketing competition. A company will develop steady by reducing the employee turnover rate and improving the sense of belonging of employees.

From the last century in the middle-late ninety's, the property service corporation had begun to appear gradually from the coastal cities to inland cities, from south to north in China. The property company developed rapidly during the period from 1994 to 2004 especially. 2005 is the critical period of maturity of property management industry during last 20 years. In 2005, Shenzhen of China was a leader in the Pearl River Delta property management industry regional economic circle, with Shanghai of China as the leader of the Yangtze River Delta property management industry regional economic circle, and Beijing of China as a leader of the Bohai property management industry regional economic circle. At the end of 2008, more than 4600 property companies had spread in large and medium cities in China.

The rapid increase of the domestic property service corporation plays an important role for the development of our country's property industry, and has gradually embarked on the road of legalization and standardization. However, because of the characteristics of the property industry and people's understanding of the property industry, it is difficult to attract employees or retain staff, strengthen the sense of belonging etc...

1.2 Literature review

In 1943, Maslow referred "the need of belonging and love" in Maslow's hierarchy theory of needs, in which "belonging" emerged at the first time, which provided the basic theory for the research about employees both in China and other countries. Through research, Buchanan concluded the definition of belonging in 1974, it is a kind of believe in feeling between individuals and the group both in aims and value. In 1986, Eisenberger proposed the key points of employees' sense of belonging, the communication and interaction between employees and organization, the feeling of caring and supporting from the positive actions of organization.

Mathieu Zajac concluded five factors that affect the causing of sense of belonging in 1990: personnel information, duty characteristics, state of roles, organization feature and relation between team and leaders. At the same period, Meyer&Allen proposed three-factor mode according to organization belonging, and subdivide the factor of affecting organization belonging into the following: the degree of challenging employees felt, organization value, organization management, interaction and participation rate between employees as well as justification of organization system. In the theory, it emphasized the importance of individuals. In 2004, McMurray&Scott proposed the relation between

appearing and vanishing of sense of belonging and factors of democracy, fair and innovation.

All in all, the sense of belonging research could be brought out in different angles: personal, organization, feeling, goal and value, which made the research more systematic and comprehensive. Therefore, the comprehension about sense of belonging is more clear and general.

In the middle 80s of 20th century, Chinese scholars began to research sense of belonging, in which three scholars' research were more systematic, they were Linwenquan (1998), Zhican (2000) and Fangliluo (2001). They concluded the commitment types of organization belonging included feeling, dream, principle, economy and chance etc..., and in further degree, they divided five commitments into psychological factor and social economy factor. They also concluded that the human relation principle was affected both by family principle as well as collectivism principle, which sinicized organization belonging.

Combining with the Eastern culture background, WangYing and Lishuzhuo (2007) analyzed the factors that influence the employee's sense of belonging from the following angles: organization variable, personal feature variable and performance variable. They concluded the factors which affect the employees' sense of belonging: loyalty to company, enthusiasm degree to work and degree of career development. At the same time, they pointed out that the medium variable that affect the sense of belonging is the satisfaction degree of job. Zhangzheng and Liyongtai (2007) held the opinion that it is easy to nourish the employees' sense of belonging from the following aspects: creation, fair, communication, excellent company image, normative attitude and custom, harmony relationship and demonstrative of leaders. ChenHaiyu thought that the procedure of forming sense of belonging is gradual and complicated. Once the sense of belonging emerged, employees are willing to combine the personal target with the company target. Therefore, the strong recognition to company development goals and the strong responsibility to the company will be emerged.

1.3 The meaning of employees' sense of belonging

Foreign scholar Byles considers that organization sense of belonging can be also called organization commitment, indicating that employees identify with organization in thoughts, feelings as well as psychology, and are willing to bear on their responsibilities and obligations of enterprises to invest time and effort, with a positive attitude and strong responsibility sense of hard work. This view based on the mutual understanding between employee and organization, the consistent objectives of the company and employees; therefore, the idea of target acceptance of the employee exists. Because of the employees' sense of belonging and love, they are willing to attribute all they have to the company in their work. Salacik believes that the sense of organization belonging is the individual's dependence on a particular enterprise and so demonstrated the corresponding behavior." This view points to the study of the sense of belonging of the staff from the observation of their behavior, to sum up the sense of belonging according to the behavior of the employees.

Since 1980s, the domestic scholars in China began to study the employees' sense of belonging. Yu Kaicheng divided the sense of organization belonging into four categories: the sense of participation, the belonging of kinship, the utilitarian belonging and the objectives of belonging. Subsequently, many other scholars had studied the concept. According to the comprehensive translation and definition, they all reflected the staff's recognition for the organization's goals and values.

1.4 The characteristics of employees' sense of belonging

The paper shows the characteristics of employees' sense of belonging in three aspects: emotional sense of belonging, sense of values belonging, and sense of achievement. The division of the sense of belonging is derived from five levels of the sense of organization belonging to the levels of Lei Hong and Zhu Ling (1995), and the reference and induction of the sense of belonging to the employees. Lei Hong and Zhu Ling (1995) inducted five levels of the sense of organization belonging and defined the meaning of employees' sense of belonging, which are used to divide the characteristics of employees' sense of belonging.

1.4.1 Emotional sense of belonging

The sense of belonging is the attitude and behavior of the members of the organization who are attached to the organization. People will inevitably communicate with others in life and they need to be recognized by others in the process of communication. And then they will feel warm and being helped in the group. A sense of belonging is a kind of subjective feeling. When people feel being cared in the organization, they will feel happy and satisfied, and then they will gradually create dependence, obedience and loyalty, and they will be refusing to leave, and finally they will lay their emotion on the organization.

1.4.2 Sense of values belonging

The sense of values is the manifestation of the objects and direction of the organization. When an employee agrees to the organization's goals and values, they will transform the organization goals into their own goals, which will result in values sense of belonging. The employees who have this sense of values belonging to the organization will take the interests of the organization as a starting point and will have strong sense of responsibility.

1.4.3 Sense of achievement belonging

The sense of achievement belonging is the members' satisfaction when they achieve the objectives through their efforts. In the process of creating wealth for the enterprise, employees also need to realize their self-value, which varies from person to person. Therefore, the enterprise should create the conditions for the achievement of the staff, and provide the wealth, the social status, etc...

1.5 Relevant theories used to form the employee's sense of belonging

1.5.1 Maslow's hierarchy of needs theory

Maslow's theory of hierarchy of needs: physiological needs, security needs, emotional and attribution needs, respect for demand and self demand. The need for emotion and attribution refers to the individual hope to get family, organization, friends and colleagues to understand the care and love. It is the need for friendship, love, warm affection and the need for trust. Employees put their own time, knowledge, skills, and energy into work, and the enterprises need to give back various resources as a return. From the basic needs of themselves, employees will compare the resources provided by the enterprises with the past or others, compare their expected value, and measure whether the resources provided by the enterprise can meet the requirements of their own needs. If employees satisfied, it will be the psychological foundation to sense of belonging.

1.5.2 Social exchange theory

Social exchange theory is the theoretic basis of the form of staff sense of belonging. In the theory, staff creates mental physical items and services for enterprises in order to achieve their own desired in money, fame, position and opportunity. At the same time, organizations give their employees a variety of resources in return. In the exchange process, employees behave to protect the interests of the company is the reflection of sense of belonging. The formation of the sense of belonging depends on the return of the enterprise and the contribution ratio of the employee in the exchange process.

2 Hunan Haishang Property Company Profile and Staff Belonging Investigation of First-line Employees

2.1 The investigation of haishang property company

2.1.1 Company profile

Haishang Property Company was founded in 2012, by Shenzhen City Sanxin real estate development property Service Corporation. There are 168 companies, including 11 office staff, 157 first-line staff. They outsource the clean work of residence district to two cleaning companies. By using the office 5S method, which is, tidying, reorganizing, clearing, cleaning and quality, the company's goal is to improve the house-owners' satisfaction, create and enhance the brand image, to create first-class property service enterprise. The property company's service area is Haishang garden. The construction area is 300,222 square meters, residential area is about 152,000 square meters, the office area is about 1.7 million square meters, the commercial area is about 1.6 million square meters, with a total area of 92,746.51 square meters, there are 1127 households in total, the greening rate is 90%, the volume rate of 2.0 construction and the construction rate is 11%. There are 9 high buildings and 5 rows of multi-layer buildings. There are 2500 underground parking spaces. There are indoor and outdoor swimming pool, tennis courts, fitness facility, children's playground and other facilities.

2.1.2 Internal structure of the company

The structure of Sanxiang haishang property service company: customer service department, engineering department, safety management department, department of greening, cleaning department, administrative department, finance department, and in which the cleaning department is outsourced. There is a manager for each department who reports to GM. As the increase of the number of the households, the number of employees of the company at the first-line level increases too. However, as the number of the manager is not increased. One person is responsible for one position. With the increase of work and first-line workers, the management difficulty increases too. If higher position could be set up, the problem could be solved effectively and the employees' satisfaction and activity could be realized as well.

2.2 Investigation of the sense of belonging of the first-line staff

2.2.1 Description of survey samples

140 copies of questionnaire were distributed and 126 of them were turned over, the number of valid questionnaires was 120, the reclaiming rate was 0.90, and the efficiency rate was 0.86, as shown in table 1.

Table 1 Survey and Statistics of Questionnaires and Statistics

Total questionnaire	Issuing questionnaires	Reclaiming questionnaire	Valid questionnaire	Reclaiming Ratio	Efficiency
140	140	126	120	0.90	0.86

2.2.2 The analysis of present situation of the staff sense of belonging

1) Basic statistical results of basic staff

The basic information of the basic staff in Sanxiang haishang property company is as follows: 75% is men and 25% is women; 58% is 35 years old or below, 21% is between 36 years old to 40 years old, and 15% is 41 to 50 years old, 6% is 50 years old or above. 67% is married, 33% is unmarried. There are 78% employees who are senior high school or below, 19% has college degree, 3% is undergraduate education, but there are no graduates or above. 28% employees' monthly income is 2500 Yuan, 11% employee's income is 2501 Yuan to 3500 Yuan, 54% is between 3500 to 4500 RMB, and 6% is over 4500.

From the point of the age structure of the employees: employees who are 35 years old or below takes the largest proportion, followed by ages between 36 and 40, 41 years old or above takes the smallest proportion. There are advantages as well as disadvantages for young team. The advantage is it will bring the creativity and vitality to the company, and the disadvantage is that young people are unstable in the first years of their work life because they are lack of experience and the uncertainty about the future career planning. The change of marriage status to the unmarried person may cause the change of company. The overall education situation is not high for the company: the education level of employee mainly in high school and below, college level plays a little part; undergraduate is less, no master's degree, which demonstrates that this industry is lack of attraction. Even if there are some college graduates, but if the company cannot provide them with the development platform or provide the opportunity to realize the self value, it will reduce the employee sense of belonging. At the end, it will cause the staff loss.

2) analysis of the position design and division of labor of the company

In Sanxiang haishang property companies, the need of first-line staff is relatively large; there is only one department manager for the direct leadership, which will lead to the problems of not being handled in time. In addition, it will be lack of supervision to employees. Serious staff may feel unfair. At the same time, the level is too less. For those who performance well and who has ability, the promotion demand is difficult to get in time.

For the first-line staff in Property Company, the contents of the work are some trivial matters. For those who are full of enthusiasm and pursuing long-term development, if they are dealing with this sort of trivial thing every day, they will lose enthusiasm for work, therefore, the sense of belonging will lost too. As the gradual increase in occupancy rate, the workload has subsequently increased. The work scope has been increased as the information and technology products have been in the application of the property company. Take the service department as example, they work six days a week. Even during the holidays, they need to make sure the cell phone turns on at any time, which will in a certain extent sacrifice their personal space and time. If there are no measures taken to solve this problem, complaint and displeasure will be caused.

3) The implementation effect of the company's salary and welfare system

In the case of the company, there are some employees who are not satisfied with the remuneration and welfare policies of the company. For monthly payment, there are no wage detail notes to provide to the employees. There is no communication between HR and the staff about the salary as well as the performance. Staff is not clear about the component of their wage, which may cause misunderstanding about their wages and performance. Greater dissatisfaction or complaining will be caused because there is no proper communication on staff performance, therefore, the sense of belonging will also be affected. As for employee benefits, there is only "five kinds of social insurance and one housing fund", which cannot motivate the enthusiasm of the staff in fact.

4) Investigation and analysis of communication situation in the organization

According to the survey, the majority of employees feel a lot of psychological pressure in the

process of communication with the owners. Real estate industry is a special service industry; it serves to owners and some other relevant personnel. And the objects are families, which make the work tedious and complicated. The Main thing is communication. If you want to be an excellent expert, it is necessary to study the service objects, relevant information about the owner, such as background, status, behavior and habits, in this way you will never loss in the process of communication with the owners. Dealing with people is a complicated thing, contacting with all kinds of people adds to the difficulty of communication even. Therefore, to this kind of employee, they need to be more patient to deal with specific problems. Study from table 3-2 about the basic information on first-line staff, 58% of employees is 35 years and below. Some young people, who are lack of social experience and the psychological ability, still need to be improved.

In addition, most of the first-line staff is not able to get attention from leaders when needed. In company, the lack of communication between leaders and employee will cause many problems: firstly, leaders will not be familiar with the situation of their employees, which will cause side effects to works. On the other hand, employees may feel the leader is not paying attention to them. The work pressure makes them distressed, therefore, employees' sense of belonging and satisfaction will be affected.

5) Survey of employee training

In the company, the training is mostly made by leaders or old employees to new employees; new employees are always being trained. However, there are no specific training programs for old employees. The training contents are only concerned with the work, which make the training boring; therefore, it cannot meet the further needs of employees.

As for the development platform provided by the company, most employees are not satisfied with it. Property companies are lack of staff career management so that they cannot focus on the career objects or the individual employee's career development. In this case, it is bad for the development of the individual employee or the overall and long-term development of the company.

6) Survey of the company's target identification

The long-term development targets and the direction of Sanxiang haishang Property Company is: continuously improve property services quality and level, improve the satisfaction of the owners, to expand the size of the company, to consolidate the company's position in the market, increase profits, and improve the competition advantage. Due to the lack of understanding on the company's goals of first-line employees, even some employees are not aware of the company goal, so some employees don't think that there is a clear long-term goal. Therefore, it is more difficult for those employees to agree with the company's goal or direction. The fact is that once an employee can combine his own goal with the company's goal, it is benefit for the company as well as the individual development. It can also increase the employees' sense of belonging.

3 Research Conclusion and Policy Recommendations

3.1 Research conclusion

3.1.1 The lack of understanding of the industry and the job duty

Sanxiang haishang Property Company's first-line staff tends to be younger; there is a small proportion of employees who are bachelor's degree or above. Most employees are only aware of the basic work about Property Company, such as the greening, health, security and other basics instead of knowing the other duties. With the improvement of industry development and improvement of the housing condition, the demands on the staff are increased. They need to study knowledge about property service, and increase their understanding of roles and responsibilities of their duties, so that the consistent goal and value system of the employees and the organization could be created.

3.1.2 The incentives of the compensation and welfare policy are limited

Employees are concerned about the salary and welfare policy, what is the content, how to communicate, and the effect of communication as well. The wage level of the first-line staff mainly concentrated between 3500 to 4500 Yuan, which should meet the basic needs of employees, and should be flexible too. If the employees are not approval of the remuneration and welfare policies, it will cause the employee dissatisfaction in different degree.

3.1.3 No smooth communication affects the vent of employee pressure

The internal communication and exchange is important for relieving the psychological and working pressure of the staff, and the proper care can increase the trust and affection of the staff to the organization. For the first-line employees in Property Company, they are always facing with different problems. Good internal communication will provide an opportunity to the staff to express and ask for

help, therefore, the sense of belonging will be increased too.

3.1.4 The training failed to improve the ability of the staff

Providing training is a vital way to increase the knowledge of the staff, to improve the ability of individuals. It will meet the needs of company development, and it is benefit for the company development too. Making the full use of HR to foster experts for the company, it is necessary to make the proper training programs to meet the needs of the development of employees as well as the individuals.

3.1.5 Staff is not clear about the goal of the company

It is not only the administrative who must be clearly aware of the goal of the company, for the first-line employees, they also need to be clear about the company objects. Being aware of the goals and direction of the company is conducive to the development of the company's daily operations, also helps employees to combine their goals with the company's goal.

3.2 Policy recommendations

3.2.1 To set up reasonable positions and to divide responsibilities

When setting up positions, the company's own position, strategic target, organization mode, human resource plan should be taken into consideration. The position compiling should match with the organization pattern.

There are some problems for Sanxiang haishang Property Company in position compiling: from the management level, the leaders are not enough. A supervisor could be added between the management and the first-line staff. By this way, it is useful for the leaders to deal with emergency promptly and effectively, managers could save more energy to deal with something more important and critical, on the other hand, the increase of positions and duties is the reflect of the company which is adapting to the change of the objective environment, not only to meet the needs of employees' self realization, but also to some extent it is incentive to employees' enthusiasm and energy. From a supervising perspective, the establishment of the position can also increase the understanding of management about first-line staff, can regulate employee behavior and job status, so that a sense of importance is produced to employees, and therefore, employees will work harder too.

The work of first-line staff is trivial, coupled with the fact that the company asks employees to keep cell phone on for 24 hours, in this way employees will be lack of private life. This policy is a serious invades to personal life. So the company can take appropriate measure to increase the number of such employees, to ensure that the employees will not be disturbed by work when they are on holiday. It is also saved experts for company.

3.2.2 Improve the salary and welfare system

For the management as well as the first-line staff, it is necessary to learn the modern performance knowledge, methods, ideas, understanding and learning. To set up different performance criteria to different staff, to make sure all the employees know their own performance appraisal and the result. Management and employees should be communicate and give feedback about the performance communication. So that employees are clearly about their performance, and they will get help from the leadership, which will also make its work more positive. The performance appraisal system will not only motivate employees to improve the work efficiency, it will also help more companies to retain employees, and eventually make the staff get more salary, meet the material needs, increase the satisfaction to the company, and finally create a sense of belonging. In addition, the company should appropriately increase the work allowance, so that employees could understand that their efforts have met the company's recognition, but also improve the company's recognition of staff.

The welfare policy is an important factor to attract top experts and motivate employee. For companies, they can adopt some flexible welfare policy to measure with the performance and ability of the staff, to incentive employees through their own efforts to achieve. Welfare programs can mixed in life and diversified, such as providing the employees with paid vacation, travel vouchers, special holiday gifts.

3.2.3 Establish good communication and management mechanism

To strengthen communication with staff is an effective tool for modern management. Communication is the link between the enterprise and the employees on emotion, thought, knowledge, information, and feedback process. Effective communication can understand employees' needs, can help to eliminate the discontent, to establish a good interpersonal relationship and improve the satisfaction and loyalty of the staff to the enterprise.

Leadership should learn to listen to the voice of the staff. Listening can solve the dissatisfaction of the staff, so that the employees feel to be respected. Managers should also be empathy, standing on the

perspective of the staff, and think for the perspective of employees. The company could provide more convenient and comfortable conditions for communication, such as: communication meeting, regular team meetings. Meetings can be small, convenient and useful to summarize the present work. Managers and employees should strengthen communication by various forms of interaction, such as in some outdoor development training and small game. Establishing harmonious interpersonal relationships is easy for exchanges and communication for two sides. Management should solve the problems encountered in the work and meet demands of the workers, give positive and effective measures and guidance, praise their positive things, and reduce the psychological pressure of their work. In addition, they need to get aware of the living conditions of the staff in order to provide material or spiritual assistant when it is needed.

3.2.4 Adjust company training plan

Providing training is an important way to promote the employee's ability and the level. The company should provide the staff with comprehensive system training with fabulous content, establish a sound training system, and to implement the training. For training contents, they should not only pay attention to company policies, responsibilities, skills and work related knowledge, but also the problem of life training, to make the employees feel warm and being cared by the company. It is also cannot ignore the training of corporate culture, so that employees can feel the spirit of enterprise. For the form of training, you can try outdoor development training, so as to avoid the traditional teaching mode which will cause the lack of interest. It also allows employees to participate and provide opportunities for their self-expression. In addition, the weico classroom and QQ group chatting will make the training go deep and continue to create a good learning atmosphere. Provided with effective communication platform, such as the establishment of internal network, the employee will understand the company's plan and summary and other information in time.

3.2.5 Developing the company's goal and direction

The development target and direction of the enterprise play an important role in the company's sustainable operation and long-term development. The property company, taking its actual situation and the market environment into consideration, should formulate a suitable target and direction. The company's goal and direction is not well known by the first-line staff. The company can share the future development direction and goal by establishing related channels, for example, by the establishment of the internal LAN, not only include learning garden, staff forum column, can also publish events of the company development of great significance. Or making a plate of company targets placed in a prominent position by publicity column updated timely. Employees will take an impression about the notice, and later they will combine it with their own work practice, gradually it will be internalized into their own goals and direction. Setting up company magazine is another method. The company is not only able to public the incident to the whole staff; it can also attract the staff's attention by some special columns. These methods are ultimately aimed to realize the consistence of goal of the company and staff, to meet the sense of achievement of employees, to achieve their sense of belonging to the company.

4 Conclusion

The paper takes a high-class residential property services company in Shenzhen as an example, combines with the general problem of employee's lack of belonging sense. Proposes solutions according to the present situation of the company, from the establishment of following five aspects—setting up more positions, salary and welfare, organizational communication, employee training, popularization of company's target, provided as the reference to those property company who are in the similar situation.

Stage-Wise Management of Enterprise Culture during Development of Private High-Tech Enterprises: Based on Case Study of Shenzhen Huawei Technologies Co., Ltd.

Wan Weiwei

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: wanweiwei@163.com)

Abstract: To study the multi-stage management of corporate culture, this paper points out the principle of stage-wise management of enterprise culture that shall be followed by private high-tech enterprise during its development by studying enterprise culture of Huawei Technologies Co., Ltd. in its three development stages: traditional during venture period, high performance culture in growth stage and adaptive culture in mature period. Meanwhile, it concludes that the stage-wise management model of corporate culture in Huawei Technologies Co., Ltd provides a set of corporate culture management model to Chinese private high-tech enterprises, which is good to enhance the competitiveness of high-tech enterprises.

Key words: High-tech enterprise; Enterprise culture; Stage-wise management

1 Introduction

With further researches on private corporate culture in academia, a part of scholars begin to pay attention to research on the role of corporate life cycle on corporate culture. The concept of corporate life cycle was first put forward by foreign scholar Mason Haire, later American managerialist raised classical model, and Chinese scholar raised growth model. Throughout the research results of domestic scholars, researches on corporate culture from perspective of corporate life cycle are not systematical, for example, Wei Huawei makes preliminary conclusion of corporate culture in start-up stage of enterprise; Lin Shutang discusses the corporate cultures in different stages of enterprise; Wang Xingdong and Luo Wanrong discuss different corporate culture concepts in different stages of enterprise. This thesis discusses stage management of corporate culture during growth of private high-tech enterprise with case analysis method.

Since reform and opening-up in 1978, China has strengthened supportive force on private enterprises, the rapid growth and expansion of private high-tech enterprises has become a bright spot of Chinese economic development. Afterwards, with the ever-increasing internationalization and intensification of market competition, the survival environment of enterprise has worsened, managers of private high-tech enterprises has begun to realize how important is construction and management of enterprise culture to survival and development of an enterprise. Enterprise culture refers to the highest goal, core value and behavioral norms that are fostered and followed by all corporate staff during years of entrepreneurship and development, it is organic complex of an enterprise's ideological form culture, behavioral form culture, institutional form culture and material form culture, a group competitive consciousness of one enterprise made great efforts to implement and show in various activities and achievements, being characterized by "civilization-oriented success". Enterprise culture is an embodiment of basic belief, values, moral standards, rules & regulations, code of conduct, cultural environment, product brand and business strategy with characteristics of this enterprise.

In accordance with "enterprise life cycle theory" proposed by US management expert Ichak Adizes, it is well-known that like all living beings in nature, an enterprise will go through a process of birth, growth, maturity and aging. If one enterprise can position correctly in its different life cycle stages matching enterprise culture, its core competitiveness and sustainable development capacity will be enhanced. As a private high-tech enterprise, Shenzhen Huawei Technologies Co.,Ltd(hereinafter referred to as "Huawei") has experienced since its founding 3 stages: venture period, growth period and mature period. It is Huawei's emphasis on stage-wise management of enterprise culture that contributes to its rapid rise as the flagship of Chinese private enterprises in a short span of few decades. Huawei established in its venture period an enterprise culture rooted in traditional Chinese culture; spread high performance culture in its growth period, innovated its technology and management and transformed rapidly into a technical enterprise; permeated adaptive enterprise culture through cross-cultural management, weakened differences of national cultures and stressed convergence of commercial culture in its mature period.

2 Enterprise Culture of Shenzhen Huawei Technologies Co., Ltd. in Its Venture Period-A Struggling Culture Rooted in Traditional Chinese Culture

In 1988, Ren Zhengfei incorporated Huawei Technologies Co., Ltd. in Shenzhen. As a private high-tech enterprise specializing in production and sales of telecommunication equipment, it engages mainly in R&D, production and sales of communication network technologies and products and provides telecom operators with network solutions in the fields of optical network, fixed network, mobile network and value-added businesses. Guided by corporate cultural idea in the venture period, the promotion of market position of Huawei's self-developed C&C08 exchange board yielded an annual sales of RMB500 millions in 1995, which also marked the end of its venture period-with agent sales as its main profit model.

During nearly ten years of Huawei's venture period (1987~1996), based on ideological foundation of "Huawei" culture- "survival is a fundamental objective", Huawei paid close attention to organic combination of internal value orientation (struggle hard amid difficulties) and external value orientation (customer), constructed enterprise culture with hard working spirit as the core and won customers, expanded market in the end. In one word, the enterprise culture of Huawei in its venture period integrated moral standard and code of conduct of traditional Chinese culture, the "wolf culture", "mattress culture" and "pressure culture" extracted could all be attributed to the spirit of unity and cooperation, hard struggle and continuous self-renewal in traditional Chinese culture, this struggling culture also became the source for construction of Huawei's core values.

2.1 Wolf culture

Huawei has fostered a "wolf culture" in its course of development-repeated establishment of unusual merits in market competition. "Wolf culture" stressed agility, unity and perseverance. Spurred by such culture, all staff in Huawei has gathered to be an indestructible cooperative group, the highly efficient organization, good teamwork and close cooperation has ever astonished many rivals. The endurance of Huawei people was also amazing, they will never go off the deep end without mature conditions no matter how great the temptation is; but once the time is ripe, they will move toward the goal and try to succeed in one stroke, no matter how great the difficulty is.

The agility of Huawei people is appraised widely in the industry, which originates from their adept forward-looking thinking ability and accurate judgment of the future. These allow them to always get insight into market trends, capture information that has not been noticed so as to seize the initiative, get the advantage and be the eventual winner. "Wolf culture" forces Huawei people to maintain an initiative stance, who have strong desire for good performance and will spare no effort to achieve success once a breakthrough is found.

2.2 Mattress culture

Without any resources and conditions and supported by hard working spirit, Huawei people make up for stupidity by diligence, storm strongholds in defiance of difficulties and study technical plan round the clock. Each developer puts a mattress under his/her office desk for resting in extra hours. It is this mattress that encourages Huawei people to go through many hardships of venture and fosters a unique "mattress culture" within Huawei company.

"Mattress culture" fosters a work style of hard working among Huawei people and inspires their high enthusiasm for work and persistent work attitude. Amid fierce market competition, Huawei people suffers high-intensity working pressure, makes the most of their own intelligence and wisdom, keeps improving work efficiency and per capita benefits, thus it becomes a model for entrepreneurship in China.

2.3 Pressure culture

Huawei transfers constantly the enterprise's competitive and development pressure to all corporate staff in order to inspire their work enthusiasm and creativity, which is so-called "pressure culture". Huawei people take the initiative to challenge the environment and themselves rather than passively complete general task, they treat overcoming difficulties as a kind of pleasure, a way to embody their self-values and even a channel to meet the needs of self-realization." The "whole staff succession system" in Huawei passes the pressure to each staff and keeps the activated state of its internal mechanism.

Thus it can be seen that Huawei adapted constantly in its venture period changes in internal and external environment, fostered its unique "wolf culture", "mattress culture" and "pressure culture", which never deflect from the core value of "customer centered, fighter-oriented, persistent hard work" despite constant changes of their expressive forms.

3 Enterprise Culture in Growing Period of Huawei-High Performance Culture

In accordance with “enterprise life cycle theory”, the enterprise has equipped itself with certain competitive power after it tided over various crises and gained a foothold in the market. Next the enterprise shall try to enter quickly into a growing period through proper business management and seizure of good market opportunities. In 1995, a self-developed product in Huawei-the exchange board enhanced the market position and gained a foothold, which marked the end of venture period characterized by agent sales and a high-speed development stage was entered.

During this period, Huawei absorbed the essence of its enterprise culture in venture period and constructed at the right moment high performance enterprise culture. Huawei holds that the enterprise lives essentially in fierce market competition and the essence of management is improvement of efficiency, the essence of business is profit-making, the mission of staff is contributions, the mission of competition is value, the demand of customer is value and the essence of market economy is input and output, all of which necessitate cohesion of high performance enterprise culture. The expansion of private enterprise shall base on high performance, this is an iron law of corporate management, Huawei is in a key transitional period from sales-driven type to refined operation type and potential profits will be sourced more from efficiency improvement of Huawei Company.

3.1 Formulation of huawei basic corporate law and establishment of core values in huawei Company

In 1988, the most complete and standard “basic corporate law” for Chinese modern enterprise-“Basic Law of Huawei Company” was promulgated, this law was divided into 6 aspects: objective, basic business policy, basic organization policy, basic human resource policy and basic control policy and it was also a systematic summary of corporate culture, corporate governance philosophy and corporate spirit. “Basic law” was presented in written form, restrained with system, it embodied core competitiveness of Huawei Company, described each elements for construction of such core competitiveness and summarized factors in base layer, carrier layer and transition layer, all of which were the pivots of core competence building.

“Basic law” defined core values of Huawei company: hard struggle, self-criticism, customer-centered, respect talents, eternal phoenix and pay attention to R&D; In a value system with high performance as the core, the core value of high performance enterprise culture and its elements were defined through 4 coordinates: internal operation, external development, flexibility & self-reliance and process control. In terms of internal operation, a spirit of hard work shall be embodied and an atmosphere of respecting talents shall be created; on the level of flexibility and self-reliance, the staff shall be restrained by self-criticism; on the level of external development, technical R&D and innovation shall be paid much attention; on the level of process control, customer service shall be centered. Such description is as follows:

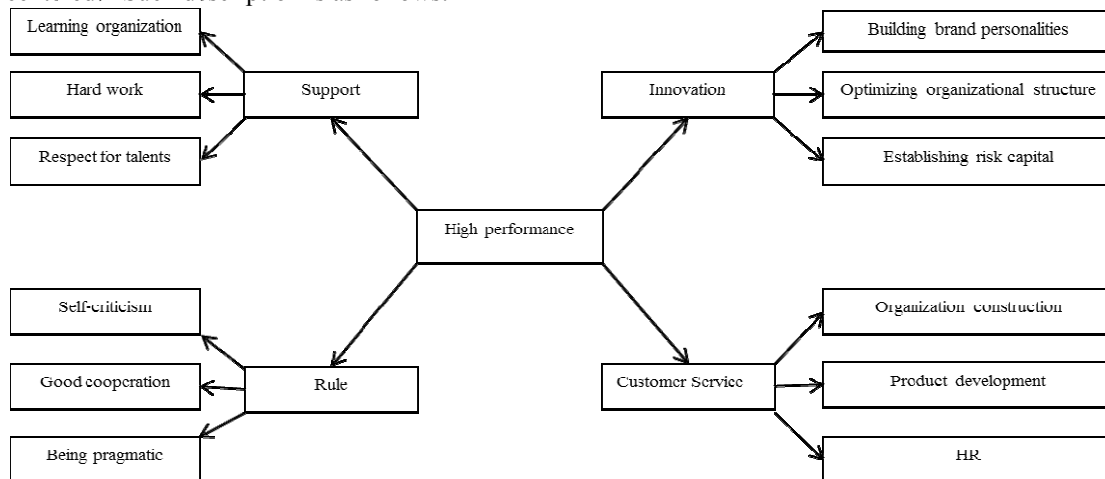

Figure 1 Core Values of High-performance Corporate Culture

3.2 Plane decomposition of high-performance corporate culture

Based on the inheritance of our initial corporate culture, “Huawei” puts forward four dimensions aimed at establishing high-performance culture: innovation culture, service culture, strictness culture and learning culture, which are linked to each other and centered on the high performance of the enterprise. (see figure 2)

1) Innovation culture

Hi-tech enterprise is mainly featured in innovation. The core of the enterprise spirit is innovation, and it is to make creative destruction, recombine the production factors and reestablish the production system. Corporate culture is an organic and integrated system, and innovation is the life of corporate culture and the key to improving the competitiveness of the enterprise. A mature organization must make continuous innovation to keep the enterprise energetic.

“Huawei” has his own opinions on innovation: first, having no innovation is the largest risk for “Huawei”, which confirms innovation; second, “Huawei” seeks his innovation motivation from the demands of clients and excellence of rivals, as well as hard work of his own staff, which helps “Huawei” to find the key to the door of innovation; third, innovation shall focus on technology and management, which answers the question where to make innovations; fourth, we shall have emphasis in our innovation, concentrate on and achieve our goals one by one, and we advocate teamwork and object individualism. “Huawei”, in innovative integration of his corporate culture, not only makes substantial innovation in his corporate culture content, but also pays great attention to innovation of the expression method when integrating the corporate culture resources.

Based on this, “Huawei” makes innovations in the method to express his corporate culture, technical R&D, brand personalities, risk capital and organizational structure. In the selection of the World’s Top 50 Most Innovation Companies in 2010 by “Fast Company”, a well-know magazine in USA, “Huawei” ranks the fifth. With innovations from the concept to the products, from internal management mechanism to client service, “Huawei” keeps trying actively.

2) Service culture

“Huawei” has always been stressing the core value to be client-oriented. Mission of “Huawei” people is to focus on the challenge and pressure concerned by clients, provide competitive communication solutions and services, and keep creating maximum value for clients. “To serve our clients” is the only reason for existence of “Huawei” and demands of clients are the power to drive the development of “Huawei”. The first and foremost principle of “Huawei” is be client-orientated and never to give a thought to short-term gain or loss while other enterprises are mainly guided by income and profit. Our service culture receives wide recognition from clients and wins more faithful clients for “Huawei”.

Being client-oriented is not created by “Huawei”, but a universal business value. Peter Drucker, a master for management, believes that the aim of enterprises is to “create clients”. The motto that “Client is God” is almost used by all Western companies. However, in the global surge of technology worship and capital worship, there are few persisting in it. Wang Labs, Motorola, Lucent Technologies, Northern Telecom, AT&T and others have failed after being tempted by technology or capital. “Huawei” is not among them, and one of the most important reasons is that we keep ourselves away from temptation of capital power and high technology without worship for capital or technology and that we keep aware of and firmly persist in the common sense of business to be “client-oriented” so as to “be engaged in limited things with limited resources and to concentrate all our resources on the core strategy”.

3) Strictness culture

“Huawei” lays emphasis on self-criticism. “Compliance with requirements of moral qualities and capacity to criticize oneself” are one of the principles of “Huawei” to select leaders. As Ren Zhengfei puts it, self-criticism of an organization will optimize the process and the management; self-criticism of an employee will improve his own qualities; development of thousands of successors with capacity to criticize themselves will enable the flag of the enterprise to wave forever. “Huawei” people will always keep it in mind that capacity of self-criticism is actually the intellect, the self-discipline power and inner control strength for self-leading and self-management so as to make self-analysis and review our own visions, values and mental modes by guidance of reason. Process of self-criticism is that to reject the dross and assimilate the essence in our mind, thus achieving enhancement and growth.

4) Learning culture

How to become an international modern enterprise with global competence? As “Huawei” is concerned, only by learning from advanced enterprises in the West and through continuous innovation and efficient management can we continue on the way to an international enterprise. In the communication industry involved in non-stopping fierce competition, without strong learning capacity, he must be weeded out. Since 1997, “Huawei” have brought in many external consultations from IBM, PWC and other companies, including process reform, employee stock ownership plan, human resources management, financial management and quality control.

Training is a necessary factor for learning enterprise. “Huawei” provides targeted and complete

training for various employees. In addition, “Huawei” adopts job rotation to promote the employees to learn from each other. Through various training and guidance, “Huawei” develops the unique learning culture: learning becomes a habit; keeps learning and learn systematically.

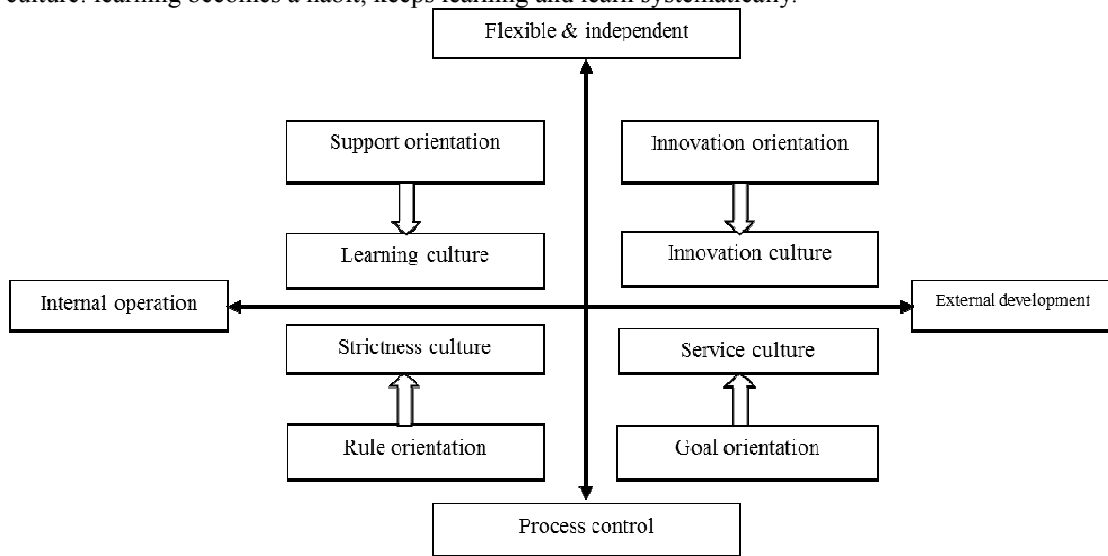

Figure 2 Plane Decomposition of High-performance Corporate Culture

4 Corporate Culture Theory for Mature Period of “Huawei”—Adaptability Culture

In 2004, having going through the severe winter of IT industry, “Huawei” ended in a draw in the intellectual property suit against “Cisco” and achieved significant potential advertising effect. From then on, “Huawei” gradually opened the door to the international market and stepped on the way to a comprehensive international enterprise. For an international enterprise, cross-culture conflict is problem that is difficult to get over, and cross-culture management is an issue that a trans-national enterprise has to deal with. In the international strategy of “Huawei” during the mature period, we adopt the corporate culture focusing on adaptability.

Adaptive corporate culture can help the enterprise adapt to the change of market business environment and go ahead of others during the adaptation. It can enable the enterprise to change rapidly when faced with different situations. It is featured in its call for confidence, trust, courage and stress on behavior style in both personal life of employees and enterprise life. It lays emphasis on and encourages culture of collective spirit that will help the enterprise to adapt to the change of market business environment.

In “Huawei”, it is widely accepted that for cross-culture management, the culture conflict occurs during internationalization is personal conflict, not that of the organization, and it can be dealt with through mutual understanding and communication. In trans-national operation and management, resistance and value arising from culture are not considerable in a short term, since ethnic cultures and national cultures are different but business cultures tend to be similar.

“Huawei” consciously infuses his culture to the overseas companies. When establishing overseas agency, “Huawei” selected employees with distinct personalities to be the head and gave play to their role as “seeding machine and propaganda team”. In the acquired international market shares, “Huawei” not only pays attention to integration with local cultures, but also consciously infuses his culture to the newly-established companies.

First, “Huawei” provides cross-culture training and cultivates a group of high-quality management. We provide not only cross-culture training for Chinese employees working overseas, but also culture of parent company for local employees of the subsidiaries. In the construction of cross-culture management team, we face the problem arising from culture difference and different cultural values.

Besides, “Huawei” has been devoted to winning based on product and facing the fierce competition in the industry, and we also know well the state policies and industrial standards of the subsidiaries, improve our product quality and service standard and win the mass with our products.

What’s more, “Huawei” is always laying emphasis on the coverage of the products and service, and

pay attention to investigating the achievements of enterprise image and national image in foreign cultures.

As a high-tech trans-national enterprise, “Huawei”, through cross-culture identification, understanding, participation and integration, establishes proper cross-culture management mode, strengthens the adaptive corporate culture, consolidate and enhance his position in the competition, and ensure to realize the strategic goal of the enterprise finally.

5 Conclusion

The fact that “Huawei” has successfully achieved the phased management with his corporate culture inspires us that as a hi-tech enterprise, the management consumption of an enterprise shall be adjusted accordingly when the whole business environment becomes different and its development pace changes in different development phrases and different management consumption. Apparently, people may feel that “Huawei” has been changing his corporate culture all the time from the traditional culture during pioneering period to “basic method” in rapid growth period and to the vision, mission and strategy during international period. There are different contents and value propositions in different periods, but it is substantially the thinking for the operation and management of the enterprise and the exploration for the growing rules of the enterprise. Differences in corporate cultures of different periods indicate the different levels of the exploration for the internal rules of the enterprise in different stages. The level-to-level management mode of corporate culture of “Huawei” provides a set of pattern for corporate culture management, and helps to improving the competitiveness of hi-tech enterprises.

Abstract: This paper combines both quantitative analysis and qualitative analysis, and puts forward concerning conditions and basics of the construction of the public bike system in university. It takes Wuhan University of Technology (WHUT) for example, and found that the related conditions of WHUT are good, and the practicability of building a campus public bike system in this college is high. It finally sets up a whole public bike system in universities, hoping that it can be improved according to the effect of actual implementation in WHUT, as well as to provide experience to other colleges.

Key words: University; Bicycle; Public; Practicability; Students

1 Introduction

Public bicycle system is a rental system for short term. Users can rent and return bicycles in any rental station. They don't need to pay for the cost of the bike, and worry about the vehicle safety as well as parking problems.(Wang Wenchi, Cao Guishan, Chen Xueying 2014)

Public bicycle service system originated from the European countries and then spreaded to China and abroad quickly as an important strategy for the sustainable development of environment(Zhao Yingmei 2013). It is run by the government and the enterprise joint cooperation to achieve win-win. It has experienced three development stages. The first generation of public bicycle system began in Dutch in 1965. The Danish capital Copenhagen in 1995 launched the second generation of public system. In the late 1990s. With the development of IT technology in Europe, it formed the third generation in a form of digital management and operations. Public bicycle used by foreigner universities students are mostly depend on the system of city. With the propaganda and practice of the resource conservation and environment friendly society, low carbon way to travel is more and more popular, and here started a boom of the construction of public bicycle rental system.(Liu Linna, Huang Rui, Lin Yuan, Zhao Hua 2014). Some Chinese colleges and universities who have spirit of exploratory also started to set up public bike rental service within the school system in recent years, it generally adopt two modes, run with urban public bike system or have its own independent system(Zhao Yingmei 2013). Overall, the campus public bike system has a high practicability.

In Samuelson's theory. When compared with personal belongings, the pure public goods have remarkable non-competitive and non-exclusive attributes. With further research on public goods, the concept of it has been enriched and expanded, and formed the broad concept of public goods, which refers to non-exclusive and non-competitive goods. Public goods are faced up with resource allocation problem as well as the plight of widespread overuse and abuse, making resource allocation inefficiently. When it comes to public bicycle, it can be reflected in following three aspects. Firstly, people would prefer to ride bicycle in the case of a bicycle available, which leads to the overuse of public bicycles. Secondly, when it is public bicycles, a man wouldn't take good care of them as usual treat of their private bicycles. Thirdly, the repairmen service is not enough.(Huang Yu, 2012)

Many researches have estimated on the problems and difficulties on the process of system construction, but lack specific solutions to solve these problems. In addition, the Mafang Shan campus of WHUT is highly scattered, with sex ratio imbalance seriously. Researches on whether these factors will effect on the practicability of the campus public bike system is also rare.

2 Feasibility Analysis of the Operation and Management of the Public Bicycle System in Universities

2.1 Supply and demand analysis

WHUT has two campuses. One is Mafang Shan campus, the other is Yujia Tou campus. Mafang

* This paper is supported by “the Fundamental Research Funds for the Central Universities”

Shan campus covers a wide area and includes five separate campus. According to statistics, 79.49% of male students and 79.17% of female students have or have had a bicycle, from which the difference between sex is not great. Due to the dispersion between campus, there is a difference between places that students accommodate and go for the class, and many students go to class by bike.

In addition, the rate of obsolescence is nearly 30%, which is a huge numbers. Combining the analysis, it is not difficult to conclude that there is a great demand for bicycle among today's college, and a considerable number of wasted bicycles at graduation season. In this way, here is a promising prospect to implement a set of abandoned bicycle recycling system. The related data are as follows:

Figure 1 Way of Going to Class

Figure 2 Frequency of Bicycle Using

2.2 Organizational conditions analysis

2.2.1 Organization system.

Through effective communication, we win support from school authorities. Besides, every school has their youth volunteer organizations, providing a platform and window for the run of the system.

2.2.2 Resource security.

There will be a large amount of abandoned bicycles every year. Besides, more than half of the students are willing to offer their old bicycles or help which will help to reduce costs.

2.2.3 High environmental consciousness.

67.16% of the students think it necessary to deal with those abandoned bicycles in time. 89.3% of the students are willing to take part in this system or even provide assistance for free. The system of recycling and reusing has a mass public base and great social benefits. The related datas as follows.

Figure 3 Attitude Towards the Public Bicycle System in Universities

3 Establishment of the Operation and Management of the Public Bicycle System in Universities

3.1 Sources of bicycles

Partly from abandoned bicycles, and others donated by students.(Ge Tengxin, Wang Shuo 2013). Department of college security collects badly damaged bicycle and issues claim notice regularly, informing students to take back their own bicycles within a specified period of time. If no owners go and get those bicycles, school will have the right to process them. On the other hand, gradutors are advocated to donate their idle bicycles to their school in order to contribute to bike rental activities.

3.2 Leasing location constructions

3.2.1 Leasing location preliminary positioning

For them to become an alternative to more traditional forms of public transport, public bicycle systems need to be efficiently managed and aimed towards sustainable mobility(Maria Bordagaray, Angel Ibeas, Luigi dell'Olio 2012). According to the distribution of the WHUT campus, we will select the park plaza and other key buildings around the park to set the leasing locations, which will be operated by security organization, or set locations around the dormitories, which will be managed by dorm staff. In this way, trial leasing location will be set around the main building of Jan Lake campus, Erudite Plaza of New campus, Teaching Building IV and Pegasus Plaza. Subdivision is as follows: main building of Jan Lake campus (space beneath the stairs), space in front of the canteen, Erudite Plaza of New campus (including underground parking field), the space around the library, Teaching Building IV (sending and receiving express corridor), Pegasus Plaza (corner of plaza), part-time base of dormitory, basketball court corner of dormitory C.(Yang Yaxia 2014)

3.2.2 Staffing and device setting of leasing location.

There should be a duty room, a computer to register, a desk and 2 chairs, basic tools to repair bike, like pump, pliers. Besides, there should be at least 3 staffs during the peak period of changing classes, and at least one staff at weekends and holidays or off-peak period.(Li Jinxia 2013)

3.3 Lease model

Campus card record students' credit degree and will play a crucial role in the bicycle rental system. When students rent bicycles by its campus card, the information will be recorded automatically, and when students brush campus cards return the bicycles, the money will be charged too.

3.4 Toll mode

From the travelers' perspective, the system should meet the demand by providing the passengers with cheap and convenient service, so the rental price must be moderate and reasonable(Liu Yang, Zhu Ning, Ma Shoufeng 2015). If students return bicycles within 7 days, they will be charged 0.5 Yuan per day. While students return bicycles over 7 days, they will be charged 0.3 Yuan per day. Compared with ordinary bicycles, mountain bicycles are more convenient and practical, so it will be overcharged 0.2 Yuan per day. If bicycles were found badly worse than before, there should be some fine.

3.5 Management and maintenance

3.5.1 Repairmen and obsolescence.

According to the research statistics, 30.85% of bicycles have been dumped for breakdown and late-time disposal, which reflects the importance of bicycle maintenance. The bicycles for renting system are partly from dumped and unclaimed bikes. Therefore, there must be some problems on their quality as well as safety. We can cooperate with repairing shops or train management staffs to master basic repair skills. Maintenance are required to inspect each bicycle once a week. If the bicycle is too

serious to maintain, put it into obsolescence.(Cheng Pengfei, Yang Sengseng, Zhao Lingling 2014)

3.5.2 Managerial personnels.

Apply to schools for recruiting students who are willing to do part-time jobs. Not only does it offers a broad stage for college students to be involved in practice activities, but also help to enhance ability of solving problems. Or it can be managed by student groups such as the community volunteer team, can actively mobilize the communities to participate in daily management (Zhao Yingmei 2013).

3.5.3 Humanized service details

Provide inflator service for free, provide disposable ponchos on rainy days and provide sunshade in hot summer.(Yang Qingxu, Liao Xiuzhi, Song Yan 2014).

4 Economic Benefit Assessment of the Operation and Management of the Public Bicycle System in Universities

According to the statistics, the percentage of students having bicycles in WHUT is about 79%. Since some of these has lost or stolen, we assumed that the proportion of still having a bicycle is 60%. Mafang Shan area is estimated at about 30000 people, so $30000 \times 60\% = 18000$, go shares to each grade is 4500. Assuming 1000 ownerless bicycle left in graduation season and estimate students will donate 500 bikes. There are total 1500 bicycles for the construction of campus public bicycle system.

We randomly selected 50 unowned bicycles to do the practical assessment, including 42 bicycle body with no serious deformation. Review indicators: chain status, car mat, outside paint integrity, pedal integrity, tires, handlebar, whether has a brake. To evaluate each bike one by one and score from 1 to 5 points. (Mei Zheling, Shi Duli, Zhang Xu 2012)

Table 1 Statistics of Bicycle Quality

Quality grade	Quantity	Ratio
1	5	10%
2	14	28%
3	9	18%
4	12	24%
5	2	4%
Serious deformation	8	16%

Bicycles graded at 3 or 4 can be recycled as a public bicycle after renovation. Bicycles graded 1 or 2 or having serious deformation will be treated as a waste. Bicycles graded 5 can be sold as a new car after renovation. Waste disposal : $1500 \times 54\% = 810$ bicycles. Repair for reuse: $1500 \times 42\% = 630$ bicycles. Repair for selling as new bicycles: $1500 \times 4\% = 60$ bicycles

4.1 Cost calculation

1) Bicycles' repair fee of rank 3, rank 4 and rank 5: the repair cost of a 50% to 60% new bicycle roughly is 70 to 80 Yuan. If we adopt the method of outsourcing and negotiate with the suppliers, by use of long-term cooperation and scale effect the coats can be cut down to about 60 Yuan per bicycle(ZhaoRui, Wang Hui, Han Yinfeng, Zhang Yanning, Hu Jianqun, Peng Jian 2014). $1500 \times (18\% + 24\% + 4\%) \times 60 = 41400$. The service life of the car after the renovation is about two years. $41400 \div 24 = 1725$ Yuan per month.

2) Maintenance cost. According to these understanding for the bicycles' basic maintenance , the costs for basic maintenance is: $630 \times 5 = 3150$ Yuan per month.

3) Management staff salaries. Operating time is from 6 to 23 points per day, totally 17 hours, 7 Yuan per hour, then the total amount is: $17 \times 7 \times 30 = 3570$ Yuan per month.

4) Personalized service. Purchase 50 one-time ponchos per month. Each one is 4 Yuan, and the total amount is 200 Yuan per month.

5) The basic flat cost is assumed to be 10 Yuan, and the life span of a second-hand bicycle after renovation is two years, so the flat cost is $630 \times 10 \div 24 = 262.5$ Yuan per month.

The total costs is $1725 + 3150 + 3570 + 200 + 262.5 = 8907.5$ Yuan per month.

4.2 Income calculation

1) Business income. Assume that each bicycle is used on average 1 hours per day, 0.5 Yuan per day, 630 bicycles, then totally all bicycles can earn 315 Yuan per day, and 9450 Yuan per month.

2) Income from the selling off the new bicycles after renovation; all bicycles can earn $60 \times 200 = 12000$ Yuan. Supposed all can be sold within 4 months, then the income is 3000 Yuan per month.

3) Income from the disposed bicycles: After investigation, our school will sell these disposed bicycles to steel mills, and the price is 5 Yuan per bicycle. Every year there will be a Centralized treatment for selling these bicycles, then income for each month is : $5 \times 810 \div 12 \approx 354$ Yuan.

4) Sponsorship income: At the same time, we can attract the surrounding businesses to invest in sponsorship and assume the sponsor is 500 Yuan per month.

5) Advertising income: Merchants around the college can put advertisements on public bicycles to promote its merchandises, which is supposed to be 500 Yuan per month.

The total income is $9450 + 3000 + 354 + 500 + 500 = 13804$ Yuan per month.

Profit calculation

The total income minus the total cost equals the total profit.

So, the total profit is $13804 - 8907.5 = 4896.5$ Yuan per month. (Chen Wei 131)

5 Conclusion

The establishment of the campus public bicycle system on the Mafang Shan campus of WHUT has high practicality. Embodied in which many students have bicycles and use it with low frequency for various reasons, causing a large amount of abandoned bicycles which, on the contrary, provide abundant resources and broad market for the campus public bike system.

The Impact of Transformational Leadership Style on Firm Innovation in Manufacturing Organizations in Sri Lanka

L.W. Amitha Kumara

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: amithakumara@yahoo.com)

Abstract: The purpose of this empirical studying is to provide how transformational leadership impacts on firm innovation in manufacturing organizations in Sri Lanka. The perpetual data were collected from 140 Production Management Leaders in 30 manufacturing organizations. The results showed that there was a positive and significant impact and relationship between transformational leadership of Production Management Leaders and firm innovation. Additionally, the findings accounted for indicating the positive relationships between transformational leadership and employee motivation and employee motivation and firm innovation. It is the fact that firms are required to look into transformational leadership development before executing of innovations. This paper opens up intellectual discussions about role of human resources development departments over firm innovation.

Key words: Transformational leadership; Firm innovation; Employee motivation

1 Introduction

To meet customers' expectations while delighting them in a way which creates the loyalty towards companies, business leaders should tap the value-creating ideas of their employees, customers, partners, and those who see and expect progress of companies. This value creation process through idea generation and converting them into real practice is identified as innovation which is one of the top three key drivers of any business in any industry in future. In fact, creativity, coupled with innovation impacts on product and process development which directly deals with effectiveness and efficiency of companies which pursue and look for delighting customers while increasing shareholders' value.

Leaders are one of very significant factors which deals with and influences on employees' innovative behavior of which is considered as the required and fundamental means of survival in competitive business environment. (Elkins and Keller, 2003).^[6] The most researchers have identified leadership is the one of the most important and critical factors which enormously influence over creative behavior and performance (Jung et al., 2003).^[9] According to him, leaders are the most powerful persons who can directly and indirectly influence on innovative behavior of employees in organizations. Innovation and leadership are two sides of one coin and they are very much interrelated and interdependent. Leadership always focuses to bring forward some change for better future as same as innovation is the process of challenging the status quo through considerable break through.

It is the fact that leaders in business are facing dynamic business environment where the change is inevitable and to face this nature of business followers should have share the leaders' vision and commit themselves to accomplish leaders' direction effectively (Baum and Locke 2004).^[5] Thus, one of the best leadership style which very clearly explains above dynamic business environment while influencing on firm innovation is transformational leadership. Transformational leaders challenging status quo while transforming followers' personal values and self-concept and moving them to higher level of expectations and aspirations (Jung et al., 2008).^[10] They enhance their performance expectations (Bass, 1990).^[4]

This study contributes to the emerging research area on the impact of transformational leadership of production management team (Head of Production, Production Manager, Assistant Production Manager and Production Executive) on firm innovation in manufacturing companies of Sri Lanka. It is the fact that all strategic and operational plans of innovation is executed by Head of Production and his team at firm level and their leadership competency is very much critical to teach minds, touch hearts and transform lives of employees who are required to come up with more innovative interventions in production floor.

In fact, it is timely important to study about the impact of transformational leadership of Production Management Team on firm innovation in manufacturing organizations and look into detailed analysis of the relationship. The next section is the literature review which comes up with a conceptual framework and the third section is mainly focused on methodology of the study. The fourth section is allocated to results of the analysis and conclusion is presented fifth section.

2 Literature Review and Development of Hypothesis

This section describes highlights of various researchers who have contributed a lot to the area of study and it is fact that the conceptual framework is supported with literatures which are available in books, journals, websites and magazines.

2.1 Transformational leadership

There are wider ranges of literature over leadership, required for organizational success and many scholars have contributed enormously on leadership role of senior management in organizations. An effective leadership means achieving organizational goals in a productive way producing and establishing sustainable results (Longenecher & Neubert, 2003).^[11] Sosik, Kahai, and Avolio (1998)^[14] found that transformational leadership increased followers' creativity in a computer-mediated brainstorming exercise. In this study, the followers' performance was assessed in part based on the number of creative ideas generated. Amabile (1996)^[11] also has suggested that by influencing the nature of the work environment and organizational culture, leaders can affect organizational members' work attitudes and motivation in their interactions, thereby affecting their collective organizational achievement. James McGregor (1978)^[13] identified four components of transformational leadership as follows.

Charisma or idealized influence - the degree to which the leader behaves in admirable ways and displays convictions and takes stands that cause followers to identify with the leader who has a clear set of values and acts as a role model for the followers. Inspirational motivation - the degree to which the leader articulates a vision that is appeals to and inspires the followers with optimism about future goals, and offers meaning for the current tasks in hand. Intellectual stimulation - the degree to which the leader challenges assumptions, stimulates and encourages creativity in the followers - by providing a framework for followers to see how they connect [to the leader, the organization, each other, and the goal] they can creatively overcome any obstacles in the way of the mission. Personal and individual attention - the degree to which the leader attends to each individual follower's needs and acts as a mentor or coach and gives respect to and appreciation of the individual's contribution to the team. This fulfills and enhances each individual team members' need for self-fulfillment, and self-worth - and in so doing inspires followers to further achievement and growth.

For the purpose of this study, above four characteristics will be utilized to measure transformational leadership of Production Management Team, perceived by themselves about their roles over firm innovation.

2.2 Innovation

Joseph Schumpeter is often thought of as the first economist to draw attention to the importance of innovation (Roger, 1998).^[15] Rogers, E. M. Diffusion of Innovation, New York: The Free Press, 1962

He identified five types of innovation named, introduction of new product or qualitative change in an existing product, process innovation new to an industry, the opening of a new market, development of new sources of supply for raw materials or other inputs, and changes in industrial.

Those ideas paved the way for coming up with some of definitions for innovation which is a change in the thought process for doing something, or the useful application of new inventions or discoveries. It may refer to an incremental emergent or radical and revolutionary changes in thinking, products, processes, or organizations. This definition indicates that innovation is process of converting new ideas into realities or real outputs and it indeed make changes in thinking, process, products and organization as a whole. Innovation is generally understood as the successful introduction of a new thing or method. Innovation is the embodiment, combination, or synthesis of knowledge in original, relevant, valued new products, processes, or services.

In fact, some researchers illustrate innovation on the basis of two phases, called initiation and implementation. This simply means idea generation and implementation (Zaltman et al., 1973).^[19] Further, Urabe et al. (1988)^[18] clarified innovation as generation of new ideas and implementing them towards a new product, process or service. It is the fact that innovation is defined successful implementation of ideas, generated within the organizations (Amabile et al. 1996)^[11] is study, above two factors also have been considered to measure firm innovation except product and process innovation and return on product development expenses.

2.3 Transformational leadership and innovation

Researchers have highlighted the fact that leaders can help direct reports to be innovative at work (Shin and Zoau, 2003).^[16] Michaelis et al. (2010)^[14] argued that the impact of transformation leadership is based on motivation, empowerment and morality, which in turn influence on innovation

positively and effectively. Transformational leaders adopt inspirational motivation and intellectual stimulation which are very significant and critical for organizational innovation (Elkins and Keller, 2003).^[3]

There are some researches which show the positive relationship between transformational leadership and innovation. Jung et al., (2008)^[10] pinpointed a positive relationship between CEOs' transformational leadership and organizational innovation in Taiwan's electronic and telecommunication companies. In Turkey entrepreneur software development companies have been studied with relevant to above matter and it has been found that R&D managers' transformational leadership style has considerably impacted on organizational and individual level innovation and further they not only promote innovative activities and ensure the market success of them (Gumusluoglu and Ilesv, 2009). In USA, Gilley et al., have described that there is the significance of transformational leadership towards change interventions and innovation in private and public companies.

Literature review, given above emphasize that it is evident that the influence of transformational leadership has direct impact of firm innovation, employee innovative behavior and employee motivation which in return impacts in innovation of organization. In fact, it is required to set the hypothesis for the study with a view of testing them in manufacturing organizations in Sri Lanka.

H1. There is a positive relationship between transformational leadership and firm innovation.

The main focus is on transactional leadership of Production Management Team (Head of Production, Production Manager, Assistant Production Manager, and Production Executive) in manufacturing organizations in Sri Lanka. The team oversees the manufacturing process and make sure that production lines are running smoothly and efficiently. They work closely with supervisors and maintenance staff to plan work, set targets and make sure the finished products meet quality standards. The conceptual framework contribution of Jung et al., (2003)^[10] is applied to test the above relationship

But, the study further focuses to test how employee motivation, created through transformational leadership is a driving force for firm innovation. Motivation is giving encouragement to someone. And innovation is a new creation or something new. An innovation can be introducing something-and idea or object-for the first time. People need motivation to be innovative. There needs to be a reason for them to work hard to create something new. Thus, the study further looks into the relationship between transformational leadership and employee' motivation. Theory of transformational leadership related many studies show that there is positive relationship of transformational leadership and other dependent variable like satisfaction, commitment, motivation and performance of the employees. The article on Motivation and Innovation of Herzberg (1979)^[8] says that innovations such as this must be based on personal productivity and should be ordered to move from personal productivity to internal client productivity to the desired organizational productivity. In addition, Lenard, Beauvais et al., (1999) introduced five source of motivation such as intrinsic process motivation, instrumental motivation external self-concept motivation, internal self-concept motivation and goal internalization. This empirical contribution paves the way for the second hypothesis, given as follows:

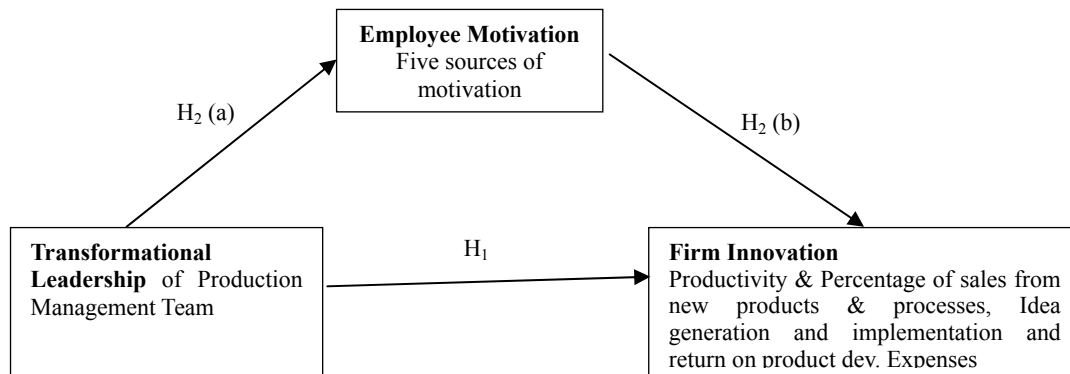

Figure 1

H2. (a) There is a positive relationship between transformational leadership and employee motivation.

H2 (b) There is a positive relationship between employee motivation and firm innovation.

FI = f(TL, EM)

FI = Firm Innovation

TL = Transformational Leadership

EM = Employee Motivation

On the basis of above hypothetical explanation, the following conceptual model can be introduced and it is required to test in the environment of manufacturing originations in Sri Lanka.

3 Methodology

3.1 Sample and procedure

Thirty manufactures of Sri Lanka were taken into considered for the study and the list of them was taken from Board of Investment. 210 members who represent Production Management Team of the organization were selected on random sample techniques. Seven members were selected from each factory and they were given structured questionnaire the impact of transformational leadership and firm innovation, mediated by employee motivation and 140 questionnaire were returned, ensuring 70% of respondent rate. 30% Heads of Production, 30% Production Managers, 10% of Assistant Production Managers and 30% Production Executives represent the sample. In fact, gender representation of the sample is 97.3% is male and 3.7% female.

3.2 Measure

Transactional leadership is measured on the basis of Multifactor Leadership Questionnaire (Tool A), introduced by Bass and Avolio (1997)^[3] which is widely used transformational leadership measure in leadership research (Awamleh & Gardner, 1999).^[2] The questionnaire is made on five rating scale which denotes that 1 stands for strongly disagree and 5 stands for fully agree. In fact, employee motivation driven behavior is measured through structured 05 questions which deals with how they can manage employee motivation which ultimately paves the way for firm innovation.

Firm innovation is measured on two different proxies, introduced by Roger (1998).^[15] The two proxies are productivity and percentage of sales from new product/s or new processes. In addition, two questions were included to measure idea generation and implementation which have been highlighted by Amabalie et al., (1996).^[1]

4 Results and Analysis

To identify the relationships among relation among transformational leadership, firm innovation, and employee motivation correlation and regression analysis is executed.

The results of correlation is tabulated in table 01 and the analysis indicates the fact that there are positive relationship among the variables, given in the table. Once the attention is paid to the relationship between transformational leadership (charisma (CRI), intellectual stimulation (ISN) inspirational motivation (IMN) and personal and individual attention (PIA) and firm innovation (FINO) the relationships with each variable is positive. This is to highlight that there is a significant ($p < 0.01$ or $p < 0.05$) and positive relationship between transformational leadership and firm innovation. In fact, the very strong positive factor of transformational leadership towards firm innovation is inspirational motivation (ISN) 0.801 where how production management team's vision is articulated to inspire themselves for higher level contribution towards firm innovation.

The figures indicate that there is a positive strong relationship between transformational leadership and employee motivation interventions among the production management team. Personal and individual attention (PIA) 0.633 very positively deals with employee motivation.

The third positive relationship, derived from the following figures is the relationship between employee motivation and firm innovation. The relationship is strong (0.624) and it indicates that if the leaders are motivated themselves they tend to act as change agents who guide others towards innovation. The correlations, explained above facilitate the hypothesis H1, H2 (a) and H2 (b).

Table 1 Correlations of Transformational Leadership, Employee Motivation and Firm Innovation

Variables		CRI	ISN	IMN	PIA	EMOT	FINO
Charisma/Idealized Influence (CRI)	P. Correlation	1	0.524	0.611	0.598	0.582	0.675
Intellectual Stimulation (ISN)	P. Correlation		1	0.732	0.506	0.523	0.786
Inspirational Motivation (IMN)	P. Correlation			1	0.599	0.567	0.801
Personal & Individual Attention (PIA)	P. Correlation				1	0.633	0.619
Employee Motivation (EMOT)	P. Correlation					1	0.624
Firm Innovation (FINO)	P. Correlation						1

*. Correlation is significant at the 0.01 level (2-tailed).

In order to test the probable impacts on innovation, multiple linier regression analysis is done and

the results are tabulated in the following tables which separately explains the probable impacts of variables separately.

Table 2 Regression Analysis of Transformational Leadership and Firm Innovation

Independent variables	Standard beta	P value
Charisma/Idealized Influence(CRI)	0.480	0.021
Intellectual Stimulation (ISN)	0.430	0.039
Inspirational Motivation (IMN)	0.490	0.034
Personal and Individual Attention (PIA)	0.295	0.049
Dependent Variable: Firm Innovation	R ² =0.673	P value= 0.033

The regression model which investigates the impacts of transformational leadership on firm innovation is presented in table 08. The R² value indicates how much of dependent variable (Firm Innovation) is expressed and explained by independent variable (Transformational Leadership). R² value of is 0.67 and it indicates the fact that dependent variable is explained by 67% through independent variable. The R² value is to be at least R² > 0.5. The regression model is significant p=0.003 where it indicates that there is a positive relationship between transformational leadership and firm innovation. This regression model supports H¹ which indicated the impact of transformational leadership is very positive on firm innovation.

Table 3 Regression Analysis of Transformational Leadership and Employee Motivation

Independent variables	Standard beta	P value
Charisma/Idealized Influence(CRI)	0.153	0.012
Intellectual stimulation (ISN)	0.394	0.043
Inspirational Motivation (IMN)	0.301	0.028
Personal and Individual Attention (PIA)	0.120	0.035
Dependent Variable: Employee Motivation	R ² =0.671	P value= 0.038

The below regression model is done with the purpose of supporting the second hypothesis H² (a) where the model explains how much of dependent variable (Employee Motivation) is expressed by the independent variable (Transformational Leadership) in the table 3. Since the R² value of the model is 0.673 and the regression model is significant because p=0.038 where it confirms the positive relationship among all variable. Thus, it is the fact that transformational leadership of Production Management Team positively impacts on employee motivation, proving H² (a).

Table 4 Regression Analysis of Employee Motivation and Firm Innovation

Independent variables	Standard beta	P value
Employee Motivation (EMOT)	0.238	0.000
Dependent Variable: Firm Innovation	R ² =0.671	P value= 0.034

The above regression model focuses on how much dependant variable of Firm Innovation is articulated and conveyed by independent variable, called Employee Motivation. Since R² value is more than 0.5 and p= 0.034 it is correct to asset that above relationship is positive and significant.

5 Conclusion

In a broader sense, the impact of transformational leadership is considerably significant and very much vital when firm innovation is executed. The empirical research in the context of manufacturing organizations in Sri Lanka indicates the fact that transformational leadership qualities of Production Management Team directly impacts on firm innovation. In fact, the relationship between transformational leadership and employee motivation also is very positive and significant while employee motivation further impacts positively on firm innovation. By and large, it is very clear to assert that transformational leadership has positive impacts in manufacturing organizations of Sri Lanka.

Since there are very less contribution of research in this nature in Sri Lanka, this paper contributes to the literature of impact of transformational leadership over firm innovation in the context of manufacturing organizations of Sri Lanka. In fact, this paper inspires other researches to explore human

resources management interventions over success of firm innovation. For examples, role of training and development, impact of line managers' soft skills, role of HR department and responsibility of shop floor leaders over implementation of innovation are new thought provoking areas and those who are interested can take initiative to explore the contribution of above areas over firm innovation.

Effects of Organizational Innovation on the Firms Production Performance: With Special Reference to Sri Lanka

J. Krishanthi Mallika, Zhao Hongzhong
School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: krishanthimallika@yahoo.com)

Abstract: Concept of Innovation is central to economic growth and can be a source of sustained competitive and effective advantage to firms (Schumpeter, 1934). On the other hand the innovation system concept is still a new title to many countries including Sri Lanka. This study tried to analyze the relationship between different types of innovations (product, process, marketing and organizational), and the firm production performance. The main objective of this study is to evaluate the Effects of Organizational innovation on the firm's production performance.

The sample consisted of 45 manufacturing firms in the Western province of Sri Lanka and drawn using a stratified random sampling method. Analysis took place in order to identify the relationship among the innovation types and the firms production performance i.e., correlation and regression analysis. The correlation analysis indicates the strong relationship between the factors and there is a significant positive relationship between all types of innovations and the firm's production performance. Since the innovation system concept is new to Sri Lanka government should act a major role in establishment of the new concept.

Key words Innovation; Organizational innovations; Production performance; Manufacturing firms

1 Introduction

Innovation is studied in various disciplines. It has been defined from different perspectives. Schumpeter, 1934^[1] includes five manifestations of innovation in its definition: Creation of new products or qualitative improvements in existing products, Use of a new industrial processes, New market openings, Developing of new raw-material sources or other new inputs, New forms of industrial organisations. The influence of the Schumpeterian vision of innovation stand still to this day and can be seen in the European Commission's Green Paper, 1995 on innovation that defines it as "...renewal and enlargement of a range of products and services and the associated markets, the establishment of new methods of production, supply and distribution, the introduction of changes in management, work organisation and the working conditions and skills of the workforce" and in Edquist's (2001)^[7] summary description of innovations as new creations of economic significance normally carried out by firms. Department of Trade and Industry from UK has perhaps the broadest and most comprehensive definition of innovation and it is "the successful exploitation of new ideas" and explains that it "involves new technologies or technological applications, which can deliver better products and services, new, cleaner and more efficient production processes and improved business models. (DCS, 2003)⁽⁴⁾.

Four different innovation types that are introduced by OECD Oslo Manual in 2005⁽¹⁰⁾. These are, Product innovation, Process innovation, Marketing innovation and Organizational innovation.

Organizational innovations produce long-term competitive advantages and important for technical innovations (Mol & Birkinshaw, 2006)^[9]. Scholars have normally defined innovation as the development and use of new ideas or behaviours in organizations. A new idea could be a new product, service or method of production or a new market, organizational structure or administrative system. The key intention of innovation is to introduce change in the organization to create new opportunities or exploit the active ones (Drucker, 1985)^[5].

Organizational innovation as a distinct concept, defined as "the implementation of a new organizational method in the firm's business practices, workplace organization or external relations that has not been used before in the firm and is the result of strategic decisions taken by management" (OECD, 2005)⁽¹⁰⁾. An organizational innovation has been defined according to OECD (2007) as "...a new organizational method in the firm's business practices, workplace organization or external relations. Organizational innovations can be intended to increase a firm's performance by reducing administrative costs or transaction costs, improving workplace satisfaction (and thus labour productivity), gaining access to non-tradable assets (such as non-codified external knowledge) or reducing cost of supplies."

According to Pleschak and Sabisch, characteristic of organizational innovations is interdependent relationship to product or process innovations. New products frequently need new production processes and it needs new organizational structures. On the other hand another characteristic is the social

dimension: They influence the corporate culture and also the attitudes and the behaviour of the employees.

Sri Lanka is an island country which is in Indian Ocean next to the southern part of India. The population is approximately 20Mn in 2013 and 70% of its population living in the rural areas whose main income is agriculture. With a human development index of 93 out of 177 countries and a literacy rate of 90%. Sri Lanka recorded the highest growth rate after independence (in 1948), in 2011 viz 8.3 percent. Further, the per capita income of the country had remarkably increased from \$871 in 2000 to \$2836 by 2011. In 2013 it was a \$3194 (Central Bank Report 2013)^[2].

Innovation is a concept central to economic growth and can be a source of sustained. Organizational innovations are not a new phenomenon, but due to their augmented importance for the global competition they have become a focus of attention for scholars.

There are a few studies that focus on the effects of Organizational innovation on the firm production performance. According to Drucker (1999)^[5], few empirical studies have closely examined the relationship between the level of organizational innovativeness and firm production performance.

Recently, Dutz and Connell (2013)^[6] also suggested that it is more important than ever to identify and assess existing constraints to investment, productivity, innovation and growth in the Sri Lankan economy.

2 Literature Review

The literature on innovation is very voluminous and diverse. Most research tends to focus on innovation outcomes of product or process. Few studies examine innovation outcomes at the firm level empirically, or the relationship between organizational innovation, and production performance.

Adam Smith's 1776, analysis of the division of labour is an early example of organisational innovation and the study of its impact on productivity.

The model of Mol and Birkinshaw (2006)^[9] try to answer the question of under which conditions will firms introduce organizational innovations. Their model uses data from the U.K. "Community innovation Survey" CIS III survey (covering the years 1998-2000), and proves significant in explaining the adoption of organizational innovation.

Their study examines variables that describe two sets of antecedents, a firm's organizational context, and its knowledge based relations. Suggest that organizational innovation is driven by the firm's competitive strategy and position.

Ulusoy, G. et al, 2008^[12] have done study of Effects of Organizational Innovations on Firm's Production Performance of the manufacturing firms in the Northern Marmara region within Turkey. The objective of this paper is to explore the role of different innovation types as well as the organizational innovations on the firm's production performance based on an empirical study covering 184 manufacturing firms in the Northern Marmara region within Turkey. A significant positive relationship between organizational innovations and the firm's production performance is determined.

Based on study of "Organizational innovation as an enabler of technological innovation capabilities and firm performance" were studied by César Camisón Ana Villar-López in 2010^[11]. And assesses the relationship between organizational innovation and technological innovation capabilities, and analyzes their effect on firm performance using a resource-based view theoretical framework. The study presents empirical evidence from a survey of 144 Spanish industrial firms and modelling of a system of structural equations using partial least squares.

The results confirm that organizational innovation favours the development of technological innovation capabilities and that both organizational innovation and technological capabilities for products and processes can lead to superior firm performance.

Jaskyte (2011) found that there is a positive relationship between innovation and performance, which creates the need in the non-profit firms to build the culture of innovation in order to improve the performance.

Empirical evidence on effects of organizational innovation on the firm production performance considerable disagreements. Some writers argue that organizational innovation positively effect to firm production performance and another scholars argue that there is a negative relationship between organizational innovation and firm production performance.

In reviewing these diverse views, it is questioned and important to assess the effects of Organizational innovation on the firm production performance in Sri Lanka. The problem of this study is, What are the effects of Organizational innovation on the firm production performance?

3 Research Methodology

3.1 Conceptual framework

Figure 1 Conceptual Framework of the Study

3.2 Hypothesis of the study

The relationship between different types of innovations (product, process, marketing and organizational) and the firm production performance is investigated in this research.

H1. There is a positive relationship exists between the firm Production performance and Organizational Innovation

H2. The relationship between firm Production performance and Production Innovation is positive.

H3. There is a positive relationship exists between the firm Production performance and Process Innovation

H4. There is a positive relationship exists between the firm Production performance and Marketing Innovation

Secondary data for the study were collected from Reports of the Central Bank of Sri Lanka, Annual Survey data of Department of Census and Statistics in Sri Lanka, internet, Journals, Research papers, Conference and Seminar papers and relevant documents.

As this study is empirical in nature, a great attempt was made to collect primary data using sample survey using well-structured questionnaires.

The population of this study consists of manufacturing firms in the Western province of Sri Lanka.

The sample, comprising 45 manufacturing firms (senior officer/executive) in the Western province of Sri Lanka, is drawn using a stratified random sampling method from the statistical data base of the National Enterprise Survey conducted by Department of Census and Statistics (DCS) in 2008 and updated annually. (Last report Published in 2014 based on the data of 2012). The Western province, which includes main three districts of the country: Colombo, Gampaha, and Kaluthara and populated with 28.8 percent of total population, was selected as approximately 42 percent of firms are located in the province (DCS,2014)⁽³⁾.

Primary data were gathered through a sample survey and the sample was comprised of the 45 manufacturing firms (senior officer/executive) in the Western Province of Sri Lanka to investigate the effect of organizational innovation as well as other types of innovations to the firm’s production performance. The questions about the production performance are asked by 5 points Likert scale.

This study uses tables, charts, graphs to present the collected data. In addition, descriptive statistics methods were used on essentially.

In order to identify the relation among the innovation types and the production performance of firm’s relationship analysis, i.e., correlation analysis and regression analysis is conducted.

Multiple linear Regression method

$$Y = \alpha + \beta_{1X1} + \beta_{2X2} + \beta_{3X3} + \beta_{4X4} + \epsilon$$

Y = Production Performance

X1 = Product innovation

X_2 = Process innovation
 X_3 = Marketing innovation
 X_4 = Organizational innovation

4 Data Presentation and Analysis

According to the data of field survey (interview of officers and executive) following information can be interpreted. According to sample, almost two third of the samples are male executive officers i.e.32 (71.1%). The geographical dispersion of the sample shows its representation in the three districts in the Western province, Sri Lanka (Colombo, Gampaha and kaluthara). Firms engaged in manufacturing food and beverages products was recorded as 19 firms (42%) while 11 firms are (24%) manufacturing garment apparel and designing were included in the analysis. 08 firms (17%) and 07 firms (15%) were engaged in two sectors, manufacturing rubber and plastic products. Following table shows the distribution of the sample according to the number of employees in the firms.

In order to identify the relationship among the innovation types and the production performance correlation and regression analysis is conducted as bellow.

Table 1 The Correlation analysis of the innovation types and Production Performance

	Prod. Innov	Proc. Innov.	Mar. Innov.	Org. Innov.	Prod. Expan.
Prod. Innov.	1	0.36	0.21	0.53	0.32
Proc. Innov.		1	0.35	0.48	0.24
Mar. Innov.			1	0.43	0.32
Org. Innov.				1	0.38
Prod. Expan.					1

In the table 1, the correlation analysis indicates the strong relationship between the factors and a significant positive relationship between all types of innovations and the firm's production performance. Among them high association can be seen with organizational innovation (0.38).

In the above multiple linear regression model analysis can be seen connection and effect of innovation types to production performance of Manufacturing firms in Sri Lanka.

Table 2 Regression analysis of Production Performance

Independent variables	beta	Significance value
Product Innovation	0.178	0.87
Process Innovation	0.143	0.53
Marketing Innovation	0.012	0.92
Organizational Innovation	0.213	0.07
$R^2 = 0.036$; $p=0.048$		

When we take a look at the types of innovation along there is no significant affect because of "p" values of these types of innovation are greater than the 0.05. When considering multiple regression model is significant ($p<0.05$) $p=0.048$ and confirm positive relationship between all innovation types and the firm's production performance.

And also R^2 value is 0.036, this indicate that 3.6% dependent variable can be expressed by independent variables like: Production, process, Marketing and Organizational innovations. It can be illustrated that types of innovation is not considerable factor to determine the production performance of manufacturing firms. 96.4% other factors effect to determine the production performance of the Manufacturing firms.

5 Conclusion

It can be concluded that most of the innovative activities are new to the firm and there was no considerable innovation in the category of 'New to the world'. And also it has been revealed that the results of these innovations haven't brought big financial gains to the firms.

Accordingly, many firms were not actively involved in the innovative process. Most of organizations still depend on traditional management, marketing, operations and daily routines instead of finding new cost effective innovative solutions. Few firms were identified well in management and

marketing innovations from above selected firms.

Generally there was insufficient allocation of funds for innovative activities as they believe that it is very difficult to recover these investments. As a result they have engaged in low cost, mainly trial and error methods and low cost reverse engineering as de-assembling old machinery and equipment for improvements and obtaining technical know-how.

As well as when considering about the types of innovation can be concluded that there are positive relationship between types of innovation and business performance of the Manufacturing firms in Sri Lanka.

All hypotheses can be accepted according to results of analysis.

The study identified the obstacles which restrain innovative attempts of the manufacturing firms in the Western province of Sri Lanka. Through the survey, the factors such as high cost of innovation, lack of funding sources internally and externally, lack of skilled personnel, lack of information on technology and the lack of economic condition of the country restricting the purchasing power of the people are obstacles of the Manufacturing firms in the western Province of Sri Lanka.

There is a need for sufficient knowledge and information infrastructure and assistance being provided by the government, universities, technical education firms, and R&D institutions.

Financial assistance from the banking system and government projects should help resource constrained firms to generate innovations as they are not capable enough to allocate needed funds themselves.

And also, government institutions, universities, technology centres, R&D firms should provide innovation infrastructure to the progress of manufacturing firms., Finally it can be point out that, Sri Lanka should pay more attention to reach to innovation economy with covering manufacturing firms as a developing country because the Improvement of firms very important to increase the economy of Sri Lankan.

Research on the Evaluation Index System of Internal Control Based on Enterprise Ethics

Xi Xiahui

Department of Finance, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 281284747@qq.com)

Abstract: Introducing Enterprise Ethics to the internal control evaluation system and combining with internal control elements, this paper establishes a preliminary evaluation index system of internal control based on enterprise ethics and uses the structural equation modeling to conduct the empirical test, finally forms an evaluation index system including 5 first class indicators, 9 second class indicators and 27 third class indicators in order to improve the level of the enterprise internal control evaluation.

Key words: Enterprise ethics; Internal control; Evaluation index; Structural equation modeling

1 Introduction

The internal control is increasingly brought to the attention of the entrepreneurs and government management department on a global scale. A large number of theoretical results and the rise and fall of the enterprise instance show that healthy and effective internal control systems play significance roles in helping enterprises to reduce the financial fraud, improve the efficiency and effectiveness of enterprise management and achieve strategic goals. However, construction of internal control is not running smoothly all the time, the enterprise operators need to regularly review their own internal control system and conduct evaluation of the design and implementation effectiveness. Meanwhile, the kind of guide to evaluate internal control will directly determine the effect of internal control evaluation and improvement direction. In recent years, such as various kinds of 'gate incident' incidents all kinds of corporate scandals put many enterprises in the spot light and behind the event reflecting thought-provoking ethical problems of companies. Therefore, it's necessary to introducing enterprise ethics to internal control evaluation system, to construct an evaluation index system of internal control for the company's ethics in order to guide enterprises focus on ethical risks, increase timely awareness to identify defects of internal control design and implementation and realize the continuous improvement of enterprise internal control.

2 Enterprise Ethics Connotation

Definition of enterprise ethics in the theoretical circle has not yet formed and there are multiple points of view. Among the great number of definitions, it's of higher recognition degree that enterprise ethics is defined as the guidance and principles of employee behavior moral, norms or standards proposed by the American scholar Lewis P.V. on the basis of his academic study in 1985. Enterprise ethics research focus business ethics as a particular social phenomenon, including the specification, function and form between good and evil, evaluation of the business ethics construction, etc. This paper argues that enterprise ethics is the basic rules for dealing with the relationship between various stakeholders and the company and is the total of the ethical consciousness of operating activities throughout the enterprise to adjust the enterprise internal and external relations ethics, embodied in managers and employees or employees within the organization, as well as the enterprise ethical relationship with external stakeholders. Enterprise ethics includes not only the individuals in the enterprise ethics, also reflecting the enterprise ethics as a whole, its business activities of the enterprise, the good and evil should and should not make the specification and it is different from the corporate social responsibility. Corporate social responsibility is enterprise obligations to society, involving little or no relationship between the internal stakeholders and enterprise ethics includes not only the external ethics but also covers the ethical relationship between people in different levels inside the enterprise. In addition, enterprise ethics is different from the corporate culture. Corporate culture is gradually formed in the business activities of enterprises approved by all the members in the organization's values, moral standard, business philosophy rules and regulations and so on, which is richer than enterprise ethics in content. Enterprise ethics mainly reflects the value judgment of good and evil, and is the core of the enterprise values, as well as the core of corporate culture.

3 Relationships Between Enterprise Ethics and Internal Control

Goals of both Enterprise ethics and internal control have intrinsic consistency, and their mechanisms of action are complementary. Internal control is essentially a kind of remedy mechanism of incomplete contract relationship, which means through internal control equivalence of related interest subjects' rights and obligations in enterprises can be reached in order to ensure stability and sustainability of the enterprise management. Through the core values of ethics ideal faith, enterprise ethics exerts a subtle role in enterprise staffs' deep psychological, widely and deeply affect the persons' spiritual world, which makes the ethics and principles throughout every corner of the enterprise management and exist the invisible and powerful control, so as to reduce the enterprise risk and create value for stakeholders. Because the enterprise ethics belongs to the category of spirit, its content is abstract, not easy to implement in the concrete actions, needs the carrier of internal control. Therefore, enterprise ethics can be introduced into the internal control of each link to make up for the internal control standard procedure not involved or lag in enterprise reform so as to make the enterprise behavior restricted by double constraints of ethics and institutional.

4 Evaluation Index System of Internal Control Based on Enterprise Ethics

4.1 Preliminary establishment

Table 1 Evaluation Index System of Internal Control Based on Enterprise Ethics

First class indicators	Second class indicators	Third class indicators
Internal environment (a ₁)	Enterprise governance (b ₁₁)	Board size(c ₁₁₁);Loyalty of board(c ₁₁₂);Due diligence of independent directors (c ₁₁₃)
	Enterprise strategy (b ₁₂)	Sharpness of the strategic objectives (c ₁₂₁); Degree of credibility of introducing strategic (c ₁₂₂); Realization of the company's business goals (c ₁₂₃)
	Ethics and values (b ₁₃)	Level of management morality (c ₁₃₁); Integrity of employee handbook and ethics norms(c ₁₃₂); Enterprises' care for employees (c ₁₃₃)
External ethics risk (a ₂)	Degree of the responsibility implementation for community (b ₂₁)	Actively handling enterprises' damage to the community (c ₂₁₁); Actively participate in community construction (c ₂₁₂); Participate in public welfare activities and charity (c ₂₁₃)
	Ethical responsibility of supplier (b ₂₂)	Vendor payment on schedule in a timely manner (c ₂₂₁); According to the rules to choose suppliers (c ₂₂₂);Establish long-term cooperation relations with suppliers (c ₂₂₃)
	Ethical responsibility of rivals (b ₂₃)	Not use unethical means to damage rivals' images (c ₂₃₁);Not through improper means to obtain the competition technical data (c ₂₃₂); Not conduct malicious competition to rivals by lower prices (c ₂₃₃)
	Ethical responsibility to the customer (b ₂₄)	Not false advertising (c ₂₄₁); Response to customer complaints quickly (c ₂₄₂); True disclosure of defect product information (c ₂₄₃)
Internal control activities (a ₃)	Incompatible positions and separation (b ₃₁)	Separation between feasibility analysis and decision-making (c ₃₁₁); Separation between examination and approval of the business (c ₃₁₂); Separation between implementation and supervision of the business (c ₃₁₅)
	Authorized examining and approving control (b ₃₂)	Soundness of authorized examining and approving system sound (c ₃₂₁); Frequency of Management authorization at will (c ₃₂₂); Major projects collective decision-making (c ₃₂₃)
	Accountant system control (b ₃₃)	Frequency of Accounting policy change (c ₃₃₁); Soundness of accounting manual accounting system (c ₃₃₂); Accounting personnel's quality (c ₃₃₃)
Information and communication (a ₄)	Transfer mechanism of internal report (b ₄₁)	Internal information generation and transmission in a timely manner (c ₄₁₁); Major or emergency rapid transfer (c ₄₁₂); Classified information confidential (c ₄₁₃)
	Information communication platform (b ₄₂)	Information sharing between departments at the same level (c ₄₂₁); Information communication between different levels and interaction (c ₄₂₂); Communication effect evaluation (c ₄₂₃)
Internal supervision (a ₅)	Organization of internal supervision (b ₅₁)	independence of the internal supervision mechanism (c ₅₁₁); competence of Supervise staffs; (c ₅₁₂); professional ethics of supervise staffs (c ₅₁₃)
	Assessment and accountability mechanism (b ₅₂)	Regular analysis of internal control implementation (c ₅₂₁); Recognition level of management to evaluation and improvement reports (c ₅₂₂); Follow-up rectification of the internal control defects (c ₅₂₃)

There are three kinds of way to select the internal control evaluation index: 1) from the perspective of objective results of internal control, if the internal control goal can be achieved, it is given to illustrate the effectiveness of the internal control for example Zhang Zhaoguo & Zhang Wangfeng (2010) established evaluation index system of internal control from five objective results and took external evaluation data availability into account; 2) refine Internal control elements and form the internal control evaluation index for example Chi Guohua & Guan Jianpeng (2011) set up four levels of evaluation index in logic framework of internal control elements; 3) Starting from the process of internal control, set up index evaluation, such as Wang Hailin (2009). Combining with five factors of COSO framework and the internal control basic norms issued by five ministries and commissions such as the ministry of finance, this paper preliminary builds index system as shown in table 1.

4.2 Structure equation modeling test

Structure Equation Modeling (SEM) can reveal the relationship between the variables which can't be measured accurately. This paper uses SPSS17.0 software for analyzing the reliability and validity of survey data and screens the internal control evaluation index based on enterprise ethics combining with AMOS17.0 construct structural equation model to test. Those are not able to be real and effective reflect the status of enterprise internal control running poor or representative indicators are weed out to reduce the index quantity, raise the efficiency and effectiveness of internal control evaluation.

1) Issuance of Questionnaires

Adopting 7 point scale measurement for each evaluation index design problems ,the internal control evaluation questionnaires are formed and distributed to enterprise internal control department or the internal audit department in the eight industries including machine manufacturing, food processing, auto manufacturing, textile garment industry, timber industry, medical instrument manufacturing industry of metal, smelting industry, etc., asking respondents with the method of score to importance representative and efficacy evaluation indexes for comments. The higher the score reflects the higher recognition on behalf of the respondents to the indicators in the evaluation of internal control. The total number of distributed questionnaires is 450 and the actual number of recovery is 340, which meets the requirements of data analysis basically.

2) Reliability Analysis of Questionnaires

Reliability Analysis is for the judgement of whether the data have stability and reliability. A reliability coefficient method of Cronbach's Alpha coefficient is used and a value of Cronbach's Alpha coefficient higher than 0.5 can be accepted in general. As shown with the output of SPSS software, the results of Cronbach's Alpha coefficient of third class indicators based on the standardized item is 0.802 reflecting relatively good reliability. The total correlation of indicators of c_{232} , c_{322} and c_{433} is less than 0.3 and after these three indicators is deleted, the degree of reliability is higher and the value of Cronbach's Alpha coefficient becomes 0.831.

3) Validity Analysis of Questionnaires

Validity reflects the reliability of measurement results and the readers of the object to be tested and it can be divided into the content validity and structure validity. Because the content of the questionnaire has been reviewed at the beginning of design, only structure validity analysis is needed in this paper. Structure validity usually uses the factor analysis method to carry on the analysis to determine whether the selected indicators consistent with the expected result. The collected sample data are randomly divided into two groups as group A and group B, each group contains 170 samples and group A is selected to factor analysis. The KMO value of in the overall questionnaire scale is 0.815 and the related significance probability (Sig) of the chi-square in Bartlett's sphere test is less than 0.001, which indicates that it's suitable for factor analysis.

Using SPSS software, the rotation matrix is obtained resulting from the factors of rotating components for the judgment of convergent validity and discriminant validity. The three-level indicators with factor loading coefficient less than 0.5 should be deleted and the rest indicators will be renamed using Z_{ij} for the second class and t_{ij} for the third class. The adjusted results are as enterprise governance (Z_{11} , including the original c_{111} , c_{112} , c_{113}), enterprise strategy (Z_{12} , including the original c_{121} , c_{122} , c_{123}), ethics and values (Z_{13} , including the original c_{131} , c_{132} , c_{133}), ethical responsibility of supplier (Z_{21} , including the original c_{211} , c_{212} , c_{213}), ethical responsibility to the customer (Z_{22} , including the original c_{241} , c_{242} , c_{243}), responsibility and authorization (Z_{31} , including the original c_{311} , c_{312} , c_{313}), accountant system control (Z_{32} , including the original c_{331} , c_{332} , c_{333}), information communication mechanism (Z_{41} , including the original c_{421} , c_{422} , c_{423}), Internal supervision and examination (Z_{51} , including the original c_{511} , c_{512} , c_{521}).

4) Structural equation modeling and analysis

Combined early indicators of processing, a structural equation model is built shown as figure 1, in which the graphical shade represents the variable measurement error or the error of the latent variables. Therefore, hypotheses are proposed as follows: the i th secondary internal control evaluation index has positive correlation with the enterprise internal control evaluation effectiveness (H_i); the j th third class internal control evaluation index has positive correlation with the i th secondary internal control evaluation index (H_{ij}). Import the data of group B data into AMOS17.0 software for low index analysis. Research shows that secondary evaluation index and third class evaluation index are presented positive correlation and the correlation coefficient are higher than 0.45. Take enterprise governance dimension for example as shown in table 2 that the path coefficient of board size index to corporate governance index is 0.57, the path coefficient of board loyalty index to corporate governance index is 0.52 and the path coefficient of due diligence of independent directors index to corporate governance index is 0.67, indicating that the selection of the third class indexes and corporate governance index have strong correlation, which can be well used to evaluate the condition of corporate governance.

Table 2 Corporate Governance Standardized Regression Coefficients

Hypothesis	Relationship	Standardized path coefficient	Value of P	Conclusion
H_{11}	$t_{111} \rightarrow Z_{11}$	0.57	***	Support
H_{12}	$t_{112} \rightarrow Z_{11}$	0.52	***	Support
H_{13}	$t_{113} \rightarrow Z_{11}$	0.67	***	Support

*** represents significant correlation in 0.001 significant level

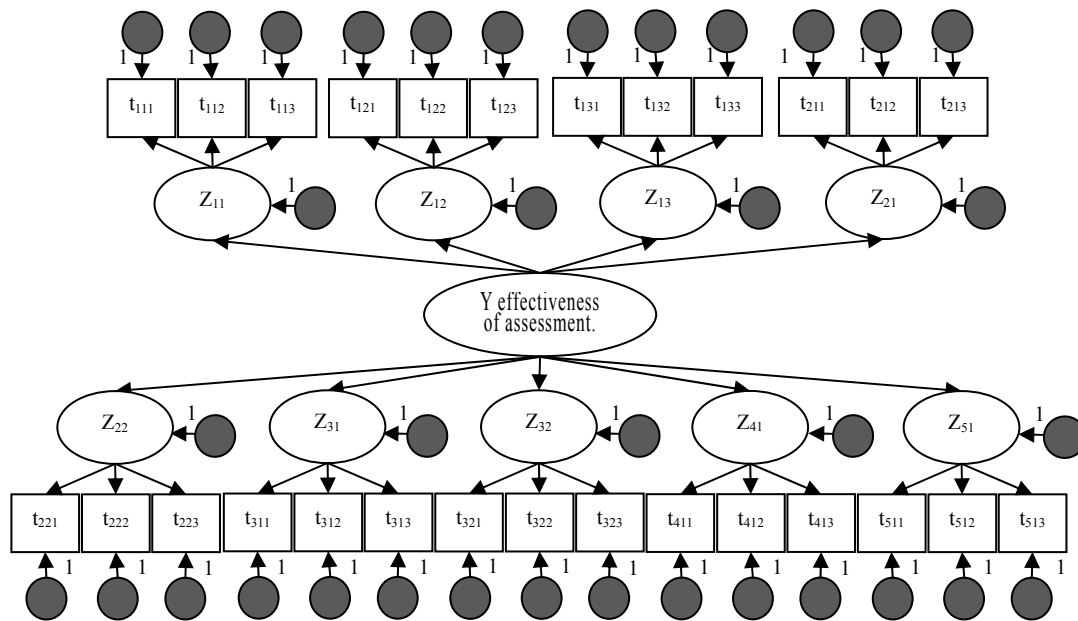

Figure 1 Evaluation Index of Structural Equation Model Test

High order index path coefficient is based on low index, reflecting the secondary indicators and on the basis of correlation between the effectiveness of the internal control evaluation. As shown in table 3, the value of P is less than 0.001 and each of the standardized path coefficients is higher than 0.5, which indicates that the selected indicators have certain representativeness and rationality to a certain extent and the evaluation index system of enterprise internal control is effective.

Table 3 Results of the High-order Factor Analysis

Hypothesis	Relationship	Standardized path coefficient	Value of P	Conclusion
H_1	$Z_{11} \rightarrow y$	0.54	***	Support
H_2	$Z_{12} \rightarrow y$	0.52	***	Support
H_3	$Z_{13} \rightarrow y$	0.58	***	Support
H_4	$Z_{21} \rightarrow y$	0.55	***	Support

H ₅	Z ₂₂ →y	0.69	***	Support
H ₆	Z ₃₁ →y	0.53	***	Support
H ₇	Z ₃₂ →y	0.60	***	Support
H ₈	Z ₄₁ →y	0.56	***	Support
H ₉	Z ₄₂ →y	0.62	***	Support

*** represents significant correlation in 0.001 significant level

From the final metrics, corporate governance is the highest level of internal control, coordinating the internal relations of interests of various bodies of institutional arrangements and corporate governance flaws and loopholes many bring fatal blow. Enterprise strategy is about the development direction, especially for manufacturing enterprises in the secondary transformation, which means the appropriateness of enterprise strategy choice will determine the future development space of the size and the persistence of the time. External ethical responsibility is inevitable requirement bring by the evolution of external environment and enterprises are no longer just responsible to the shareholders, but should also take other stakeholder needs into account. as mentioned in the COSO report, business control activities is to help management ensure policies and procedures of the instruction to be executed and incompatible positions and separation, authorized examining and approving control and accountant system control are is the most basic and the most universal in different enterprises control activities. Information communication is to ensure the business decisions required for the rapid generation and transmission of information, so that the enterprise can take quick reaction to the big event, thus the soundness of information communication platform is the important carrier of effective internal control. Additionally, assessment and accountability mechanism is an important part of the evaluation of internal control effectiveness. Internal control is an embedded system in the enterprise management activity and its effectiveness and continuous improvement depends on the assessment of internal control and responsibility mechanism. When lacking of the link of evaluation, the internal control system will lack of implementation and improvement, remaining the execution of internal control deviation and control error of the system itself is difficult to be uncorrected.

5 Conclusion

The selection of evaluation index has an influence on the evaluation results of enterprise internal control. Introducing enterprise ethics to internal control evaluation system can help to construct an evaluation index system of internal control to evaluate the effectiveness of enterprise internal control design and implementation and to exert an important guiding role in achieving the continuous improvement of enterprise internal control. This paper establishes a preliminary evaluation index system of internal control based on enterprise ethics and uses the structural equation modeling to conduct the empirical test, finally forms an evaluation index system including 5 first class indicators, 9 second class indicators and 27 third class indicators. Since enterprise internal control itself is a complex system, trying to construct a set of general evaluation index system of internal control must be a process of constant improvement and it remains to be further studied.

Innovations on Moral Consciousness Education and its Cultivating Principles*

Fan Chunli

School of Accounting, Zhongnan University of Economics and Law, Wuhan P. R. China, 430073
(E-mail: 70449642@qq.com)

Abstract: The history of human morality shows that morality develops from naturally and spontaneously to freely and consciously. During current social transition period in China, there exists some serious problems such as moral anomie and lack of good faith, thus cultivating moral consciousness has become a hot issue both in ideological and political education research. In this paper, according to the definition and development of morality and consciousness, it redefines the concept of moral consciousness and points out that moral consciousness has functions of cognition, education, evaluation as well as regulatory. It discusses the strategic significances of cultivating moral consciousness in order to promote human development under socialism, the construction of socialism with Chinese characteristics and the sustainable development of the society as a whole. It also proposes some basic principles in cultivating moral consciousness including adhering to Chinese characteristics; focusing on the pursuit of value and continuous innovation and compatibility; paying attention to its application and so on.

Key words: Moral consciousness; Subject development; Cultivating principles

1 Introduction

In the process of thoughts and ideas development, moral change and choice of conception guide every major change in human society. Each person, every nation and even the entire world are beginning to reflect, examine the morality under economic globalization and multiculturalism. The history of human morality shows that morality develops from naturally and spontaneously to freely and consciously. Or in other words, human morality has always been on the way to moral consciousness.

Under the background of global economic integration, Chinese society is facing profound changes in economic structure, social structure, pattern of interests and new ideas. Utilitarianism, libertarianism and so on all in different ways declined to reflect the market conceptions and invaded into everyday life in contemporary Chinese society. Different demands and different moral expressions clashed with each other. Ethical and moral problems were triggered by these collisions. Irritability and anxiety were deepened by social mood of moral alienation. Rational thinkers of public morality were excluded. In a word, there exists the phenomenon of moral anomie and lack of good faith in some areas. All these posed severe challenges on the construction of our common spiritual home. At the time when we should be vigilance of thoughts and behaviors dominated by economic interests and market-oriented ideology and when social moral status were asked and tortured repeatedly, people were often touched by some so called grassroots love and the most beautiful phenomenon. Relations among people are adjusted by moral code of conduct. The appeal of morality is expanding and the influence of morality will also continue to sublimate.

The report of 18th party congress lists significantly to enhance soft power of culture as one of the objectives of completing a comprehensive well-off society and of reform and opening, stresses to carry out the study and education of socialist core value system, to lead the socialist core value system as social thought, social cohesion and consensus. Mr. Fei Xiaotong in 1997 first proposed that in response to the trend of global integration, we should emphasize cultural consciousness. To strengthen the reflection on morality, we should note that moral consciousness was not only an important part of cultural consciousness, but also the first issue of basic research. Currently, according to the data of CNKI up to 2013, more and more papers focused on moral consciousness research. Since 1983 Chinese scholars have been studying on moral consciousness, which is basically consistent with China's reform and opening up. They mainly explained the current situation of social and moral changes with their academic sensitivity. Until 2000 the research on this area increases very slowly. Only 4 papers each year

* Research Project: 2015 Human and Social Science Research Project Sponsored by Hubei Provincial Department of Education : Cultivating Approaches of Socialist Core Values for College Students with Perspective of Moral Consciousness (Item No.15Z068)

on average chose moral consciousness as their main topics. Recently, especially after 2007, there were about 10 or more papers focused on moral consciousness and the number is increasing every year. Moral consciousness is gradually valued by academic research. Research groups and core authors have been come into being. Study subjects began to be diversified and research methods are also more suitable for research in this field.

2 Definition of Moral Consciousness and its Function

To discuss the issue of moral consciousness, we must firstly define moral consciousness, clarify the evolution of the conception, its meaning and content, which is also the start point for moral consciousness research.

Morality was accompanied by human generation. There were rich researches on ethical thoughts in ancient China. Kant often mixed ethic and morality and there was a clear separation between ethic and morality by Hegel. He believes that ethics are absolute objective idea, but mainly in the subjective moral aspect. According to Hegel, morality primarily includes your own subjective reflection, your own faith and universal reason to follow the will of decision, or universal obligation. According to Marx and Engels, they clearly attributed the morality to ideology. With the development of times, the word morality is generally used in social ideology. From the nature of the provisions, the so-called morality is the human reality, determined by economic relations with criteria to evaluate good and evil, relying on public opinion, inner conviction and traditional practices to maintain a type of social phenomenon. We believe that it is biased simply mixing morality with ideology. Morality should include not only the ideological level of thinking, understanding of spirit, but also the achievement of ethical behavior of moral subjects including individuals, ethical groups and system.

On the other hand, in Chinese the term consciousness comes from The Analects of Confucius. According to Confucian, freedom, spontaneity and repeatability are the basic feature of our daily life embodying empiricism, inertia of common sense thinking and dominated by lust, instinct, kinship, clan and other natural emotions. With respect to spontaneity, consciousness represents the inner self-discovery, self-liberation and external innovation. Consciousness should go beyond thinking on creative behavior. Therefore, consciousness, from the point of view of ideological and political education, is the reflection of people's mental state and behavior state.

In summary, we can conclude that, moral consciousness means self-awareness, self-reflection, self-creating and self-enforcement including morality and conscious purposes. Thus, moral consciousness has functions of cognitive, education, evaluation and regulation, which can promote the individual initiative to understand the law of moral life, standard practice in moral life and the initiative to understand themselves, their own sense of family to others, to social responsibility and obligation to the country. It could help people to educate themselves, to establish a correct duty, honor, justice and happiness and other conceptions, to cultivate good moral consciousness, moral and ethical behavior, to become a moral purity, ideal noble person, to enhance the force of moral judgment of social members, to evaluate the reality, to form a huge social force and people's inner strength of will, to help people to adjust their behavior according to socially accepted moral standards timely, to guide and correct people's behavior, to regulate the relationship of people, nature and society and to promote social improvement and harmony.

3 Strategic Importance of Cultivating Moral Consciousness

Morality is non-mandatory and can only rely on people's consciousness and public opinion. To cultivate a high degree of moral consciousness is an important task of ideological and political education and a positive respond to the ideological and political education of social reality. Only through cultivating people's moral consciousness could promote the comprehensive development of a person, the social harmony and stability and the long civilization of the world.

3.1 An inevitable requirement of moral subject development

The morality distinguish human from animal. From the relations of morality and human, the main purpose of moral study is to investigate the essential characteristics of human activities and the relevant provisions. The moral consciousness is human consciousness and the moral consciousness is the need of people as a moral subject of development. President Xi Jinping in 2009 ever stressed the need to strengthen the moral training of young cadres, to guide them to cherish personality, reputation and image, to enhance sense of moral responsibility and courage them to be responsible for the force entrants, courtesy and honesty, law-abiding pioneer and leader of life decent, fun and healthy. To

cultivate high degree of moral consciousness, it will promote the socialist core value system to deeply root in people's heart and to improve the quality and degree of social civilization and civilized citizens significantly.

Construction of moral consciousness is a prerequisite of good moral character, which means that an individual's moral quality will manifest the moral stability and tendency. They are habits of certain social forces in accordance with the will of choosing according to the formation of social ethics. To have high moral quality, we must cultivate a high degree of moral consciousness. How to nurture civic consciousness of socialist morality so that people could realize the relationship, the developing mode and activities of their own, of others, of the community, of the nature is the most fundamental moral personality issue. Then people could stick with ethical behavior, overcome the moral blind, build moral feeling, clarify moral confusion, enhance moral judgments, rectify moral redress from the strengthening of moral internalization, promote the ethical practice of knowing and doing, and develop moral habits.

Moral consciousness is the cornerstone of human spiritual world. The human spiritual world refers to the sum of knowledge, feelings, consciousness and other states displayed in the process of transforming the subjective world. Moral consciousness is the most concentrated expressing of knowledge, emotion and basic consciousness in the spiritual world. Moral consciousness needs to achieve rational moral awareness, persistent pursuit of moral and ethical behavior. It helps people to form a rational and social psychology, to establish a correct outlook on life, values, and unswervingly to uplift spirit for the building of a modern socialist country with Chinese characteristics common ideal and the realization of communism conviction.

Moral consciousness promotes the comprehensive development of people. Marxism, from the analysis in the relations between real people and real production, points out that a comprehensive human development is people's fully physical, intellectual, free and harmonious development. Moral freedom is the basis of freedom and free-hearted owner. In the process of achieving moral consciousness, by understanding their own moral and ethical conduct through proper reflection, evaluation, selection, practice, it will help to promote human comprehensive sustainable development by improving people's self-awareness, sound mind, analytical skills and intellectual level.

3.2 Exploration of deepening moral education

Moral education is the foundation of ideological and political education and we must actively respond to major theoretical and practical issues of economic and social development. Moral consciousness provides a new start point for proposing the deepening research on moral education. Cultivation of moral consciousness requires us to effectively reflect moral education, to reinterpret fundamental purpose, content carrier, modes and methods of moral education, to promote the development of moral education research from the perspective of cultivating moral consciousness.

Cultivation of moral consciousness is to adapt the new changing requirements of moral education elements. The current status of moral reality shows the mismatch phenomenon of China's moral education and raises a higher requirement for moral education. Education should not just instill some moral knowledge. Main object relations of moral education, content, methods and means all must be innovated. People's increasing awareness of equality challenged the authority of previous educators. It is an equal relationship between the educator and the educated. Moral confusions, decision-making complexity of people's behavior and choice, call for a wide range of forms and methods of moral education. This requires that the educators' main task is to guide and promote the active participation of the educated to moral education process in order to be inspired by educators' moral consciousness.

Cultivating moral consciousness is the response of enhancement of the timeliness of moral education. With the intense social change, everyday moral event undoubtedly provides the best material for moral education. The speed and frequency of social moral events increase the timeliness and effectiveness of moral education. Moral education is the main object of moral development. The purpose of moral education is to help the moral subjects to form correct moral and ethical values and behaviors, and consciously resist the erosion of bad moral thought accordingly. Moral education itself persuades and influences the contents and the implementation of moral education, which evoke the inner moral consciousness of the people.

3.3 Strategic needs of continued social progress

Morality is a basic consensus and spirit of the bottom line for a heritage, healthy and harmonious society. As a social ideology close to economic basis, moral status reflects the social and economic changes. To cultivate moral consciousness, we must base on lively social reality and social life, and strongly respond to new situations and new problems, new features and new trends that occur in social development process.

Moral consciousness research can promote the creation of a harmonious and orderly society. Morality is essential to maintain social ties. Building socialist harmonious society is not to eliminate social conflicts, but to contain and resolve social conflicts. Xi Jinping pointed out that when interests were coordinated, thoughts were rationalized, social development could be obtained in a timely manner to resolve the instability. Various conflicts could be effectively groomed and social harmony would have a solid foundation. Thus, in-depth, comprehensive, systematic study of moral consciousness is an important way to achieve social consensus, to enhance social forces, promote and deepen social construction so as to ensure the healthy social operation and social harmony.

Moral consciousness will promote the implication of virtue strategies. Marxism, combined with the rule of law and by virtue, is the basic principles and theoretical achievements in China. The right thought grasped by the masses will become the material force to transform the society and the world. Only by correctly solving ideas, views, position issues could stimulate people's enthusiasm for socialism and fundamentally promote and ensure the party's program and course implementation. Morality requires systematic and comprehensive study of moral consciousness. Global communication in the event of Western morality under modern context, through a variety of moral reflection, scientific understanding of the essence of morality, could correctly help to understand ethical standards, to promote socialist morality and socialist core values, to adhere the route of socialism with Chinese characteristics, to build a moderately prosperous society and a democratic, civilized and harmonious modern socialist country with great practical significance.

Moral consciousness research will drive overall sustainable development of society. Morality coordinates the relations of people, between people and society, between nation and state, between people and nature. In the long run, studying on moral consciousness not only relates to the spiritual civilization, but also the material civilization; not only relates to the current social development, but also the sustainable development of society. In all aspects of economic construction, political construction, cultural construction, social construction and ecological civilization construction, cultivating people's moral consciousness will help people to create a good family formation, career, civic and moral quality, to improve market economy, science and technology, ecology, moral status of the network and other areas, to achieve a comprehensive coordinated sustainable development of human society. It has a worldwide significance.

4 Principles of Cultivating Moral Consciousness

To cultivate a high degree of moral consciousness, we must aim to foster self-esteem, rational calm and positive social attitude. It plays a basic role in rejuvenating the culture, enhancing the international influence of national moral and cultural values, achieving the great rejuvenation of the Chinese nation. At this level, moral consciousness seriously answered exactly what we should have as a fashion and spirit, and should be able to open the way to foster such moral. In the new era of Socialist members of nurturing moral consciousness of society, we must overcome the experience of westernized, mysterious blur of generalization and so indiscriminate tendency to stick with Chinese characteristics, focus on the pursuit of value, continuous innovation and attention to applicable compatible with a degree in principle.

4.1 Be with Chinese characteristics

To cultivate moral consciousness with Chinese characteristics, the process must be on the moral development of innovation and in the future it must have a full understanding, in particular it must strengthen the ethical standards of Chinese civilization changes in education, understand the Chinese moral tradition, cherish national culture and moral traditions. The time dimension has also cultivated moral consciousness. Different ages have different moral standards. Only understand Chinese modern era of moral development can we value in line with the present individual pursuit of morality and in the internal point of self-awareness, self-reflection, self-perception, the foreign viewpoint of social and moral self-awareness, self-evaluation. The need to make the final approval from the heart of Honor and Disgrace in the current era, strengthens social morality, professional ethics and family virtues and individual moral character.

To cultivate moral consciousness with Chinese characteristics, we must co-exist in a world of various different morals, recognize and establish our own moral positions, which have a spatial dimension of moral consciousness. Different countries have different moral values. Morality ultimately belongs to the category of ideology, and is determined by certain economic basis of society, and serves to a certain degree of social and economic infrastructure and services. To achieve moral consciousness,

we must first understand the multicultural world in different moralities. Western modernity as instrumental rationality considers morality as ethics of post-modernism, freedom law, which is different from that of East Asian countries that are similar in common Confucian cultural background. The difference is the objective reality of social existence, diverse social development and inevitable trend. We should respect differences, respect the masses on ideology, values differences; allow diversity to establish symbiotic diversity. Ideological and cultural diversity in the field of human society is a normal state. A variety of social thought promoting the emancipation of the mind inspire the vitality of the community; promote innovation theory, science and technology, culture and other aspects. Only initiatively understanding the various ethics could we have confidence to confirm the position of moral standards with Chinese characteristics in line with China's actual identity of the socialist ethical standards through autonomous adaptation, innovation and courage. It's also good to learn all the outstanding achievements of civilization created by mankind, to learn the spirit of having his country's moral standards in universal values to achieve moral self-confidence on the basis of moral consciousness, moral self-improvement, to enhance the international influence of national moral and cultural values.

4.2 Concern the pursuit of value

Marxism has always stressed that the status of human subjectivity in understanding and practice in activities. To cultivate moral consciousness, we must reflect the intrinsic value of the pursuit. To comprehensively improve the quality of civic morality is the basic task of socialist moral construction. To promote civic morality, we must cultivate a high degree of moral consciousness. To cultivate moral consciousness is the essence of our lives guiding individual's self-awakening, self-reflection, self-creating, pro-active moral reflection and improving personal moral consciousness as people implementing outstanding ethical behavior habits rather than passive behavior in line with regulatory requirements.

The 18th party congress put forward the strategic goal of socialism with Chinese characteristics, that is, in the centenary of its founding, building a moderately prosperous society; at the time of the founding of the centenary, becoming a prosperous, powerful, democratic, civilized and harmonious modern socialist country. Cultivation of moral consciousness requires us to consciously respond to the times, through a five in one process building in all areas to build various aspects of moral consciousness including: to provide value to coordinate economic development, to specify ethics direction; to expand scientific and technological development of moral criticism and ethical reflection; to analysis narrow human anatomy center stance, to participate in the construction of ecological civilization, to advocate environment-friendly, ecological principle of fairness.

To cultivate moral consciousness, we must actively respond to the real hot events such as series of successful best case advocated by the network, moral hazard events causing great social debate. We must study the effects of these phenomena on social individuals; analyze the root causes of the initiative to guide people to the social phenomenon of moral understanding, evaluation, reflection, purpose and to plan socialist core values to go through people's daily lives, to highlight the good and the beautiful.

4.3 Continuously innovate and be compatible

To cultivate moral consciousness, we must face different moral values. To strengthen the moral self-confidence such as believing in and sticking to our own moral and cultural superiority and superior in comparison, we must put our efforts to strengthen the socialist concept of honor as the core of moral consciousness. In comparing openness and tolerance, constructive dialogue, absorbing, focusing on cultivating moral consciousness means of modernization, we must understand a language accepted by the world socialist core moral concise. In comparison with the times, we must break the insularity of private position, independent innovation, theoretical innovation and maintain inexhaustible momentum.

We must pay attention to cultivate moral consciousness implicit methods. Cultivate a high degree of moral consciousness, we should pay attention to the formal, compassionate care and psychological counseling, the practice of habituation. We must deepen the masses to build spiritual civilization, extensive volunteer service; promote learning from Lei Feng activities; learn publicity moral model normalization. Last but not least, we should organize diverse cultural activities and networking, and guide the masses of self-expression, self-education, self-awareness, and consciously resist the adverse impact of value orientation.

4.4 Be applicable

To cultivate moral consciousness, we must prevent the pan moral. Cultivating moral consciousness is thought mainly to adjust the internal of the people, plus the moral relativity of certain properties. Its function is not unlimited. If we exaggerated moral consciousness function, we often got counterproductive. Cultivation of moral consciousness includes to foster individual moral introspection

and external audits on two levels. If we put the moral criticism to the extreme, to the lives of others and carry out any social phenomena pan-moral criticism, it will inevitably lead to confrontation between people, cause people to doubt moral state, increase moral anxiety, undermine social cohesion. If we attribute economic political and legal culture and social issues to the issue of moral consciousness, it will easily lead people to doubt the moral standards, increase pessimism emotional and deepen social alienation.

To cultivate a high degree of moral consciousness, we cannot ignore the importance of the legal rules. Moral consciousness through personal self-reflection, the value of the times to respond to public opinion, individual conscience and other non-coercive power plays an important role; and the law is to ensure the implementation of the national force in order to adjust the behavior of both legal and illegal relations as the basic category, management of social order. Morality and law are parallel regulators of social norms and indispensable. The law is above all the bottom line and is the higher moral standard of social rules. If we exaggerated function of moral consciousness, contrary to the spirit of the rule of law, the rule of law will be stagnated and will result in the constraints of social stability and development.

5 Conclusion

The history of human morality shows that morality develops from naturally and spontaneously to freely and consciously. During the current social transition period in China, there exists some serious problems such as moral anomie and lack of good faith, thus cultivating moral consciousness has become a hot issue both in ideological and political education research. In this paper, according to the definition and their development of morality and consciousness, we redefine the concept of moral consciousness and points out that moral consciousness has functions of cognition, education, evaluation as well as regulatory. It discusses the strategic significances of innovation and cultivating moral consciousness in order to promote human development under socialism, the construction of socialism with Chinese characteristics and the sustainable development of the society as a whole. It also proposes some basic principles in cultivating moral consciousness, including adhering to Chinese characteristics; focusing on the pursuit of value and continuous innovation and compatibility; paying attention to its application and so on.

Research on Management Innovation of Talents Introduction in Colleges

Fang Wei

Department of Human Resources, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 3033523@qq.com)

Abstract: In recent years, colleges develop dramatically and talents introduction becomes a significant part. This paper aims to offer some advises on preceding investigation and posterior supervision based on the existing problems in talents introduction, and conclude that talents introduction should be beneficial to colleges progress, echelon building of talents and disciplinary development, to find a series of new methods of talents assessment and management.

Key words: Talents introduction; Management innovation; Investigation; Colleges

1 Introduction

21st century is a time when talents compete intensely. For colleges, discipline is laying the foundation but talents are playing the key part, that is, the quality and quantity of talents decide colleges' comprehensive strength and prospect. According to the demand of teaching and scientific research, teachers are introduced or hired, becoming the important part of faculty building. For the past few years, talents introduction in colleges develops well in both quality and quantity. On one hand, fresh blood is injected in faculty, improving the problems lying in education background, professional title and age and also bringing different teaching theory, on the other hand, there are some defects in management, such as defective hiring formalities and unsound assessment and motivation mechanism, which influence the effects of talents introduction. Starting from solving these problems, this paper discusses how to introduce talents and perfect the management.

2 Background

2.1 No scientific assessment and rational programming

There are no scientific forecast to talents demand and assessment to talents introduction, making the talents unable to develop their wisdom and intelligence, kind of a waste for colleges. Generally speaking, talents who have good background and high professional title are preferable without being assessed on their practical teaching and scientific research. On no basis of academic progress and faculty construction will make the talents introduction blind and short-sighted, squandering human resources and preventing the colleges' overall aims from being realized.

2.2 No favorable environment to retain talents

Talents value much the working environment of the college, including respect on their givings, good working conditions and liberal academic space. In fact, all of these factors are affecting their working enthusiasm. Firstly, preferential treatment is a blank check, big gap with the promises in introduction, resulting in the distrust to colleges. Secondly, colleges haven't dealt with the relations between talents, who have great difficulty in college identification because of the unbalanced state of mind. Thirdly, the defective recruitment mechanism and competition system prevent them from initiating their intelligence.

2.3 No talents introduction cost accounting and lower benefit

The cost includes manpower, material resources and financial resources and talents with high-quality are the goal or the benefits. Strong sense of benefits must be built for talents introduction is human resource development. In fact, because of no cost accounting and irrational recruitment process, all of the cost waste for nothing.

3 Management Innovation

3.1 Multi-channel recruitment process innovation

Recruiting is the premise and primary step, from position analysis, condition analysis, recruitment in formation release to talents assessment.

3.1.1 Scientific planning attracts talents

The plan is the basis and attached to the overall layout of the colleges. There are 4 principles: first, following the scientific development perspective; second, working things selectively; third, building discipline echelon personnel; fourth, systematical analysis on position demands. For talents introduction,

formulating the plan should associate with the discipline building, defining the faculty construction and analyzing the status of talent team. Accordingly, the talents introduction principles should be made out of actual needs.

3.1.2 Making full use of modern communication means to release information

More publicity means good advertisement on the colleges and wide social influence. Releasing information on careers fairs or internet improve publicity and using media reports broaden introduction channel to academies and all social sectors.

3.1.3 Exploring the new introduction approach

The competitive talents development situation asks for innovation and new forms in bringing in talents. Flexibility in talents introduction is attached much importance, for example, hiring adjunct professors, relieving the talents shortage of colleges in inferior position and discipline. Thus, this approach enhances the competitive strength of colleges, lowers the cost and promotes the social talent resource sharing .

3.1.4 Improving talents assessment and investigation

Upon talents introduction, colleges should make profound investigation and assessment accordingly under the supervision of sophisticated administrators in functional department and professional teaching supervisors. Through trial lecture, he or she will be evaluated on the specialized knowledge, potential in academic research, initiative spirit and team work. Except for that, they will also investigated on their political caliber, professional ethics and personal quality. If necessary, personnel department invite experts and scholars to discuss their academic capability.

3.2 Incentive mechanism and assessment innovation

The management and utilization of talents is another key point in talents introduction, better way to stimulate their enthusiasm and initiative and increase benefits.

According to Maslow, people have 5 kinds of needs: physical needs, safety, social needs, self-esteem, self-actualization needs (as follow).

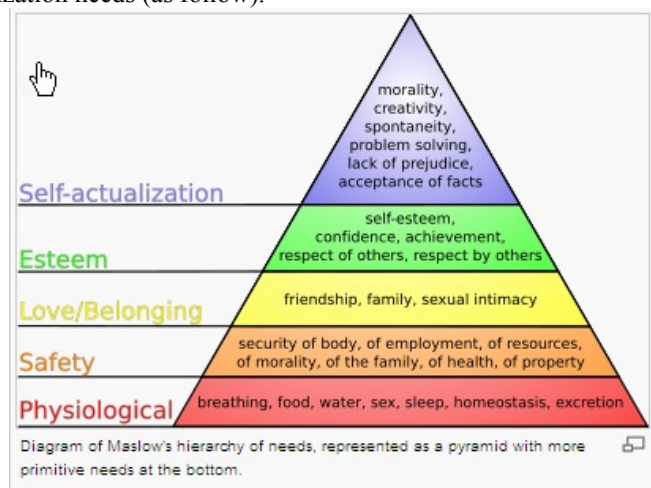

Figure 1 Maslow's Hierarchy of Needs

For teachers, their needs can be featured as prior spiritual needs, strong achievement needs, deep self-esteem needs and spiritually abundant physical needs. All the colleges have formulated preferential policies, such as settling-in allowance, scientific research start-up funding and family members settling-in in order to meet the basic needs of the introduced talents, who have strong achievement motivation and self-fulfillment needs, therefore, it is more important to build a free and lively academic environment and policy conditions for attracting and retaining talents.

3.2.1 Creating favorable working environment

Favorable working environment is beneficial to developing talents potential. Colleges should keep their promise and follow the articles of agreement, offering them settling-in allowance and hardware and software, endowing them some rights for exploring their capability, saving enough space for their assignments, aiding them to handle the relations for fear of the psychological imbalance in those within campus because of the different preferential policies, building liaison system with college authorities so that they can keep in firm touch with high-level talents' opinions and advises and take their needs into consideration and retain them.

3.2.2 Adopting flexible position recruitment system

Based on public recruitment, equal competition and talents first, the system should be formulated on the performance and achievements, fully defining the principles. By means of lower position, higher space and flexible assessment, some genuine talents will stand out, effectively avoiding the defective hierarchy in campus, strongly strengthening the incentive system of equal competition.

3.2.3 Establishing fair and valid performance assessment system

Except for the appropriate performance evaluation, the system should stand on motivating abilities development and career plan according to their abilities and performances. In colleges, professional titles evaluation and employment, administrative duties appointment and dismissal, and internal subsidy allocation are the main management elements of leading role, which are supposed to be strict and standardized for building the performance-oriented, fair competition and aggressive environment, helping them self-actualize with preferential allocation, financial support in research and understanding in mentality.

3.2.4 Stress on talents cultivation and rational flow

With the rapid development of discipline and updating of the knowledge, talents are also in great need of updating their knowledge. Meantime, objectively speaking, talents rational flow is helpful for human resources efficient allocation in universities and to the utmost extent exploiting their potential, appreciating the whole social human resources.

4 Conclusion

Talents introduction is the first step of human resource management and the key issue of colleges progress. Only through management innovation and higher benefits of talents introduction will colleges win in the talents competition. The development of modern times requires the colleges to be bound to explore all kinds of methods, improve related policies, make deep reform, and build personnel management system under socialist market economy. Forming fairly competitive, standardized and scientifically efficient talents introduction mechanism is going to refuel the construction of colleges and the development of higher education.

Research on Development Path of High-Tech Industries in University Town

Chen Chao

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 317216058@qq.com)

Abstract: The University Town (UT) is targeted for the city in which a multitude of universities are located. With the development of modern society, universities have gradually transformed from single-purpose academic organizations to multi-purpose unions of scientific research and development, achievement transformation and incubation, enterprise consulting, training, etc. The transformation of universities also accelerates the development of high-tech industries. This paper elaborates the development path selection of high-tech industries in UT from three aspects: successful cases, institutional innovation and development trends.

Key words: University town; High-tech industries; City functions; High-tech development parks

1 Introduction

With the rapid development of modern cities, re-innovation becomes the dominant impetus factor for economic development. Thus, universities inevitably become the main force source of scientific innovation. The establishing of UT strengthens the relationship between universities and the economic development in cities, and makes universities become the core organization and impulse for the city development. For this reason, the establishing of UT can rebuild traditional industries through the innovation in knowledge, science and technology. Further, emerging industry in UT can be developed for the demand of society and guiding consumption by high-tech means. Thus, the transformation and upgrading of the industrial structure in UT can be accelerated. The pattern and quality of economic development can be transformed and improved respectively, and then the target of industrial development can be achieved.

2 Analysis of High-Tech Industries' Development Path

Because UT is the knowledge intensive region, the motive power of UT is included by knowledge innovation and scientific research. Advanced science and technology are widely required not only as a support for openness, sociability, marketization and industrialization of UT, but also for developing the ideas of cultural and innovative engineering to upgrade the industries. In the situation of new economy, the trend shows that technical innovation and knowledge innovation obviously interweave. The preceding steps of technical innovation extend into the procedure of scientific transformation. Meanwhile, knowledge innovation extends into the field in which scientific knowledge is transformed into productivity. In sum, the establish of UT offers the cities more industrial support and plays more and more important role in the improvement of industries in the city and the fostering of new economic growth. The primary architecture of the research is depicted in Figure 1.

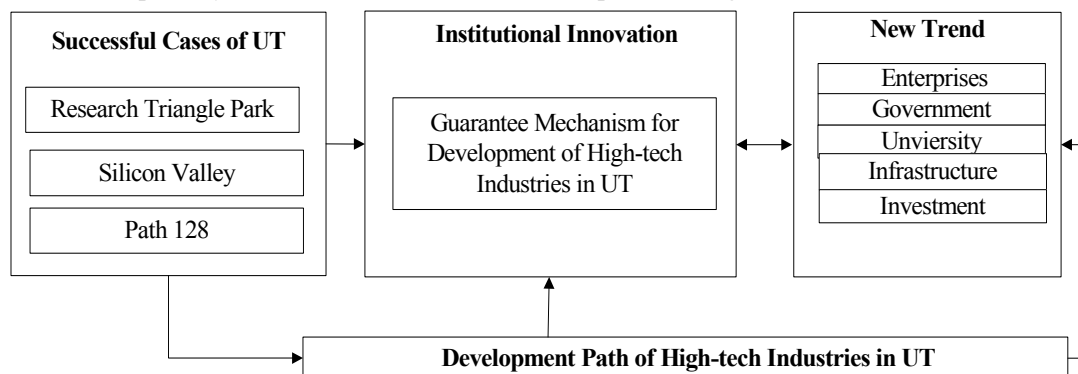

Figure 1 Primary Architecture of Development Path of High-Tech Industries in UT

2.1 Successful cases in USA

- 1) A paragon of the collaboration among government, business and academia

The Research Triangle Park (RTP) is located at the geographic central area among Durham, Chapel Hill and Raleigh in North Carolina USA. Duke University (Durham), University of North Carolina (Chapel Hill), North Carolina State University (Raleigh) and a number of community colleges are located around RTP. Therefore, RTP is also the geographic center of the three famous universities, which is the origin of the name of RTP. RTP first establishes in 1959 and initiates by academic, industrial and commercial circles. RTP betakes itself to attracting high-tech research and development organizations which have world class and greatly promising, and offers necessary services for the initial and elementary stage of the industrialization of the organizations. The management and operation organization of RTP is the Research Triangle Foundation mainly originated by Duke University, University of North Carolina and North Carolina State University. Since the establishment of RTP, the three universities have become its strong backup based on which market opportunities, research and development systems and the quality of talent are accumulated. Consequently, RTP has become a paradise of scientists, engineers, entrepreneurs, companies and organizations. It also has become a paragon of the collaboration among government, business and academia in the development of worldwide high-tech industries.

2) The Miracle of Silicon Valley and Path 128

In USA, there are two areas where high-tech industries are densely located with higher level and larger scale than RTP. The one is Silicon Valley in California with Stanford University, UC Berkeley, California State University and the California Community College System. The other one is the Path 128 zone with a number of famous universities such as Harvard University, MIT, etc. in the Boston area. Without exception, technology talent and high-tech industries zones are established around universities in these regions. Moreover, the collaboration between regions and universities strengthens the universities' function of supporting high-tech industries. As a result, the development of the cities and regions are pushed forward. For example, the Stanford Research Park is also one of the earliest high-tech industries zones in USA, and has become a significant form and approach of the collaboration between Stanford University and the high-tech enterprises in the region. Meanwhile, other state universities and community colleges play a greatly important role in technical training. Saying without exaggeration, the new economy of the United States are derived from these universities and the zones where high-tech industries are densely located.

2.2 Institutional innovation: guarantee mechanism for development of High-Tech industries in UT

In the domestic and international practice of developing high-tech industries, a great deal of exemplary successful experience can be obtained. For example, Silicon Valley, Path 128 zone and RTP are all originated from regional top-rank universities in USA. Top-rank universities and community college systems become the core resource of the technical innovation and training in the development of high-tech industries in cities and regions. Meanwhile, for the purpose of making UT the most important incubation garden for the development of high-tech industries, municipal functionality innovation should also be pushed forward. It is an important innovative features that UT becomes the technological innovation center of high-tech industry of city. In addition, the market-oriented association and cooperation between university-based academic institutions, the business community and the government shows great effects. Therefore, it has become an important model that promoting the development pattern transformation of the UT to upgrade the industrial structure by the cooperation of the government, business and universities and research institutions. And for the innovative features of UT as the incubator for high-tech industries, the system and environmental innovation that suitable for the high-tech industry is the basis.

From the city and high-tech industry development, the high-tech parks or similar business parks has been becoming an important driving force for the development of UT since the early 1990s. A variety of high-tech industries and service organizations such as high-tech parks, college students entrepreneurship parks and returned overseas business services Parks has been established at present. In fact, Beijing, Shanghai, Guangzhou, Wuhan, Nanjing, Xi'an, Chongqing and other large & medium-size cities have intensive universities and research institutions, which is a significant feature of UT to realize the innovation of high-tech cities. However, these UT do not give full play to its advantages. And people always emphasize the gap of high-tech between China and developed countries, but they ignore the mechanism defect. Therefore, the key of interactive development between high-tech of UT and city is the innovation of urban functions, which forms a complete set of high-tech innovation, market adaptation and industrialization mechanism. For high-tech industrial parks and business parks, the most important thing is not to lead the venture capital firms, grasping the project by the government, but firstly to promote the innovative features of city, create the venture capital investment environment that

suitable for high-tech industries, and establish of the comprehensive advantages of city development to promote restructuring and upgrading of city industrial structure.

2.3 New trend of High-Tech industry development of UT

The high-tech industries development of UT needs to make efforts in the following directions at present. First, it should be clarity that the main body of innovation is enterprises, and the positive interaction between enterprises and universities should be established. Through the establishment of an effective mechanism of Industry-Academy-Research, the investment (venture capital, etc.) on the university and research institutions will play skillfully deflected role. Second, the infrastructure for high-tech transformation should be established, such as incubators and pilot base. If UT wants to foster technology companies have independent intellectual property rights, it is necessary to build the high-tech development parks (Science Park, Innovation Center), which will provide a suitable hardware and software environment for startup of original technological feats, and not just stay in the traditional patterns. The growth of private small and medium technology enterprises should be concerned, which are the most effective way for high-tech incubators. Third, the establishment of multi-level and multi-channel technology investment and financing system should be developed to increase R&D funding. In addition to raise R&D funding by enterprises themselves, the external funding also should be fully utilized. The pluralistic financing system by government, enterprises, financial institutions, individuals and foreign investment should be established. UT should actively create a favorable external venture investment environment for the industrialization of high-tech, improve the standard market system for the venture investment and guide the multi-channel, multi-level investment for high-tech industries.

3 Conclusion

UT can transform traditional industries by the innovation of science and technology, develop emerging industries making use of high technology that required by social development and consumer demand, transform and upgrade the industrial structure as soon as possible. Then, the economic development mode and the quality of economic can be improved to realize city industrial development target, thus the virtuous development of economic, social culture and ecology will be promoted. The successful cases of high-tech industry by UT in United States-USA "triangle" Science and Technology Park, the "Silicon Valley" and "Path 128" miracle, are the high-tech industry collaboration model of the government-business-academia in the world. America's new economy is basically generated in these universities and high-tech industry-intensive region.

The key for UT to achieve high-tech and interactive development of the city is the innovation of city functions, which forms a complete set mechanisms of high-tech innovation, market and industrialization. It creates a good venture capital investments environment for the development of high-tech industries, establishes the comprehensive advantages of city development.

The high-tech industries of UT need to make efforts in the following directions at present. First, it should be clarity that the main body of innovation is enterprises, and the positive interaction between enterprises and universities should be established. Second, the infrastructure for high-tech transformation should be established, such as incubators and pilot base. Third, the establishment of multi-level and multi-channel technology investment and financing system to increase R&D funding.

Design and Implementation of Large Instrument Platform of Wuhan University of Technology

Peng Minhong, Zhang Lijun
Centre for Materials Research and Analysis, Wuhan University of Technology,
Wuhan, P.R.China, 430070
(E-mail: pengmh@whut.edu.cn)

Abstract: It is a powerful mean to construct a sharing platform for large-scale instruments and equipment in universities, which is able to use limited resources effectively and efficiently. This paper mainly presents the design goal, design principle, and multi-function of sharing platform in Wuhan University of Technology. It has made the transition from traditional manual management to network information management possible, as well as provided the detailed scientific basis for effective macro-management, construction and development in labs. It will also provide a unique hands-on experience of using the construction experience of each modular and the reserved interface to satisfy individual requirements for constructing the sharing platforms in any other field.

Key words: Large-scale instruments; Sharing platform; Practice; Multi-level management system

1 Introduction

In recent years, the government raises investments in the field of scientific research of universities^[1]. Currently the number of large-scale instruments is increasing, but the existing instruments didn't fully play their roles^[2]. Some departments of government and universities are actively exploring the construction and innovation of the opening and sharing mechanism and promoting the construction of instrument resources developing and sharing system to make use of resource integration, development and sharing^[3-4]. Many universities have developed sustainable research and innovation for large-scale instruments opening and sharing, and it has formed a series of effective policies and measures^[5]. The construction of sharing platform can bring a lot of benefits to universities, such as taking advantage of large-scale instrument resources, achieving high quality resource sharing, increasing instruments using efficiency, and playing more important role in education, scientific research and innovation in the future^[6]. Many universities have successively launched construction of large-scale instrument sharing platform. But many platforms only provide the function of information consultation and online reserve, but the deep test service and standard management procedures have not been finished. Only the combination of most advanced instruments and management concept can create first-class academic research environment and train up first-class talents^[7-8]. By the end of 2013, Wuhan University of Technology has established large-scale instruments opening and sharing platform which possesses instruments management, lab management and metrological certification. This paper mainly introduces the software function of the platform.

2 System Design Goal and Principle

2.1 Design goal

The design goal of this system is to establish an intelligent management system, which combines the software with the hardware, possesses excellent compatibility and has a strong scalability. As a management core of the whole centre, the system will have the functions of information disclosure, user authorization, user records, reservation and charge, environment monitor, statistics report forms, etc. It will not only provide convenient and fast service for users but also offer paperless easy-operated management environment for administrators, so the public lab resource can be used fully and economically.

2.2 Design principles

System design reflects the following principles:

1) The advancement principle; 2) The economy principle; 3) The stability principle; 4) The scalability principle; 5) The safety principle; 6) The openness principle; 7) The usability principle.

3 System Constitution

The system combined the management system with hardware equipment. The management system includes authorization system, multi-level user authority management system, multi-level instruments

authority management system, equipment management/ booking/ using system, charging system, file sharing system and report and results management system. The hardware includes power supply controller and IC card.

4 Multi-layer Function Structure

4.1 Client authorization system

As the core of the whole platform, client authorization system adopts centralized authentication strategy based on network. Clients can freely log into the platform and visit allowed resources at any time and place.

4.1.1 Multi-level authorization

This system can be designed to flexibly define the permissions of the administrators and users. For example, the instrument management platform can be divided into several sub-platforms, such as facility office administrator, school administrator, department/ institute administrator, instruments administrator, laboratory manager, etc.

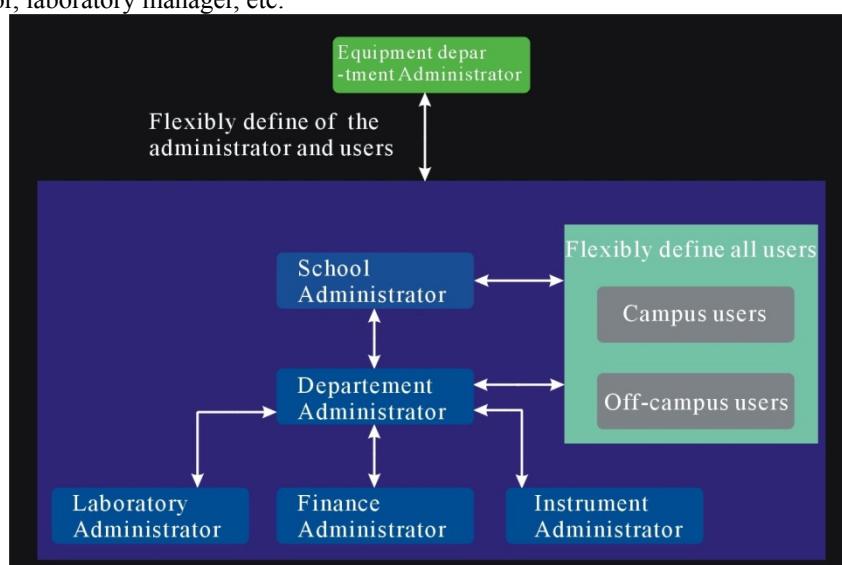

Figure 1 Multi-level Management Design

Ordinary users need to register and apply to administrator to activate the account.

Equipment administrators are in charge of instrument routine maintenance, including training users, setting various restrictions on instrument reservations, checking fees, uploading data, and etc.

Financial managers are responsible for managing finance such as charge and recharge.

Other administrator authorities are distributed by departments depending on the situation, which could activate new user accounts, manage blacklists, release instrument information, and set instrument opening.

Top administrator has the highest authority. According to different situations, one can manage authority distribution, monitor equipments' operation, usage condition, and charging status, gather the overall equipment performance information, grasp all macro information on equipment operation, and print report forms as necessary.

4.1.2 Appointment/ operation authorization

The system directly restricts user login time and location according to booking/ paying situation. Users can only be verified from a specific computer terminal or card reader, granting them access to use and control the corresponding equipment.

4.2 Equipment management/ booking/ operation system

4.2.1 Equipment management

Information entering: The administrator checks in the instruments' classification, name, model, specification, quantity, value, source, department (section, office), situation, administration, and location. In this way, users can find the relevant equipment information and its usage condition conveniently.

Instrument user standard: Some equipments can only be used after training.

Instrument charging standard: Administrators can set how the usage of device is charged, pay by number of times, operation time, or sample number, and the usage sum per unit.

Blacklist management: Those who had a no-show, didn't pay or used overtime will appear on the blacklist. This will affect their future use of the instruments.

Automatic statistics report: According to the information standard of education ministry, data will be counted and reported. We can query laboratory reported losses, maintenance, and scrapping, as well as usage time and the number of people in use.

4.2.2 Instrument booking/ usage system

The department administrator of instrument can open and close booking time period. Users can schedule equipment usage as easily as using Google Calendar. The booking system will automatically notify the authorization system to confirm and verify users' specified place and time period according to the appointment.

4.3 Charging system

The funds account takes one research group as a unit. Fund managers pay to the finance manager to recharge account. After using the equipment, the charging system will automatically calculate the cost and balance from the account according to both the appointment and actual usage time. Users can check the funds balance and print personal fund usage report. Lab administrator and management department can check the account balance, print fund usage report and instrument charge record report.

4.4 Document sharing system

Document sharing system allows users to visit their file data directly. The system includes lab's users catalogue, lab-in sharing catalogue and platform sharing catalogue. Users can upload and download their required files by directly dragging to the designated place.

4.5 Report forms management system

The system can automatically generate forms. While statistical report is generating, the system can generate real-time statistical data chart, including 1D line chart, histogram and pie charts. These interlocking data can reflect the usage and utilization degree of instrument management system.

4.6 Laboratory monitor system

In order to provide equipments with good working conditions, lab administrator needs to monitor the equipment premises, corridor and laboratory, ensuring their safety. This system uses real-time streaming technology to intercept the monitor screen recorded by web camera, so that the lab administrator can monitor the lab in real time and acknowledge its condition.

Figure 2 The Picture of Monitoring Equipment

5 The Implementation Effect

The platform has run for nearly a year and reflected the following actual effects:

- 1) Integrated experiment resources, avoided repeated purchase, coordinated and unified managing equipment and personnel, obtained maximum benefit.
- 2) Shared instrument information, made it easy to open and query for public, benefited to developing coordination from both inside and outside of the university.

3) Achieved entire automation management, avoided complex registration procedures, reduced labor cost, tracked the instrument usage state in real time, recorded equipment reservation conditions, financial settlement and instruments fault conditions, improved management efficiency.

4) Collected, gathered and analyzed experiment data information, provided online evaluation feedback of the test results timely, generated statistical reports automatically. Lightened the burdens of the administrators and improved work efficiency.

5) Had the function to upload the references, documents, records and other experimental resources of users to sharing files for obtaining more reliable data.

6) Set up the automatic payment system regulated the standards and methods of payment promoted sharing platform into a virtuous cycle.

7) Combined software and hardware without modifying the instruments saved cost and increased economic & social benefits.

6 Conclusion

It is very important to construct a unique sharing platform in Wuhan University of Technology, which can provide the detailed scientific basis for effective macro-management, construction and development in labs, improve the level of teaching and scientific research, promote the crossing and integration between different disciplines and strengthen the cultivation of innovative talents as well. We believe that, the sharing platform will play a major role in the development of science and technology and economic construction of China in the future.

Study on the Collaborative Innovation of Art-Originated Production*

Wu Xiaolian

Hubei Institute of Fine Arts, Wuhan, P.R.China, 430205

(E-mail: 2783535835@qq.com)

Abstract: Based on the economic evolution perspective in *Das Kapital*, the characteristic features of creation-oriented industries and the features of their industry parks are analyzed. It can be concluded that the division of labor is the basis for the change of production mode; and that collaborative innovation is the premise for the assembling of creative industries. As an aggregation of industries, cultural parks or art zones is a new mode of development, where various resources (such as enterprises, universities, research institutes, government agencies, intermediary organizations, etc.), through function division, target orientation, integration and optimization, can share their resources, complement each other with their advantages, cut their costs and share their profits, thus leading to the 1+1>2 collaborative innovation effect and scale economy effect.

Key words: Creative industries; Collaborative innovation; Scale economy; Art creation

1 Introduction

From a micro perspective, the art-creation-originated industry belongs to art industry, and it is a cultural industry from a macro perspective. Nowadays, both the art industry and cultural industry have entered an unprecedented development phase and they're developing at a speed faster than ever before. Because of the innate embeddedness and versatility of art and culture, many governments construct industry parks to foster, develop and expand the art industry. Generally speaking, the construction of cultural parks and art zones have to experience the following phases: the infrastructure preparation, the rebuilt of old architectures, the repairing and restoring of cultural relics, the construction of value links, etc. And meanwhile they have to adapt themselves to the development trend of technicalization and clustering development. However, compared with the construction practice of industry parks, the theoretical studies of cultural parks and art parks are slightly falling behind. This is especially true with the vague concept of parks, which leads to the divergence concerning what criteria to abide by in the construction and planning process, how to manage them according to different categories, etc. All this constitutes a serious obstacle for the development of art parks. Therefore, it's necessary and urgent to clarify the concepts and categories of art parks and only in this way can correspondent construction criteria and innovation system be built.

2 The Concepts and Categories of Parks Originated from Art Creation

What is art industry? And what is cultural industry? Scholars' answers to these questions are different. The most representative answer comes from Professor Justin O'Connor who's from the University of Manchester in Britain. He has not only defined the concept and scope of cultural industry, but also elaborated the relationship between cultural industry and art industry. According to him, cultural industry not only includes the traditional industries such as the radio industry, the television industry, the publishing industry, the recording industry, the design industry, the architecture industry, the new media industry and so on, it also embraces the art industry such as the visual art, handicraft, theater, music hall, concerts, performances, museums, art galleries and so on, for these industries mainly deal with symbolic commodities and their economic value mainly comes from their cultural values. The official definition of cultural industry also varies from country to country. Germany, South Korea and France defines cultural industry as "replicable industry"; Japan and U.S. vividly address it as "content industry" or "copyright industry"; while Britain from a brand-new perspective calls it "creative industry". In 1998, *British Creative Industries Mapping Documents* points out that the enterprises that gain their

* This paper is a part of the research effort of the following projects: the Humanities and Social Science Fund Project of the Ministry of Education "Socialist Core Value System Leads the Development of the Art Industry"(13YJA710047), The Cultivation of Young Theorists in Marxism Project for Universities in Hubei "The Art Production Theory of Marxism and its Contemporariness"(15ZD056), the Humanities and Social Science Fund Project in Hubei Province "The Research of Public Art from the Perspective of Art Leading the Urban Development"(2014ZD008)

development from individuals' creation, skills and talents, and the activities that create potential wealth and employment opportunities through the exploration of copyrights, can all be called creative industries. They cover 13 professions — advertising, architecture, art and antique transaction, arts and crafts, design, fashion, television broadcasting, leisure software, music, performing arts, publishing and software. Then, UNESCO combines “cultural industry” and “creative industry” into “cultural creative industry”, explaining that “the series of activities involving the production, reproduction, storage and distribution of cultural products and services are according to industrial standards”.

Since 2003, China set up the "Statistics Research Group of Cultural industries", led by the National Bureau of Statistics, and supported by the Ministry of Culture, Administration of Radio, Press and Publication Administration, the State Cultural Relics Bureau and other units. The group believes that the activities that involve providing the public with culture, entertainment products and services, and all other activities that are relevant to them, can all be classified into “cultural and its relevant industries”. Accordingly, the National Bureau of Statistics released *Culture and the Classification of its Related Industries* in 2004, and it classifies eighty industries in the *National Economic Industry Classification* (GB/T4754—2002) into nine categories, which are 1. News services; 2. publishing and copyright services; 3. radio, television, film services; 4. arts and cultural services; 5. cyber culture services; 6. cultural entertainment services; 7. other cultural services; 8. the production of cultural commodities, equipment and other related products; 9. the sales of cultural commodities, equipment and other related products, etc. On the basis of this, *Culture and the Classification of its Related Industries* was revised in 2012. Culture and its related industries are classified into four categories, which are 1. production activities involving the creation, manufacture, distribution, and exhibition of cultural products(including goods and services) which take culture as their core content and proceed for the purpose of meeting people’s spiritual needs; 2. the assisting production activities that are necessary for the production of cultural products; 3. the production activities(including manufacture and sale) of cultural products which serve as physical carriers or manufacture tools(application, distribution, display tools); 4. the production activities(including manufacture and sale) of specialized equipment that are necessary for the production of cultural products. Here, the production of “cultural products which take culture as their core content” is put in the first place because the industrial feature of “content as the king” and its implied value demand have to be emphasized. This is because both cultural career and cultural industry are based on creativity as a fundamental means and meet people's spiritual consumption through the production of products. In turn, the consumption vitality of products will spur the production of products. Just as Marx claims “Production is just consumption, and consumption is just production. Each party is its counterpart. Yet there is a medium between the two.” The direct impact of the medium is organizational design and institutional arrangements. Cultural parks or art zones is just such a design and arrangement that has collective function and aggregate effect, thus forming a management and control mode that can efficiently arrange and integrate the resources in the specific area.

So far, according to the different approaches to arrange and integrate resources, art zones can be classified into the following four types: creative art type; the combination of production, study and research type; cultural entertainment type; integrated type.

First, the creative art type takes original products as its core and is based on creative design. Through the joint development of cultural products by creation, design, performing arts, videos and audios, publishing and so on, a highly-industrialized supply chain is formed. For example, the most renowned Beijing "798" Dashanzi Art District in China was once regarded as one of the world's 22 most culturally iconic art centers in urban areas. The combination of production, study and research type mainly relies on universities and focuses on research and development, forming characteristic yet inimitable manufacturing clusters. The Tanhualin Art Village in Wuhan is a good example. Hubei Institute of Fine Arts and the unique cultural resources near Tanhualin have offered constant development vitality for it. Compared with the above two types of industry parks, cultural entertainment parks highlight humanitarian advantages and develop a new mode of economics as festival exhibition and tourism consumption. The successive success of “Impression Liu Sanjie”, “Impression the West Lake”, “Everlasting Regret” and “Cosmic Voyage” are some of the examples. The integrated type depends on the power of technology to manifest regional specialties through the assembling of industries. For instance, the Tianjin Happy Economic Special Zone has transferred the music instrument resources of the Jinghai music instrument manufacture industry into cultural capitals, and has constructed a comprehensive industry park that includes the manufacture of music instruments, performing arts and shows, tourism, exhibition transaction, and so on. It has constructed a corporate industry that integrates production, study and research; eating, accommodation and play; tourism,

entertainment and shopping, etc.

3 Synergy in the Combination of Production, Study and Research Parks and Its Theoretical Basis

Marx claims “Many people plans to work together in the same production process or in different yet related production process. This is called synergy.”^[1] In today’s knowledge economy era, “planning to work together” refers to the complementing of resources and interaction of advantages of different disciplines, different industries and different domains. The different disciplines, industries and domains can get what they need, what they’re good at; they can share risks as well as profits; thus constitutes a well-integrated organization mode of production.

Cultural parks or art zones is such a kind of organizational mode of production, where relevant universities, institutes and enterprises gather together there, operate under the rules of the market and take advantage of mass operation, thus achieving synergy of saving capitals and reducing cost by sharing professional expertise, production skills, market information, etc.

Members within the organization, through informal loose restriction rules or formal contractual ones, constitute a supply chain; or they can work across chains by cooperating with different industries, and incorporate the art-originated design, production, processing and sale into a whole, thus forming a great coupling force of value. This coupling force is just like what Marx concludes: An individual’s strength is small, but the small strengths combined can generate a force that is greater than the sum of them all. Therefore, the combination of forces can save time and expand the space they function.

Marx also believes that Many workers who can complement each other are engaged in one or the same work. This is because the simplest collaborative work can play important roles in even the most developed collaborative forms. Based on the different roles shouldered by the “simplest collaborative work”, they have constructed the “most developed collaborative form” in the cultural parks or art parks, enabling members within them to fulfill different goals and different missions because of their different orientations. Just as scholars such as Freder and Ulrich, Achartinger and Rammer(2002) claims, apart from the transmission of knowledge, the interaction of knowledge is becoming more and more important. Santorohe and Chakrabarti (2003) even propose four basic modes based on this “collaborate form”—research funding types, collaborative research types, knowledge transmission types and technology transmission types, which represent different interaction relations between enterprises and universities. The Primary task of enterprises is to incorporate the large number of professional knowledge into a whole and then encourage the transference, communication and sharing of it among group members(Kong, 2000). In this process, how to fully explore implicit knowledge which is difficult to simulate by rivals plays a decisive role, because it not only decides the enterprise’s ability to allocate resources, integrate and exploit resources, optimize and develop resources and its competence to protect its property rights, but also determines if the enterprise can identify, discover and take control of opportunities and even the chances to create future (Spender, 1996). Therefore, the knowledge emphasized here is not only a resource, but more an ability and this is the basis of enterprises’ heterogeneity, which is the key for enterprises to gain core competitiveness^[2].

In the practice of socialist market economy with Chinese characteristics, the most successful “simplest joint labor” and “the most advanced collaboration form” is, in the first place, university science and technology parks and hi-tech development zones. After them, the new economic lightspot goes to cultural parks or art zones. Cultural parks or art zones is the gathering place for art-originated creations, which hopes to get the investment or hatch funding from enterprises so that large-scale and “popcorn” type of industrial chain can be constructed. So far, some of the cultural parks and art zones in China still have the problem of “selling horse meat as beefsteak” problem, and the rally function and aggregation effect of the parks are not fully exerted, thus jeopardize the financing flow, transport capacity, etc. While facing such a serious situation, how to form park economy with great vision in the globalization context and construct sensible industrial chains is an important issue for the whole society.

4 The Collaboration of Production, Study and Research is the Driving Force for Creative Development

Marx once says: If the working process is complex, different operations can be given to different people as long as there are a large number of people working together, so that different operations can proceed at the same time. In this way, the working hours to produce the required sum of products can be shortened. As for the cultural parks or art zones, the participating elements take artistic work as their

core, which is independent, individual and abstract. Artistic creation repels simplification, conceptualization, formulization and standardization, for artistic works is the achievement of the creation subject's mental and physical effort, and it conveys the artist's aesthetic sensibility, design ability, image delivering capacity and the competence to use them. Art is using artists' comprehensive labor and creation achievements to elevate our life, better our environment and change the world while offering a sensible sublimation access to satisfy human's instinct desires.

According to Marx's viewpoints about complex labor, art should "distribute different operations to different people", and organize art production in standardized and mass production so that more artistic products can be produced to satisfy the needs of the developing society. "Different operations proceeding at the same time...can shorten the working hours to produce the required amount of products" can prove that the construction of supply chains originated from artistic creation can also save the working hours required to produce each commodity. The construction of supply chains involves various links like material purchase, products production and final consumption, and concerns suppliers, manufacturers, retailers, consumers and so on. In a supply chain elicited by artistic creation, seamless joint from artistic creation or artistic design to the consumption of artistic products is also required so that a relatively complete network can be forged. This structure not only demands various creation companies to offer different products, but also needs market operation in charge of marketing, logistic management and advisory services, which can coordinate their cooperation and competition so that they can get additional benefits that otherwise can't be obtained, or supply a mechanism that can influence the law or property transfer, and this will be significant for the business goal to explore products in depth and produce them repeatedly, including offering more market opportunities for relevant industry chains^[3]. It can be concluded that the members and organizations within cultural parks "not only improve personal productivity through collaboration, but also create a productivity which inevitably becomes a collective force." Not to mention the newly-generated strength of the total force merged by various forces, in most productive labors, social contact alone will elicit competition and energy boost, and consequently promote individual's work efficiency.

But Marx also emphasizes that modern industry never perceives the existing form of a certain production process as the final one. When the low-carbon and environment-friendly cultural industry is taken as a national development strategy, the construction of art-originated parks will inevitably become a new engine of the new economic norms. When creation becomes a driving force for the economic development, the government will take an active part and take advantage of various policies and measures to build a bridge for universities, research institutes and enterprises, so that a new cooperative interaction, which is called "triple helix"^[4], can be established.

"The triple helix" refers the comparatively independent and yet interrelated cooperation among the universities/research institutes, industries and the government. Because of the cooperation, each curve in the "triple helix" has gained a stronger research and development ability than before. Universities and enterprises acting as the subjects of "scientific republic" (Merten, 1973) and "technology complex" respectively is given special emphasis. Based on the powerful organizational platform of the government, they get heterogeneous tasks and assignments and constitute an environment for creation together (Etzkowitz, 1996), thus breaking the pattern in which enterprises always play a core and leading role in economic development. In this way, the role of universities in economic development is becoming more and more prominent. Universities will finally become a social institute that has similar functions as enterprises and the government, producing enormous economic growth. With the development of economic globalization, they even recruit talents from worldwide, and so begins the global development of the university-industry-government "triple helix" and thereupon an open civil society is formed. In this civil society, free and open negotiation and cooperation are increasing and creation potential can be maximized.

Creative arts is rooted in free environment and the cultural industry is the domain that most needs creation. In such an open and free space, it's much easier to form a corporate body that can share resources—cultural parks or art zones, and produce a series of economic spillover effects, enabling the market elements such as knowledge, talents, technology, information and so on to play their part in the mutual trust between schools and enterprises, thus constructing a creative eco-friendly environment. For example, Beijing 798 Art District gathers a lot of cultural institutes and studios such as 798 Space, Tokyo Art Project, Left Bank Corporation, Century International Photography Gallery, Eulees, Pace, etc. covering different domains such as paintings, photographing, sculpture, advertisement design, publishing, etc. It has become an important center for contemporary Chinese art. In the creation process where there are many subjects participating and many elements interacting with each other, the bio-helix

market effects emerge, encouraging the parks' creation for the second time and third time and also turning creation into the driving force for the cultural parks or art zones.

5 Conclusion

It can be concluded that innovation-oriented industries can't be separated from collaborative innovation. Most governments regard cultural parks or art zones as a major form to foster and develop industries. As an organizational design and institutional arrangement, cultural parks or art zones is a new development mode after the emergence of university science parks and hi-tech development zones. In the cultural parks and art zones, various resources(such as enterprises, universities, research institutes, government agencies, intermediary organizations, etc), through function division and target orientation, integrate and optimize their resources, enabling various market elements such as innovation, knowledge, technology, talents, information, etc. to gather together and be distributed rationally. In this relatively-open space, resources and advantages are shared, costs are cut down and profits are shared and maximized, thus leading to the 1+1>2 scale economy effect. In this process which involves various subjects participating and various elements interacting with each other, collaborative innovation, secondary innovation and tertiary innovation takes place, becoming the creation in innovation and even more, the driving force for economic development. Thus, the collaborative innovation of production, study and research is not only the inevitable development trend of innovation economy, but also the primary engine for the development of cluster economy.

3 Journal, Wuhan University of Technology Wuhan, P.R.China, 430070

Abstract: Strengthening Government-Industry-University-Institute Collaboration is one of the most important ways to deep the structural reform of science and technology, develop new innovation institution and speed up the construction of national innovation system. Government-industry-university-institute collaboration plays a decisive role on the positive effects of regional economy. This article designs the dynamics simulation system model and investigates the mechanism of government-industry-university-institute collaboration of Shahe glass research institute mode. Analyze the factors related to the development of glass research institute, build the flow chart to explore the intrinsic mechanism, analyze the dynamic mechanism of government-industry-university-institute collaboration interaction and develop simulation model of system dynamics by Anylogic. Through the analysis of sensitivity based on Monte Carlo simulation, we explore the evolutionary process of the influence which the government-industry-university-institute collaboration affect the development of glass research institute and regional economy development. Finally we analyze the co-building background of Shahe glass research institute, motivation and function of the cooperation parties and the management system and operational mechanism. Conduct some superficial discussions on the achievements, possible difficulties and countermeasures in the development process.

Key words: Government-industry-university-institute collaboration; Research institutions; Regional economies; System dynamics.

1 Introduction

January, 2010, Shahe Glass Research Institute of Technology was formally established by Shahe Municipal People's government and Wuhan University of Technology to develop the government-industry-university-institute collaboration and promote industrial upgrading in Shahe glass technology. Because the technical forces are weak in the small and medium-sized enterprise. So it will promote the industrial development by various forms of government-industry-university-institute collaboration.

At present, the domestic government-industry-university-institute collaboration is facing the following background:

1) The enterprise restructuring of scientific research institute. After scientific research institutes transmitting into enterprise they become responsible for their own profits and losses which mobilize the enthusiasm of scientific and technical personnel engaged in economic construction. However, the market property also determines the "limited company" pursue the guideline of "short, flat, fast" and pay more attention on output and short term but despise input and long term. It is difficult to achieve public goals to drive the industry and regional economic development.

2) The shortage of innovation ability in small and medium sized enterprises. China's small and medium-sized enterprises lack the awareness and motive forces of independent innovation and the innovation personnel costs tend to be high^[2]. Only 25% of the national scale industrial enterprises have R & D institutions and less than 40% have the R & D activities. Sales revenue accounted for only 0.56% of the investment in research and development (Large and medium-sized enterprises is only 0.71%)^[1]. With the rapid development of science and technology, the transformation of scientific research achievements has become a bottleneck problem to solve the current economic contradiction.

3) Practice of a variety of government-industry-university-institute collaboration model. The State Council has issued relevant comments to strengthen science and technology and economic integration and government-industry-university-institute collaboration and improve the ability of serving the economic and social development. The parties have carried out cooperation in various forms. For example, Tsinghua University corporate with many local governments in the establishment of research institute. Dongguan city jointly set up 12 research institutions with universities and colleges. The related organizations have carried on the beneficial exploration of cooperation mode and mechanism, for

example, grotesque theory from research Institute of Tsinghua University in Shenzhen.

In this article, we adopt the method of system theory, on the basis of system dynamics theory. Combine with the characteristics of the model in Shahe glass research institute, build the simulation model of system dynamics which take the Shahe glass research institute operation mechanism as the core. We investigate the mechanism of government-industry-university-institute collaboration of Shahe glass research institute mode.

System dynamics (SD) is the combination of feedback control theory, information theory, system theory, decision theory, computer simulation and system analysis method. It applies the viewpoint of system thinking to define the system organization boundary, operation and information flow. Describe the dynamic complexity of system by causal feedback, build up quantitative model and applies computer simulation method to simulate the system behavior under different strategies. At last by changing the structure we help people understand the system dynamic behavior model. Then analyze and design the high leverage solutions of complex problems and improve the system dynamic performance. As a method to investigate the behavior of system dynamics, SD is suitable for the research of the internal mechanism in Shahe Glass Research Institute of technology development under the interaction of government-industry-university-institute collaboration.

2 Government-Industry-University-Institute Model based on System Dynamic

2.1 The construction of system dynamics flow diagram

Internal mechanism of Shahe glass research institute's development is affected by four factors. Government comes first. If the government fulfill scientific outlook on development, play a leading role and increase support to Shahe glass research institute. It will promote the development of Shahe glass research institute directly. Besides, if the government carries on the reasonable planning and division for enterprise location it will help them realize the aggregation effect thus drive the development of Shahe glass research institute indirectly. Secondly, colleges and universities will affect the development of Shahe glass research institute in the area of strategy and development goals. On the basis of decision, the laws and regulations of the government and policy and industry development status, colleges and universities can make up strategy measures according to its own characteristic disciplines. Specific development goals which based on the achievements in scientific research will applies in actual production. The third is industry which includes industrial structure and the entrepreneur group. From the view of industrial structure, industrial capital accumulation and accumulation of workers will play a decisive role. From the point of the enterprise leaders, the fourth is the research institute. The core part of the research institute is the orientation and the innovation of mechanism, the research institutes' orientation relate to the development goals, development principle and mode of operation. Take the market as the guidance, accurate positioning will further promote the development of the sand glass institute. Academy of sand glass accrual and execution mechanism promotes the sand glass institute of modern mechanism innovation, thus providing a guarantee for the development of the sand glass institute.

Based on these four ways of analysis, discover the sand glass institute development dynamics system consists of four feedback loops (see Figure 2): 1) feedback loop 1, composed of Shahe city government function of the feedback loop; 2) feedback loop 2, produced by Wuhan University of science and technology strategic planning of the feedback loop; 3) the feedback loop 3, produced by Shahe City glass industry structure feedback loop. 4) feedback loop 4, feedback loop of the policy action of sand Institute.

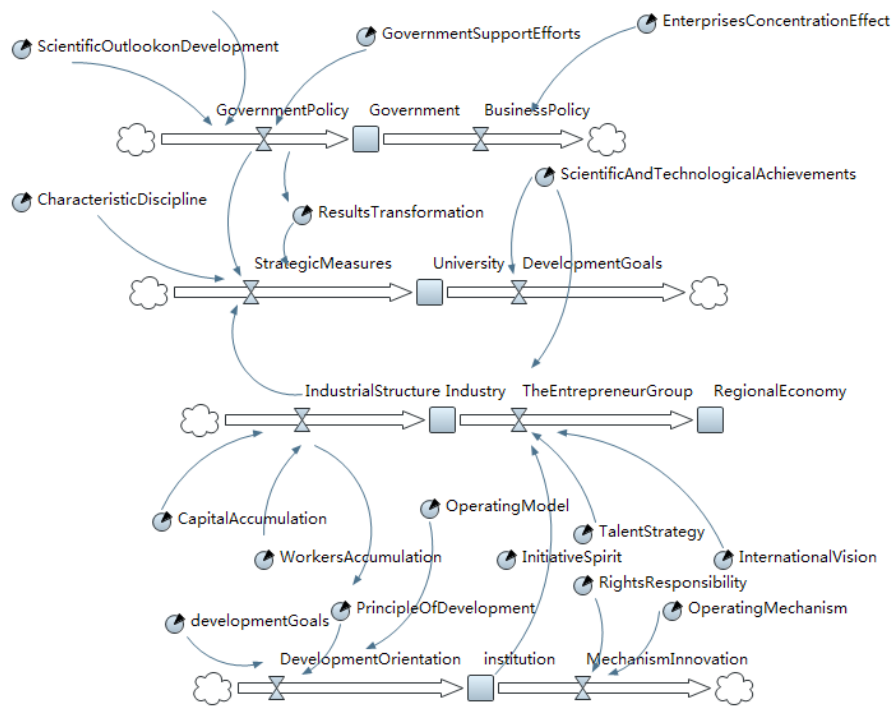

Figure 1 Government-Industry-University-Institute Collaboration System Dynamics Flowchart

2.3 Establishment of kinetic function relationship

The mathematical formulation of the system dynamics model is represented by the variable relationship in the flow chart, and the main kinetic relationship is described as the formula (1) to the formula (4):

$$d(\text{government}) / dt = \text{government decision-making} + \text{enterprise decision-making} \quad (1)$$

$$d(\text{university}) / dt = \text{development objective} + \text{strategic measures} \quad (2)$$

$$d(\text{industry}) / dt = \text{industry structure} + \text{entrepreneur group} \quad (3)$$

$$d(\text{institute}) / dt = \text{mechanism innovation} + \text{development orientation} \quad (4)$$

1) Shahe City Government’s related decision of the glass industry in accordance with the scientific development concept of guidance and create the goal of "national glass production base and the glass of the world". By leading role of the government, combine with the industrial support. So as to improve the level of science and technology of glass industry, and achieve the comprehensive and sustainable development, expressed as the following formula:

$$\text{Government decision-making} = \text{Scientific Development View} * \text{government leading role} * \text{government support} \quad (5)$$

2) Corporate policy is decide by the enterprise aggregation effect. Put the enterprises’ similar function together and strengthen the cooperation between each other. Realize the sharing of infrastructure and further reduces the enterprise production cost. Increasing the profits of the business and make the enterprises adjust to the policy statement. The formula is as follows:

$$\text{Enterprise policy} = \text{enterprise aggregation effect} \quad (6)$$

3) Colleges base on its glass materials engineering disciplines advantages, make the glass research in the national leading level. Colleges according to the market situation, create scientific and technological achievements and scientific and technical personnel to actively participate in the transformation mediated. The formula is as follows:

$$\text{Strategic measures} = \text{results for the transformation of the characteristics subject} * \text{industry} \quad (7)$$

4) The new development goals can be determined according to the latest research achievement of science and technology. The scientific and technological achievements represents a new direction for the future development of science and industry, exhibit important meaning and value, represented by the following formula:

$$\text{Development goals} = \text{Scientific and technological achievements} \quad (8)$$

5) The current glass industry is one of the three pillar industries of Shahe City, and the annual consumption of broken glass accounted for 50 percent of the national total. Rich glass industry professional and technical personnel will make Shahe City glass industrial structure rationalization degree improve. Represented by the following formula:

$$\text{Industrial structure} = \text{capital accumulation} * \text{worker accumulation} \quad (9)$$

6) Whether the Shahe city entrepreneurs groups have an international vision, whether the direction of future development of glass industry can be predicted. Training the professional and technical personnel, make the innovations continuously. It will greatly influence the sustainable and healthy development of the Shahe glass industry in the future. Represented by the following formula:

$$\text{Entrepreneur group} = \text{innovation spirit} * \text{talent strategy} * \text{International Perspective} \quad (10)$$

7) Shahe City Glass Technology Research Institute’s reasonable responsibilities of organizational structure and establish scientific operation mechanism. Represented by the following formula:

$$\text{Mechanism innovation} = \text{operating mechanism of the accrual basis} \quad (11)$$

8) With the market oriented, to take the Shahe glass industry development as the core, make clear the development goals, clear the sand glass college location, unswervingly adhere to the basic principles of the sand glass Institute, and comprehensively improve the efficiency of operation mode. Enable the development orientations of the sand glass institute have more time significance. The formula is as follows:

$$\text{Development positioning} = \text{development target} * \text{Sha Glass Institute positioning} * \text{basic principles} * \text{operating mode} \quad (12)$$

3 Experimental Analysis of System Dynamics Simulation

This paper use Anylogic simulation software to analysis in the dynamic mechanism of the above academic innovation and the design of the system dynamics mode. Among them, the initial parameters of the system are set as shown in Table 1. Base on the Monte Carlo simulation method multiple runs of the simulation system, observe and compare the different values of academic innovation with the evolution of analog clock. Thereby, the research on the government, industry, academia, research and other factors to the sand glass Institute hair exhibition and Shahe City Regional Economic Development (in units of 100).

Table 1 Academic Innovation simulation system mainly variable initial parameter settings

Parameters	Introductions	Default
Prospective Government Decision	Indicates the level of government decision-making	50
Higher Education Institutions	Represents the development strategy of Wuhan University of Technology	100
Industry level	Indicates the level of Shahe City Glass Industry	50
Institute of Organizational Structure	Represents Shahe glass research institute organizational structure set level	100
Institute Development Level	Indicates the degree of development of Shahe glass research institute	s00
Regional Development Level	Indicates the level of economic development Shahe City	150

3.1 The influence of government decision-making level on the development of institute

According to the simulation results, the improvement of the level of government decision-making will lead to the development of the Institute to accelerate (as shown in Figure 2). In the mode of cooperation between the government and industry, the Shahe municipal government develops the forward-looking policies for the success of the sand glass Institute Foundation. Municipal government through civil servants is encouraged to establish the scientific development viewpoints and play the role of the government in the regional economy. So as to improve the participation enthusiasm and to promote the sand glass Institute was established successfully.

After years developed, the municipal government established the development strategy of “industrial prospering City, prospering the city by science and technology”, and put forward the following measures:

- 1) Establish a scientific view of development

With the cooperation of Wuhan University of technology, make the idea that "strengthen government university industry cooperation, science and technology to promote the city, to build

national glass production base and the world of glass" strikes root in people's hearts and become the long-term development goals of "does not change because of the change of leadership".

2) The government's leading role

Shahe municipal government fully understand and play a leading role in regional innovation, strengthen the cooperation between government and industry, accelerate the construction of regional innovation system with the characteristics of the city. Build the sand glass Institute with Wuhan Science University of technology and declared to the Hebei Provincial Department of science and technology innovation platform to apply for funding. Reduce the technical risks of the enterprise and enhance the enterprises to participate in the enthusiasm of cooperation and innovation, make the good foundation for glass industry upgrade replacement.

3) Increasing government support

Shahe city government appointed a government office, deputy director of the Academy of sand glass served as vice president. Take the liaison work in Building Materials Association and coordinate with the sand glass institute in the construction process. The government will also give the sand glass institute certain career preparation, accelerate the construction of facilities and provide comfortable work and living conditions for Shahe experts, technicians and encourage them to make more contribution to the development of Shahe, etc.

4) enterprise aggregation effect

Shahe government also gives full play to the enterprise aggregation effect, reduce the enterprise production costs. The initiative is the 17 square kilometers layout of hundreds of glass industrial parks the park roads, drainage, power supply, gas, communications and other facilities have been basically perfect.

Figure 2 Government Influence Factors on the Development of Shahe Glass Research Institute

3.2 The influence of University Strategy on the development of Institute

The improvement of university strategy formulation is benefit for improving the research institute development level (as shown in Figure 3). Wuhan University of Technology develops the comprehensive development goals and strategic measures to provide the opportunity for the success of the sand glass Institute. Wuhan University of Technology is the national key university with science and engineering, and the goal of the research university is to provide an opportunity for the development of Sand Glass Institute. Specific measures are as follows:

1) Creating a wealth of scientific and technological achievements

Around the goal of "the overall level of the domestic first-class, part of the subject of the world first-class", all the scientific and technical workers in Wuhan University of technology concentrated on theoretical basis, high technology and achievements to academic research in the long-term and have accumulated huge scientific and technological achievements. Meanwhile, the school attaches importance to the function of social service, and actively strengthens scientific and technological cooperation with local government and industry enterprises.

2) Actively converting scientific and technological achievements into work

The school has set up a series of papers to guide the scientific and technical personnel to actively participate in the transformation of the results of the work. Carrying out the "15551 talent project", introducing and training a number of strategic scientists, subject leading figures in teaching and researching and top-notch talent, promote discipline, specialty and course construction, promote teachers to upgrade the overall level. The school decided to rely on Collaborative Innovation Center and graduate student training basis to carry out professional degree graduate team to guide pilot work.

3) Efforts to develop specialty disciplines

In China's glass materials engineering disciplines, the school has the strongest teaching and scientific research system, and the glass research in China is in the leading level. It's an important basis for our country engaged in architectural glass, glass thermal engineering and equipment research and development.

For school and Shahe city government, to build a glass technology research institute and actively involved, put the glass specialty basic research in the school, placed the research, application in test and industrialization in the sand glass Institute and Shahe glass enterprises, improve the efficiency of personnel and equipment.

Figure 3 Universities strategic Influence on the Development of Shahe Glass Research Institute

3.3 The impact of industry level on the development of Institute

From Figure 4, it can be seen that the improvement of the industry level in Shahe benefits from the development of the Institute. The industrial structure and entrepreneur group of Shahe also provides a steady stream of impetus and creativity for the development of Sand Glass Institute. The entrepreneurs use the excellent innovation and creativity, pay attention to the implementation and training of talent strategy, and expand the cooperation and exchanges with university actively. Bring a large number of fresh strength into sand glass institute and constantly enhance the international competitiveness of the sand glass Institute. Therefore, the industrial structure and entrepreneur group of Shahe is the power of Sand Glass Institute.

1) Complete the accumulation of industrial capital and workers actively

In the end of 1996, Shahe glass industry small flat wise tensile production line is 128, production accounted for about 5% of the country. By the end of 2006 reached 224 production lines. After 20 years' developed, Shahe glass industry becomes one of the three big pillar industry. But the talent shortage, low technological content and the innovation ability is not strong. Under the dual pressures of the market and policy, it has the internal power of industrial upgrading and the cooperative technological innovation.

2) The innovation spirit of Shahe entrepreneur

Shahe glass industry mainly takes the cullet as raw materials in the initial period. The products are mainly applied in the low layer building in rural areas and small towns. Over 30 years' developed, from the flat wise tension to grid transformation, "one kiln line above the pellet production" to the present floats glass production. It reflects the Shahe glass people have followed the development trend and the courage to innovation of entrepreneur quality. The enterprise innovation request becomes the biggest power of government industry university institute cooperation and the basic safeguard of the achievement.

3) The talent strategy of Shahe entrepreneur

On the one hand, by the sand glass courtyard platform, the enterprise workers participate in the glass technology job training hold by Wuhan University of Technology, guarantee the safety in production of the new production line security; On the other hand, select out some outstanding high school graduates to Wuhan University of Technology for oriented training. These students will become the backbone of Shahe glass enterprise technology, management, operation and various departments after graduated. And by their promotion, many graduated college students may choose to work or create business in Shahe.

4) The international perspective of the entrepreneur in Shahe

The upgrade and the development of the industries expand the corporate in Shahe and make Shahe

entrepreneurs have sufficient lung power of technology support and technology development. They begin to expand the overseas market actively. Build overseas investment and factories to further promote the cooperation between the enterprise and Wuhan University of Technology and the sand glass Institute, and provide another opportunity for the development of Sand Glass Institute.

Figure 4 The Impact on the Industry Level of Development of Shahe Glass Research Institute

3.4 The influence of research institute organization institute on the development of Institute

As shown in Figure 5, the level of organizational structure of the Institute has a positive effect on the development of the Institute. Institute set the organizational structure that to take the dean responsibility system as the core characteristics. And constantly improve the personnel, scientific research and a variety of innovative management system. Establish the comprehensive supervision and incentive equilibrium, achievements and security evaluation and financing mechanism. Make the Security Research Institute develop healthy.

1) Establish the accrual basis

Shahe glass school is responsible for the implementation of the dean, and set the management committee and academic committee. The management committee is responsible for the overall development plan and major decisions of Research Institute. The academic committee is responsible for validation of Research Institute’s research direction.

2) Establish the scientific operating mechanism

Firstly, establish comprehensive supervision and incentive balance mechanism. Through the development and implementation of fair and reasonable assessment system, we can solve the internal coordination and development issues in the development process. Then, achievethe implementation of the system of personnel appointment and the person in charge of the project. Thirdly, establish the concept of "talent resource is the first resource", to make the qualified personnel attract more talents to work in the sand glass Institute. Establish scientific talent management system and mechanism. Finally, establish the scientific research results transformation mechanism.

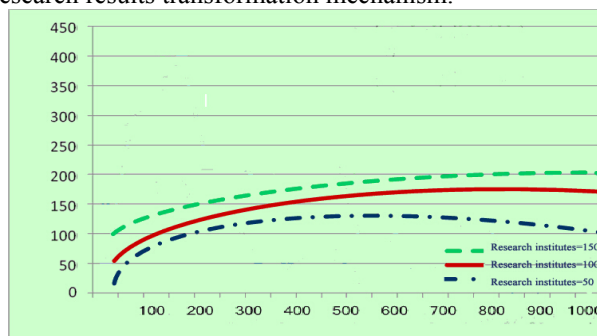

Figure 5 Effect of Structure Research Institute Shahe Glass Research Institute for Development

3.5 The impact of development of research institute on industry level

As shown in Figure 6, with the development of Research Institute, the glass industry development level continues to improve. Based on the glass materials science frontier and continuous through the independent innovation, the Institute has become a scientific research and academic exchanges and personnel training basis. Subsequently provide complete professional and technical support and core competitiveness for Shahe glass industry development. Therefore, take the glass courtyard with the market as the guide and make the positioning accurately.

1) Develop specific development goals

The sand glass Institute developed a detailed development goal: by the parties' co-operation strive to create China's glass technology R & D center and technology sources cradle. Realize the real integration of officer, production, learning and research and the win-win situation. Explore the effective integration of new models and the establishment of market and service oriented business system and mechanism actively.

2) Shahe glassy Institute positioning

The basic orientation of the sand glass Institute is Shahe glass industry technology development, service center and China's important glass production basis; Function positioning is Shahe glass industry new technology, new products and new technology R & D and radiation center, Shahe glass industry technical and management personnel training center, important scientific and technological achievements, transformation, industrialization base technology R & D center.

3) Basic principle

Adhere to the service of the glass industry in Shahe as the core, and support the development of the whole industry. Explore the new mode of industry, research and research base actively. Adhere to the collection of resources and constantly enhance service capabilities. Adhere to the combination of science and industry, and co-ordinate the relationship between the University and the University.

Figure 6 Impact on the Industry Level Development Institute

3.6 The impact of industrial development level on regional economy

As shown in Figure7, with the development of the glass industry in Shahe, Shahe City, the regional economic development level continues to improve. The construction of the Shahe glass research institute can guide the development of the Shahe glass industry, perfect the mechanism of regional innovation development and give full play to the local industry leading role in regional innovation. Finally promote the regional economic innovation and leap continuously. In order to build a new efficient operation mode, sand glass Institute can take the following measures:

Figure 7 Glass industry Development's Impact on Regional Economic Level

As a basis for industry-research, it should research carried out by the base mode. Try to build and research the cooperation platform in the scientific and technological achievements and applications, human training and other aspects. Sand Glass Institute carry out the mode of "the open, cooperation and sharing". Under the government leadership and organization, build the long-term cooperation and innovation mechanism with the enterprise.

The sand glass Institute accord to the enterprises' demand and establish a joint research and

development center. Help the enterprises to introduce international resources, the high technology and research and development strength. Introduce the concept of venture capital funds and help the enterprises grow rapidly. Thereby pull the depth of the cooperation in the political research.

4 Conclusion

This article constructs the system dynamics simulation model, analyze the related factors which takes the sand glass operation mechanism as the core and explores the operation mechanism of government industry university institute cooperation. Then use the anylogic software to build the development system dynamics simulation model. Explore the process of evolution of the influence of research officer in Research Institute and the regional economic development. The research found: municipal government forward-looking decision is the basis of the sand glass institute's success; Wuhan University of technology's development goal and strategic measure is the opportunity of the sand glass Institute's success; Shahe Industrial Structure and entrepreneur group is the power and modern management system and mechanism of system innovation is the guarantee.

In short, research officer parties use its characteristics, cognitive and discuss the co-operation model. Decide the form, the breadth and depth of the co-operation and ultimately affect the effectiveness of the cooperation and the sand glass Institute formed and development. While in this mode, the government, the production, the colleges, the management system and the market localization is the restriction factor which decides the Shahe glass technology research institute to establish and its development effectiveness.

(E-mail: 252434311@qq.com)

Abstract: Technology-based small micro enterprise are smaller companies group, in the proceeding of development they face lots of problems just as the lack of innzxcovation power, financing difficulties, lack of technology and so on. In order to solve these problems, they can structure a collaborative innovation mode with research institutions of higher learning. Based on the analysis of the game relationship between Technology-based small micro enterprises, government departments, financial institutions and research institutions of higher learning, builds a collaborative innovation model of Technology-based small micro enterprises and research institutions of higher learning, then puts forward corresponding countermeasures and suggestions.

Key words: Technology-based small micro enterprise; Collaborative innovation; Institutions of higher learning; Financial support

1 Introduction

Technology-based small micro enterprises are smaller companies group which engage in research, development, production and management of technology products, independent accounting or independent accounting relatively^[1]. In July 2013, the state council premier Li Keqiang chaired a state council executive meeting and pointed out that the small micro enterprises are numerous, and most of them are numerous. They can play in promoting economic development and market prosperity, expanding employment. This meeting decided that small micro enterprises will temporarily exempt from value-added tax and business tax if their sales are less than 20000 Yuan per month from August 1, 2013. Although the national tax policy brings benefits for 600 small micro enterprises, small sizes and insufficient funds Make them faced the plight of low level of innovation and development^[2].

At present, scholars at home and abroad have lots of further researches. Baldwin^[3] proposes independent innovation and collaborative innovation are two main ways of enterprises' innovation, then analyzes the independent innovation and collaborative innovation comparison from the design cost, communication cost, production cost and transaction cost four aspects, think that cooperative innovation is the innovation trend of enterprises. Bunduchi^[4] puts forward that trust is a key element of collaborative innovation between partners. Because trust can reduce the costs and risks of collaborative innovation, improve the overall performance. Xue-mei XIE^[5] thinks that vertical and horizontal innovation network have different influences for the performance of technology-based enterprises by using structural equation model, and cooperative innovation between enterprises has the biggest impact to improve enterprises' technology innovation performance. Yu-ming XIE and Yun-Fei Shao^[6] put forward that cooperative innovation should have two elements: investing and sharing resources, recombining the enterprise organization. Pei ZHOU^[7] thinks collaborative innovation combined with multivariate interaction can form the open three-dimensional joint innovation network mode. Sheng XU^[8] considers that cooperative innovation with complementary patents is helpful to take the cooperation strategy based on the option game and cooperative game theory.

If enterprises own strong technical innovation ability, they can more quickly respond to the external environment, and easily improve the enterprises' innovation performance, strengthen enterprises' competitive advantage^[9]. The key factors to affect the collaborative innovation of technology-based small micro enterprises mainly contain research specialist staff, science and technology departments, patents and so on. Research institutions of higher learning have the advanced patents and plentiful technical personnel, but lack the platform of translating the research achievement into products. And technology-based small micro enterprises own production, sales, service and other

* This paper is supported of the 2015 Collaborative Innovation Center Research Foundation of Technology-based small micro enterprises' startup and development

resources. In the ever-changing market environment, technology-based small micro enterprises, who want to raise their ability of innovation and market competitiveness, should carry out the cooperative innovation with research institutions of higher learning.

2 The Subjects' Relations of Collaborative Innovation

Technology-based small micro enterprises develop as the core of new technologies, new products, and new technology. These enterprises have a larger proportion in the technology industry in China. They are the important impetuses to promote technology development and technology progress.

2.1 The collaborative innovation relations with government departments

The government plays an important role in the innovation process for enterprises^[10]. The main obstacle of innovation for technology-based enterprises lies not in the enterprises' scale, but in the characteristics of innovation projects, the technology innovation strategy, and technical guidance of management. In the study of growth and development about technology-based small micro enterprises, some scholars propose the improvements in government procurement support policies.

The collaborative of Technology-based small micro enterprises and government departments can play an important role in reducing the operating cost of enterprises, attracting outside investment, achieving the optimal allocation of resources and so on^[11]. The science and technology innovation fund in our country is a project which foster and support technology-based small micro enterprises with high technical content, good market prospects. In the process, government departments play an indirect role in the development of the enterprises, but the driver directly affects the performance of the enterprises.

In a specific area, the government's policy guidance is important to the expansion of technology innovation network. Especially the government public policy about research and development play a role in the technological innovation and technological innovation network expansion. The government's policy of science and technology, technical guidance and research and development funds provide important guarantee for technological innovation network expansion. Local governments should actively guide various kinds of resources of science and technology to mutually support technology-based small micro enterprises in technology innovation.

2.2 The collaborative innovation relations with financial institutions

At present the study about financing and financial services of technology-based small micro enterprises is relatively more. In the financial system study of technology-based small micro enterprises, only optimizing the technology-based small micro enterprises' financing system by the government, commercial Banks and regulatory departments collectively, the innovation activities are well developed. Establishing the financial service system according to the characteristics of technology-based small micro enterprises is the effective way to support their development. Venture investment loan is an important safeguard to promote the level of development for technology-based small micro enterprises.

2.3 The collaborative innovation relations with research institutions of higher learning

In the research of the talents training for technology-based small micro enterprises, establishing scientific training system and carrying out effective innovation personnel training can promote the development level of innovation projects well. Research institutions of higher learning have the advantage of knowledge. They can provide advanced technical personnel, technical solutions, management consulting services, decision-makers suggestions and so on. The relationship among technology-based small micro enterprises and government departments, financial institutions and research institutions of higher learning is shown in Figure 1.

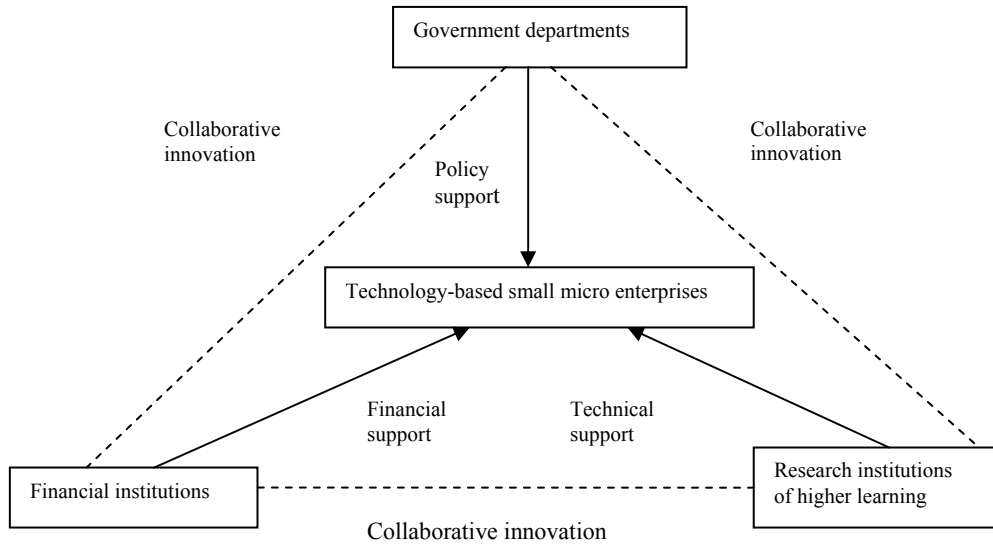

Figure 1 The Relationship among Different Subjects

3 The Game Model of Collaborative Innovation Between Technology-Based Small Micro Enterprises and Research Institutions of Higher Learning

3.1 Basic assumptions

Hypothesis 1: Only considering the dynamic evolution game between technology-based small micro enterprises and research institutions of higher learning except the influence of financial institutions and government departments.

Hypothesis 2: The game decision on both is bounded rationality. All information specific to the game is known to both players. The one don't know the decision of the other in decision-making. For technology-based small micro enterprises, they can choose independent innovation or collaborative innovation. For research institutions of higher learning, they can choose to cooperate with different scale enterprises, maximize the research proceeds. The one adjusts the strategy according to the other eventually, then reach game equilibrium.

Hypothesis 3: If the game both sides choose cooperative innovation, they will get the benefits according to their investment proportion. If technology-based small micro enterprises choose independent innovation and research institutions of higher learning choose cooperation with large and medium-sized enterprises, collaborative innovation revenue is zero. If the one chooses collaborative innovation but the other refusing, the side who choose collaborative innovation will bear all costs for it.

3.2 Structuring the game model

Make assumptions to various elements in the game process: Technology-based small micro enterprise is game 1. a_1 is technology investment cost of technology-based small micro enterprises for collaborative innovation. b_1 is core competitiveness of technology-based small micro enterprises. c is coordination using coefficient of resources. d_1 is the probability of successful innovation for technology-based small micro enterprises alone. f is the probability of success of collaborative innovation between technology-based small micro enterprises and research institutions of higher learning. g_1 is the profit distribution proportion of technology-based small micro enterprises. Research institutions of higher learning is game 2, the symbols in the same way, and $g_1 + g_2 = 1$.

According to the above assumptions, the game matrix of collaborative innovation between technology-based small micro enterprises and research institutions of higher learning is as shown in Table 1.

Table 1 Game Matrix of Collaborative Innovation

Revenue of game		Game 2	
		Collaborative innovation	Independent innovation
Game 1	Collaborative innovation	$g_1(b_1 + b_2)cf - a_1,$ $g_2(b_1 + b_2)cf - a_2$	$b_1d_1 - a_1, b_2d_2$
	Independent innovation	$b_1d_1, b_2d_2 - a_2$	b_1d_1, b_2d_2

Assuming the ratio of choosing cooperative innovation strategy is x for Game 1, then the ratio of independent innovation strategy is $1-x$. At the same time, assuming the ratio of choosing cooperative innovation strategy is y for Game 2, then the ratio of independent innovation strategy is $1-y$.

For Game 1, the revenue of collaborative innovation is u_1 , and the revenue of independent innovation is u_2 .

$$u_1 = [g_1(b_1 + b_2)cf - a_1]y + (b_1d_1 - a_1)(1-y) \tag{1}$$

$$u_2 = (b_1d_1)y + (b_1d_1)(1-y) \tag{2}$$

The average revenue \bar{u} is as follows:

$$\bar{u} = xu_1 + (1-x)u_2 \tag{3}$$

For Game 2, the revenue of collaborative innovation is v_1 , and the revenue of independent innovation is v_2 .

$$v_1 = [g_2(b_1 + b_2)cf - a_2]x + (b_2d_2 - a_2)(1-y) \tag{4}$$

$$v_2 = (b_2d_2)x + (b_2d_2)(1-x) \tag{5}$$

The average revenue \bar{v} is as follows:

$$\bar{v} = yv_1 + (1-y)v_2 \tag{6}$$

Game 1 and Game 2 will make the final decision according to the benefits.

4 The Collaborative Innovation Strategy Between Technology-Based Small Micro Enterprises and Research Institutions of Higher Learning

4.1 Establishing the cooperation concept of sharing risk and benefit

When setting the profit allocation rate, technology-based small micro enterprises and research institutions of higher learning should fully consider input and output of resources between the two sides. Only establishing good relations of cooperation and trust, collaborative innovation can play a proper role. Technology-based small micro enterprises and research institutions of higher learning should establish the mechanism of sharing risk and benefit, enhance the confidence in collaborative innovation, then to achieve a greater degree to reduce the innovation cost and fully arouse the enthusiasm of the two sides.

4.2 Setting a clear goal of collaborative innovation: promoting the core competitiveness

If Technology-based small micro enterprises want to improve their core competitiveness, they should improve the resources allocation mechanism in the aspects of human resources, technological resources, financial resources and so on. The collaborative innovation with research institutions of higher learning is helpful to reach resources sharing agreement about human resources and technical resources. At the same time, technology-based small micro enterprises should take active measures to improve the financing channels, and set the management mode which is adapted to the socialist market competition.

4.3 Improving the resources utilization efficiency of collaborative innovation

The main aspect of collaborative innovation between technology-based small micro enterprises and research institutions of higher learning is the effective sharing of resources. But the utilization efficiency of resources and the waste of resources should be the focus for the two sides. Technology-based small micro enterprises and research institutions of higher learning must set the clear goal of collaborative innovation, and keep every employee to understand the meaning of collaborative innovation, then reach the ultimate goal.

5 Conclusion

From the point of Game Theory, the collaborative innovation of technology-based small micro enterprises and research institutions of higher learning has the important meaning for each other.

Establishing the cooperation concept of sharing risk and benefit, Setting a clear goal of collaborative innovation: promoting the core competitiveness and Improving the resources utilization efficiency of collaborative innovation are helpful to strengthen the cooperation between the two and maximize the effectiveness of the collaborative innovation. At the same time, the methods, the methods and patterns of technology-based small micro enterprises and research institutions of higher learning will be the directions for future research.

A Study on Value Pursuit and Orientation of Local Colleges and Universities from the Perspective of Industry-University-Research Alliance

Tian Jianwei

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070
Pingdingshan University, Pingdingshan, P.R.China, 467000
(E-mail: pdstjw@163.com)

Abstract: This paper employs literature analysis, theoretical analysis, comparative analysis and other research methodology and proposes the local colleges and universities in industry-university-Research alliance should consider the academic value and educational value as the main goals and balance commercial interests as well. The regional-oriented and open applied technology colleges and universities should be established to cultivate talents with the path of cooperative education of industry-university-research. As the main participants of the alliance, local colleges and universities need to establish a sense of service, market concept and take advantage of the talents, product advantage and to strengthen the link between teachers, researchers and the enterprise to participate in enterprise technical reform and innovation, and use alliance platform to promote application technology and enhance the quality of personnel training, and provide support for students' innovation and entrepreneurship. Local colleges and universities should actively take the cooperative road of industry-university-research with market allocation of resources in the mode of government led and promoted alliance.

Key words: Industry-university-research alliance; Local colleges and universities; Orientation; Study

Industry-university-research alliance is the advanced form of the cooperation in the fields of industry, university and research. The main bodies are enterprises, universities, scientific research institutions formed with the alliance. In order to adapt to the increasingly fierce market competition, seize new market opportunities and realize technological innovation and common vision and to obtain the best benefit and comprehensive advantages, governments, financial and intermediary organizations establish an advantage-complemented and risk-benefit sharing and common development relations that are formal and cooperative but not merged based on the participants' developmental strategic objectives and intents.^{[1][2]} The establishment, implementation and promotion of industry -university -research alliance have important influence on the development of national and social technological innovation activities and the improvement of comprehensive strength.^[3] For local colleges and universities, they should adapt to the trend of technological innovation and treat the active participation in the strategic alliance of industry-university-research as important task and means of improving their own technological innovation capability and talent training quality and make contributions to the development of local economy and society.

1 Introduction

The researches on industry-university-research alliance abroad mainly analyze the influences and roles for universities, enterprises and regional economy from the cooperation of industry-university-research and the transaction cost theory, resource based theory, game theory, strategic choice theory, the triple helix theory were proposed and the "Silicon Valley", the British "partner program", Japan's government-industry -university cooperation formed. Domestic researches on industry-university-research alliance theory originated from the middle and late 1980s. There has accumulated a large number of research results, mainly from the perspective of economics, management science, including research on the main body of the alliance, the selection of partners, the dynamic mechanism, the trust mechanism, the organization mode, the performance evaluation, the benefit distribution mechanism, the government responsibility and so on. BaiLiqingfeng and LiHaiou (2012) brings out the enlightenment for local colleges and universities on the basis of categories, mode and operating mechanism of industry-university-research strategic alliance of Ministry of Education-administrated universities. YaoJie (2014) analyses the problems existed in industry-university-research strategic alliance of Chinese universities grounded on combing the current development situation of the industry-university-research strategic alliance, and proposes the healthy development measures of the universities strategic alliance

based on attribution and analysis, including awareness rise, system construction, clear guidelines and implementation path exploration.

2 Value Pursuit of Local Colleges and Universities from the Perspective of Industry-University-Research Alliance

The value pursuit of the members in industry-university-research alliance is the driving force and the goal of the construction of the alliance. Industry-university-research alliance is a resource sharing, advantage-complemented and risk-benefit sharing organization, in which the value pursuit includes mainly commercial, academic and educational value pursuit. Enterprise has the advantages of manufacturing sites and equipment, rich manufacturing management experience and abundant funds; the disadvantages are the poor independent research and development ability, the low technical level, the inaccessible technical information channels and the insensitivity to the development trend of new technology. The advantages of local undergraduate colleges and universities are having a high level of academic and scientific research achievements, the accessible academic information, the advanced scientific research equipment and high-quality talents; the disadvantages are lack of research funds, manufacturing experience and weak ability in undertaking risk. The main goal of local undergraduate colleges and universities participating in industry-university-research alliance is to promote the development of its connotation and characteristics development, while obtaining more resources and funds to realize self-development, strengthen survival and development abilities. Local colleges and universities in industry-university-research alliance should consider the academic value and educational value as the main goals and commercial interests as well. By joining in industry-university-research alliance can improve teachers' applied research and development abilities, produce more and high level scientific and technological achievements, get more higher level achievement awards, create more and better practice and innovative entrepreneurial opportunities for students, create a good environment for the practice of talents cultivation and employment environment.

Meanwhile, local colleges should balance the pursuit of economic interests. On one hand, more funds motivates more teachers to participate in the alliance building, on the other hand, the demand of market and commercial interests drive also make teachers do more applied researches, jump out of the original narrow academic circles to market and achieve scientific and technological achievements transformation and application to achieve the benign development among colleges or universities, the alliance and other participants.

3 Developmental Orientation of Local Colleges and Universities from the Perspective of Industry-University-Research Alliance

The triple helix theory holds that university, industry, government are three relatively independent areas and are the core power in the era of knowledge-driven economy development. They interact with each other to promote social development and have different roles in the alliance. Enterprise is the main part in the industry-university-research alliance and plays a dominant role in “industry-university-institute” cooperation. Local colleges and universities are the main undertakers in educating and cultivating qualified talents who meet the need of the social production development. Local colleges and universities should become major participants in the industry-university-research alliance mainly by means of talents output and technology innovation achievements to participate in the activities of science and technology innovation.

The author randomly selects about 20 universities of the east, the west and the middle China as the study objects (as first figure shows the location of the universities). The author analyzes the top-level design of the universities such as the school-running orientation, service orientation and etc. The study result is as the second list(CPT is the the abbreviation of combination of production and teaching).

Figure 1 Location of the 20 Universities

Figure 2 Statistics of the School-running Orientation

3.1 Serving regional innovation and development

National innovation system is a subsystem of the core competence of a country, which consists of three parts, the knowledge innovation system, technology innovation system and institutional innovation system. National innovation is fundamental driving force for development for enterprises, universities, scientific research institutions, governments and intermediary institutions, and it regards inspiration, introduction, transformation and diffusion of new technology as the main activities for common social and economic goals and the above mentioned constitute the institutional network through constructive interactions^[4]. Industry-university-research alliance that combines the main bodies of knowledge innovation (universities, research institutions) with the main bodies of technology innovation system(enterprises) and the main bodies of institutional innovation(governments) closely, scientifically and orderly is the key to the operation of national innovation system under the new situation. According to the innovation system theory, the interaction and communication between people, technology and information are the key to the whole performance of the system. There is a situation that universities, research institutes and enterprises work alone in innovation for a long time in our country, and there is no, complementary advantages, benign and orderly flow about resources. In view of these phenomena, the country pointed out the direction for the construction of national and local strategic industry-university-research alliance and provides a strong policy support for the construction and development of it in terms of policy, which is to promote the construction and development of the strategic industry-university-research alliance. For example, in Oct. 2010, the 12th five-year-plan points out that ‘guide and support innovation elements to gather in enterprises and quicken the establishment of technology innovation system that take enterprise as main parts and is market-oriented and industry-university-research combined; strengthen the innovation driving force of scientific research institutes and universities, encourage large enterprises to increase R & D investment, stimulate the

creative vitality of small and medium-sized enterprises, and play the important roles of entrepreneurs and leading technology talents'. The chart 2 shows that 65% of the universities set their orientation as local universities totaling 13 universities, and ranks as the second.

Local undergraduate colleges and universities are the main force and backbone to realize regional innovation. Local undergraduate colleges and universities belong to the municipality and the funds are from the local government. So it is Local undergraduate colleges and universities' mission and responsibility to serve the regional economic construction and social development based on locality. Meanwhile, local undergraduate colleges and universities are closely combined with local social and economic development. Naturally it becomes centers of the scientific research, knowledge innovation and technology development and engines of the regional innovation system in the process of providing intellectual support for economy, society and related industries.

3.2 To establish applied technique-oriented research

Based on locality, local colleges, universities and enterprises have the common administration, policy, culture environment and industry background together with the low cost of cooperation. Therefore, local colleges and universities have natural advantages in serving locality. For small and medium-sized enterprises, it is obviously unwise and unrealistic to invest a large amount of money for the applied research, risk investment, and to realize industrialization independently. The chart 2 shows that 70% of the universities set their orientation as applied universities totaling 14 universities, and ranks as the first.

Local colleges and universities usually emphasize theories and under-emphasize applications in scientific study due to the limitations of history and their own conditions. They pursue the higher and larger blindly and cannot obtain breakthrough. However, they can base themselves on locality, establish application-oriented research and obtain achievements in application with the talent advantage, science and technology, achievements around the industry and region needs and carry out science and technology support, technical service and theoretical guidance. Local colleges and universities should be closely combined with the regional economic and social development in accordance with the needs of regional and small-sized enterprise innovation. And they should adhere to be problem-oriented, demand-guided and thus to help enterprises to solve technical problems, participate in enterprise technical innovation, provide technical advice, training service and talents support, and help them to improve products quality and management to realize the independent innovation of enterprises by means of joint research and collaboration innovation.

Colleges and universities should establish an evaluation mechanism of applied research and actively promote the scientific and technological achievements transformation and guide researchers to comprehend the market demands, enterprise needs and actively carry out the enterprise technology consultation and product research and development cooperation. Colleges and universities should promote their own capacity to serve enterprises and realize academic value pursuit through seeking researching subjects and projects in production lines and hence form their characteristics in industry-university-research cooperation.

3.3 The principle of open college-running model

Universities are open systems, only through the energy exchange with the outside world, will they gain vigor and vitality and develop well. [5] The chart 2 shows that 65% of the universities set their orientation as local universities totaling 13 universities, and ranks as the second. The chart 2 shows that 65% of the universities set their orientation as open universities totaling 7 universities, and ranks as the third.

The advantages of Local Universities lie in the applied research, technical information, scientific equipment and scientific research personnel, but they are lacking in production practices, market information, experimental facilities and research funding. It is necessary for local universities to adhere to the principle of complementary resources, increase their opening up, and work closely with enterprises so that the scientific and technological elements, which has long been cornered in local universities, can integrate and recombine the economic elements of enterprises. Nowadays, science, technology and production cycles are getting shorter and have got the integrated development trend, and therefore the boundaries between basic research, applied research, development research and industrialization have increasingly blurred, and the problems in the actual production, especially in the production with high-tech are pregnant with significant research subjects and breakthroughs, which are hard-won opportunities for local universities. Therefore, in addition to basic research, which can promote advanced achievements by following the technology development law, there is the need for local universities to aim at target market demand and establish a market consciousness, user

consciousness and production management concept, which will result in effective convergence between research and the corporate production and market application.

By building industry-university- research alliances, colleges and universities can gradually reach out into society, achieving the demand joint, personnel movement and co-built platform with enterprises, industries, government and other research institutions. In this way, knowledge and scientific research can be transformed into real products and the platform of communication can be built for the purpose of personnel training, scientific research and social harmonious development..

3.4 Strategy of industry-university- research cooperative education for talent cultivation

Since the end of the last century, Local Universities have tried to increase college enrollment enlargement and the scale expansion, namely, the extended development, as their main feature. The cultivation of large numbers of advanced applied talents for regional development, who can meet the need of local development and industrial requirements with practical ability and innovation ability and the improvement of teaching quality and efficiency, namely, connotative development, have become the main target for local undergraduate colleges and universities for a long period. Based on this understanding, the quality improvement of applied talents has come to be the key for connotative development of local colleges. The cultivation objective of local universities is to provide advanced applied talents for local regions. So it is the important task for local colleges and universities to cultivate students' abilities concerning innovation, practice, research and development and the combination with theories into practice. For a long time, local undergraduate colleges and universities only pay attention to knowledge teaching instead of practical application in daily teaching, or practice teaching is ignored for various reasons in the talent cultivation. Industry-university- research Cooperative education model is an educational model which focuses on the development of students' overall quality, comprehensive ability and employment competitiveness, takes advantage of a variety of environmental and educational resources among schools and enterprises and research units and their respective advantages and combine the classroom-based school education with production and research practice.^[6]Local colleges and universities ought to give the industry-university- research alliance platform a role to play and establish industry-university- research cooperative education mechanism to provide guarantee for the cultivation of applied technical talents. Colleges and universities should actively promote the establishment of a professional guidance committee, which is made up of the research alliance parties involved, and complete a top-level design from the perspective of personnel cultivation objectives, curriculum construction, teaching practice, double-quality staff construction and the construction of practice and training platform so that all resources can be made good use of to service the cultivation of applied talents.

To enhance the quality of advanced applied talents, there is the need to establish more practice and training bases or platforms, and this requires a closer, long-term, lasting and profound cooperation with related enterprises in the region. Through the construction of industry-university- research cooperative alliances and the government guidance or market push, the alliances concerned ought to form a long-lasting, stable, and profound partnership. Thus students can have more opportunities to learn at industry-university- research cooperative bases, put to use their theoretical knowledge and basic skills in the production, have direct access to productive and empirical knowledge, and thus the effectiveness of practical teaching can be greatly improved and more high-quality, application-oriented talents can be cultivated.

To enhance the quality of advanced applied talents, there must be adequate double-qualified and innovative teachers. Due to the fact that local colleges and universities focus on cultivating applied talents, the staff ought to have high academic level besides the double-qualified teachers, who have got abundant practical experiences and strong practical teaching ability. Double-qualified teachers can be cultivated through such means as within training and outside introduction and combination of full-time and part-time teachers. Through the personnel system innovation, the industry-university- research alliance ought to allow a wide flow range with all its alliance professional and technical members, and thus teachers from the local universities can be regularly sent to the alliance branches to carry out practice and training for the purpose of combining theories with production practice; at the same time, other senior technical members with industries or enterprises can go to colleges and universities for their part-time work. Such double-qualified talents with relative freedom can meet the needs of cultivating applied talents.

Figure 3 Location of the Open Universities and the Fusion of Production and Education Universities

4 Cooperation Mode Between Local Universities and Industry-University-Research Alliances

Many different types of industry-university- research alliances exist in China mainland. According to the governmental role and the establishment mechanism of industry-university- research alliances, industry-university- research alliances can be classified into the government-directed model, the government-driven model and market-driven guidance mode; According to the research participants, industry-university- research alliances can be classified into the point-to-point type, the point-to-chain type and the network-based type. Faced with the conservative social and cultural macro-environment and underdeveloped financial and intermediary markets, local undergraduate institutions cooperate mainly with medium-sized and small enterprises, which are lacking in adequate financial support and communication channels. Based on this condition, Local universities and colleges ought to give priority to the government-led alliance mode, giving government the intermediary role to in the alliance and getting such privileges as policies, taxation and financial subsidies from the government. And this type of point-to-point mode can give incentives to the development of universities. At the same time, under appropriate conditions point-to-chain alliances and network-based ones should be constructed so that Local Universities and Colleges can participate actively in the market-led mode of cooperation.

Local Universities and Colleges should raise awareness for the initiative construction of teaching-research-production alliances. Based on their actual conditions and external environment, they should make a reality of the optimal allocation of resources through scientific cooperation mode and institutional innovation. In particular, they should change the existing operating system of scientific research institutions, so that the research scientific resources which are long divorced from the market can enter the market. Through the market-oriented allocation of the resources, Local Universities and Colleges should carry out scientific research and establish operating rules and organizational models which are in line with market economy mechanism. By the use of economic levers and market regulation, Local Universities and Colleges should allow scientific research resources to serve economic development automatically, and actively strengthen contacts and cooperation with enterprises as regards to technology transfer, joint research breakthroughs, academic seminars, personnel exchange and scientific and technological services. Thus, Local Universities and Colleges combine their scientific and technological advantages, dominant talent position and academic strengths with the advantages of industrial enterprises to realize industrialization connection in terms of research and development, test and product achievements, striving to take a place in the high-tech fields.

5 Conclusions and Prospects

For local universities and colleges, the establishment of industry-university- research alliances meets the need of their service with the local and national innovation, the connotative development, and it is also a must for the realization of their sustainable and healthy development. In the early stage when Local Universities and Colleges participate in the alliances, Local Universities and Colleges should

improve the academic level and education quality as their main pursuit, taking into account the commercial interests as well. Local universities and colleges are the important participants in industry-university- research alliances, and they need to establish service awareness, market concept, the user concept, making use of school talent superiority, scientific and technological advantages to strengthen the contacts between teachers and researchers and enterprises and participate in enterprises' technological transformation and innovation.

Such shortcomings as a lack of quantitative research and inadequate analysis exist in the paper. More people are expected to participate in the industry-university- research research with regards to local universities and colleges so that theoretical results can be further enriched, promoting the rapid industry-university- research development concerning local universities and colleges.

A Study on the Innovation of the Students' Management Work in the Context of the School-Enterprise Cooperation

Luo Bin

School of Applied Foreign Language, Wuhan Business University, Wuhan, P.R.China, 430056
(E-mail: 126953202@qq.com)

Abstract: Students management work plays a very important role in the college education process. This study focuses on the problems that usually occur in the daily students' management work in the context of school-enterprise cooperation, and tries to find methods to solve problems. This essay uses methods of documentary research, observation research, qualitative analysis to summarize the core-principles of students' management work and come up with a conclusion that student management work need innovations to make the education process more effective. The essay offers two innovative ways to help solve these problems.

Key words: Students' management work innovation; School-enterprise cooperation; Change the way of work; Professional ability

1 Introduction

The new talent training mode--the school-enterprise cooperation talent training mode, is served for fitting the social and market needs. It takes the advantage of school and enterprise's different education environments and resources to cultivate the practical talents through the classroom instructions and practices; on the other hand, this new mode's collaboration and integration of functions and resources of scientific research and education can offer new sources of innovations for enterprises and society. The studies that are on the school-enterprise cooperation talent training mode came up earlier overseas, which is as early as 1900s. Ever since 1980s, the U.S, British, German, and Australian have made series of extensive and in-depth researches and studies both in theory and in practice on this issue according to their own characteristics and needs. And from then, series of distinct school-enterprise cooperation systems, modes and projects emerged ever since.

China's school-enterprise cooperation talent training mode click into place after 1992, when the "industry-university-researchcooperation joint development project" launched by the State Economic and Trade Commission, the former State Education Commission and Chinese Academy of Sciences. China's studies on the school-enterprise cooperation talent training mode mostly focused on the importance of school-enterprise cooperation, the school internal mechanism reform, the cooperation model, and the connotative meaning of school-enterprise cooperation. Among all the researches, the study on the student's management is very few. New talent training mode calls for new student's management. Thus, the aim of this essay, is to offer the theory and introduction of experiences on the issue of school-enterprise cooperation talent training mode.

2 The Core-principle of Students' Management Work

In a general sense, the students' management work means the series of services, managements, and supervisions work about college students. According to Shan zuo min's essay named "the manage system reform under the context of school-enterprise cooperation talent training mode", he regarded the students' management work's subject classification as the following: Firstly, the perspective of pedagogy. This angle of view brings the student's management work into the category of general education. It often regarded as "implicit curriculum" in the context of school education. Secondly, a psychological perspective. The students' management work is considered as an environment factor of the process of individual socialization. Thirdly, the management perspective. It takes the students' management work as a requirement for the university's organization and can be used for fully displaying its functional role. It's the base of exploring the significance and methods of the fulfillment of the mission of university. Fourthly, the legal perspective. The students' management work is considered as an offer, and the offer's base is the school and the students' education service contract. Finally, is the sociological perspective. This perspective lays emphasis on the interactive relationship between different Social organizations and group factors, and it looks on the students' management affairs in a holistic social development way.

This essay's understanding on the nature of students' management work is that the students'

management work is served for the realization of education aim. The core-principle of students' management work is to promote the "individual's all-round and free development", and aims to the growth and development of students by means of certain managements and services.

3 The Innovation Necessity of Students' Management Work in the Context of School-Enterprise Cooperation

The school-enterprise cooperation talent training mode is a new practice and new mode in the new era of the reform and development in the area of college education. It is guided by the market requirements and aims at cultivating the students' ability of practice and adaptability. It also is an effective way of employment promotion. But in the meanwhile, the problems of present administration systems become increasingly striking. At present, the mainly problems rise mainly in the following aspects:

3.1 The complexity of management

The school-enterprise cooperation involves multiple managements and education bodies, so it is very important to coordinate the relationship between students, college and enterprises. Thus, it is very normal that the management become more and more complexity. For example, the school-enterprise cooperation will have to face the management differences between in school and outside school. And it is very common that the blind area and cross region in the management appear to make problems even more complex.

3.2 The distinctiveness of management

The school-enterprise cooperation involves the enterprise's participation in the education link. It will lead to the management differences in many ways, such as ways and means. For example, the involvement of enterprises may cause the contradiction between the ideal and the reality, which could bring students emotion fluctuations and influence their understanding to the society, family, and career. Thus, we should realize that the difference of the traditional management mode and the new school-enterprise cooperation exist. We should take targeted measures and grasp key point of work to adjust our work on students' thoughts, behaviors to make them better adapt to the collage life.

3.3 Management objects become increasingly difficult

3.3.1. Students are facing more and more financial and psychological pressure

Because of the teaching arrangements of the school-enterprise cooperation, students will have less time in-school learning, and they need to spent one or two years' work at enterprises. This will make them have not enough time for self-growth, and lead to the inadequate prepare for entering the society. This inadequate in preparing could cause some puzzles for students psychological and emotional. Normally, students may have extra cost in their study because of the use of resources of enterprises, and this also brings some pressure for students.

3.3.2. Students are lacking of initiative and intentionality

Students of the school-enterprise cooperation have already identified the future working industry, even the specific company, so it is very easy for them to lose their initiative and intentionality of future plan.

3.3.3. Students are easy to have conflict during the students practice

Students' internship is the key link for checking the teaching effect and quality. But in reality, many students take passive attitude towards internship. Sometimes, students may slack in work, and work without enthusiasm just because they are not satisfied with enterprise environment, or individual task. Other students only regard the internship as a way of relaxing, free themselves and a flee from the classroom learning and the control of school. We found that, many students' attitude to the internship become more and more boring, passive, and blind after their initial work. As for the college, because of the constraints of human, physical, financial resources, it cannot guarantee the management, counseling of students. This kind of "loose" management cannot make sure the effect and increase the risk of safe production. In a word, many problems may happen during the internship stage and lead to the conflict between students, enterprises, and colleges.

Students' management system is made aiming at the students' development. It includes a series of specific management philosophy, management content, management tools, and management process and management system. Any problem occurs in the context of school-enterprise cooperation calls for new ways of management to solve.

4 The Innovations of the Student's Management Work in the Context of the

School-enterprise Cooperation Talent Training Mode

4.1 Involving the work ethics, professional ability into daily education

Enterprise operating aims at the profitability, while the running of colleges aims at imparting knowledge and educating people. Enterprises and schools' different principles lead to different thoughts on management ways, capital investment, training mode, etc. But both sides' ultimate aim is to cultivate a future productivity that owns work ethics and professional ability. The college students' administrator should conduct discussions and exchange ideas with the enterprise on the relevant matter and help students to grasp a basic conception about the relationship between the major and future working requirements. College can make use of visiting, symposium with students and enterprises, set a role model, outstanding student experience sharing etc. to let students have some understanding about job principles, code of professional ethics, work standards, personnel quality. All the work can make students have a thirst for knowledge learning, good vision for the future work which will help during the entire stage of students' college life. We should also make students education activity carry out in a relative real environment. The content of activity should include occupational ethics education, team work spirit, legal awareness, safety awareness, and life services. This will be a very important part of students' management work, and also served as a education aim for school-enterprise cooperation talent training mode. For the first-line students' management worker, it needs continuous learning on the understanding of students and the enterprise and fight for becoming a specialist.

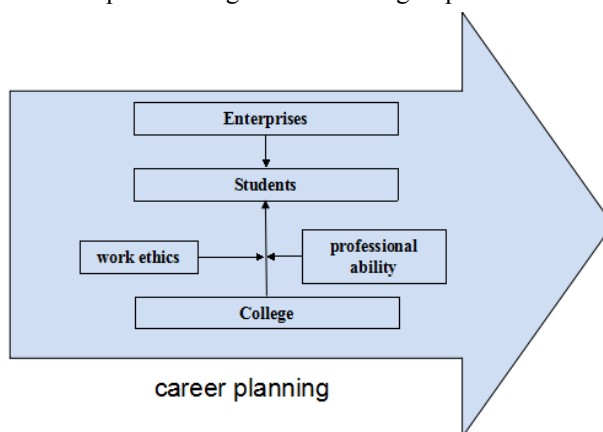

Figure 1 Student Management Work Model

4.2 Career planning should be carried out throughout Students' entire College Life

Students today are independent, with their own character and self-assertiveness. We cannot force them to do anything if they do not want to. And career planning as a new course, plays even more role in students' future development. So if we can make the career planning work throughout students' entire college life, even during the period of the internship will make sense. The career planning's carried out should be made according to the students' different stage. For example, for the freshmen, the most important part is to let them know about their strengths and weaknesses, their interests and values. For the internship stage, it is more important to let them know about the reality of working world, and let them know how to turn the weaknesses to strengths.

5 Conclusion

It is a very complex and urgent problem that need to draw attention to. This new talent training mode--the school-enterprise cooperation talent training mode, which takes the advantage of school and enterprise's different education environments and resources to cultivate the practical talents become increasingly popular all over the world. And this mode is playing a more and more important role in China's working environment. On the other hand, the complexity, and the distinctiveness of the issue make the study on it become very hard.

This essay only put forward two basic ways, including the involving of work ethics, professional ability into daily education and career planning should be carried out throughout students' entire college life to answer to this problem. But we still need more researches on the details of the fulfillment. And, the school-enterprise cooperation talent training mode is vary from college to college, and from course to course. So, we cannot make one system or methods be available for every situation. So, the outlook

about this issue is to make more thoroughly research and need include some quantitative analysis to make the research more reasonable and more convincing.

Abstract: This paper employs the bibliographic inquiry of publications about Burnout in Brazil in the period of 2012 through July 2015. For this, researches were made using the SCIELO database where 67 papers were cataloged, describing applied researches in various professional categories, mainly analyzing the incidence of Burnout in professionals of the Health and Education segments. The results of this research confirm the inquiry made by FREIRE et al (2012), in which the results are close to the ones shown here, the difference being the broadening to studies of professionals of other segments, also pointing out the need for better understanding of the syndrome in an interdisciplinary, critic and systemic view.

Key words: Burnout; Burnout in Brazil; Systemic and interdisciplinary Vision

1 Introduction

Maslach, Jackson and Leiter (1997) defined burnout as a psychological syndrome of emotional exhaustion, depersonalization and reduction of personal realization that is inflicted upon people that work with other people's capacity. The concept was initially developed by Freudenberg in the 70s, however there is a need to improve and update the concept and ways of measurement of this syndrome along the time, due to changes on lifestyle and working conditions. Main symptoms are: emotional exhaustion, depersonalization and reduced professional achievement; fatigue; pain; immunodeficiency; sexual dysfunction, distrust, irritability, loss of initiative, tendency to isolation.

Previous studies about burnout that try to identify and also understand how subjects react to their jobs in relation to lack of satisfaction about the activities, low organizational engagement, absenteeism, intention of quitting their jobs, turnover and performance at work. (MASLACH, LEITER and JACKSON, 2012).

The main objective of this paper is to analyze the current scientific production about this subject being developed in Brazil, with focus in the work environment, and ascertain which are the instruments used to measure this syndrome.

2 Methodology

The method used as basis for this study was the bibliographic exploratory research (MICHEL, 2009), through the inquiry of published Works in Brazil from 2012 until July 2015. The SCIELO-Scientific Electronic Library Online database was used with the following keywords: burnout no Brazil, syndrome de burnout. There was scrutiny in choosing only papers that studied Burnout inside Brazil. 67 papers were cataloged analyzing the Burnout syndrome in workers of different segments and activities, with focus on the ones from the Educational and Health segments. However, there is a notable broadening of studies researching other professional categories as shown in the results.

3 Theoretical References

3.1 Concept of burnout

Shaufeli; Leiter and Maslach (2009) wrote a valuable paper for the knowledge of Burnout, as 35 years of research and experiments about this syndrome was investigated and thoroughly described.

The concept of Burnout appeared in the USA in the 70's, and afflicted particularly professionals of Health such as medics, nurses and psychologists as well as lawyers and police officers, which complained about the lack of energy or the extraction of such during their work and losing the value and sense of their jobs. A metaphor known and used by Freudenberg (1974) to express this experience is of a lit candle, which demonstrates the exhaustion of energy to maintain itself lit. The syndrome contains three basic elements: exhaustion, isolation and delusion; and seems to be consequence of chronic stress related to work.

The authors of this study observed that the origin of this concept is rooted to a more openly social, economic and cultural development context and it appears with the fast and deep changes of the transition between the industrial society to a service economy. This process is happening since the last quarter of century XX until today, and it seems present in the work life around the world. There have been thousands of publications about the subject and is estimated that more than 6000 works that exists, as researchers and alumni try to understand it and how to prevent it.

In some countries such as Sweden and Netherlands the Burnout is found in manuals as a defined medical diagnosis, and these countries have the trained professionals to evaluate and treat these cases. However, the majority of the nations don't have these resources and don't understand the syndrome as a clear and defined health issue. The study demonstrates that at times, when this illness was detected there was influence of social values defended by the government. This led young idealist professionals to be deluded with the development of the more humanist careers and ended up in frustration, as the solution of the social issues lived in that context could not be reached by their individual effort but by systemic components of various factors. Schaufeli, Leiter and Maslach (2009, p.207) indicates, "The experience of burnout does not refer as an inconvenience or occupational risk, but as a devastating attack at the professional identity".

The same work points out that in the 21st century there is two distinct contributions in the life of a worker that influence the appearance of the syndrome:

1) The lack of balance between demand of services, which is always rising and the lack of resources needed for this work, such as personnel, equipment, supplies or even time and space.

2) The reasons for the dissatisfaction or frustration: Current employees are critic and demanding and realize that, for example, there is a lack of coherence between the organizational speech and what it does in reality. Sometimes there are conflicts between corporate values and individual values of the employee.

Despite those facts, there is the observation of the emergence of Burnout in countries everywhere; and this seems to show that there are relations between the emergence of the syndrome and the economic development of countries. For example as China and India are progressing economically, there is focus and more studies on the subject. There is a hypothesis that the globalization, privatization and new workers' demands, such as, development of new skills, new types of work, pressure for productivity and quality and accelerated pace in all work processes, are the cause for the emergence of Burnout.

However, Schaufeli, Leiter e Maslach (2009) points out that the fact of Burnout being globalized does not mean that its understanding and treatment has to be equal everywhere. For some, the syndrome is so intensive that is believed that there is may lead to the psychological death of the subject. For others, the development process of the syndrome includes the exhaustion in its most light form and the neutralization of the subject happens only at its final stage. The right to claim benefits and financial compensation depends on the understanding of Burnout in determined context, as its imperative to obtain the formal diagnosis and the acknowledgement of the authorities. Moreover using the scientific research it may be possible to develop specific instruments to detect and evaluate subjects afflicted by Burnout.

3.2 Measuring the burnout: maslach burnout inventory x copenhagen burnout inventory

Christina Maslach and her fellow researchers developed the MBI (standing for Maslach Burnout Inventory). The MBI is a quiz containing twenty-two questions addressing three central issues: emotional exhaustion, depersonalization and personal realization. (CARLOTTO and CÂMARA, 2007).

Despite the broad use of this instrument in empirical studies about Burnout around the world, we have considered important to bring another instrument to polarize against the MBI. It is the Copenhagen Burnout Inventory (CBI). This instrument consists of three scales that measures the personal Burnout, Burnout related to work and the Burnout related to customer services (KRISTENSEN, BORRITZ, VILLADEN and CHRISTENSEN, 2005).

The basis for the critique issued by these authors about the MBI are as follows:

- Burnout is a broad term, and the MBI deals with it in specific terms;
- There is no clear relationship between the MBI and the concept of Burnout;
- What the MBI measures is not clear;
- The MBI is not a public instrument, but is one distributed by a commercial company.

It is important to emphasize that they elaborated a pilot study named PUMA (in Danish stands for:

Burnout, Motivation and Satisfaction at work Project), and the most natural thing to do would be to translate the questionnaire to Danish, but as the studies about the subject deepened they have considered that would be better to develop a tool to close the eventual gaps of the MBI; and this lead to the CBI.

Our suggestion is that the measurement of the Burnout should be done by both instruments as to identify eventual differences and similarities, being applied in the same group of people.

Describing the summary of the main elements known and discussed about Burnout today, we have surveyed studies in Brazil and developed a general analysis about it the country.

3.3 Bibliographical review about studies of burnout in brazil

In Brazil, studies about Burnout are lacking and specified in determined segments of profession, as pointed out by Trigo (2010). The author made a bibliographical review, using BVS, index Psi and Pepsic databases, meeting 27 papers about the subject in Brazil. These studies were made in the Health segment with professionals such as nurses and medics. As a matter of the World Health Organization has being working dor some time with a quality of life assessment called WHOQOL, and moreover a Brazilian version of the World Health Organization's Quality of Life Instrument--Short Version (WHOQOL BREF) was tested already a decade or so ago by Berlim et al (2005) with patients 98 patients with major depression.

Still in 2008, Carlotto and Câmara (2008) made studies of bibliographic reviews about the subject in Brazil. The authors identified that the first studies about Burnout in the country emerged in the 90's, through the publication of the first group of thesis and papers about it. In the same period, the first groups of research in universities and institutes were created, being intensified after 2001. To the authors, the interest for Burnout was risen due to three key factors:

The first of them were the modifications introduced in the concept of health and better quality of life of the WHO – World Health Organization. The second was the rise of demands of the population in relation to social, educational and health services. At last, the awareness of public organizations, researchers and clinical services relating to the syndrome, understanding, the need to deepen its studies and the importance of prevention, as it was more complex and noxious compared to initial projections. (CARLOTTO AND CÂMARA, 2008, page 153)

Freire *et al* (2012) made a specific study about the state of art of the Burnout syndrome in Brazil. Using bibliographic research aiming to analyze the production of knowledge about Burnout, the author inquired the Scielo - Scientific Electronic Library Online database about works between 2000 and 2009 in which the results follow below:

There were 25 papers found, 60% of these approach professionals of the Health segment, 20% teachers, 4% police officers, 4% psychiatric clinic patients and 12% other categories. The central focus was to analyze the prevalence of the Burnout syndrome. (FREIRE et al, 2012, page 66)

In 2015, in bibliographic review done by the authors of this paper, using Burnout no Brazil keywords, cataloged in the Scielo database the existence of 67 papers about the subject between the years of 2012 and 2015. Those papers were distributed as follows:

- 30 papers focused in health professionals such as nurses, psychologists, health agents, etc.
- 16 papers focused on the effects of Burnout in students and professionals of the education segment.
- 07 papers analyzed the methodological procedures of the factorial scale of the *Maslach Burnout inventory-Human Services Survey* (MBI-HSS).
- 3 papers analyzed the syndrome in civil servants.
- 2 papers analyzed the incidence in firefighters.
- 2 papers analyzed the issue with focus on employees of funerary services.
- 2 papers researched the syndrome on professionals in the dance segment.
- 2 papers had emphasis on swimmers.
- 1 paper investigated the syndrome in athletes in general.
- 1 paper analyzed the syndrome on soccer players and
- 1 paper analyzed the Burnout on tennisists.

Figure 1 About the Scientific Production about Burnout in Brazil, 2012 – 2015
Source: Scielo, 2015

Clearly Health and Education are the areas most affected, but it's also perceived a broadening of segments in which its professionals receives the attention of researchers, which could mean a relevant advance in the field of study of the syndrome, its recognition by authorities and mainly, in detailed investigation processes, according to the specific demands of each segment of work. However, the process of questioning and investigating has to advance as the current society in which we live require every time more of its workers, intensifying hence the incidence of Burnout.

4 Concluding Remarks

The different arguments held in the whole world indicates that the Burnout syndrome doesn't yet have a complete definition and its researches show different points of view in the matter.

The bibliographic review developed points to a broadening of professionals afflicted by the syndrome and a rising in the research numbers. This indicates the need and interest of a more meaningful and effective action in organizations that must concern themselves about people affected by the syndrome, as it causes ailments to workers and society.

However, we can observe that the economic and social contexts in Brazil accord with what previous studies pointed out: Development in search for a better and stable economy, but with a long way to go. This fact hits all population in its cultural and social way of life, which permits a distant view about better life quality to workers and, as indicated by Schaufeli, Leiter e Maslach (2009) studies, what could be considered as a positive pole of a continuum in which the negative pole would be the Burnout.

Furthermore, if we consider the current crisis going on in Brazil, which in itself led to an impasse in the rights of the worker, bringing a scenario of intensification of outsourcing and inflexibility in the workers' rights. We could foresee a scenario of losing quality of life and intensification of bad developments to the health of the worker, which could rise the Burnout cases in different segments of Brazilian workers. Hence studies about the Burnout Syndrome are urgent as well as improving life styles.

Abstract: Access to adequate housing has been recognized as a human right since 1948 with the Universal Declaration of Human Rights as a fundamental right to life of the people. However, regarding the issue of housing, this cannot be treated only as a floor and four walls for protection against the weather. When we talk in the dwelling it is necessary to ensure the survival and minimal structure that guarantees the rights of citizenship to individuals. Is worth mentioning that the large agglomerations in cities lead to what the UN recognized as “favela” or “slums” as mentioned by the United Nations Human Settlements Program (UNHABITAT). This urban element may be described as a wide range of human settlements for low-income and poor living conditions that characterize one of the many manifestations of poverty all around the world. In this context, this paper aims to describe the relationship between access to housing and direct citizenship. Results suggest that there is still need for assertive public policies not only to grant access to protection and housing, but also on the need to have wider access to basic rights and human dignity in the Region. Moreover it is also necessary to ensure a context that would allow access to public services of quality regarding basic items like sanitation, education and employment opportunities. As a matter of fact without access to dwelling people feel marginalized, but with substandard shelter very often life itself is at risk and compromise the future generations. The cause of these problems is an evident lack of basic sanitation, deforestation and pollution arising from the large number of illegal occupation of public and private areas.

Key words: Dwelling; Citizenship; Sustainability; House; Human rights

1 Introduction

An individual needs several things for their survival, from food to supply their hunger, water to kill their thirsty, to a housing to protect themselves. The latter can ensure their safety and that of their families. But Dwelling cannot treat it only as shelter, but also should concern a guarantee of a risk-free environment survival and worthy life now and in the future.

Although the dwelling is often seen only as protection, it should be treated in a more complex way. Therefore, it can't be seen as if the purpose was only one set of walls covered by a roof. Issues related to housing involve security and freedom to access other goods and services in a society (SEN, 2000).

As a matter of fact the exclusion of large populations of the formal housing market, which has adequate housing, has been leading marginalized individuals to progressively occupy areas not incorporated into the formal housing market or even to areas that should not be intended for housing. These new areas are often recognized as illegal occupations, and end up without the necessary basic infrastructure (ONU, 2014; FERREIRA; BIASOTTO, 2012; UNHABITAT, 2014).

Thus, this irregular occupation process becomes precarious causing problems to their occupants and other people of these localities. These problems are of environmental order, in addition to the related lack of adequate public services like sanitation, fresh water, access to electricity grid, among others, which makes it unhealthy people to remain in these locations. The lack of access to dwelling housing leads individuals to seek public shelters, among other options that are available in many locations as the camps of homeless and landless.

So Dwelling is an issue that deals with access to a broader citizenship status which includes the freedom and access to public health services, sanitation, education, and access to economically active individual situation since you can use your address to have access to bank accounts, purchase products, among others.

Based on this context, this article aims to describe the relationship between Dwelling and Human Rights; and we attempted to describe the problem of dwelling and its impact on access to Basic Human Rights in general. Thus, if it's possible to understand this situation, also is possible carry out a better performance in this aspect and which require more assertive action to ensure a minimum of citizenship to their people.

2 Access to Dwelling for Access to Citizenship

2.1 Dwellings as human rights

People in order to survive initially seek for basic needs as food and water, because with hungry and thirsty, the human being is weak and helpless. As described in Maslow's Pyramid of Needs these demands when supplied, at least partially, lead people to seek for the attaining a higher level of human needs.

So after meeting the physiological needs individuals seek security to continue surviving as the next level of the hierarchy of needs. Thus, the human being is constantly searching to meet their needs, makes the question of access to housing an unavoidable primary issue for survival. The protection provided by the housing guarantees the security provided to move to the second level of Maslow's needs, hence is as basic as access to food and water.

However, it is worth noting that the housing used in this paper, is not related only to a protection for individuals, which is, keep your safety. The property in question is seen as the means to achieve citizenship, so it's worth highlighting that access to adequate Dwelling has been recognized as a human right in 1948 with the Universal Declaration of Human Rights (ONU, 2014).

The HPS (Federal Homelessness Partnering Strategy) defines "homeless" as individuals who live on the streets, spend the night in public shelters; overnight in unhealthy places the human condition; aside from that these individuals continually alternate in strangers' homes, friends and parents (HAMILTON, 2014).

According to UN-HABITAT (2003) housing rights are also registered and defended within other international human rights instruments, for example: the International Convention on the Elimination of All Forms of Racial Discrimination (1965); the Convention on the Elimination of All Forms of Discrimination Against Women (1979); the Convention on the Rights of the Child (1989); the Convention Relating to the Status of Refugees (1959); the International Convention on the Protection of the Rights of All Migrant Workers and Members of Their Families (1990).

Another aspect that should be highlighted is the study by the United Nations Human Settlements Program (UNHABITAT). This study used the generic term "slum" to represent a wide range of human settlements for low-income and poor living conditions that characterize one of the many manifestations of poverty. So the question of dwelling is directly related to living conditions of the individual (UNHABITAT, 2014). Noteworthy are some general features that are common to most slums (ALVES, 2010; UNHABITAT, 2014; ONU, 2014), they are they:

- a) Lack of access to basic public services (drinking water, sanitation, electricity, paving etc.);
- b) Poor or illegal dwellings, and inadequate structures that are out of the division of land and construction standards; with inadequate materials and in inappropriate places such as hillsides;
- c) Population density;
- d) Unhealthy and hazardous locations (lack of basic sanitation, proximity to pollution sources, inundation, landslides etc.);
- e) Insecurity of tenure and irregular or informal settlements;
- f) Poverty and social exclusion.

As may be seen these irregular promoted inappropriate living conditions blocks individual's capacity to exercise full citizenship, and put their lives and their families at risk. Therefore, without access to Dwelling access to citizenship also becomes limited.

2.2 Dwelling and the citizenship rights

Dwelling may be seen as a center of stability for individuals, because having an address represent is an anchor of your history. It's a reference to their interaction with other individuals, the basis for interactions and economic and social development. Therefore, the dwelling works as one of the factors that guarantees rights to individuals.

According to the UN (2014) to adequate Dwelling should include:

- Ownership security: Everyone has the right to live without the fear of suffering removal, improper or unexpected threats.
- Availability of services, infrastructure and public facilities: people should have access in their dwellings to water networks, sanitation, gas and electricity; as well as public services in the surrounding area (schools, kindergartens, health clinics, sports and leisure areas, as well as public transport, cleaning, garbage collection etc.).
- Affordable cost: as the cost for the purchase or rental of a dwelling, it must be affordable and not compromise the family budget for food expenditures, culture, leisure etc. Another important

aspect regarding the costs are related to maintenance of the dwelling (water, electricity, taxes etc.);

- **Habitable:** Adequate Dwelling must provide good protection against cold conditions, heat, rain, wind, humidity and also against threats from fire, landslide, flood and any other factor that endangers the health and lives of people and consider the size of dwelling and the amount of rooms should be consistent with the number of residents.
- **Non-discrimination and prioritization of vulnerable groups:** Adequate Dwelling must be accessible to vulnerable groups in society such as elders, women, children, disabled people, people with HIV, victims of natural disasters etc.
- **Appropriate Location:** adequate Dwelling must be in place that offers opportunities for economic development (jobs and income), cultural (leisure) and social (public living spaces such as parks). The location of the dwelling must also allow access to environmental goods, such as land and water, and a balanced environment; as well as security and freedom to access other goods and services in a society.
- **Cultural adequacy:** The way to build dwelling and the materials used in construction must express both the identity and the cultural diversity of residents. Reforms and modernization must also respect the cultural dimensions of housing.

Thus, dwelling becomes a means to obtain citizenship because with the living in a fixed address is provided to the individual being recognized as being economic and social may claim the state for improvements in their locality and to exercise labor activities, social and financial for your wellbeing.

When we talk about dwelling is relevant to mention the Statute of Cities, from Brazil (2001), which defined the general guidelines for urban policy, including among others the guarantee of the right to sustainable cities, understood as the right to urban land, dwelling, environmental sanitation, urban infrastructure, transportation and public services, work and leisure, for present and future generations (FERREIRA; BIASOTTO, 2012).

So, we emphasize that in addition to social and economic issues, also the environmental issue should be taken into account when the problems with housing are treated. Housing should not be built, or even permission, in areas which compromise natural resources such as vegetation and water.

An example of this may be found in invasions in watershed areas in the state of São Paulo, Brazil (BRIDGES, 2012; BONDUKI, 2009). These watershed areas are easily accessible to social movements of homeless, locally organized groups, and individuals who simply find opportunity to take ownership of an area for building a house.

Thus, this irregular occupation process becomes precarious causing problems to their occupants and other people of these localities. These problems are in addition to the environmental, related to lack of adequate public services like sanitation, fresh water, access to electricity grid, among others, which makes it unhealthy people to remain in these locations.

As described by the UNHABITAT, slums consist of an informal settlement, densely populated and characterized by substandard housing surrounded by misery. Slums actually differ in size and other characteristics from country to country, but in general the majority lacks reliable sanitation services, providing clean water, reliable electricity, and other basic public services and private. The villas built in the slums range from tin houses, timber and even masonry, but weakly secure adequate housing (UNHABITAT, 2014).

As an example of how the removal of a slum may bring benefits to a city, there is the case of the removal of slum "Catacumba" in Lagoa Rodrigo de Freitas: "When a slum was taken away in 1970, the buildings in the area, whose values were being depreciated, reversed the curve and began to appreciate, increasing the wealth of the neighborhood and the city for the benefit of all" (FERREIRA; BIASOTTO, 2012). So, in addition to promoting benefits to the purchasers of the villas are also generated positive externalities in the localities affected by this transformation.

In a study published by the UN organization dealing with dwelling at UNHABITAT (2014), the socially focused architect Anna Heringer recommends to overcome the challenge of creating shelters taking in consideration as main tasks:

- Search for potential existing resources and each locality;
- Increasing confidence of the communities in your own skills and resources;
- Train people in the enhanced utilization and construction based on locally available natural materials;
- Build with confidence through individual efforts and collective work;

- Create job opportunities
- Promote Job cultural diversity.

Based on these tasks one may attain a breakthrough not only in the number of dwellings, but also an increase regarding equality between individuals and more peaceful environment. This situation actually helps to develop active citizenship among members of the community being created.

To promote access to dwellings is worthwhile highlighting also projects by the TETO organization. These institutions jointly with the FSC (Forest Stewardship Council) form a partnership so that all houses constructed by the organization in Brazil are made with certified wood for example (GREENSAVERS, 2014). A TETO works in poor communities of Latin American countries and is present in 19 countries: Argentina, Bolívia, Brasil, Chile, Colômbia, Costa Rica, Equador, El Salvador, Guatemala, Haiti, Honduras, México, Panamá, Paraguai, Peru, Uruguai, Nicarágua, República Dominicana e Venezuela (TECHO, 2014).

This partnership between the TETO and FSC hence reinforces also concern for environmental issues. So, the Ibero-American countries need to think in a systematic and integrated manner the issues of Dwelling, and the sharing es should not only be designed locally but interdependently (GREENSAVERS, 2014).

Note that worth mentioning programs developed by other countries that seek to subsidize 25% to 90% of the dwelling value depending on the group's poverty vulnerability, the property value of the remaining beneficiary complements with mortgage up to 25% of their income. The Chilean program is part of public policies developed that offers not only benefit the community, but also tax incentives to builders. As the Department of Economic Studies of the Colombian Chamber of Construction (CAMACOL), others Latin American countries such as Colombia, Mexico, Panama, Peru, Chile and Brazil develop similar programs in relation to the goal and subsidies, which varies are the criteria regarding the value or percentage subsidized. Note also that government initiatives are not enough to combat the deficit dwellings therefore are extremely important initiatives of society as a whole in favor of decent dwelling.

3 Conclusion

Dwelling should be treated in a systematic and interdisciplinary way, as problems related to limited access to basic needs collectively affect living conditions in general. Moreover homelessness leads to exclusion of citizenship. A house is not only a place to live based on wood and stone, but considered as dwelling is as well an address; and hence a local identity that to build people their life story, have a family and other social ties in their localities. Moreover a house helps to guarantee human rights to their owners. In fact, access to housing should also guaranteed access to security, education, sanitation, social life, among other things mentioned in the declaration itself of Human Rights.

Therefore, that much remains to be done regard dwelling and hence access to citizens' rights. As mentioned before low performance in basic indicators mean people still living in slums, and this many times have not only serious social impacts but also environmental impacts and both end up affecting the rest of the population. As matter of fact building shelters in inappropriate places lead to lack of access to citizens' rights and creating huge problems for public health and future education building a vicious circle with the encouragement of informal and illegal. The children raised in environments that come from these kinds of conditions will be hindered from basic human rights and won't have opportunities outside the informal or illegal. Thereby, when it comes to Dwelling, we cannot think only of shelters. We must understand that this is a basic human issue that needs to be considered to ensure social inclusion, environmental care and the well-being of all.

Research on Development Path of Strategic Emerging Industries in the Context of Regional Innovation^{*}

Dai Lei, Wang Xiuting

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 13545866099@163.com, wxt660@126.com)

Abstract: Under the background of constructing a resource-conserving and environment-friendly society, it's important to study how to perfect our development path of strategic emerging industries and supporting policy to cultivate the core competitiveness of the industries and develop China's economy and society. We analyzed the main factors, environmental factors and functional factors of China's strategic emerging industries base on the study of development path of strategic emerging industries at home and abroad combined with regional innovation perspective. And then, we expanded the common point-line-surface development path to a new one under China's macro and micro environment.

Key words: Strategic emerging industries; Regional innovation; Innovative development path; Economics

1 Introduction

Currently, there already are many international researches on regional innovation, industrial development as well as industrial planning. But most studies confined within the industries, and ignored the important impact of the macroeconomic environment of regional innovation in the process of finding development path of strategic emerging industries. How to take advantage of regional innovation-related advantages; accelerate the development of strategic emerging industries? And how to cultivate and enhance the core competitiveness of strategic emerging industries, promote the regional innovation systems to meet the development needs of the regional economy? All these issues relate to the cross of regional economy, industrial innovation and strategic management, which has a broad exploration of space.

2 An Overview on Development Path of Strategic Emerging Industries

Strategic emerging industries refer to industries that have strategic positions in the national economy with significant and long-term impact on economic, social development and national security and would become the pillars of the region's future economic development(Wei Haihan, Yu Qian Liu &Jingyu, 2012).

2.1 Connotation and characteristics of strategic emerging industries

According to the national definition of strategic emerging industries, strategic emerging industries are extension of the emerging industries, which not only have the general needs, but also need the unique resource endowments. Namely, there is a regional innovation system as a development platform to make them the true strategic emerging industries(Han Minchun Cai Yufe, 2012).

According to its definition, scholars have in-depth research on characteristics of strategic emerging industries. Shi Ping, Zheng Jianghuai (2010) argues that strategic emerging industries are characterized mainly in five aspects: evolution, periodicity, clustering, body interaction, knowledge-intensive and professional. Lai Yahong(2011) summed up its seven features, namely: strategic orientation, comprehension and innovation, high-speed growth, multiple risk, spatial and temporal dynamics, international openness and green and low carbon(Lai Yahong, 2011).Thus the formation and rise of strategic emerging industries are not only impacted by its own inherent laws , but also by many external factors such as technological innovation with time characteristics, global competition, national and regional industrial policies, and so on.

2.2 Research status of strategic emerging industries' development path

1) Domestic research on development path of strategic emerging industries

Chinese scholars Hu Shuhua and Mou Renyan(2008) , thinking from the perspective of main factors, summed up the point - line - surface and surface - Line - Point development Path(Mou Renyan, 2008).

^{*} Supported by Hubei province science and technology plan projects, Study on Development Pattern and Case Study of Industrial Technology Research Instituts and other New Industrial Technology Innovation Platforms (Item No. 2015BDF021)

As to the first path, it means to rely on new technologies or new products to develop industry chain, forming lines, then develop into industrial parks, technology parks, and so on, promoting industrial intersection. For the second one, it means to attract enterprises to enter the park to create industry chain and industry groups relying on existing industrial strengths and foundation, then joint to overcome certain key technologies or develop a new product. According to driving factors, Zhang Wenqiang(2013)proposed market-oriented innovative development path, Gakken-driven innovative development paths, and government guidance Innovative development path(Zhang Wenqiang, 2013).

2) Developed countries' research on development path of emerging industries

Strategic emerging industries in US are mainly developed by the cultivating of industrial park. In 1950s, some high-tech-intensive areas were formed around universities, called" Science and Technology Industrial Park" in US. The development path of American strategic emerging industries was supported by the establishment of these industrial parks, which attract enterprises to enter, from the surface to a point, generating leading enterprise, and attracting upstream and downstream enterprises come into park to form industry chains.

Germany adopted a research-driven innovative development path: Technology Innovation Strategic Alliance. In most of their government policies, major research programs and national high-tech strategy, the Industrial Technology Innovation Alliances are given multi-faceted guidance, supports and funding. The Government has also established alliances website that provides a platform for alliance cooperation, communication, development and services. In recent years, nearly a hundred Innovation Alliances were established throughout Germany which play important roles in strengthening regional research, accelerating product development process, and promoting the development of the service sector.

United States, Germany and other developed countries have been fully aware of the importance of strategic emerging industries, and have found their own development path. Now, our research on the development path of emerging strategic industries still stuck in the hierarchy of "face", which limited to the development of the industry itself, as well as the formation of industrial clusters, ignored the special advantages and functions of strategic emerging industries as a part of regional innovation system. Wang Peng et al.(2011) studied the interaction mechanism of the adjustment of industrial structure and regional innovation, and found that there was a close link between the two. Li Yuhua, Wu Xiaofeng et al.(2014) also believe that because of the pre-guiding, complexity, risk-taking of technology innovation, a regional innovation ecosystem is needed to share resources and the cost of innovation, promote the formation of technical standards to promote the innovation and evolution of strategic emerging industries Based on the above research, we intend to extend the strategic emerging industry development path to the "system", namely to build industry innovation ecosystem, focusing on the integration of industry and industry, industry and region.

3 Analysis of Development Path Under the Perspective of Regional Innovation

Regional Innovation System refers to an institutional network which is distinctive, associated with regional resources and with the purpose of promoting the generation, mobility, updating and transformation of new technologies or new knowledge in a special area.

3.1 Analysis of the main elements of strategic emerging industries

Regional innovation system consists of three parts- main elements- including companies, universities, research institutions, service agencies and local governments in the region, functional elements -including system innovation, technological innovation, management innovation and service innovation within an area, environmental elements -including structure, mechanism, government or legal regulation, infrastructure and security conditions, etc. with the function of outputting technical knowledge, material goods and benefits. Strategic emerging industries, as sub-module of regional innovation system, also consist of these elements.

As shown in figure 1, strategic emerging industries are dominated by different main element when they stay in different stage. Located in the formative period, new industries should be biased towards the government-led model to achieve industry-university-research cooperation. At the beginning of their development, the core technologies of strategic emerging industries have been made some breakthrough, but their non-scale development, imperfect policy system and unsound investment and financing system made government the dominant main element. At this time, government, enterprises and academic sectors were asked to join together to form joint ventures, technology alliances or R&D consortia to lead technological advances, effective integration of resources, accelerate the promotion of technological progress and improve innovation capability, which on the one hand dispersed the investment risks of

each body and on the other hand, promoted the complementary of resources and the exchange and integration of innovative thinking.

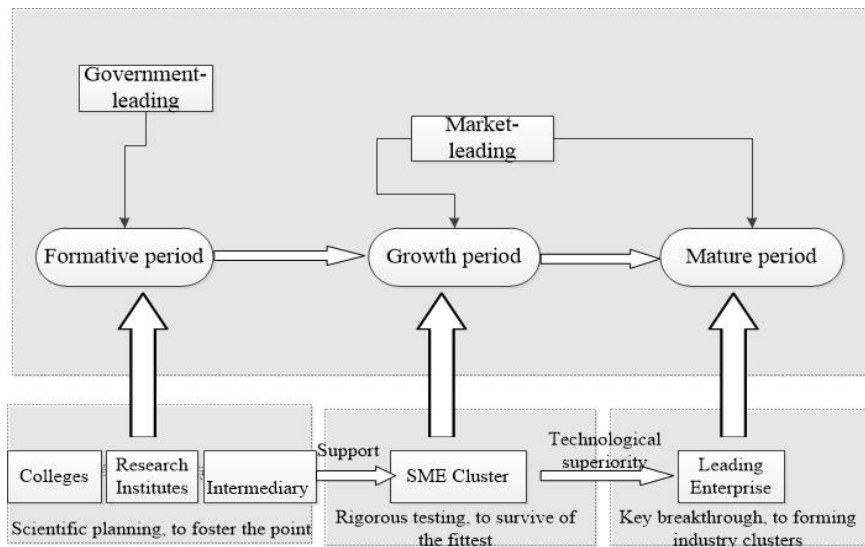

Figure 1 Distribution of the Main Elements of Strategic Emerging Industries

In the growth period, SMEs play a leading role, and symbiotically develop with large enterprises. At this stage, the main product and technological process has been initially formed, industry begun to take shape, and the enterprise technical risk and market risk gradually leveled off. Empirical studies show that there is a positive correlation between the intensity of market competition and innovation performance of enterprises. So, government, just as an auxiliary tool to regulate the market now, should reduce direct investment in industries to ensure free competition. The government's auxiliary methods include: a. Introduce standardized policies to prevent large enterprises monopolize technical standards and improve the entry barriers for SMEs; b. Provide innovative services policies for SMEs, such as the establishment of business incubator, technology information management consulting services and so on.

In the mature period, large enterprises play a leading role. At this stage, core technology has been widely grasped and technical barriers have largely disappeared, there will be a large number of enterprises swarm into the industry. The market-oriented development model with the leading of large enterprises can lead higher degree of concentration of resources for industrial development, and generate economies of scale, thereby reducing the cost of innovation. At this time, the new emerging industry may already be in gestation, so big enterprise can rely on resource advantage, quickly adjust industrial structure, and lead the industry to achieve rapid transformation. For example, Hyundai, Samsung, LG and other large enterprise groups have played a huge role in the process of international competition and became the leader of the information industry.

3.2 Analysis of the environmental elements of strategic emerging industries

Currently, the innovative development of strategic emerging industries in China is still subject to low R&D outcome, low conversion rate, and low utilization of regional advantages, resulting in low self-innovation ability, lacking of core competitiveness and industry leader. The fundamental reason was that the synergy and cooperation between industries were overlooked and the related business areas scattered, which led to less lateral and longitudinal exchange, making them unable to form industry cluster. Therefore, the development path of China's emerging industries to break existing bottleneck should first be adjusted to the development of characteristic industrial parks targeted at the formation of industrial clusters.

Environmental elements consist of market cultivation system and policy supporting system. Market cultivation system means that whether macroeconomic condition is good or not, and whether the social demand and resource supply meet our need. Policy supporting system includes innovation guidance, fiscal subsidy, R & D investment and talent introduction. After the above conditions, the park-driven development path of emerging industries is summarized in Figure2: 1) After the completion of the park, two situations may arise. First, with large leading enterprises in the park, upstream and downstream businesses will be attracted and a certain industry clusters will come into being in a short time; Second, the park has a unique resources endowment which can attract new enterprises to enter, leading to a rapid

formation of industrial clusters according to the allocation of resources, regulating of park as well as industrial difference. 2) With new business settling, the companies which have abundant production-related association in the park will implement farm-out based on their own advantages, which will produce a synergistic effect, and form industrial clusters. First, horizontal enterprise will agglomerate together. Namely, companies with similar properties or business will gather together to achieve the integration of resources and advantage complementary. Second, vertical industry chain will come into being, forming an integrated development including production, product procurement, subcontracting, R&D and consulting. 3) There is a mix of collaboration based on resource sharing and specialization and competition based on the production of similar products or services between the companies in the park. So, with the continuous expansion of enterprise groups, an intricate innovative network will form among governments, research institutions and SMEs, then the industrial cluster come into being. 4) Enterprises in the cluster experience long-term cooperation, and easy benefit from knowledge spillover because of geographical adjacency which may lead to the development of new technologies, new companies and even new industrial chains.

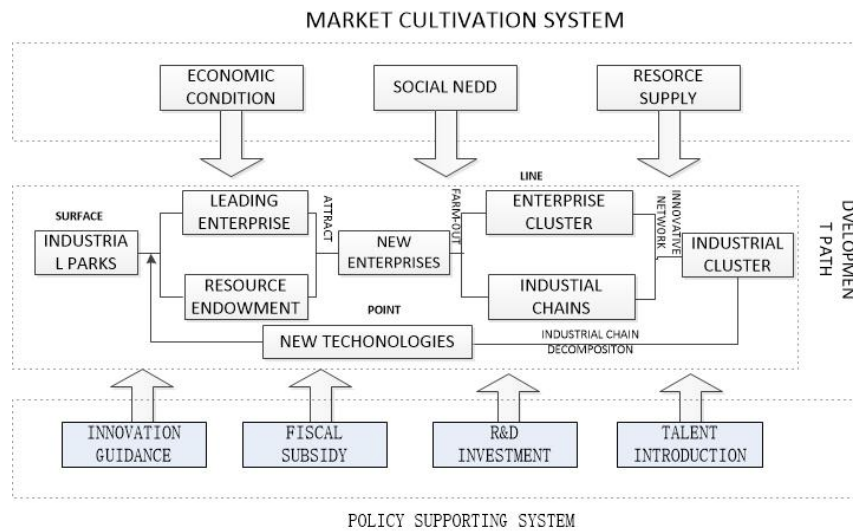

Figure 2 Internal Development Path of Strategic Emerging Industrial in Park

3.3 Analysis of the functional elements of strategic emerging industries

From a technical perspective, the existing technological trajectory will impose a repulsion effect on new industries, which may reduce the validity of diffusion of the new technology because of the lack of complementary infrastructure. From a marketable point of view, new technologies need the consequent choice of the market, but emerging industries can only make market testing and develop in the niche market composed of a small number of leading users, so government is needed to provide them some protective supporting policies (RAVEN, 2005). From a systematic perspective, the institutional system under the old technological paradigm hindered the development of new technologies, and the education system, financial system and patent system launched to support the technologies has not been completed, resulting in a huge demand of government.

4 Conclusion

As shown in figure 2, the internal formation of industrial clusters enhanced the relationships among enterprises and industries, making it possible for the strategic emerging industries' robust growth without the government's auxiliary, and to some extent, the formation of innovation network distracted the repulsion of emerging industries. As shown in figure 3: 1) Colleges and universities and the research institutes provided technical support, talents and information for companies. Because of the high-risk and high-resistance of strategic emerging industries, companies rarely spent a lot of energy to R&D activities. But the universities and scientific research institutes, as a nonprofit organization, could be pencil-thin in innovation research, which to some extent makes up the defect of the little innovation investment of the companies. 2) As a guide of innovative development, government's configuration and optimization of resources could reduce the cost and accelerate the pace of innovation. The government's

R&D investment and policy support for universities and scientific research institutes is one of the most important factors to promote innovation. 3)The presence of scientific and technological agencies effectively reduced the questions of high transaction costs and the hardness of technical searching caused by asymmetric information and information monopoly.

As a part of the regional innovation system, certain correlations must be synchronized between industries or park subsystems. For example, there must be a certain relationship between high-end equipment manufacturing industry and new materials industry, new material industry and biological industry and new generation of information technology industry and new energy automotive industry.

It combined the advantages of internal drive and external drive, and form an innovation ecosystem in the entire region that promoting interdisciplinary research and application between industries, and making the development path from the point-line-surface to the point-line-surface-system.

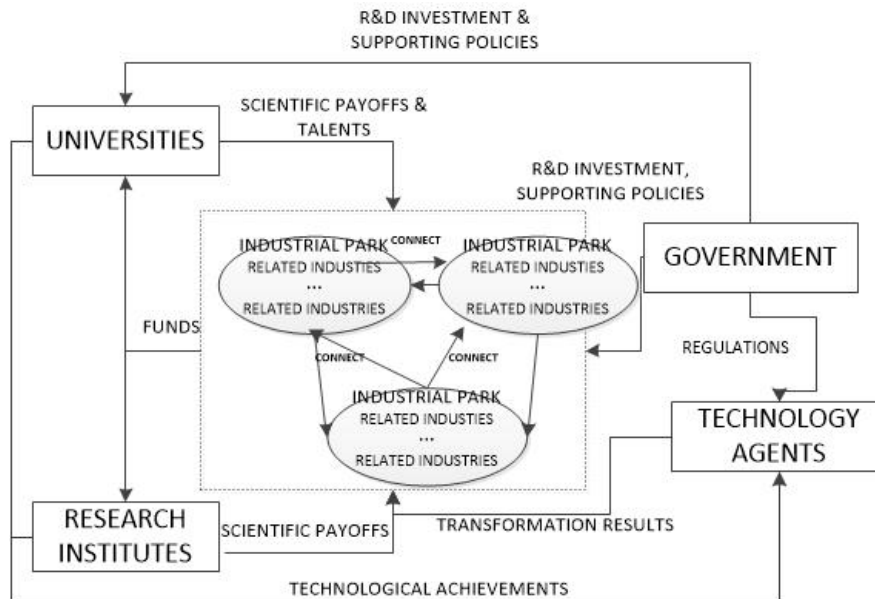

Figure 3 Development Path of Emerging Industries in the context of Regional Innovation

To overcome the obstacle of institutional system under old technology paradigm, following advices are proposed.

1) Increase R & D investment and taxation subsidies. "Twelfth Five-Year Plan" pointed that government should play a fundamental role in the development of investment-driven industry, and guide social investment tilted to the strategic emerging industries. The main measures include: a. Start and nurture emerging industries of strategic markets through government procurement, subsidies, and so on. b. Cultivate the appropriate consumer groups through pilot demonstration at the beginning of the development of strategic emerging industries. c. Promote the popularization of the products of strategic emerging industries through fiscal funds. d. Protect domestic market through technology standards, tariffs, political influence and other methods. e. Encourage domestic enterprises to actively explore the international market. f. Establish a sound legal system for new industries to improve the market environment.

2) Perfect financial system of strategic emerging industries by promoting the reform of financial system. a. Moderately introduce governmental credit and guarantee agencies to improve the success rate of loan. Besides, other debt financing instruments such as SME collective bonds, financial leasing and asset securitization can also be used in the process. b. Contribute to the financial system reform to attract private capital to participate in the process of innovation, which could arouse the support from banking and financial industries and combine the government investment and social investment to support the development of strategic emerging industries. c. Conduct financial innovation in the field of consumer credit to promote the product requirements of strategic emerging industries.

3) Strengthen the planning and guidance of strategic emerging industries to avoid vicious competition and redundant construction. States should clearly formulate a development plan combined with regional advantages and promote the development of industries with different emphasis in different

stages. Meanwhile, the government should adhere to the use of macroeconomic regulation to avoid the situation that the market mechanism is replaced by the government financial investment. Miao Yu(2011) has pointed that the government's most important role in the development of strategic emerging industries is to create an environment to encourage innovation. The main force to explore the market can only be the enterprise, which is unable substitute by the government.

4) Improve the intellectual property system to reduce the risk of enterprise innovation. In the aspect of layout, the government should actively guide the scientific layout of IPR system of strategic emerging industries, and closely track market competition and patent technology trends to set up an IPR review system for major economic activities. And in terms of promotion, we should establish and perfect the green channel of patent review and optimize the patent examination methods to accelerate and promote the establishment of public service platform in industrial agglomeration areas.

Study on Brand Positioning in the Perspective of Game Theory

Li Dahu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: shandaad@126.com)

Abstract: This study firstly analyzes connotation of brand positioning from four aspects including advertising, marketing strategy, micro system and brand equity, analyzes the feasibility of Game Theory as a tool used in the study of brand positioning based on the related research. This study establishes a brand positioning model based on Game Theory, which is used to analyze different brand positioning patterns. Importance of brand positioning, information and market is proved from the analysis of the model, this study also finds that first-mover advantage exists in brand positioning. Finally, the limitations and future research directions of this study are summarized.

Key words: Brand; Brand Positioning; Game Theory; First-mover Advantage

1 Introduction

1.1 Brand positioning

“Positioning” is proposed by Al Ries and Jack Trout in 1969, it means to find competitive position of products in the minds of consumers. Later researchers have done in-depth study and interpretation of “positioning”, for example, Lynn B.Upshaw considers customer positioning as the only effective position, Philip Kotler defines positioning as the action of finding the products’ unique position in the minds of customers (Yang Fangping and Yu Mingyang, 2010).

Based on the concept of “positioning”, “brand positioning” can be analyzed from four aspects including advertising, marketing strategy, micro system and brand equity (Li Xuexin and Li Haipeng, 2012). In the perspective of advertising, brand positioning is a key element to achieve brand differentiation and create unique position, advertising highlights the differences between brands. In the perspective of marketing strategy, brand positioning is a necessary approach to occupy a unique position in the minds of consumers and increase market share. In the perspective of micro system, brand positioning is a system to find the positioning point (Li Fei, 2009). In the perspective of brand equity, brand positioning is an effective way to increase brand equity, it helps the formation of consumer brand association, increases brand equity by positive and sustainable brand association.

1.2 Game theory

Game theory focus on the decision, action and equilibrium as well as the mutual influence between different but interconnected decision makers. Brand positioning can be studied in the perspective of game theory, the reasons are as follows: First, brand positioning need to consider the competitors, competition situation, price sensitivity and other conditions which meets the applicable conditions of game theory (Luo Pinliang and Lu Yi, 2007). Secondly, brand positioning is an action of seeking their own interests which are exclusive egoism and just game theory insist on (Abhijit Sengupta and Danica Vukadinovic Greetham, 2010). Finally, brand positioning contain strategies, action, effects and payoffs of different brands, all of them are basic conditions of game analysis.

2 Brand Positioning Model

2.1 Hypothesis

All products of some kind are only supplied by *Brand A* and *Brand B* which are indistinctive and can be replaced by each other. The two brands face the same market which can be divided into two segment markets including *Market X* and *Market Y*. The two segment markets independently face a same demand curve, there are no barriers to market entry and exit or supplies of the two brands. Products of the two brands are same in the unit costs. *Brand A* is first-mover in this model.

2.2 Problems analyses

Problems need to be solved by this model are as follows: First, each of the two brands has to decide which segment market will it enter to, that means “Which is the brand positioning point for each brand?”. Second, each brand has to judge each other's actions according to the market competition situation, that means “What are the market and game environments going on?”. Third, each brand has to adjust according to each other's actions and results, that means “What dynamic adjustments will be taken in brand positioning?”

2.3 Model description

1) game elements

Participants: Brand A and Brand B.

Strategy: Decision are making according to the principle of profit maximization.

Actions: Enter to Market $j(j= X, Y)$ or not.

Payoffs: Payoffs are determined by the market rules.

Information Sets: Information is complete.

2) game timing. Brand A is first-mover, then Brand B. M_X means entering to Market X, M_Y means entering to Market Y, M_{X+Y} means entering to Market X and Market Y.

3) game extended type. Figure1 shows the game extended type (payoffs are in model analysis).

Figure 1 Brand Positioning Game Extended Type

3 Model Analysis

Inverse demand function of Market $j(j= X, Y)$ is :

$$p_j = a - bq_j = a - b(q_{Aj} + q_{Bj}) \tag{1}$$

The equilibrium price of Market j is p_j , a and b are coefficients, q_{Aj} is quantity of supply in Market j which supplied by Brand A, and q_{Bj} is quantity of supply in Market j which supplied by Brand B.

There are two categories of market entry decision of Brand $i(i=A, B)$, they are unilateral entry and bilateral entry (Ye Qing and Chi Wei, 2012). Unilateral entry includes two cases(Case1 and Case2), bilateral entry includes five cases(from Case3 to Case7).

Case1: Brand A enters Market X, Brand B enters Market Y.

Case2: Brand A enters Market Y, Brand B enters Market X.

Case3: Brand A enters Market X and Market Y, Brand B enters Market X.

Case4: Brand A enters Market X and Market Y, Brand B enters Market Y.

Case5: Brand A enters Market X, Brand B enters Market X and Market Y.

Case6: Brand A enters Market Y, Brand B enters Market X and Market Y.

Case7: Brand A enters Market X and Market Y, Brand B enters Market X and Market Y.

3.1 Unilateral entry

Because of products indistinction and markets' same demand curve, the two unilateral entry cases(Case1 and Case2) are same in equilibrium, so Case1 is used to analyse the equilibrium of unilateral entry. In Case1, Brand A monopolizes Market X and Brand B monopolizes Market Y.

For Brand A, the reverse demand function in Market X is:

$$p_X = a - bq_X = a - b(q_{AX} + q_{BX}) = a - bq_A \tag{2}$$

The total profit of Brand A is:

$$\Pi_A = \Pi_{AX} = (p_X - c)q_{AX} = (a - bq_{AX} - c)q_{AX} \tag{3}$$

Condition for maximum Π_A is the derivative of Π_A is 0:

$$a - 2bq_{AX} - c = 0 \tag{4}$$

That means when $q_{AX} = (a - c) / 2b$ the total profit of Brand A is to the $Max \Pi_A = (a - c)^2 / 4b$.

Samely, for Brand B, the optimal supply quantity is $q_{BY} = (a - c) / 2b$, $Max \Pi_B = (a - c)^2 / 4b$.

3.2 Bilateral entry

Bilateral entry includes two categories: the first is a brand enters only one market and another brand enters two markets(from Case3 to Case6), the second is the two brands both enters two markets(Case7).

According to the hypothesis, Brand A is first-mover and decisions are making according to the principle of profit maximization, so in first bilateral entry Case5 and Case6 are both irrational because rational decision of Brand A in bilateral entry is entering two markets. In addition, Case3 and Case4 are similar in equilibrium, the only difference is which market is Brand B's profit comes from, so Case3 can be used to analyse the equilibrium of the first bilateral entry and Case7 for the second.

3.2.1 The first bilateral entry(*Case3* for example)

1) Decision of *Brand A*

As the first-mover, the rational decision of *Brand A* is regarding the two markets as its monopoly markets according to the principle of profit maximization, *Brand A* will determine the optimal supply for the two markets which is the same with the one in unilateral entry. In other words, the optimal supply quantity of *Brand A* is:

$$q_{AX}=q_{AY}=(a-c)/2b \quad (5)$$

2) Decision of *Brand B*

According to the principle of profit maximization, *Brand B* determines its optimal supply depends on *Brand A*'s decision. The equilibrium price in *Market X* is:

$$p_X=a-bq_X=a-b(q_{AX}+q_{BX})=a-b[(a-c)/2b+q_{BX}] \quad (6)$$

The total profit of *Brand B* is:

$$\Pi_B=\Pi_{BX}=(p_X-c)q_{BX}=\{a-b[(a-c)/2b+q_{BX}]-c\}q_{BX} \quad (7)$$

Condition for maximum Π_B is the derivative of Π_B is 0:

$$(a-c)/2-2bq_{BX}=0 \quad (8)$$

That means when $q_{BX}=(a-c)/4b$ the total profit of *Brand B* is to the maximum.

When *Brand A* supplies $(a-c)/2b$ and *Brand B* supplies $(a-c)/4b$, the equilibrium price is:

$$p_X=a-b[(a-c)/2b+(a-c)/4b]=a-b(a+3c)/4 \quad (9)$$

3) Total profits

Total profit of *Brand A* is:

$$\Pi_A=\Pi_{AX}+\Pi_{AY}=(a-c)^2/8b+(a-c)^2/4b=3(a-c)^2/8b \quad (10)$$

Total profit of *Brand B* is:

$$\Pi_B=\Pi_{BX}=(a-c)^2/16b \quad (11)$$

In addition, it can be proved that optimal supply and total profit are not changed in *Case4*.

3.2.2 The second bilateral entry(*Case7*)

1) Decision of *Brand A*

Compared with the first bilateral entry(*Case3*), the rational decision of *Brand A* in the second bilateral entry(*Case7*) has no change, that is:

$$q_{AX}=q_{AY}=(a-c)/2b \quad (12)$$

2) Decision of *Brand B*

Brand B's optimal supply depends on *Brand A*'s decision both in *Market X* and in *Market Y*. The equilibrium price in *Market X* and the equilibrium price in *Market Y* are:

$$p_X=a-bq_X=a-b(q_{AX}+q_{BX})=a-b[(a-c)/2b+q_{BX}] \quad (13)$$

$$p_Y=a-bq_Y=a-b(q_{AY}+q_{BY})=a-b[(a-c)/2b+q_{BY}] \quad (14)$$

And the total profit of *Brand B* is:

$$\Pi_B=\Pi_{BX}+\Pi_{BY}=\{a-b[(a-c)/2b+q_{BX}]-c\}q_{BX}+\{a-b[(a-c)/2b+q_{BY}]-c\}q_{BY} \quad (15)$$

Condition for maximum Π_B is the derivative of Π_B is 0, in other words, it is:

$$q_{BX}=q_{BY}=(a-c)/4b \quad (16)$$

The equilibrium price is:

$$p_X=p_Y=a-b[(a-c)/2b+(a-c)/4b]=a-b(a+3c)/4 \quad (17)$$

3) Total profits

Total profit of *Brand A* is:

$$\Pi_A=\Pi_{AX}+\Pi_{AY}=(a-c)^2/8b+(a-c)^2/8b=(a-c)^2/4b \quad (18)$$

Total profit of *Brand B* is:

$$\Pi_B=\Pi_{BX}+\Pi_{BY}=(a-c)^2/16b+(a-c)^2/16b=(a-c)^2/8b \quad (19)$$

3.3 Cases of incomplete information

If the information is incomplete and the two brands acts in the same time, no brand can observe each other's actions. In this situation, each brand will regard the two markets as their own monopoly markets, similar to unilateral entry decision, each brand supplies $(a-c)/2b$ to each market. In this case, each brand's rational decision leads to irrational results: *Brand A* and *Brand B* supply the same amount of indistinctive products in the two markets, that means the two markets are both perfectly competitive market and no brand can make profits, the total profit of the two brand is 0.

If the information is incomplete and the two brands acts not in the same time, a brand's decision depends on the other one. In this case, equilibrium can be analysed by the Cournot Duopoly Model: For the two brands, optimal supply for each market is $(a-c)/3b$, the total profit of each brand is $2(a-c)^2/9b$ which equally comes from the two markets.

4 Results

4.1 Complete information

1) Interrelationship exists in brand positioning. *Brand A*'s total profit when it enters both *Market X* and *Market Y* is not less than when it enters only one of the two markets. To a certain degree, *Brand A*'s total profit depends on *Brand B*'s decision: If *Brand B* enters only one of the two markets, *Brand A* can get the maximum total profit which is $3(a-c)^2/8b$ while *Brand B* gets the minimum total profit which is $(a-c)^2/16b$; If *Brand B* enters both *Market X* and *Market Y*, *Brand A*'s total profit is $(a-c)^2/4b$ and *Brand B*'s total profit is $(a-c)^2/8b$.

Brand B's total profit depends on *Brand A*'s decision: when *Brand A* enters only one of the two markets can *Brand B* get the maximum total profit which is $(a-c)^2/4b$ by monopolizes the other market.

2) First-mover advantage exists in brand positioning. As the first-mover, *Brand A*'s minimum total profit is $(a-c)^2/4b$ which is just the maximum total profit of *Brand B*. By the rational decision of *Brand A*, the maximum total profit of *Brand A* is $3(a-c)^2/8b$ while *Brand B* gets the minimum total profit which is $(a-c)^2/16b$. In other words, the first-mover *Brand A* increases its own total profit and reduces *Brand B*'s total profit at the same time.

4.2 Incomplete information

When information is incomplete and the two brands act not in the same time, both *Brand A* and *Brand B* make decisions according to the principle of profit maximization and supply the same amount of indistinctive products in the two markets, it leads to irrational results and no brand can make any profits because the two markets are both perfectly competitive market.

When information is incomplete and *Brand A* is first-mover, it's Cournot Duopoly Model. The total profit of each brand in equilibrium is $2(a-c)^2/9b$, that means *Brand A* gets a lower profit than it has when information is complete and *Brand A* as first-mover. But for *Brand B* it's a better situation because it not only gets rid of the repression of *Brand A* but also gets a higher profit than any other situation.

5 Conclusion

This study establishes a brand positioning model based on Game Theory, through model analysis it finds that first-mover advantage and interrelationship exist in brand positioning. The first-mover can obtain a favorable position in markets by information screening and first-movement. Also market exploring helps the first-mover increases its own advantages and represses the competitive brand. The brand which acts latter should widely collect information to have an accurate positioning which avoids competing in the same market with the stronger one, otherwise it will lead to irrational results for both.

Limitations of this study should be summarized. In this study, brand positioning is analyzed by a brand positioning model which uses market segmentations to represent brand positioning differences, but in reality brand positioning differences can exist in the same market, so further and smaller market segmentations are needed. In addition, some hypotheses can be relaxed in order to obtain more general conclusions, for example, classifying different markets according to the market capacities (Gregory S.Carpenter, 1989), analyzing the influence of costs when unit costs are different in brand positioning, adjustments needed when market barriers are existing. All of the above will be studied in the future.

Abstract: This paper constructs the evaluation index system of industrial clusters' innovation capability evaluation and uses of factor analysis method to evaluate Wuhan high-tech industry in 2007-2013 industrial clusters' innovation ability. The results show that industrial clusters' innovation ability in Wuhan High-tech zones has significantly increased in recent years. But it still exists a gap in innovation ability of industrial clusters, such as the incomplete laboring-division system in the industrial chain of enterprises, the insufficient collaborative system and the unstable R&D backbone. The deficient innovative research is also counted in the list, for the majority enterprises still entrap themselves in imitative innovation.

Key words: Industrial cluster; Innovative capability; Environment supporting capacity; Research ability; Factor analysis method

1 Introduction

With the rapid development of the global high-tech industries, industrial clusters have become the significant regional advantage of high-tech zones and the inexorable trend of the industrialization. To foster the high-tech industrial clusters is the significant move to optimize present industrial structure and strengthen the competitiveness as well as implement the policy of "thriving the province through industry". So-called industrial clusters serve as an organic system comprised by related enterprises and institutions in some certain field, complementary or competitive, which gather together in some region to form a complete structure in upper, middle and lower reaches, featuring the sound industry system with peripheral support and flexibility. The practice demonstrates that industrial clusters can not only promote the overall competitive ability of industries and enhance the efficient collaboration among firms, but also do good to strengthen the capacity for independent innovation of enterprises so as to create in a clustered way. So far, Wuhan has formed the traditional industrial clusters represented by Zhuanke automobile industry, Qingshan iron steel & petrifaction and environmental protection industry, and DongXihu logistics industry of agricultural food. Besides, it has also formed the high-tech industrial clusters typical as photoelectron information industry and biomedical industry in East Lake High-tech Zone. After several years' development, Wuhan Hi-tech industrial clusters set the stage for forming correlative industry chain in upper, middle and lower reaches. However, there still exists a certain degree of bottlenecks, including imitative products flooding into the market due to insufficient innovation ability, low technical added value and technology spillovers value of products. Moreover, some hi-tech industrial clusters are also confronted with problems of constancy, hierarchy and level of innovation. Based on this, the article will make some evaluations on the innovation ability of Wuhan hi-tech industrial clusters, which is not only beneficial to potentially grasp the essential factor of innovation activities, but also conducive to inspire vitality and its potential of innovation so as to accelerate the sustainable development.

2 The Construction upon the Evaluation Index System of Innovation Capacity of Industrial Clusters

Innovation capacity of industrial clusters contain components or specific elements operationally processed in specific perspectives. As the capacity itself is an abstract concept, its operability and measurable nature must be embodied in carrier levels. According to the above principle, taking into account of the availability of index data, the industrial cluster's innovation capability evaluation index system is constructed as shown in table 1.

In this system, the carrier of the innovation capacity can be attributed to four aspects: input capacity, environment-supporting capacity, output capacity, and research capacity, where

a total of 22 indicators are selected to evaluate industrial cluster's innovation capability.

Table 1 Wuhan High-Tech Industry Cluster Innovation Capability Evaluation Index System

Target layer	Indicator	Unit
Input Capacity	The number of R&D activities in Above-scale enterprises	No.
	The Number of Staffs of R&D in Above-scale enterprises	personnels
	The Expenditure of R&D of Above-scale Enterprises	Tens of thousands Yuan
	The Expenditure of the Development of New Products in Above-scale Enterprises	Tens of thousands Yuan
Environment-supporting capacity	National Laboratory	No.
	The Expenditure of Research and Experimental Development (R&D)	0.1 Billion Yuan
	Contract Turnover in Technological Market	0.1 Billion Yuan
	National-level Technological Business Incubator	Stores
Output Capacity	Total Industrial Output	0.1 Billion Yuan
	Local Fiscal expenditure	0.1 Billion Yuan
	High-tech Industry Output	0.1 Billion Yuan
	Added value in High-tech industries	0.1 Billion Yuan
	High-tech Products Export Delivery Value	0.1 Billion Yuan
	High-tech Product Sales Revenue	0.1 Billion Yuan
	Total Profit of High-tech Products	0.1 Billion Yuan
	New Products Sales Revenue of Above-scale Enterprises	0.1 Billion Yuan
Research capacity	The Number of Patent Applications of Above-scale Enterprises	pieces
	Science and Technology Research Institutes	Institutes
	National-level Enterprise Technology Center	Institutes
	National-level Engineering Research Center	Institutes
	Projects supported by National Science and technology program	Projects
	The Number of Scientific Achievements	No.

3 The Evaluation of Innovation Capability of Industry Clusters in Wuhan High-Tech Zone

3.1 Data sources

According to above indicator system of the evaluation, the data from 2008 to 2014 is selected in Wuhan Statistical Yearbook and is evaluated by factor analysis.

Table 2 The Indicator Data from 2007-2013

Indicator	2007	2008	2009	2010	2011	2012	2013
X1	264	287	308	319	325	326	389
X2	24276	28651	31076	33602	44244	46170	49982
X3	378956	512785	671523	8822376	1038336	1269103	1503407
X4	487621	698742	882635	1064343	1218807	1461464	1616071

X21	891	1012	1198	1450	2051	2400	2500
X22	266	278	301	315	392	380	404

(Data sources: Wuhan statistical yearbook from 2008 to 2014)

In order to eliminate some unreasonable effects possibly caused by different dimension, it's necessary to standardize the data before analyzing the principal component so as to make the average value of each variable 0 and make the variance 1 as well.

3.2 The condition of factor analysis

Before factor analysis, we firstly need to test the standardized 22 indicators about whether they are suitable for factor analysis, including the calculation of KMO and Bartlett spherical test. The results show that the KMO value of the raw data is 0.724, good one; the Bartlett ball test value is 0, fit for multivariate normal distribution, which proves they are suitable for factor analysis.

3.3 Data department

According to the principle of factor analysis, we use SPSS18.0 to calculate the feature values, contribution rate, cumulative contribution rate of each factor and the factor load matrix of each index after orthogonal rotation, as shown in Table 3.

Table 3 Total Variance of Factor Interpretation in Innovation Factor of Industrial Clusters

Ingredient	Initial Eigenvalues			Extraction of sum of squares loaded			Rotate the sum of squares loaded		
	total	variance	accumulation	total	variance	accumulation	total	variance	accumulation
1	19.900	90.454	90.454	19.900	90.454	90.454	16.774	76.244	76.244
2	1.042	4.735	95.188	1.042	4.735	95.188	4.168	18.945	95.188
3	.586	2.661	97.850						

According to the principle of the eigenvalues being set over 1, it turns out that the result of initial eigenvalues of the first factors is more than 1, and the two common factors extracted by SPSS18.0 replace the original 22 indexes. After the maximum rotation, the contribution rate of variance reaches 76.244% and 18.945% respectively, and the accumulated variance reaches 95.188%, indicating the two factors include the amount of information of the original 22 evaluation indexes and they can replace those original ones to evaluate the innovation ability of industrial clusters in Wuhan New and High-tech zones.

Table 4 Score Matrix of Principal Component Factor of Industrial Clusters' Innovation Ability

index	ingredient		index	ingredient		index	ingredient	
	F1	F2		F1	F2		F1	F2
X1	.059	-.017	X9	.101	-.105	X17	.122	-.154
X2	.037	.039	X10	-.146	.429	X18	.285	-.702
X3	.069	-.031	X11	.086	-.072	X19	.044	.024
X4	.062	-.018	X12	.083	-.064	X20	.053	.004
X5	.059	-.011	X13	.069	-.042	X21	.047	.015
X6	.078	-.053	X14	.045	.021	X22	-.009	.139
X7	.132	-.178	X15	-.008	.137			
X8	.012	.093	X16	.069	-.043			

According to the score matrix of factor as table 4, score function of factor is:

$$F1 = 0.059X1 + 0.037X2 + 0.069X3 + \dots + 0.047X21 - 0.009X22$$

$$F2 = -0.017X1 + 0.039X2 - 0.031X3 - \dots + 0.015X21 + 0.139X22$$

3.4 Comprehensive evaluation

The two factors, F1 and F2 from different aspects, reflect the present condition of the industrial clusters' innovation ability in Wuhan High-tech Zones during 2007 to 2013. Taking the contribution ratio between variance corresponding to each common factor and cumulative variance as weight calculation, we can obtain the comprehensive score, namely: $F = 0.8010F1 + 0.1990F2$, as showed in Table 5.

Table 5 Factors and Comprehensive Scores in 2007-2013

	F1	F2	scores of innovation ability	comprehensive ranking
2007	-1.20711	-.31033	-1.03	1
2008	-.58838	-.89265	-.65	2
2009	-.15813	-1.09451	-.34	3
2010	-.56949	.94296	-.27	4
2011	-.19863	1.63813	.17	5
2012	1.13290	-.52655	.80	6
2013	1.58885	.24295	1.32	7

The comprehensive evaluation scores of industrial clusters' innovation ability in Wuhan High-tech Zones between 2007 and 2013 are calculated by factor analysis. The figures in table 5 show that industrial clusters' innovation ability in Wuhan High-tech zones has significantly increased in recent years. This is inseparable from our city's huge resources investment, excellent environmental facilities and increased research capacity in the development of industrial clusters.

4 Conclusion

Compared with the southeastern China, Wuhan high-tech Zone still exists a gap in innovation ability of industrial clusters, though it has been continuously improved, such as the incomplete laboring-division system in the industrial chain of enterprises, the insufficient collaborative system and the unstable R&D backbone. The deficient innovative research is also counted in the list, for the majority enterprises still entrap themselves in imitative innovation. To make it better, we need to improve the diversion and co-ordinance mechanism of the whole industrial chain under the leadership of government and the Industry Association. It is necessary to establish the shared platform of basic research in different industries, carry out technical reserves and strengthen the independent innovation ability of the enterprises. What's more, we should make efforts to design attractive salary incentive system, namely, a series of measures to stabilize the R&D talents, like implementing of share holding program to R&D backbones, involving Sci -Tech achievements in the income distribution and establishing the funds for outstanding contribution, etc.

Only in this way can we fundamentally enhance the sustainable innovation ability of the Hi-tech industry clusters in Wuhan.

Abstract: By analyzing the development background, theory and construction content of smart city, we concluded that wisdom degree of enterprise is directly related to sustainable development of smart city construction. From the perspective of logistics enterprises, we designed the indicators of personnel Intelligence level, hardware digital level, immediacy of management & intelligent of innovation of logistics enterprise, built the Evaluation Model of wisdom degree of enterprises, and by using this Model, evaluated wisdom degree of Ningbo Zhongtong Logistics Group.

Key words: Smart City; Wisdom Degree of Enterprise; Evaluation model; Case study

1 Introduction

Formation of city is in close relevance with social economic form. The budding city emerges in tribes when human being remains in food-gathering stage. When society evolves to Agrarian Age, city develops into town since it functions as exchange. When society moves into industrial civilization, large scale machine and labor division come into being gradually and urban civilization occupies a leading position. When society promotes itself into the new era, Knowledge Economy, mingling with Industrial Economy, City Economy and Information Economy, constitutes the living environment of smart city and compacts the formation of smart city. (See Fig. 1)

Figure 1 Environment of Smart City

Our knowledge of smart city grows when Gore(1998) proposed the concept of “Digital Earth”, then, Smart Earth”, Microsoft “Smart Cloud”, Oracle “Excellent City Service”, Cisco “Smart Connected City”, MIT “Science & Technology Promoting City”, Digital China “333”(3 techniques, 3 stages and 3 frameworks) of constructing smart city, and so on. The 3rd Information Wave results in a rapid development in smart city theories, techniques and practices.

Pan Yunhe academician (2011) considers the construction contents of smart city a multi-dimensional relation. He emphasizes the solution schemes and macroscopical development strategy of information channel, production and service and their application system construction and development, smart health care, smart transportation, smart environment and smart power grid, etc. Xu Qingrui academician (2012) proposed an image of further constructing smart city by integrating digital city, knowledge city, innovation city, creating city and ecological city. Smart city can be build by 3 levels: smart enterprises, smart society and smart government under the perspective of city economic

* This paper is supported by Ningbo natural science foundation (2013A610287); Ningbo soft science project (2013A10010) and The IOT technology and application demonstration project of CFLP (2013TAA006).

development. (See Fig.2) Through analyzing its driven power, smart enterprises plays a key role in smart city development.

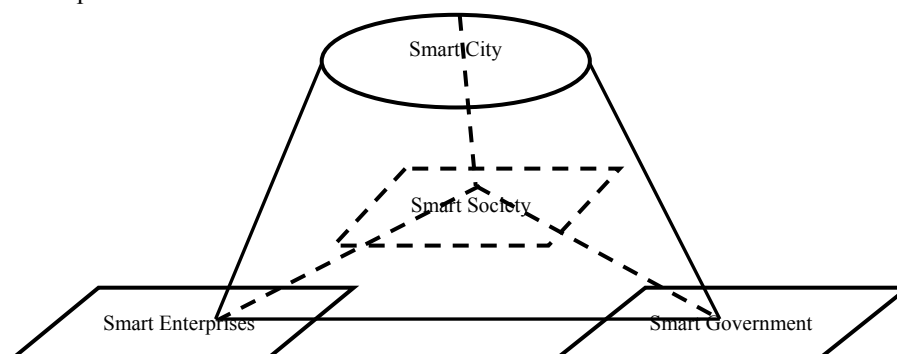

Figure 2 Structures of Smart City

Enterprises are the chief cells in city development and the main source of government fiscal revenue. The wisdom degree of enterprises is directly relative to whether sustainable development can be achieved in smart city construction. Therefore, the research for wisdom enterprises has very important significance.

2 Wisdom Degree Analyses of Logistics Enterprises

Smart enterprises have to be supported by informatization and intellectualization and highlight digitization, perception, interconnection and collaborative in running process. Therefore, analyzing the wisdom degree of enterprises should rest on the aspects like the intelligence of enterprise personnel, the digitization of enterprise hardware, the instant of enterprise management and intellectuality of enterprise innovation. As a comprehensive industry, logistics industry is more representative in enterprises wisdom degree analyzing.

2.1 Intelligence index analysis of logistics enterprise personnel

Promoting the wisdom degree of logistics enterprises means to promote the performance efficiency, effectiveness and benefit of relevant position functions in logistics enterprises, and means to optimize the implementation scheme of each logistics link to guarantee an indeed capacity of quick response, flexible production and supply chain management. Thus, logistics enterprise personnel have to be equipped with a higher intelligence.

The main elements of intelligence evaluation index analysis of logistics enterprise personnel include logistics personnel education background distribution, education background matching rate of logistics skill position, ownership rate of logistics industry qualification certificate, ownership rate of computer level certificate, work shift times of current technical position of logistics enterprise, working life of engaging logistics enterprise technical position and so on.

The education background distribution index shall treat 2 categories differently: manager at or above middle-level and business staff. According to the real situation of logistics industry in our country, manager is usually at junior college degree and the business staff high school degree.

On the aspect of education background matching rate of skill position, logistics enterprises involve many posts, such as, transportation, storage, distribution processing, delivery, finance, human resource management, marketing, maintaining and informatization management, etc. So, matching rate is better counted by wide-caliber.

For the ownership rate of logistics industry qualification certificate, Logistician, Logistics as well as various vouching clerks and accountants shall be included.

The ownership rate of computer level certificate aims to examine the informatization processing capacity of logistics enterprise personnel, so related certificate of informatization shall be included.

The evaluation of work shift times in current technical position of logistics enterprise mastering each link of logistics enterprise management entirely through position shifting, which is a foundation in promoting the wisdom degree of logistics enterprises, According to the current situation of logistics industry development in our country, 3 times, 2 times and 1 time shall be considered as a basic request.

The working life index of engaging logistics enterprise technical position is not only an examination of employment stability of logistics enterprise and a measurement of technical proficiency

of logistics enterprise personnel, but also a basic element of logistics enterprise promoting informatization and intellectualization transformation.

The detail of intelligence evaluation index system of logistics enterprise is shown in Table 1. If a logistics enterprise meets the demands of more than 4 indexes at Level A in Table 1, this logistics enterprise can be thought to achieve the minimum standard of intelligence level at which a smart logistics enterprise personnel should reach. Personnel intelligence level is only one element of smart logistics enterprise. To evaluate the wisdom degree of a logistics enterprise comprehensively still needs other related indexes supports.

Table 1 Intelligence Evaluation Index System of Logistics Enterprise Personnel

Evaluation Index		Level					
		5A	4A	3A	2A	A	Non -A
Education Background Distribution	manager at or above middle-level	> 90% College Degree	80-90% College Degree	70-80% College Degree	60-70% College Degree	50-60% College Degree	< 50% College Degree
	business staff	> 90% High School Degree	80-90% High School Degree	70-80% High School Degree	60-70% High School Degree	50-60% High School Degree	< 50% High School Degree
Education Background Matching Rate of Skill Position		> 70%	60-70%	50-60%	40-50%	30-40%	< 30%
Ownership Rate of Logistics Industry Qualification Certificate		> 60	50-60%	40-50%	30-40%	20-30%	< 20%
Ownership Rate of Computer Level Certificate		> 50%	40-50%	30-40%	20-30%	10-20%	< 10%
Work Shift Times in Current Technical Position		3	2.5	2	1.5	1	0
Working Life of Engaging Logistics Position (over 3 years)		90%	80-90%	70-80%	60-70%	50-60%	< 50%

Note: 1.5 and 2.5 of work shift times in Table 1 means after 1 and 2 times shifting as the whole, 1 work time is shifted in partial position.

2.2 The hardware digitization index analysis of logistics enterprise

The hardware digitization of logistics enterprise is necessary to realize a smart enterprise. Digitization is the basis of informatization and an effect path of collecting, processing and applying all kinds of data. Digitization here represents the level that logistics enterprise employs modern science and technology leading by informatization.

The main indexes of evaluating logistics enterprise hardware include EDI utility ratio, Bar Coding utility ratio, comprehensive operation ratio of GIS/GPS GSM /GPRS /CDMA /3G, RFID utility ratio, popularity of ISO9000 certification, utility ratio of Internet of Things and so on.

EDI (Electronic Data Interchange), a way that computer processes commerce, is a basic condition of logistics enterprise digitization. It is made up of EDI software & hardware, communication network and standardized data. It includes establishing EDI Data and standard system, especially the application of code standard, the establishment of security standard, and popularization of application standard and so on.

Bar Coding is a data carrier, with which data can be collected and transformed quickly. By designing, making, scanning and reading bar code, Bar Coding is an effect path of accelerating goods management informatization and enterprise modernization management. It also is a technique foundation of realizing POS system, EDI application and supply chain management. It attributes to handle jillion goods data conveniently, so it makes up the most fundamental condition in smart logistics enterprise.

GIS, GPS, GSM and GPRS, and other wireless communication techniques are essential configuration of a smart logistics enterprise. These systems provide technique support of inquiry function for goods management. Upgrading and updating their products guarantee information modernization.

RFID is an automatic identification technology to goods by using unique reader to handle the label attached to goods, so as to support smart management for logistics enterprise. RFID making use of non-contact identification is to the benefit to reduce the operating management cost and improve service level for logistics enterprise.

ISO9000 Quality Management System promotes the overall quality management level by

establishing standardized system of every link, like purchasing, storage, delivery, loading & unloading, distribution processing and transportation and so on. As a result, popularizing this system helps to promote digitalization level and management service efficiency.

Technique of Internet of Things interconnects ubiquitous end equipments and facilities by wireless or wired communication network to provide a smart platform support for improving management service level based on various logistics enterprise data handled by cloud computing. Obviously the application level of Internet of Things represents the degree of smart enterprise.

The Hardware Digitization Evaluation Index System of Logistics Enterprise is shown in Table 2.

Table 2 Hardware Digitization Evaluation Index System of Logistics Enterprise

Evaluation Index	Level					
	5A	4A	3A	2A	A	Non-A
EDI Utility Ratio	(90%,100%]	(80%,90%]	(70%,80%]	(60%,70%]	(50%,60%]	[0,50%]
Bar Coding Utility Ratio	100%	> 95%	> 90%	> 85%	> 80%	< 80%
comprehensive operation ratio of GIS/GPS GSM /GPRS /CDMA /3G,etc.	> 90%	> 85%	> 80%	> 75%	> 70%	< 70%
RFID Utility Ratio	100%	> 95%	> 90%	> 85%	> 80%	< 80%
Popularity of ISO9000 Certification	100%	≥ 90	> 80%	> 70%	> 60%	< 60%
Utility Ratio of Internet of Things	> 90%	(80%, 90%]	(70%,80%]	(60%,70%]	(50%,60%]	< 50%

2.3 The instant index analysis of logistics enterprise management

Instant of logistics enterprise management is also called “real-time”, which is a management featuring a quick response by logistics enterprise. Logistics industry is a compound service industry, which functions particularly in the field of production, consumption, investment and trade. Instant of logistics enterprise management is of more significance in the process of social and economical transformation.

Instant responsivity of vehicle scheduling is the ratio between successful allocating times and total allocating times in a certain standard interval. A smart logistics enterprise learns the car operation on the line clearly and vehicle scheduling knows well about the condition of car operation. To define certain standard interval concerns traffic condition and relates closely to how hard the enterprise seeks profit.

Instant responsivity of is the ratio between finished delivery and demand in a certain standard interval. The standard interval differs in material delivery of manufacturing enterprise and end consumption of urban & rural. If manufacturing enterprise entrusts its delivery of internal production logistics to third party logistics enterprise, its time request is strict and controllable from enterprise delivery center to buffer and conversely to delivery center or finished products storage. End consumption of urban & rural can be influenced by multiple factors like traffic condition, supply varieties and quantities and so on.

Instant responsivity of replenishment is the ratio between finished replenishment and demand in a certain standard interval. Under the circumstance of supply chain management, the time and quality of upstream and downstream node supply can be guaranteed. When it is out of this circumstance, replenishment purchase limits its instant responsivity.

Instant responsivity of line optimization is the ratio between finished amount of line optimization and total demand amount in a certain standard interval. Line optimization can be influenced by multiple factors like order quantity, order district distribution and line patency condition and so on.

Instant responsivity of information inquiry is the ratio between successful information inquiry amount and total demand amount in a certain standard interval. Information inquiry can be divided into external inquiry and enterprise internal inquiry. Logistics enterprise should fulfill the basic duties of clients' inquiry. Clients have high expectation to instant response of information inquiry in information age. Internal inquiry is a fundamental condition of improving management performance in logistics enterprise. Therefore, to improve instant responsivity of information inquiry is a basic path to make a logistics enterprise smart.

Instant responsivity of reverse logistics is the ratio between finished amount of reverse logistics and normal amount in a certain standard interval. Since central government put forward “Five in One” integration (economic construction, political instruction, cultural instruction, social instruction and ecological civilization instruction) to build a wild China, reverse logistics volume will be increased rapidly. Smart logistics enterprise should undertake the important historical development task of leading

fashion to increase the instant responsiveness of reverse logistics.

Table 3 shows the instant evaluation index system of logistics enterprise management.

Table 3 Instant Evaluation Index System of Logistics Enterprise Management

Evaluation Index	Level					
	5A	4A	3A	2A	A	Non-A
Instant Responsivity of Vehicle Scheduling	(95%,100%]	(90%,95%]	(85%,90%]	(80%,85%]	(75%,80%]	< 75%
Instant Responsivity of Delivery	(95%,100%]	(85%,95%]	(75%,85%]	(65%,75%]	(60%,65%]	< 60%
Instant Responsivity of Replenishment	(95%,100%]	(90%,95%]	(85%,90%]	(80%,85%]	(75%,80%]	< 75%
Instant Responsivity of Line Optimization	(85%,100%]	(85%,95%]	(75%,85%]	(65%,75%]	(60%,65%]	< 60%
Instant Responsivity of Information Inquiry	100%	(98%,100%]	(95%,98%]	(93%,95%]	(90%,93%]	< 93%
Instant Responsivity of Reverse Logistics	(95%,100%]	(85%,95%]	(75%,85%]	(65%,75%]	(60%,65%]	< 60%

2.4 Intellectual index analysis of logistics enterprise innovation

Whether a logistics enterprise is intellectualized or not depends importantly on if its innovation is intellectualized. Intellectualized innovation can be evaluated from key indexes, such as innovation perceptible degree, innovation network correlation degree, innovation systematization ratio, innovation coordination ratio, and innovation patent registration ratio and utility ratio of innovation technology.

Innovation fruit may appear in different production and management link in various forms in logistics enterprise, but intellectualized innovation fruit must be perceptible since a full perception is an important feature of intellectualized enterprise. Perceptible degree is a proportion that each main link of innovation fruit can be coded, which is decided by the role that innovation fruit play in digital construction.

Innovation network correlation degree is a proportion that innovation fruit can be applied in networking management. Intellectualized logistics enterprise management must be based on internet or local area network. Whether innovation fruit can be networked reflects the innovation orientation and networked level of a logistics enterprise.

Innovation systematization reflects the sustainable innovating capacity of an enterprise in whether its innovation is proceeding orderly and is making up an integral whole. Innovation systematization ratio is the rate that innovation fruit can be ranked into the enterprise’s operating system.

Collaborative innovation is the trend of smart enterprise. Innovation fruit coordination ratio is between achieved fruit amount by a logistics enterprise team and total amount of the whole enterprise, which reflects the collaboration level of an enterprise. Under the circumstance of supply chain management, collaboration is a necessary path to gain competitive advantage in market.

Innovation patent registration ratio of innovation fruit is between patent registration amount of innovation fruit and total amount of innovation fruit of this enterprise. It stands for the enterprise’s level of innovation fruit in this field at home and abroad.

Utility ratio of innovation technology reflects the enterprise’s technological innovation popularization degree. It is the ratio between applied amount of innovation technology and total amount of innovation technology.

Table 4 shows the intellectual analysis index of logistics enterprise innovation.

Table 4 Intellectual Analysis Index of Logistics Enterprise Innovation

Evaluation Index	Level					
	5A	4A	3A	2A	A	Non-A
Innovation Perceptible Degree	(95%,100%]	(85%,95%]	(75%,85%]	(65%,75%]	(60%,65%]	< 60%
Innovation Network Correlation Degree	(90%,100%]	(80%,90%]	(70%,80%]	(60%,70%]	(50%,60%]	< 50%
Innovation Systematization Ratio	(90%,100%]	(80%,90%]	(70%,80%]	(60%,70%]	(50%,60%]	< 50%
Innovation Coordination Ratio	(90%,100%]	(80%,90%]	(70%,80%]	(60%,70%]	(50%,60%]	< 50%
Innovation Patent Registration Ratio	(95%,100%]	(85%,95%]	(75%,85%]	(65%,75%]	(60%,65%]	< 60%
Utility Ratio of Innovation Technology	100%	[98%,100%)	[95%,98%)	[93%,95%)	[90%,93%)	< 93%

3 Wisdom Degree Evaluating Model of Smart Logistics Enterprise

There are mainly 2 methods to make multi-index comprehensive evaluation currently. One is Subjective Evaluating Method. Evaluating expert defines the importance of each index to object and weights it according to his/her experience judgment, represented by Expert Inquiry Marking, Analytic Hierarchy Process, and Fuzzy Comprehensive Evaluation Method. The other is Objective Evaluating Method. To weight it according to the calculation made by index data which reflect objective information, represented by Principal Component Analysis, Factor Analysis, Gray Relational Analysis Grade Method and Artificial Neural Network Method.

Evaluating method of this paper is to screen and define the principal component of smart enterprise operation firstly, then to weight it appropriately according to survey questionnaire and experience observation, which is a combination of both methods mentioned above.

Figure 3 Weight Map of Smart Logistics Enterprise Evaluation Index

Smart logistics enterprise evaluation may be examined in the perspective of human, finance and material traditionally. It may also be evaluated from operation level and management level in modern enterprise. Otherwise, both methods of enterprise's key elements. That is comprehensively evaluating human power element, hardware element, management element and innovation element.

Combined with the wisdom analysis result of logistics enterprise above, 4 first-grade indexes may derive to 6 second-grade indexes, which constitute the evaluation index system of smart logistics enterprise.

The reality of logistics enterprise development in our country is a short establishment time and a growing enterprise scale. So, the principle of weighting is human power element and hardware element occupying 30% respectively, management element and innovation element occupying 20% respectively. The weight is shown in Fig 3.

R stands for human power element, then $R_1, R_2 \dots R_n$ stand for second-grade indexes of human power element. H stands for hardware element, then $H_1, H_2 \dots H_n$ stand for second-grade indexes of hardware element. M stands for management element, then $M_1, M_2 \dots M_n$ stand for second-grade indexes of management element. I stands for innovation element, then $I_1, I_2 \dots I_n$ stand for second-grade indexes of innovation element. E_c stands for comprehensively evaluation index. Therefore, evaluation model of Smart Logistics Enterprise can be listed as following:

$$E_c = 30\%R + 30\%H + 20\%M + 20\%I \tag{1}$$

Among which, $R = \sum_{j=1}^6 R_j, H = \sum_{j=1}^6 H_j, M = \sum_{j=1}^6 M_j, I = \sum_{j=1}^6 I_j$.

4 Wisdom Degree Evaluation of Zhongtong Logistics Group

4.1 Construction situation of ningbo Zhongtong logistics group

Zhongtong Logistics Group, founded in 1996, was one of the pilot units in Ningbo smart city program. It has regular staff of 601 people and relates to over 4800 employee. It is a state AAAA level comprehensive logistics enterprise, key logistics enterprise in Zhejiang Province and in Ningbo, and also a Top 10 logistics enterprise in Ningbo. In June, 2014, it was awarded Top 100 E-commerce Enterprise of Zhejiang Province and Top 10 Enterprise of Cooperative development in E-commerce and Logistics of Zhejiang Province.

4.2 Wisdom degree evaluation of Zhongtong logistics group

With field research to Zhongtong Logistics Group, author made a questionnaire survey to Human Resource Department, General Affairs Department, Operating Department, Market Department and Information Department. Its wisdom degree of evaluation index is listed in Table 5, 6, 7 and 8(In these tables, “√” indicates the current level of Zhongtong Group indexes).

Table 5 Personnel Intelligence Evaluation Index Value of Zhongtong Logistics Group

Evaluation Index		Level					
		5A	4A	3A	2A	A	Non -A
Education Background Distribution	manager at or above middle-level	√	80-90% College Degree	70-80% College Degree	60-70% College Degree	50-60% College Degree	< 50% College Degree
	business staff	√	80-90% High School Degree	70-80% High School Degree	60-70% High School Degree	50-60% High School Degree	< 50% High School Degree
Education Background Matching Rate of Skill Position		√	60-70%	50-60%	40-50%	30-40%	< 30%
Ownership Rate of Logistics Industry Qualification Certificate		> 60%	50-60%	√	30-40%	20-30%	< 20%
Ownership Rate of Computer Level Certificate		> 50%	40-50%	√	20-30%	10-20%	< 10%
Work Shift Times in Current Technical Position		3	√	2	1.5	1	0
Working Life of Engaging Logistics Position (over 3 years)		90%	√	70-80%	60-70%	50-60%	< 50%

The result infers that personnel intelligence evaluation index values of Zhongtong Logistics Group are: $R_1=5, R_2=5, R_3=3, R_4=3, R_5=4, R_6=4$.

Table 6 Hardware Digitization Evaluation Index Value of Zhongtong Logistics Group

Evaluation Index	Level					
	5A	4A	3A	2A	A	Non-A
EDI Utility Ratio	(90%,100%]	(80%,90%]	(70%,80%]	(60%,70%]	(50%,60%]	√
Bar Coding Utility Ratio	100%	> 95%	√	> 85%	> 80%	< 80%
comprehensive operation ratio of GIS/GPS GSM /GPRS /CDMA /3G,etc.	> 90%	> 85%	√	> 75%	> 70%	< 70%
RFID Utility Ratio	100%	> 95%	> 90%	> 85%	> 80%	√
Popularity of ISO9000 Certification	100%	> 90%	√	> 70%	> 60%	< 60%
Utility Ratio of Internet of Things	√	(80%, 90%]	(70%,80%]	(60%,70%]	(50%,60%]	< 50%

The result infers that hardware digitization evaluation index values of Zhongtong Logistics Group are: $H_1=0, H_2=3, H_3=3, H_4=0, H_5=3, H_6=5$.

Table 7 Instant Evaluation Index Value of Management in Zhongtong Logistics Group

Evaluation Index	Level					
	5A	4A	3A	2A	A	Non-A
Instant Responsivity of Vehicle Scheduling	(95%,100%]	√	(85%,90%]	(80%,85%]	(75%,80%]	< 75%
Instant Responsivity of Delivery	(95%,100%]	√	(75%,85%]	(65%,75%]	(60%,65%]	< 60%
Instant Responsivity of Replenishment	(95%,100%]	√	(85%,90%]	(80%,85%]	(75%,80%]	< 75%
Instant Responsivity of Line Optimization	(85%,100%]	√	(75%,85%]	(65%,75%]	(60%,65%]	< 60%
Instant Responsivity of Information Inquiry	100%	√	(95%,98%]	(93%,95%]	(90%,93%]	< 93%
Instant Responsivity of Reverse Logistics	(95%,100%]	(85%,95%]	√	(65%,75%]	(60%,65%]	< 60%

The result infers that instant evaluation index values of Zhongtong Logistics Group Management are: $M_1=4, M_2=4, M_3=4, M_4=4, M_5=4, M_6=3$.

Table 8 Intellectual Analysis Index Value of Innovation in Zhongtong Logistics Group

Evaluation Index	Level					
	5A	4A	3A	2A	A	Non-A
Innovation Perceptible Degree	(95%,100%]	(85%,95%]	√	(65%,75%]	(60%,65%]	< 60%
Innovation Network Correlation Degree	(90%,100%]	√	(70%,80%]	(60%,70%]	(50%,60%]	< 50%
Innovation Systematization Ratio	(90%,100%]	√	(70%,80%]	(60%,70%]	(50%,60%]	< 50%
Innovation Coordination Ratio	(90%,100%]	(80%,90%]	(70%,80%]	(60%,70%]	√	< 50%
Innovation Patent Registration Ratio	(95%,100%]	(85%,95%]	(75%,85%]	(65%,75%]	(60%,65%]	√
Utility Ratio of Innovation Technology	100%	[98%,100%)	[95%,98%)	[93%,95%)	√	< 93%

The result infers that intellectual analysis index values of Zhongtong Logistics Group innovation are: $I_1=3, I_2=4, I_3=4, I_4=1, I_5=0, I_6=1$.

On the basis of results above, put the corresponding values into the formula. We can get the wisdom degree coefficient of Zhongtong Logistics Group:

$$E_c = 30\%R + 30\%H + 20\%M + 20\%I \tag{2}$$

$$= 30\%(5+5+3+3+4+4)/6 + 30\%(0+3+3+0+3+5)/6 + 20\%(4+4+4+4+4+3)/6 + 20\%(3+4+4+1+0+1)/6$$

$$= 1.2 + 0.7 + 0.77 + 0.43 = 3.10$$

The index infers that the wisdom degree coefficient of Zhongtong Logistics Group is 3.10 in June, 2014, which means its wisdom level is between 3A and 4A.

5 Conclusion

From the perspective of logistics enterprises, this paper built the Evaluation Model of wisdom degree of enterprises, and by using this Model, evaluated wisdom degree of Ningbo Zhongtong Logistics Group. With the construction of smart enterprises, the status of enterprise wisdom degree evaluation is gradually strengthened. This research will gradually expand the application space; meanwhile, the Evaluation Model will be more perfect in the empirical process.

Empirical Research on the Impact of International Trade: Based on the Panel Data of 9 Provinces in China on the Evolution of Regional Industrial Structure

Chen Siqi

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: chensiqi1994hh@163.com)

Abstract: Based on panel data of the 9 provinces such as Beijing, Tianjin and other the northern region, as the hinterland of modern Tianjin port in China, this paper selects these regional industrial structure as dependent variable, selects trade, consumption, foreign direct investment as independent variables, and constructs a semi-logarithmic model and uses it to do empirical research on the relationship between the regional foreign trade and industrial structure since 1990s. Empirical results suggest that the impact on the evolution of regional industrial structure from Tianjin's international trade is asymmetry. Among which the effect on the evolution of industrial structure from import trade is positive, while export trade hinders the industrial structure adjustment.

Keywords: International trade; Industrial structure; Asymmetry; Export-oriented strategy

1 Introduction

The hinterland of modern Tianjin port is mainly the 9 provinces in North and Northwest China including Tianjin, Beijing, Hebei, Shandong, Henan, Shaanxi, Gansu, Shanxi and Inner Mongolia. Large amounts of agricultural and sideline products from were transported to Tianjin port where exported to the international market, and also a lot of manufactured goods from the international market were imported to the hinterland rural market. Therefore, the rapid development of modern Tianjin port trade effectively promoted the process of industrialization in North China, led to the change of industrial structure in immediate hinterland of Tianjin port. This paper attempts to further analyze what foreign trade play role on industrial structure change under the modern market economy.

In recent years, the research on the relationship between international trade and industrial structure is always a hot issue in academic research, and the scholars have gained certain achievements. Those literature can be divided into the following two types of views: a view is that foreign trade has the promotion to the industrial structure. Yang Quanfa(2000) argues that international trade play the role in promoting the first industry development; import can provide more motivation for industrial growth than that of export; service trade, bulk raw materials export and unclassified goods imports can significantly promote the tertiary industry growth. Wu Jinhong (2006) believes that the mutually interaction relationship between international trade and industrial structure. Chen Jianhua, Ma Xiaokui (2009) thinks that there exists a long-run co-integration relationship and a one-way causality between the structure and foreign trade structure. Li Ronglin, Jiang Qian (2010) states that the export and import structure are highly relevant to the industrial structure, the influence of international trade structure to industrial structure is strong in the long run but very weak in the short run.

But the other shows that international trade has no effect or no significant effect on the industrial structure. Wu Haifeng, Liu Guangyan (2004) point out that the relationship between the structure of China's foreign trade and industry not only exists to promote each other, but also to some extent from each other. Yuan Xin (2010) argues China's foreign trade has not been able to effectively promote the upgrading of industrial structure. Zhang Jie, et al. (2013) thinks that although export-led development pattern in China has accelerated the process of industrialization, it will probably inhibit the transformation of industrial structure from industrialization to tertiarization.

Although the academic conclusions are different, but most studies only selected a period of import and export trade data to investigate the effect of foreign trade on the industrial structure adjustment, while ignoring the influence of other variables. This paper selects the related data of foreign trade, FDI and consumption since the 1990s from modern Tianjin Port Hinterland 9 areas such as Tianjin, Beijing and other regions, to test whether foreign trade plays a role in the evolution of industrial structure in history, and to examine the export-oriented trade strategy sustainability from the long-term perspective.

2 Empirical Analysis

Based on the principles of economics, the influential factors on a country's industrial structure

adjustment include its international trade, consumption, investment, industrial policy and institutional factors. In order to study the impact of the structural change from international trade, this paper selects these regional industrial structure as dependent variable, selects trade, consumption, foreign direct investment as dependent variables, selects the ratio of the output value from the secondary and tertiary industries to GDP as independent variable to construct a semi-logarithmic model about their relationship. our specification of the model is:

$$RY_{23it} = \ln EX_{it} + \ln IM_{it} + \ln C_{it} + \ln FDI_{it} + \varepsilon_{it} \quad (1)$$

where RY_{23} represents the industrial structure, EX, IM, C and FDI respectively represent export, import, consumption and foreign direct investment, i and t respectively represent individual and time. In the model, this paper takes the natural logarithm of the other variables except RY_{23} , in order to eliminate the heteroscedasticity in regression model. The relevant data of 9 provinces, such as Beijing, Tianjin, etc, where the value of import and export trade is converted to the value of its currency in Renminbi, according to the current exchange rate, In order to eliminate the influence of price changes, and make corresponding treatment for the related data in 1987-2013 by the CPI. The characteristics of the main variables show in table 1.

Table 1 Main Variables' Descriptive Statistics

	RY_{23it}	$LNEX_{it}$	$LNIM_{it}$	$LNFDI_{it}$	LNC_{it}
Mean	0.836313	11.59185	11.12943	12.2681	6.827032
Median	0.84	11.51646	11.07027	12.72952	6.837541
Maximum	0.99	15.26867	16.13568	15.89949	9.459104
Minimum	0.64	7.562203	6.439947	3.989207	4.522332
Standard deviation	0.088416	1.750018	2.195228	2.216882	1.10982
Observations	198	198	198	198	198
Cross -section	9	9	9	9	9

In order to make empirical conclusion more robust and creditable, In this paper three models such as mixed effects model, entity fixed effects model and random effects model are used to estimate in eviews6.0, the regression results is in table 2.

Table 2 Three Models' Estimation Results

Independent variable	OLS	FE	RE
Constant	0.514424 (17.94369)	0.534680 (31.77585)	0.531576 (23.32825)
$\ln EX_{it}$	0.045103 (5.135597)	-0.013787 (-2.270499)	-0.010879 (-1.811496)
$\ln IM_{it}$	0.020282 (3.525401)	0.016176 (3.264596)	0.018891 (3.915902)
$\ln FDI_{it}$	-0.007801 (-1.925704)	-0.001065 (-0.450992)	-0.001687 (-0.720248)
$\ln C_{it}$	-0.048478 (-7.024635)	0.043134 (5.902970)	0.035344 (5.047057)
F-Test		97.286929 (0.0000)	
Hausman Test			17.971741 (0.0012)
R^2	0.647	0.932	0.932
Adjusted R^2	0.639	0.728	0.627
D.W statistic	0.200811	0.462774	0.462774
F-statistic	88.32	211.79	174.78

Note: Except for the numbers in the brackets below F-test and Hausman-test value are p-value, and the others below the coefficients are t-statistic.

The test results show that entity fixed effect model should be chosen. But it finds that the value of DW is lower, it indicates the possible autocorrefation in the same period of the cross section. So we improve the model with the method of adding the lag of all variables. The final result is Equation (2)

$$RY_{23it} = (0.546 + 0.084) + (0.546 + 0.112)D_2 + \dots + (0.546 - 0.004)D_9, \quad (2)$$

$$- 0.013 \ln EX_{it} + 0.008 \ln IM_{it} + 0.038 \ln C_{it} + 0.008 \ln FDI_{it} + 0.787 AR(1)$$

(11.89) (-2.7) (1.89) (4.76) (3.67) (17.82)

R² = 0.975 F = 526.47 DW = 2.04

where the dummy variable (D2、 D3...， D9) is defined as:

$$D_i = \begin{cases} 1 & \text{if } i \text{ belong to } i \text{ province} \\ 0 & \text{other} \end{cases}, \quad i = 2, 3 \dots, 9$$

In order to further analyze the influence of main variables on the industrial structure change, according to the information from Table 2, the coefficients in model are standardized, the results are as follows.

$$RY_{23it} = -0.265 \ln EX_{it} + 0.206 \ln IM_{it} + 0.475 \ln C_{it} + 0.191 \ln FDI_{it} \quad (3)$$

According to Equation (3), in the selected variables, except for exports, imports, consumption and foreign direct investment has respectively a positive impact on the evolution of the regional industrial structure, in which the largest contribution is consumption, the following by import, but export shows unfavorable to the industry structure adjustment. Therefore, the obvious differences and asymmetry are found in terms of the adjustment of industrial structure for import and export.

3 Result

According to the above analysis, the estimation results show that consumption and FDI in 9 areas have a positive role in the evolution of the industrial structure; and there are differences for import and export in the impact on the industrial structure adjustment, of which there is a positive effect for import trade on the industrial structure adjustment, and there is negative effect for export trade.

Why does export play a negative role on the evolution of industrial structure? The reason is that the export oriented development strategy has the inherent defects in the characteristics of processing trade. Since the 1990s, export has gradually become the engine of economic growth in China, the processing trade become the main form of foreign trade. However, a variety of problems in China's processing trade exist such as the poor imported technological level, value-adding ratio, spreading effect and so on, the export processing growth mode has a negative effect on the advanced industrial structure in China. Therefore the changing of China's processing trade growth mode is urgent.

In contrast, in China the imported products are mainly raw materials, energy products and intermediate products, import trade can create effective demand, accelerate techno-logic progress, facilitate capital accumulation and bring upgrade of industry structure, so import trade has an important role in promoting the adjustment and optimization of the industrial structure.

4 Conclusion

4.1 Although international trade can promote the economic growth of a country or region in a short run, it is not a positive effect on the development of industrial structure in the long run.

The impact on the upgrading of modern industrial structure in North and Northwest China from Modern Tianjin port import and export trade respectively is asymmetric, where import trade has more obvious effect, and the empirical research by the current data also proved this conclusion. With the opening and development of Tianjin port trade in the modern times, the foreign trade had the profound influence on the evolution of the industrial structure in North and Northwest China. In which there is always a positive effect for import trade on the industrial structure adjustments, while this role for the export trade in modern times is weak, and it is negative in the contemporary era. Therefore, although foreign trade can promote the economic growth of a country or region in a short run, it is not a positive effect on the development of industrial structure in the long run. There is an inevitable contact between export of primary products and the modern rural economic stagnation in North China in the 1930s, similarly the “Dutch Disease” and the poverty of Latin American countries are also the results of this export-oriented development strategy. Therefore, the future growth path in China is also balancing the internal and external demands to achieve the transformation of growth mode. To this end, on one hand, it continues to expand production and export through technological innovation, on the other hand, the level of domestic income need to upgrade on the base of productivity improvement in order to change huge potential market demand into reality needs. So China' economy will be sustainable development.

4.2 The export trade has hindered upgrading of the industrial structure, and the extensive

export-oriented strategy is not sustainable.

Since the 1990s, under the support of export oriented strategy, China's large number of processing trade activities bring about the illusion of leading development of China's foreign trade structure, which has no inevitable internal links with China's industrial structure, and the impact from export trade on upgrading of industrial structure is not obvious, and even shows a certain impediment. Thus, we believe that the traditional export-oriented strategy is not sustainable, and some adjustment should be made to achieve the transformation from the extensive, labor-intensive export-oriented strategy to the capital-intensive, diversification of export markets development mode. Therefore, technology-intensive, competitive advantage export-oriented pillar industry group should be cultivated in order to become the leading industry in the intensive export mode; at the same time, China from the following aspects to enhance the utilization of FDI, such as guide foreign industries to invest, attention to personnel training and strengthening technological innovation.

Abstract: Succeeding the steam and power technology revolutions, the third Industrial Revolution is another significant leap in the history of human civilization, promoting tremendous development of productivity and fundamental changes of industrial structure and social life with the outstanding features of radical innovation, deep integration and wide application in emerging technologies. The paper reveals the profound changes of connotation and extension of the strategic emerging industries in the Third Industrial Revolution, and provides their selection criteria, evaluation index system, and entropy evaluation model. With 32 manufacturing industries and 6 service industries in Hubei province the paper proposes the key strategic emerging industries of Hubei in the Third Industrial Revolution.

Keywords: The Third Industrial Revolution; Strategic emerging industries; Evaluation index system; Entropy evaluation method

1 Introduction

Succeeding the steam and power technology revolutions, the third Industrial Revolution is another significant leap in the history of human civilization. With the outstanding features of radical innovation, deep integration and wide application in the emerging technologies such as digital manufacturing technology, internet technology, renewable energy technology, new material technology, biotechnology, space technology etc., it will promote tremendous development of productivity and fundamental changes of industrial structure and social life, and even the great adjustment of international economic pattern. The Third Industrial Revolution is historically significant for China's national and regional development. In Sept. 2013, President Xi clearly pointed out that a new round of technological revolution and industrial innovation is emerging. Some important scientific problems and crucial techniques have taken on the sign of revolutionary breakthrough, promoting the cross amalgamation and group progress of key technologies and continuously accumulating the energy of breakthrough and innovation. A historical intersection is formed between the forthcoming new round of technology revolution and industrial innovation, and China's accelerating the transformation of economic growth mode, providing a rare opportunity for implementing innovation-driven strategy. Chances are easier missed than seized. If seized, it is an opportunity; if missed, it is a challenge. We must be mindful of potential danger and hold on to and make good use of the opportunities of the new round of technology revolution and industrial innovation. Never wait, nor hesitate, nor slack.

To catch hold of the great historic opportunity of the Third Industrial Revolution, it is necessary to seize and comply with the general trend of its industrial development in the first place. Broadly speaking, its industrial development includes three main trends:

Firstly, low-carbonization. The Third Industrial Revolution sprang up from the background of dual crisis of energy and environment. Green, low-carbon, renewability, and sustainability have become the core essence of its industrial development whose mainstream direction and inevitable choices will include those energy efficient, low-pollution and sustainable businesses such as new energy resources, energy conservation and environment protection, new material, biological medicine, the new generation of information technology, digitalization manufacturing, etc.

Secondly, amalgamation. The industrial development of the Third Industrial Revolution is characterized by multi-industry cross amalgamation with domination of informatization amalgamation. The new generation of information technology is merged constantly with new materials, new energy resources, manufacturing industries, energy conservation and environment protection, logistics, commerce and trade, education, entertainment, finance, etc., promoting upgrading and updating of all walks of life with mutual permeation and support. Meanwhile, by merging new materials into manufacturing, biomedicine and energy conservation and environment protection, biomedicine into agriculture, new energy resources, food service and energy conservation and environment protection, and manufacturing into service, the industry boundaries gradually blur and new industries constantly

emerge.

Thirdly, humanization. As the soul of the Third Industrial Revolution, returning to human-centric values will change the style and philosophy of human production and life in essentiality. People attach more importance to their well-being and life quality, consequently pushing the development of a series of happiness-oriented industries which involve human life and health, convenient traffic, green food, leisure tourism, culture creativity etc.

2 Domestic and Overseas Research Overview

The domestic and overseas research of strategic emerging industries mainly focuses on their demarcation, formation reasons, selection, growth and development procedure, policies etc. The American economist W·W·Rostow (1959) firstly proposed the conception of leading sector and leading industries(Walt Whitman Rostow, 2001). Japan and South Korea gained great fruits by aiding key industries to lead the entire economic growth. Ever since, people have increasingly emphasized those industries with strategic importance. It was A·O·Hirschman (1958) who put forward the conception of strategic industries. He considered strategic industries the same as leading industries, believing that the leading industrial sector is the most compact economic system in the relation of “input-output”(Albert Otto Hirschman, 1991). Paul R· Krugman (2000) proposed two criteria to identify the strategic sector: on the one hand, whether there are high rewards of capital and labor; on the other hand, whether there exists technology spillover effect, namely, external economy(Paul Krugman,2000). Many Chinese scholars have also studies the demarcation of strategic emerging industries. For instance, Li Xiaohua (2010) argued that the strategic emerging industries, with great strategic significance to economic growth, were characterized by strategicness, uncertainty, positive externality, and complexity(Xiaohua Li, 2010). Su Dongshui (2010) suggested the definition of forerunner industries similar to strategic emerging industries as: with great strategic status in national economic system, forerunner industries are some industries or industrial clusters to develop in advance and lead other industries to develop in a certain strategic target direction(Dongshui Su, 2010). After reviewing domestic and overseas research fruits, Liu Hongchang (2011) believed that strategic emerging industries are of great strategic position in national economy and related to the national or regional economic artery and industrial security, and that by deep integration of emerging technology and emerging industries, they are characterized by strategicness, innovativeness, growth, relatedness, guidance quality, and high risks(Hongchang Liu, 2011).

In the State Council’s Decision of Accelerating cultivation and Development of Strategic Emerging Industries approved in Sept. 2010, the strategic emerging industries are defined as: based on great technology breakthrough and development demand, the strategic emerging industries are of knowledge and technology concentration, low material resource consumption, great growth potential, and high comprehensive benefits, which play a significant role in guiding the overall and long-term development of economic society. On the basis of our national conditions and technological and industrial situations, the Decision determines the seven important industries which are to be especially cultivated and developed at the present stage: energy conservation and environment protection, the new generation of information technology, biology, sophisticated equipment manufacturing, new energy resources, new materials, new energy automobile(the State Council,2010).

3 Essential Features of Strategic Emerging Industries

Strategic emerging industries have two essential attributes: strategicness and emergingness.

Table 1 Features and Comparison of Strategic Industries and Emerging Industries

	emerging industries	strategic industries
reasons of emergence or existence	technology innovation, changes of relative cost structure, emergence of new market demand	great strategic position, influence on national economy growth and optimization and upgrading of industrial structure
major performance or features	big differences from original industries in technology, product function, production mode and flow, and raw material	priority in national economy project

The strategic emerging industries are neither emerging ones nor strategic ones. They rest on the deep integration of those two and possess the attributes of both. In the State Council’s Decision of

Accelerating cultivation and Development of Strategic Emerging Industries approved in Sept. 2010, the strategic emerging industries are defined as: based on great technology breakthrough and development demand, the strategic emerging industries are of knowledge and technology concentration, low material resource consumption, great growth potential, and high comprehensive benefits, which play a significant role in guiding the overall and long-term development of economic society. This definition also reflects the main properties of strategic emerging industries:

(1) Wholeness. Strategic emerging industries involve development of the whole national economic society. They promote optimization and upgrading of industrial structure, which plays a key role in seizing the commanding height of industrial competition in the future.

(2) Relevance. Relevance means that those industries are highly related to one another, which makes an apparent influence on supporting and leading the relevant industries along the matched industrial chain.

(3) Knowledge and technology concentration. One of the major reasons for the appearance of strategic emerging industries is technological innovation. Those industries are the fruits of new technology industrialization, and R&D input-output is correspondingly greater.

(4) Low material resource consumption. Development of strategic emerging industries is required to be sustainable. It means resource consumption of unit output is relatively low, which conforms to the resource-saving and eco-friendly notion.

(5) Great growth potential. Strategic emerging industries are also characterized by being able to satisfy and cultivate great demands, and possessing vast developing potential and market size.

(6) High comprehensive benefits. Their comprehensive benefits are embodied in two aspects, technology and economy. Technically, they help to master core technology to gain the regional or national competitive advantage; economically, the benefits lie in contributions to national economy, such as providing employment opportunities, increasing revenue, earning foreign exchange through exports etc.

4 Selection Criteria of Strategic Emerging Industries in the Third Industrial Revolution

The selection criteria of strategic emerging industries in the Third Industrial Revolution are proposed with reference to former research fruits and theories and with the combination of their fundamental features.

(1) Development foundation criterion. As deep integration of new technology and new industries, strategic emerging industries are still in small scale and at the initial stage. When developing strategic emerging industries, a region should make the first breakthrough in fields with best foundation and condition and give priority to industries with some comparative advantage and better comprehensive benefits, to facilitate the rapid growth of strategic emerging industries and finally form strategic pillar industries.

(2) Industrial innovation criterion. Unlike tradition pillar industries, the most important distinction of strategic emerging industries is they no longer rely excessively on such traditional factors as location, capital, resources and environment etc. Their rapid growth and sustainable development mainly depends on innovativeness, including technical innovation, management innovation, and idea innovation brought about by knowledge, intelligence, and technology.

(3) Industrial contribution criterion. Strategic emerging industries should play the great leading role in the overall and long-term development of economic society. Not merely are they the major supporting force in economic growth, but also they make great contributions to employment, livelihood, society, and environment.

(4) Development potential criterion. Accordingly, strategic emerging industries should satisfy the demand of high-growth, which means for quite a long time in the future, they will have vast and steady Markey prospect and development space to maintain their fast growth.

(5) Industry relevance criterion. This criterion is key to measure their influence. Only with stronger correlation effect, overflow effect and spreading effect can one industry facilitate others' development and undertake the important task of promoting industrial structure optimization and adjustment.

When judging whether one or several industries should be regarded as key strategic emerging industries, it is improper to pay attention to whether one single criterion is met. All the four criteria should be considered in a comprehensive way. Only those industries with very high comprehensive level can be viewed as key industry and given priority.

5 Selection Index and Model of Strategic Emerging Industries

5.1 Selection index of strategic emerging industries

According to the conception and features of strategic emerging industries, their selection index system is designed from five perspectives (industrial development foundation, industrial innovation power, industrial contribution, industrial growth potential, and industrial relevance) with their principles and criteria, and availability and maneuverability of index data, as is shown in Table 2.

Table 2 Evaluation Index System of Focus Selection of Strategic Emerging Industries

first level	second level	third level	index
industrial development foundation	industrial scale	proportion of output value	output value of some local industry/local total output value
		proportion of number of enterprises	number of enterprises of some local industry/total number of local enterprises
	industrial concentration	market share	sales volume of some local industry/sales volume of this industry all over the country
		enterprise concentration ratio	proportion of enterprise number of some local industry/proportion of enterprise number of this industry all over the country
		location quotient	output value proportion of some local industry/output value proportion of this industry all over the country
		specialized modulus	employment proportion of some local industry/employment proportion of this industry all over the country
industrial innovation	innovation input	R&D proportion of input	R&D input of some local industry/local total R&D input
		R&D input intensity	R&D funds input of some industry/main business income of this industry
		Per capita R&D input	R&D funds input of some local industry /employment figure of this local industry
	innovation output	labor productivity	output value proportion of some local industry/employment proportion of this local industry
		comparative labor productivity	labor productivity of some local industry/labor productivity of this industry all over the country
		new product sales rate	new product sales volume of some local industry/total sales volume of this local industry
		cost efficiency	profit amount of some local industry/total cost of this industry
industrial contribution	economic contribution	industrial contribution rate	increment of added value of some local industry/increment of local GDP
		Industrial pulling rate	contribution rate of some local industry * local GDP growth rate
	social contribution	employment proportion	employment figure of some local industry/local total employment figure
		tax proportion	tax amount of some local industry/local total tax amount
	export contribution	export proportion	export amount of some local industry/local total export amount
industrial growth potential	growth rate	growth rate of production value	output value growth rate of some local industry within n years
		employment growth rate	employment figure growth rate of some local industry within n years
	market prosperity	growth rate of sales value	sales volume growth rate of some local industry within n years
		income elasticity of demand	sales volume growth rate of some local industry/growth rate of local per capita income
industrial relevance	consumption coefficient	rate of intermediate demand	the ratio between the sum of intermediate demand of each industry from some industry and aggregate demand from this industry
		rate of intermediate input	the ratio between intermediate input of some industry and its total input
	spread effect	Influence coefficient	j industry: average value of the sum of the jth row divided by the sum of each row in Leontief inverse matrix
		response coefficient	i industry: average value of the sum of the ith row divided by the sum of each row in Leontief inverse matrix

5.2 Selection entropy evaluation method of strategic emerging industries

In order to obtain more accurate and reasonable calculating results and to eliminate subjective factors as

much as possible in the evaluation process, entropy evaluation method is adopted for calculation. It is a objective weight method which determines the index weight based on the information size offered by each index of observations. Suppose there are m schemes to be evaluated and n evaluation indexes, forming a data matrix of original index $X = (X_{ij})_{m \times n}$. With regard to some index X_j , the bigger the gap of index value X_{ij} , the greater role this index plays in comprehensive evaluation; if all values of some index are equal then this index plays no role in comprehensive evaluation. In information theory, entropy is to measure uncertainty. The more information there is, the smaller uncertainty, and the smaller entropy; the less information, the greater uncertainty, and the larger entropy. According to features of entropy, randomness and disorder degree of a scheme are judged through calculating entropy values which is used to estimate dispersion degree of some index. The greater its dispersion degree is, the more influence this index has on the comprehensive evaluation. Consequently, on the basis of variation degree of each index, each index weight can be obtained by making using of information entropy to provide basis for multi-index evaluation.

6 Solid Selection Evidence of Strategic Emerging Industries in Hubei Province

According to correspondence coefficients of Hubei industrial sector, service sector, strategic emerging industries and industrial sectors of national economy, the synthesis scores are obtained for each strategic emerging industry, as is shown in Table 3. In the Third Industrial Revolution, Hubei strategic emerging industries include energy conservation and environment protection industry, the new generation of information technology industry, bio-industry, new material industry, sophisticated equipment manufacturing industry, new energy resource industry, and new resource automobile industry.

Table 3 Synthesis Scores and Rankings of Hubei Strategic Emerging Industries

name	synthesis score	ranking
energy conservation and environment protection industry	0.16546	1
the new generation of information technology industry	0.14643	2
Bio-industry	0.07386	3
new material industry	0.05154	4
sophisticated equipment manufacturing industry	0.04485	5
new energy resource industry	0.04166	6
new resource automobile industry	0.00253	7

7 Conclusion

In the Third Industrial Revolution, industrial development is of low-carbon, amalgamation, and humanization. The strategic emerging industries are characterized by such new features as wholeness, relevance, knowledge and technology concentration, low material resource consumption, great growth potential, and high comprehensive benefits. With those new features, this paper proposes the development foundation criterion, industrial innovation criterion, industrial contribution criterion, development potential criterion, and industrial relevance criterion of selecting strategic emerging industries under the background of the Third Industrial Revolution. According to the availability and maneuverability of index data, the selection index system is designed in five aspects of industrial development foundation, industrial innovation, industrial contribution, industrial growth potential and industrial relevance. According to the current condition of Hubei industrial sector and service sector, by using 5-dimensional index system and entropy model, the Hubei strategic emerging industries in the Third Industrial Revolution include energy conservation and environment protection industry, the new generation of information technology industry, bioindustry, new material industry, sophisticated equipment manufacturing industry, new energy resource industry, and new resource automobile industry.

The Strategy of Rare Earth Value Compensation Based on Trilateral Game*

Yang Limei¹, Cai Linghui¹, Zhang Qiyao²

1 School of Economics and Management, Inner Mongolia University of Science and Technology, Baotou, P.R.China, 014010

2 School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: ylmt@126.com, clh2013023@163.com, imutzqy@163.com)

Abstract: Value compensation is an important driver of achieving sustainable economy and society development in rare earth resources area. To make reasonable value compensation, a trilateral dynamic game model is built based on the analysis of the government, the third-party compensation appraisal institution and rare earth industry. Analysis shows that the possibility of decision-making conspiracy between the third-party compensation appraisal institution and the rare earth industry can be decreased by increasing their penalty, strengthening the government supervision, and standardizing the value compensation mechanism.

Key words: Value compensation; Conspiracy; Government supervision; Trilateral game

1 Introduction

Rare earth, which is widely used in traditional industries and high-tech fields, is known as the “industrial vitamin”. The survey shows that the high loss of rare earth enterprises occurred in our country in recent years and the rare earth resource has a low price as the Chinese cabbage. The price of rare earth is lower than the value of rare earth. That is not only because we have no voice on the pricing right of rare earth in the international market, but also because our government does not have a comprehensive understanding of rare earth mining industry. The assessment of rare earth cost is lower than its value and then a serious shortage of value compensation has happened. The government introduces a third-party compensation appraisal institution which can evaluate the value compensation exactly of the rare earth mining to solve these questions. The third institution is profitability, and it may generate a conspiracy during the process of the evaluation. In this paper, we analyze the decision action of the three parts by using the trilateral dynamic game model, in order to provide a reference for the three parts in theory.

2 Literature Review

The value of rare earth are composed of mining right value (the cost of exploration and exploitation), ownership value (the cost of users) and the value of environmental right to the local (environmental damage cost). The concepts of value and cost are closely related, the compensation of resource value is the compensation of resource cost (Zhang Yun, 2007). Li and Zhang (2005) consider that the value of mineral resource is belongs to the compensation, and the premise is defining the property right (Li Guoping and Zhang Yun, 2005). Under the condition of socialist economy, the government supervise the industry during it cost calculation by cost method in order to improve the benefits of social and economic. Zhang (2012) propose that the cost method should pay more attention on practice analyze during the mineral resource value, it lack of the normative theoretical framework (Zhang Qian, 2012).

Rare earth is the non-renewable mineral resources. There are many measures to compensate the value of the non-renewable resources, such as: resource tax, resource compensation, the pollution tax, environment compensation fee, etc. The third-party compensation appraisal institution could evaluate the compensation value exactly based on the measures. However, Zhao and Fan (2012) think that the third-party compensation appraisal institution will have a monopoly position once it gain the qualification to evaluate, and they provide an evaluation result that is maybe biased whether the real assessment it is because of the conspiracy. The institution often forget the government regulation that how to carry on the evaluation work independently, fairly and objectively for their own interests. So, we must punish the offenders in order to make them realize the regulation (Zhao Jun, 2012). The institution and the industry would make contractual relationship for long-term cooperation and their own

* This paper is supported by western project of national social sciences foundation (13XJY014) and social science planning project of Inner Mongolia (2013B030).

interest(Bird.R.C, 2005). Sun and Yu (2010) consider that the contractual relationship is not only based on the value and the reputation of parties, but also is related to the rules of information exchange and being trustworthy, flexible and cooperative during the current cooperation process. It is more important that they cherish the future relationship(Sun Yuanxin and Yu Maojian, 2010). The third-party compensation appraisal institution and rare earth industry are going to conspire based on the long-term cooperation and profit. And a contractual relationship will be established. The government should supervise the two participators to prevent collusion.

3 The Construction and Analysis of Trilateral Game Model

3.1 Behavioral strategy and related economic parameters

The article assumes that all the information in the game is complete, the order of action is successive and every participator knows each other totally.

3.1.1 The decision-making of government

There are two decisions in the compensation model: supervise and no supervise. The government should pay C_1 as the regulation cost. If rare earth industry or third-party compensation appraisal institution have a conspiracy, and the government had supervise their actions, it will earn non-business income (penalty). Instead, the government will lose non-business income (penalty).

3.1.2 The decision-making of the third-party compensation appraisal institution

There are two choices for the third-party compensation appraisal institution when the institution evaluates the compensation value during the rare earth mining. If the third-party compensation appraisal institution choose conspire with rare earth industry, they can earn R_2 but cost C_2 for it. Meanwhile rare earth industry also have two choices: on one hand ,no conspire, the third-party compensation appraisal institution regulated by the government with the punishment of F_2 ; on the other hand, conspire, the third-party compensation appraisal institution regulated by the government with the punishment of $\alpha F_2(\alpha > 1)$. Besides, all of the punishment is given to the government.

3.1.3 The decision-making of rare earth industry

There are two choices for rare earth industry when the third-party compensation appraisal institution evaluates the compensation value during the rare earth mining. It needs to pay C_3 when rare earth claims to conspire; we will also get R_1 as extra income. Meanwhile the third-party compensation appraisal institution have two choices: first is no conspire, rare earth industry regulated by the government with the punishment of F_3 .second is conspire, rare earth industry regulated by the government with the punishment of $\alpha F_3 (\alpha > 1)$. Besides, all of the punishment is given to the government. P_1 is the probability of government regulation . P_2 is the conspiracy probability of the third-party compensation appraisal institution. P_3 is the conspiracy probability of rare earth industry.

3.2 Cost matrix

Table 1 Cost Matrix

Name	①	②	③	④	⑤	⑥	⑦	⑧
Government	$C_1 - \alpha F_2 - \alpha F_3$	$\alpha F_2 + \alpha F_3$	$C_1 - F_3$	F_3	$C_1 - F_2$	F_2	C_1	0
The Third Institution	$C_2 + \alpha F_2 - R_2$	$C_2 - R_2$	0	0	$C_2 + F_2 - R_2$	$C_2 - R_2$	0	0
Rare Earth Industry	$C_3 + \alpha F_3 - R_3$	$C_3 - R_3$	$C_1 + F_3 - R_3$	$C_3 - R_3$	0	0	0	0

The expected cost of government mixture Nash optimality:

$$A = P_1 C_1 + 2(1 - \alpha) P_1 P_2 P_3 (F_2 + F_3) + P_2 P_3 (\alpha - 1) (F_2 + F_3) - 2P_1 P_2 F_2 - 2P_1 P_3 F_3 + P_2 F_2 + P_3 F_3 \tag{1}$$

P_1 is an independent variable, A is a dependent variable. We need to compute the partial derivative with respect to P_1 if the government wants to realize the minimization of cost.

$$\frac{\partial A}{\partial P_1} = C_1 - 2(\alpha - 1) P_2 P_3 (F_2 + F_3) - 2P_2 F_2 - 2P_3 F_3 = 0 \tag{2}$$

The expected cost of the third-party compensation appraisal institution mixture Nash optimality:

$$B = P_2 C_2 - P_2 R_2 + P_2 [P_1 P_3 \alpha F_2 + P_1 (1 - P_3) F_2] \tag{3}$$

P_2 is an independent variable, B is a dependent variable. We need to compute the partial derivative with respect to P_2 if the third-party compensation appraisal institution wants to realize the minimization of cost (that is, the maximization of profit).

$$\frac{\partial B}{\partial P_2} = C_2 - R_2 - [P_1 P_3 \alpha F_2 + P_1 (1 - P_3) F_2] = 0 \tag{4}$$

The expected cost of rare earth industry mixture Nash optimality:

$$X = P_3 C_3 - P_3 R_3 - P_3 [P_1 P_2 \alpha F_3 + P_1 (1 - P_2) F_3] \tag{5}$$

P_3 is an independent variable, B is a dependent variable. We need to compute the partial derivative with respect to P_3 if the rare earth industry wants to realize the minimization of cost (that is, the maximization of profit).

$$\frac{\partial X}{\partial P_3} = C_3 - R_3 - [P_1 P_2 \alpha F_3 + P_1 (1 - P_2) F_3] = 0 \tag{6}$$

The above system of simultaneous equations is solved to arrive at the probability.

$$\begin{cases} \frac{\partial A}{\partial P_1} = C_1 - 2(\alpha - 1)P_2 P_3 (F_2 + F_3) - 2P_2 F_2 - 2P_3 F_3 = 0 \\ \frac{\partial B}{\partial P_2} = C_2 - R_2 - [P_1 P_3 \alpha F_2 + P_1 (1 - P_3) F_2] = 0 \\ \frac{\partial X}{\partial P_3} = C_3 - R_3 - [P_1 P_2 \alpha F_3 + P_1 (1 - P_2) F_3] = 0 \end{cases} \tag{7}$$

To make the description easier to follow, we hold the following hypothesis. First, it is twice as profit that a single participator insists to conspire as the total profit that all participators intend to conspire. It is also twice as punishment that a single party insist to conspire as the total punishment that all participators intend to conspire when the government had supervised, this article supposed that $\alpha=2$. This is to say, more risk, more profit, and more punishment. Second, the third-party compensation appraisal institution and rare earth industry have nearly equal extra income that $C_2 - R_2 = C_3 - R_3$ when they intend to conspire. Third, the punishment have the same amount $F_2 = F_3 = F$ when one of the participators intends to conspire and be supervised by the government. It can be seen from formula (7):

$$\begin{cases} P_2 = \frac{R_3 - C_3 - P_1 F_3}{P_1 F_3} \\ P_3 = \frac{R_2 - C_2 - P_1 F_2}{P_1 F_2} \end{cases} \Rightarrow P_2 = P_3 \tag{8}$$

Making $P_2 = P_3 = P$, and then take it in the formula (2):

$$P_2^* = P_3^* = \sqrt{\frac{1}{4} + \frac{C_1}{(\alpha - 1)4F}} - \frac{1}{2(\alpha - 1)} \quad (\alpha > 1) \tag{9}$$

Setting $\alpha=2$:

$$P_2^* = P_3^* = \sqrt{\frac{1}{4} + \frac{C_1}{4F}} - \frac{1}{2} \tag{10}$$

It can be seen from formula (7):

$$P_1^* = \frac{R_2 - C_2}{(P_3 + 1)F_2} = \frac{R_3 - C_3}{(P_2 + 1)F_3} \tag{11}$$

To put formula (10) into formula (11):

$$P_1^* = \frac{2(R_2 - C_2)}{\sqrt{F_2^2 + 2F_2 C_1 + F_2}} = \frac{2(R_3 - C_3)}{\sqrt{F_3^2 + 2F_3 C_1 + F_3}} \tag{12}$$

It can be seen from the formula (11) that the third-party compensation appraisal institution and rare earth industry will intend to conspire if the probability of government regulation is lower than the probability of Nash optimality. That is $P_1 < P_1^*$, $p_1 < \frac{R_2 - C_2}{(P_3 + 1)F_2}$ or $p_2 < \frac{R_3 - C_3}{(P_2 + 1)F_3}$. Otherwise, they will choose no conspire.

It can be seen from the formula (12) that $P_1 = 0$ if $R_2 = C_2$ and $R_3 = C_3$. The third-party compensation appraisal institution and rare earth industry will not intend to conspire if the extra income is equal to the cost, so that the government has no necessary to supervise. We can also see that $P_1 > 0$ if $R_2 > C_2$ and $R_3 > C_3$, the two will conspire because the extra income is higher than the cost, and the government will increase the probability of regulation. The $P_1 < 0$ if $R_2 < C_2$ and $R_3 < C_3$ is meaningless.

3.3 Model analysis

There are many factors which can be seen from the formula (10) affect the probability of conspire, such as: C_1 is the regulatory cost of government; F is the punishment that one of the participators intends to conspire after the regulation of the government. From the equilibrium: the probability of conspire in the two participators are in direct proportion to the regulatory cost of government under the changeless of the punishment F . The probability of conspire in the two participators are in inverse proportion to the punishment F under the condition that the C_1 is changeless.

From the formula (12), we can see that five major factors have influenced the probability of government regulation: the extra profit (R_2-C_2) of the third-party compensation appraisal institution, the extra profit (R_3-C_3) of rare earth industry, the punishment F_2 of the third-party compensation appraisal institution when supervised by the government, the punishment F_3 of rare earth industry when supervised by the government, and the regulatory cost C_1 of the government. From the equilibrium, we can see that the regulatory probability of the government is in direct proportion to the extra profit (R_2-C_2) and (R_3-C_3) under the condition that the punishment F_2 , F_3 and the cost C_1 are changeless. The regulatory probability of the government is in inverse proportion to the punishment F_2 and F_3 under the condition that the extra profit (R_2-C_2) and (R_3-C_3) and the cost C_1 are changeless. The regulatory probability of the government is in inverse proportion to the cost C_1 under the condition that the punishment F_2 , F_3 , the extra profit (R_2-C_2) and (R_3-C_3) and the cost C_1 are changeless.

4 Conclusions

By the analysis of the cost function of the participators and the influence of each variable to the three major participators, some suggestions to realize the maximum of profit for each part are provided.

From the view of government, the government and the third-party compensation appraisal institution should establish rules and contract norms, which can make the third-party compensation appraisal institution to evaluate the compensation value fees around fairness and equality. And the punishment level for the appearance of the conspiracy to decrease the conspiracy is also need to be increased.

From the view of rare earth industry, reducing the cost during rare earth mining process, integrating industry chain and optimizing the industrial structure, which can reduce the cost by increasing industry concentration and expanding the production scale. The long-term and law-abiding concept is necessary to rare earth industry; good business ethics always reduce transaction cost.

From the view of third-party compensation appraisal institution, the institution should objectively and professionally evaluate the rare earth resources. In the evaluation, the institutions must establish an internal check and review system for assessment results. Right now, the third-party compensation appraisal is a new business, whatever in theoretical research and empirical research. It has a big space to develop.

Abstract: Combined export trade with practical experience of standardization in Zhejiang Province, this paper did an empirical study on the coordinated development of standardization level and exports. After setting standardization-measuring indicators and provincial macro-economic variables, relevant data from 1990 to 2013 were lead into a principal component regression model, analyzed the development situation and ran an empirical test on the effect of standardization on export trade in Zhejiang Province. It draw a conclusion that all the standardization-measuring indicators have made a positive facilitation on Zhejiang's export trade, and the index weight for each indicator was given according to the empirical test.

Key words: Standardization; Export trade; Zhejiang province; Principal component analysis

1 Introduction

Since joining the world trade organization, the internationalization of China's economy has been accelerated. Take export data for example, China's exports have increased from \$266.15 billion in 2001 to \$2.2096 trillion in 2013. It is growing 21.7% per year. And China was the largest country in foreign trade of the world since 2013. However, the expansion of exports partly relied on ways such as increasing production and lowering the price. Export products mostly were traditional products with comparative advantage (primary products and labor-intensive manufactured goods). The extensive growth model makes our country suffered various forms of trade restrictions and trade barriers in the process of expansion of foreign trade. Today the international trade restrictions against China still are the traditional ways such as anti-dumping and countervailing. As the tariffs and traditional non-tariff barriers in international trade constrained and weakened and the influence of the technical trade barriers strengthened in international trade, standards as the major form of the technical barriers are getting more and more attention. Its impact on China's export also cannot be ignored.

As an important part of international trade rules, standards have become an irreplaceable role to guarantee the quality of products, strengthen information symmetry, promote the commodity flow and improve market confidence. Based on these, the standard competition between countries is becoming a mainstream trade competition, and plays an important role in the formation of non-tariff trade barriers. Countries with vulnerable standard will be at a disadvantage in the international competition. Therefore, having a mature and perfect standardization system is not only an important micro dynamic mechanism for the development of China's import and export trade, but also the path from the trade nation to the trading powerful nation for China.

The strategic significance of standardization is recognized and generally emphasized in both academia and industry. Many Chinese and overseas scholars pointed out that the standards have the potential to encourage and discourage the development of international trade at the same time, that is, they have both positive and negative impact on a country's international trade development, which differs from impact from the traditional tariff or most other non-tariff barriers to trade [Blind & Jungmittag, 2005; Moenius, 2004; Dennis & Shepherd, 2007; Blind, 2001]. It is concluded that the standards shared between the import and export countries have a significantly positive relationship with a country's bilateral trade volume via examining 471 industry technical standards in 12 countries from 1980 to 1995 by Moenius. And he proposed that the standards for the unilateral export countries in the importer provide the product quality and reliable information transmission [Moenius, 2004]. It is presented that under the restrained conditions of the presence of highly multinational homogeneity, high cost of product improvement, higher foreign demand price elasticity as well as standard policy implementation effect, international trade with largely accepted imported standards can improve product revenue on the basis of the related literature review of international standards with their compatibility during 50 years by Schmid and Kotulla [Schmid & Kotulla, 2011]. Clougherty and Grajek confirmed

* This paper is supported by Science and Technology Projects of Zhejiang Province (No.2014C35008)

that the common language, degree of homogeneity among countries etc. are the factors which affect the scale of trade between the two countries by taking ISO9000 standard system along with the panel data regression and co-integration analysis. And they put forward that the powerful members possessing much ISO standards would profit more from standardization, however those small ones think ISO9000 represents one kind of trade barriers caused by the compliance costs [Clougherty & Grajek, 2013]. Hou Junjun investigated the influence of national standard for Chinese trade scale. And he thinks that the current standard lagging behind and the increase of the standard will shrink of China's import and export trade in the short term, but in the long term will be a promotion action [Hou & Ma, 2009]. Xu Jiexiang discovered in the short term the standardization mainly brings negative effect on China's export trade, but would produce positive promoting effect on China's trade in the long run by analyzing the impacts in both long and short term from the perspective of local equilibrium [Xu & Zhang, 2010]. Ge Jing, Wang Yiyi magaged the standards and international trade data among over 60 different industries from different countries during the period 1996-2005, and established the panel data regression model analysis to conclude that there will have different effect and influence mechanism raised by same standards in the developing countries and developed countries and the international trade between developed countries [Ge & Wang, 2009]. Yang Lijuan analyzed the influence of the national and international standards on China's import and export trade after excluding mandatory standards. It is found that the increase of the national and international standards on China's foreign trade has positive influence [Yang, 2012]. Hou Junjun carried on the empirical research with the international trade data of Hunan province, and pointed out that the rise of each of the Hunan standardized index significantly promote the growth of foreign trade of Hunan province. Among them the enterprise standards, the national standards that Hunan participated in revising and existing patents have greater influence on export trade, on the other hand the special funds of standard research, technical committee and local standard stock have a bigger influence on import trade [Hou & Liu, 2012].

This paper takes Zhejiang province for example to analyze impact of standardization on export trade basing on the relevant data of parts of Zhejiang industry. Using principal component regression analysis method to conduct empirical test for evaluating effect of standardization, we get the conclusion that the level of standardization affects export trade in Zhejiang province. And basing on this conclusion, we put forward some feasible suggestions for standardization in Zhejiang province.

2 The Collaborative Development of Export Trade and Standardization in Zhejiang Province

The export trade of Zhejiang province has maintained a rapid development since the Reform and Opening-up. Statistical data shows, Zhejiang's exports started with \$21.89 billion in 1990, ranking fifth among the cities in the east China. In 1997, the exports first hit \$100 billion, and by the next year, Zhejiang surpassed Shandong Province, ranked fourth in the whole country and maintained the ranking until 2010. In 2011, the exports reached \$2163.49 billion, surpassed Shanghai becoming one of the third largest export provinces in China, followed after Guangdong and Jiangsu. During this period, the exports of Zhejiang ranked first place in the east China with a 17.97% average annual increase.

Figure 1 depicts the import and export trade data of Zhejiang province and a general trend of foreign from 1986 to 2013, and we placed the growth curve of national foreign trade for comparison. The chart demonstrates, foreign trade in Zhejiang had experienced a period of rapid expansion, and trade surplus occurred for the growth of exportation was significantly higher than imports in decades. By comparing the growth figure of Zhejiang and the nation's, we can see the two curves share a similar trend of development, but the average annual growth figure in Zhejiang province won the nation's every year since 1990. Zhejiang seized the opportunities of the Reform and Opening-up, and quickly adapted itself to an export-oriented economy after China joint WTO, great achievements have been made in a decade.

The national standard (GB) has the most widely application scope across the country level admitted by STANDARDIZATION LAW OF THE PEOPLE'S REPUBLIC OF CHINA. Due to the influence of national standard is far-reaching, the enterprises or scientific research institutions with technology or research and development ability take an active part in the national standard revision to strengthen the advantages of technology and management for product development.

Figure 1 The Scale of Export Trade & Growth Rate of Zhejiang Province

Data source: 1978-2013 China Statistical Yearbook, 1986-2013 Zhejiang Statistical Yearbook, Zhejiang customs statistical bulletin, collected by author.

By the end of 2013, the amount of national standard that enterprises, scientific research institutions, universities and individuals in Zhejiang province have participated in drafting or amending, has been 3284. It ranked the third place behind Shanghai and Jiangsu province in east China area. Figure 2 shows the annual increment and stock of national standard that Zhejiang has participated in drafting and amending.

Figure 2 National Standard Increment & Inventory of Zhejiang Province

Data source: National standardization committee of national standard database, standard information service network in Zhejiang province, Zhejiang standard information and quality safety of the public science and technology innovation service platform, data retrieved by author.

Figure 2 illustrates that after joining to WTO, the average annual growth of national standard increment and stock drafted or revised by Zhejiang is significant, particular the number of holding the recommended national standard, is of high-speed growth. The reason is that enterprises and scientific research institutions of Zhejiang province can meet the needs of the diversification of foreign markets, and implementation of standardization strategy of the province. The development of standardization program of Zhejiang province is from passive to active and from weak to strong because of the entry barriers into overseas markets and the improvement of the demands of product quality in domestic market. It's concluded that the amount of national standards positively correlates with Zhejiang's exports.

The industry standard is indispensable scientific guidance and effective means because it

effectively fills the gap of national standard in a particular industry. By the end of 2013, Zhejiang enterprises and other organizations have accumulated participating in drafting or amending 2853 items of industry standards. The top ten industries ranking by the number of possessed standards in Zhejiang province are respectively as follow: JB, machinery, 26%; QB, light industry, 23%; HG, chemical industry, 12%; FZ, textile industry, 11%; SN, commodity inspection, 10%; YY, medicine industry 4%; JT, traffic, 4%; GA: public safety, 4%; SB, business, 3% and NY, agriculture, 3%. Considering the above industries from the aspect of standard stock, they are the top ten standard advantage industries, and in fact they cover machinery, textile, chemical fiber, clothing, low-voltage electrical appliances, bearing gear, stationary that are all important and advantaged industries of Zhejiang province.

Figure 3 Industrial Standard Distribution of Zhejiang Province

Data source: Standard information service network in Zhejiang province, Zhejiang province standard information and quality safety of the public science and technology innovation service platform, arranged by author.

Figure 4 Exported Product Categories of Zhejiang Province

Data source: 2004-2014 Zhejiang Statistical Yearbook, summarized by author.

Figure 3 and Figure 4 shows, in Zhejiang, the industries with higher standardization level are of larger export scale, so that standardization level of one industry can improve its export scale. Mechanical and electrical products, textile and clothing industry, agricultural and sideline products are the ones of the largest exports in Zhejiang, specifically, the annual exports account for more than 80% of Zhejiang province exports. These industries accounted for 72.97% in the national and provincial standardization technical committee of Zhejiang province. The establish of standardization committee at all levels, working group or secretariat shows that this region has great advantages and influence in the field of one industry in the provincial or nationwide. Organizations' leadership should be fully brought

into play, so as to improve the level of technology and standardization in Zhejiang export trade by applying standards in exports. Besides, the standard proportion of industries, such as machinery, light industry, chemical industry, textile, agriculture, has reached 81.04%. These industries almost cover Zhejiang's advantage industries, that means, Zhejiang's traditional advantageous industries are also the ones of standard advantages, and the ones occupied the most part of exports in Zhejiang province.

3 Empirical Test

This paper setup principal component regression model to examine the relationship between standardization level and export trade in Zhejiang Province. We select standardization-measuring indicators and provincial macro-economic data as independent variables, Provincial exportation figures as dependent variable, the result suggests that all the standardization-measuring indicators have positive effect on Zhejiang's export trade, and the index weight for each indicator is given according to the empirical test.

3.1 Variables selection

The amount of export is the direct embodiment of the level of foreign trade and international competition ability in a country or a region. Exports data from 1991 to 2014 in Zhejiang Province were selected as a description of Zhejiang's export trade development level.

STANDARDIZATION LAW OF THE PEOPLE'S REPUBLIC OF CHINA defines China's standard system as four hierarchy: national standards, industry standards, local standards and enterprise standards. Through literature review, the former measuring the relationship between standardization and foreign trade always used the stock of national standards the country or region participated in drafting or amending to measure the level of standardization. This empirical method is one-sided. We should take industry standards, local standards and enterprise standards the region participated in drafting or amending into account as well. However, enterprise standard is amended by themselves and the implementing scope is also the enterprises themselves. The function of these enterprise standards is limited for the whole industry. Besides, considering that there is a large amount of private enterprises in Zhejiang Province, the content of enterprise standards appear unavoidably repetition even conflicts in the amending or revising process. And declaration of implementing and abolishing a enterprise standard is in charged by the technical supervision department of county level, maybe has different statistical caliber and insufficient data. So we won't add the enterprise standard stock to the econometric model as an independent variable in this paper. In general, we use the stock of national, industry, local standard drafted or amended by Zhejiang province as the main descriptions of standardization development indicators.

In addition to the standard stock, the enhancement of regional scientific and technological innovation plays a significant role in promoting export performance and the grade of export products. We select the stock of patents have been granted every year, annual research funding to measure the level of technological innovation in Zhejiang Province. Patents stock is an important indicator to show the degree of activity of regional technology; annual research funding is an important driving force for technological development, adequate research funding support helps carry out research and standardization work more efficiently.

Imports and exports of an area would be affected by many factors, so we add some auxiliary variables in order to interpret export trade development more objectively. Foreign direct investment (FDI) is a potential factor in the promotion of exports, FDI can adapt to the international market demand, improve product quality and expand product export, while foreign-funded enterprises uses low-cost host artificial as well as incentives, combined with their high technology, improve product market competition force, and thus boost exports. Gross Domestic Product (GDP) is a description of economic growth indicator, when the increase of the gross national product of a given area significantly more than people's consumption demand, there will be a large number of products and services selecting export, therefore the growth of GDP can promote the expansion of exports, while economic growth can lead to improvement of the economic structure, to bring more economic benefits for the industry. Average exchange rate (EXR) is a tool to measure the purchasing power in the international of country's currency, the exchange rate decline indicates the currency appreciation, exports have been hampered, the exchange rate raise will stimulate exports. Consumer price index (CPI) is a measurement of inflation in a region, CPI rise, eroding purchasing power, reducing household demand for consumer goods, manufacturers would increase foreign exports.

In summary, we select six indicators, including national standard, industry standard, local standard,

patents, stock of technical committees in Zhejiang, the input of standardization of research funding, and four economic comprehensive indicators, including foreign direct investment, gross domestic product, the average exchange rate and consumer price index, to establish a multiple variables regression model with above indicators data and Zhejiang export trade data, try to give a demonstration support of the relationship between the level of standardization and export trade in Zhejiang province.

3.2 Model building

Principal component analysis (PCA) was first proposed by statisticians Karl Pearson in 1901. It is a statistical procedure that uses an orthogonal transformation to convert a set of observations of possibly correlated variables into a set of values of linearly uncorrelated variables called principal components. The number of principal components is less than or equal to the number of original variables.

This paper established a multivariate liner regress model based on Zhejiang’s data of export as the dependent variable and all scales of standard stock, patents, research input, macro-economic parameters as independent variables. The original multivariate regression model is as follows:

$$EX_t = C_t + a_1GB_t + a_2HB_t + a_3DB_t + a_4ZL_t + a_5JF_t + a_6TC_t + a_7FDI_t + a_8CPI_t + a_9GDP_t + a_{10}EXR_t + \mu_t \quad (1)$$

EX_t refers to exports of Zhejiang province in t year, C_t is intercept, a_i is the coefficient of corresponding variable, μ_t is error term. GB_t is national standard stock, HB_t is industry standard stock and DB_t is local standard stock of Zhejiang Province in t year. ZL_t is patent stock of Zhejiang in t year. JF_t refers to the research funding used for standard research in t years. TC_t is the quantity of technical committees at all levels in Zhejiang province. FDI_t is foreign direct investment of Zhejiang province in t year. CPI_t is the consumer price index in t year. EXR_t is average rates in t year. GDP_t is the gross national product (GNP) of Zhejiang province in t year.

3.3 Empirical analysis

First of all, it is necessary to standardize the original data. Then we use SPSS21.0 software for principal component analysis. Table 1 shows that the characteristic value of first principal component was 7.09 with the 70.904% total variance explained contribution. The characteristic value of second principal components was 1.412 with an explained contribution of 14.117%. The contribution rate of the first two principal components already reached 85.021%, so we choose the first and second principal component to establish the model.

According to Table 2, we see that the first principal component gets greater loading on variables such as GB, HB, DB, ZL, JF, FDI and GDP, it represents the levels of standardization and economic. The second principal component contains the levels of consumption and exchange rate.

We can get the following equations of two principal components from the corresponding rotated factor loading matrix and coefficient matrix of composition score:

$$F1_t = 0.186 * ZGB_t + 0.162 * ZHB_t + 0.017 * ZDB_t + 0.181 * ZZL_t + 0.16 * ZJF_t + 0.033 * ZTC_t + 0.104 * ZFDI_t + 0.062 * ZCPI_t + 0.138 * ZGDP_t - 0.178 * ZEXR_t \quad (2)$$

$$F2_t = -0.166 * ZGB_t - 0.077 * ZHB_t + 0.332 * ZDB_t - 0.151 * ZZL_t - 0.051 * ZJF_t + 0.332 * ZTC_t + 0.132 * ZFDI_t - 0.357 * ZCPI_t + 0.029 * ZGDP_t + 0.488 * ZEXR_t \quad (3)$$

Adding ZEX(Standardized Value of Exports) with F1 and F2 to use the multiple linear regression analysis, then we can obtain the regression equation of the principal component as follow:

$$ZEX = 0.00000064 + 0.97 * F1 + 0.217 * F2 \quad (4)$$

T value	42.191	9.435
---------	--------	-------

Here F value is 934.541, the adjusted coefficient of determination is 0.988, which directs that the model’s goodness of fit is very well. After looking up the particular table, we know the upper limit of D-W is 1.546 while N equals 24 and K equals 2. Our D-W value is 1.891 less than the upper limit, that means there is no autocorrelation in random error terms of this regression equation. Thus, two principal components can significantly explain the changes in exports of Zhejiang Province.

We can obtain the weight coefficient of each variable in the standardized multiple regression equation. Intercept has been ignored, as it is always zero in the regression equation of the principal component. We can obtain the standardized multiple regression equation as follows:

$$ZEX = 0.144 * ZGB + 0.140 * ZHB + 0.089 * ZDB + 0.143 * ZZL + 0.144 * ZJF + 0.104 * ZTC + 0.130 * ZFDI - 0.017 * ZCPI + 0.140 * ZGDP - 0.067 * ZEXR \quad (5)$$

Zscore(DB)	.017	.332
Zscore(ZL)	.181	-.151
Zscore(JF)	.160	-.051
Zscore(TC)	.033	.332
Zscore(FDI)	.104	.132
Zscore(CPI)	.062	-.357
Zscore(GDP)	.138	.029
Zscore(EXR)	-.178	.488

According to the above equation, we know the degree explanations of each explanatory variables for the dependent variable. GB, HB, DB, ZL, JF, TC, FDI, GDP these seven quotas forward promote the exports of Zhejiang Province while the increase of EXR and CPI inhibit the exports of Zhejiang Province.

Considering the contribution rate of each standardization indicator, the rank of them is GB > JF > ZL > HB. GB, HB, DB are standardization index at three levels we select in this paper. Every 1% of growth would relatively bring 0.144%, 0.14% and 0.089% positive output on Zhejiang exports. Among them, national and industry standards play more important role than the local one, for the latter's limitation effective range of position, implementation and impact within the very area. The impact coefficient of ZL, JF and TC is 0.143, 0.144 and 0.104. If considering the above six indicators as the level of standardization, that means standardization level increases 1%, exports will increase 0.764 %. Therefore, standardization level has a significant influence on exports. Moreover, FDI and GDP raising 1% will bring 0.13% and 0.14% increase for exports. It shows that these two indicators have a positive correlation with exports.

CPI and EXR have a negative impact on exports. Inflation of prices rise the company costs, so that the product will lose price advantage. It is a little unexpected that exchange rate brings some negative impact to the export of Zhejiang Province. One of explanations is: in Zhejiang Province, the main competition advantage of export product is prices, the prices which is substantially lower

than the price of the same class local product in the importing countries cause that the importing countries adopt anti-dumping investigation or other trade protection measures to restrict import; price advantage of export product will be more obvious while exchange rate rises and RMB depreciates; thus the rise of exchange rate will enhance the risk that importing countries may adopt anti-dumping investigation to the export product of Zhejiang Province; consequently, the rise of exchange rate may cause slight decline of the export of Zhejiang Province.

4 Conclusions

In this paper, we measure the standardization level of Zhejiang province with the factors such as national standards and industry standards. We consider the standardized level as explanatory variables, and introduce other indicators which affecting the export trade of Zhejiang province. Finally we build a regression model by the method of principal component analysis. According to the results of empirical test, we get a clear conclusion that standardization level of Zhejiang province plays a positive role in promoting export trade. Different standards have different effects on promoting export trade. The strongest is national standards, next in order are industrial standards, and local standards are the weakest. At the same time, the stock of patents, the number of standard committees at all levels and input funding of scientific research also have positive effects on export trade in Zhejiang province.

Test results show that the increase of standards stock can promote the expansion of export trade, structure optimization and the rise of interest. Zhejiang province need to encourage enterprises to carry out independent research and development vigorously in the field of standard and improve the technological level of the standards at all levels. Standard committees at all levels must play active roles in building linkage mechanism of technology development, standards establishment and standards promotion on the base of existing levels of technology development and production capacity. And committees need to actively guide non-enterprise organizations and enterprises to carry on technological innovation and to participate in the draft and revision of international and domestic standards so as to short the cycle of standard revision, actively follow the trends of international advanced technology and international standards.

Standard of the international competition is related to the interest distribution of the export trade, and it is the necessary means of getting the trade initiative. Export enterprises should promote independent intellectual property rights in standards and strengthen international competitiveness of standards. Participate in the activities of the international standard actively and strive for voice of the international standard are the way for enterprises in Zhejiang province to improve trade position, transform our passivity into initiative, strive for more trade profits. Compared to the flourishing development of domestic standard system revision activity in recent years, the case of enterprises in Zhejiang province involving in the revision of international standard system is not much. In addition to the agriculture and acoustic, there are not international technology subcommittees of machinery, light industry, chemical industry, textile and other traditional advantage industries settling down. That shows the advantage industries in Zhejiang province has not formed the real international influence, industry standards have no initiative in the international market. Therefore, enterprises should be guided by innovation to improve their research and development capabilities and independent intellectual property. Then enterprises try them best to involve in the drafting and revision of international standards, launch international advanced level of products and train specialists in the field of standardization to grasp standards initiative and effectively improve the terms of the export trade.

Research on the Performance Evaluation of Logistics Service in Private Express Industry Based on AHP

Liu Yuanyuan, Qin Yuanjian

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: snailwhut@126.com, qyjhb@163.com)

Abstract: With the rapid development of economic, China's private express industry is using its own advantages to achieve remarkable results. However, in the course of development, the industry highlights a lot of problems, and these issues affect the development and expansion of China's private express industry. Based on this background, this paper analyzes the performance evaluation system of logistics service for private express industry, presents the principles about building the index, and constructs new performance evaluation index system.

Key words: Private express industry; AHP; Logistics service performance; Performance evaluation

1 Introduction

In recent years, as the fast development of China's economy, consumption has been growing. In 2013, total sales of consumer goods in China rose close to 13.1 % compared with 2012 according to the nation bureau of statistics. In addition, with the continuous development of Internet technology and mobile terminal technology, the scale of online shopping population is also increasing. IResearch data show that China's online shopping transactions in 2013 reached 1.85 trillion yuan, up 42.0%. That such a large-scale online shopping population greatly boosted the development of the offline of private express delivery companies.

At present, China's private express delivery industry has entered a rapid development period. According to the data of National Post Web site, China's express delivery business volume reached 9.2 billion, an increase of 60.0%, and the courier business income reached 1,430 yuan, an increase of 36.0%. China's private express delivery industry is growing rapidly. However, China's private express delivery industry, which has been attacked by express delivery giants internally and externally, has long relied on the price war in the low-end market access to a place of survival, which is not conducive to improving the level of business and brand image. The most effective way to break through the tight encirclement is to find a performance evaluation system suitable for private enterprises' characteristics, analyze its existing problem in the various links, and improve logistics performance. This paper establishes the logistics performance evaluation index system of express enterprises through the investigation of several private express delivery enterprises. In order to help private express companies give an accurate evaluation of their own logistics service, and improve China's logistics services of private express, this paper uses Analytic Hierarchy Process to find out the key factors of indexes.

2 Literature Review

At present, there are many articles about service performance research, which mainly focus on the definition of service performance and the research of evaluation model and theory. The Chinese scholars, from multiple perspectives, primarily describe the development situation and its characteristic on domestic express industry.

The Finnish scholar Gronroos (1982) and the American scholar Parasuraman, Zeithaml & Berry (1985) brilliantly described the concept of service performance, and constructed the evaluation system model. What's more, they conducted a thorough study on the concept and structure of service performance. Bienstoeck, Mentzer & Bird(1997) set up the physical distribution performance evaluation system (DPSQ), including a total of 15 indicators which could be divided into three dimension: time reliability, availability and environmental conditions. Later, Mentzer, Flint & Kent (1999) extended the DPSQ, they carried out an in-depth investigation on American large third party logistics enterprises--Defense Logistics Agency and its customer. Then they came to the conclusion that there were 9 factor can influence Logistics Service Quality(LSQ), and put forward the logistics service performance evaluation model(LSQ), which contained dimensions, related to 25 indicators. Moreover, Chinese scholars such as Wang Zhitai, Tian Yu (2004), Liu Mingfei (2006), Zhou Yaoyang (2007) and Zheng Bing (2007) probed into the LSQ to a variable extent.

Directing at domestic characteristics, Chinese scholars have set up a different performance

evaluation system on local logistics service performance, which use various methods and techniques. But, the research on the performance of logistics service performance of private express industry in China is still insufficient. Comprehensive application of various evaluation methods and learn from each other in the private express industry logistics service performance evaluation also does not see more.

3 The Logistics Performance Evaluation Index System of Express Enterprises

3.1 Principles of establishing the logistics service performance evaluation system

All the evaluation index system should be designed in following some basic principles. According to the characteristics of customer service and the current situation of the development of evaluation system for the private courier enterprises in China, the performance evaluation system should be established in following five principles.

1) Specific and realizable principle

The various index involved in evaluation index system should base on the actual situation of the private courier enterprises and get from the actual situation of logistics operation. Meanwhile, the index must have certain operability and can be more easily to judge.

2) Objective and measurable principle

It should combine of quantitative and qualitative, and design some scientific and reasonable evaluation index.

3) Multi-channel and all-round evaluation principle

It should collect as much information as possible and execute a multi-channel and comprehensive evaluation. Meanwhile, it needs to use combination of the superior assessment, peer assessment, subordinate assessment, staff assessment and so on.

4) Hierarchical principle

In order to in-depth analysis, the evaluation levels of the evaluation index system should be separated in accordance with the importance degree of the private courier enterprise logistics process. Meanwhile, the selection of index in every level should be focused, and the key performance index should be focused on analysis.

5) Dynamic long-term principle

To establish the index system should not be restricted to the current situation of the private courier enterprise. The index system should change with the change of economy, market and private courier enterprise management. In addition, the different patterns courier enterprises that have different logistics operations should have the different index system of logistics service performance.

3.2 The index system of logistics service performance evaluation

As the principle of performance evaluation index system and standard is clear, the index system can be designed now. Based on strategic target of express enterprise customer service, combined with strategic management theory, system management theory and stakeholder theory, through analyzing the influence factors of customer service and other related factors, this paper gets a four-dimensional structure of evaluation system which including logistics operation service dimension, logistics marketing service dimension, logistics quality service dimension and logistics support service dimension.

3.2.1 Logistics operation service dimension

Logistics operation service system is function performance form of the logistics service. As the types of express companies may be different and the owner of express companies engaged in different industries or nature, the operational service system may be different. But typical logistics operation service systems have similarities which are composed of three links: transport activity, warehousing activity and distribution activity.

1) Transport activity index system

It is the process that express enterprise transports owner's products from the production base to express enterprise distribution center in the regional market. The main performance indicators include: goods timely delivery rate, transportation loss and accident frequency.

2) Warehousing activity index system

In order to make the owner prepare product smoothly and transferred to the customer expediently. The express enterprise takes four stages of activities which including receiving, storage, loading and picking to deal with the most products in the distribution center. The main performance indicators include: import and export timely delivery rate, inventory accuracy.

3) Distribution activity index system

After the owner and its customers realize the commodity exchange, the activities which deliver products from distribution center to customers is defined as distribution activity, in short-distance transport within the enterprise market in a given area. The main performance indicators include: distribution accuracy, cargo damage rate.

3.2.2 Logistics marketing service dimension

Logistics marketing management system can make a satisfactory effect to customer and drive bidirectional regulation of the sales and service. Marketing management has a direct impact and effect on logistics operation service system, logistics quality service system and customer satisfaction. Marketing activities are started in the research and analysis of the market, aim at achieving the purpose of corporate earnings through meeting customer demand better than competitors. Private express enterprise is no exception. As a result, logistics marketing service index system can be mainly evaluate from two aspects that the market competitiveness and profitability which formed by carrying out the logistics marketing.

1) Market competitiveness index system

This index system mainly reflects the capacity that enterprise provides logistics service products to meet customer requirements better than competitors, its indicators mainly reflects in: ratio of new customers, customer repurchase rate and market share.

2) Profitability index system

It refers to profitability of logistics service product and customer profitability of its service which are provided by the third party logistics enterprise. The main indicators mainly reflect in: main service product profitability, main customer profitability.

3.2.3 Logistics quality service dimension

Logistics quality service system is the main aspects of customer service satisfaction evaluation which is composed of customer expectations and perception of service quality. And in order to make the customer satisfied, maintain its loyalty and keep its buying behavior, enterprise need to make the customer to perceive logistics service quality and realize that the logistics service product can create value for it. So the quality of logistics service system has an important influence on customer satisfaction. Logistics service quality is the comparison results between customers expected and perception of the services, and the decisive factors of it are reliability and reactivity.

1) Reliability index system

Reliability refers to the enterprise completes correctly promised service which reflects reliable and real performance. The index system is mainly reflected in: order processing accuracy, settlement accuracy and delivered goods in good condition rate.

2) Reactivity index system

Reactivity is refers to the enterprises ready to provide customers with quick, efficient service at any moment which reflects the degree of promptness and helpfulness and includes service punctuality. The index system is mainly reflected in: handle customer complaints timely, urgent order completion rate.

3.2.4 Logistics technology support service dimension

Logistics technology support for the logistics service system function mainly displays in improving the business activities operation mode and operation processes. The aim of it is to improve the operation efficiency and the effect of various business functions. In marketing activities, in order to achieve the innovation of the marketing activity, the application of "soft technology", especially the use of information technology can make the marketing activity cognizes the needs of customers more precisely and responds to the needs of customers more quickly and effectively, which can provide the most suitable logistics service products and more value to the customer's demand. The support function for the quality of logistics service system mainly displays in "hard technology". And through customer's perception of physical equipment, the logistics service quality can increase.

There are three conclusive logistics technology support service indexes: network scale, hardware facilities and after-sales service. The network scale which is the nature of express service determines an express company must have a site network of wide regional coverage, tightly managed which is the foundation of the express company to provide express service. Hardware facilities mainly refers to the transportation, selection, delivery tools and the number and level of warehousing facilities. After-sales service refers to the response to express enterprise dealing with customer complaints, compensation, dissolving crisis ability, etc.

In conclusion, the indicators which affect the performance of private express enterprise logistics service can be concluded (Table 1).

Table 1 Private Express Enterprise Logistics Service Performance Evaluation Index System

	First level index U_i	Secondary level index U_{ij}
Private express enterprise logistics service performance evaluation index system	Logistics operation service U_1	goods timely delivery rate U_{11}
		transportation loss and accident frequency U_{12}
		import and export timely delivery rate U_{13}
		inventory accuracy U_{14}
		distribution accuracy U_{15}
		cargo damage rate U_{16}
	Logistics marketing service U_2	ratio of new customers U_{21}
		customer repurchase rate U_{22}
		market share U_{23}
		main service product profitability U_{24}
		main customer profitability U_{25}
	Logistics quality service U_3	order processing accuracy U_{31}
		settlement accuracy U_{32}
		delivered goods in good condition rate U_{33}
		handle customer complaints timely U_{34}
		urgent order completion rate U_{35}
	Logistics technology support service U_4	network scale U_{41}
		hardware facilities U_{42}
		after-sales service U_{43}

4 Evaluation of Private Express Enterprise Logistics Performance by AHP

Logistics service performance evaluation of private express enterprise must follow certain principles, use scientific methods of analysis, and put forward the effective solution of future development through the analysis of the specific content for the private express enterprise logistics service performance. Analytic Hierarchy Process is such a method system, by which the goal of enhancing logistics service performance is decomposed into several elements. Based on this, form a hierarchy model of factors according to the relationship, come to the importance weight of each factor relative to the overall goal, find out the key factors and improve logistics service performance.

4.1 Determine the importance weight of first level index relative to the target layer

Through questionnaire survey and interviews with relevant experts, combined with related literature, take the pairwise comparison method, and score (1-9 point) for the importance weight of first level index relative to the target layer. Thus, the judgment matrix of the importance of first level index relative to the target layer is as follows:

$$A = \begin{pmatrix} 1 & 1/2 & 1/4 & 2 \\ 2 & 1 & 1/2 & 4 \\ 4 & 2 & 1 & 6 \\ 1/2 & 4 & 1/6 & 1 \end{pmatrix}$$

The feature vector $WA = (0.275 \ 0.513 \ 0.074)^T$

$\lambda_{max} = 4.01$, $CI = 0.003$, $RI = 0.9$, $CR = CI/RI = 0.004 < 0.10$, conformance test.

4.2 Determine the importance weight of secondary level index relative to first level index

1) Logistics operation service system

$$U_1 = \begin{pmatrix} 1 & 2 & 3 & 4 & 1/2 & 1/4 \\ 1/2 & 1 & 2 & 3 & 1/4 & 1/6 \\ 1/3 & 1/2 & 1 & 2 & 1/5 & 1/7 \\ 1/4 & 1/3 & 1/2 & 1 & 1/6 & 1/8 \\ 2 & 4 & 5 & 6 & 1 & 1/2 \\ 4 & 6 & 7 & 8 & 2 & 1 \end{pmatrix}$$

The feature vector $WU_1=(0.139 \ 0.082 \ 0.053 \ 0.036 \ 0.257 \ 0.432)^T$.

$\lambda \max=6.114$, $CI=0.023$, $RI=1.24$, $CR=CI/RI=0.018<0.10$, conformance test.

2) Logistics marketing service system

$$U_2 = \begin{pmatrix} 1 & 1/2 & 1/5 & 2 & 3 \\ 2 & 1 & 1/3 & 4 & 6 \\ 5 & 3 & 1 & 6 & 8 \\ 1/2 & 1/4 & 1/6 & 1 & 2 \\ 1/3 & 1/6 & 1/8 & 1/2 & 1 \end{pmatrix}$$

The feature vector $WU_2=(0.241 \ 0.516 \ 0.073 \ 0.045)^T$.

$\lambda \max=5.087$, $CI=0.022$, $RI=1.12$, $CR=CI/RI=0.019<0.10$, conformance test.

3) Logistics quality service

$$U_3 = \begin{pmatrix} 1 & 4 & 1/4 & 1/3 & 2 \\ 1/4 & 1 & 1/6 & 1/4 & 1/2 \\ 4 & 6 & 1 & 2 & 6 \\ 3 & 4 & 1/2 & 1 & 4 \\ 1/2 & 2 & 1/6 & 1/4 & 1 \end{pmatrix}$$

The feature vector $WU_3=(0.051 \ 0.457 \ 0.278 \ 0.078)^T$.

$\lambda \max=5.150$, $CI=0.037$, $RI=1.12$, $CR=CI/RI=0.033<0.10$, conformance test.

4) Logistics technology support services

$$U_4 = \begin{pmatrix} 1 & 3 & 1/4 \\ 1/3 & 1 & 1/7 \\ 4 & 7 & 1 \end{pmatrix}$$

The feature vector $WU_4=(0.211 \ 0.084 \ 0.705)^T$.

$\lambda \max=3.032$, $CI=0.016$, $RI=0.58$, $CR=CI/RI=0.028<0.10$, conformance test.

From the above calculation, the results are as follows:

The weight of goods timely delivery rate $U_{11}=0.138*0.139=0.0192$;

The weight of transportation loss and accident frequency $U_{12}=0.138*0.082=0.0113$;

The weight of import and export timely delivery rate $U_{13}=0.138*0.053=0.0073$;

The weight of inventory accuracy $U_{14}=0.138*0.036=0.0049$;

The weight of distribution accuracy $U_{15}=0.138*0.257=0.0355$;

The weight of cargo damage rate $U_{16}=0.138*0.432=0.0596$;

The weight of ratio of new customers $U_{21}=0.275*0.125=0.0344$;

The weight of customer purchase rate $U_{22}=0.275*0.241=0.0663$;

The weight of market share $U_{23}=0.275*0.516=0.1419$;

The weight of main service products profitability $U_{24}=0.275*0.073=0.0201$;

The weight of main customer profitability $U_{25}=0.275*0.045=0.0124$;

The weight of order processing accuracy $U_{31}=0.513*0.136=0.0698$;

The weight of settlement accuracy $U_{32}=0.513*0.051=0.0262$;

The weight of delivered goods in good condition rate $U_{33}=0.513*0.457=0.2344$;

The weight of handle customer complaint timely $U_{34}=0.513*0.278=0.1426$;

The weight of urgent order completion rate $U_{35}=0.513*0.078=0.0400$;

The weight of network scale $U_{41}=0.074*0.211=0.0156$;

The weight of hardware facilities $U_{42}=0.074*0.084=0.0062$;

The weight of after-sales service $U_{43}=0.074*0.705=0.0522$.

Sorting of secondary level indexes' weight in the logistics service performance can be seen in Table 2 by comparison.

Table 2 Evaluation Index Sort of Weight in Private Express Enterprise Logistics Performance

index	U ₃₃	U ₃₄	U ₂₃	U ₃₁	U ₂₂	U ₁₆	U ₄₃	U ₃₅	U ₁₅	U ₂₁
weight	0.2344	0.1426	0.1419	0.0698	0.0663	0.0596	0.0522	0.0400	0.0355	0.0344
sort	1	2	3	4	5	6	7	8	9	10

5 Conclusion

From the analysis above, these indexes like the delivered goods in good condition rate, handle customer complaints timely, market share, order processing accuracy and customer repurchase rate etc. occupy the greater weight. Therefore, private express industry should mainly focus on these aspects to improve their own conditions and service levels, so as to occupy a greater market share in the express market.

This paper provides an overview of logistics performance in private express industry, presents the principles about building the index, and constructs new performance evaluation index system. Although as objective, rigorous, and credible as possible in the process of the study, there are still limitations and consequent deviation inevitably, such as subjectivity of expert scoring. Subsequent studies can further follow up to address these issues.

Research on Industrial Technology Innovation Strategic Alliance Life Cycle

Wu Jingming, Li Chilin

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: anboyin147@163.com, lichl@189.cn)

Abstract: Industrial technology innovation strategic alliance has great advantages and positive impact on different aspects of the enterprise thus has been the focus of business and management academic circles both at home and abroad. This research utilizes the method of modeling, proposes the transplantation of life cycle theory model to industrial technology innovation strategic alliance. The perspective of this research is that the life cycle of industrial technology innovation strategic alliance is similar but also different with the enterprise life cycle. Based on this, this paper builds a life cycle model of industrial technology innovation strategic alliance. The conclusion that the alliance will reflect different evolution characteristics, when the industrial technology innovation strategic alliance is in different evolution period is given in the end.

Key words: Industrial technology innovation; Strategic alliance; Life cycle; Evolution; Model

1 Introduction

Strategic alliance is defined as two or more than two independent economic entity, for the common strategic target, form a benefit-sharing and risk-sharing loose network organization through a variety of contract arrangement, equity arrangement or the tacit understanding between each other (Luiz & Rodrigo, 2009). Strategic alliance is a product of the new technology and the new competition which means wide range of applications of computer and network technology and cooperation in the competition of companies. Industrial technology innovation strategic alliance is a technology innovation cooperation organization which based on the enterprises development needs and the common interests of the parties, aiming at improving industry's capacity for independent innovation, choosing a legally binding contract as the security, and composed by the enterprise, university, research institutions or other organizations jointly (Liu Zhiying & Wang Dandan, 2013). Strategic alliance has great advantages and positive impact on different aspects of the enterprise, such as to accelerate new product development, reduce product costs, promote enterprise mutual learning and be convenient into other markets, etc. Therefore it has been the focus of business and management academic circles both at home and abroad. However, it is also extremely unstable, for example, when considering about alliance liquidation, mergers of members and alliance reorganization, the instability ratio of strategic alliance is as high as 30% ~ 50%. And it also can be reflected by the phenomenon of high failure rate and short life cycle of strategic alliances, even the increase of its number is fast. As a result, the research on strategic alliance instability and its life cycle become an important task to managers.

2 The Theory of Enterprise Life Cycle

The enterprise life cycle is a theory combination of evolution, which refers to the analogy of enterprise organization and living organisms and the organization is seen as a living organism. The theory is that enterprise is similar with any living organisms, experiencing from the birth, growth, maturity, recession and other process in its ecological environment (Stephen, 1997). And each stage, enterprise will compete for acquiring and outputting resources in the outside ecological environment, complete their metabolism and change its organic structure to realize the organization growth. In other words, the enterprise life cycle theory points out that enterprise development is a process of several stages, and study the characteristics and problems of each stage in the process.

2.1 The traditional enterprise life cycle theory

There is a representative enterprise life cycle model was proposed in 1995, which considering the enterprise scale impact in enterprises life cycle (Figure 1). The enterprise life cycle model chooses the scale of enterprise as the ordinate, which divides the scale of enterprise into two cases which includes large and medium-size enterprises (MLEs) and small enterprise (Small). Besides, development stage is chosen as the abscissa, which divides the enterprise life cycle into Courtship period, Seeking-survival period, Development period, Maturity period, Recession period and transformation period (Chen Jiagui, 1995). The model describes the business mode of three kinds of growth: low-development type, the

normal development and advancing development. Low-development type refers to the enterprise was small when it sets, after years of growth and development, has not become large and medium-sized enterprises. The normal development type refers to the small business over a period of time growth, the quality is improving and the strength is increasing, then grow to a large and medium-sized enterprises. Advancing development refers to the enterprise is born in large and medium-sized enterprises which has high starting point and strong strength. This kind of situation is related with socialization and diversification of stocks right in large companies which are modern and social, as well as the springing of institutional investors and legal investors. The above three growth ways can generalize the actual situation which have strong ability of explanation.

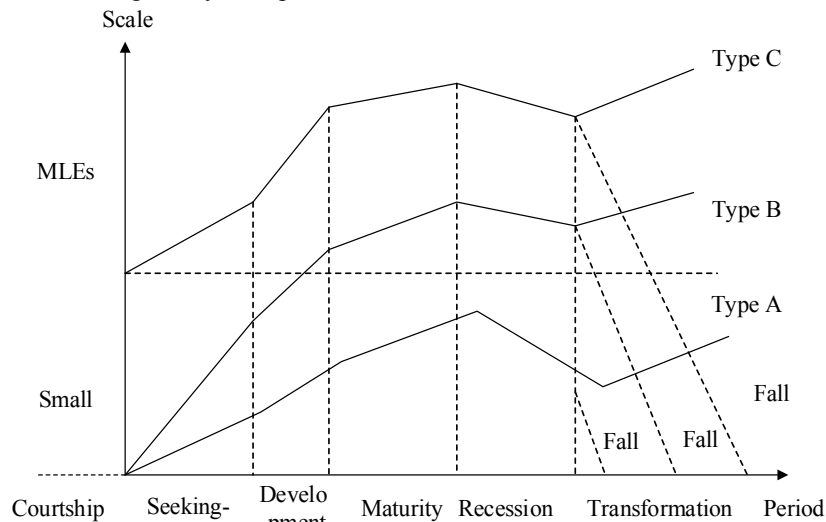

Figure 1 The Model of Enterprise Life Cycle

Many scholars have done a lot of study on enterprise life cycle, while many enterprises life cycle model appeared. These models have different stages, the descriptors of each stage is also different, thus there is no a phase model of authority can be widely accepted.

2.2 The transplantation to industrial technology innovation strategic alliance

Everything has its own life cycle. In essence, the enterprise life cycle theory is the successful transplantation from biology theory and research methods to economics. It is also a kind of economic research method innovation. Then industrial technology innovation strategic alliance as a kind of loose network organization, which means organized-markets and market-oriented organization, also has its own life cycle. Industrial technology innovation strategic alliance is a technology innovation system which made up of many technological innovation (Juan-Pablo, 2002). The features of industrial technology innovation system are entirety, relevance, objectivity and environment adaptability. Every technology innovation in the alliance does not have its own effect, its occurrence and development and its impact on entirety depend on the occurrence and development of other technology innovation, industrial technology innovation strategic alliance is integral (Clive Savory & Joyce, 2015).

The life cycle of industrial technology innovation strategic alliance is different with the enterprise life cycle. The enterprise life cycle is very obvious, which is the whole process of an enterprise which includes generation, development and destruction. And the life cycle of strategic alliance depends on enterprises' quantity, quality and strategy as well as the whole process of entire alliance which includes generation, development, maturity and destruction. Compare with a single enterprise life cycle, the life cycle of industrial strategic alliance is longer, but definitely not a simply accumulation of single life cycle. But the life cycle of industrial technology innovation strategic alliance is a process of enterprise belong to the alliance, which includes formation, development and end, based on technology innovation chain.

3 A Life Cycle Model of Industrial Technology Innovation Strategic Alliance

Figure 2 A life Cycle Model of Industrial Technology Innovation Strategic Alliance

Similar with the process of any organization from produce to destruction, industrial technology innovation strategic alliance also follows evolution law of life cycle. A life cycle of industrial technology innovation strategic alliance is shown in figure 2. From the point of the standard life cycle theory, industrial technology innovation strategic alliance will go through several stages, which include formation, development, maturity and recession. However, when risk can be effectively evade and seizing new development opportunity, or able to continuously innovate, the alliance will go into the next round before recession stage or in the process of recession, so that develops and successes to achieve regrowth.

4 The Characteristics in Different Evolution Period

When the industrial technology innovation strategic alliance is in different evolution period, the alliance will reflect different evolution characteristics which can be shown in Table 1.

Table 1 Different Evolution Characteristics in Different Evolution Period

Evolution period Characteristic	Formation	Development	Maturity	Recession	Regrowth
Alliance scale	Little number of members, few leading industrial enterprises	Enterprises, universities, institutions enter, alliance expands rapidly	Large number of members, structure stable, efficient operation industrial chain	Parts of members quit alliance, the numbers decline, alliance disorganizing	Alliance recombines, screen and absorb new members, or maintain existing scale
Competition and cooperation in members	Loose cooperation	Loose cooperation to close cooperation	Close cooperation to moderate competition	Loose cooperation, unhealthy competition, or relieve cooperation relationship	Close cooperation
Innovation activity and innovation level	Focus on little members innovation, low collaborative innovation level	Focus on alliance collaborative innovation, innovation level heighten	Emphasize the whole industry innovation, Industrial innovation advantage forms, higher innovation level	Collaborative innovation effect declines, insufficient innovation motive power	New collaborative innovation effect forms, technology breakthrough realizes

In the growth phase of the industrial technology strategic alliance, alliance members have close cooperation and develop technical innovation activities. The main problems in this stage are lack of sustained investment resources in the alliance innovation activities, especially money, cooperative disputes and changes of alliance members, low alliance innovation efficiency, alliance innovation achievement transformation difficulty and so on. When the technology of industrial technology alliance is mature, a large number of innovation achievement is produced, industrialization degree is higher, and structure and operation is relatively stable, the alliance enters the mature stage. The major problems may exist in the mature stage are that some of the successful experience of the pilot alliance failed to spread widely or failed to play its role in the demonstration and radiation of the entire industry, at the same time, there are some obstacles in the commercialization of the alliance innovation. When the alliance members emerge the phenomenon such as division and lack of trust, technology and products aging, market shrinkage, alliance profits decline, it has tended to decline and ability of sustainable development is insufficient. And the future direction of the alliance is not clear, if it can seek new breakthrough or alliance successful transformation, the alliance will enter regrowth stage.

5 Conclusion

Industrial technology innovation strategic alliance is the main organizational form in the future. It not only guides the industry technology innovation, but also has become an important competition science and technology means between countries and region which plays an important role in the led industrial innovation. The research on the alliance life cycle has important meaning for the study of industrial technology innovation strategic alliance which can promote the competitiveness of industry too. A life cycle model of industrial technology innovation strategic alliance which is similar with the traditional model but still has differences is given in this research, and illustrate characteristics in different evolution period. But as the enterprise is different and its environment is changeable, the life cycle may be dynamically changing which still needs more study.

On Development Modes and Policies for the Strategic Emerging Industries in China

Zhu Hanxiong, Xiao Yi, Hou Renyong
Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: zhuhx@whut.edu.cn)

Abstract: Strategic emerging industries are developing fast in China. Development strategies and policies have been set up in key provinces and cities. On the perspective of regional factors and based on the relevant research results, this paper proposes three development modes for strategic emerging industries: feature development, comprehensive development and coordinate development. It further proposes measures for fiscal policy, industrial policy, financial policy and personnel policy in promoting strategic emerging industries.

Key words: Strategic emerging industry; Development mode; Development measure

1 Introduction

Strategic emerging industries grew fast in 2013 when the overall economy was weak. Their growth rate is higher than that of traditional industries, and part of the industry growth rate is about twice of the overall growth of the industrial economy. Many provinces and cities issued strategic emerging industry development strategies and policies, and vigorously promoted the development of strategic emerging industries. They attach great importance to developing strategic emerging industries and aim to seize the future industry heights. They implement the innovation-driven strategy, and focus on the breakthrough and innovation in technology of key industries. They implement special projects, attract talents, provide financial security and foster the market of strategic emerging industries. To further understand and foster strategic emerging industries, the study of their development modes and policies has theoretical and practical significance.

2 Review of the Present Research

2.1 Research of development modes of the strategic emerging industries

On the perspective of the life cycle and technology level, Wang Lizheng (2011) analyzed the relatively suitable development modes of strategic emerging industries at different stages of development and pointed out several issues about selecting the appropriate modes of development.(Wang Lizheng, 2011)Zhong Qingliu considered that the pushing strategy of strategic emerging industries should adhere to the priority of research, and at the same time maintain the innovation-driven rather than investment-driven.(Zhong Qingliu, 2010)

2.2 Research of development policies

Liu Cheng analyzed the characteristics and fundamental roles of industrial policies, and learn from the national industrial policies that promote the development of emerging industries practiced by Japan, the European Union, the United States and South Korea, he put forward that how to play the positive role of industrial policy measures in fostering the development of strategic emerging industries.(Guo Xiaodan and Song Weijia , 2011) From six aspects: industrial and technological policies, market development policies, international cooperation policy, investment and financing policy, tax policy, specific policies, Zhang Yuzhe(2011) sorted and evaluated the policies of strategic emerging industries supported by various ministries in recent years.(Huang Xingting and Yang Yu, 2011) Cheng Yu (2011) treated the wind industry as a specific research object, and researched the policy system and policy path of Denmark, Germany, the United Kingdom, the United States, the Netherlands. These five countries are full of wind energy developing wind energy industry. He put forward that when our country developing wind industry, first of all, it is not only to emphasize the technological innovation, but also need to build strategic industrial system and regulatory regime; secondly, he proposed that we should provide sufficient time and opportunity for learning and growth of new industries; finally we should win political support and social recognition.(Shen Junxi, 2011) Li Shu considered that the emerging industry in China is still in its infancy, and it is facing many problems and development difficulties. The emerging industry urgently needs government's guide and support. We should develop and implement technology policy about strategic emerging industries, vigorously promote the product market cultivation, pay more attention to personnel

training, and promote industrial development and infrastructure construction to improve the external environment. (Liu Cheng, Gu Qiang, Dong Ruiqing, 2011)

3 Development Modes of Strategic Emerging Industries

Judging from different perspectives, China's development modes have different categories listed as follows:

(1) Based on the relationship between strategic emerging industries and traditional industries, there are two modes to foster and develop strategic emerging industries. The first is to support a fully independent strategic emerging industries and the second is to develop strategic emerging industries based on the transformation of traditional industries.

(2) Based on the perspective of industry life cycle, industry life cycle can be divided into four phases: birth, growth, maturity and decline. Depending on strategic emerging industries' different characteristics in technology system, innovative modes, leading design, industrial scale and market environment. The development modes can be divided into four corresponding modes in four stages.

(3) Based on the technical level and viewed from the status of the industrial core technology in the world, the development modes can be divided into two types: one is the mode that technology leads development and the other is the mode that technology follows development.

From a regional perspective, and according to the development situations of seven emerging industries in different regions in China, the paper proposes a development measure in accordance with geographical characteristics which is different from the past strategic emerging industry development pattern. This new measure can be divided into three modes based on the perspective of regional factors: feature development, comprehensive development and coordinated development.

3.1 Feature development

Feature development refers to the selection of major industries preferentially from seven industries rather than emphasizing the balanced development of seven industries, which can ultimately form the feature industry in the region which is based on related material and technical resource and combined with the natural resources of their own.

Currently, west of China is the distinctive model of feature development. With 10 years' implementation of the west development strategy, the western development has made great achievements. In 2012, as the statistics of national strategic emerging industry shows, the proportion of increased value of the west in the new field of energy was 48.87%, which led the country level and the share of the eastern, central and northeast regions were 25.59%, 22.43% and 3.11%. The western region is rich in new energy and renewable energy resources like geothermal and solar energy, wind power, etc. We should combine the development of strategic emerging industries with the build of national energy base and resources deep processing base. We should do the technological construction for the traditional resource and energy industry in the western region. In the western region, we can build coal, hydropower, integrated oil and gas development bases, construct medium-sized geothermal stations, develop solar energy heat utilization project and solar photovoltaic utilization project, construct medium-sized wind power project base and develop rapidly the new energy industry in the western region. Among them, Qinghai province has regarded solar power, wind power industry and other new energy industries as the primary areas of development of new industries. From 2011 to 2015, Qinghai will maintain the growth rate of new energy industry more than 20%. In the year of 2015, the industrial added value of solar energy, wind power and other new energy industry reached above 15% accounted for the promotion of the province's industrial added value. Since the build of the first-stage project in August 8, 2009, millions of kilowatts of wind power base in Jiuquan has gradually been one of the world's largest wind power project so far and it becomes the logo engineering in the area of our country's new energy.

3.2 Comprehensive development

Comprehensive development means that the seven strategic emerging industries are covered at the same time so as to make the effective development by leaps and bounds. relying on science and technology, human resources, and environmental advantages of the region.

In the course of developing strategic emerging industries, the typical area practicing the comprehensive development mode is the coastal area in eastern China. In 2012, in the area of energy-saving and environmental protection industry, new generation of information technology industry, biological industry, high-end equipment manufacturing, new energy industry, new material industry, new energy automotive industry in the country respectively accounted for 62.34%, 73.05%, 50.22%, 61.67%, 28.13%, 40.60% and 31.46%, in all the strategic emerging industries accounted for 65.41% which is more

than half of the country’s total share. The strategic emerging industries in the eastern region are not only large in the developing scale, but also have deeper degree of development than any other regions.

Table 1 The Distribution of Strategic Emerging Industries in Four Regions in 2012 (Unit: %)

Region	Environmental protection industry	New generation of IT industry	Bio-industry	High-end equipment manufacturing	New energy industry	New materials industry	New energy automotive industry	All strategic emerging industries
East	62.34	73.05	50.22	61.67	28.13	40.60	31.46	65.41
Central	19.79	10.52	19.48	14.16	24.14	37.65	63.46	13.80
Northwest	11.17	11.56	22.45	14.83	42.83	17.89	1.30	14.97
Northeast	6.70	4.86	7.84	9.34	4.90	3.86	3.78	5.82

In 2010, Jiangsu, Zhejiang and Guangdong, three eastern provinces, have been fully covered by seven industries. Five eastern provinces like Beijing, Tianjin and Fujian have covered six industries. The total investment of various industries in the eastern provinces is much higher than the Midwest; the related industries’ projects which have a large amount of investment were most concentrated in the east. Meanwhile, some prefecture-level cities in the eastern provinces usually develop the same industry, and degree of concentration of the same industry is higher than that of the Midwest. Take the Guangdong province as an example, in 2013, the industry added value of the strategic emerging industries in Guangdong Province is 317.77 billion Yuan which is up 8.1% over last year accounting for 12.4% in the above-scale industrial share of the province. The output value of industrial sales is 1.26674 trillion Yuan which is an increase of 10.5%. The export delivery value is 464.264 billion Yuan which is an increase of 5.1%. Its profit is 97.869 billion Yuan which is an increase of 17.5%. The province has formed new industries which are included in new display, software, bio-medical, new materials, new generation of communications and LED, etc. The annual output value of these industries is hundreds of billions. Pearl River Delta region has been a place gathering national semiconductor lighting, new display, solar photovoltaic and bio-pharmaceutical industry. Among them, Guangzhou became the information, software, biotechnology, new materials industry base; Shenzhen became a national industrial base of electronic information, biomedicine, e-electric vehicles; Shenzhen, Foshan, Dongguan, Heyuan and other places became the gathering base of the solar photovoltaic industry. In the aspect of core technology, some key technologies in the key areas like electronic information, new energy, high-end equipment manufacturing, and environment have achieved a breakthrough. Only in 2010, the high-end new electronic information, new energy vehicles and LED have achieved more than 1800 patent applications including more than 300 patents and more than 50 breakthrough technologies. Metamaterials, neutrino, genome, stem cells have gotten to the international advanced level.

3.3 Coordinated development

Coordinated development is a mode that is between the feature development and comprehensive development. It combines the feature development and comprehensive development. First, there is the consensus for the comprehensive development of the entire region, then the region can be divided into several sub-regions, with advantages combined and preferentially develop one or several industries in the sub-region, which can form the industrial chain. This mode can ultimately get to the simultaneous development of the entire region. As the table shows, there are four stages in the coordinate development mode. Take the Central China as an example:

Figure 1 Coordinated Development

First, the sub-regions should analyze their own advantages. Generally, the target area can be divided into several sub-regions according to the administrative units. The central area can be divided into six sub-regions: Hubei, Hunan, Jiangxi, Anhui, Shanxi and Henan. The advantages and characteristics of

each sub-region can be identified. The comparative advantage may come from resources, on the other hand, it may also come from the long-term accumulation. Sometimes it is not easy to identify, so we should combine with the overall situation of the country, the central region, have a deep and comprehensive analysis about the advantages and lay the foundation for a proper position.

Second, the comparative advantages should be combined to give a position to the feature direction of strategic emerging industries. For example, if an area has the advantage of resources, we can focus on improving the level of resource utilization and go into the technology, the higher value-added downstream sectors. Hunan Province is rich in bauxite, magnesium, sulfur, iron, kaolin, and other non-ferrous metals and non-metallic mineral resources, and it has an initial formation of the advanced battery materials, hard materials, metals and new materials. In an area which has the advantages in equipment manufacturing, we can focus on the higher technological content of new equipment in the field of traffic to lay their own direction. Such as key enterprises in Nanchang, Jiangxi Province: Changhe Aircraft Industry Group, Hongdu Aviation Industry Group. For biotechnology and other high-tech industries, we need some urban centers like Wuhan, Changsha, and Zhengzhou which are more developed in financial and human capital. These cities have some senior elements of foundation, and for those cities which are not sufficient in elements should be assessed that whether they have sufficient support stamina.

Third, special industrial chain should be created to avoid isolated development. Developing feature industries, viewed from the long-term competitiveness, we should focus on building characteristic industry chain. The cities in the central area developing strategic emerging industries should avoid the development of an industry in isolation. They should regard the downstream businesses as one and create a complete industrial chain. We can gather downstream businesses, upstream businesses of the same industry, and service enterprises to the neighboring region in the form of building industry clusters, which can form the industry chain with the local characteristics, thus creating the overall competitiveness of the industry.

Fourth, inter-regional division of labor and differences in competition should be promoted. The current relatively backward infrastructure, couple with the existing financial system and performance evaluation mechanism result in a lack of industrial division of labor and cooperation between the central cities. The traditional industries and emerging industries have similar problems. This requires speed up infrastructure construction, facilitate regional connectivity, lower cost of cooperation. It also needs to change the concept of development. Based on comparative advantages, the existing institutional mechanisms should be gradually reformed to adapt to the trend of regional cooperation and development. And ultimately it will get to the coordinated development of the six provinces of seven strategic emerging industries.

4 Development Policies for Strategic Emerging Industries

Strategic emerging industries are often new with uncertainty and risks. To avoid their market failure, the government needs to choose the proper policies for strategic emerging industries. The government also needs to adjust, regulate and constrain the market to achieve optimal allocation of industrial resources and to enhance industrial competitiveness. The government can regulate policies from the four aspects: taxation, industry, finance and human resources.

4.1 Fiscal policy

Government should establish the funds of strategic emerging industry development, build a stable financial investment growth mechanism, increase financial investment, practice innovation, make efforts to support the development of key technologies and innovation development of major industries, let the major innovations become industrial products, construct major demonstration projects and innovation capacity buildings. Government should regulate specific practicing programs of financial incentive policies of strategic emerging industries; take some supporting ways such as: interest payments on loans, interest subsidies, free grants, debt and investment. We should strengthen the combination of financial money and financial capital; provide all support for technology development, industrialization, platform construction, major projects, industry clusters, market development, etc. We should improve the efficiency of government procurement for strategic emerging industries, improve government procurement assessment methods, give the preferential treatment of new products to strategic emerging industries. We should stimulate government procurement and ordering system of strategic emerging industry of independent innovation, increase the size of government procurement for strategic emerging industries to avoid repeated purchases and increasing costs. We should regulate tax incentive directory to support the development of strategic emerging industries, specifically divide the sectors and segments of

supported strategic emerging industries and turn the direction of tax incentives of company to industry. We should increase the types of indirect tax. By accelerating depreciation expense deduction, the reserve funds, we can reduce the burden of the corporate tax to promote the development of strategic emerging industries. We should focus on tax incentives of venture capital of strategic emerging industries. We can give tax incentives from corporate income tax, personal income tax and value added tax to increase venture capital power given by domestic and foreign capital for the development of strategic emerging industries.

4.2 Industrial policy

Government should foster technological innovation and the ability of achievement transformation, and accelerate the construction of industrial technology development system that is business-oriented and has the forms of engineering (technology) research centers, engineering labs, (business) laboratory, enterprise technology center. We should vigorously promote independent innovation transformation and improve the mechanism of results release to encourage universities and research institutes to transfer to the technological achievements of business, to encourage scientific and technological personnel to carry out independent innovation achievements in industry activities. We should establish and improve intermediary service system, develop research and development service, business services, technology trade, intellectual property rights and technological achievements. We should actively undertake industrial transfer in Europe, America, Japan, Korea and other key countries and regions, and enhance the scale and level of industrial transfer. We should support the backbone enterprises of strategic emerging industries to go out, establish the production and marketing base, explore the international market, and establish the partnership with foreign well-known enterprises. We should integrate the resources of existing innovation platform, accelerate the large body of scientific research institutions like industrial technology research institute to guide them to transfer into a large comprehensive organization. We should improve the opening mechanism of the relevant market. Strengthen the corporation between the central enterprises, Chinese Academy of Science and multinational corporations, deepen the accessing reform of private investment, optimize government service environment, encourage enterprises to invest strategic emerging industries and explore and improve the opening and sharing mechanism of innovation platform management.

4.3 The monetary policy

Government should promote banking institutions, guarantee agencies, venture capital firms, insurance companies to set up the development financial alliance to promote the development of strategic emerging industries. Banking institutions should increase credit support for strategic emerging industries, implement the prime lending rate policy and avoid floating in principle. We should encourage the credit business innovation like product orders (contracts), equity, intellectual property rights setting arrived (pledged) rights and ensure that we can meet the effective business credit needs. Security agencies should focus on supporting the development of strategic emerging industries, and guarantee to meet the demand on equal conditions. For government supporting projects, various financial institutions should regard them as the key supporting projects, and banking institutions should increase credit support. Venture capital funds, guarantee funds, insurance and other capital allocations should be followed, which should play the linkage effect to reduce investment risk. We should further improve the market system and support qualified enterprises to seek financing by listing on the stock market. We should promote the construction of the OTC securities market to meet the needs of start-ups in different stages. We should improve the transfer board between the different levels of the market, gradually realize the organic link between the various levels of the market. We should develop the bond market, expand SME collective bonds and the issue size of notes, actively explore the development of high-yield bonds with low credit rating and a private placement of convertible bonds and other financial products, and steadily advance corporate bonds, enterprise bonds, short-term financing bonds and medium-term notes development and broaden the way of the corporate debt financing.

4.4 Personnel policy

Government should vigorously promote the development of major engineering talent and implement the policy of specific treatment. We should perfect the discovery and assessment mechanism of high-level overseas talent and to build "Overseas Talent Dynamic Information Library" and "Talent Assessment Industry Expert Database". We should focus on introducing the originals of high-end, core technology in the industry, the manager of large project, system integration, advanced technology, enterprise management innovation to create a Shanghai state-level overseas talents innovation base with core competitiveness. Combined with the law and characteristics of the building of strategic emerging industry talent, we should adhere to open, equitable, competitive, merit selection principles of nurturing talent,

explore the establishment and improvement of selection mechanism and create a good atmosphere that is conducive to all kinds of talents to stand out. We should vigorously promote the leading talent, strategic and emerging industries of excellence, highly skilled talents and technological innovation of outstanding team and other personnel and team selection activities and establish and improve the selection mechanism. We should strengthen and improve the system of experts recommend. We should improve professional personnel competency assessment system; we should emphasize the selection and development of non-public corporate personnel and further broaden the channels of personnel selection. We should improve the talent training mechanism: "market-oriented, the government-supported". We should encourage and support enterprises and social organizations to establish personnel fund related to strategic emerging industries and arrange some funds in major industrial project funding for training. We should create conditions to encourage talents to participate in academic activities and keep track of technological development and update their knowledge. We should guide enterprises to play advantages of higher education institutions, secondary education and vocational training, help companies improve business-service capability and quality personnel. We should intensify personnel training and industrial docking efforts. Around of the line of strategic emerging industries development, we can promote the "talent + project" training mode and promote the "school-enterprise union" action with business-oriented, market-oriented, a link of industry, academia, research, and application. We should accelerate the pace of industrialization in the practice of innovative talent cultivation, technology research and development; accelerate the transformation of scientific and technological achievements to build a technology innovation platform.

5 Conclusion

Strategic emerging industries are playing a key role in new economic development. For a sustainable economic growth to take root in China, it is necessary to understand the need and urgency for developing these industries. The paper studies the status quo of current practices of strategic emerging industries in the major regions in China. It proposes four development modes and gives suggestions for government policy support. It is hoped that more research will be conducted in this area to help the healthy development of strategic emerging industries in China.

Impact Formation Factors on Industry Cluster of China's General Aviation

Chen Da, Qin Yuanjian, Han Zhou

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: chenda8@126.com, qyjhb@163.com, 314656302@qq.com)

Abstract: By analyzing the germination factors and enrichment factor in the germination stage and the enterprise aggregation stage of the general aviation industry cluster formation process combined with the characteristics of general aviation industry, the research explores typical factors influence on industry cluster start from scratch and from one to more enterprises in the cluster and through the structured model certifies the factors .

Key words: General aviation industry cluster; Germination; Enrichment

1 Introduction

By attracting to implementation of the nation's low altitude airspace uncontrolled policy for private aircraft after 2015, many areas across the country are in the planning and construction of Aviation Industrial Park, to the general aviation industry cluster development in the region, as the local area bring social and economic development in the new growth pole. General aviation industry chain is long and complex. There are three main types of general aviation industry park in the present development. The first one is the whole industry chain cluster integration of R&D, manufacturing and operations. The second one is the R&D and manufacturing cluster as the main business. The third one is the operation cluster as the main business. The General Aviation Complex for Love-flying in China is a example^[1].

Industry cluster is an effective regional economic organization form of industrial development. Industry cluster is the development direction of general aviation industry. Based on a study of the germination of Latvia industry cluster, Kulakova (2014) concluded that there are 5 stages of cluster formation process^[2]. From the conclusion of 5 stages, it can be seen that the industry cluster's formation and development is a two stages process, start from scratch and from one to more. The formation process from scratch is a process of germination. This process is influenced by the "compulsory factor" and "endogenous factor". The compulsory factor refers to the process of the system side and the policy promoting the germination process. The endogenous factor refers to the industrial foundation for the existence of historical reasons. Compulsory factor is the factor promoting the germination by means of the system and policy. The endogenous factor is the factors that industry base of germination by the reason of the existence of history. From one to more process is a process of enterprise aggregation. This process is influenced by the "enrichment factor".

General aviation industry has the characteristics of high technical barriers, high policy barriers, high industry correlation and high network dependent. These characteristics have brought new problems to the research of the formation of the industrial clusters. The paper will analyze the germination factors and enrichment factor in the germination stage and the enterprise aggregation stage of the general aviation industry cluster formation process combined with the characteristics of general aviation industry. The aim of the research is to explore typical factors influence on industry cluster start from scratch and from one to more enterprises in the cluster and and through the structured model certificate the factors.

2 The Research Background and Assumptions

It is necessary to consider the formation of general types of industrial clusters to form industrial clusters of general aviation industry, but also to follow the characteristics of the general aviation industrial development. Results from the domestic and foreign experts and scholars from different angles of industrial cluster research explain, research mainly from the industrial cluster theory, national strategy theory, comparative advantage theory and externality theory. The new classical economist Alfred Marshall (1890) put forward the external economic theory, pointed out the reason in the same industry enterprises relying on the regional industrial clusters is the external economic agglomeration brings^[3]. In the global and marketly today, the development of industrial clusters has been unable to develop in isolation, and the development trend of industrial clusters is no longer confined to the regional lock in the past, while the regional interaction and dynamic locking greatly limits the network

innovation resources industrial cluster creation, therefore existing external resource dependence determines single network of industry cluster and regional network and cross regional network the linkage between clusters and clusters, outside links greatly promoted among the industrial cluster's network connection, making a single cluster network diversified into the development of clusters, clusters with cluster external environment developing close access to resources, fundamental facilities sharing, supporting environment, so network externality is significant, and this depends on the network externality in the general aviation industry is particularly evident.

Abbott Young Allyn (1996) considers the inherent relationship between the division of labor, the production of the production and the increasing returns mechanism^[4]. Dynamic interactive relationship exists between the social division of labor, the cluster and the industrial chain. Yan Bei War (2013) put forward the concept of cluster industry chain. It is pointed out that the cluster industry chain is engaged in a combination of a certain industry factors of production, resources and geographical spatial factors, economic entities in the economic activities in the process of mutual association, the formation of network organization based on competitive and cooperative relations^[5].

According to Webber's (1909) classification of influencing factors of industrial location, these factors are divided into two types, namely, the agglomeration factors and regional factors. Agglomeration factors refers to only and common features of industry related factors in the formation of industrial clusters, such as specialization degree of division of labor, industrial chain length, degree of industrial linkage, the preferential policy for the industry and so on, and these factors determines the industry in the region is gathering or dispersing; location influencing factors is refers to the formation factors of industrial clusters only related with geographic conditions^[6], in the general aviation industry as general aviation resources, consumer demand for navigation and innovative entrepreneurial culture, regional technological innovation, regional general aviation infrastructure and so on, these factors due to differences in regional conditions caused the formation and development of cluster in certain areas.

And Porter (1998) proposed diamond theory, established a diamond model, pointed out factor conditions, demand conditions, related and supporting industries, enterprise strategy, enterprise structure and competition, and the government and opportunities are the impact factors of the formation, development and upgrading of industrial clusters^[7].

Synthesizing the results of these studies, this paper argues that the influencing factors in the formation of China's general aviation industry should include two categories, germination factors which decide the formation of industrial clusters of and enrichment factors which decide the cluster gathering or dispersing. The germination factors include traditional industry foundation(industrial atmosphere, the foreground of the industry)and government function, and the enrichment factors include competence of investment(governmental capital, civil capital), market promotion(operation market, consumer market), location condition(airspace environment, infrastructure), collaborative business of industrial chain(length,correlation degree) and driving of industrial value chain (resource allocation, rule-driven). Therefore, according to Porter's evaluation method to the cluster^[8], this study uses the two indicators of integration density and scale to evaluate the formation of China's general aviation industrial cluster, and then put forward the following hypotheses:

Hypothesis 1: Germination factors and enrichment factors have a positive correlation.

Hypothesis 1a: More solid traditional industry foundation and positive government function has a positive effect of competence of investment, market promotion and collaborative business of industrial chain.

Hypothesis 1b: Better location condition and more strong driving of industrial value chain lead to more solid traditional industry foundation and positive government function.

Hypothesis 2: More positive correlation between germination factors and enrichment factors benefits for the formation of China's general aviation industry.

Hypothesis 3: Germination factors has a positive effect of the formation of China's general aviation industrial cluster.

Hypothesis 3a: More solid traditional industry foundation and positive government function owe to higher integration density of China's general aviation industrial cluster.

Hypothesis 3b: More solid traditional industry foundation and positive government function owe to larger scale of China's general aviation industrial cluster.

Hypothesis 4: Enrichment factors has a positive effect of the formation of China's general aviation industrial cluster.

Hypothesis 4a: Higher competence of investment, stronger market promotion, better location condition, more collaborative business of industrial chain and stronger driving of industrial value chain

owe to higher integration density of China's general aviation industrial cluster.

Hypothesis 4b: Higher competence of investment, stronger market promotion, better location condition, more collaborative business of industrial chain and stronger driving of industrial value chain owe to larger scale of China's general aviation industrial cluster.

Table1 The Variables

Germination Factors	Enrichment Factors
Traditional industry foundation (industrial atmosphere, the foreground of the industry)	Competence of investment (governmental capital, civil capital)
	Market promotion (operation market, consumer market)
	Location condition (airspace environment, fundamental facilities)
Government function	Collaborative business of industrial chain (length, correlation degree)
	Driving of industrial value chain (resource allocation, rule-driven)

3 The Data and Results

This sample belongs to the cluster level, and the required data can not be totally obtained from publicly available information, so this study uses a questionnaire survey, while valid questionnaires collected to establish the title entry database, then making a reliability test, validity testing and structural equation modeling analysis and fitting work. Analysis software SPSS for windows 13.0 and LISREL 8.7 version, are used in this study. The questionnaire is overall designed in accordance with a combination of qualitative and quantitative methods based on Likert 5 point scale, which designed 1 “strongly disagree”, 2 “disagree”, 3 “can not be determined”, 4 “consent”, 5 “strongly agree”.

This study distributed 200 questionnaires, 154 of which were recovered, and the recovery rate was 77%. Research purposes strictly excluded the part does not meet the requirements or information missing, more serious questionnaires, 142 valid questionnaires, with a total effective rate of 71%.

Validity questionnaire items used in this study are mostly from the literature, and finalize the questionnaire, expert consultation, pre-test and fix part of the formulation and content of the questionnaire, therefore the questionnaire has considerable the validity of the content, but also able to meet the requirements of building a validity. However, taking into account the unique nature of the object of study as well as cross-cultural factors, the paper still use confirmatory factor analysis to test the construct validity of the scale by LISREL 8.7 statistical software. At the same time, this study using Cronbach's coefficient to test the reliability of each scale. Indicators are shown in Chart 2, are within an acceptable range, indicating that the study sample data with the theoretical scale good fit. In addition, due to no ready meter used to the index of driving of industrial value chain, exploratory factor analysis based on extracting characteristic roots greater than 1 4 items (71.4% explained degrees) to construct a single dimension scale.

Table 2 Reliability and Validity of Variables

Index	Traditional industry foundation	Government function	Competence of investment	Market promotion	Location condition	Collaborative business of industrial chain	Driving of industrial value chain	Integration density	Scale
<i>CFI</i>	0.989	0.964	0.966	0.945	0.990	0.980	0.990	0.955	0.970
<i>GFI</i>	0.975	0.957	0.988	0.958	0.987	0.979	0.941	0.979	0.977
<i>AGFI</i>	0.970	0.976	0.968	0.954	0.983	0.972	0.887	0.913	0.954
<i>RMSEA</i>	0.065	0.072	0.056	0.052	0.074	0.076	0.056	0.074	0.062
$\chi^2(df)$	29.71(24)	14.284(8)	8.218(6)	11.673(7)	49.68(27)	16.965(8)	17.776(10)	9.336(6)	18.29(9)
<i>Cronbach's α</i>	0.85	0.87	0.83	0.84	0.90	0.85	0.80	0.83	0.81

The study used statistical analysis software LISREL8. 7 to examination and found that the overall model shown in Chart 3, considering the basic fit standard of the model, the factor loadings of each latent variable in this study were between 0.5 and 0.95, and have reached a significant level. Thus, it can be certain that the model generally consistent with the requirements of the basic adaptation standard. In addition, this paper used the indicators of overall fit to test the goodness of the observed data fit with the theoretical model, specific results are as follows: $\chi^2 = 51.80$, $df = 45$, $RMSEA = 0.055$, $90\% RMSEA =$

(0.009, 0.085), CFI = 0.97, GFI = 0.93. The parameters were within the acceptable range, which can be considered good fit of the overall model of this study. Path coefficients and parameters in Chart 3 on the theoretical model assumptions were summarized.

Table 3 Path Coefficients and Parametric Assumptions

Path	Path coefficients	P	Parametric assumptions	Results
γ_{11}	1.02*	0.031	Assumption 1a	True
γ_{12}	0.71*	0.040	Assumption 1a	True
γ_{13}	0.85*	0.021	Assumption 1b	True
γ_{14}	0.61*	0.012	Assumption 1a	True
γ_{15}	0.73*	0.036	Assumption 1b	True
γ_{21}	1.17*	0.024	Assumption 1a	True
γ_{22}	0.22*	0.011	Assumption 1a	True
γ_{23}	0.56*	0.030	Assumption 1b	True
γ_{24}	1.34***	0.000	Assumption 1a	True
γ_{25}	-0.24*	0.021	Assumption 1b	False
β_{11}	0.98***	0.000	Assumption 3a	True
β_{12}	0.28**	0.003	Assumption 3a	True
β_{21}	1.11*	0.033	Assumption 3b	True
β_{22}	2.21*	0.045	Assumption 3b	True
α_{11}	1.17*	0.023	Assumption 4a	True
α_{21}	2.14*	0.018	Assumption 4a	True
α_{31}	0.26*	0.026	Assumption 4a	True
α_{41}	0.23	0.768	Assumption 4a	NA
α_{51}	3.13*	0.031	Assumption 4a	True
α_{12}	1.22**	0.005	Assumption 4b	True
α_{22}	1.24*	0.013	Assumption 4b	True
α_{32}	0.78**	0.007	Assumption 4b	True
α_{42}	0.96*	0.042	Assumption 4b	True
α_{52}	0.61*	0.022	Assumption 3b	True

4 Conclusion and Outlook

On the basis of the existing research, through the establishment of the theoretical models and hypotheses, the study verify germination factors and enrichment factors have a positive correlation, and more solid traditional industry foundation and positive government function has a positive effect of competence of investment, market promotion and collaborative business of industrial chain. Though better location condition and more strong driving of industrial value chain lead to more solid traditional industry foundation, but more strong driving of industrial value chain can not owe to positive government function. That may be because local governments occasionally take own strategies which are not fit for the overall value chain. Thus, the hypotheses “germination factors has a positive effect of the formation of China’s general aviation industrial cluster”, “enrichment factors has a positive effect of the formation of China’s general aviation industrial cluster”, are certificated true. While there is not proof of collaborative business of industrial chain owing to the integration density of general aviation industry. And from the results, the indicator γ is bigger where β and α is bigger, so the hypothesis 2 is verified true.

However, there are limitations on the following aspects: Firstly is the sample selection that data source enterprise area is too concentrated, which limited the amount of sample recovery; secondly is variable selection that the research model has not yet considered the situational elements, which will be the next direction; further research on China's general aviation industrial cluster will focus on the mechanism of the impact factors operating, which can be considered more basic and applied research studies.

Abstract: At present, the field of theoretical research has not reached an agreement on a unified standard of the indicator system of the industry cluster degree. This paper summarizes the existing studies of industrial clusters and built up the calculation indicator system of the cultural creative industry cluster by using the general designing principles. An exclusive calculation indicator system in terms of the static and dynamic indicators is built on base of the industrial characteristics. It provides the calculation criteria from the macro and micro perspectives. The quantitative results can grasp the industrial inherent regularity and reflect the regional technology spillovers of the industry cluster.

Key words: Cultural creative industry; Industry cluster; Cluster degree; Calculation indicator

1 Introduction

Measuring the cluster degree is the foundation of quantitative researches in the study of industry clusters. Generally speaking, the measurement indicators of the industry cluster degree include the accessibility of various resources within a specific area, the spillovers among enterprises in the cluster and the natural advantages of the location and so on. However, due to the impact of different economic development levels and other social and cultural factors, the indicators of the industry cluster degree are various in different regions. At present, there is no agreement on a unified standard of the indicator system of the industry cluster degree in the field of theoretical research in the world.

The study of the calculation indicator system of the cultural creative industry cluster is still in the exploratory stage. Only a few scholars in China such as Zhou Guoliang^[1](2010), Bao Feng^[2](2013) made the systematical research in this aspect.

2 The Summary of Calculation Methods to General Industry Cluster Degree

At present, there are two categories of measure methods of the regional industry cluster degree: the qualitative analysis and the quantitative analysis. Lots of literatures have discussed on the measurement of cluster degree^[3]. As Krugman^[4](2000) used the method of Gini Coefficient to estimate the degree of the U.S. manufacturing clusters. Elson and Glaeser (1997) refused to use the Gini coefficient because it does not take into account the differences in the scale size of enterprises, so they proposed a new indicator, which considering the differences of the industrial organizations^[5]. Michelle Porter^[6](2004) proposed the criteria to evaluate different types of industrial clusters, which include the geographical scope, the number of companies, association degree of the lateral and vertical correlation, value-added activities, stages of development and the innovative environment^[7].

All the identification methods above have their own advantages and disadvantages. It is apparently the single use of one approach can't meet the research objectives.

3 Designing Static Indicators for the Cultural Creative Industry Cluster Degree

According to Professor Michael Porter', the industrial cluster is 'a group of companies which are geographically close to each other and exist in a specific industrial area with their commonalities and complementarities linked'. The two basic preconditions for the formation of the industry cluster are the geographical proximity and industrial links. Therefore, to identify a regional industry cluster must meet two criteria: first, the sufficient number of industrial enterprises gathered in the geographic area. Second, industrial enterprises and affiliates in the cluster have close contact. This article made an analysis of the connotation, characteristics and the formation factors of the cultural creative industry cluster, which is

* This paper is supported by Humanities and Social Sciences Projects of Hubei Provincial Department of Education (No.15Q035), the Research Projects of Industrial Policy and Management Research Center of Hubei Province (No. CY20150209)

followed by the calculation indicator system from a macro and micro perspectives.

3.1 The calculation from the macro perspective

From a macro perspective, the calculation indicators include Space Concentration Index of the Cultural Creative Industry, Hirschman - Hefoyinde Index (HHI) of the Cultural Creative Industry and Gini coefficient of the Cultural Creative Industry.

3.1.1 Space concentration index of the cultural creative industry (CRn)

CR_n is an important indicator to measure the degree of the competition in a given market. It is about the ratio of some total value (such as output, number of employees, fixed assets, etc) of the largest companies to that of the whole industry. It represents the concentration ratio and the degree of competition within an industry, and can be used in the analysis of the judgment of geographic areas where the cultural creative industry cluster locates in. The calculation methods as follows:

$$CR_n = \frac{\sum_{i=1}^n X_i}{\sum X_i} \tag{1}$$

‘Xi’ represents the market share of the output, employees’ number, fixed assets of company ‘i’; ‘ $\sum_{i=1}^n X_i$ ’ represents the total market share of the output, employees’ number, fixed assets of the largest enterprises; ‘ $\sum X_i$ ’ represents the overall market share of the total output value, the total number of employees, the total fixed assets in the certain region; ‘n’ represents the total number of regions which accounts for over 60 percent of the total market by the descending order of its market share. The value of CR_n lies in the scale of 0 to 1. CR_n is simple and practical, but it can’t consider all enterprises and the market distribution; so the calculation result will varied with the number of selected companies.

3.1.2 Hirschman-Hefoyinde index of the cultural creative industry(HHI)

HHI index is a key indicator to measure the market structure and the industrial structure in Industrial Economics. It gives the better reflect of the degree of industrial concentration by calculating the uneven disparities. HHI of the Cultural Creative Industry is calculated as follows:

$$HHI = \sum_{i=1}^N (X_i / X)^2 = \sum_{i=1}^N S_i^2 \tag{2}$$

‘Xi’ represents the scale of company ‘i’ in the industry; ‘X’ represents the total scale of the industry; ‘N’ represents the total number of companies in the industry; ‘Si’ represents the market share of company ‘i’ (i=1,2,...N) in the industry. The value of HHI lies in the scale of 0-1. Using the HHI can be a supplementary method to obtain more accurate and comprehensive results.

3.1.3 Correlation coefficient of the cultural creative industrial chain (LD)

The industrial extension is an important standard to judge whether the industry cluster is formed.

Therefore, the correlation coefficient ‘LD’ reflects the activities among enterprises in the upstream and downstream industry chain. Its calculation is as follows:

$$LD = Ri / R \quad (0 < LD < 1) \tag{3}$$

‘Ri’ represents the output of the cultural creative industry in the region ‘i’; ‘R’ represents the total output of the tertiary industry in the region ‘i’. The value of LD lies in the scale of 0-1. The more the result tends to the maximum, the more active and dynamic the cultural creative industrial chain is.

3.2 The calculation from the micro perspective

From the micro perspective, we can explore the concentration degree of the industrial scale and elements in a specific area. Location Quotient (LQ) is proposed firstly by P. Haggetndt. It reflects the strengths and weaknesses of the particular industrial sector, and also figures out the image of its position and function in the whole region. The value of LQ is calculated as follows:

$$LQ_{ij} = \frac{X_{ij} / \sum_j X_{ij}}{\sum_j X_{ij} / \sum_j \sum_i X_{ij}} \tag{4}$$

‘X_{ij}’ represents one of the main economic indicators of the industry ‘i’ in the region ‘j’; ‘ $\sum_i X_{ij}$ ’ represents the total output of the every industry in the region ‘j’; ‘ $\sum_j X_{ij}$ ’ represents the total output of the industry ‘i’ in every region; ‘ $\sum_j \sum_i X_{ij}$ ’ represents the total output of the every industry in every region.

If LQ<1, it indicates that the level of specialization in the area under the overall level of the region. The industry cluster in the region has not yet formed; If LQ=1, it indicates that the level of specialization in the area equals to the overall level of the region; If LQ>1, it indicates that the cultural creative industry cluster has been formed. For the calculation indicators of the cultural creative industry cluster degree, a selection of indicators that are LQ_{FA}, LQ_{TO}, LQ_{PT}, and PDR_{ij}.

3.2.1 The location quotient of fixed assets of the cultural creative industry (LQ_{FA})

$$LQ_{FA} = \frac{FA_{ij} / FA_j}{FA_i / FA} \quad (5)$$

'i' represents the cultural creative industry; 'j' represents the region 'j'; 'FA_{ij}' represents the fixed-asset investment of the cultural creative industry in the region 'j'; 'FA_j' represents the total fixed-asset investment in the region 'j'; 'FA_i' represents the fixed-asset investment of the cultural creative industry in the whole region (larger than the region 'j'); 'FA' represents the total fixed-asset investment in the whole region (larger than the region 'j');

If $LQ_{FA} > 1$, it indicates that the cluster has been formed in the region 'j'; If $LQ_{FA} > 1.12$, it indicates that the degree of cultural creative industry cluster in the region 'j' is in a high level;

3.2.2 The location quotient of total output of the cultural creative industry (LQ_{TO})

$$LQ_{TO} = \frac{TO_{ij} / TO_j}{TO_i / TO} \quad (6)$$

'i' represents the cultural creative industry; 'j' represents the region 'j'; 'TO_{ij}' represents the total output of the cultural creative industry in the region 'j'; 'TO_j' represents the total output of all industries in the whole region (larger than the region 'j'); 'TO_i' represents the total output of the cultural creative industry in the whole region (larger than the region 'j'); 'TO' represents the total output of all industries in the whole region (larger than the region 'j');

If $LQ_{TO} > 1$, it indicates that the cultural creative industry cluster has been formed in the region 'j'; If $LQ_{TO} > 1.12$, it indicates that the degree of cultural creative industry cluster in the region 'j' is in a high level;

3.2.3 The location quotient of potential talents of the cultural creative industry (LQ_{PT})

Because creative talents are the major factor to the formation and rapid development of the cultural creative industry cluster, so the author designs the following indicator for the potential innovative talents of cultural and creative industry cluster.

$$LQ_{PT} = \frac{PT_{ij} / T_{ij}}{PT / T} \quad (7)$$

'i' represents the cultural creative industry; 'j' represents the region 'j'; 'PT_{ij}' represents the total number of students who major at the Culture Industry in the region 'j'; 'T_{ij}' represents the total number of employees in the cultural creative industry in the region 'j'; 'PT' represents the total number of students who major at the Culture Industry in the whole region (larger than the region 'j'); 'T' represents the total number of employees in the cultural creative industry in the whole region (larger than the region 'j');

If $LQ_{PT} > 1$, it indicates that the cultural creative industry cluster has strong potential capability for the further development in the region 'j' because of the cluster of the potential talents.

3.2.4 The ratio of the participation degree in the cultural creative industry (PDR_{ij})

The formation of the cultural creative industry cluster is inseparable from the consumer demands and participation of the public. So the author designs the following indicator for the participation degree in the cultural creative industry.

$$PDR_{ij} = PD_{ij} / PD \quad (8)$$

'i' represents the cultural creative industry; 'j' represents the region 'j'; 'PD_{ij}' represents the participation degree in the culture industry in the region 'j'; 'PD' represents the total participation degree in the cultural creative industry in the whole region (larger than the region 'j');

The calculation of PD_{ij} can be varied with the sources of data and specific characteristics of different regions. It cover lots of cultural and creative activities, such as the circulation number in public libraries or cultural centers, the number of visitors in museums, the attendance of art performances and the annual number of published books and newspapers. If $PDR_{ij} > 1$, it indicates that the cultural creative industry cluster in the region 'j' has strong impetus because of the high level of participation degree in the public.

4 Designing Dynamic Indicators for the Cultural Creative Industry Cluster Degree

The processes of clustering are dynamic and changing continually, so this section of research is about the dynamic indicators of the cultural creative industry cluster degree. Making the hypothesis that

the study period is $[T_1, T_2]$. 'i' represents the cultural creative industry; 'j' represents the region 'j'; the output of the cultural creative industry in the region 'j' at the beginning of the study period is P_{ij1} , and it turns to P_{ij2} at the end of the study period. CI_{ijt} represents the degree of the cultural creative industry cluster in the region 'j'. Let:

$$S_{ijt} = \sqrt[n]{P_{ij2} / P_{ij1}} - 1, S_{it} = \sqrt[n]{\sum_{j=1}^n P_{ij2} / \sum_{j=1}^n P_{ij1}} - 1 \quad (9)$$

(S_{ijt} represents the average growth rate of the cultural creative industry cluster in the region 'j'; S_{it} represents the average growth rate of the cultural creative industry cluster in the nationwide.)

Therefore, $CI_{ijt} = S_{ijt} / S_{it}$.

When $S_{it} > 0$, the average growth rate of the cultural creative industry cluster in the nationwide is in the growth stage. Then:

If $CI_{ijt} > 1$, it indicates that the degree of the cultural creative industry cluster in region 'j' is in the growth stage, but the growth rate is less than the national level. If $CI_{ijt} < 0$, it indicates that the degree of the cultural creative industry cluster in region 'j' is in the shrinking stage.

When $S_{it} < 0$, the average growth rate of the cultural creative industry cluster in the nationwide is in the decelerating stage. Then:

If $CI_{ijt} > 0$, it indicates that the degree of the cultural creative industry cluster in region 'j' is in the shrinking stage. If $CI_{ijt} < 0$, it indicates that the degree of the cultural creative industry cluster in region 'j' is in the growth stage, and the growth rate belongs to the leading level in the nationwide.

5 Conclusions

The paper selects the quantitative methods according to the research purposes and the characteristics of the industry, and then builds a comprehensive quantification system of measurements. This system provides the criteria of the calculation of industry cluster degree from the macro and micro perspectives. The calculation results reflect the spatial characteristics and the regional technology spillovers of the industry cluster. As a quantitative analysis method, the calculation indicators can give us the clear rational knowledge of the evolution laws of the cultural creative industry clusters.

Coupling and Optimizing the Development Path and Environmental Policy of Hubei Laser Industry Based on Path Creation Theory in China

Wan Xingzi, Yang Qing

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(Email: y_ding@whut.edu.cn, yangq@whut.edu.cn)

Abstract: At present, the main factors that limit the development of laser industry in Hubei Province is its weak capacity for independent innovation, which severely holdbacks the development of laser such high-tech industries, therefore, it's very necessary for Hubei laser industries to create an Independent innovation development path.

Key words: Hubei Laser Industry; Path Creation; Negative lock-in

1 Introduction

The “negative lock-in” effect in path dependence and self-reinforcement seriously fetter industrial formation and development, so in order to seize the opportunity of the international economic situation and to better promote the development of industry, the “negative lock-in” state formed in industrial upgrading is supposed to be broken and making path creation come into being. Joseph A. Schumpeter is the first economist who discussed the “path creation”. The “creative destruction” concept put forward by him answers the questions concerned in the path dependence^[1]. The “creative destruction” means that the process of path creation actually is a course of an organization's continuously breaking through the existing boundaries, system, technology constrains and so on in the organization. Garud and Karnoe(2001)^[2] are the most famous scholars in such field. They defined the concept of path creation and held that the economic agents like entrepreneurs treat history as the original material and put it into consideration in a complex process in which the economic agents act in accordance with systematic procedures and social cognition and the history plays an influential but not a decisive role. They held that breaking through the path is a process of “mindful deviation” and such process is the core content of the path creation theory. The path creation doesn't mean that the entrepreneurs are able to make strategic choices that free of constraint; on the contrary, they are embedded into the organization that they jointly established and mindfully deviated from. “Mindful deviation” means that the entrepreneurs not only have the ability to break themselves out from the existing structure, but also to mobilize the collective staff, although they may encounter resistance and inert on the course of path creation efforts^[3].

Scholars hold that when path independence theory fails to explain the choosing process of technology or system paths, the path creation theory can take the place. The path independence theory denies history's decisive influence in fatalism and emphasizes the Adaptive function among innovative subjects and between the subjects and environment. Pham(2007)^[4] believed that there are five principals followed in the path creation course . They are technology determine norm, mindful deviation norm, real-time influence norm, mutual recognition and interdependent norm and smallest misunderstanding norm. Schienstock(2011)^[5] thought that five interacted modules are included in the process of path creation. The first one is “New opportunity window” relevant to new technology-organization normal form; the second one is the promising new business and new markets; the third one is pressure from the external social - economic factors; the fourth one is the critical transformative event; the fifth one is people's willing to change things. As a whole, path's generation, last, termination and new path's come into being these four phases are the dialectical unity of subjective initiative role played by path's natural formation and economic subjects. Sydow(2009)^[6] pointed out that entrepreneurs play a critical role on the course of path breakthrough or creation. When strategic rigidity appears in an organization or the organization confronted with survival threat, enterprise policymakers are bounded to spend time and efforts in learning and searching more likely intervention plans on the path so as to break away from the path independence or realizing path unlocking.

2 Methodology

2.1 Relevant models of path creation

From the path independence model, it can be told that once the path independence forms, the industry will develop along the given course and technology and system are likely to enter the track of

benign cycle, gain a rapid optimization and shape into positive lock-in effects; it might down along the original wrong path and even be locked in some invalid state, forming negative lock-in effect, for which “unlocking” is a must, therefore, we should transform to path creation from path independence and break the “lock-in” in effect. The path creation model shows in figure 1. Garud and Kanoe will break the “mindful deviation” the path independence concluded. As for phase III, the organization can deviate from the existing path through the mindful action to unlock so as to break the original path independence.

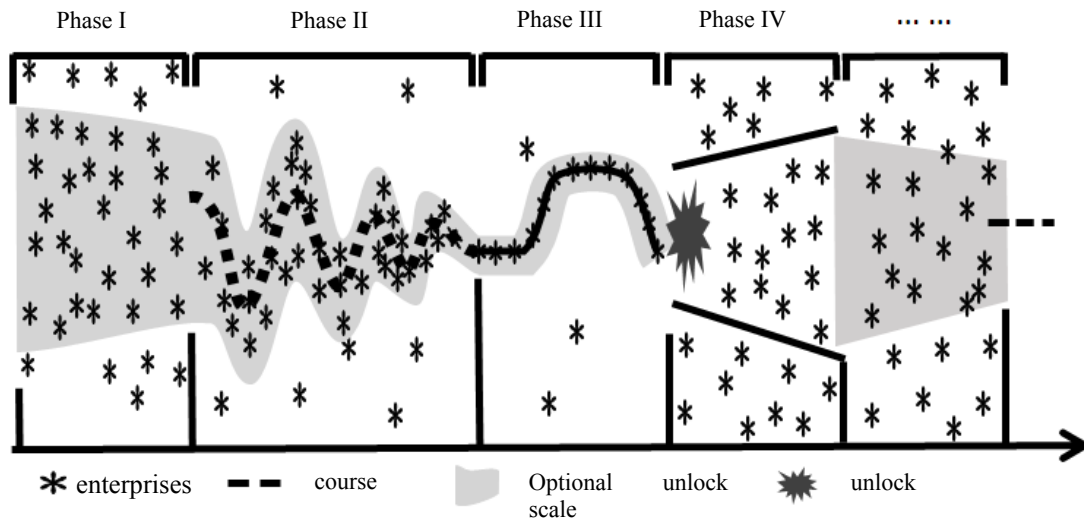

Figure 1 Path Creation Models

2.2 Hubei laser industry’s development path and the modeling and emulation of environmental policy

(1) Logistic model

Biology usually uses the logistic model to describe the population growth pattern whose increase speed accelerates at the very beginning and when the speed reaches some value, it will slow down growth until zero and at last stop rising. Sometimes, it also uses the logistic model to describe the interaction between populations. According to the domestic and overseas scholars’ studies, the industry’ path is also in line with such pattern. For example, a first developed technology’s unit cost will gradually decrease after other technologies’ transitions including self-accumulation, self-reinforcing and scale reward these three phrases. At the same time, the learning effect and coordination effect as well as the adaptive expectations of people to further popularity activated from the technology of popularity and unceasing seepage will lead to the technology make the constant increase positively cycle through the first mover advantage of the first impressions are most lasting. And another more advanced and high-efficient new technology might fall into industry dilemma because of being applied into the market in a later time and doesn’t earlier occupy a certain market share, and may lock-in some kind vicious cycle and be unable to extricate themselves. Hence, path independence and popularized technologies existing in technology transition are inefficient.

(2) Relations between Hubei laser industry path independence and path creation

By the equation (3.3) to (3.6) and (4.1) - (4.4), figure 2 shows the relations between laser industry path independence and path creation:

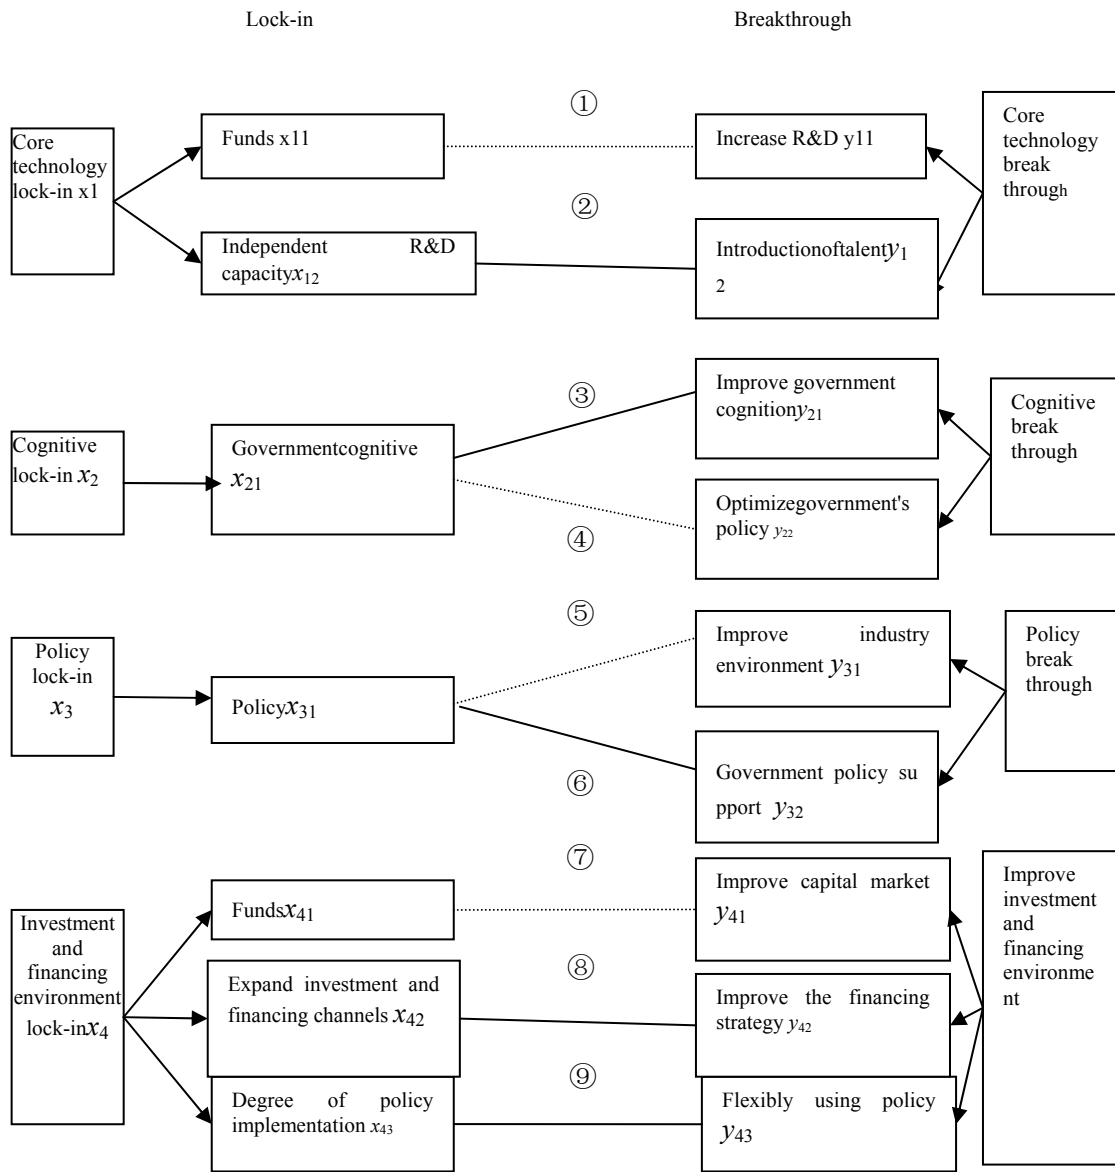

Figure 2 Relations Between Hubei Laser Industry Path Dependence and Path Creation

(3) Experts' evaluation

The full line in Table 1 shows the strong relativity between locking factor and breakthrough factor, that is ②, ③, ⑥, ⑧ and ⑨ directly breakthrough for the locking factors; the dotted line shows the weak relativity, that is ①, ④, ⑤ and ⑦ breakthrough the locking factors through approaching strategy and sustainable development path. Figure 1 shows the influence the locking factors broken through in the path creation plays on the ones in path independence by experts evaluation.

As shown in Table 1, if we set the locking factors respectively as x_{11} , x_{12} , ... , x_{43} , and breakthrough them from the direction of its corresponding breakthrough factors, the rate of change of locking factors is the degree of influence the breakthrough factors exert on the locking factors represented by the degree of relation.

Table 1 Expert's Measuring Scale

No	Locking factors	Breakthrough locking factors	Degree of relation (1 point scale)
①	Funds x_{11}	talents	0.1
②	independent R&D capacity x_{12}	R&Dinput	0.3
③	Governmental cognitive x_{21}	Improve governmental cognitive	0.2
④		Optimize governmental policies	0.1
⑤	Policy x_{31}	Improve industrial environment	0.1
⑥		governmental policies support	0.2
⑦	Funds x_{41}	Improve capital market	0.1
⑧	Investment and investing channel x_{42}	expand investment and financing channels	0.2
⑨	Degree of policy implementation x_{43}	Flexibly using policy	0.1?

3 Results and Discussion

Above all, Hubei laser industry has formed four kinds of lock-in: core technology lock-in, cognitive lock-in, policy lock-in and investment and financing environment lock-in. Hubei laser industry corresponding to the lock-ins take core technology lock-in breakthrough, cognitive lock-in breakthrough, policy lock-in breakthrough and investment and financing environment lock-in breakthrough these four combined strategies. Ahokangas and the others(1999)^[65] also put forward a evolution model from the structure description of cluster and divided the development of the regional clusters into origin and emergence, increase and convergence and maturity and adjusting these three phases. The research, from the perspective of cycle and scale, makes a unified exploration on the path evolution of Hubei laser industry and filters out available, scientific and reasonable path.

(1) Core technologies lock-in and breakthrough evolution

Technology Logistic equation: $x_1(t) = r_1 x_1 (1 - \lambda_1 x_1)$

Technology lock-in equation: $x_1(t) = r_1 (\sigma_{11} x_{11} + \sigma_{12} x_{12}) [1 - \lambda_1 (\sigma_{11} x_{11} + \sigma_{12} x_{12})]$

Technology breakthrough equation: $x_1(t) = r_1 (\rho_{11} y_{11} + \rho_{12} y_{12}) [1 - \lambda_1 (\rho_{11} y_{11} + \rho_{12} y_{12})]$

Basic conditions: $\rho_{11} + \rho_{12} > \sigma_{11} + \sigma_{12}$, $\rho_{12} > \rho_{11}$

Evolutionary parameters:

$r=2$; $b=0.9$; $x=[0.1 \ 0.2]$; $y=[0.11 \ 0.21]$; $cx=[0.1 \ 0.2]$; $cy=[0.12 \ 0.31]$

Figure 3 Technology Lock-in and Breakthrough Evolution

Figure 4 Cognitive Lock-in and Breakthrough Evolution

(2) Cognitive lock-in breakthrough evolution

Cognitive Logistic equation: $x_2(t) = r_2 x_2 (1 - \lambda_2 x_2)$

Cognitive lock-in equation: $x_2(t) = r_2 (\sigma_{21} x_{21}) [1 - \lambda_2 (\sigma_{21} x_{21})]$

Cognitive breakthrough equation:

$$x_2(t) = r_2 (\rho_{21} y_{21} + \rho_{22} y_{22}) [1 - \lambda_2 (\rho_{21} y_{21} + \rho_{22} y_{22})]$$

Basic conditions: $\rho_{21} + \rho_{22} > \sigma_{21}$, $\rho_{21} > \rho_{22}$

(3) Policy lock-in and breakthrough

Policy logistic equation: $x_3(t) = r_3 x_3 (1 - \lambda_3 x_3)$

Policy lock-in equation: $x_3(t) = r_3 (\sigma_{31} x_{31}) [1 - \lambda_3 (\sigma_{31} x_{31})]$

Policy breakthrough equation: $x_3(t) = r_3 (\rho_{31} y_{31} + \rho_{32} y_{32}) [1 - \lambda_3 (\rho_{31} y_{31} + \rho_{32} y_{32})]$

Basic conditions: $\rho_{31} + \rho_{32} > \sigma_{31}$, $\rho_{32} > \rho_{31}$

Evolutionary parameter: $r=2$; $b=0.8$; $bx=0.8$; $by=0.81$; $rx=2.7$; $ry=2.71$; $ix=0.7$; $iy=[0.27 \ 0.28]$; $cx=0.45$; $cy=[0.4 \ 0.5]$

(4) Investment and financing environment lock-in and breakthrough evolution

Investment and financing environment Logistic equation: $x_4(t) = r_4 x_4 (1 - \lambda_4 x_4)$

Investment and financing environment lock-in equation:

$$x_4(t) = r_4 (\sigma_{41} x_{41} + \sigma_{42} x_{42} + \sigma_{43} x_{43}) [1 - \lambda_4 (\sigma_{41} x_{41} + \sigma_{42} x_{42} + \sigma_{43} x_{43})]$$

Investment and financing environment breakthrough equation:

$$x_4(t) = r_4 (\rho_{41} y_{41} + \rho_{42} y_{42} + \rho_{43} y_{43}) [1 - \lambda_4 (\rho_{41} y_{41} + \rho_{42} y_{42} + \rho_{43} y_{43})]$$

Basic conditions: $\rho_{41} + \rho_{42} + \rho_{43} > \sigma_{41} + \sigma_{42} + \sigma_{43}$, $\rho_{42} > \rho_{41}$, $\rho_{43} > \rho_{41}$

Evolutionary parameter: $r=2$; $b=0.8$; $bx=0.7$; $by=0.7$; $rx=3$; $ry=3.1$; $ix=[0.7, 0.2, 0.6]$; $iy=[0.27 \ 0.6 \ 0.28]$; $cx=[0.45 \ 0.2 \ 0.5]$; $cy=[0.4 \ 0.45 \ 0.5]$

Figure 5 Policy Lock-in and Breakthrough Evolution

Figure 6 Investment and Financing Environment Breakthrough Lock-in and Breakthrough Evolution

4 Conclusion

First, we should improve the human resource culture system. The laser industry is a kind of professional and knowledge-intensive industry which strongly depends on the technological talents, therefore, absorbing and cultivating comprehensive high-quality talents who have skillful science and technology techniques, solid professional knowledge and outstanding management ability is the foundation of improving independent innovation ability of high-tech industries. Second, increase investment. The laser industry is a high and new technology industry so adequate funding for research

expenditure lays the foundation of its development. If the research funding is not adequate then the new core techniques are hard to gain and the whole industry's development will be affected. Last but not least, strengthen technological innovation system construction. The cultivation of the core technologies is the key to improve the independent innovation of the laser industry and there are two ways can be taken: one is that some products can rapidly realize the industrialization production through importing technology or manufacturing equipments and strengthen the production capacity of manufacturing a complete set of equipment so as to cultivate core techniques; the other is that developing new products and forming new industry, at the same time putting efforts on importing, digesting and absorbing, developing own manufacturing facilities as well as continuously developing own core technologies on the basis of its own core technology gained. Its own core technology are supposed to be formed covering the all links of the laser industry chain including components, laser devices, integrated laser devices and laser technology application, so as to make industry layers collaborate with each other and form a benign circulation.

National Innovation Systems and Developing Countries: A Critical Review of Literature

Nyambayar Bukhchuluun

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: nyambaa_nbr@yahoo.com)

Abstract: Developed over the past three decades, the national innovation system concept (NIS) has been widely used by both scholars and policy makers to explain how interactions between a set of distinct, nationally bounded institutions supports and facilitates technological change and the emergence and diffusion of new innovations. This concept provides a framework by which developing countries can adopt for purposes of catching up. Initially conceived on structures and interactions identified in economically advanced countries, the application of the NIS concept to developing countries has been gradual and has coincided-in the NIS literature-with a move away from overly macro-interpretations to an emphasis on micro- level interactions and processes, with much of this work questioning the nation state as the most appropriate level of analysis, as well as the emergence of certain intermediary actors thought to facilitate knowledge exchange between actors and institutions. This paper reviews the NIS literature chronologically, showing how this shift in emphasis, while offering insights to how new technologies are selected, developed, and diffused, has also diminished somewhat the importance of both institutions, particularly governments, and the process of institutional capacity building. In doing so, the paper suggests that more recent literature on intermediaries such as industry associations may offer valuable insights to how institutional capacity building occurs and how it might be directed, particularly in the context of developing countries where governance capacities are often lacking, contributing to less effective innovation systems, stagnant economies, and unequal development.

Key words: National innovation systems; Development; institutional capacity; Intermediaries; Industry associations

1 Introduction

Innovation, understood as the recombination of existing ideas or the generation of new ideas into new processes and products is widely viewed as the main driver of growth in modern capitalistic economies. In most accounts, the national innovation system (NIS) concept is described as that set of national institutions which contribute to generation and diffusion of new technologies and which provide the framework within which government and firms negotiate policies to influence the innovation process.

The gradual inclusion of developing countries within the NIS discussion has coincided with several interrelated shifts in the NIS literature occurring over the past three decades: (1) a move away from macro institutional explanations to a focus on specific system processes, (2) a more recent emphasis on the role of intermediary and non-governmental actors in this regard, and (3) the increasing internationalization of the NIS concept.

The aim of this paper is to provide a comprehensive review of the NIS literature, seeking to characterize and explain these changes and their implications within the context of a limited yet growing body of work on the role of intermediaries, particularly industry associations, in developing countries. In doing so, it suggests that an emerging emphasis on such intermediaries in developing countries offers valuable insight on linkages between the often disconnected processes – within the NIS literature – of technology creation and diffusion and processes of institutional capacity building and governance.

2.1 National innovation system: early concepts and approaches

Derived in part from the ideas of List and his concept of *national systems of production*, the NIS concept was first proposed by Freeman as a response to the *Washington consensus* and to the neoclassical approaches to growth. In this way, the NIS concept has always been intrinsically linked to public policy. For Freeman and others, technological change and innovation are central to economic growth – a notion Freeman pointed to as obvious since the industrial revolution and already well established by Schumpeter. Furthermore, innovation, in this view, is understood as not only the work of individual firms, but as a collective endeavor, requiring diverse and substantive sets of knowledge, resources and expertise. As such, different countries will have different capacities for innovation. Unlike the neoclassical view of growth, therefore, the NIS concept argues that governments and collective activities can and do play a central orchestrating role in the generation and diffusion of innovation in a

national economy. Freeman (1987) made this point quite clear in his analysis of Japan's post-war 'catching up' policy. In other words, institutions matter: they can create and support an environment through which collective knowledge and resources can be more easily exchanged for the pursuit of new ideas and opportunities, in what are increasingly complex and inherently uncertain enterprises.

Some early studies correspond to work that looks at the role of intermediaries, but not from an innovation systems perspective. Looking primarily at firm based collaboration, this work views intermediaries as performing three primary functions. First, the function of *information collection and information exchange* through respective networks. In this role, intermediaries scan for network related information (e.g. actors, activities, and trends within a network and possibly outside it), collect and package this information, and then share it with network members. Such information might include current and emerging technologies, new products and processes, changing regulation, and potential partners and competitors. Second, in sharing information with network members, intermediaries can directly contribute to the *construction or development of a said network*. By bringing similar and/or complementary actors together, the intermediary acts as an important network selection mechanism, both in determining, to some degree, which actors can enter and maintain a position in the network and, in doing so, facilitating the technological transfer and diffusion of certain technologies within the network over alternative technologies. In this construction role the intermediary can also contribute to the collaborative culture and structural characteristics of the network, encouraging certain network norms (e.g. frequency and modes of interaction between members).

Finally, once a collaborative relationship between network members are established, intermediaries can then help *manage and develop* those relationship, *facilitating the collaboration process*. They may do this by recognizing the changing collaborative needs of the parties and facilitating both parties in identifying and meeting those respective needs, thus furthering the development of the relationship. In doing so, the intermediary may become both the point of contact and venue for initiating and conducting meetings between the respective parties as collaboration becomes more direct and/or complex.

2.2 New conceptual boundaries and process dynamics of NISs

While the NIS concept took hold as a policy prescription for catching up and was further bolstered by the popularity of Porter's (1990) theory of 'the competitive advantage of nations', early concepts of the NIS came under increasing criticism for being too vague, open to misinterpretation, and too inclusive to the point of being impractical, as well as concerns that the national emphasis of the concept missed what was felt as the more important underlying processes through which innovations actually come about. As a result, several concepts were developed that while ground in innovation systems theory, and ideas of collective learning and path dependency, considered innovation "at other levels of the economy than the nation state". As mentioned previously, the first of these was the *technology systems* approach proposed by Carlsson and Stankiewicz which begins with a particular technology and looks at what actors and institutions influence its development and diffusion. The second was the sectoral systems of innovation approach developed by Breschi and Malerba (1997) who argued that innovation could be best understood by looking at a set of products and a distinct set of agents who interact through networks in the development, production and sale of those products. These agents hold sector specific knowledge and their interactions are influenced by institutions that may have both local and international dimensions. Importantly, Breschi and Malerba argued that looking at innovation at the sector level offered greater insight to how sectors and thus sets of technologies interact and change over time.

The third approach was the regional innovation systems (RIS) concept which proposes that innovation is best understood as a local or regional phenomenon where interactions, knowledge exchange and learning occur between geographically proximate actors and institutions which are bounded to a particular location. The RIS concept is based on the observations that high-tech innovative activity tends to agglomerate in a select number of high capacity metropolitan regions – home to high tech industries, research universities, financial and legal institutions, government agencies, and highly skilled labor – and that the tacit and asymmetric knowledge flows that characterize innovation are best communicated through face-to-face interaction which co- location facilitates.

2.2.1 Functions, process dynamics, and politics

Moving beyond the mainly structural framework offered by the NIS concept, approaches to innovation systems such as those above looked to not only how innovation systems facilitate the emergence and diffusion of innovation, but the extent to which such systems are effective in doing so. To this end, Jacobsson and Johnson (2000) proposed a *functions approach* to innovation systems which set out to first identify the primary functions of an effective innovation system and to then determine the

relative importance of various functions and related interactions pertaining to both the innovation process and the growing capacity of a particular innovation system. What was somewhat novel about this approach is that while it was applied primarily to *technology* innovation systems (i.e. the micro systems level), the set of functions eventually identified can potentially be used for understanding innovation systems at different levels of analysis, from technology and sectoral systems up to the regional and national systems of innovation. Based on a number of previous studies that have taken a functions approach to innovation systems propose a list of seven primary functions that effective innovation systems support: (1) entrepreneurial activities; (2) collective learning; (3) knowledge diffusion through networks; (4) technology selection/promotion; (5) market formation; (6) resource mobilisation; and (7) technology legitimacy/overcoming resistance. Importantly, positive fulfilment of these functions and interactions between them are viewed as leading to virtuous cycles of innovative activity, whereas a lack of any one function fulfilment or interactions can lead to system inefficiencies and failure (e.g. an inability to overcome incumbent resistance to a new and improved technology).

In verifying the set of above functions, studies by Bergek and Jacobsson (2008) employ a historical event analysis method to essentially map the events, interactions, and processes involved in particular technology innovation systems in the successful development and commercialisation of various clean technology innovations in Germany (e.g. biofuels and solar cell technology). Both of these studies found similar trajectories and patterns regarding system functions and interactions: (1) responding to exogenous events and trends (e.g. global warming and competitive forces), governments introduce incentives (e.g. tariffs, subsidies, funding) to encourage investment in particular technology areas; (2) these incentives stimulate entrepreneurial activity resulting in experimentation, knowledge exchange, and the development of nascent technologies and production systems – from which an initial yet limited market emerges; (3) aiming to improve viability and expand markets for these new technologies, entrepreneurs and industry, through the auspices of *industry associations and advocacy groups*, successfully lobby government for more incentives and institutional changes; (4) this success decreases uncertainty which encourages further investment, resource mobilization, and subsequent market growth. In some cases, virtuous cycles are punctuated by vicious cycles (e.g. initial regulation proves ineffective) requiring additional industry lobbying and subsequent policy correction.

From these technology innovation system case studies, three important notions regarding institutional interactions within innovation systems can be derived. First, the successful emergence, development, and commercialization of new technologies is the result of interactions and linkages between micro firm level processes and macro-level institutions: interactions that both purposively, and recursively link firm level processes to broader industry activities and government policies – demonstrating that technology innovation systems both shape and are influenced by a broader yet highly active national innovation system. In these case studies, it is government, at the national level, that initially stimulates entrepreneurial activity and then responds to the needs of nascent technology producers and the demands of a fragile yet emerging market. Second, while not the focus of these studies, it is *industry associations* that are identified as lobbying government on behalf of entrepreneurs and industry for greater incentives and advantageous market conditions – although not identified as such, these are industry associations playing the role of *institutional intermediaries*. Finally, the presence and interplay of both virtuous and vicious cycles demonstrates that politics and negotiations between institutions, as evidenced by the activities of industry associations, are both inevitable and central as processes through which institutions are informed, policy adjustments are made and incentives gained, industry standards are set and favorable market conditions created.

2.2.2 Applying NIS to rapidly emerging economies and less developed countries

While the majority of studies on innovation systems during this period looked at different levels of analysis other than the nation state (technology, sectoral, and regional innovation systems), and focused primarily on such innovation systems in the advanced economies of the North, a concerted shift toward the application of the NIS concept to developing countries was also occurring. Much of this involved studies that moved away from the newly industrialized economies of East Asia to focus on the large and rapidly emerging economies of China, India, and to a lesser extent Brazil. These three countries, particularly China and India, emerged rapidly as global economic powers following consecutive government policies toward greater economic liberalization: China's 'open door' policies of the late 1970s and market reforms in the 1980s and 1990s, and India's liberalization policies beginning in 1991. Although the actual policies employed by these two countries differed somewhat due to different historical and national contexts, the strategies employed for 'catching up' purposes were very similar. These included: greater openness to foreign trade and foreign direct investment, the denationalization of

certain industries (China), the opening up of indigenous industries to global competition, and greater support for private enterprise and entrepreneurial activity; along with co-current policies toward the technological development, maturation, and the global orientation of indigenous industries. These liberalization policies are very reminiscent of the catching up strategies employed earlier by Japan and the newly industrialized countries of East Asia.

In looking at the economic liberalization efforts and subsequent NISs of China and India, several points are worth further consideration. For both China and India, the state has played a significant role in carrying out reforms and shaping the innovation system. It might be argued however, that China's innovation system, the product of a single political party and a tendency toward central planning, relies very much on downward streams of information (i.e. the government acting upon macro generated information and the institutional strengths and bureaucratic biases of the state and its agencies), whereas India's innovation system, residing within a far more pluralistic state and devolved regional powers, might rely much more on upward streams of information (i.e. the government acting more upon information from both industry and civil society). As a result, China might be less capable than India in meeting the needs of rapidly changing and increasingly complex industries such as ICT and biotech, hampering its efforts to establish and grow such industries domestically. On the flipside, however, India's pluralism may allow certain industries or actors to dominate upward streams, influencing government policy to their benefit, yet to the disadvantage and underdevelopment of the wider economy.

These structural and political differences may have implications for how China and India engage and react to external flows of knowledge, capital, and commerce. Along the lines of Gu and Lundvall's argument above, it is possible that China's more top-down NIS may better protect the interests of indigenous industry at the expense of absorbing and developing radical innovations from abroad, whereas India's NIS, while possibly more capable of integrating global R&D flows, may do so at the expense of its indigenous industries. This raises questions as to how and to what extent the integration of foreign knowledge and technology into a NIS is informed and negotiated, particularly given the prominence of global interactions and interdependences exhibited by most high-tech sectors.

2.3 Internationalization of NISs and industry associations in developing countries

The concurrent ideas that NISs exist within and interact with an increasingly global economic system and that, within this context, different NISs will exhibit different capacities for innovation and competitiveness go back to the earliest iterations of the NIS concept. Within the NIS literature, the term internationalization or the globalization of the NIS concept is used in three ways, and these often interchangeably. The first is the notion that the NIS concept, conceived initially on frameworks identified in already developed countries can be transferred to the context of developing countries. While transferability is a long standing notion, its application to developing countries is a more recent trend. The second notion refers to the related and common practice in the literature of comparing the NISs of different countries – much of this between countries of the developed North. The third notion concerns the extent to which a country's NIS is characterized by global linkages and interactions (i.e. open to external knowledge flows). An example in the early literature is international interaction and global standard setting between leading research universities.

2.3.1 Industry associations and developing countries

As discussed previously, literature that purposively connects industry associations to NIS is limited and remains desperate among many existing threads; even though studies on technology innovation systems have identified industry associations as playing a prominent role in the innovation process. In applying the NIS concept to developing countries, however, it is apparent, as Kshetri & Dholakia, (2009) argue, that (1) governments are subject to considerable structural changes (i.e. these are not static institutions), (2) governments will be stretched to meet the growing needs of a relatively poor but increasingly upwardly mobile population (see Frankel, 2006), and as a result (3) governments will often “lack resources, expertise and legitimacy required in developing new templates and monitoring industry behavior”. In such contexts, they argue, industry associations “are likely to be more effective and efficient institutions” in articulating industry needs, mobilizing resources and working with government to develop and implement new regulatory frameworks.

As such, a recent study by Kshetri and Dholakia looked at the role of industry associations in India, explaining how India's National Association of Software and Services Companies (NASSCOM) facilitated the development of India's offshoring industry. According to this study, NASSCOM was particularly effective in articulating, both to the Indian government and the public, the supposed economic benefits of the offshoring industry by establishing a dissemination and diffusion network

involving government agencies, policy makers, member companies, and various social organizations (i.e. legitimizing the industry). NASSCOM also leveraged this network to actively participate in the development and enforcement of industry standards and practices (i.e. setting industry norms and behavior), gaining industry favorable tax incentives, and played a significant role in shaping India's intellectual property right laws. Kshetri and Dholakia argue that central to NASSCOM's success was the positioning and use of 'elite' members and officials (highly experienced and visible members of industry with deep government connections) to lead outreach and lobbying efforts, and an effective strategy of working with the Indian judicial system and courts – rather than central government agencies – “to enforce the substance of legal claims”. In the case of working directly with the courts, NASSCOM supposedly did this due to the perceived weaknesses of the courts regarding commercial and copyright law, and the probable lack of judicial oversight by a resource stretched central government; a prominent example of an industry association stepping in to fill a regulatory void, and initiating institutional reform.

Another study on industry associations in India by Arocena and Sutz (2007) also looked at the role and effectiveness of NASSCOM, but in comparison to the early efforts of industry associations promoting India's burgeoning biotech sector. According to this study, the biotech industry associations played a similar role to what NASSCOM did for outsourcing and ICT, including lobbying for tax incentives, working with government to strengthen the regulatory environment, setting industry standards, and shaping intellectual property laws. For knowledge diffusion among members, like NASSCOM, the biotech industry associations organize “seminars, workshops, fact sheets, participating in trade fairs and registering presence in key markets of export interest like the US etc.” Arocena and Sutz argue, however, that the major biotech industry associations at the time, the Association of Biotechnology-Led Enterprises (ABLE) and the All India Crop Biotechnology Association (AICBA) suffered early on from competing interests within their memberships and between the two associations, with ABLE viewed as representing only the interests (tax, regulatory, and export) of a select number of pharmaceutical companies located in Bangalore to the expense of the broader industry. As a result, the biotech industry was not as effective, initially, as the ICT industry, led by NASSCOM, in lobbying for incentives and in delivering benefits to a majority of its members. Despite differences, both case studies reveal strong politics of development. It is clear that NASSCOM and ABLE work closely with the state to promote innovation policy reforms which will have positive impact on their members' activities. Liberalization and integration with the world economy are two of these reforms.

3 Conclusion

This paper has sought to critically review the literature of NIS, focusing on industry associations. In doing so, it has identified three major shifts which can guide our conceptual understanding of the role of such associations in innovation and development. First of all, an early yet extensive body of work that captures the structures of national innovation systems and the interactions between various actors. During this period, ideas from innovation and evolutionary theory such as collective learning and path dependency were applied, although most studies at this time present innovation systems as presently comprised (static) and from a macro-level perspective. While looking almost exclusively at developed countries, NIS studies on both developed countries and newly industrialized countries at the time showed insightful differences between countries regarding incentives and competencies. While some reference is made to intermediaries as institutional actors, their role and function in the NIS is not concretely identified.

Secondly, a later wave of NIS literature questioned both the macro-approach of earlier studies and the importance of innovation systems as a solely national concept. As such, this literature developed concepts of technology, sectoral, and regional innovation systems. This diverse work placed a growing emphasis on processes, relation and spatial dynamics between actors leading to insight as to how new technologies arise, develop and diffuse and to how innovation systems evolve over time. In this literature, the role and contribution of industry associations begins to emerge, particularly regarding advocacy and lobbying. This period also saw an increasing number of studies looking at the NISs of emerging economies such as India, Brazil, and China along with developing countries such as Indonesia and the Philippines, although much of the emphasis here is on sectoral systems of innovation.

Thirdly, a subset of more recent literature shows a growing emphasis on the internationalization of innovation systems, looking more closely at the role and activities of MNCs and the prominence of global knowledge flows and markets. For developing countries, this raises questions and opportunities

concerning global linkages as mechanisms for building innovation capacities, as well as questions of autonomy, influence, and control. This coincides with a growing literature on innovation within certain high-tech sectors such as ICT and biopharmaceuticals occurring in emerging powers such as India and South Africa. Within this literature, there is increasing yet limited work on the role of industry associations in developing countries (e.g. ICT in India), but a significant gap remains as to the diverse set of functions and activities that these industry associations actually perform.

In conclusion it might be said that although the NIS literature has so far paid little attention to the role of industry associations in innovation, the current shift towards emerging economies and less developed countries requires more systematic investigation of these institutional intermediaries and their role in influencing politics of development. Only this way we can achieve better understanding of innovation institutions in developing countries.

Developing Innovative Products in China's Consumer Electronics Market: From Customer-Oriented to Value-Driven Marketing

Allan Gueye Mane

School of Management, Wuhan University of Technology, Wuhan, P.R China, 430070

(E-mail: mane.allan@yahoo.fr)

Abstract: Consumer behavior changes have led to changes in company marketing practices. Today's marketers have to pay closer attention to people's behavior and needs in order not to lose relevance especially in high growth markets and industries such as Consumer Electronics. The Purpose of this paper is to first analyze the approaches used by Chinese consumer electronics companies to develop innovative products and finally propose a framework for the integration of value-driven marketing practices. The paper adopts a multiple case study approach and finds that the most successful innovators are deep need seekers, market readers and sometimes technology drivers who value customer needs satisfaction and infuse service value into brand value. We draw as a conclusion that the integration of value-driven practices through business model transformations and new business perspectives should enhance the companies' product-related and non product-related differentiation capabilities and creativity, Customer Engagement and more importantly lead to enhanced product innovation capabilities, business model innovation, brand reinforcement and better customer experience.

Key words: Innovation; Value-driven Marketing; China; Consumer Electronics

1 Introduction

To survive and have a good positioning in the industry they are evolving, companies need fundamental ways to generate new ideas and bring them to the market. New product development and innovation enable companies to gain competitive advantage by conceiving and creating revolutionary, state-of-the-art products and services for new or extra uses. With the fast changing business environment and a tough competition centered in the newest technology, developing and providing the right innovative products in the consumer electronics industry has become a great challenge for marketers. The basis for competition has fundamentally moved from product or price to process or service value where deeper levels of engagement and more connection make a successful product. On one hand, in order to satisfy their needs, the marketing team is supposed to use the companies' resources and capabilities to solve the customers' problems by getting inside their imaginations. On the other hand, the marketing department's core functions may recently have encountered a shift from understanding and satisfying the customer needs to understanding what will captivate them. Over the past 60 years, marketing has moved from being product-centric (Marketing 1.0) to being consumer-centric, Marketing 2.0 and today, marketing has seemingly evolved from customer-oriented to value-driven (from Marketing 2.0 to Marketing 3.0) in response to the new dynamics in the environment (Kotler et al, 2010). It has become more crucial to bring variety and create deep and meaningful value to customers' lives instead of only looking for what the customer wants because sometimes the customer does not really know what he wants and is willing to be surprised. Is there a fundamental alteration in the approaches used by Chinese companies to develop innovative consumer electronics products? How can value-driven marketing be beneficial to Chinese companies in the development of innovative consumer electronics products?

This paper builds on Kotler's theory about value-driven marketing and analyzes the approaches used by Chinese companies to differentiate themselves from the competitors in the development of new but innovative products in the consumer electronics market and finally proposes a conceptual framework that highlights the benefits of combining deep researches on customers needs with customer needs anticipation and value-driven marketing practices.

2 Literature Review

2.1 From customer-oriented (marketing 2.0) to value-driven marketing (marketing 3.0)

According to Kotler et al. (2008), customer-oriented marketing departments study customer needs and wants in well defined market segments with the major responsibility of identifying and interpreting marketplace change. More than any other group in the company, they must be trend and opportunity seekers. They allocate marketing effort in relation to the long-run profit potential of the targeted segment

by developing winning offers for each target segment which enables to find the right products for the customers. However, Narver et al (2004) argue that understanding and meeting customers' expressed needs will lead to low-level innovations; that high level innovation is possible if the focus is on customers' latent needs. Moreover, according to some critics such as Kotler's, the consumer-centric approach implicitly assumes the view that consumers are passive targets of marketing campaigns; that consumer empowerment will lead to highest levels of innovation.

In 2010, Kotler, in cooperation with Hermawan Katajaya and Iwan Setlawan, presented his latest marketing findings where the key aspect is the advancement from consumer-oriented marketing to value-driven marketing, a radical move from product or price as the basis for competition, to process or service value. According to Kotler (2010), there is a major rethinking of marketing which is having a profound impact on the behavior of producers and consumers because of 1) the restoration of confidence and economic growth after the recent financial meltdown, 2) the economic power rapidly shifting to emerging countries that are experiencing higher rates of growth than the rich countries and 3) the technology shifting from the mechanical world to the digital world.

Marketing has therefore come to an era, in which horizontal communication and values like honesty, originality and authenticity become important: Marketing 3.0 or the values-driven era (Kotler et. al, 2010). In fact, Marketing 3.0 relies heavily on the marketers' ability to sense human anxieties and desires, which are rooted in creativity, culture, heritage, and the environment. In other words, it includes principles to drive deeper levels of engagement and connect more completely with consumers (Kotler et al., 2010) in order to deliver more value.

Table 1 Evolution and Comparison of Marketing Concepts

	Marketing 1.0 Product-centric Marketing	Marketing 2.0 Customer-oriented Marketing	Marketing 3.0 Value-driven Marketing
Objective	Selling products	Satisfying and retaining the customer	Make the world a better place
Enabling forces	Industrial Revolution	Information Technology	New wave technology
How companies see the market	Mass buyers with physical needs	Smarter customer with mind and heart	Whole human with mind, heart and spirit
Key marketing concepts	Product development	Differentiation	Values
Company marketing guidelines	Product specification	Corporate and product positioning	Corporate, vision, values
Value propositions	Functional	Functional and emotional	Functional, emotional and spiritual
Interaction with consumers	One-to-many Transaction	One-to-one relationship	Many-to-many collaboration

2.2 New product development and innovation in the Chinese consumer electronics industry

New Product Development (NPD) is usually considered as a preliminary step in product or service development because it involves stages that must be completed before the launching of the product in the market. However, it is a broader field dealing with the design, creation and marketing of new products. New products are vital to the growth and prosperity of most manufacturing firms (Cooper and Kleinschmidt, 1987). NPD can be a way to improve an already established product in order to keep up with market trends and changes or a way to compete with particular products or services through innovation. Zhongguancun, considered as China's Silicon Valley, provides an innovation-driven environment that enables the development of world-class innovative products and the implementation of new technologies (Van der Toom, 2013). The Booz and Company 2013 China Innovation Survey contradicts a piece of conventional wisdom that innovation in China tends to focus on copying and making incremental improvements to existing products. In fact, the survey has showed that Chinese companies, to a higher degree than most global competitors, pursue the same kind of innovation strategies that are practiced by the world's most successful innovators, notably companies based in Silicon Valley. As Chinese companies become more competitive in innovation, they increasingly worry about potential obstacles to further innovation growth. The areas of concern include difficulties in understanding market needs, particularly in the industrial sectors (Booz and Co., 2013). Consumer electronics (CE) being electronic equipment intended for everyday use typically include mobile market, fitness and health tech, smart devices, gaming devices, computer hardware, computer software, and digital distribution. Competition in the consumer electronics market is tough and sometimes customers do not always know what they want; they love to be surprised. Therefore, the challenge in innovation is

not only technical but also commercial for the development of affordable new versions of products.

Should companies still do deep research about customer needs before launching new products or should they develop new products based on brand new concepts?

Is Customer needs satisfaction a sufficient approach to develop and launch innovative products in the Chinese consumer electronics market? If consumers are well informed and can easily compare several similar product offerings that all can satisfy their needs, what should marketers do to become a particular magnet for clients and prospects? How can value-driven marketing enhance Chinese consumer electronics companies' innovation capabilities?

3 Research Methodology

A descriptive study of the business models, innovation level, product offerings, and marketing practices of top ten ranked innovative companies in the Chinese consumer electronics industry was conducted. As a research strategy, a multiple case study approach has been used. To collect data, a qualitative search and multiple-source secondary data approaches was adopted in order to get multiple sources of evidence. The data have been collected from company releases, articles, newspapers, management journals, industry data, established theories, company reports, government institutions, and industry surveys. The data were analyzed using content and thematic analysis.

4 Chinese Consumer Electronics Companies: Approaches to Innovative Product Development

The Booz and Co. 2013 China Innovation survey posed a series of questions about the innovation strategies that companies are pursuing, using the taxonomy developed over the last eight years in Strategy&'s Global Innovation 1000 study, which slots innovators into three categories: Need Seekers (superior end-user understanding), Market Readers (creating value through incremental innovations), and Technology Drivers (leveraging R&D investments to drive both breakthrough innovation and incremental change, in hopes of meeting the known and unknown needs of their customers via new technology). The 2013 China Innovation Survey shows that a much higher share of Chinese companies are following the Need Seeker strategy. Fully 44 percent of the Chinese companies surveyed see themselves as conducting activities that make up the Need Seeker strategy. Chinese companies also favor different innovation tools. For example, at the ideation stage, they are making greater use of customer-focused tools such as direct customer observation and end-user/customer focus groups with less use of feedback from sales/customer support, and technology road mapping.

Table 2 Innovative Chinese Consumer Electronics Companies

Companies	Sources of Innovation	Product or Service
Business Model Innovators		
Xiaomi	Pricing strategy reinvention of the smart phone business model Partnership with Google to offer creative and valuable products	The Red Rice sold out in less than 90 seconds and piling up more than 7 million preorders MiPad, the first tablet featuring Nvidia's Tegra K1 mobile processor
Haier	Customer needs anticipation Customer feedback Customer observation Employee self organization	Tianzun air conditioner Sweet potatoes and fruits washing machine for peasants Mini-refrigerator with a computer desk for students
Tencent	Internet user intelligence Micro innovation Execution excellence	WeChat, the fifth-most-used Smartphone app worldwide in 2014
Altering the Customer's Way of Life		
Baidu	From software to hardware	Xiaodu iErmu, a Wi-Fi-controlled camera for monitoring children, aging parents, or pets from afar
Geak	Wearable-tech pioneer	Smartwatch and novel Geak ring
Phantom	Focused product line and Affordable price points Addressing consumer concerns about air pollution	App-controlled EcoTower for air clearing in Beijing Energy-efficient lightbulbs
Haier	Making home appliances connected to a network and then through a smartphone application	U+ system, for air quality supervision

Technology Drivers		
Hisense	New Generation TV	ULED TV and VIDAA2 TV
LeTV	Full package of services	The platform + content + terminal + devices +application combo
Inspur	Program Combination	I50, a portable TV that adopts Android 4.2 system
Vivo	New technology Product Development	Xplay3S, the world's first smartphone with a 2k HD screen and Quad HD panel Smart Touch and Smart Motion

5 Conceptual Framework for Value-Driven Marketing Integration

Through Customer-driven marketing practices, companies can continuously gather and evaluate ideas for new products, product improvements, and services. Thanks to that “sense-and-respond” philosophy (Kotler et. al, 2009), customer-driven marketing can be a source of innovation. However, if marketers are to respond to the environment and consumer behavior changes in order to differentiate their offers from the competition and be more creative by delivering innovative solutions to meet human needs through sustainable principles, they ought to integrate value-driven marketing practices and communicate their values to the customers and collaborate with them. This process usually requires business model transformations, refined business processes and new business perspectives that are necessary to enhance the brand’s mission. A clearly defined brand mission that provides great value and connects emotionally should lead to a good brand reputation, which participates to the enhancement of customer engagement. Engaged consumers may co-create experience and value, and contribute to organizational innovation processes and consumer loyalty (Hoyer et al., 2010; Prahalad and Ramaswamy, 2004; Brodie et al., 2011).

5.1 Sources of innovation in value-driven marketing: collaboration and co-creation

Collaboration can be a new source of innovation. Companies must collaborate with one another, with the shareholders, the consumers, competitors, trade magazines, media, government agencies, advertizing agencies, universities and commercial laboratories, distributors and suppliers. They can share similar sets of values and desires and give suggestions about new product possibilities (concepts, techniques and materials). For instance, inviting the customer to participate as a co-creator in the company’s development of products and communications is a powerful method for business leaders to differentiate their companies from competitors, all the while creating more value for customers. Therefore, we believe that the combination of customer-oriented marketing practices with value-driven marketing practices should lead to enhanced product innovation capabilities, business model innovation, brand reinforcement and better customer experience.

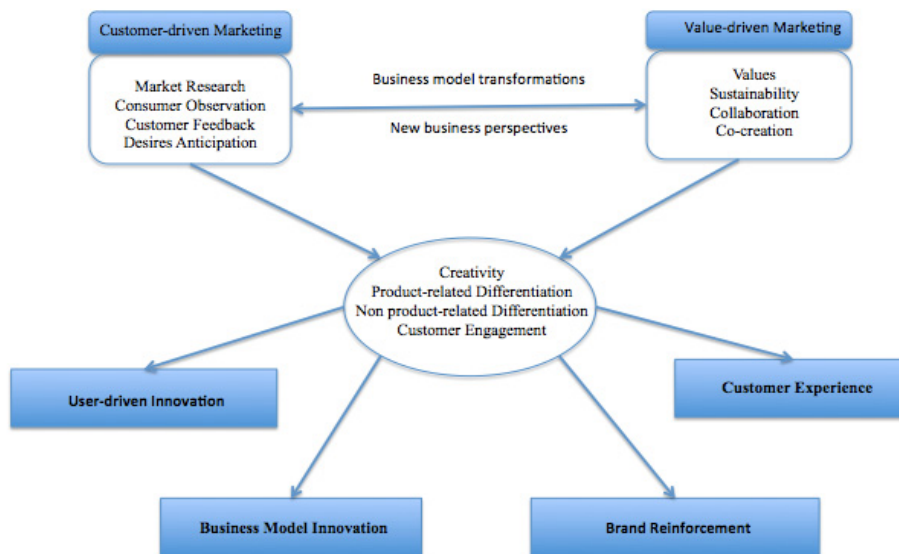

Figure 1 Conceptual Framework

-User-driven Innovation: provides better product innovation capabilities. It is characterized by the development of customer-driven models that focus on a participatory approach to user involvement in the design of new products and services such as customer participation platforms, multiple stakeholder interactions and virtual customer experience environments.

- Business Model Innovation will become as important as technological innovation (Chesbrough, 2006). The business model is the main way for a business to create value for its customers and captures some piece of that value for itself. Value-driven marketing requires changes in the business model which means the way the product or the service is offered to the market. Business model innovation implies a deep communication of the values to the employees, which can lead to Entrepreneurial Innovation. For example, Haier's autonomous project teams that self-organize.

- Brand Reinforcement is enabled by a sound communication of the company's mission and values that convey the meaning of the brand to the customers in terms of offerings, core benefits as well as the uniqueness of the offerings. New products and relevant marketing program changes can have an impact on the product success.

- Customer Experience is all about creating an integrated experience for the customer. How the customers feel when they interact with the company and its offerings greatly depend on the company's efforts to tie emotional bonds with the customers. Co-creating and co-designing with customers can increase the customer lifetime value (CLV).

6 Conclusion

Marketing is still about developing segmentation, choosing the target segment, defining the positioning, providing the four Ps, building brand around the product and having an acute insight of consumer needs and a new product development that suits the market. However, the fast changing business environment and consumer empowerment and risks related to new technologies have created certain alterations in marketing practices. In addition to its basic functions, Marketing consists nowadays of implementing a whole package of product and service proposal ranging from the product itself, useful accessories, an ongoing information service provision, to customer feedback and co-creation. Most of the companies studied know how to create value for their customers. Some of the companies implicitly develop some value-driven practices in the way they empower their customers and the way they connect with them through brand equity, social responsibility and social media. However, they are not very focused on new innovation sources such as open innovation, collaborative marketing, and co-creation.

We believe that both customer-driven and value-driven marketing are necessary to deliver superior value to the customer. Successful value-driven marketing practices cannot be implemented without the basics of customer-driven marketing. In a market like China, the fragmentation of customer needs across the vast country make it more and more important to understand the customers' needs in order to tap into demand in lower-tier cities. This paper thus proposes a model for the integration of both practices. However, further empirical research is needed to determine the relationship between product innovativeness, co-creation and customer experience or the impact of value-driven practices on business model innovation or brand reinforcement.

Study on the Evaluation of City Innovation Ability in Beijing

He Yun

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 763884892@qq.com)

Abstract: The construction of innovative city is the most important way to improve the core competitiveness of the city. A scientific evaluation, which can accurately and objectively reflect a city's innovation oriented construction level, so as to promote the sustainable development of the innovative city. This paper builds the evaluating indicator of innovation ability of city from four aspects. Then, it builds the model of evaluation on innovation ability of city by principal component analysis. Finally, we evaluate the innovation ability of Beijing in the last ten years based on the statistical data and relevant information of the National Bureau of statistics.

Key word: Innovative city; Innovation ability; Evaluation; Principal component analysis

1 Introduction

Innovative city is an important pillar of the innovative country, is the center of the regional innovation system. Innovation ability is a comprehensive reflection of the knowledge and technology development of the city, which is the key to the sustainable and healthy development of city economy, it is of great significance for the evaluation of city innovation ability^[3]. Evaluate the innovation ability of a city objectively and correctly, has a special significance for the development of urban development strategy, the choice of development goals and the cultivation and promotion of competitive advantage.

At present, many cities in China are in the initial stage of the transition to a innovative city. In the competition of innovative city development, a clear direction of development will avoid blindly arrogant. Study on city innovation ability, is conducive to the strengthening of the city's understanding of their own situation, clear the gap between the cities of the same kind, thus for the sustainable and healthy development of the innovative city provide reference^[5]. Therefore, to strengthen the study of urban innovation ability is conducive to the construction and development of innovative cities and the realization of the national construction innovation system.

2 The Status of Evaluation Study of City Innovation Ability

Innovative city is a kind of city which mainly depends on the development of science and technology, knowledge, talent, culture, system, idea and so on. It has a wide influence and plays a leading role. Among them, the concept of innovation is the guide, knowledge innovation is the condition, the cultural atmosphere innovation is the foundation, the science and technology innovation is the core, the innovation talented person is the power, the system innovation is the safeguard.

In terms of city innovation ability evaluation index system, foreign scholars hasn't been studied directly, the related research only European Innovation Scoreboard and Hudgens knowledge competitiveness index system slightly representative. In China, scholars mainly based on the regional innovation ability evaluation index system to analyze innovation ability of city. Today, domestic research on innovative city evaluation system mainly concentrated on urban innovation capability, but also did not form comprehensive evaluation research. The research of city innovation capability evaluation is initial and there are many defects.

First, the selection of the evaluation index in the evaluation system is diversity and each has its own merits but no specific criteria^[6]. Secondly, the domestic evaluation study is based on two aspects: classification evaluation and comprehensive evaluation. The evaluation results of these two methods will be misleading to the target of the construction of innovative city. For example, classification evaluation allows a single index repeated, it will exaggerate the role of this indicator and guide the city to focus on building in this aspect^[8]. The structure of comprehensive evaluation system is more comprehensive, but often partial to amplify the influence of the science and technology innovation in evaluation and ignore the construction of other non innovative elements. Finally, the existing studies are mainly quantitative indicators, lack of qualitative indicators, and the system of innovation, cultural innovation and other indicators of quantitative, will produce an unfair evaluation results^[6].

Through the scientific and quantitative assessment of the innovation ability of Beijing, the government can provide the decision-making for the government to carry out the innovation project and measure the effectiveness of city innovation system, the progress of the project to carry out real-time

feedback; It can be helpful for the decision makers to discover the problems in time, and help to formulate effective policy control the situation and to guide the direction of follow-up work.

3 Principal Component Analysis

Principal component analysis(PCA) is probably the most popular multivariate statistical technique and it is used by almost all scientific disciplines. Its origin can be traced back to Pearson and Karl who apply it to the study of non random variable, but its modern instantiation was formalized by Hotelling who extended it to random variable research^[2]. The basic idea of PCA is to establish the original variables which are inter-correlated, then reduce the dimensionality of a data set consisting of a large number of interrelated variables, while retaining as much as possible of the variation present in the data set. In this process, the total variance of the variables is constant, and the new variables are sorted in descending order, and the greater the proportion of the variance contribution rate is, the more the role of the comprehensive evaluation.

Using principal component analysis method to determine the weights has the following advantages: 1) extract the most important information from the data table and eliminate the influence between evaluation criteria; 2) can reduce the workload of the index selection; 3) when we use PCA to analyze the problem, according to the size of the variance, the principal component is arranged in sequence depend on the size of the variance, we just use the first few retain most of the variation present in all of the original variables that can reduce computational effort^[9].

PCA calculation steps are as follows: 1) the original data standardization transformation; 2) Calculate the Correlation Matrix of sample; 3) calculate the correlation matrix eigenvalues and eigenvectors; 4) calculate the contribution rate of each variation; 5) Rescale Principal Components(PCs) and choose the number of PCs according to the cumulative contribution from quasi extracting principal component; 6) using the principal component of evaluation to make a comprehensive analysis.

4 Evaluation Indicators System of Innovation Ability of City

4.1 The principle of choosing evaluation indicators

The establishment of the evaluation system of urban innovation ability should follow the principle of scientific, systematic, representative and operational^[9]:

1) Scientific principle. Index set must be based on the premise of scientific nature, the meaning of the index should be clear, and the calculation method can be used to reflect the connotation and extension of innovation system. It should be from the actual situation of the city, and can basically meet the domestic and international urban evaluation of the general standard requirements.

2) Systematic principle. It must make a comprehensive reflection of the innovation, must take into account its systematic, integrity. Not only should include government investment in innovation, but also related to the political, economic, institutional and cultural and so on.

3) Representative principle. In the selection process of the index, try to select the typical, which can represent a certain area and overlap with the other indicators less indicators.

4) Operability principle. Innovation is a full range of dynamic changes in the process. Such as people's life style, spirit and value of the change is difficult to use accurate data measurement. Therefore, evaluation index should be determined from the practical point of view, the evaluation index must comparable and can be measured and available in reality.

4.2 The establishment of evaluation indicators system

In many of the city's innovation ability evaluation index system, the different evaluation system has different emphases, which involves a variety of indicators. In order to measure the city innovation ability scientifically, objectively, accurately and reasonably, this paper puts forward the evaluation index system of the urban innovation ability to reflect the systematic, operational and representative. On the basis of reference to the research on the evaluation index system of innovative cities both at home and abroad, starting from Innovation resources, innovation carrier, innovation environment, innovation output, 12 representative indexes were selected, and the corresponding statistical evaluation index system was established. Including culture, education, science, technology, infrastructure, comprehensive economic indicators of a total of 12, as it shown:

X_1 —Population(Million)

X_2 —GDP (Billion);

X_3 —Per capita GDP (yuan);

- X_4 —The number of technology people (Ten thousands);
 X_5 —Large and middle scale Industrial enterprise research number(%);
 X_6 —The books number of public library per million(copies);
 X_7 —Authority for patent (item);
 X_8 —Invention patents accounted for the proportion of patents(%);
 X_9 —the proportion of R&D expenditure account for GDP (%);
 X_{10} —Industrial output value of high tech industry(billion);
 X_{11} —Third industry specific gravity(%);
 X_{12} —The local technology and education financ allocate account for the total (%).

5 Case Study

The dataset that has been used in our case study has been obtained from Beijing statistical yearbook, science and Technology Statistics Yearbook. We have chosen 2004-2013's data in study and use SPSS17.0 statistical software to extract the main factor and calculate the score. In this way, we can have a comprehensive and systematic evaluation of Beijing urban innovation capability. The original data is shown in Table 1.

Table 1 Original Data

	X1	X2	X3	X4	X5	X6	X7	X8	X9	X10	X11	X12

First, in order to avoid the influence of dimension and order of magnitude, the standard treatment of raw data is needed. The new variable is described by $ZX_1, ZX_2, \dots, ZX_{12}$

Second, using SPSS17.0 software as an analysis tool, through Analyze - Correlate - Bivariate tool, we can establish the variable correlation coefficient matrix as shown in Table 2.

Table 2 The Correlation Matrix

The criteria we take into account for the number of the retained components are: the cumulated contribution percent in variation explained by the retained components should be higher than 85% and the eigenvalues of each retained component should be higher than 1.

We choose Analyze – Data Redution – Factor in SPSS to determining the number of principal component. As shown in Table 3, the dimension reduction results show that the eigenvalues of the first 3 components are greater than 1, and the cumulative contribution rate is 91.898%, that is, about 92% of the total variance can be explained by 3 potential components. In Table 4 are indicated the data after factors' rotation.

Table 3 Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	8.392	69.930	69.930	8.392	69.930	69.930

The data in Table 5 lead to the final conclusions on the factorial structure of the analyzed variables, as follows:

1)The first principal component in $X_1, X_2, X_3, X_4, X_6, X_7, X_9, X_{10}, X_{11}$ have a large load. These 9 indicators mainly reflect the comprehensive strength of the city's innovation from social, economic, scientific and technological this four aspects, it can be interpreted as the city's comprehensive strength of innovation.

2)The second principal component is strength on X_8 , can be interpreted as the regional innovation ability.

3)The third principal component in X_5, X_{12} have a large load, can be interpreted as innovation investment.

Dealing with the data in Table 4, each data divided by the square root of the corresponding

eigenvalues, the corresponding principal component score can be obtained in this way.

After calculating the scores of the principal components, using comprehensive factor score formula: $\sum F = (F_1 \times f_1 + F_2 \times f_2 + F_3 \times f_3) / (f_1 + f_2 + f_3)$, to calculate the comprehensive score. The principal component is arranged in sequence depend on the comprehensive principal values and the score is the basis for the evaluation of the innovation ability of Beijing City.

Table 5 The Scores and Order of Components

	F1	Rate	F2	Rate	F3	Rate	F	Rate
2004	-4.1327	10	-2.175	9	-1.7	9	-3.6141	10
2005	-2.9454	9	-2.307	10	-0.837	7	-2.6364	9
2006	-2.3676	8	-1.757	7	2.0099	1	-1.821	8
2007	-1.4	7	-1.948	8	0.9494	3	-1.2228	7
2008	-0.6617	6	-0.545	6	1.4155	2	-0.4252	6
2009	0.44368	5	2.2519	2	0.4998	5	0.68955	4
2010	1.01761	4	0.1875	5	-1.749	10	0.61314	5
2011	2.27775	3	2.0721	3	-0.498	6	1.95514	3
2012	3.7249	2	3.305	1	0.8571	4	3.36411	1
2013	4.04348	1	0.9161	4	-0.947	8	3.09765	2

As shown as table 6, the comprehensive score of innovation ability in Beijing is increasing. That since 2004, Beijing's urban innovation ability is continuously enhanced.

From the innovation index data and comprehensive score of the calendar year, the total social investment for R&D is increasing accounted for the proportion of GDP, the increasing number of patents and invention patents accounted for the proportion of patents expose that the quantity and quality of the innovation result is increased; The proportion of people engaged in scientific research has been increasing, which shows that the innovation and Entrepreneurship Talent team continues to grow. Enterprises as the main body of the urban innovation system is gradually strengthened, the innovation environment is improving, and the total output value of high-tech industry is increasing, and the output of innovation is increasing. On the whole, the realization of the innovative city in Beijing is the highest, and it has a few characteristics: 1) science and technology resource intensive, R & D strength; 2) the market is perfect, open degree is high; 3) knowledge creation and flow ability is outstanding, have a strong education and research institutions innovation ability.

6 Conclusion

The article establish the evaluation model by principal component analysis and get the method of how to evaluate the innovation ability of city. The evaluation result show that the construction of innovative city in Beijing is still insufficient; independent innovation ability is not enough and enterprise has not yet become the subject of independent innovation. The increase in the number of enterprises has not led to the number of enterprises in the development of the R&D sector. At the same time, the innovation system and mechanism need to be improved

On the results of the above evaluation, the following suggestions are put forward for the development of innovation ability in Beijing:

1) Government should support and encourage enterprises to increase investment in science and technology, and build a new organization system which is the main body of enterprises^[10]. We have to focus on accelerating the transformation of scientific and technological achievements into productive forces, efforts to improve the innovation ability of enterprises.

2) The government can provide help for the enterprise financing, provide project support for the development of enterprises, the implementation of tax incentives and other ways to increase investment in science and technology innovation activities.

3) The government should encourage foreign R & D institutions and local colleges, research and development institutions and enterprises to carry out extensive exchanges and cooperation. Build clusters innovation network, strengthen coordination and cooperation between enterprises, universities, research

institutions and intermediary organizations to create a better environment for innovation.

4) Take the enterprise as the leading, form the University and scientific research organization to participate in the research and the mechanism. In order to achieve scientific and technological information sharing, large-scale equipment sharing, technology exchange information sharing platform for regional innovation system, accelerate the process of enterprise innovation.

GMM Model-Based Study on the Impact of Housing Prices on Residents' Consumption in the Yangtze River Delta Region

Sun Haiyan

College of Jincheng, Nanjing University of Aeronautics and Astronautics, Nanjing, P.R.China, 211156
(E-mail: shy2014@nuaa.edu.cn)

Abstract: In recent years, China's real estate prices have become the focus of public attention. Based on the theories related to housing prices and residents' consumption, the present paper has collected the relevant data from the Yangtze River Delta region of China for the period from 2002 to 2013, and applied the dynamic panel GMM model to carry out empirical study on how housing prices affect residents' consumption. However, it has been found that the impact of the housing prices on the residents' consumption in the Yangtze River Delta region of China has two-way effects.

Key words: Housing prices; Residents consumption; GMM model; The yangtze river delta region

1 Introduction

With the development and improvement of China's market economic system reform, the real estate industry expands rapidly. Since the beginning of the 21st century, China's spending power in the real estate industry has been growing, and housing prices have been constantly rising. For example, household consumption expenditure per capita for urban residents in 2002 was RMB 624.2, whereas household consumption expenditure per capita for urban residents rose to RMB 1745.1 in 2013 (Figure 1). Meanwhile, with the growth of consumer demand, the growth rate of China's real estate market prices is striking. For example, the average housing price in China increased from RMB 2250 per square meter for 2002 to RMB 6237 per square meter in 2013 (Figure 2). The average growth rate of housing prices was 8.88%, and the growth rate even reached 17.76% in 2004 when housing prices continued on the upward trend. Due to the impacts of the Financial Crisis, housing prices generally fell by 1.65% in 2008, although the growth rate was reversed by 23.18% in the following year. Since then, the growth rate has been steady. The Yangtze River Delta region is known for its strong economic strength, but it was once speculated as one of the regions with the worst real estate bubbles. It can be seen from Figure 1 and 2 that the changes of average residents' consumption and housing prices in the Yangtze River Delta region are in line with those in the other parts of China. Or, in other words, these two factors continue on the upward trend in general, and a certain relationship should exist between residents' consumption and housing prices. Therefore, studies on the impacts of real estate prices on residents' consumption in the Yangtze River Delta region have strong practical significance because they could help local government control policies related to the real estate industry more efficiently, guide reasonable consumption tendency, and promote a stable and healthy economic development in the Yangtze River Delta region.

Figure 1 Data of Average Household Consumption Expenditure per Capita for Urban Residents from 2002 to 2013 (unit: RMB)

Figure 2 Data of Average Selling Prices of Commercial Housing from 2002 to 2013(unit: RMB)

2 Literature Review

Domestic and foreign scholars have done a lot of empirical studies on the impacts of housing prices on residents' consumption, with three major perspectives established regarding the relationship between these two factors, namely, the presence of a promoting relationship, the presence of an inhibitory relationship, and a non-significant relationship.

2.1 The promoting relationship

Through empirical studies on the U.S. Real Estate Market, Shiller and Case (2003) found that increases in housing prices could lead to the growth of residents' consumption. Chen (2006) carried out some empirical research, and the results showed that increases in housing prices could significantly promote residents' consumption. Using some provincial-level panel data, Li Yong-Gang, Gao Bo and Zhang Peng (2013) established some simultaneous equation models to study the relationship among land supply, housing prices and residents' consumption, and found that housing prices imposed a significant and positive impact on residents' consumption.

2.2 The inhibitory relationship

Engelhardt (1996) did some empirical studies on the impacts of changes in housing prices on the consumption decisions made by homeowners, and found that increases in housing prices did not significantly contribute to the rise in consumption expenditure. However, when housing prices fell, residents' consumption significantly decreased due to the decrease of housing prices. Li Yin and Zhan Shi-Hong (2011) established a VEC model for empirical analysis purpose, and found that changes in real estate prices and household consumption expenditure were negatively correlated. Kuang Wei-Da (2011) used a two-stage model based on aspects of housing prices and consumption expenditure, and tested the impacts of changes in housing prices on housing and non-housing consumption. They found that changes in housing prices imposed a negative impact on the two types of consumption.

2.3 A non-significant relationship

The study by Poterba (2000) showed that an increase in real estate wealth would not affect consumers' decisions. Lin Xia and Jiang Yang (2010) found that the wealth effect of rising housing prices was not significant when regression analysis was applied. Dai Ying-Jie and Zhou Kui-Sheng (2012) used FAVAR model to test the relationship between housing prices and consumer behavior, and draw the conclusion that the wealth effect could not be identified.

Through a review of empirical literature by domestic and foreign scholars, it is clear that these findings are not consistent. Also, since the method of ordinary regression analysis is commonly applied, pseudo-values for regression analysis exist. Meanwhile, due to the reason that the real estate market has strong regional characteristics, and China's economic development is uneven, it is not surprising that housing prices vary greatly in different regions of China, and there is a general lack of reference value in terms of household income for different regions. Therefore, the present paper studies the impact of housing prices on residents' consumption in the specific Yangtze River Delta region with practical significance.

3 Empirical Design

3.1 Data source

The present paper takes the Yangtze River Delta region as its study object, and the study was

carried out from 2002 to 2013. The data such as household consumption expenditure per capita, average selling prices of commercial real estate and household disposable income per capita are obtained from sources such as “China Statistical Yearbook”, “Statistical Yearbook of Jiangsu Province”, “Zhejiang Statistical Yearbook”, “Shanghai Statistical Yearbook”. For the aspect of household consumption expenditure per capita, household consumption expenditure per capita of urban residents is used as the indicator. Average selling prices of commercial real estate are measured as the sales volume of commercial real estate divided by the corresponding sales areas. For the aspect of household disposable income per capita, household disposable income per capita of urban residents is used as the indicator.

3.2 The establishment of dynamic models

The basic regression model for panel data is:

$$y_{it} = \alpha y_{it-1} + \beta X_{it} + \mu_i + \varepsilon_{it} \quad (1)$$

Where y_{it} represents an explained variable, X_{it} represents an explanatory variable or another control variable, μ_i represents the regional effect, reflecting the fixed effect of each studied region, and ε_{it} represents the residual error. Since one major defect of static models lies in that they assume the explained variables are maintained in a relatively stable path, such model specifications might be incorrect. Therefore, the present study uses dynamic models instead. Dynamic models can reveal the dynamic change of the explained variable. Arellano-Bond applied the GMM method, and found that such method could help overcome problems inherent in equations that individual fixed effects might exist. Here first-order differential treatment is applied to equation (1) to get the following equation:

$$\Delta y_{it} = \alpha \Delta y_{it-1} + \beta \Delta X_{it} + \Delta \varepsilon_{it} \quad (2)$$

It can be seen from equation (2) that individual fixed effects could be effectively removed. Given that the two-way causal relationship might exist between studied variables, the present study further processes variables with the possibility of endogenous issues. Arellano-Bond emphasized that when GMM was used for estimation purpose, model specification and the effectiveness of instrumental variables should be reasonably judged. Therefore, the general Arellano-Bond and Sargan tests are applied in the present study. With the consumption function model as the basis, the present study makes a few improvements.

$$C_t = \alpha + \beta Y_t \quad (3)$$

By taking the logarithm of both sides of the equation (3), data fluctuations could be removed:

$$\ln C_t = \alpha + \beta \ln Y_t + \mu_t \quad (4)$$

In order to test whether housing prices would affect residents' consumption, the consumption variable, HP , was introduced to the equation (4), with the equation modified as:

$$\ln C_t = \alpha + \beta \ln Y_t + \gamma \ln HP_t + \mu_t \quad (5)$$

This present study uses dynamic panel data. According to the principle of GMM model specification, in order to test whether a non-linear relationship exists between housing prices and residents' consumption, $(\ln HP_{it})^2$ should be included in the model with further modification to establish a dynamic GMM model as shown below:

$$\ln C_{it} = \alpha + \lambda \ln C_{it-1} + \beta \ln Y_{it} + \gamma \ln HP_{it} + (\ln HP_{it})^2 + \mu_i + \varepsilon_{it} \quad (6)$$

Where the subscript i represents different cross-sectional unit; the subscript t represents different time period; C_{it} represents average household consumption expenditure per capita currently; C_{it-1} represents average household consumption expenditure per capita previously; Y_{it} and HP_{it} are explanatory variables, for which Y_{it} represents average household disposable income, and HP_{it} represents average selling prices of commercial real estate; μ_i represents the stochastic error. Given that the impacts of housing prices on residents' consumption might have some lagging effect, the data of the capital stock from the previous year are used to characterize HP variable.

4 Results of Empirical Analyses

The present study uses dynamic panel data models(6) to test the dynamic impacts of housing prices on residents' consumption in the Yangtze River Delta region, with statistical descriptions of major variables shown in Table 1:

Table 1 Statistical Table of Major Variables

Variable	Sample size	Mean	Standard deviation	Minimum	Maximum
$\ln C$	240	7.16	0.42	6.54	7.95
$\ln Y$	240	9.94	0.31	9.01	10.69
$\ln HP$	240	8.70	0.55	7.56	9.71

With the application of GMM method and the use of STATA12.0 software, model (6) is specifically implemented to do the estimation work for the Yangtze River Delta region, Zhejiang, Jiangsu and Shanghai, respectively, with results shown in Table 2.

Table 2 The Regression Output

Variable	The Yangtze River Delta region		Jiangsu		Zhejiang		Shanghai	
	Parameter	T value	Parameter	T value	Parameter	T value	Parameter	T value
$\ln C_{it-1}$	0.591***	9.81	0.461**	2.37	0.352*	1.86	0.657***	10.13
$\ln Y_{it}$	0.413*	1.82	0.314*	1.67	0.217**	1.99	0.613**	2.38
$\ln HP_{it}$	0.396*	1.95	0.412*	1.89	0.219***	6.95	0.451*	1.75
$(\ln HP_{it})^2$	-0.084**	2.56	-0.16*	1.76	-0.032**	2.17	-0.051*	1.83
α	2.374***	4.26	0.957*	1.71	0.989**	2.33	0.267***	7.476
AR(1)	0.06		0.071		0.13		0.064	
AR(2)	0.041		0.035		0.037		0.019	
Sargan test	0.053		0.075		0.064		0.081	
Wald test	0.0000		0.0000		0.0000		0.0000	

note: ***, **, * means statistical significance is attained at 1%, 5% or 10% level.

It can be seen from the test results (shown in Table 2) that although model residuals contain first-order serial correlation, second-order serial correlation is absent. The results of Sargan test showed that the selection process of instrumental variables is reasonable, and over-identification problem does not exist. Meanwhile, a long-term stable relationship exists among $\ln C$, $\ln Y_{it}$ and $\ln HP_{it}$, with the output of regression analysis statistically significant. However, as a specific city sample belongs to the Yangtze River Delta region, the impacts of these two factors on residents' consumption could display some level of differences, and this is especially true for the case of measured coefficients that correspond to housing-related variables. For example, these coefficients have shown totally different dynamic processes.

4.1 Residents' disposable income

The coefficient for the Yangtze River Delta region is 0.413, indicating that an increase of RMB 1 in income leads to an increase of RMB 0.413 in consumption. This pattern is not only consistent with the principle that income level determines consumption ability in Economics, but also indicates a positive relationship between rising income and residents' consumption. In the present study, Shanghai has the highest coefficient value (0.613). Therefore, in comparison to Jiangsu and Zhejiang, residents from Shanghai own higher proportions of disposable income, which are then used for consumption purpose.

4.2 Housing prices

For the Yangtze River Delta region, the estimated coefficient of housing price variable is statistically significant at the 10% level. Also, the reason why some squared terms are negative is that an inverted U-shaped pattern exists between housing prices and residents' consumption in this region, which suggests that the magnitude of the change in housing prices has imposed a major positive impact on residents' consumption. However, a negative changing trend is also possible after the magnitude of the change has reached a certain level. Overall, the patterns found in Shanghai, Zhejiang and Jiangsu are consistent, the real estate market in the entire Yangtze River Delta region has remained active, and fluctuations of housing prices have promoted the wealth effect and residents' consumption. However, once housing prices continue to rise until they surpasses the limit of disposable income, and when the speculative component occupies a large proportion, the real estate market is then prone to bubble, resulting in a heavy financial burden on residents. Also, the positive wealth effect of housing price fluctuations on residents' consumption could be counteracted, diminished, or even reversed.

5 Conclusion and Suggestions

5.1 Conclusion

For the Yangtze River Delta region, a two-way causal relationship exists between housing prices and residents' consumption, which indicates that reasonable household demand has played a certain role in propelling housing prices. Meanwhile, surging housing prices could further intensify market bubbles. Therefore, although the positive wealth effect brought by household demand in terms of propelling housing prices deserves more attention, the negative side effects of rising housing prices on residents' demand should not be ignored, and this requires us to pay more attention to the two-way causal relationship between housing prices and residents' consumption in the Yangtze River Delta region.

5.2 Suggestions

5.2.1 An increase of expected household income through multiple ways

On the one hand, since the actual consumption ability varies in the Yangtze River Delta region, the minimum wage could be increased to different levels so that the proportion of household income keeps burgeoning, and residents' ability to deal with the rising housing prices could be enhanced. On the other hand, the development and improvement of social security and public services in the Yangtze River Delta region could effectively protect low-income consumers. Finally, the implementation of reasonable credit policies for low-income populations could provide them with more employment opportunities, increase their income levels, and enhance their spending power. Meanwhile, by using tax leverage, tax policies could be adjusted to favor low-income populations in order to further reduce income inequality.

5.2.2 A reasonable guidance for establishing an objective attitude towards commercial real estate consumption

It is essential to provide a reasonable guidance for establishing an objective attitude towards commercial real estate consumption. On the one hand, media propaganda could be used to help those people in blind pursuit of commercial housing. For example, young people who just leave the campus are encouraged to rent apartments first before they make a well-planned purchase. By doing so, their consumption potentials could be reasonably released, and their spending power could be effectively enhanced. On the other hand, the government could introduce some reasonable policies to encourage diversification in consumption. For example, the government could develop the housing security system, with public renting houses, cheap renting houses and talent apartments as the major component. Meanwhile, the approach of small apartment building is encouraged so that different levels of demand could be met, and people could determine their spending power based on their income levels. Also, the gradual transition process could not only help maintain relatively stable housing prices, but also help promote the positive wealth effect of housing prices on residents' consumption.

5.2.3 The development of strategies for managing different housing prices

Due to the complexity of China's real estate market, although the government of the Yangtze River Delta region has released a series of regulation policies, such as purchase and load limit policies, in order to reasonably control housing prices, the desired results haven't been met yet. Therefore, based on development characteristics of Yangtze River Delta, specific strategies aiming at managing housing prices should be developed by the government. For example, increased efforts in controlling cities with high housing prices could help ensure housing prices to return to a reasonable range, and prevent the inhibiting effect of high housing prices on residents' consumption. Meanwhile, the growth rate of housing prices for cities with median-level housing prices could be slowed down to ensure a stable development of the real estate market, and cities with low-level housing prices are encouraged to meet reasonable household demand in order to promote the healthy development of the real estate market.

Nanjing, P.R.China, 210000

(E-mail: 18751868869@163.com, mlj339@aliyun.com)

Abstract: Improving the total factor productivity (TFP) is a fundamental guarantee for the realization of economic transformation and sustainable development. This paper takes a new approach to investigate the TFP of Chinese industry. We discuss the advantage of Färe-Primont (FP) index to calculate TFP and differences from other indexes. Using the panel data of Chinese provincial areas in 29 provinces covering a 14-year period (1999-2012), we calculate the TFP of Chinese industry. The results showed that: (1) TFP of Chinese industry is low overall; (2) TFP growth is largely powered by technological progress and it exceeds the decline in mix efficiency in 2008-2012, also, technical efficiency improvement is negligible; (3) There are significant differences in the growth rate of industrial TFP among the northeast, the east, the central and the west. The development of the eastern region is unbalanced and it has obvious technical advantages compared with other parts of China.

Key words: Färe-Primont TFP index; Regional differences; Technological progress

1 Introduction

Industry occupies an extremely important status in the national economy. The level of industrial development of a country, directly determines the level of technology and economic development of the country. In 2014, Chinese industrial output value is 22799 billions, accounted for 35.82% of GDP, an 18% increase from a year earlier.

With the Chow (1993) as the symbol, the TFP of Chinese economy has gradually become a hot issue for many domestic and foreign scholars¹. They use different data to measure the growth of TFP in China, the growth of industrial TFP, influence factors of TFP growth. Meng Lingjie (2004) analyzed the provincial data from 1952 to 1998 using the DEA-Malmquist index. He pointed out the TFP growth is mainly derived from the improvement of technical progress in the whole period. It exceeds the decline in productivity which is determined by pure technical efficiency and scale efficiency². Zhongxiu Zhao (2010) believed FDI has a positive effect on Chinese industrial productivity, and the contribution of FDI to productivity is enhanced by its interaction with Chinese human capital³. Guo Qingwang (2006) applied the nonparametric DEA-Malmquist index approach to estimate TFP growth, efficiency change and the rate of technological progress from 1979 to 2003. He believed disparities of provincial economic growth are large and have been increasing owing to the relatively increasing disparities of TFP growth especially the rate of technological progress⁴. Most previous studies used Malmquist TFP index. There are some flaws: Malmquist TFP index isn't multi-plicatively complete or transitivity. This means it can't be used to make multi-temporal and/or multi-lateral comparisons of TFP and efficiency reliable. In recent years, some scholars apply the Färe-Primont index to calculate TFP index. Xingjian Hong (2014) analyzed Chinese TFP between 1995 and 2012 by Färe-Primont index⁵. Sanzidur Rahman (2012) applied the Färe-Primont index to calculate TFP indices for agriculture in 17 regions of Bangladesh covering a 61-year period (1948-2008)⁶. No scholars have analyzed China's industrial productivity by FP index so far.

Characteristics and innovation of this paper is that we use the latest approach of measure and decomposition of TFP: Färe-Primont index. Färe-Primont index are economically-ideal in the sense that they satisfy all economically-relevant axioms and tests from index number theory, including an identity axiom and a transitivity test. This means they can be used to make reliable multi-temporal (i.e., many period) and/or multi-lateral (i.e., many firm) comparisons of TFP and efficiency. Laspeyres, Paasche, Fisher, Malmquist-*hs*, Malmquist-*it* and Hicks-Moorsteen indexes all fail the transitivity test and can generally only be used to make a single binary comparison (i.e., to compare two observations only). For more details on the importance of index number axioms and tests, see O'Donnell (2011b)⁷.

The purpose of this paper is using FP index to analyze TFP of Chinese industry. It decomposes the TFP index into six finer components: technical change, technical-, scale- and mix-efficiency changes, residual scale and residual mix-efficiency changes. Decomposition of the components of TFP changes

into finer measures of efficiency corrects the existing literature’s blame of a slow growth in technical efficiency as the main cause of poor TFP growth in China.

2 Methodology

The Färe-Primont index number approach is developed using the aggregate-quantity framework, which does not rely on the availability of price data and does not require any assumptions concerning either the degree of competition in the product markets or the optimizing behaviour of firms (O’Donnell, 2012a,c). The analytical procedure involves the DEA linear program (LP) to estimate the production technology and associated productivity and efficiency levels: (i) technical change (measuring movements in the production frontier); (ii) technical efficiency change (movements towards or away from the frontier); (iii) scale efficiency change (movements around the frontier surface to capture economies of scale); and (iv) mi efficiency change (movements around the frontier to capture economies of scope) (O’Donnell, 2010, 2011b, 2012c).

2.1 The färe-primont index of total factor productivity

The productivity of a single-output single-input firm is almost always defined as the output-input ratio. O’Donnell (2008) generalizes this idea to the multiple-output multiple-input case by formally defining the total factor productivity (TFP) of a firm to be the ratio of an aggregate output to an aggregate input. Let $x_{it} = (x_{1it}, \dots, x_{Mit})'$ and $q_{it} = (q_{1it}, \dots, q_{Nit})'$ denote the input and output quantity vectors of firm i in period t ($q_{it} \in R_+^J$ and $x_{it} \in R_+^K$). Then the TFP of the firm is (O’Donnell, 2010):

$$TFP_{it} \equiv \frac{Q_{it}}{X_{it}} \tag{1}$$

Where $Q_{it} = Q(q_{it})$ is an aggregate output, $X_{it} = X(x_{it})$ is an aggregate input and $X(.)$ and $Q(.)$ are non-negative, non-decreasing and linearly homogeneous aggregator functions. The associated index number that measures the TFP of firm i in period t relative to the TFP of firm h in period s is (O’Donnell, 2011a, b):

$$TFP_{hs,it} \equiv \frac{TFP_{it}}{TFP_{hs}} = \frac{Q_{it} / X_{it}}{Q_{hs} / X_{hs}} = \frac{Q_{hs,it}}{X_{hs,it}} \tag{2}$$

Where, $Q_{hs,it} = Q_{it} / Q_{hs}$ is an output quantity index and $X_{hs,it} = X_{it} / X_{hs}$ is an input quantity index. Thus, TFP growth can be expressed as a measure of output growth divided by a measure of input growth. DPIN estimates the production technology (and associated measures of productivity and efficiency) using DEA LPs. DEA is underpinned by the assumption that the (local) output and input distance functions representing the technology available in period t take the form (O’Donnell (2011b)):

$$Q(q_{it}) = D_0(x_0, q_{it}, t_0) \tag{3}$$

$$X(x_{it}) = D_1(x_{it}, q_0, t_0) \tag{4}$$

Where q and x are vectors of input and output quantities and $D_0(.)$ and $D_1(.)$ are the output and input distance functions. The Färe-Primont TFP index is given by (O’Donnell, 2011b):

$$TFP_{hs,it} = \frac{Q_{hs,it}}{X_{hs,it}} = \frac{D_0(x_0, q_{it}, t_0) D_1(x_{hs}, q_0, t_0)}{D_0(x_0, q_{hs}, t_0) D_1(x_{it}, q_0, t_0)} \tag{5}$$

2.2 Measures of efficiency

The following finer measures of efficiency change are computed by decomposing TFP changes. These efficiency measures are defined and explained with reference to two production frontiers: a mix-restricted production frontier (when the mixes of outputs or inputs are held fixed) and an unrestricted production frontier (when both input and output mixes are allowed to vary), where each point refers to a combination of aggregate input and output (Figure 1, adapted from O’Donnell, 2012b):

$$\text{Input-oriented technical efficiency } ITE_{it} = \frac{Q_{it} / X_{it}}{Q_{it} / \bar{X}_{it}} = \frac{\bar{X}_{it}}{X_{it}} = D_1(x_{it}, q_{it}, t)^{-1} \leq 1 \tag{6}$$

$$\text{Input-oriented scale efficiency } ISE_{it} = \frac{Q_{it} / \bar{X}_{it}}{\tilde{Q}_{it} / \tilde{X}_{it}} \leq 1 \tag{7}$$

$$\text{Input-oriented mix efficiency } IME_{it} = \frac{Q_{it} / \bar{X}_{it}}{Q_{it} / \hat{X}_{it}} = \frac{\hat{X}_{it}}{X_{it}} \leq 1 \tag{8}$$

$$\text{Residual input-oriented scale efficiency } RISE_{+it} = \frac{Q_{it} / \hat{X}_{it}}{Q_{it}^* / X_{it}^*} \leq 1 \tag{9}$$

$$\text{Residual mix efficiency } RME_{it} = \frac{\tilde{Q}_{it} / \tilde{X}_{it}}{Q_{it}^* / X_{it}^*} \leq 1 \tag{10}$$

Where $TFP_t^* = Q_{it}^* / X_{it}^*$ denotes the maximum TFP that is possible using the technology available in period t , $\bar{Q}_{it} \equiv Q_{it} D_0(x_{it}, q_{it}, t)^{-1}$ is the maximum aggregate output possible when using x_{it} to produce a scalar multiple of q_{it} ; $\bar{X}_{it} \equiv X_{it} D_1(x_{it}, q_{it}, t)^{-1}$ is the minimum aggregate input possible when using a scalar multiple of x_{it} to produce q_{it} ; \tilde{Q}_{it} and \tilde{X}_{it} are the (output-mix and input-mix preserving) aggregate output and input quantities at the point of mix-invariant optimal scale (MIOS), which refers to a point where a ray through the origin is tangent to the mix-restricted production frontier; \hat{Q}_{it} and \hat{X}_{it} are the aggregate output and input obtained when TFP is maximised subject to the constraint that the output and input vectors are scalar multiples of q_{it} and x_{it} , respectively. (O'Donnell, 2012b).

Figure 1 Technical, Scale and Mix Efficiency of a Multi-input Multi-output Firm

Equation (6) presents the most common measure of the input-oriented technical efficiency, that is, the minimum aggregate input possible to produce a given level of aggregate output (slope OA/slope OB). The scale efficiency in equation (7) is the commonly used measure, which shows efficiency derived due to economies or diseconomies of scale (i.e. by varying operation size) and is expressed here as the ratio of TFP at a technically efficient point to TFP at an associated point of MIOS (slope OB/slope OD). Mix efficiency in equation (8) is a measure of the potential change in productivity when restrictions on input and output mix are relaxed. Mix efficiency depends on the economies or diseconomies of scope in input use. The pure mix efficiency is closely related to the familiar concept of cost-allocative efficiency. This is the ratio of TFP at a technically efficiency point on the mix-restricted frontier to TFP at a point on the unrestricted frontier (slope OB/slope OU). Residual scale efficiency in equation (9) is the ratio of TFP at a technically efficient and mix-efficient point to TFP at a point of

maximum productivity, which is a scale effect (slope OU/slope OE). However, the term residual is used here to reflect the fact that although all points on the unrestricted frontier are mix efficient, each has different input and output mixes. Finally, the residual mix efficiency is the ratio of TFP at a point of MIOS to TFP at a point of maximum productivity. This involves movement from an optimal point on the mix-restricted frontier to the optimal point on the unrestricted frontier, which is a mix effect (slope OD/slope OE). The term residual is used because such movement also involves a possible change in scale (for full details, see O'Donnell, 2012b).

2.3 The components of TFP change

The TFP indices expressed in terms of aggregate quantities as in equation (2) are multiplicatively complete. O'Donnell (2011b) presents the decomposition of TFP changes in the aggregate quantity space as follows:

$$TFPE_{it} = \frac{TFP_{it}}{TFP_t^*} = ITE_{it} \times ISE_{it} \times RME_{it} \quad (11)$$

$$TFPE_{hs,it} = \left(\frac{TFP_{it}^*}{TFP_s^*} \right) \left(\frac{ITE_{it}}{ITE_{hs}} \right) \left(\frac{ISE_{it}}{ISE_{hs}} \right) \left(\frac{RME_{it}}{RME_{hs}} \right) \quad (12)$$

3 Data

This paper covers a 14-year period (1999-2012) in 29 regions of china. Considering the availability and representation of data, this paper does not include Tibet, Hainan, Hong Kong, Macao and Taiwan. Many existing empirical studies have indicated that the difference between data sources and processing methods is one of the important reasons for the difference of the results. In the light of the majority of literature, this paper takes the number of employees every year as a labor input (in Ten thousand). Fixed assets-net value also is a input which represents capital investment level. For price index of investment in fixed assets, since there are no complete data for provincial price index of investment in fixed assets, we use national price index of investment in fixed assets in 1999-2012. We adjust initial value of fixed assets to the the year 1999 which is the base period. We choose gross industrial output value (in million) as a output since this measure is preferable to value a regional's economies of industrial.

All initial data used in the paper are taken from the China Industry Economy Statistical Yearbook (1999-2012), Chinese Statistical Yearbook (1999-2012) and web site of China's national bureau of statistics.

4 Empirical Results

The results shown in Table 1 reveals that average growth rate of TFP level is estimated at 10.39%, technical efficiency level at 1.11%, scale efficiency at 0.54%, residual-scale-efficiency at 0.75%, residual- mix efficiency level at 0.06%, and technology progress is 10.38%. The implication is that China is doing well in terms of technology progress and pure efficiency but not on mix efficiency or scale efficiency, that is, the ability to derive economies of scope by changing optimal input and output mixes. According to the system clustering (table 2), TFP of Chinese industry can be divided into three stages: a sustained and stable growth in 1999-2003. We believe that the new industrialization strategy choice of old industrial base in the northeast of plays an role more or less. The growth rate of TFP reached to 16.6% in 2003. From 2004 to 2008, TFP was fluctuated in growth and got the maximum value 19.6% in 2007. However, mix efficiency declined at an annual rate of 6.2%. The implication is that China managed to maintain technical efficiency and scale efficiency in this period, but could not sustain mix efficiency change. In other words, managers are unable to derive economies of scope by changing input or output mixes optimally in their production process. The inability to decompose the components of TFP changes into such finer measures of efficiency led the previous studies to incorrectly blame a decline in technical efficiency (Shen Neng, 2007) as the main cause of poor TFP growth in China¹³. The third stage is 2009-2012. China is not immune from the global crisis the economy has already slowed, TFP was fallen by about 1.9%. The decline of TFP in the third stage is mainly due to the decline in technical efficiency and scale efficiency.

Figure 2 Trend of TFP Change and Its Components

DPIN3. 0 can be downloaded in <http://www.uq.edu.au/dpin/cepa/economics.php>

The main driving force of the growth of Chinese industrial TFP is the advances in technology from the year 2002 (Figure 2). As the productivity changes have been decomposed into finer measures than conventionally reported in the literature, it is possible to correctly isolate the component (i.e. mix-efficiency change) that is actually falling. China joined the world trade organization (WTO) in Dec 10, 2002. On one hand, the technological spillover effect of FDI has promoted the technical level of Chinese industrial sector. On the other hand, the development of high-tech industry in China has played a positive role in the transformation of traditional industries. The status of the information technology industry is becoming increasingly important, thus accelerating the improvement of the overall technological progress of Chinese industry. The average level of TFP of Chinese industrial is 11.19 and its contribution is 42.44 (table 3).

Table 3 TFP Growth and Contribution(%)

	TFP growth	Industrial growth	Contribution
2000	9.033204917	14.32032335	63.07961557
2001	9.708247804	20.9992389	46.231427
2002	13.18937488	40.17220294	32.83209264

2004	47.7800237	41.78693344	14.3420198
2005	-10.8480332	24.73577498	-43.85564315
2006	10.35516524	25.82051868	40.10440443
2007	19.57556969	27.98207809	69.95752649
2008	-0.479766932	25.20077083	-1.903778798
2009	2.938135331	8.087473293	36.32945946
2010	9.987346231	27.40762175	36.44003235
2011	15.37129506	20.85316672	73.71204221
2012	2.247283419	8.650022465	25.98008766
Average	11.19183083	24.18823201	42.4433035

In order to compare the difference of industrial TFP in different regions, on the basis of the existing analysis results, we further divide China into four major regions: the east, the west, the northeast and central. We estimates the TFP changes of Chinese provinces according to FP index method, and then get the total average. There are some differences in the level of TFP in the four regions. Table 4 shows that in promoting industrial growth of TFP, the four regions is consistent with the country: mainly caused by technical progress. Overall, Chinese industrial productivity is low. TFP in the eastern region at a level of 0.27, is significantly higher than that in other regions. On the whole, the level of TFP in decreasing order is the east, northeast, central and the west. Compared with other regions, the eastern has no significant difference in scale efficiency, but its technical efficiency is much higher than others. This shows that the eastern has obvious technical advantages. The STDEVA of the east is 0.06, this meas the East is more imbalance in development compared with other regions. Although this paper analyzes the industry in this sector, it still reflects the regional gap of economic development since 1999. The root cause of this difference lies in the difference of the TFP (mainly caused by technological progress and technical efficiency). Therefore, improving the TFP will be the key to promote the growth of Chinese industrial (Especially the improvement of technical efficiency). However, as the differences in the level of economic development, industrial structure and other aspects of the industry, relevant policies should be different in the formulation .

Table 4 Average TFP and Decomposition in Various Regions

	Average TFP	OTE	OSE	STDEVA	2012 average
Northeast	0.209447619	0.655038095	0.96562619	0.034616124	0.363233333
East	0.271010582	0.889698209	0.945691718	0.056229596	0.425633333
Central	0.203079762	0.632397619	0.950164286	0.030653967	0.255663636
West	0.166062987	0.665195455	0.866947403	0.031738384	0.368866667

5 Conclusion

Chinese industrial TFP has a fluctuated growth over the past 14 years and technology progress is the driving force. However, the negative effect of the technical efficiency can not be ignored, which shows that Chinese industrial growth have relied heavily on technological progress. There are significant differences in the growth rate of industrial TFP among the northeast, the east, the central and the west. The development of the eastern region is unbalanced and it has obvious technical advantages compared with other parts of China.

The above conclusions are important for the Chinese government to make regional development strategies and relevant policies. It is obvious that the Chinese government should consider provincial characteristics while making regional development strategies. We give the following suggestions. First, to narrow the gap of regional economic growth, China needs to pay attention to the improvement of technical efficiency and scale efficiency. Various policies to promote technology transfer to the central and western regions will improve the efficiency of the technological progress. At the same time, China can't ignore the environmental problems and should strive to promote all-round, coordinated, and sustainable economic and social development. For developed regions, they should focus more on raising technological efficiency so as to ensure long-term sustainability for their industry economic growth. Second, developing enterprises' ability of independent innovation and cultivating strategic emerging industries will positively contribute to technical change and technical efficiency. Finally, increased investment in extension will enable some managers to address their failing to derive economies of scope by applying optimal input and output mixes from their production process. China needs enterprise-reform measures aimed at increasing average enterprise size by reorganization and merger, which will significantly influence TFP growth as well as various efficiency measures as it is the most dominant determinant of TFP growth. Especially in some competitive industries, encouraging and guiding the potential expansion of enterprises through mergers and acquisitions and other ways can quickly expand industry scale. To promote concentration, the Chinese government should create a good financing environment directly and indirectly, the conditions for the accumulation of development, and give more support through tax and industrial policies.

Mode Section of Purchasing New Luxury in China

Guan Sifan, Xu Hongyi

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: guansf0723@126.com)

Abstract: Compared with expensive, prohibitive and old traditional luxury, mass production, mass consumption and ordinary commodity, combined with domestic and international authoritative “new luxury” literature, further explores the “new luxury” differs from traditional luxury, The innovation of this study is: On the basis of existing studies on the channel of new luxury goods, more consumers choose to purchase common approach advantages and disadvantages, analyze the main factors affecting consumer channel choice.

Keywords: New luxury; Purchase approach; Factor

1 Introduction

“new luxury” is a kind of “supplementary type” product with superior quality, strong functionality and acceptable price, which are sought after by consumers in recent years. China is becoming the world’s most important and fast-growing “new luxury” consumer market, the industry inside and outside has paid increasingly close attention to the “new luxury”.

From the perspective of the audience, this study combined domestic and international authoritative “new luxury” literature, further explored the difference between “new luxury” and traditional luxury, product characteristics and classification. the innovation of this research is: base on basic researches about new luxury channel, compare advantages and disadvantages of consumers purchase, analyze the main factors affecting consumer channel choice.

2 Characteristics of the New Luxury

The products in people’s lives and service of certain products are defined as “new luxury”, compared to similar products, it has better quality, better design, better taste, and in stark contrast to ordinary products so that consumers yearn it, though expensive, it does not like prohibitive veteran luxuries. Though widely cited, This definition is not good enough to distinguish the distinction between “new luxury” and “old luxury” in the traditional sense and “general merchandiset” hat is non-luxury. With respect to the top consumer products and old luxury for showing off, new luxury is a new class of goods with great quality, high prices, mass production, superior technology. In new concept of luxury goods, “luxury” indicates a high degree of shape recognition, brand premium; “new” represents new attention and moderate ration. New luxury emphasize the connotation and technology, industrial design and technology details which could reveal the brand’s high quality and high taste. Product demand based on the emotional needs, keeping up with fashion and trends, expensive, between the ordinary and the old luxury consumer goods, providing consumers sophisticated integration of super value and premium. Thus, based on the literature and theoretical analysis, this article intends to define “new luxury” as “high identification, good quality with moderate brand of premium.”

Table 1 Compare of New Luxury and Traditional Luxury

category	new luxury	traditional luxury
influence	emotional involvement	little
pay ability	tolerant	unique
price	premium	more expensive
quality	above medium	top material manual
social base	value driven	pyramid top

The biggest difference between the new luxury and traditional luxury is that emotional factors inherent in the new luxury can stimulate consumer emotional appeal. The new luxury is always based on the emotional needs, it might just meetconsumers’ emotional purchase needs at a certain time, or a certain brand faithand weak planning.

3 New Luxury Purchase Pattern Analysis

Traditional luxury is of high tariffs, abroad consumption is the trend. The current Chinese luxury consumption is increasingly going abroad, the high cost of tariffs make consumers more willing to go abroad to spend. According to the “2013 luxury consumption,” the survey data show that China’s consumers who buy luxury goods abroad accounted for 57%; through purchasing channels accounted for 23%; the domestic luxury store is 20%. It is visible that abroad consumption of luxury goods has become a trend of high consumers. In the new luxury goods sector, since consumers generally have a certain sensitivity to price, in the choice of a variety of channels, they will show greater subjectivity, assess the advantages and disadvantages of each channel, as well as rely more on the network to collect information.

Table 2 Advantages and Disadvantages

	Purchase channel	advantages	disadvantages
offline channel	exclusive store	Authentic guarantee ,buy and get	high price
	Outlet	authentic guarantee	out of season commodity
	abroad purchase	low price	overall high purchase price
online channel	Purchase professional	convenience, affordable	risky
	aboard online shopping	authentic guarantee	more time and effort
	domestic shopping website	uncertain preferential price	convenience, need to wait

Overall, the off-line purchase has better quality and less risk, the disadvantage is the higher price. The on-line purchase got relatively favorable price, but the risks are great, it takes more time and effort, two approaches both have advantages and disadvantages, how to choose depends on consumers’ sensitivity to price and consumers’ willingness to spend more time and effort, and risk tolerance.

4 Purchase Influencing Factors

According to the analysis of literature and the investigation of new luxury industry, factors can be divided into three types: product type, customer type, purchase risk.

4.1 Product type

Product type determines the impact on channel information of purchase decision. The products are divided into search products and experience products. “Search type” product is one that consumers have already understood main characteristics of goods before purchase. “Experience” products means that consumers need to experience the main characteristics of goods in order to understand (such as: perfumes, cosmetics, etc.). The “Search products” is defined as the properties of which have been known by consumer before the purchase, it is a new kind of luxury that does not need the ground feel, and it is easier to obtain information via the Internet so that consumers can make purchase decisions. And the “experience products” is defined as that only through direct experience could consumer understand the main properties of the product, it is not easy to understand product attributes from the information search process.

Since the price of new luxury goods is more expensive than ordinary commodity, so consumers have become more rational in consumption, they will do some advance information gathering. Consumers’ price sensitivity of the product determines the choice of channels, those who are not sensitive to price will choose to buy directly in the store, price sensitive and English familiar young consumer will pay more time and energy to compare price difference of different channels, by means of global shopping platform to complete a time-consuming and complicated purchase behavior. For more price sensitive and unwilling to spend too much time customers, they usually choose to pay more money to get from purchasing professional, miss some middle process, which can buy the Heart of merchandise as well.

4.2 Consumer type

According to the above four categories of severe new luxury groups, we find that some inherent law, which is not difficult to find that ways influencing consumer purchase choice are price sensitivity, brand quality requirements, information channel, time and energy, and so on. Non price sensitive consumers can select quick and direct channels, and the price-sensitive choose to pay a certain portion of time and energy in order to pay less money and get equal value of goods or services. High quality requirements consumers choose low risk purchase, price sensitive, brand requirements, quality requirements consumers choose lower risk channels.

4.3 Perceived risk factors

Risk is an important factor in consumer choice of channels. The study found that many consumers do online information search, and the final purchase is completed in the traditional physical store, the emergence of this phenomenon is because of perceived risk of consumer shopping behavior.

Most of the new luxury consumer have high requirements of brand and quality, so it is particularly important to weigh the possible risks facing channels and channel choice. Consumers cannot foresee perceived risk consequences of their actions, resulting in unhappiness, consumers will held certain prior purchase target, when consumers cannot determine which best matches the risks arising from the target; or after the purchase behavior, they cannot achieve the desired objectives and lead to bad consequences.

5 Conclusion

Most of the new luxury goods can meet the emotional needs of consumers, consumers' emotional needs are high, New Luxury companies must understand the emotional needs of consumers, and tap the potential demand of consumers, find the right product positioning.

In dual-channel context, the new luxury should establish official brand sales network, provide consumers with genuine commitment and quality assurance and reduce the risk of online shopping channels, improve after-- service mechanism, combine the online store, such as the online purchase product got quality or repairing problems, customer can go directly to the nearest store.

Due to the limitations of the physical store, there is still a majority of consumers who cannot go to the store to buy a new luxury, in order to meet the needs of this population and to retain the customers who do online shopping or buy through purchasing professional, the new luxury brand should pay more attention to two channel selection modes under consumer trends, to develop their own online shopping channel, through its own propaganda to strengthen regulatory and quality assurance of network sales, at the same time, launch promotion and publicity activities in the occasional time.

In the future, consumers will tend to choose convenient, efficient, low risk shopping channels, enterprises should gradually establish a network platform which can match personnel development.

Research on the Model of the Industrial Cluster Synergy Development

Ye Hui, Wang Zhou

School of Automotive Engineering, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: yehui1222@whut.edu.cn, wangzhouzhou123@126.com)

Abstract: Industrial cluster synergy development is one kind of important economic phenomenon around the world. This paper investigated the problems about the synergy development of industrial cluster in Wuhan City Circle (WCC). The guideline about making government planning was proposed. The developmental model of key industrial elaborate cultivation and basic platform support was built according to the industrial cluster theory, regional synergy development theory and so on. The model of the industrial cluster synergy development in WCC was obtained in this paper. Meanwhile, the research results can also give a model and reference to industrial cluster development in other areas.

Key words: Industrial cluster; Synergy innovation; Wuhan city circle; Development model

1 Theoretical Review about Industrial Cluster Synergy Development of Cross-Regional City Circle

1.1 The review of industrial cluster theory

The concept of “industrial cluster” was first proposed by Michael E. Porter, who was a professor in Harvard University and an expert on management, with the aim of defining the phenomenon of area concentrated production^[1]. In subsequent work by Pike(1992)、Wright(1996)、Rofins(1997), similar definitions of industrial cluster were proposed. The main part of industrial cluster was enterprise or organization. The characteristic of industrial cluster was all enterprises with the similar geographical position and sharing certain partnership or resource. And the aim of industrial cluster was to improve the market competitiveness. Domestic research started relatively late, the definitions of industrial cluster were proposed by Zeng Zhonglu (1997)、Wei Jiang (1999)、Xu Kangning (2001)、Xu Changle(2009). All those definitions were similar. The definition of industrial cluster which was proposed by Liu Youjin、Huang Lucheng(2001) was different from the traditional concept of cluster industry. They thought industrial cluster was not generalized industry but some specific industries including computer industry, facsimile industry, medical device industry and so on^[2]. According to the definition proposed by different scholars, this text believes integrated industrial cluster must have several typical characteristics including: ① Industrial cluster is an aggregation of related business organization, non-business organization and support organization in a certain field. ② All enterprises are area concentrated in industrial cluster and the relationships between each enterprise are cooperative, complementary and competitive. ③ The aim of industrial cluster is building integrated industry chain and value chain, improving the core competence and cultivating the competitive advantage of the whole industry in specific region. ④ Industrial cluster is one kind of intermediate organization, which is more stable and flexible than that of market.

1.2 The formation mechanism of industrial cluster synergy development of city circle

The theoretical basis of synergy development is synergetic theory. The ultimate aim of synergy development is synergy innovation. The synergy development is a collaborative process which can't be achieved by only one element. All the innovative elements, which come from enterprises, colleges or public research institutions, cooperates with each other very well according to complicated non-linear interactions. Industrial cluster synergy development of city circle is the process of innovative ecosystem, which consists of industry chain, technology chain and innovation chain of the industrial cluster inside the city circle.

The aim of industrial cluster synergy is to improve the efficiency of cluster system, cluster subsystem and the environment of cluster system and enhance the advantage of cluster system. All enterprises inside the cluster system combine together via resource synergy, system synergy, competition synergy and aggregation synergy modes. Because of information and resources sharing between different enterprises, all enterprises can not only increase the advantage of scale effect, but also improve the efficiency and flexibility of production. Meanwhile, the knowledge collaboration becomes more convenient and the knowledge renewal becomes faster, which leads to spillover effect of knowledge. The advantage of all enterprises in industrial cluster will appear gradually in terms of production cost,

production efficiency and innovation speed, which is due to the result of synergistic effect.

The formation of city circle industrial cluster needs to go through three main stages including aggregation, integration and cluster. The enterprise expands regionally within the city circle in the early stage of industrial cluster development. A lot of small and middle enterprises with specialization aggregate in the city circle but the cooperative relationships between different enterprises are unstable. This is the initial form of industrial cluster. With the development of economic integration within city circle, the number of aggregated small and middle enterprises increases continuously. The frequent cooperation about technology and production chains is carried out between different enterprises. And some small and middle enterprises start to look for the support from other enterprises, colleges and scientific research institutions. This is the integration stage of city circle industrial cluster. With the development of small and middle enterprises, a reasonable, stable and benign collaboration network of city circle has been built. The relationship between the enterprises inside and outside of city circle is stable. The number of value creation activity increases and the industry chain, technology chain and knowledge chain expand constantly. Till then, the city circle industrial cluster has been built and the synergistic effect starts to take effect on knowledge, technology, production and value.

2 The Existing Problems During the Synergy Development of Wuhan City Circle Industrial Cluster

In 2004, the government of Hubei province of China launched an official document named “the opinions about several issues involving the construction of Wuhan economic circle” and clearly put forward the concept of constructing Wuhan city circle. In 2005, No. 10 state document proposed that the Wuhan city circle was the first city circle among the four city circle in Central China. Wuhan City Circle (WCC), also named “1 + 8 City Circle”, includes: Wuhan city, Ezhou city, Huanggang city, Xiaogan city, Xianning city, Xiantao city, Tianmen city and Qianjiang city. Wuhan city is in the geographic center of WCC. The area of WCC is less than 1/3 of Hubei provincial area, the population of WCC is 1/2 of Hubei provincial population and the GDP of WCC is 60% of Hubei provincial GDP. Wuhan city is the center of WCC and Huangshi city is the sub-center of WCC. On December 7 2007, WCC was approved as the comprehensive experimental zone for resource efficient and environmental friendly reforms by the State Council. During 10 years’ development, WCC has experienced every stage of city circle development. The economy of WCC has grown fast and comprehensive strength of WCC has increased obviously. However, compared with other city circle in China, there are still certain gaps between WCC and those city circles in terms of urban agglomeration size, center city size, urban system, intercity linkage, industry development, city attraction and sustainable development.

2.1 Lack of macro-cooperation between government and enterprise in the development of WCC industrial cluster

Nowadays, there are six main industrial clusters in WCC including mechanical manufacturing, new energy, high-tech industry, agricultural products processing, light textile and environmental protection. Except the industrial clusters of light textile and agricultural products processing, the core enterprises of other four industrial clusters are located in Wuhan city. The division of labor in city circle is not clear and united coordination as well as coupled motion is absent, which undermines the radiation effect of WCC industrial cluster. Meanwhile, the cooperation and communication between other 8 cities except Wuhan are absent and the division and cooperation system between different cities has not been built. The governments of different cities in WCC should play their own roles to make the cooperation more efficient by building a good environment of economy. However, until now, the effective cooperation between the governments and enterprises is missing and the development direction of WCC industrial cluster is not clear. Meanwhile, the efficient talent flow is impeded by district barrier, which is supposed to appear in industrial cluster development. The talent localization phenomenon is obvious in WCC and the high-level talent flow is not smooth. The majority of the talents comes from their own area, which is due to the regional economic difference in WCC or different talent policy in WCC. All these mentioned factors can affect the development of industrial cluster. The problem of talent flow can’t be solved only by enterprise themselves.

2.2 Lack of effective value-cooperation in WCC industrial cluster

Nowadays, there are some problems appearing in WCC industrial cluster such as small, loose and weak. The scale and the structural hierarchy of the whole industry are small and low. Only opto-electronic information industrial cluster is competitive and influential. The other industrial clusters are in the initial stage of aggregation. The structural hierarchy of the whole industry in WCC is low and

the productions of the most of enterprises are in the low-end of the value chain, which affects the vertical collaboration of all enterprises in different industrial clusters. The only way to gain competitive advantage is decreasing the cost of production. For example, the core enterprises of biological medicine industrial cluster gather in Wuhan city. As the risk of research on application is relative high, the research and development inputs of all enterprises are cautious. Therefore, the research and development parts with high additional value are deficient in industry chain and most of products need to be import from other developed area in China such as Jiangshu and Zhejiang provinces. The aim of industrial cluster is to build value chain but WCC is lack of the value of synergy. Based on the current situation, the industrial cluster only appears in the economic development zone and high-tech development zone and the phenomenon of “only enterprise but no industry” still exists in some industrial fields. Most of the enterprises prefer doing their business by themselves to working together. The small and middle enterprises which offer specific services to the big enterprises are not professional and inadequate, which leads to “big and complete” phenomenon appearing or not closely linkage between sales department and production department in those big enterprises.

2.3 Lack of mutual-cooperation between enterprises and institutes of WCC industrial cluster

Lack of mutual-cooperation is reflected in two aspects. First, the cooperation between enterprises themselves is inadequate. This is because there is no platform for enterprises in WCC to communicate and cooperate. Even in the same city, the cooperation between enterprises is not enough. Different enterprise can not share their knowledge and technology as well as share some common utility. Second, the cooperation between enterprises, colleges, research institutions, financial institutions and public service agencies is inadequate. The researches and developments of colleges and institutions are not market-oriented, that is why the research results can not realize industrialization. The technical problems of enterprises can not be solved by their own research department. Meanwhile, a difficulty in financing always hinders the development of small and middle enterprises that need capital. However, all financial institutions prefer to loan their money to big companies. The structural imbalances exist in all kinds of supply and demand relations. The unfavorable cooperation between enterprises and institutions hinders the competitiveness of the whole industrial cluster.

3 The Model of the Industrial Cluster Synergy Development in WCC

3.1 Making a planning in order to optimize the direction of industrial cluster synergy development

In terms of industrial cluster synergy development, the government needs to play a role on macro-management besides the effort of enterprises and relevant institutions. Therefore, the government of Hubei province of China must make a programmatic planning on guideline of WCC industrial cluster development as soon as possible. In this guideline, the advantages and resources of 1+8 cities in WCC need to be optimized by overall coordination firstly. The advantage industries in different cities need to be exerted efficiently and combine organically. The better-targeted industrial cluster, the development of collaborative innovation and the stable value chain are built in WCC. Secondly, the University-Industry Cooperation should be carried out between different cities and industries by government guidance according to the innovation system of industrial cluster. WCC has many universities and scientific research institutes. However, the phenomenon of talent drain always happens in WCC, which is due to industrial cluster differentiation and the broken talent chain. In order to overcome this weak point, WCC should build basic research and development platform to solve the common problems in industry and promote regional innovation by developing talent cluster and strengthening collaboration between industry and colleges. At last, developing the core enterprises of different industries should be encouraged in government planning. The innovation model of synergy development named “core enterprises + small and middle enterprises + public research institutions” should be built according to the integrated and collaboration production system, which is led by the core enterprises in certain industry.

3.2 Elaborate cultivation of six leading industrial clusters with the aim of three-dimensional development in WCC

Based on the identified six industrial clusters in Hubei province, all the limit resource in WCC should be gathered on these six industrial clusters. First, four industrial clusters including mechanical manufacturing, new energy, high-tech industry and environmental protection are the priority projects which should be developed simultaneously. This is because there are some advantages in these four industry fields in Hubei province and these four industry fields are the state key industries and strategic emerging industries. It is a good opportunity to develop these four industries. In order to build the fourth

pole of economic growth in China, WCC needs not only to exert the effect of the existing high-tech industry system, but also to maintain momentum of development via continual system and technology innovation. A cooperative and innovative system should be built and the communication between different enterprises should be encouraged in these industrial clusters. The core competitiveness of enterprises will be improved by exerting high-tech and the regional industrial integration system should be built by extending industry chain and forming characteristic industrial cluster. Second, agricultural products processing and light textile industrial clusters should be developed as the secondary key industrial cluster. In terms of layout of agricultural products processing and light textile industrial clusters, the traditional conception of taking Wuhan as a core needs to be broken up. By comprehensive considering the requirement of industry characteristics and economic benefits on cooperation factors such as human resource, public research and etc., other cities such as Xiaogan city and Huangshi city can be chosen as a priority selection to fully develop the advantage of industrial infrastructures and form industrial clusters. In summary: Wuhan East Lake High-Tech Development Zone should be chosen as the core region to develop mechanical manufacturing, new energy, high-tech industry and environmental protection industrial clusters. Meanwhile, Huangshi city, ezhou city, huanggang city and xianning city should form industrial agglomeration zone of these four industrial clusters and develop coordinately. The other core city in WCC such as Xiaogan city should be chosen as the core region to develop agricultural products processing industrial cluster. Meanwhile, the adjacent areas such as Wuhan Wujiashan Cross-strait Scientific Industrial Park, Qianjiang city, Xiantao city and etc. should form industrial agglomeration zone of this industrial cluster. Huangshi city should be chosen as the core region to develop the light textile industrial cluster. Meanwhile, Xianning city, Tianmen city and etc. should form industrial agglomeration zone of this industrial cluster. The comprehensive development of different industrial clusters will be realized from aggregation “point” to integration “chain” and then to cluster “face”.

3.3 Developing three main platforms and leading efficient development of industrial cluster in WCC

In order to provide high quality service to industrial cluster in WCC, three main platforms need to be developed. The first one is to develop “Knowledge sharing platform”. This platform is dominated by colleges and scientific research institutes. The boundaries of different knowledge are broken and the transmission of knowledge becomes accurate and easy via moderate exploration of compensation service. More enterprises in different industrial clusters can share industry frontier knowledge, solve the industry common problems economically and obtain optimal benefit with the help of synergy innovation of different industrial clusters. The second one is to develop “Technology sharing platform”. This platform is dominated by core enterprises. The research public platform is built in different industrial clusters via combining powerful companies. The paid use of research results is carried out according to the contributive proportion of enterprises. This platform can lift efficiency of research and development in the whole industry, shorten research period, increase transformation efficiency of technology, avoid wasting on the same project and improve competitiveness of the whole industrial cluster. The third one is to develop cooperation platform with the aim of vertical cooperation by organizing “government, college and enterprise” together. Based on the efficient cooperation platform of “government, college and enterprise”, the periodic information collection system for supply and demand of talent and information exchange and broadcast system of industry frontier are built. Meanwhile, the information exchange platform is improved and the information publishing normality mechanism of talent’s supply and demand is formed. In a word, in order to improve the industrial cluster synergy development in WCC, on the one side, the cooperation between colleges, research institutes and enterprises needs to be carried out and the function of multi-body cooperation needs to be realized between colleges, research institutes and enterprises. On the other side, industry association needs to be built with the aim of guiding the cooperation between different industrial clusters in different cities.

4 Conclusion

“Wuhan City Circle” is not only the economic engine of “central rise” strategy, but also the strategic node connecting the economic circle of Pearl river delta, Yangtze river delta, around Bohai sea and western region of China. WCC should take its historical mission to perfect market economy system in China. The core task of WCC is to fully develop industrial cluster in this circle. The research results of this paper can provide reference for improving industrial cluster development of city circle and give certain reference function for developing industrial cluster in central and western regions of China.

Abstract: As product complexity and market competition have dramatically increased, firms find it important to gain competitive advantages in terms of their product development processes. It becomes especially important to make the optimal investments of product development, in order to select appropriate product development strategies. In this paper, we propose a means of optimising the product development plan using product development net revenues obtained from R&D investments. The optimization mechanism of this product development model is provided. Finally, our model is used in a case, to show its application in product development decision-making.

Key words: Product development; Optimisation; Decision-making; Model

1 Introduction

Product development is a broad field of endeavour that deals with the design, creation and marketing of new products. Sometimes it is referred to as new product development (NPD), a discipline that focuses on developing systematic methods for guiding all the processes involved in getting a new product to market. There are two parallel paths involved in the NPD process: one involves idea generation, product design and detail engineering; the other involves market research and marketing analysis. Companies typically see new product development as the first stage in generating and commercialising new products within the overall strategic process of product life cycle management that is used to maintain or grow their market share^[1,2,3].

From the early 1980s, the research emphasis is on the role of new product development (NPD) as a potential source of competitive advantage in the technology and innovation management literature. Most measures of product development performance are based on end-result outcomes that characterize overall project performance such as customer satisfaction, time-to-market, development cost, or product quality^[4,5]. The measures focusing on financial and sales are profit, financial break-even point, return on investment, and sales. Internal operational measures relate to cost and the proficiency of NPD process. Other measures include innovativeness, quality, technological success, creation of new market, market share, time to market, and customer satisfaction. The performance measures are utilized against how well the product meets the company's planned objectives. While the majority of studies used multi-items to measure product success or failure, other studies used uni-item measures^[6,7,8]. Griffin and Page identified five categories of 16 core-measures: customer acceptance (unit sales, market sales, revenue, revenue growth, customer acceptance, customer satisfaction), financial performance (margin, profitability, break-even time, IRR/ROI), product-level (cost, launched on time, product performance level, quality, speed to market), firm-level (percent of sales by new products), and program-level measures^[9,10,11]. While a considerable body of research has focused on the product development problems in the convenient optimisation model and its application in R&D investment arrangement are still necessary to be researched^[12,13,14].

Because of the importance of product development investments, we will develop mathematic models to optimise the product development investment arrangement. The optimisation goal is net revenue. Finally, our model is used in a case to show its application in product development investment decision-making.

2 Quantitative Analysis of Product Development Investments

We assume a competitive environment with a constant increase rate of competitive product performance. We assume the product performance is decided by one or more competitors; in particular, we assume that product performance is additive over the new product's developmental stages. The additive assumption is reasonable if the new product can be structured into modules and if teams are well coordinated. We assume the customer utility function for product performance is a log function, and we also assume the product development time-horizon is divided into some equal periods; in fact, the length of each period is one year. Investments in product development are made at the beginning of each period.

Some symbols are explained below:

Q_0 : Product performance in period 0.

t : A positive integer.

Q_t : Product performance in period t .

l_t : Size of the development team at stage t .

α : Labour productivity parameter, $\alpha \in (0,1)$.

k : Capital productivity parameter.

c_t : Development cost at stage t .

c_t^* : Optimal development cost at stage t .

c_t^{opt} : Optimal development cost at stage t .

w : Human wage rate.

S_t : Market share at stage t .

S_t^{opt} : Optimal market share at stage t .

Q : Competitive product performance level at period 0.

θ : Increase rate of competitive product performance level at each period.

N_t : Product demand at period t .

P : Price of product.

Z_t : Total net profit at stage t .

Z_t^{opt} : Optimal net profit at stage t .

$\beta : k / w^\alpha$.

T : the whole period under consideration.

The performance contribution per activity is analogous to a Cobb-Douglas production function^[15]. According to that function, the labour productivity parameter is between 0 and 1. The formulation assumes that the performance of each task improves only by conducting work on it. We have

$$Q_1 = Q_0 + k l_1^\alpha \tag{1}$$

$$Q_t = Q_{t-1} + k l_t^\alpha \tag{2}$$

$$c_t = w l_t \tag{3}$$

Because the customer utility function for product performance is log function, we have

$$S_t = \frac{Q_t}{Q_t + (1+\theta) Q} = \frac{Q_{t-1} + k l_t^\alpha}{Q_{t-1} + k l_t^\alpha + (1+\theta) Q} \tag{4}$$

Therefore, we can have

$$Z_t = P N_t S_t - c_t = P N_t \frac{Q_{t-1} + k l_t^\alpha}{Q_{t-1} + k l_t^\alpha + (1+\theta) Q} - w l_t \tag{5}$$

Because $\beta = k / w^\alpha$, we have

$$\frac{d Z_t}{d c_t} = \frac{P N_t \beta \alpha (1+\theta)^t Q c_t^{\alpha-1}}{(\beta c_t^\alpha + Q_{t-1} + (1+\theta)^t Q)^2} - 1 \tag{6}$$

Let $\frac{d Z_t}{d c_t} = 0$; we then have

$$\beta \sum_{m=1}^t c_m^\alpha + Q_0 + (1+\theta)^t Q = \sqrt{p N_t \beta \alpha (1+\theta)^t Q c_t^{\alpha-1/2}} \tag{7}$$

Because $0 < \alpha < 1$, we know c_t^* does exist, where $E = Q_{t-1} + (1+\theta)^t Q$. We can know

$$\begin{aligned} \frac{d^2 Z_t}{d c_t^2} &= p N_t \alpha \beta (1+\theta)^t Q \frac{(\alpha-1) c_t^{\alpha-2} (\beta c_t^\alpha + Q_{t-1} + (1+\theta)^t Q)^2}{(\beta c_t^\alpha + Q_{t-1} + (1+\theta)^t Q)^4} \\ &\quad - p N_t \alpha \beta (1+\theta)^t Q \frac{2\alpha \beta c_t^{2(\alpha-1)} (\beta c_t^\alpha + Q_{t-1} + (1+\theta)^t Q)}{(\beta c_t^\alpha + Q_{t-1} + (1+\theta)^t Q)^4} \tag{8} \\ &< 0 \end{aligned}$$

So, c_t^* is the optimal investment cost at stage t.

Three parameters in Formula (7)— α , β and Q —can be estimated using solving method and historical data.

3 An Example

As an example, U Software Ltd. has been devoting itself to bringing optimal management practices based on state-of-the-art IT technology (including communication technology) to management and business innovation activities of its clients; it has been a leading supplier of proprietary enterprise management/ERP software, service and solutions. The financial data of U Software is shown in Table 1.

Table 1 U Firm Financial Data (RMB hundred million)

t	0	1	2	3	4	5	6	7
R&D investment (c_t)	0.28	0.43	0.57	0.90	1.14	1.47	1.49	1.69
Market share (S_t)	22.7%	15.9%	16.8%	17.6%	18.4%	20.4%	21%	20.6%
Operating profit (Z_t)	0.2633	0.5011	0.6291	0.5154	0.3415	0.4707	0.5785	1.2963

From the company data, considering the economic environment, we let $\theta = 0.16$. Considering that ERP software became the main product from the period 0, we let $Q_0 = 0$. We know $P^*N_t = (Z_t + c_t)/S_t$, so the values of P^*N_t are shown in Table 2.

Table 2 Value of pN_t Each Year (RMB hundred million)

t	0	1	2	3	4	5	6	7
P^*N_t	2.393	5.856	7.138	8.042	8.052	9.513	9.85	14.5

Using the data from t=0 to 6, the required parameters are estimated; we have $\alpha = 0.209$, $\beta = 0.203$ and $Q = 1.94$. The root mean square error (RMSE) is 0.031, the sum of square error (SSE) is 0.0058 and the correlation coefficient (R) is 0.9. At t=7, we can have $c_7^{opt}=0.037$, $Z_7^{opt} = 2.75$, $S_7^{opt} = 0.192$. Compared with the actual data at t=7, we can learn that after optimisation, market share and cost decreased, but the profit improved greatly.

From Formula (7), we initially get c_1^{opt} , then c_2^{opt} to c_7^{opt} . The results are shown in Table 3.

Table 3 Optimal R&D Expenditure (RMB hundred million)

t	1	2	3	4	5	6	7
c_t^{opt}	0.055	0.053	0.04	0.038	0.032	0.034	0.046

Suppose $S_0 = 0$ when t = 0. All results of profit and market share are provided in Tables 4 and 5.

Table 4 Optimal Product Development Profit (RMB hundred million)

t	1	2	3	4	5	6	7
Z_t^{opt}	0.2202	0.5038	0.74	0.8316	1.052	1.118	1.647

Table 5 Market Share After Optimisation

t	1	2	3	4	5	6	7
S_t^{opt}	0.047	0.078	0.097	0.108	0.114	0.117	0.118

4 Conclusion

From the above results, we can know that the system product development cost decreased and market profit improved greatly, following profit optimisation. From Tables 3-5, we can conclude that if the enterprise's R&D expenditure is large at each stage of developing a new product, although it will have the advantage of a higher market share, its profit level is not always high. In order to have a good R&D investment efficiency, the enterprise should arrange its R&D expenditure properly.

The Selection of Strategic Emerging Industries in the Face of the Third Industrial Revolution

Zhao Wenzhe, Li Xiaoping

Personnel Department, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: zwz@whut.edu.cn, lixiaoping@whut.edu.cn)

Abstract: The third industrial revolution is another major leap after steam technology revolution and power technology revolution during the history of human civilization. Its main indicators are the major innovation, deep integration and wide application of emerging technologies to promote the great development of productivity and fundamental changes of industrial structure and social life structure. This paper reveals the connotations of strategic emerging industries in the third industrial revolution, the deep changes of extension, the criteria of choices of strategic emerging industries, evaluation index system and evaluation model of entropy. Combined with 32 manufacturing industries and 6 service industries in Hubei province, this paper proposes the key points of strategic emerging industries in Hubei province during the third industrial revolution.

Key words: The third industrial revolution; Strategic emerging industries; Evaluation index system; Entropy method

1 Introduction

In the context of the third industrial revolution, major scientific and technological innovations will promote the great development of social productivity and lead to significant changes in industrial structure and structure of social life. In the process of developing strategic emerging industrial planning, it is vital to select suitable strategic emerging industries according to its features of regional resources and economy. Combined with the basic features of strategic emerging industries, this paper proposes the criteria of selecting strategic emerging industries in the third industrial revolution and designs the index system of selecting strategic emerging industries.

2 Industrial Development Trend During the Third Industrial Revolution

The third industrial revolution is another major leap after steam technology revolution and power technology revolution during the history of human civilization. Its main indicators are the major innovation, deep integration and wide application of emerging technologies such as digital manufacturing technology, the Internet technology, renewable energy technology, new materials technology, biotechnology, space technology and so on. They will promote the great development of productivity, fundamental changes of industrial structure and social life structure and great adjustment of international economic pattern. The third industrial revolution is historically significant for China's and regional development. In September 2013, the general secretary Xi Jinping clearly said "a new round of technological and industrial revolution is emerging, and some important issues of science and key core technologies have achieved the revolutionary breakthrough, which promotes the integration of key technologies, group development and continuous accumulation of reform energy. The emerging new round of technological and industrial revolution integrates with the accelerated economic development of China historically, which provides great chance for implementing innovative and driving strategy. Chance is fleeting. What can be seized is opportunity, and what cannot be seized is challenge. We should enhance our awareness of crisis, grasp and make good use of new round of technological and industrial revolution rather than wait or get relaxed."

To seize the historical opportunity of the third industrial revolution, we must first grasp and follow the industrial development trend of the third industrial revolution. Generally speaking, there are three major trends of industrial development during the third industrial revolution: first is low-carbon. The third industrial revolution is emerging under the double crisis of energy and environment. Green, low-carbon, renewable and sustainable industry is the core nature of the industrial development of the third industrial revolution. The sustainable industries of low energy consumption and low pollution such as new energy, energy-saving and environmentally friendly, new material, biopharmaceutical, new information technology and digital manufacturing industry are the mainstream direction and inevitable choices of the industrial development of the third industrial revolution. Second is integration. The major feature of industrial development of the third industrial revolution is integration of information and the

cross integration of various industries. The new information technology, new material, new energy, manufacturing industry, energy-saving and environmentally friendly industry, logistics, commerce, education, entertainment and finance integrate continuously with mutual penetration and support to promote continuous upgrading of industries. At the same time, new material and manufacturing industry, biopharmaceutical and energy-saving and environmentally friendly industry continuously integrate, biopharmaceutical industry and agriculture, new energy, restaurant, and energy-saving and environmentally friendly industry continuously integrate, the manufacturing industry and service industry integrate continuously, which makes the industrial boundary obscure and allows the emergence of new industries. Third is people-oriented. People-oriented value is the soul of the third industrial revolution, which will bring fundamental changes to human's way of production and life and thoughts. People focus more on healthy and quality life, which will promote the development of happiness-oriented industries, including human life and health, convenient transportation, green food, leisure and tourism, cultural and creative industries.

3 Domestic and Foreign Research Review

The domestic and foreign research of strategic emerging industries focuses on the definition, development reasons, selection, growth, development and policies of strategic emerging industries. The American economist W.W. Rostow (1959) first proposed the concept of leading sector and leading industry (Rostow, 2001). Japan and South Korea have made great achievements in promoting the overall economic development by supporting key industries. Since then, people begin to focus more on the strategic industries. A.O. Hirschman (1958) first proposed the concept of strategic industry who regards strategic industry and leading industry as the same concept. He argues leading industry presents the closest economic system in the relationship of "input – output"(Hirschman, 1991). Paul R. Krugman (2000) argues there are two criteria of recognizing strategic departments by research: first is whether there is higher capital or labor return rate; second is whether there is spillover effect, namely external economy (Paul R. Krugman,2000). There are a lot of studies of defining strategic emerging industries by domestic scholars. For example, Li Xiaohua (2010) argues that the strategic emerging industries are of great strategic significance for economic development. They are strategic, uncertain, positively external and complex (Li Xiaohua & Lv Tie, 2010). Su Dongshui (2010) defines the leading sector similar to strategic emerging industries: leading industry is industry or industrial group which plays an important strategic role in national economic system with advanced development to guide other industries to develop towards a strategic goal. Liu Hongchang (2011) combines with the domestic and foreign research results and argues that strategic emerging industries occupy an important strategic position in national economy and they are related to regional or regional economic growth and industrial security. They are the deep integration of emerging technology and industries with the features strategy, innovation, growth, relevance, orientation and risk (Liu Hongchang, 2011).

In "Decision on Accelerating Cultivating and Developing Strategic Emerging Industries of the State Council" approved in September 2010, it defines strategic emerging industries as: strategic emerging industries are based on major technological breakthrough and development needs to lead the economic and social long-term development with intensive knowledge and technology, less consumption of material resources, great growth potential and good comprehensive benefits. They are based on our national conditions and industrial basis to confirm the seven major industries to cultivate and develop: energy saving, new generation of information technology, biotechnology, high-end equipment manufacturing, new energy, new materials, new energy vehicles and other industries (The State Council, 2010).

4 Selection Criteria of Strategic Emerging Industries in the Third Industrial Revolution

Strategic emerging industries are based on major technological breakthrough and major development needs to lead the economic and social long-term development with intensive knowledge and technology, less consumption of material resources, great growth potential and good comprehensive benefits. It contains features of wholeness, relevance, intensive knowledge and technology, low consumption of material resources, great growth potential and good comprehensive benefits. Based on the previous outstanding research results and theories and combined with the basic features of strategic emerging industries, this paper proposes the selection criteria of strategic emerging industries in the third industrial revolution.

4.1 Development basis

Strategic emerging industries are a deep combination of emerging technology and emerging

industry at the early stage of development with a small scale. The regions should make breakthroughs in fields with the most basic and greatest condition and first develop industries with comparative advantages and good comprehensive benefits when developing strategic emerging industries in order to promote the rapid growth of strategic emerging industries and develop strategic pillar industries.

4.2 Industrial innovation

Strategic emerging industries are different from traditional pillar industries mostly because they are not too dependent on the traditional elements of location, funding, resources and environment. Their rapid growth and sustainable development mainly depends on innovation, including the technological innovation brought by knowledge, intelligence and technology, management innovation, concept innovation and so on.

4.3 Industrial contribution

Strategic emerging industry should lead the long-term development of economy and society. They should not only be the major supportive force of economic development but contribute to employment, people’s life, society, environment and other aspects.

4.4 Development potential

Development potential means strategic emerging industries should meet the high requirements of growth with broad and stable market prospect and development space and rapid growth in the future period.

4.5 Industrial relevance

Industrial relevance is key to evaluating the influence of strategic emerging industries. Only the industries with strong relevance, spillover effect and diffusion effect can promote the development of other industries to assume the great responsibility of promoting the optimization and adjustment of industrial structure.

When evaluating whether one industry or several industries should be developed as the strategic emerging industries or not, we should not just focus whether they meet one criterion or not but comprehensively consider the four criteria. Only the industries with high comprehensive ability can be given priority to development.

5 Selection Index and Model of Strategic Emerging Industries

5.1 Selection Index of Strategic Emerging Industries

According to the concept and features of strategic emerging industries and combined with the principles, criteria, the accessibility and operability of index data of strategic emerging industries, it designs the index system of selection of strategic emerging industries from industrial development basis, industrial innovation, industrial contribution, industrial development potential, industrial relevance as shown in Table 1.

Table 1 Evaluation Index System of Selection of Strategic Emerging Industries

Class A	Class B	Class C	Index
Industrial Development Status	Industrial Scale	Output proportion	Output of a local industry/local overall output
		Enterprise proportion	Enterprise number of a local industry/overall number of local enterprises
	Industrial Agglomeration	Market share	Sales of a local industry/ national sales of the industry
		Enterprise concentration degree	Enterprise proportion of a local industry/national proportion of the industry
		Location entropy	Output proportion of a local industry/national output proportion of the industry
		Specialization coefficient	Employment proportion of a local industry/national employment proportion of the industry
Industrial Innovation	Innovation Investment	R&D investment ratio	R&D investment ratio of a local industry/overall local R&D investment ratio
		R&D investment degree	R&D investment amount of a local industry/revenues of main business of the industry
		R&D investment per capita	R&D investment amount of a local industry/ employment number of the local industry
	Innovation Output	Labor productivity	Output proportion of a local industry/employment proportion of the industry
		Comparative labor productivity	Labor productivity of a local industry/national labor productivity of the industry
		Sales rate of new products	Sales of new product of a local industry/total sales of the local industry
		Utilization ratio of cost	Profit of a local industry/total cost of the industry

Industrial Contribution	Economic Contribution	Industrial contribution ratio	Incremental of a local industry/local GDP growth
		Industrial influence ratio	Contribution of local industry/local GDP growth rate
	Social Contribution	Employment proportion	Employment number of a local industry/total number of local employment
		Tax proportion	Tax of a local industry/total local tax
Export Contribution	Export proportion	Exports of a local industry/local total exports	
Industrial Development Potential	Growth Rate	Output growth rate	Output growth rate of a local industry with n years
		Employment growth rate	Employment growth rate of a local industry with n years
	Market Prospect	Sales growth rate	Sales Growth of a local industry within n years
		Income elasticity of demand	Sales growth rate of a local industry within n years/ local per capita income growth rate
Industrial Relevance	Consumption Index	Intermediate needs	Ratio of the sum of intermediate needs of a certain industry by various industries against the total demands of the industry
		Intermediate input	Intermediate input/ overall input of an industry
	Spread Effect	Influence coefficient	j industry: sum of j line of Leontief inverse matrix divide the average of the sum of each line
		Reaction coefficient	i industry: sum of i row of Leontief inverse matrix divide the average of the sum of each row

5.2 Entropy Method of Selection of Strategic Emerging Industries

In order to make the calculation results more accurate and reasonable and eliminate subjective factors as much as possible in the evaluation process, this paper adopts the entropy method. It is an objective weighting method which determines the index weight according to the information size provided by index observation. There are M programs to evaluate and N evaluation indexes to develop the original data matrix. As for an indicator, the greater the gap of index is, the greater role of this indicator will play in overall evaluation. If the indexes of an indicator are equal, the indicator plays no role in overall evaluation. In information theory, entropy is a measurement of uncertainty. When the volume of information is larger, the uncertainty will be smaller, as well as the entropy; when the volume of information is smaller, the uncertainty will be greater, as well as the entropy. According to the features of entropy, the randomness and disorder degree of a program and the dispersion degree of an indicator can be judged by evaluating the entropy. The greater the dispersion degree of the indicator is, the greater impact of the indicator on overall evaluation will be. Therefore, we can make use of information entropy based on the degree of variation of the indicators to calculate the weight of various indicators and provide basis for the overall evaluation of various indicators.

6 Empirical Data of Selection of Strategic Emerging Industries in Hubei Province

According to Hubei industrial sector, service sector and the corresponding coefficient of strategic emerging industries and sectors of national economy, this paper works out the overall score of all the strategic emerging industries as shown in Table 2. Under the third industrial revolution, Hubei strategic emerging industries are energy saving and environmentally friendly protection industry, new generation of information technology industry, biological industry, new material industry, high-end equipment manufacturing industry, new energy industry and new energy vehicle industry.

Table 3 Overall Scores and Ranking of Strategic Emerging Industries in Hubei Province

Name of strategic emerging industries	Overall Score	Ranking
Energy saving and environmentally friendly industry	0.16546	1
New generation of information technology industry	0.14643	2
Biological industry	0.07386	3
New material industry	0.05154	4
High-end equipment manufacturing industry	0.04485	5
New energy industry	0.04166	6
New energy vehicle industry	0.00253	7

7 Conclusion

This paper studies the choice of strategic emerging industries in the third industrial revolution. Through the analysis of industrial development trend in the third industrial revolution, this paper constitutes a set of selection index system of strategic emerging industries from industrial development basis, industrial innovation, industrial contribution, industrial development potential and industrial relevance. Then this paper conducts an empirical analysis of strategic emerging industries in Hubei Province by entropy method.

The Construction of Evaluation Index System of Regional Collaborative Innovation Driven by National Innovation

Cheng Shiwei, Qin Yuanjian

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 379078635@qq.com, qyjhb@163.com)

Abstract: The Regional synergy innovation driven by national innovation has become the focus of theoretical research, therefore, building a perfect regional synergy innovation capability evaluation index system helps to measure and analyze the regional collaborative innovation ability. In this article, we take the scholars of the existing theoretical research as basis to analyze the theory of collaborative innovation. According to scientific and practical nature and the system principle, we divide regional collaborative innovation capacity into five indices: innovation support ability evaluation index, knowledge Innovation ability evaluation, configuration of knowledge evaluation index, applying evaluation index and innovative environment supporting capacity evaluation. Through these five aspects, this article constructs a complete regional synergy innovation capability evaluation index system. In the end, we come to the conclusion that evaluation index system of scientific calculation methods could be further verified, and figure out several effective measures for strengthening regional collaborative innovation ability in our country.

Key words: Regional collaborative innovation ability; Cooperative innovation ability evaluation index; Construction of evaluation index system

1 Introduction

1.1 Research purposes

With the implement of "Thirteenth five year plan", we take the innovation-driven development strategy as a major strategic when information technology, biotechnology, new energy technology, new materials technology and some cross-integrated technology are triggering a new round of technological revolution and industrial revolution.

Therefore, the construction of synergy innovation ability evaluation index system can effectively evaluate regional economy, showing that prominent contradictions existing in the process of regional economic development. Then we put forward corresponding improvement measures and suggestions in order to promote country's overall economic health and sustainable development.

1.2 Literature review

Chinese scholars' researches on regional synergy innovation have been widely studied related influence factors and dynamic mechanism of the development of collaborative innovation, and capacity for development planning and evaluation, and many other aspects. This article forces the researches on evaluation index system for national innovation-driven regional synergy innovation ability, and reviews the articles in recent three years:

Xiong Xiaogang^[1](2013) pointed that for effective integration of regional innovation system is an important way to promote development of cross-regional economy, at the same time analyzed the influence factors of coordinated development of regional innovation system. Then he integrated the scholar's research conclusion "three factor theory" and "four force effect theory", at the same time put forward a number of coordinated development of regional innovation promoting measures. Yan Junzhou^[2](2013) said that innovation can play a key role in view of the national macro-economic environment, then took Henan province as example to propose independent innovation strategies can be implemented. In February, Qi Shaoping^[3](2013) made a study on motive mechanism of regional collaborative innovation, focused on the macro development trend of science and technology innovation in China, and pointed out that cooperative innovation is at the heart of the area elements and resources effective gathering and symbiosis. Therefore regional synergy innovation system mechanism reform, which reflects through a new service mode, profit distribution, capital investment and assessment and monitoring, is particularly important, He Ling^[4](2013) had a detailed study of the regional assessment mechanisms for collaborative innovation, on the basis of relevant theoretical background, she pointed out that regional collaborative innovation is formed by five elements: innovation resource protection, configurability, application of knowledge innovation ability, knowledge, and innovation supporting capacity of the environment. At the same time, Li Lin^[5](2013) took the form of empirical

research on the evaluation index system of regional innovation synergy and analyzed their application. He noted that the regional collaborative innovation is an important factor in considering regional collaborative innovation. The literature built the regional collaborative innovation synergy degree evaluation system from four aspects: collaborative innovation subject form and quantity, innovation mechanism guarantee, innovation degree of organization and coordination, technology knowledge flow. When it comes to 2014, Gao Lina^[6](2014) researched on the innovation of regional cooperative mechanism and spatial characteristics, and found out that the flow of innovation body is the mainly the formation of collaborative innovation. Innovation of market transactions and knowledge flow promotes regional collective learning process. What's more, the spatial distribution of innovative elements make collaborative innovation partner selection with local features, so spatial interaction is obvious, which is an important mechanism to drive the overall economic growth. In the same year, Zhao Jiandong^[7](2014) studied collaborative innovation development planning based on the perspective of regional industry analyses production, then figured out that synergy innovation can break efficiency, scientific research institutions, enterprises R&D department dispersed closed state. Therefore we can establish more pattern, deeper cooperation to form regional innovation system in order to promote regional economic development. Then he took a college's item in Guangdong province as example to do the case planning analysis, which has certain effectiveness.

Above are reviewed from the related theories of regional collaborative innovation, collaborative elements, innovation ability assessment and evaluation system to build the research of this paper.

2 The Relevant Theories of Regional Synergy Innovation Ability

2.1 Synergetic theory

Synergetic theory was advanced by Germany physicist Hawking. He believes that various systems containing multiple subsystems within, and each subsystem contains multiple elements, most of which are in constant evolution and development. The core idea of synergy is to produce an orderly system structure and make the system add value through synergy. To achieve the goal of synergy, the subsystems and subsystem elements must collaborate with each other, even turn to causal relationship. In that case can the whole system eventually produce orderly structure.

2.2 Triple helix theory

Coexistence of the main innovations can be achieved. Regional synergy power depends on the collaboration between innovation subjects of win-win or multi-win. Common development among each subject is the power source of university and regional collaborative innovation. The construction of collaborative innovation motivation mechanism can also be inspired from the triple helix theory. In the 1990 of 20th century, United States scholars Henry and Roy made the triple helix theory, it was based on interaction among government, enterprise and university. This kind of interaction creates innovation power, which leads to encouraging triple helix relationship. Regional collaborative innovation subjects come from government, university and enterprise, but triple helix theory lies in market-bond. Building the institutional environment of innovation can not only interactively integrate innovation elements, but also provide theoretical support for the alternate growth of regional synergy subjects.

2.3 Drive theory

Innovation "potential" has been played. Drive theory means that when the organism's needs were not met, drive stimulus would produce within organism. This drive stimulus causes an organism needs met within, operation needs to be met. Then it disappears, through internal digestion or degradation, it appears again. So, drive theory is always called 'Drive reduction theory' or 'On the need to meet'. This kind of drive force can be divided into the primary drives and later acquired drives. Suppose that we take the main regional collaborative innovation as an anthropomorphic research, then we can find out that social organization also applies to drive theory. As the main subject of regional innovation in business, government, universities and research institutes have their own original drive on organization attribute. Productivity, profit growth, dissemination of knowledge, culture and innovation are all regarded as the demands, and this diversity of needs has polar complementary. If the government can organize it together to form the regional community of collaborative innovation will drive the timely release and zoom, the requirements of various innovation main body will receive different levels of satisfaction. At the same time, due to the strategic objective of enhancing innovation, later acquired drives will appear. From the categories view, we can classify regional collaborative innovation drives into knowledge-driven, market-driven and government-driven.

3 Construction of Evaluation Index System for Regional Synergy Innovation

3.1 The principles of building evaluation indicators

(1) The principle of combining scientific and practical

The principle of scientific means selecting indicators supported by relevant theories, and combining the comprehensiveness and relevance of indicators in order to make the index reflect their abilities faithfully. But setting of indicators should combine with innovation practices, especially national conditions and interior features of this region. In a word, setting of indicators should reflect the region's innovation ability and development potential.

(2) System integrity principle

Setting the indicator system should be reviewed from systematic view. Indicator system ought to reflect the systematic, gradation characteristics. Because regional innovation system is composed of several subsystems organic, this decided the innovation ability of systemic characteristics. But to evaluate the ability, the setting indicator system must be systemic. It should reflect the following several abilities comprehensively and systematically: innovation resources, knowledge creation, interaction and sharing of knowledge, knowledge application and innovation environment.

(3) The principle of combining static and dynamic

Innovation ability evaluation indicators must reflect the current situation of regional innovation and scale characteristics on the one hand. On the other hand, they should take the differences of regional demographic and spatial range into consideration, what's more the potential for further development. Therefore, setting indicators has to take three types of indicators into account. One is absolute indicator(gross) to reflect the size, another is relative value indicators (per capita quantity or ratio) to consider the differences of regional demographic and spatial range, the last is growth rate indicators to reflect regional development potential.

3.2 Construction of evaluation index system

Previous results combined with this research theme, from the perspective of “Innovation is the creation, transfer and application of knowledge” to construct a theory of collaborative innovation capability evaluation index system of regional frameworks:

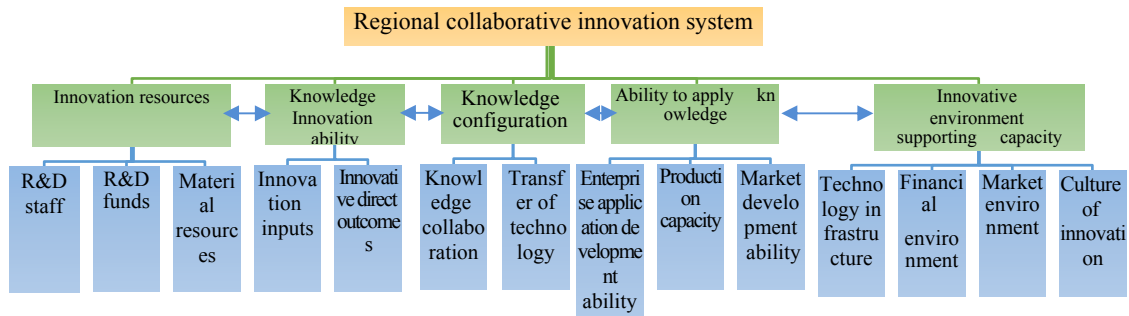

Figure 1 Theoretical Framework of Regional Cooperative Innovation Capability Evaluation Index System

Table1 Innovation Resources Support Ability Evaluation Indexes

Domain layer	Evaluation index name	Variable identification	Unit
Human resources	The number of professional and technical personnel per ten thousand people	K1	Person/ten thousand people
	College degree or above per ten thousand people	K2	Person / ten thousand people
	Average years of schooling	K3	Year / person
Funding resources	Local government investment in science and technology	K4	One hundred million yuan
	Fiscal investment in science and technology / Local fiscal expenditure	K5	%
	Foreign capital investment	K6	Ten thousand yuan
Material resources	Scientific equipment acquisition costs	K7	Ten thousand yuan
	R&D additional personnel and equipment per person fee	K8	Ten thousand yuan / person
	Scientific research and comprehensive technical services newly increased fixed assets / whole society assets	K9	%

(1) Innovation resources support ability evaluation index

Innovation resources, which are premise and condition of regional innovation, are to reserve resources for innovation. All these activities are built on the basis of resources. The evaluation of innovation resources supports ability inextricably to evaluate the level of protection of relevant elements for the foundations of regional innovation activities. Specifically, financial resources should be evaluated from three aspects: government and corporate investment in science and technology, and other sources of investment in science and technology.

(2) Knowledge innovation ability evaluation index

From a certain perspective, knowledge innovation is the start point of regional innovation activities. If there is no knowledge innovation, the subsequent link of regional innovation cannot be completed, it can't bring new products and the generation of economic performance finally. Concentrated manifestation of knowledge innovation is the fundamental research and experimental development (R&D). We can use R&D spending relative to GDP ratio in order to reflect direct funding for knowledge innovation strength. In terms of organizational inputs, we can use a number of researches and development institutions to reflect. On the direct scientific and technological achievements of knowledge innovation, basic carrier or manifestations of direct outcomes are the following four aspects: patent of invention, scientific research projects, research papers and science and technology achievement award. Indicators were set up from these aspects to evaluate results of direct output of knowledge innovation.

Table 2 Knowledge Innovation Ability Evaluation Indexes

Domain layer	Evaluation index name	Variable identification	Unit
Knowledge innovation investment	Number of scientists and engineers of R&D per ten thousand people	K10	Person / ten thousand people
	Research and development (R&D) personnel full-time equivalent	K11	Person/year
	R&D spending relative to GDP ratio	K12	%
	Number of research and development institutions	K13	a
Innovative direct outcomes	Number of employment invention patent ownership per ten thousand people	K14	Item/ten thousand people
	Institutions of higher learning R&D project number	K15	Item
	Number of R&D activities personnel number of scientific papers per ten thousand people	K16	Article/ ten thousand people
	Won a national science and technology achievement award item number	K17	Item

(3) Knowledge configuration capability evaluation index

Configuration is a kind of promoting knowledge in different ways of interaction among innovation subjects. To create the knowledge to successfully reach its demands, or to make various different innovation have full exchange between the nature and structure of knowledge in the subject, links must be configured through knowledge to achieve this goal.

Knowledge distribution manifestation can be divided into direct and indirect market-based trading mechanisms of technology transfer. Technical cooperation refers to enterprises, universities, research institutes and other relevant innovation around to get some technical knowledge and cooperation between research and development, during the process of cooperation to promote the flow of knowledge and knowledge value increment. Evaluation of technical cooperation capacity can mainly through four indicators: same province different units working papers published, universities and research institutes of scientific research funds in enterprise funding ratio, number of scientific research project research and development of college and enterprise cooperation, number of joint scientific research institutes and enterprises to apply for a patent for invention. Technology transfer mainly refers to take direct way of market transactions engaged in technology trade to make the technical flow from suppliers to the demand side. By means of this kind of configuration, achieve the purpose of flow and sharing of knowledge. Hence, the knowledge configuration ability evaluation indices can be built as follows:

Table 3 Knowledge Configuration Capability Evaluation Indexes

Domain layer	Evaluation index name	Variable identification	Unit
Knowledge collaboration	Number of authors with province exclusive units of scientific papers	K18	Paper
	Registered capital is provided by the end of part of enterprises with foreign investment	K19	Millions of dollars
	Universities and research institutes in the activities of science and technology funds from enterprises the proportion of funds	K20	%
	Number of college and enterprise cooperation and development of scientific research project	K21	Item
	Scientific research institutes and enterprises jointly apply for a patent for invention of growth	K22	%
Technology transfer	Technical market transaction	K23	Ten thousand yuan
	Industrial enterprises above designated size foreign technology import amount	K24	Ten thousand yuan
	R&D personnel to foreign transfer of patent and royalty per ten thousand people	K25	Ten thousand dollars /ten thousand yuan

(4) Knowledge application ability evaluation index

The key subject of knowledge application is enterprise. If there are no enterprises, universities, research institutes and other organizations to apply new knowledge, scientific and technological achievements cannot be effectively transformed into real economic efficiency. In other words, if there is no application of knowledge, science and economy will always be in a state of two sheets of skin, then any advance in technology in regional economy would play a less important role in promoting.

From internal enterprise process analysis of innovation, there must be three basic links to successfully accomplish whole process of enterprise internal knowledge application: application development, production and manufacturing and market development, which can truly achieve ultimate fusion of scientific research and economic development. The application ability of enterprises' upstream basic knowledge can be expressed through three aspects: internal expenditures R&D funding, number of new product development projects, enterprises are applying for patents. Based on the above analysis, construct evaluation indicator of the ability to apply knowledge series.

Table 4 Knowledge Application Ability Evaluation Indexes

Domain layer	Evaluation index name	Variable identification	Unit
Enterprise application development capabilities	Spending on Enterprise R&D sales revenue share	K26	%
	Number of new product development projects of large and medium industrial enterprises	K27	Item
	Number of large and medium industrial enterprises patent application	K28	Item
Production capacity	Equipment used in production and operation of industrial enterprises above the designated size price	K29	Billion yuan
	Level of investment in technological transformation of industrial enterprises above designated size	K30	Tenthousand yuan
	Proportion of original equipment for production and management of electronic control equipment	K31	%
Marketing capabilities	Industrial enterprises above the designated size and new product sales revenue	K32	Billion yuan
	Exports of products of industrial enterprises above designated size	K33	Billion yuan

(5) Innovative environment supporting capacity evaluation

Environment of innovation can be divided into hard and soft environment. Innovation infrastructure is representative of the hard environment, including physical and technological infrastructure. Physical infrastructure includes transportation, communication facilities, etc. Technological infrastructure including technical standards, technical databases and so on. Soft environment reflects from laws and policies, demand, quality of personnel, as well as creative and cultural aspects. At the same time, many factors cannot be precisely quantified in the soft environment. Looking for alternative indicators, we can only do quantitative analysis indirectly. Here, using tens of thousands of patent applications as a measure of employment indicators.

Table 5 Innovative Environment Supporting Capacity Evaluation

Domain layer	Evaluation index name	Variable identification	Unit
Infrastructure	Number of libraries	K34	a
	Hundreds of household computer ownership	K35	a/ Hundreds of families
Financial environment	Number of venture capital firms in the region	K36	a
Market environment	Government expenditures	K37	Ten thousand yuan
	Residents' consumption level	K38	Ten thousand yuan
Culture of innovation	Employees of patent applications per ten thousand people	K39	Item/ten thousand people

4 Conclusion

Synergy innovation has already become the non-ignorable form of world economy and science and technology development. To fully mobilize and coordinate the resources can effectively realize regional dimensions of collaborative innovation, which is the inevitable outcome and important content of deepening regional cooperation. The same time, synergy innovation can break the university, scientific research institution, enterprise R&D department's disperse and closed state, then establish more deep cooperation and form regional innovation system, promote the development of regional economy. This article is under the reality that the State's innovation-driven economy relies on innovation for sustainable development, so it's important to strengthen regional collaborative innovation and put forward regional collaborative innovation capability evaluation index system. Then the related data can be found in reference books such as "China Statistical Yearbook on Science and technology", "High-tech industry development in China", "Report of regional innovation capability of China", "Yearbook of Chinese scientific and technical papers statistics and analysis", "Almanac of China's finance" and so on. At the same time, methods can be applied to systematically and objectively evaluate the regional economy, such as DEA, fuzzy mathematics method, method of measurement of composite systems, etc.

We can strength regional synergy innovation capacity under the case of innovation-driven, except for construction of the evaluation index system in order to reduce the uncertainty of innovation activities. There are also four aspects of activities to strengthen it as follows:

- (1) Respect the law, promote collaboration, and strengthen regional synergy innovation.
- (2) Open and interact, improve level, enhance the exchange of innovation.
- (3) Find the right path, and foster venture.
- (4) To strengthen investment, optimize the configuration.

This paper has no empirical analysis due to time and space factors. By entering appropriate data and applying a few models, we can provide domestic situation of regional economic development. And depending on the characteristics of regional economic development to put forward proposals for economic development and measures, which can help our country's economic development presents a balanced, coordinated and sustainable situation. As a result, we can realize the leaping development of economy.

Leading Industry Selection of Modern Service Industry in Wuhan Based on Entropy Method

Xiang Lu, Hou Renyong

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 243141466@qq.com, hourenyong@126.com)

Abstract: Leading industry selection deeply affects the regional industrial structure adjustment and upgrading, how to choose the appropriate leading industry is a hot issues of regional economic research, also a realistic problem urgently to be solved. This paper focuses on the leading industry selection of modern service industry in Wuhan. Through establishing the leading industry selection model from four aspects: industrial basis, industrial innovation, industrial linkage, industrial potential, and calculating indicators with entropy method, the paper determines financial industry, modern logistics industry and modern business industry as the leading industries of modern service industry in Wuhan at present stage. At last, some corresponding countermeasures and suggestions are put forward.

Key words: Leading industry; Modern service industry; Selection model; Entropy method

1 Introduction

In recent years, Wuhan puts forward the strategic task of breakthrough development of modern service industry. Along with the Jiangnan District and East Lake national independent innovation demonstration zone have been approved the “National Service Industry Comprehensive Reform Pilot Area” and “National Modern Service Pilot”, the development of modern service industry in Wuhan is entering into a new historical period. However, the structural imbalance of Wuhan modern service industry is gradually emerged. As we know, modern service industry has many industry categories which have many differences, such as the development level, the degree of correlation, the important degree, the development potential and so on. Therefore, choosing the appropriate leading industry to lead the modern service industry develop orderly is an urgent subject.

Studies on leading industry start in Japan and western countries. The American economist Rostow (1959) first puts forward the concept of “leading sector” and he believes that “leading sector” is the key sector with high growth rate which has two features: first, it’s a source of innovation can rapidly introduce the technology innovation; second, it’s a “diffusion point” can produce a greater demand to other sectors^[1]. Japanese economist Makoto Shinohara (1994) puts forward that “the income elasticity of demand” and “the rate of increase in productivity” are the core factors to judge whether an industry belongs to mainstay industry or not^[2]. Hirshman (1998) proposes that due to the scarcity of resources, no region or country can develop all the industry commonly. Governments should make reasonable choices to promote the limited resources into the key areas^[3]. Li Na and Wang Fei (2012) analyze the evolution of China's leading industry from 1992 to 2005 based on the proportional growth deviation method^[4]. Wang Chunyan (2013) believes that technology innovation, resources endowment, industrial policy and infrastructure construction are the main factors affecting the development of leading industry^[5]. Zhou Zhenhua (2014) puts forward that the “growth potential”, “shortage of the elasticity of substitution” and “bottleneck effect” are the important factors affecting the leading industry selection^[6].

In summary, although researches on leading industry are very rich, they focus on national economic areas or regional economic areas, few takes the modern service industry as the research object. Therefore, the paper has certain theoretical significance.

2 Regional Leading Industry Selection Model

The paper draws on the outstanding research achievements and puts forward the four benchmarks of leading industry selection.

The first benchmark is industrial basis. It refers to the leading industry should have a larger scale and higher level, can form a strong influence on regional economy.

The second benchmark is industrial innovation. It refers to the leading industry should be different from the traditional industry which heavily relies on location, capital, policy, resources and environment factors, the leading industries should be derived by innovation, including knowledge, intelligence, technology innovation, management innovation, concept innovation and so on.

The third benchmark is industrial linkage. It is a key measure of leading industry influence. Only with strong correlation effect, spillover effect and diffusion effect an industry can be regarded as leading industry.

The fourth benchmark is industry potential. It refers to the leading industry must comply with the requirements of high growth, in the next period of time should have broad, long-term, stable market prospect and development space.

Figure 1 Benchmarks of Leading Industry Selection

According to the selection benchmarks of regional leading industry, the paper constructs the indicators of leading industry selection. The first class indices contain industrial basis, industrial innovation, industrial linkage and industry potential. The second class indices contain industrial scale, industrial agglomeration, innovation input, innovation output, consumption coefficients, spread effect, growth rate and market prospect. See table 1.

Table 1 Indicators of Leading Industry Selection

First class indices	Second class indices	Third class indices
Industrial basis	Industrial scale	The proportion of output value (X_1)
		The proportion of employment (X_2)
	Industrial agglomeration	Concentration of enterprises (X_3)
		Specialization coefficient (X_4)
		Location entropy (X_5)
Industrial innovation	Innovation input	The proportion of R&D staff (X_6)
		The proportion of R&D funds (X_7)
	Innovation output	Workers compensation rate (X_8)
		Labor productivity (X_9)
Industrial linkage	Consumption coefficients	Intermediate demand rate (X_{10})
		Intermediate input rate (X_{11})
	Spread effect	Influence coefficient (X_{12})
		Sensitivity coefficient (X_{13})
Industry potential	Growth rate	Value added growth rate (X_{14})
		Employment growth rate (X_{15})
	Market prospect	Income elasticity of demand (X_{16})

3 Data and Methodology

According to the Wuhan City Statistical Yearbook 2014 and the first and the second economic census results, the paper collects and calculates the relevant data of various industries in the service industry in Wuhan.

To be clear, because public management, resident services and other services data are difficult to be obtained, and their scale and influence are small, so the paper does not consider them, only considers the modern logistics industry (contains transportation and warehousing) (I1), information service industry (I2), modern business industry (contains wholesale and retail) (I3), accommodation and catering industry (I4), financial industry (I5), estate (I6), education industry (I7), culture and entertainment industry (I8).

Table 2 Data of Service Industry in Wuhan

Industry Indictor	I ₁	I ₂	I ₃	I ₄	I ₅	I ₆	I ₇	I ₈
X ₁	0.140	0.069	0.255	0.087	0.163	0.153	0.102	0.031
X ₂	0.135	0.031	0.206	0.066	0.036	0.072	0.111	0.023
X ₃	1.384	1.231	2.577	2.188	0.558	2.663	0.464	1.177
X ₄	0.962	1.017	0.936	1.417	1.017	0.884	1.116	1.604
X ₅	1.104	1.158	1.297	1.240	0.712	1.606	1.653	1.180
X ₆	2.395	0.375	0.953	1.058	1.440	0.934	1.864	0.674
X ₇	1.146	1.135	1.221	1.098	0.899	1.243	1.305	1.591
X ₈	1.016	1.281	0.679	0.590	1.735	0.943	1.098	0.925
X ₉	1.875	4.070	2.231	2.393	8.109	3.871	1.668	2.388
X ₁₀	0.415	0.326	0.485	0.363	0.570	0.760	0.161	0.714
X ₁₁	0.512	0.326	0.261	0.576	0.339	0.298	0.290	0.432
X ₁₂	1.018	1.011	1.005	0.974	1.021	0.960	0.957	1.053
X ₁₃	0.987	0.949	0.979	1.007	1.137	1.039	0.923	0.981
X ₁₄	0.087	0.183	0.123	0.113	0.168	0.127	0.210	0.173
X ₁₅	22.85	15.486	9.672	10.64	3.055	9.465	17.04	6.461
X ₁₆	0.028	0.014	0.044	0.011	0.025	0.020	0.017	0.008

At present, research on leading industry selection, factor analysis and AHP are most common [7]. However, factor analysis need sample size is more than five times of variables, limitation is relatively large; AHP method is simple and practical, but it has disadvantages of subjective.

In order to make the result more accurate and reasonable, and in the evaluation process as far as possible to eliminate the subjective factors, the paper uses entropy method to calculate. The entropy method is a kind of objective weighting method, according to the information provided by the indicators to determine the index weight [8].

Suppose there are m programs, n indicators, the matrix, the concrete steps are as follows:

- (1) Calculating index proportion. (i=1, 2, ..., n; j=1, 2, ..., m)
- (2) Calculating index entropy, $k=1/$
- (3) Calculating index coefficient.
- (4) Calculating index weight.
- (5) Calculating comprehensive score of each program.
- (6) Comparing the comprehensive score of each program, and choose the best program.

4 Results

Through calculation, the paper obtains the index weight of leading industry selection. See Table 3.

Table 3 Index Weight of Leading Industry Selection

First class indices	Second class indices	Third class indices
Industrial basis (0.236)	Industrial scale (0.137)	The proportion of output value (0.05)
		The proportion of employment (0.087)
	Industrial agglomeration (0.189)	Concentration of enterprises (0.064)
		Specialization coefficient (0.09)
		Location entropy (0.035)
Industrial innovation (0.267)	Innovation input (0.096)	The proportion of R&D staff (0.056)
		The proportion of R&D funds (0.041)
	Innovation output (0.170)	Workers compensation rate (0.059)
		Labor productivity (0.112)
Industrial linkage (0.244)	Consumption coefficients (0.121)	Intermediate demand rate (0.042)
		Intermediate input rate (0.079)
	Spread effect (0.123)	Influence coefficient (0.064)
		Sensitivity coefficient (0.059)
Industry potential (0.163)	Growth rate (0.096)	Value added growth rate (0.047)
		Employment growth rate (0.049)
	Market prospect (0.067)	Income elasticity of demand (0.067)

From Table 3, we can see that the most important indicator is industrial innovation, especially innovation output, it indicates that the leading industry must have strong innovation capability; the second is industrial linkage, it measures the influence of one industry to other industries; the third is industrial basis, especially the industrial agglomeration, it indicates that leading industry should be the advantage industry which has strong competitive advantage and clustering effect; the last is industry potential, it predicts the industry's vitality in the future.

Through calculation, the paper obtains the comprehensive score of service industry in Wuhan.

Table 4 Comprehensive Score of Service Industry in Wuhan

Industry	Index	Comprehensive score	Ranking
Financial industry		0.4672	1
Modern logistics industry		0.4507	2
Modern business industry		0.4429	3
Culture and entertainment industry		0.4106	4
Estate industry		0.3780	5
Accommodation and catering industry		0.3760	6
Education industry		0.3180	7
Information service industry		0.3085	8

From Table 4, we can see that the top three position are: financial industry, modern logistics industry and modern business industry; the 4-7 position are: culture and entertainment industry, estate position, accommodation and catering position, education position; the last position is information service position, although it is technology intensive and potential, due to the small scale, it should belong to strategic emerging industry.

Generally speaking, the number of leading industry is 2~3. Therefore, the paper determines financial industry, modern logistics industry and modern business industry as the leading industries of modern service industry in Wuhan at present stage.

5 Conclusions

The selection of leading industry deeply affects regional industrial structure adjustment and upgrading. The paper puts forward the selection benchmarks of regional leading industry from four aspects: industrial basis, industrial innovation, industrial linkage and industrial potential. According to the selection benchmarks, the paper constructs the indicators of leading industry selection and uses entropy method to calculate the comprehensive score of the service industry in Wuhan. Finally, the paper determines the leading industries of modern service industry in Wuhan are financial industry, modern logistics industry and modern business industry. And corresponding countermeasures and suggestions are put forward as the following.

5.1 Building the Midwest financial services center

First, around the Wangjiadun Financial Street and Optics Valley financial harbor, centralize banking, securities, insurance and other financial industries to promote financial park construction, build a modern financial services gathering platform.

Second, improve the financial organization system, actively introduce and cultivate the headquarters of financial institutions.

Third, broaden the field of financial services, promote financial product diversification and financial instruments innovation, and enhance the agglomeration function.

5.2 Building the national modern logistics center

At present, the primary task is to promote the traditional transportation and warehousing industry upgrade to modern logistics industry.

First, improve infrastructure, build a information platform and a nationwide high-speed, transport-linked, three-dimensional logistics network system.

Second, according to the "logistics base headquarters, logistics parks, logistics centers, distribution centers," speed up construction of the park, focusing on planning, "one port, six parks, eight centers".

Third, through tax breaks, expand financing channels and other policy measures, support local logistics companies and introduce international logistics business headquarters.

5.3 Building the national modern business center

First, through information technology, guide the traditional wholesale market transformation to modern market.

Second, through modern management methods, guide the traditional retail formats transition to the modern mode.

Third, optimize the layout of commercial outlets and build a multi-level business gathering system.

Evaluation of Hi-Tech Zone Development Level from Endogenous Function and Collaborative Innovation Ability Dimensions: An Empirical Analysis of National High-Tech Zones*

Sun Qian, Hou Renyong

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: sunqian9012@qq.com, hourenyong@126.com)

Abstract: Hi-tech zones play important roles in driving Chinese economic development, upgrading the industrial structure and promoting regional innovation. Current researches treat high-tech zone as a “black box” and ignore high-tech zone’s inner structures. This paper constructs an indicator system from endogenous function dimension and collaborative innovation ability dimension to make comprehensive evaluation of 56 national hi-tech zones with factor analysis and cluster analysis. The result of factor analysis and cluster analysis shows that: (1) Chinese national high-tech zones’ overall strength is still weak, most of which are 33 high-tech zones in “double-inferior” situation; (2) high-tech zones’ system function does not match their collaborative innovation capability; (3) Development level of national high-tech zones faces a serious differentiation. Based on these, this research provides differentiation policy suggestions to different hi-tech zones which is of great significance in policy making.

Key words: High-tech zones; Endogenous function; Collaborative innovation ability; Evaluation

1 Introduction

Up to now the number of national hi-tech zones is more than 56. There is no doubt that hi-tech zones play important roles in driving Chinese economic development, upgrading the industrial structure, attracting foreign investment and promoting regional innovation. After the prosperity derived from policy driven period, high-zones lacked the driving force of development facing the danger of deterioration of high-tech industry. The root cause for this deterioration is that high-zones lack sustainable innovation capability and dynamic adaptability. According to review the research status quo of industry cluster innovation, many researchers’ work is focusing on analyzing the fundamental source and sustainable power of cluster collaborative innovation ability at knowledge level^[1,2]. Presently, researches mainly focus on the process of single enterprise’ network-innovation in specific cluster^[3].

This paper explores development problem of high-tech zones from cluster body level on the basis of the development status quo of Chinese national high-tech zones. The high-tech zone is a kind of institutional arrangement, its internal development mechanism lies in industrial cluster, and its source of driving economy development consists in the effective coordination of all resources in the cluster and the economies of scale and collaboration effect among subjects. Throughout the development history of high-tech zones, almost all the high-tech zones fail to form reasonable industrial clusters. In order to understand deeply of national high-tech zones’ development status quo, this work aims at evaluating quantitatively development level of national high-tech zones through establishing high-tech zones development indicator system using factor analysis and cluster analysis, inducing development trend of national high-tech zones and providing some targeted guidance for national high-tech zones.

2 Analysis Frameworks and Evaluation Indicator System Construction

Industry cluster derives from a famous British new classical economist Marshall’ Industrial district theory. The notion of Industry cluster is put forward by Michael Porter. He points out that industrial cluster is a group of enterprises and associated institutions which are interconnected and geographically close each other, and they belong to a particular industry and associate together owing to the commonality and complementary (Porter.M.E, 2002). WANG Jici considers that Industry cluster is constructed by amount of professional companies and related support institutions which are agglomerated flexibly within a certain geographical range. These organizations become an intensive cooperative network which is rooted in local social and cultural environment (WANG Jici, 2001). WEI Jiang and GE Chaoyang deem that industry cluster is a spacious industrial organization which comes from perfect industrial chains and industrial association (GE Chaoyang&WEI Jiang, 2003). From these notions, we can find that some characteristics of cluster: first, a lot of organizations agglomerate; second,

* This paper is financially supported by self-determined and innovative research funds of WUT(No. 155103001)

industrial chains are the key part for agglomeration; third, there are connections between industries and then a spatial organic organization carrier forms.

Unfortunately, current researches treat high-tech zone as a “black box”(Giblin&Majella,2011). The evaluation of high-tech zones’ performance is still result-oriented and ignores structures of high-tech zones. This situation may result in some problems: (1)fail to Insight into the structure of the innovation system itself ;(2) ignores the collaboration effect between system elements;(3)cause deviation to the evaluation for high-tech zones’ performance. In order to make an objective evaluation and overcome the result-oriented mistake, this paper builds a indicator system which agree with the structure of high-tech zones ,measure the endogenous coordination function of high-tech zones ,collaborative innovation ability and correlation between them and analyze high-tech zones’ defects and deficiencies from endogenous perspective.

On the basis of the notion of high-tech zone innovation system, we can find that(1) high-tech zone innovation system is an innovation network which is consist of firms, universities and other support institutions;(2) high-tech zone innovation system’ collaboration is not a simple accumulation of elements but an reasonable integration among various elements;(3)the key function of high-tech zone innovation system is to promote collaborations among system members and create collaborative innovation ability from supportive context. Therefore we can conclude an analysis framework of high-tech zone innovation system’s endogenous function and collaborative innovation ability. See Figure 1.

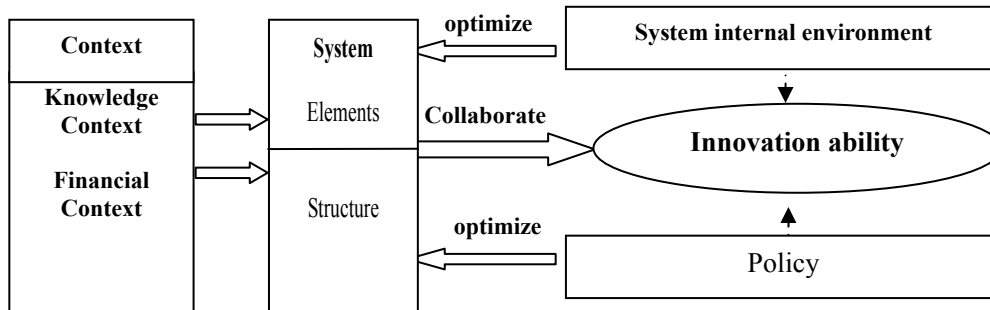

Figure 1 Analysis Framework of High-tech Zone Innovation System

Table 1 Indicator System

Frist class indicators	Second class indicators	Third class indicators
Endogenous Function	System Elements	V ₁ Number of Registered Enterprises
		V ₂ Intramural expenditure of funds on R&D in high-tech zone
		V ₃ Intramural expenditure of funds on R&D per firm
		V ₄ Number of R&D activities personnel in high-tech zone
		V ₅ Number of R&D activities personnel per firm
	System Structure	V ₆ Industrial connection degree
		V ₇ Enterprises density in the same industry
	Knowledge Context	V ₈ Number of research publishes by regional universities and institutes
		V ₉ Number of patents in regional universities and institutes
		V ₁₀ Expenditure of funds on R&D in regional universities and institutes
		V ₁₁ Number of R&D activities personnel in regional universities and institutes
	Financial Context	V ₁₂ The total venture investment
Collabrative innovation ability	Economic Performance	W ₁ Industrial added value in high-tech zone
		W ₂ Net profit in high-tech zone
		W ₃ Gross Industrial Output Value in high-tech zone
	Social Benefit	W ₄ Number of Employees
		W ₅ Per capita income
		W ₆ Taxes in high-tech zone
	Cluster Growth Performance	W ₇ Technology income
		W ₈ The growth rate of net profit
		W ₉ The growth rate of technology income
		W ₁₀ Return on Assets

According to the notion of industry cluster and high-tech zones' connotation, this research builds a evaluation indicator system from high-tech zone innovation system's elements (e.g. firms and support institutions)、 structure (e.g. industry chains and value chains) and relations among innovation subjects. This indicator system includes two part: endogenous function part and collaborative innovation ability part. According to previous researches and the collaboration's connotation, the indicator system includes 33 endogenous function indicators and 19 collaborative innovation ability indicators. Owing to availability of data, we optimize indicator system, finally we get an indicator system with 23 indicators which is scientific and logical. See table 1.

3 Empirical Analysis

3.1 Data Collection

This paper collects 56 national high-tech zones' data in 2014 according to the indicator system. These data is collected from *China Statistical Yearbook of High-tech industry (2015)* and *China Statistical Yearbook on Science and Technology (2015)*. In order to avoid errors result from data' s different dimensions, this paper makes dimensionless processing to these data with statistical standardization method.

3.2 Data Analysis

3.2.1 Factor Analysis

This article explores high-tech zone innovation system's collaborative innovation ability by Statistical Product and Service Solutions (SPSS) 20.0. According to SPSS analysis, endogenous function and collaborative innovation ability's KMO values respectively are 0.831 and 0.759, both of them are above 0.6, which means all indicator simples' inner reliabilities are pretty good. In addition, Bartlett test's p-values are 0 which means simples' inner validities are pretty good. (See table 2) Therefore, in accordance with Bartlett test and KMO values, simples are suitable for factor analysis.

Table 2 KMO & Bartlett test

Indicator		Endogenous function	Collaborative innovation ability
KMO value		0.634	0.767
Bartlett test	Approx. Chi-Square	162.926	195.605
	df	55	45
	Sig.	0.000	0.000

On the basis of simples' correlation matrix, we can get factor eigenvalues and contribution rate of accumulated variance. (See table 3). There are 3 eigenvalues above 1 in endogenous function part, and there 2 eigenvalues above 1 in endogenous function part. The contributing rates of cumulative sums of squares in these two parts respectively are 84.782% and 80.635%. That means all variables can explain most information and simples can reflect the fact. So we get 3 common factors in endogenous function part and 2 common factors in collaborative innovation ability part.

Table 3 Total Variance Explained

factor	Endogenous function			Collaborative innovation ability		
	rotation sums of squares loadings			rotation sums of squares loadings		
	eigenvalue	% of Variance	Cumulative %	eigenvalue	% of Variance	Cumulative %
1	4.777	43.423	43.423	6.325	63.253	63.253
2	2.631	23.916	67.340	1.738	17.382	80.635
3	1.919	17.442	84.782			

According to factor analysis result (see table 4), in endogenous function part, the first common factor has higher loadings in V1、 V2、 V4、 V7、 V10. These indicators mainly reflect scale of input to high-tech zone innovation system, so the first common factor can be named as Investment Scale factor. The second common factor has higher loadings in V9、 V11、 V12. These indicators mainly reflect the support of knowledge context and financial context to the high-tech zone innovation system, so the second common factor can be named as Context Support Factor. The third common factor has higher loadings in V3、 V5. These two indicators mainly reflect the innovation investment of enterprises in high-tech zone innovation system, so the third common factor can be named as Element Collaboration

Factor.

In collaborative innovation ability part, the first common factor has higher loadings in W1、W2、W3、W4、W5、W6. These indicators mainly reflect the economic performance and social benefit of high-tech zone, so the first common factor can be named as Output Performance Factor. The second common factor has higher loadings in W8、W9、W10. The return on assets (ROA) shows the percentage of how profitable a company's assets are in generating revenue. Net profit can compare companies' performance in the same industry. These indicators mainly reflect the development trend of high-tech zone innovation system, so the second common factor can be named as Operation Level Factor.

Table 4 Rotated Component Matrix& Component Score Coefficient Matrix

Endogenous function							Collaborative innovation ability				
indicator	Rotated Component Matrix			Component Score Coefficient Matrix			indicator	Rotated Component Matrix		Component Score Coefficient Matrix	
	1	2	3	1	2	3		1	2	1	2
V1	0.9	-0.264	0.23	0.161	-0.105	0.117	W1	0.815	0.18	0.158	0.108
V2	0.879	-0.014	0.439	0.158	-0.006	0.222	W2	0.968	-0.066	0.188	-0.039
V3	-0.084	0.351	0.787	-0.015	0.299	0.297	W3	0.923	0.102	0.179	0.061
V4	0.89	-0.064	0.404	0.16	-0.026	0.205	W4	0.934	-0.294	0.181	-0.176
V5	-0.122	0.306	0.621	-0.022	0.28	0.314	W5	0.932	0.284	0.064	0.471
V6	0.573	-0.417	-0.238	0.103	-0.166	-0.12	W6	0.96	0.012	0.187	0.328
V7	0.892	-0.344	0.172	0.16	-0.137	0.087	W7	0.172	-0.314	0.17	-0.189
V8	0.042	0.367	-0.289	0.147	0.146	-0.146	W8	-0.064	0.644	-0.012	0.146
V9	0.343	0.674	-0.535	0.115	0.188	-0.271	W9	0.05	0.705	0.01	-0.003
V10	0.82	0.548	-0.148	0.008	0.218	-0.075	W10	0.145	0.871	0.028	0.523
V11	0.415	0.764	-0.051	0.164	0.065	-0.026					
V12	0.355	0.633	-0.596	0.064	0.251	-0.302					

In line with the component score coefficient matrix and collected data, SPSS can calculate automatically common factors' scores, and then we rank 56 national high-tech zones according these scores(see table 5).For sake of convenience, the names of high-tech zones are abbreviated.

Table 5 High-tech Zone Rank

name	total	Rank	total	Rank	name	total	Rank	total	Rank	name	total	Rank	total	Rank
BJ	1.730	1	3.104	1	WF	-0.025	25	0.039	21	HZ	-0.094	32	0.008	23

3.2.2 Regression Analysis

To illustrate qualitatively there is a relevance between endogenous function indicators and collaborative innovation ability indicators, we make regression analysis to these collected data. In regression analysis, endogenous function's factors are treated as independent variable and collaborative innovation ability's factors are treated as dependent variable.

According to the result of regression analysis, in regression coefficient's T test, $p=0$, which means regression coefficient is not 0. In residual's T test, $p=0.89 > 0.05$, which means residual can be treated as 0. Therefore endogenous function has a significant impact to collaborative innovation ability, and regression function is

$$Y=1.22X$$

In regression analysis, $R^2=0.924$ which is very close to 1, and that means the degree of fitness is quite high. Scatterplot is as follow. See figure 2

Figure 2 Scatterplot

3.2.3 Cluster Analysis

On the basis of above research, we have known that there is a strong relevance between endogenous function and collaborative innovation ability. To figure out the strength of high-tech zones in these two aspects, this paper makes a double dimensions cluster analysis. The double dimensions cluster analysis consists of 2 hierarchical cluster analysis. Two dimensions are endogenous function and collaborative innovation ability. We keep the number of cluster as 4. 4 stands for 4 classes from good to poor.

According to the result of cluster analysis (see figure 2), in endogenous function dimension, Beijing is the first class which means Zhongguancun high-tech zone's inner structure is quite reasonable and it has a great development potential. The second category includes Shanghai, Xi'an, Wuhan, Nanjing, Shenzhen, Changchun, Hefei, Chengdu, Guangzhou and Guiyang. The third category includes Qingdao, Zhuzhou, Zhongshan, Tianjin, Shijiazhuang, Anshan, Daqing, Wuxi, Zibo and Changsha. The rest high-tech zones are in the fourth category. In collaborative innovation ability dimension, Beijing is still the first class. The second category includes Shanghai, Xi'an, Wuhan, Nanjing, Shenzhen, Changchun, Hefei and Chengdu. The third category includes Jinan, Shenyang, Tianjin, Shijiazhuang, Anshan, Daqing, Wuxi, Zibo, Guangzhou and Changsha. The rest high-tech zones are in the fourth category.

Putting two hierarchical cluster analysis results into a coordinate system (see figure 3). This figure vividly illustrates all national high-tech zones development status quo. The first quadrant is cut into 16

sections. When high-tech zone is in section 1、section 2、section 5 and section 8, that means this high-tech zone’s inner structure matches its collaborative innovation ability, in other words, this high-tech zone is in equilibrium. Similarly, when high-tech zone is in other sections, which means this high-tech zone’s inner structure and collaborative innovation ability are in discordance. This high-tech zone is out of equilibrium. According to the result of cluster analysis, most high-tech zones are in equilibrium, but their overall strength is weak.

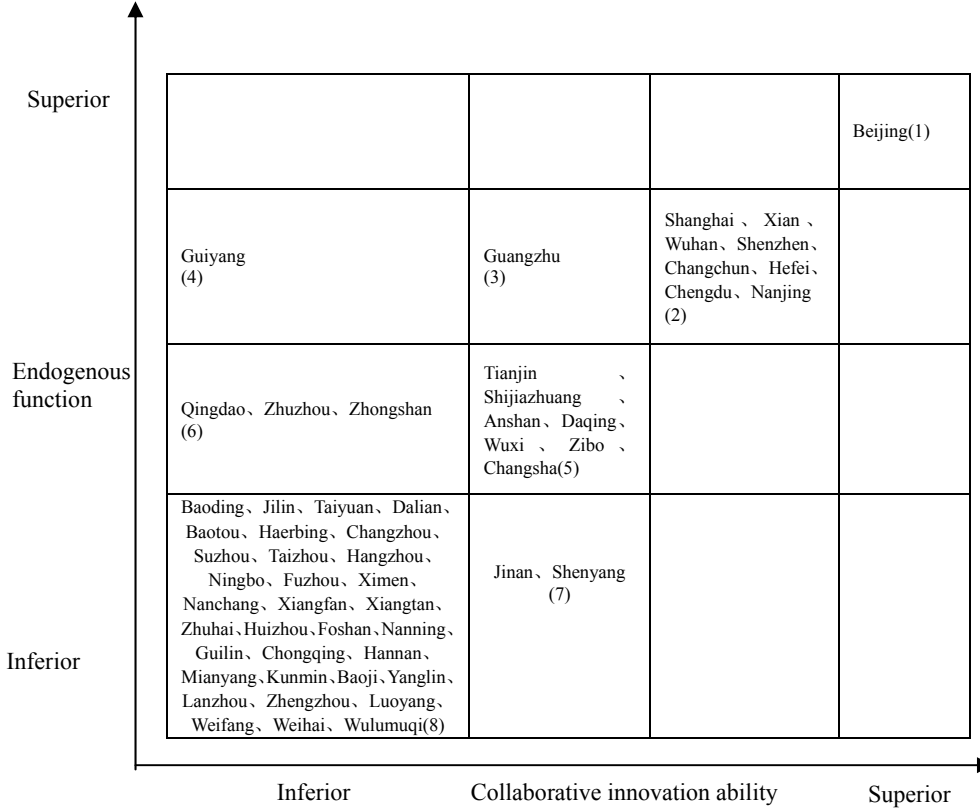

Figure 3 Cluster Analysis Result

4 Results

Based on the above analysis national high-tech zones’ overall strength is still weak. In 56 national high-tech zones there are 33 high-tech zones in “double-inferior” situation which means these 33 national high-tech zones’ endogenous function and collaborative innovation ability both are inferior. There are only one high-tech zone in “double-superior” situation——Beijing. Other high-tech zone are at medium level. According to the result of cluster analysis and factor analysis, Constraints can be found as follow.

(1) High-tech zones with superior endogenous function and inferior collaborative innovation ability (in section3、4and 6). These kind of high-tech zones usually have problems in operation level factor and output performance factor. That means these high-tech zones do not reach the scale economies effect. Although these high-tech zones have reasonable inner structure, incomplete industrial chains severely obstruct the output ability. That is the reason why is this kind of high-tech zones with superior endogenous function and inferior collaborative innovation ability. Only by completing industrial chains, inviting more investment can strength of endogenous function be improved.

(2) High-tech zones with inferior endogenous function and superior collaborative innovation ability (in section7). Taking Jinan high-tech zone as an example, its endogenous function is inferior, but collaborative innovation ability is relatively good. This situation reflects that the development of Jinan high-tech zone relies on input such as R&D funds and human resource, and that means Jinan high-tech zone is still in the stage of resource diving. Although resource diving mode can maintain Jinan high-tech zone’s development, this development is not sustainable. When resources is of shortage, Jinan high-tech zone’s development will be sluggish. Therefore this kind of high-tech zones should strengthen the cooperation with local universities and institutions improve the relation among firms in high-tech zones

and encourage the co-R&D activities among universities and firms.

(3) High-tech zones with inferior endogenous function and inferior collaborative innovation ability (in section 8). Most of national high-tech zones are in section 8. Their endogenous function and collaborative innovation ability both are inferior. Taking Jinan high-tech zone as an example, its investment scale factor and element collaboration factor are in lower ranked locations, which means enterprises in this high-tech zone “enjoy” a low R&D investment, lack knowledge resources provide by local universities. Lack of collaboration among innovation subjects is main obstacles in endogenous function dimension. For this kind of high-tech zones, therefore, government should strengthen the support to enterprises’ innovation, build the platform to innovation subjects making them collaboration. On the other hand, government should accelerate to realize regional economic integration, embed high-tech zones in global R&D network and knowledge network.

5 Conclusion

This paper constructs a two-dimension indicator system to evaluate the endogenous function and collaborative innovation ability of national high-tech zones with cluster analysis, factor analysis and regression analysis. According to the result, Chinese national high-tech zones’ overall strength is still weak. In 56 national high-tech zones there are 33 high-tech zones in “double-inferior” situation. On basis of evaluation, this research puts forward some suggestion to 3 kinds of high-tech zones, which have great reference value.

Effects of Culture on Service Encounters & Customers' Satisfaction

Mansoorah Ahmed, Wang Aimin, Asad Ullah

Management School, Wuhan University of Technology, Wuhan, P.R. China, 470070

(Email: guria_h@hotmail.com, wangam@vip.163.com, asadecon@yahoo.com)

Abstract: This paper refers to an important discussion of effects of culture on customer satisfaction keeping in view the service encounters. For many researchers and marketers, customer satisfaction has become a critical success factor and carries an important aspect of business process. Culture is believed to be an important social influence which has significant impact on consumers and the way they behave. Authors assert that culture is a prominent part of social interactions while customers' involvement with others in business. Customers shape up their perception on service quality primarily during the service encounters because of embedded features of services as intangible and inseparable. Using the content analysis technique and view of literature, Geert Hofstede's Model for cultural differences offers a practical roadmap. However, for a firm operation in cross cultural environment, a deep down further analysis of other local cultural dimensions are helpful for better customer interaction. Today's service firms should be aware of the importance of adapting services to the new culture, while maintaining the core service quality standard. Especially for high intangible and high contact services, good employee-customer interactions are key, and a better understanding of how to adapt service delivery behavior to the values of major cultural groups are highly beneficial to service firms.

Key Words: Culture; Inter-cultural; Customer Satisfaction; Service Encounters; Services Outsourcing

1 Introduction

Market globalization is one of the most important changes that have impacted the services marketing over the past 25 years. Enormous opportunities emerged for services marketing organizations to expand across geographical boundaries (Knight, G, 1980-1998). Market globalization also triggered multiculturalism that resulted in increase in international immigrants living within a country (Riddle, D, 1992). World trade organization data 2012 shows estimated services turnover in \$ 4.25 trillion value and 24% contribution in overall global trade.

As with globalization and wide presence of multinationals across world, managers are increasingly engaged in cross cultural work environment and therefore, these progression exhibit challenges to the management practices because managers behavior acceptance would greatly differ by culture & country. The complexity in multiculturalism and managers' job is to deal with effectively in a service organization is a focal point of this concept paper.

Intense heterogeneity level in Services results as high level of customization in service encounters. Because of this, a unique approach is usually used. Since, services are clearly distinguished from manufacturing products primarily based on tangibility factor. Therefore, these are regarded as intangible, untouchable and cannot be stored. Due to the perish ability of the services, usually, are consumed as it gets produced. One of the main concerns when marketing services within multicultural countries or internationally is the fact that the intangible and inseparable characteristics of services are particularly affected by the cultural influences.

2 Literature Review

Many authors and marketers understand and believe that customer satisfaction is the most critical aspect for any firm. Since, it is logical frame that customer satisfaction will eventually result in customers' retention and loyalty to the product or services a firm offer with continuous stream of revenue. Many firms devise & execute their marketing activities with an ultimate goal of customer satisfaction, a key area that convey the strong connection between multiple staged buying behaviors of the customers. Authors⁷ suggest that positive word of mouth from customer side is only possible through pleasant and satisfied experience with product or service. Such experiences further motivate customers on repeat buying or to try the other product mix or line extensions of the same firm and explicitly share the information with their closed one. Communication strategy with a blend of cultural norms become more important particularly Societies that are closely knitted with a group of people just like Pakistan where social relations are stronger and wider and as a result, dissatisfied customers quickly switch to other product or services and spread a negative word of mouth. In such market dynamics, firms get

trapped into enormous pressure to continuously strive in improving their services and products or both.

Culture is defined as a society’s entire way of life and its products. A society which has shared culture composed of individuals. A several implications are observed like culture is learned and shared, at the same time it is non-material as well as material. For many reasons, a man kind is so successful because of cultural significance and its impact on daily life. Culture is believed to be an important social influence which has significant impact on consumers and the way they behave and is a prominent part of social interactions while customers’ involvement with others in business^{1,2,8}. Due to the inherent features of services as intangible and inseparable, customers shape up their perception on service quality primarily during the service encounters. Although there are several factors that influence an overall customer satisfaction like how well service provider understand the customer problems and ready or tailored made solutions. However, in a cultural perspective, social interaction becomes an important determinant in customer satisfaction during a service encounter⁹. Service encounter refers to a situation when a customer and a service provider come into contact¹⁰. Inter-cultural interactions happen when customer and services provider who interact with each other are from different cultural back ground. Thus cultural differences do affect behaviors, expectations and resulted customers’ satisfaction during such service encounters.

In order to examine how customer service is influenced by culture, Professor Geert Hofstede’s 5 Dimensional Model for cultural differences³ offers a practical roadmap. Research, also by others, has shown that services are affected by the cultural dimensions. The 5 dimensions in this model (power distance, individualism vs. collectivism, masculinity vs. femininity, uncertainty avoidance and long-term vs. short-term orientation) represent common issues in the cultural systems of countries and are centered on five fundamental areas of human behavior. The partly emphasis in this article is on the dimensions like, power distance, individualism vs. collectivism, masculinity vs. femininity and uncertainty avoidance because their effects are more immediate. Following caption are some of the examples of comparing Pakistan with developed & developing countries.

Figure1 Comparison of Cultures by Geert Hofstede

(Source: <http://geert-hofstede.com/countries.html>)

The above caption is good explanation to the cultural differences exist among comparative countries. We may refer to examples of call centers or IT help line that most of the western companies are outsourcing to Indian or Asian countries. These call centers’ agent are directly dealing with the customer in a service encounter with diverse cultural back ground and expectations.

The above discussion from literature provides a sufficient background of the issue and hence is helpful in assessing the effects of culture on service encounters and resulting in the impact on customer satisfaction.

3 Pakistan’s Culture

Pakistan’s population is exceeding 180 million with a growth rate 1.47% and is ranked as sixth most populous country with an area covering 796,095 KMs and has a 1,046 KMs coastline along the Arabian Sea and the Gulf of Oman in the south and is bordered by India to the east, Afghanistan to the west and north, Iran to the southwest and China in the far northeast. Ethnic divide of Pakistan includes Punjabi, Sindhi, Pashtun (Pathan), Baloch, Muhajir (immigrants from India at the time of partition and their descendants). Islam is the official and widely practicing religion with Muslim 97% (Sunni 77%, Shi’a 20%) and minorities are 3% of population including Christian, Hindu, and other (inc. Sikh). Urdu is the only official language of Pakistan. English as 2nd language is mostly spoken in Pakistani elite, private corporate and most of the government ministries.

The extended family is the basis of the social structure and individual identity. Loyalty to the family comes before other social relationships, even business. Nepotism is viewed positively, since it guarantees hiring people who can be trusted¹¹. The family is more private than in many other cultures. It is considered inappropriate to ask questions about a Pakistani’s wife or other female relatives. Families are quite large by western standards, often having up to 6 children.

Pakistan is a hierarchical society. People are respected because of their age and position. Older people are viewed as wise and are granted respect. Pakistanis expect the most senior person, by age or position, to make decisions that are in the best interest of the group. Greetings are therefore often between members of the same sex. Men shake hands with each other. Once a relationship is developed, they may hug as well as shake hands. Pakistanis take their time during greetings and ask about the person’s health, family, and business success. Pakistani names often include a name that denotes a person’s class, tribe, occupation, or other status indicator.

Pakistanis do not require as much personal space as most western cultures. As such, they will stand close to you while conversing and you may feel as if your personal space has been violated. Do not back away. Pakistanis are generally indirect communicators. Direct statements are made only to those with whom they have a long-standing personal relationship. Pakistani maintains indirect eye contact while speaking.

Pakistanis prefer to converse in a non-controversial manner, so they will say they “will try” rather than admit that they cannot or will not be able to do something. Silence is often used as a communication tool. Pakistanis prefer to do business in person. They see the telephone as too impersonal a medium for business communication. You should arrive at meetings on time and be prepared to be kept waiting. Pakistanis in the private sector who are accustomed to working with international companies often strive for punctuality, but are not always successful. In general, Pakistanis have an open-door policy, even when they are in a meeting. This means there may be frequent interruptions. Business meetings start after prolonged inquiries about health, family, etc. Never inquire about a colleague’s wife or daughters. During the first several meetings, business may not be discussed at all as the relationship is still being developed.

Figure 2 Effects of Culture on Service Encounters and Customer Satisfaction

4 Conclusions

Culture plays an important role in determining how customers expect services to be delivered, today's service managers should be aware of the importance of adapting services to the new culture, while maintaining the core service quality standard. Especially for high intangible and high contact services (e.g., professional services), good employee-customer interactions are key, and a better understanding of how to adapt service delivery behavior to the values of major cultural groups are highly beneficial to service firms.

In a multi-cultural service encounters, several guidelines are suggested for reducing the service quality gap: First, service firms should focus on providing the training and awareness about cultural differences when employees move from one culture to other or interacting over dynamic IT environment. Also have ready technology related solutions such as brief profile of the customer with their social norm on the computer screen during a service encounter. This will also enable the service provider to quickly adapt to the new cultural characteristics. Second, firms may focus on the communication skills with emphasis on the accent that is clear and concise to avoid discrepancies in expectations of customer and service provider with respect to service quality. Some time, customer from a diverse culture may not be well worse with the language ability commonly used by the service provider and in such case; service provider should have some resource dedicated to coop-up language issue. Finally, service provider should have a sound procedure and system to log customer complaints occurs due to cross-cultural reasons and timely address those complaints to avoid customers' switch to other products or services

Co-Creating Brands across Nations: A Case Study of Leading Chinese Brands Co-Creating Brand Value Experiences in Pakistani Market

Asad Ullah, Mansoor Ahmed, Wang Aimin

Management School, Wuhan University of Technology, Wuhan, P.R. China, 430070

(Email: asadecon@yahoo.com, guria_h@hotmail.com, wangam@vip.163.com)

Abstract: This paper proposes a framework for co-creation of cross cultural brands. Due to the increasing trade relations across nations and establishment of brands across countries, the importance of brand management in other countries have been increased. Service dominant logic is an emerging area that focuses on inclusion of customers in service creation area, inspired from the idea that products are evaluated on the basis of service they offer to the customers. The paper takes four Chinese firms operating in Pakistan and applied Case Study as research method to come up with the propositions. During last decades, Chinese companies have emerged internationally and are doing business across globe. In Pakistan there are many Chinese companies who have launched their brands. This paper aims to develop a framework for the customer satisfaction and brand management through brand co-creation and SDL.

Key words: Brands; Brand co-creation; Service dominant logic

1 Introduction

The field of marketing is in consistent flux for more than a decade^[1] (Payne, Storbacka, Frow, & Knox, 2009) and researchers around the globe have observed a paradigm shift in the field of marketing (Ambler, 2006)^[2]. Customer perspective, which went out of focus for a while, is now gaining back the attention from academic researchers (Payne et al., 2009). Vargo and Lusch (2004) have challenged the traditional goods-dominant logic of marketing by proposing the service-dominant logic (SDL) of marketing that highlights a new role of the customer in marketing process as a co-creator of value^[3].

Brand management is an important area of research study within the domain of marketing. Traditionally, researchers have considered brands as company's property (Merz, He, & Vargo, 2009; Veloutsou, 2008)^[4-5] to facilitate customer transactions (Mäläskä, Saraniemi, & Tähtinen, 2010; Morrison, 2001)^[6-7]. Brands have emerged as key organizational assets and are being considered as important managerial resources (Balmer & Gray, 2003; Hatch & Schultz, 2003; Louro & Cunha, 2001; Mäläskä et al., 2010)^[8-10]. In this changing paradigm of marketing and after the emergence of relationship marketing, brand management process has now shifted its focus from just a mere identifier and differentiator of company's products or services (Cowley, 1996)^[11] to delivering a promised experience (Pine & Gilmore, 1999; Randall, 2000)^[12-13]. Researchers have now started emphasizing to build the brands around customers instead of company that is supposed to enhance the customers' relationship experience with the brand (Payne et al., 2009).

With a specific reference to brands, Fournier (1998) had pointed out the dearth of relationship studies in the area of consumer products^[14]. Following the work done by Fournier (1998), concept of customers' relationship with their brands have gained sufficient consideration by the researchers (Muniz Jr & O'guinn, 2001; Rozanski, Baum, & Wolfsen, 1999; Smit, Bronner, & Tolboom, 2007) and they have started discussing the consumer brand interactions through relationship lens (Swaminathan, Page, & Gürhan - Canli, 2007)^[15-18]. Aggarwal (2004) suggests that despite the difference in their nature of relationship, consumers' social relationships with humans are reflected through their relationships with the brands. Despite the sizeable work in the area of branding by researchers (Jevons, 2007), a very little emphasis is placed to the studies of brand relationships, customer experiences, and co-creation (Payne et al., 2009)^[19-20].

2 Service-dominant logic (SDL)

Introduction of different perspectives in marketing (including relationship marketing, market orientation, services marketing, experiential marketing, and brand relationships etc.) over the last three decades have challenged the traditional goods-dominant logic of marketing (Smit et al., 2007). It is learnt that the common thread between these newer perspectives is a significant shift in customer's exchange relationship with company that has moved i.e. from tangibles to intangibles such as skills, knowledge, and processes (Payne et al., 2009). Built on the work done earlier in the area of relationship marketing, service-dominant logic highlights the significance of intangible knowledge resources,

communicative interaction, and the concept of value-in-use (Ballantyne & Varey, 2006) ^[21]. Vargo and Lusch (2004) suggest that service is at the heart of every marketing interaction. They consider goods or products as the delivery mechanism for service and suggest that the service value is realized as the products are used or consumed (Vargo & Lusch, 2004), thus introducing the concept of value-in-use (Ballantyne & Varey, 2006).

A key foundational proposition of SDL suggests that the customer is always a co-creator of value (Vargo & Lusch, 2004). SDL proposes that a continuous customer-supplier dialogue and interaction is required in the processes of product design, production, delivery, and consumption in order to co-create value (Ballantyne & Varey, 2006). These advancements in the area of value creation and value co-creation open the avenues of understanding branding and brands through co-creation and customer experience lens and, hence, will lead towards brand co-creation.

3 Brand Co-Creation

Keller and Lehmann (2006) consider brand relationship and customer experiences as significantly developing research areas. Dall’Olmo Riley and De Chernatony (2000) stress to build brand and relationships around customers instead of company ^[22-23]. They have directed future researchers towards the area of brand co-creation (Bello, De Chernatony, & Shiu, 2007) ^[30]. Prahalad (2004) posits in his co-creation point of view that value is embedded in the personalized experiences, hence, considering brand as an experience that a customer goes through. Building on Prahalad’s views about brand in co-creation perspective ^[24], De Chernatony (2010) experientially defines brands as “a cluster of functional and emotional values, which promises a unique and welcoming experience” ^[25]. This perspective of brand as an ongoing customer experiences is consistent with the concepts of co-creation and service-dominant logic (Payne et al., 2009). Although recent research puts emphasis on co-creation, Brodie, Glynn, and Little (2006) highlight that a little work is done in the area of branding with reference to co-creation and customer experiences ^[26].

4 Brand Co-Creation across Nations

International trade is the key driver of the global economy. In the era of globalization, business organizations are no more bounded by the geographical boundaries of their country-of-origin. Brands that are carried by these business organizations are also not limited to one country and are assuring their presence and penetration in their relevant lucrative markets around the globe. Organizations need to interact and cooperate with their local network partners to gain the competitive advantage in the local market (Håkansson & Snehota, 2006; O'Donnell, 2004) ^[27-28]. As branding is considered to be as an interaction process of value co-creation (Mäläskä et al., 2010), brands are required to be co-created by parent company, local network partners, and customers in order to develop positive associations and yield favorable results from the local market (Brodie et al., 2006; Merz et al., 2009; Payne et al., 2009). In order to be successful, international brands need to shift their focus from organization-centered brand management practices to relationship-centered brand management practices (Leitch & Richardson, 2003) ^[29].

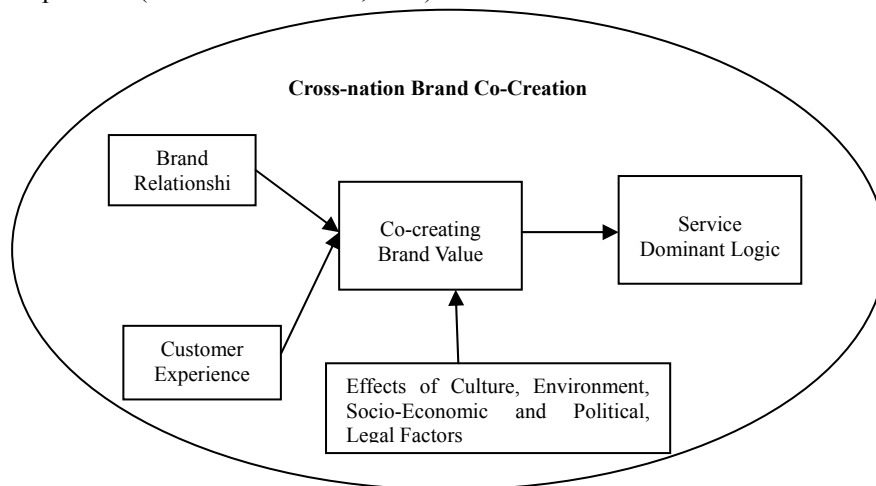

Figure1 Proposed Framework of Cross National Brand Management with SDL

Pakistan is one of the largest markets for Chinese brands with a population of about 20 million people. Leading Chinese brands including Haier, Changhong Ruba, Huawei, and Oppo have recently entered the Pakistani market through their local network partners in Pakistan. These brands need to acculturate themselves according to the local market dynamics to yield the maximum benefit. Brand management practices, especially, are required to be modified according to the local market requirements. Brand experiences are required to be localized and co-created by the parent companies, local network partners, and the customers.

5 Conclusion

From the above discussion, it is concluded that Chinese companies have to face competition with other companies as well as Pakistani companies in the market. The emergence of Service dominant logic is going to change the mindset of customers across the globe and so is the case with Pakistan. In order to remain competitive in the market, companies need to co-create the brand value with the customers in order to create higher brand image and for this they should keep in mind the effects of different factors including culture, environment, political and legal. Service dominant logic is gaining more importance as a result to manage the brand image in highly competitive environments; Chinese companies need to be more and more after the co-creation of brands with customers.

Abstract: This paper applies the method of system analysis, from the aspects of integrity, hierarchy, adaptability, stability and so on, this paper expounds the system design concept of yacht products, and the yacht product system is also defined. Through the analysis of the yacht variety and scale, component and the yacht cabin, yacht modular design innovation content, it is concluded that the “function determines form and the material limit process and form shape style” yacht design point of view.

Key words: Yacht; Product design; Cabin space; Design innovation; System design

1 Introduction

Yacht is a high-end ship, is a special kind of water transport, but also a kind of personalized products. Since twenty-first Century, with the continuous development of China's economy, the yacht industry also developed. However, the development of yacht design is still not mature, and the gap between the international levels is relatively large, it is difficult to meet the needs of yacht production enterprises. At present, the trend of the international yacht design is as follows: personalized, large-scale, more functional, green, and intelligent.(Gangqiang Zheng, 2014)Yacht system design research in China for less, Small yacht shape and interior design features were analyzed by Li Gong. (Li Gong, 2007)Yong Peng explores the application of CATIA V5 in yacht design.(Yong Peng&Weibin Liu, 2007) Bai Wei Feng analyzed the multidisciplinary design optimization technology and which application in the design of the ship. (Baiwei Feng&Zuyuan Liu&Haichao Chang,2009) Overall, the research on the system design of yacht product innovation is still to be further studied. Therefore, it is urgent to carry on the systematic analysis to the yacht product, in order to identify its intrinsic law, thus promoting the yacht product design innovation.

2 System Design Concept of Yacht Product

“System” is a unified whole, usually consisting of several elements, the connection between the elements, mutual interdependence, interaction, and through this form and have a one or several specific functions.(Wu Xiang,2000) System design method is based on the theory of system theory, the method can be used for product design and development. System design involves the creation of information, the introduction of information, conditions, technical support, design innovation, design and output, and so on. The system has the characteristics of integrity, hierarchy and adaptability. As a large complex product,(Jianquan,2001) the yacht has the characteristics of integrity, hierarchy, adaptability and sustainability. The analysis of these characteristics can promote the innovation of yacht product design.

2.1 Overall design of yacht system

Integrity is the basic characteristic of system design, and the overall design concept is one of the core ideas of system design. For example, a yacht is a complex system of ship products, and the space environment is the main part of the whole system. System design of yacht cabin space including: hierarchical cabin layout, function cabin distribution, cabin furniture design, cabin color collocation, cabin material selection, cabin furnishings decoration design, the subsystem design together constitute cabin space as a whole, and match the hull form swim whole boat, so as to meet the needs of users. The building of the space design style of the yacht cabin is built on the basis of the overall functional requirements, which will only meet the individual function from the whole will cause the design disorders. The core idea of yacht system design is based on the whole. The design flow of the system is the important guarantee to promote the innovation of the yacht product design.

2.2 Level of yacht system design

In the system theory, the structure of the system has the characteristic of hierarchy. This means that the systems are often part of larger systems, and can be split into a number of elements of the constituent elements and can continue to split into smaller systems, thus forming a multi-level characteristic, structure of the system is. (Wu Xiang,2000)In the yacht system between the various levels, the elements of the system cross link and produce mutual influence. System design should be carried out with the hierarchical characteristics of the system to design and optimize the link. For example, the yacht cabin

space environment system can be tentatively divided into three levels, in cabin space design and planning, all levels of the key elements of the selected cross collaborative design make the design more perfect. (As shown in Figure 1)

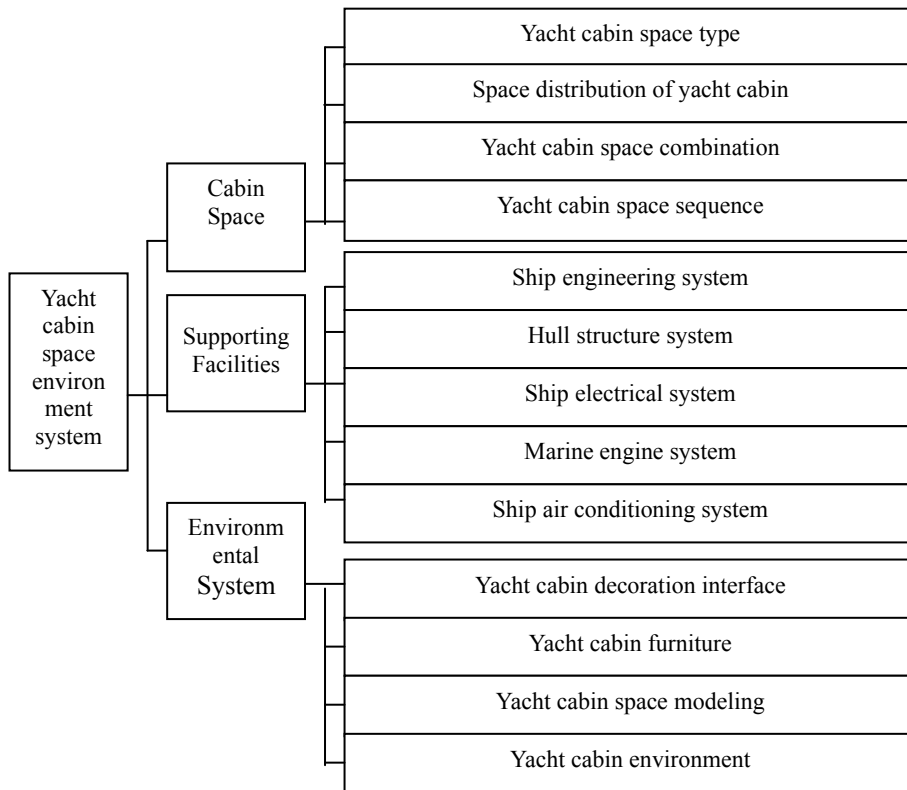

Figure 1 Analysis Chart of Space Environment System of Yacht Cabin

2.3 Adaptability of yacht system design

The adaptability of the system is that the structure and function of the system can be changed with the change of the environment. Yacht system design also needs to have adaptive characteristics, in order to adapt to market changes. With the development of the times, the system design of the space environment of the yacht cabin should be changed to meet the needs of users. This change may be a small amount of design exploration, such as with increase of the yacht scales, some yacht in the compartment side design clamshell opening, the boat parked and water more convenient. It may also be produced fundamentally by gradually quantitative qualitative change. For example, the size of the yacht gradually increases, and the space of contact with the outside world is gradually increased, the possibility of using the external environment of the user becomes larger. In order to obtain a better sea experience, enterprise has developed a new flying bridge yacht, greatly expanding the area of the yacht cabin space. Since then, the flying bridge design has gradually become an important part of the yacht. It can be said that it is adaptive to promote the innovation of the yacht.

2.4 Stability of yacht system design

The function, structure and characteristics of the system have some degree of stability, which can be kept relatively constant under the influence of external factors. The relative stability of the system determines the continuity of the system design. Yacht cabin space design includes, for example, the facilities, the cabin space and environmental system, such as elements, each element has a clear structure of the independent system and in a certain period of time does not occur fundamental change. The stability of the space function of the yacht cabin has brought the continuity of the system design, which provides the basis and guarantee for the innovation of the yacht system design.

3 System Analysis and Definition of Yacht Products

The systematic cognition of the complex product system is the basic premise of the innovation and development of yacht design. In western developed countries, the marine culture has a long history, the

yacht is more popular, has become an important part of the people's leisure life, the awareness is higher. While the development of China's yacht is short and the yacht more as a business, reception and other uses, awareness is still to be improved.

3.1 Function to determine the type of yacht: yacht varieties and scale division

The general definition of the ship's yacht mainly refers to the luxury yacht, which generally has many functions such as navigation, leisure, entertainment, sports, reception and so on. According to the function and use of different emphases, usually can be divided into: yacht business, leisure yacht, sports yachts, fishing boats and other categories, its functions have different emphases can blend with each other.

Yacht ship size and scale is often determined by the functional requirements, yacht according to the size of the scale can be divided into four categories: 36ft following yacht (many fishing boats or exposure boat), 36ft ~ 60ft medium-sized yachts (Multi Sport yacht), 60ft to 90ft in large luxury yachts (leisure yachts), 90ft above super yacht (for business yacht). Also the functions and scale often determines the yacht bow shape, depending on the bow shape, the yacht is divided into fore peak yacht (forward) bow and axe bow type yacht (vertical bow), inverted bow and axe type yacht (bow backward), bulbous bow type yachts; different according to the shape of the top of the yacht, for hardtop yacht, a sliding cover type yacht, open-air flying bridge yacht, shading flying bridge yacht etc.; according to production can be divided for the production of yachts, personalized custom yachts, production type of boat of personalized custom yachts etc..

Each yacht manufacturing enterprises have their own boat type distribution, such as the boat type of China a representative yacht business concentrated in 43ft, 48ft, 53ft, 58ft, 63ft, 68ft, 78ft, 86ft. While the other large and medium-sized yacht manufacturing companies are concentrated in the 52ft, 62ft, 72ft, 90ft, 138ft, 145ft. Each kind of different functions, scale different yacht, the respective waterline below to obtained by line design, calculation and experiments in the pool.

Yacht design not only need to meet the functional requirements, but also need to focus on the human nature of space design and modeling art aesthetic. In with the development of technology and market demand changes, yacht original relatively Hale line folding angle shape gradually transition to arc lines, become more and more full, rounded, has more affinity and humanization characteristic. According to the different scales of yacht cluster analysis, it can find the relevant characteristics. 60 feet below the medium and small boats, its shape and structure is relatively simple, the design common embodied in: the cabin space for 1 ~ 3 layer structure; lines clear and flowing, morphological structure is often symmetrical distribution. 60 to 90 feet of large yachts, the shape of the space structure is relatively complex, with multiple functions. The level of the deck cabin and the ship body line design is much layered, which reflects the luxurious and elegant fashion style, which often represents the development trend of modern yacht. Large yacht design common embodied in: the cabin space for 2 ~ 4 layer structure; the side window line multi to streamline mainly, in order to give people a sense of beauty and life. 90 feet above the yacht design, its shape and the space structure is very complex, the function is richer, is the luxurious representative. Mega yacht design common embodied in: deck cabin space for more than three layers of multilayer structure; tough lines, simple and generous and highlights the sense of strength and speed.

3.2 Material qualification process: yacht assembly and compartment division

From the design and manufacturing process, the yacht can be divided into the lower part of the main hull and superstructure two parts. Among them, the inner part of the lower hull is still a type of building space. Therefore, the main contents of the functional structure of the cabin space of the yacht. The hull and superstructure of the medium and small boat are generally made of glass steel. The main hull is large luxury yachts for steel, and the superstructure can be aluminum or glass steel structure. Different materials determines the main hull and superstructure of production equipment, construction technology, environmental conditions, technical personnel and other requirements, there is a big difference, must be constructed in the specific production area. Main hull and superstructure construction process can be roughly decomposition for the hull manufacturing, berth closure, parts and components production and installation etc. several manufacturing stages, various tasks package is by making the sequence of combination, and then the assembly line. (Hou Liang,2003) of the hull construction main process analysis shows, yacht cabin parts and components production easier for modular design, production and assembly, which has a composite structure of cabin space module. Yacht main hull and superstructure can only part of the modular design and production.

Overall, the yacht hull parts and components can be divided into: module of ship bow, stern, sheer, masts, bulwark, lifeboats, etc. facilities. Typical large yacht the deck cabin space partition and layout are

as follows: bilge deck usually consists of master room, VIP rooms, the crew cabin, sanitary ware and other space; main deck usually include Sharon area, driving cabin, kitchen, bow leisure area, a well region of a stern, swimming platform space; upper fly bridge decks are usually include simple driving Taiwan, leisure areas, the surf zone, BBQ area, boat parking areas space.

The space and interior design of the yacht can be used for reference to other types of interior design and interior design. Yacht is not only a water transport, but also a moving "building", which itself has some characteristics, such as space allocation, flow lines, etc.. Yacht on the basic configuration, such as driving module of room equipment, engine room equipment, bathroom, lifeboat, anchors and associated electrical products have achieved mostly standardized production, in the actual yacht development only integration can be. For example, in terms of power control, yacht to the integrated configuration of ship with communications equipment, driving with instrumentation, radar antenna, satellite navigation system, ship engines, generators and other equipment, to meet the navigation function and direction identification, security need.(Hou Liang,2003)(as shown in Figure 2)

Figure 2 Small Yacht Engine and Propeller Equipment Installation Figure^[8]

3.3 The form of the style: yacht modular design innovation

The yacht as a high-end consumer goods, the essence of leisure, entertainment and make it different from ordinary passenger. But yacht still belongs to the ship, yacht design must be based on the design of the ship, but it needs to be creative and innovative. From the "aesthetic characteristics" of the yacht cabin, the yacht is usually a graceful and smooth front, reflecting a sense of speed and power. The use of arc line, the tough ship modified softer, aesthetic characteristics of the art. The international famous yacht brand is more exquisite, the emphasis is on the level and the style of the whole. Through the design of yacht design and cabin space and interior module analysis can explore the yacht superstructure modeling and hull and cabin space of beauty and harmony, so as to realize the fusion of art aesthetic, creative design and science and technology.

In the study of the yacht modular design, it is also to consider the cultural and aesthetic, etc.. Because of the functional requirements and regional culture and other factors often determine the yacht design aesthetic style. The "localization" design of the yacht cabin is the design idea of the regional trend of internationalization. Guided by the idea of the design and localization of the yacht, yacht module design module is built, and the style of yacht is classified. For example: tug yachts, classical and modern minimalist fashion, personality type, type, type of bionic prospective. Then to yacht module system component library based, combined with localization of user needs, use of the yacht design feature and component composition system analysis and design, R & D of yacht design modeling and space unit to design a universal problem solving and design for yacht provided to provide a scientific basis, and docking project to lay the foundation.

The yacht cabin module analysis include: Based on user's physiology and the psychological demand of the cabin space and activities of the module function analysis, module form, attribute classification, the shape and size design of; design of standard based on the unity of form and structure, the cabin features; research on 3D virtual design based on man-machine engineering database; for disassembling and recycling of environmentally friendly materials and supplies design and application. (Feng Bowei, Liu Zuyuan, Chang Haichao,2009) Which, yacht cabin space and activities of the analysis of the function module, module, module attribute classification, module of form and scale design and research is the focus of yacht module system research, it is yacht modular design. The yacht cabin space module design as the basis, expand the derivatives related design and research content, such as: the morphology, structure, function, material based, the establishment of yacht cabin color classification module database, according to the color brightness, hue, purity changes form the color character

classification, in order to be able to make consistent with the character of the user's color scheme.

4 Conclusion

In this paper, the design and innovation of yacht products, from the integrity, hierarchy, adaptability, sustainability and other aspects of the system design concept of yacht products. And the yacht product system is also defined. Through the analysis of the content of yacht variety and scale, component and the yacht cabin, yacht modular design innovation, put forward: function determines form and the material limit process, shaping the style of the design point of view. It lays a foundation for further research on the innovation of yacht products.

Abstract: In the era of Internet and mobile Internet, marketing activities rapid developed, marketing of agricultural products because of mourning in their own characteristics have been changed slowly. And agricultural products marketing mode has had a profound impact on the development of agriculture, rural and farmers. Suitable agricultural products marketing mode will affects the quality and efficiency of agricultural products circulation, the interests distribution relations of the value chain of agricultural products, the speed and pace of agricultural industrialization. In the era of Internet, under the background of consumers participation gradually become normal, O2O marketing mode of agricultural products was discussed. On the basis of the theory of the representative Farmigo mode, with empirical research, this paper constructed its marketing process, obtained the responsibilities and division of the participants, in order to provide a reference for the consumers of agricultural products, production and marketing enterprises from a new marketing perspective.

Key words: Consumer participation; O2O mode; O2O mode of agricultural products; Farmigo mode

1 Introduction

1.1 The concept and connotation of consumer participation theory

In traditional market, consumers tend to passively accept products, rather than take the initiative to pick products. In recent years, with the increasing development of the internet and mobile internet technology, customer participation in product marketing has become increasingly prominent. Therefore, more and more scholars and experts focus on its theoretical exploration and empirical research. A group of scholars and experts who gave the concept of consumers participation earliestly (Greenwald, Leavitt as the representative), considered that consumer participation is the activities of participating in the production and delivery of service products. In 1990s, Fire thought consumer participation include material participation and spiritual participation. Dabholker (1990) pointed out that the customer participation sometimes is an un-optional self-service, and sometimes it is to gain information in the process of getting service. Cooke (2004) argued that the essence of enterprise marketing consist of internal marketing for employees and external marketing for customers. Internally, the employee participation will improve the quality of business decisions. In terms of external, customer participation can improve customer satisfaction and service performance.

1.2 Affecting factors of consumer participation

An tian,zhang hua(2005)came to the conclusion that customer participation level is positively related to service provider's job stress by study on the relationship between customer participation and its relation with service provider's working pressure. Because too much customer participation will cause more transparent information and more uncertainty in the process, leading to be difficult to predict consumers' behavior for the service providers. However, in the era of network media, consumer participation and consumer experience have become one of the most powerful means of converting traffic to purchase. Therefore, Holland and Menzel (2001) by combining with customer participation and e-commerce marketing concluded that customer participation has a significant effect on customer loyalty. Customer participation will significantly improve customer loyalty. Bagozzi and Dholakia (2006) proposed the concept of small group brand community. It is pointed out that the small group brand community is the consumers who share the feelings of the brand and social identity. In this group, if members want to join the group, they must share similar consumer behavior. In other words, consumers need to participate in community activities, in order to integrate into the community. Based on the above conclusion, Scott and Mickal Alexander (2007) through further study got that only those who get high-quality experience will take an active part in the activities of brand community. Zephyr (2007) thought that if you want only to create a unique product demand and unique consumer experience, consumers will participate actively. and consumer's high degree of trust and highly involvement will be

getten.

1.3 Theoretical mode of consumer participation

Hong Chong, Yang xiutai et al. (2009) constructed theoretical quantitative model between customer participation, trust and satisfaction. The results further confirmed the consumer satisfaction can greatly improve the consumer participation and the level of trust. Brenda (2010) studied that one of the proper and correct methods of looking for the consumers is to carry out promotion and activities related to consumer. Only those consumers who willing to pay and participate in the activities are valuable for the enterprises. Liu Jianxin et al (2010) pointed out that consumer participation is generated on the basis of consumer demand and value of interest. Yan Jun Peng (2011) has built up a consumer participation scale, and designed the four dimension model of preparation, information exchange, cooperation, interpersonal interaction, and measured the four latent variables through 17 observed variables. Zhang Yi et al. (2011) concluded that there is a positive relationship between consumer participation and satisfaction. Relying on the subject of the role of consumer participation in tourism planning and development, Sunny (2013) concluded that consumer participation is the key to sustainable development. Consumer participation is to motivate consumers participate in activities actively, in order to form the characteristics of tourism. Schmitt (2014) pointed out that the essence of consumer participation is decided by three aspects of the brand: the brand category and personality, brand appeal, brand influence and symbol, etc. Consumer participation consists of four stages, followed by consumer recognition, consumer experience, consumer comprehensive, and consumers representative.

2 Research on Agricultural Products O2O Mode of Consumer Participation

2.1 Concept of O2O mode

O2O, is short for online to offline, also known as the online and offline mode. O2O is brought online consumers to consume in store. Consumers pay for the goods and services online, then experience services offline. The entity store information is brought to the network or mobile internet users by group buying, discounts, information sharing and service booking, so as to convert them to their own offline customers. The service offline can attract customers online. The customer can screening services and clinch a deal online.

2.2 Characteristics of O2O mode

2.2.1 Online and Offline

O2O is conceptually online and offline. But this line is not necessarily the internet. After internet of everything, when there is no water in drinking water machine, it will automatically book water, direct dock send water company database, not by you operating a mobile phone or computer. but it need offline and offline interaction. it may be offline touch online or online touch offline. And the two parts are indispensable in forming the value of O2O.

2.2.2 Service standard side C

Different from C2B, the standard of O2O model is in side C, while the standard of C2B model is in side B. The relationship of C2B and customer is enlightenment and being enlightenment, such as Huawei's production of mobile phone is a typical of industrialized production mode. Only need to write a unified specification, and taught customers to use and maintenance. Although O2O mode produce commodities or provide service, it customizes according to customer demand, to meet the demand of the customers. This is the contradiction between lower productivity and advanced service thinking. It is the reason that O2O is fire but not prosperous., and can't be satisfied by side C.

2.2.3 The extension of side B and C interaction chain

In general, merchants extend the transaction participation chain through offline services. And get customers through their own advantages as more as possible. Consumers extend the transaction participation chain through online information and choose the Optimal Commodity by shopping around. The chains are interact with each other, in order to maximize their own interests by minimizing the participation of the third party, such as O2O take-away. Businesses extend the access to information by extending the logistics and distribution services and consumer' online choice.

C2B mode is the consumer to business mode. Its essence is to maximize pursue consumer participation in the production and marketing process of leading business. The core idea is serving for consumers and providing customer satisfaction products. C2B model believes that consumers demand is prior to enterprises production. Conventionally, consumers customize products and prices in accordance with their own needs, or actively participate in product designing. While production enterprises produce production to meet the consumer's personalized needs. The whole process is the process of consumer

experience marketing.

2.3 Characteristics of agricultural products O2O mode

2.3.1 Control the loss by O2O mode

Before the product has yet been produced, it has been sold out, and the loss directly been controlled. For example, conventionally, a whole pig is to be divided into the plum blossom, former clips, abdomen nan, hind legs and other body parts. Then these parts are sold out. Consumers have to passively buy these divided segmentation. On the one hand, it doesn't really meet the needs of the consumers. On the other hand, consumer preferences of meat, such as ribs, hind legs are often in short supply. While the former clip, plum, belly meat is unsalable. Finally, because of the freshness and shelf life, they have to be discounted. And by O2O mode, the product already know who is sold to before sales, and consumption in different areas will be well coordinated. By O2O mode, consumer will know the specific appearance of the products before they see and receive the products. It will greatly increase the level of their participation and experience feeling.

2.3.2 Connect with consumer by O2O

Consumer dock with agricultural production enterprises by a mediation platform, and the intermediary platform is called aggregation platform. The conventional aggregation platform includes website, WeChat and so on. In these channels, WeChat has strong sociality. It is the earliest started channel. Now it is better than e-commerce platform, and have a better result in docking with consumer. By WeChat, consumers achieve their sense of participation, satisfy their leading character to the marketing of agricultural products, imply their greatest level of experience feeling.

2.3.3 O2O mode can achieve maximum consumer participation

Consumers quickly get through experiential marketing channels by activities and propagation. For example, the intermediary platform integrate agricultural products sales online and offline through the congregation raised, evaluation, collective activities. And realize interaction through KOL information dissemination, micro movies, pictures, feelings. The consumer's opinions or suggestions are adequately expressed on goods to prompt agricultural production enterprises providing the best products and services.

2.3.4 O2O mode can properly control marketing cost, and reduce the terminal sales prices of agricultural products

In traditional agricultural products sales, the interests of producers, agricultural product middlemen, consumers have failed to adequately safeguard because of too much intermediate links, loss in circulation, spoiling and metamorphism of agricultural products. Everyone failed to enjoy higher returns in this session. Through the centralized bulk purchase, the purchase cost, the integrated marketing costs, the cost of warehousing, logistics cost, circulating capital, inventory risk costs are significantly reduced. Eventually O2O will directly make the agricultural producers and consumers benefit.

3 Representative Mode Research of O2O—Taking “Farmigo” mode as an Example

3.1 Concept of “Farmigo” mode

Farmigo is composed of farm, I and go. It is a platform connecting the farm and the consumer. Farmigo is a representative enterprise of the United States agricultural product O2O innovative business mode. With the unique business mode, Farmigo is hailed as “innovative agricultural products online sales platform” by many media. Looking from the pattern, Farmigo is more similar to a agency connecting consumer and farm. For farmers, Farmigo is an online platform, a new sales channel. Farmers can manage production, sales and distribution of their agricultural products through it. For consumers, Farmigo is an online market. They can buy high quality fresh product directly from the farmers through it.

3.2 Responsibilities and processes of “Farmigo” mode

Farmigo is a typical user demand oriented mode. Farmigo makes a web page for each community, and then the leader can add products to the community. Leaders need to invite at least 20 friends or neighbors to join community. There is no maximum number to food community. Leader publish food demand information every two weeks. 10% of community sales will taken as leader's reward. In addition, leaders also enjoy the food discount. Leaders take an active in motivating people around him to join the community.

Participating parties of Farmigo mode include consumers, farmers, online mediation platform. The rights and responsibilities of the participating parties are shown in the following table:

Table 1 Rights and Responsibilities of Participating Parties of Land Subscription Mode

object	core responsibilities
“Farmigo” platform	create a shopping website specified for community add priority selected farm products invite community residents to join the community negotiate discounts
farmer (agricultural production enterprises)	plant Use “Farmigo” and similar platform to sale products collect payment and delivery
ultimate consumers	through the “Farmigo” and similar platform to buy products pay enjoy exclusive discounts and proprietary products

Marketing process of “Farmigo” mode is as follows:

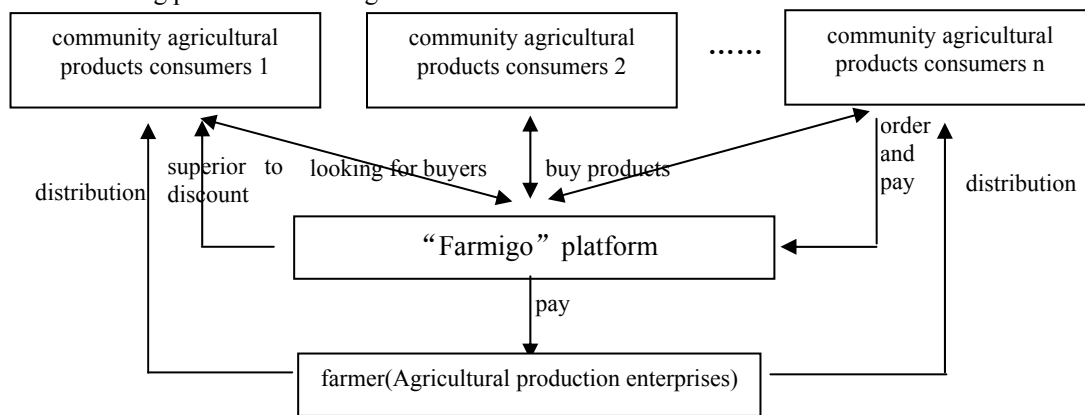

Figure 1 Marketing Process of “Farmigo” Mode

3.3 Characteristics of Farmigo mode

3.3.1 Achieve multi-win-win

By implementing the middle platform, consumers can participate in the choice of varieties of products and enjoy a low discount. For farmers and the farmer's cooperatives, this pattern can provide job opportunities, increase income.

3.3.2 Social and economic benefit

On the one hand, to the ultimate consumer, this mode fully realize consumer participation and leading. It provides healthy, fresh, safe, green customized products. At the same time, it also meet the psychological needs of becoming "private custom". On the other hand, it remove the intermediate. Intermediary platform not only revitalize the agricultural land, but also solve the problem of the production and sale of agricultural land through letting Ultimate consumer directly transact with farmer.

3.4 Difficulties faced with Farmigo mode

The key of O2O is disintermediation, so for agricultural products e-commerce, O2O is certainly the trend of the future. Let consumers dock with producers directly, shorten the flow of intermediate links, thereby reduce the cost.

3.4.1 Cold chain logistics

Agricultural e-commerce’s demand for cold chain logistics is far more than other industries. Under the background of Farmigo mode, cold-chain logistics become the weakness which restrict the development of the Farmigo mode of agricultural products . Previously, there are only various fresh e-commerce platform and other business users. While under Farmigo mode, there may be a farmers of a certain village. The object needing to serve increases, then the market capacity will increase. The difficulty of the cold chain logistics similar to individual express business also increases.

3.4.2 Development of target intermediate platform

So far agricultural e-commerce based on Farmigo mode is very little. Most agricultural e-commerce is: what I have here, you come here and see what you want. And Farmigo mode is about what I want, and who can provide me with this product. It takes consumers and customers demands as orientation. For example, I want to eat sausage. Farmigo mode is the consumer put forward the specific about ingredients, taste, dry degree, and the price. Then farmers see consumer’s demand, meet their

demand, and make a deal. It is similar to private customization. But there is so few middle platform specifying for development of agricultural products O2O mode.

3.4.3 Agricultural products ordered production

In past agricultural products production, the biggest problem is that the market is difficult to predict. The phenomenon of bad market occurs frequently. Often the production increases, while income doesn't. And traditional ordered production can only solve the problem of scale, and give priority to the public demand. Fragmentary and niche demands can not been satisfied. And with the emergence of Farmigo mode, there is a big platform can easily collect various consumer demands. The producer can perform a specific production to achieve the result of long tail effect. Professional producers can harvest in this market.

4 Conclusion

Consumer participation oriented agricultural products O2O marketing mode is still in trying stage in our country. its development space is huge, but its constraints also exist. First of all, individual customization has high requirement for aggregation ability of O2O platform. Personalized needs of consumers differ in thousands ways. How to personality first, then aggregate is a huge challenge for platform's own data tracking, sorting customers, response speed, finding a suitable manufacturer. Secondly, the mode also has high requirements for traditional enterprise supply chain, especially logistics distribution capability. Therefore, agricultural products O2O mode is still in the exploration stage. In the future, the research on the agricultural product customization platform, the agricultural products production enterprise logistics and supply chain construction and the construction of agricultural products cold chain transportation system will go on.

Development of Regional Non-Public Economy in China: Historical Review on the Growth of Non-Public Economy in Hubei Province of China since the Reform and Opening-up

Zhong Xianzhe

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: zhongxianzhe56@163.com)

Abstract: Non-public economy plays a significant role in Hubei province which is the bellwether of 'the Rise of Central China'. There has been a long way for Hubei non-public economy from absence to emerge, from permission to encouragement, support and guidance. The high-speed development and vitality of non-public economy have constituted important driving forces for Hubei's economic development, prosperity and expanding employment market, increasing taxes and maintaining social stability. In this study, the development of non-public economy in Hubei province since the reform and opening-up has been divided into three stages: First stage of restoration and development (1978-1992), second stage of rapid development (1992-2002) and third stage of scientific development (since 2002). Moreover, characteristic of each stage has been analyzed in detail. Finally, this paper discussed the important characteristics of the overall development of non-public economy in Hubei province.

Key words: Reform and opening; Hubei province; Non-public economy; History

1 Introduction

With the deepening of reform and opening up, and establishment and improvement of our nation's socialist market economy, Non-public economy in China has started from scratch and expanded from a small to a large project which shows the process of strengthening and consummation, and becomes an important force in China's economic and social development. Non-public economy plays a significant role in Hubei province which is the bellwether of 'the Rise of Central China'. Non-public economy not only remains an important factor for economy but also is the main channel of absorbing labor force. Meanwhile, it is an important way to get rid of poverty, and constitutes an important force in modernization. Hence, Non-public economy has played an important role to enhance Hubei's GDP. '2013 Hubei private economy development report' issued by the Hubei Statistics Bureau showed that in 2013, the growth of private economy accounted for up to 54% of GDP, rose of 0.9% than that of the previous year. Meanwhile, the report showed that the added value created by non-public economy was 1332.17 billion Yuan, an increase of 151.58 billion Yuan over last year, and 62.6% of Hubei's GDP came from non-public economy. The sale value and profit of large non-public enterprises were 2559.61 and 1385.3 billion respectively, increase of 19% and 29.9%. The number of total employees in non-public enterprises was 6.739 million, increasing 19.2% over the previous year.

Non-public economy in Hubei province has achieved effective results. Meanwhile, some problems still exist, mainly in five areas: firstly, the difficulties in financing in non-public enterprises; secondly, non-standardization in the business and management of the small- and medium-sized non-public enterprises; thirdly, high cost pressure and taxes; fourthly, downward pressure for the growth quarter by quarter; Fifthly, safeguarding the equality development of non-public economy.

The achievement in Hubei's non-public economy is a kind of historical products, and requires a certain degree of historical condition which is on the basis of long-term history^[1]. Hence, it is an important research direction to sum up the history of the development of non-public economy in Hubei Province, and the specific characteristics of each historical stage.

Historical periods of non-public economy were divided into three or four stages on the basis of the Party Congresses in academia. The division of three stages of J.P. Ding^[2]: the initial exploring period (1978-1997), the whole expanding and deepening period (1997-2002), the theoretical and practical innovation period (since 2002). The division of three stages of J.W. Li^[3]: the beginning and exploratory stage (1978-1992), the specification and deepening stage (1992-2002), the new development stage (since 2002). The division of four stages of L. Li^[4]: the early stage (1979-1991), the expanding and exploration stage (1992-1997), the specification and enhancing stage (1998-2002), the innovative development stage (since 2003). The division of four stages of G.J. Qiu^[4]: the initial stage (1978-1992), the exploration stage from point to surface (1992-1997), the orderly exploring and rapid development stage (1992-2002), standardization and systematization development stage (since 2002).

There has been an important way for Hubei non-public economy from absence to emerge, from permission to encouragement, support and guidance. The high-speed economic development and economic vitality have constituted important driving forces for Hubei's economic development, prosperity and expanding employment market, increasing taxes and maintaining social stability. In this study, the development of non-public economy in Hubei province since the reform and opening-up has been divided into three stages: First stage of restoration and development (1978-1992), second stage of rapid development (1992-2002) and third stage of scientific development (since 2002). Moreover, characteristics of each stage are analyzed in detail.

2 The Development of the Non-Public Economy in Hubei Province

2.1 Restoration and development stage of non-public economy in Hubei province

In 1978, the 3rd session of the 11th congress was not only a major historical turning point of China's economy and social development, but also the turning point of non-public economic development. After the 3rd session of the 11th congress, Hubei province held three successive meetings, forming three high tides about the Discussion for the Criteria of Truth and the Liberation of Thought. Individual private economy developed from 'The tail of capitalism' to 'The economic supplement of socialist public ownership', and from 'Restricting development' to 'Permitting to exist and develop within the limits prescribed by law', which laid the ideological foundation for the development of non-public economy in Hubei province. Since 1979, family-contract responsibility system was put into practice in the countryside of Hubei province. By the end of 1982, family-contract responsibility system already basically popularized. The state-owned enterprises began to explore the reform of enterprise which decentralized management autonomy as the core. Along with the open of trade market in the cities, a large number of individual businesses emerged. Hanzheng Street was the first to recover small commodities market in China, it developed into the largest small commodity wholesale market in the central China from a small market. At the same time, businessmen from Hong Kong, Macao and Taiwan came to Wuhan and entered the market of Hubei province. In October 1984, Third Plenary Session of the Twelfth Central Committee passed 'the central committee of the communist party of China about the decision of the economic system reform', China entered the economic system reform stage which regarded cities as the focal point, and non-public economy was growing rapidly. Hubei province has carried multiple significant experimental reform tasks, and has taken the leading role in the pilot provinces. Under the situation of the opening to the outside world, the economic zones were established. The Donghu Lake area of Wuhan is the high-tech industry development zone since 1984. In addition, the first one set of television production line was imported in 1986. It was found that non-public economy in Hubei province has had the big development through a series of reform steps. In 1978, the number of individual businesses in the province was 7000. While by the end of 1987, the number was nearly half a million. At the same time, private economy has developed to a certain extent. Hubei province began to form the co-existence pattern of state-owned, collective, individual and privately owned economy. However, the economic conditions changed from loose to tight from the second half of 1988. On one hand, the government began to administer the economic environment and to readjust the economic order, due to the signs of the first-round economic overheating and the growing problems caused by the disorderly development of town and township enterprises. On the other hand, global (drastic change of Soviet Union and Eastern Europe) and domestic (the political storm in 1989) developments gradually changed the political and economic situation in ways unfavorable to non-public economy. Individual businesses and private enterprises were over-punished in the national tax check up. The socialist development of China suffered a serious setback as a result of collapse of Soviet Union and tremendous changes in the east Europe. In the case, the development of the private and individual economies was undermined, and has experienced slowdown in growth. The phased characteristics of non-public economy in Hubei Province were: (1) The development of non-public economy has been greatly affected; (2) From 1989 to 1992, the private and individual economies in Hubei Province experienced a sharp slowdown before the Deng Xiao Ping's speech in the south trip. For instance, the number of private enterprises in Hubei province was hovered at about 2000 from 1989 to 1992. The financial problem of private economy in Hubei province is that the gap is expanding with the developed regions.

The phased characteristics of non-public economy in Hubei Province were: (1) Private economy intermixed with individual business and cooperative economic organization; (2) Small in scale and low in grade; (3) Mainly family-owned companies; (4) Spontaneous development.

2.2 Rapid development stage of non-public economy in Hubei province

Table 1 Development of Non-Public Economy in Hubei Province from 1992 to 1997

	1992	1993	1994	1995	1997
Number of private enterprise	2127	5730	15000	24992	38998
Rank in China	19	14	-	-	9

The 'talk in the South of China' by Deng Xiaoping in 1992 gave answer to the basic questions of what socialism is, solved the problem of capitalism or socialism, and brought non-public economy enormous vitality. In March 1993, the first meeting of the Standing Committee of the 8th NPC changed the country's constitution and made it clear that the state carried out the socialist market economy. The fourteenth National Congress of the Chinese Communist Party brought forward the stratagem goal for building socialism market economy. Hubei provincial government caught the chance to accelerate the development of private economy in Hubei province. In 1993, the provincial government held a working meeting for individual private economy in Xiaogan for the first time in the name of provincial party committee, which became a milestone of the development history of individual private economy. In 1995, Hubei province held a working meeting for individual private economy for the second time, and promulgated 'Regulations for private enterprises and individual businesses in Hubei province'. Hubei province has a rapid increase in the number of private enterprises and individual businesses, and scale of private enterprises was expanding rapidly. Hubei province has held economic meetings for individual private economy for six times, and worked out a series of policies about loan, land and staffing. From the 'talk in the South of China' by Deng Xiaoping to the end of 1997, individual private economy in Hubei province achieved a historic breakthrough in five years. The development of private economy in Hubei province is rapid, and the two Three-Year plans were finished two years ahead of schedule. As shown in table 1, the number of private enterprises increased significantly, from 2127 in 1992 to 38998 in 1997, Hubei's ranking in China was uplifted from the 19th place to the 9th. Meanwhile, the number of individual businesses increased from 590000 in 1992 to 1.861 million in 1997 (as shown in table 2), and the ranking was uplifted from the 12th to the to third place.

Table 2 The Number of Individual Businesses in Hubei Province in 1992, 1994 and 1997

	1992	1994	1997
The number of individual businesses	590000	1200000	1861000

In the 1997, the Party's 15th Congress proposed that non-public economy was an important component part of China's socialist market economies, non-public sector comprising self-employed and private business should be encouraged and guided to facilitate its sound development. This advancement of consciousness and fundamental theoretical breakthrough laid a solid foundation for the development of non-public economy. The Second Session of the Ninth NPC in March 1999 passed constitutional amendments and established the law status of self-employed or private enterprises and other non-public sectors of the economy. In May 1998, Hubei's provincial government inspected the development of private economy in Zhejiang province, then held a working meeting for private economy and issued 'the decision about quickening the development of private economy'. It became clear that county economy should base on private economy. Meanwhile, the asset storages of middle and small-sized enterprises should be activated. Hence, a pattern of individual economy in ownership system economy developing side by side has taken shape. A group of state enterprises have transferred into private enterprises, or have developed into mixed ownership enterprises and share-holding enterprises.

The phased characteristics of non-public economy in Hubei Province were: (1) Rapid and stable development of gross scale: The number of private enterprises, registered capital, total output and turnover have risen among other provinces; (2) Change of the pattern of economic growth: The development of private economy has changed the mode by converting from quantity type to efficiency type, and part of individual businesses has basically been on the road of industrialization development in big scale; (3) Private enterprises have become a strong plate: The registered capital of private enterprises are 2.4 times higher than that of individual businesses; (4) Expanding business scope: The scope of non-public economy has expanded from traditional industries containing commerce & trade and catering to modern industrial and commercial industries, services and social undertakings.

2.3 Scientific development stage of non-public economy in Hubei province

Encouraging, supporting and guiding the development of the non-public sectors of the economy was raised in 16th Congress of the Communist Party of China, which injected new strength to non-public economy of province. In February 2005, the State Council issued 'Several opinions about

encouraging, supporting and guiding the development of self-employed or private enterprises and other non-public sectors'. In addition, the National Congress issued 'Property law' and the modified 'Corporate Income Tax'. The legal system for protecting private property were set up, which further improved the public's enthusiasm in starting up private businesses, and constantly pushed non-public economy in Hubei province forward. The development of private economy has become an overall significant strategy in province to meet new situation for the WTO entry and new requests of constructing China into a comprehensive well-off society. The strategies are 'Continuing to follow the basic private economic system in county economy, and accelerating the processes of industrializing agriculture and the countryside, as well as impelling the town development'. Meanwhile, improvement of the policy environment, reduction of the number of matters which require government approval, pushing forward the reform of property right system and relaxing market access conditions and business scope were implemented to develop the scientific, export-oriented, large-scale and modern private economy.

The communist party's 18th national congress emphasized that non-public economic development should be unswervingly encouraged, supported and guided, and the equal use of production factors for all kinds of proprietary system economies, fair competition among enterprises as well as equal protection should be ensured. This showed that Central Committee of CPC has attached great importance to the development of non-public economy, and gave political, economic status of private economy and private entrepreneur high evaluation and fully affirmation^[6]. The 10th party congress in Hubei proposed that We should 'focus on the breakthrough development of private economy, unswervingly promote reform of ownership', 'scale up efforts to encourage, support and guide the development private economy, create a market environment for fair competition among economic entities under diverse forms of ownership and facilitate stronger growth of the non-public sector'. Hubei province conscientiously carried out the spirits of the communist party's 18th national congress and the Hubei's 10th party congress, followed closely the topic of the scientific development and accelerating changing the pattern of economic growth. In addition, Hubei province continued on provide fair access to the markets and improved the financial condition, which can optimize the non-public economic development environment and urge non-public economy to a new level of development. In these years, Hubei's non-public economy kept developing fast, and has entered a new phase of comprehensive and rapid development.

The phased characteristics of non-public economy in Hubei Province were: (1) The great attention of Hubei Provincial CPC Committee; (2) Development of non-public economy to scientific, export-oriented, large-scale and modern; (3) High evaluation and fully affirmation for the political, economic status of non-public economy and private entrepreneur; (4) Optimization of the non-public economic development environment from all perspective; (5) Rapid progress of the non-public economy and a new phase of comprehensive development.

3 Conclusion

After more than 30 years of development, unique economic development model has been formed in the Hubei's non-public economy. By analyzing the main stages of the development of Hubei's non-public economy and summarizing the characteristics of the different stages, four features are found in the process of non-public economy development:

(1) Non-public economic aggregates rank in the top few places of central China, but still lags far behind some advanced regions.

After the fast progress of recent years, Hubei's non-public economic aggregates gained great achievement. '2013 Hubei private economy development report' issued by the Hubei Statistics Bureau showed that the growth of private economy accounted for up to 54% of GDP in 2013, rose by 0.9% than that of the previous year. Private economy plays an enormous role in supporting economic development. Meanwhile, the report showed that the added value created by non-public economy was 1332.17 billion Yuan, an increase of 151.58 billion Yuan over last year, and 62.6% of Hubei's GDP came from non-public economy. Concerning the Middle Area, the economic aggregates of Hubei Province rank in the top few places, and are second only to Henan province. While the economic aggregates still lag far behind some advanced regions. According to statistics from the Jiangsu Statistics Bureau, the added value created by non-public economy was 3975.67 billion Yuan, accounted for up to 67.2% of GDP in 2013, rose by 10.4% than that of the previous year. It is more than three times ahead of the same period of Hubei province. Meanwhile, an unbalance development of regional non-public economy is a projecting character in Hubei, such as the single-largest-city of Wuhan. Comprehensive strength of other

cities and counties is of the weak.

(2) Non-public economy has developed fairly fast, but quality of development needs to be enhanced.

In recent years, Hubei's non-public economy develops dramatically. The number of private enterprises increased from 150000 in 2006 to 1.079 million in 2013, and the ranking was uplifted from the 12th to the 3rd place, and the registration capital increased from 236.29 billion Yuan to 8851.3 billion Yuan. The number of individual businesses increased from 1.063 million in 2006 to 201.4 million in 2013, and the registration capital increased from 24.88 billion Yuan to 102.99 billion Yuan. '2013 Hubei private economy development report' issued by the Hubei Statistics Bureau showed that the sales value and profit of large non-public enterprises were 2559.61 and 1385.3 billion respectively, an increase of 19% and 29.9%. While the quality needs to be improved with the rapid development, on one hand, high-technology industry development is not enough. Most of private enterprises in Hubei province focus on the service industry and sub-scale industrial enterprises. As capital-intensive and labor-intensive enterprises, there are lack of private enterprises with the high-tech content, high additional value and fission development. On the other hand, industry collection needs to be further strengthened. Compared with the coastal provinces with developed private economy, the specialization, intensive and large-scale development in Hubei's non-public economy is needed to be improved. The lack of the development of industrial cluster restricts the improvement of quantity and quality of private enterprise.

(3) There are large numbers of non-public enterprises, but limited in scale

In recent years, the number of Hubei's non-public enterprises is growing very rapidly, but the scales are usually small. Hubei municipal Bureau of statistics data showed that the number of market subjects is 3.3511 million, registered capital of 2555.311 billion. The numbers of new private businesses and new individual businesses are 131300 and 935400, increase of 90.8% and 73.8% respectively. There are 788 new registered foreign companies with total investment of 9.054 billion dollars, increased by 84.7%. Thus it can be seen that there are large numbers of non-public enterprises in Hubei with rapid growth rate. While great disparity exists in scale and strength between the non-public enterprises in Hubei province and in developed provinces and cities, such as zhejiang province. There are 12, 13, 15, 16, 17, 18 and 15 enterprises included in the top 500 Private Enterprises in Hubei from 2008-2014, respectively. While the numbers are 185, 161, 180, 144, 142, 139 and 138 in Zhejiang province. It is the necessary for private enterprises in Hubei to make them more influential and powerful.

(4) The government spared no effort to develop the non-public economy, but the soft environment for development is needed to be improved.

In recent years, with the core idea of 'Industry first, Entrepreneur preferred' and with the service concept of 'Prefer to trouble the government rather than the enterprise', Hubei province strives to create humanism circumstance, policy environment and service environment that are conducive to the development of non-public economy. In addition, it is advocated that the good humanism circumstance is of great importance in promoting the development of talent, project, capital, enterprise and the entrepreneur. Moreover, policy innovation should continue to promote the establishment of concepts of respecting the commercial and attaching great importance to the enterprise, while the development of soft environment will not be attained by sudden flight. This is because Hubei province has long been affected by inland consciousness and agriculture culture, which requires a long transitional period to change the official consciousness, thought of contempt trade and honesty deficiency. Situations of 'Law enforcement equals penalty, Management equals fee and difficult accessibility, unfriendly look, and difficult dealing' still exist to varying degrees. Hence, government should strengthen the law-enforcing supervision and regulate the behavior of the government to make the policy of improving the soft environment for Hubei's non-public economy fulfills.

Research on Model Establishment for Incubation Network of Innovative Cluster*

Wu Na

Huaxia College, Wuhan University of Technology, Wuhan, P.R.China, 430223
(E-mail: haha0629@126.com)

Abstract: Innovation is the basic requirement and development goal of sustainable development of industrial cluster. The task of industrial cluster development is to incubate and cultivate innovation cluster, rather than build cluster with low-cost. In this paper, on the basis of the formation mechanism of cluster innovation theory, the incubation network of innovative cluster forms was analyzed from three aspects: behavior subject, resource and activity. After taking theory of network organization and coordination theory as the instruction, incubation network model of innovative cluster was established, and this plays an important role in upgrading the industrial cluster to innovative cluster.

Key words: Innovative cluster; Cluster elements; Incubation network; Model establishment

1 Introduction

The earliest concept of industrial cluster comes from the industrial area proposed by Marshall (1890)^[1]. Porter (1990) and then proposed the assertion that industrial clusters can strengthen national competitive advantage^[2]. Cluster planning has become an important mode of governments to formulate development policy. Such as Britain, the United States, European Union and other developed countries which have to set up high-tech development zones as a strategy to promote national innovative industrial development.

Most of the industrial cluster in China only builds the industrial chain and industrial clustering currently, pursuit of cost reduction, investment and expansion of the scale, as well as GDP, export and other short-term benefits. Unlike traditional industrial cluster, which takes industrial chain as the link aggregation production factor, pursues productivity improvement. The innovation cluster mainly takes value chain as the link, gathers the innovation resources, and promotes the formation of innovations within the cluster and knowledge spillovers. Within the innovation cluster, based on the mutual cooperation between different subjects, technological innovation conducive to the formation of network development trend of technological innovation, and increase the market efficiency of technology supply. Therefore, promoting industrial clusters to innovation becomes a hot research recently; and incubating innovative cluster is an important issue in front of us.

2 Innovation Cluster Formation Mechanism

The formation of innovation cluster is based on the industrial cluster, and the innovation cluster is the advanced stage of industrial cluster. After the formation of industrial clusters, why some develop into innovation clusters, while others don't? Many scholars give their own interpretation, among which, Depression (1989), thought that the internal economic constraints and incentives, external constraints and pressure is the cluster innovation formation reason, he believed that the source of innovation cluster derived from scope economy and discontinuous, complex technology, accumulation of the learning process^[3]. Linage believed that interaction between network members and the interaction between network were vital for the formation of cluster innovation. The organization's natural selection tendency and the complementary nature of the resources might have an impact on the organization's innovation and the choice of alliance object, so as to affect the inter organizational relationships or network, and then affect the formation of innovation cluster^[4]. Therefore, he believed that natural selection, resource complementarity, the formation of groups in the innovation system and the interaction of the participants were four decisive factors contributing to the innovation cluster. Montresor et al. (2008) through the empirical study of OECD15 member countries believed that innovation cluster formed in the establishment of the cluster economy internal innovation system^[5]. Park (2003) by the principle of dynamic change of the Pacific rim economic space, believed that the knowledge spillover effect were an important factor in the formation of innovation cluster^[6]. Lee (2003) believed that the reason for the formation and development of innovation cluster was a kind of policy environment which sustained,

* This paper is supported by Hubei Provincial Department of Education Humanities and social science research project in 2014 (NO.14G523)

stable and favorable for scientific and technological innovation [7].

Summarizing the foreign scholar’s research, we can find that the economy, technological diversity, knowledge spillover effects, and policy environment are the main driving factors for the formation of innovation cluster.

3 Analyses on Incubation Network Components of Innovation Cluster

Hakansson (1987) believes that any network consists of three basic components: behavioral agents, resources, activities [8]. Incubation network components of the innovation cluster from these three aspects will be analyzed as follow:

3.1 Behavioral agents

Innovation cluster is within a certain geographical area, which consists of enterprises, research institutions, universities, venture capital firms, intermediary service organizations, etc., through the industrial chain, value chain and knowledge chain to form a strategic alliance or a variety of cooperation, it is a kind of industrial organization form that has a cross-sectoral and cross-regional leading role as well as international competitiveness. Thus, the behavioral agents of the innovation cluster incubation network are composed of government, knowledge center, industry and market demand, innovation service organization, as shown in Figure 1.

3.2 Resources

Resource element is the main carrier to achieve communication and interaction between the behavioral agents in cluster structure, mainly including knowledge, technology, information, material products, capital, policies and regulations, personnel, culture, market, products and services, etc... In the process of participating in the activities, behavioral agents in network only with the help of the flow of resources can form a formal or informal relationship between each other. Inside the incubator network, through rational flow and allocation of resources, and promote the production of technological innovation activities.

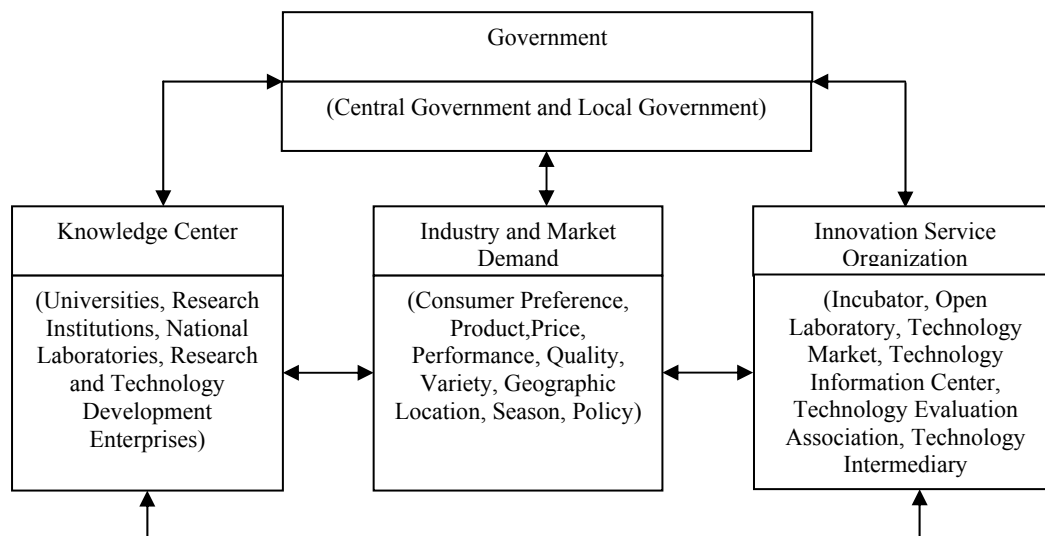

Figure 1 Schematic Diagram of Behavioral Agents of the Innovation Cluster Incubation Network

3.3 Activities

The activities of the behavioral agents in the innovation cluster incubation network are carried out around the resources; the occurrence of the event is the flow of resources. According to different type of resources, the main activities of innovation incubation network includes technological flow, information flow, personnel flow, material flow, capital flow and so on. Resource flow plays a role in connecting different behavioral agents, adjusting production and innovation activities, it can be said that it is the blood circulation system in incubator network of the innovation cluster.

3.1.1 Technology flow

The flow of technology is the most valuable kind of flow, basically it is a kind of technologicaleconomic behavior and social behavior, it can eliminate the technical potential difference between technical output and acceptance, and can improve social productivity and technical ability, and it is also one of the important ways of technological innovation. The path of technological flow in the

incubation network of innovation cluster is mainly as follow:1)technological flow between enterprises in the cluster; 2)technology flow between enterprises ,universities and scientific research institutions in the cluster;3)technical flow between enterprises and intermediary organizations in the cluster;4)technical flow between enterprises and financial institutions in the cluster;5) technical flow between universities and scientific research institutions in the cluster;6)technology for social communication;7)technological flow between enterprise in the cluster and the outside of the cluster.Technology is made up of many technical factors,among the many factors that are related,When a technical factor changes, it is bound to lead another technical factorchange,thus produce the chain effect of dominoes,this effect is the technology flow and innovation process of innovation cluster incubation network.

3.3.2 Information flow

The flow of information is an important condition for the effective operation of innovation cluster incubation network.Innovation cluster is an open system based on the knowledge property system and mutual trust,formal institutional arrangements; informal contactswill have a positive impact on innovation.If the faster the flow of information, the lower the cost, the higher the efficiency of the network, that the better the innovation ability of the behavioral agents. There are many channels of information flow, such as the industry association, the technology market, the chamber of Commerce and other formal channels, also have informal channels such as private communication.Through information flow, we can strengthen the communication between the behavioral agents, close the distance between each other, and establish trust in each other.From the type of information, mainly including product information, market information, personnel information, policy information, etc...The enterprise within innovation cluster incubation network can more easily get the relevant information of competitors, upstream suppliers, downstream customers,which can better insight into industry trends, market demand, technological change and other information.

3.3.3 Innovative personnel flow

Innovative personnel having professional skills, experience and social knowledgeflow effectively, this energizes the formation of innovative cluster.A certain proportion of innovative personnel flow within innovation cluster network is beneficial to knowledge spillovers.The path of the personnel flow generally occurs in the following:1)between horizontal enterprise, competitor or partner within the innovative cluster;2)between enterprises and suppliers in the vertical industry chain of the innovative cluster;3)between enterprises, universities and research institutions within the innovative cluster; 4)between the enterprise agencies and other service organizations within the innovative cluster.The flow of innovative personnel has brought new ideas, knowledge and skills to behavioral agents, which can promote the renewal and enhancement of basic knowledge, and can adapt to the uncertainty of the external technology and market as soon as possible.Innovative personnel flow is conducive to promotethe overall innovation ability ofinnovation cluster incubation network.

3.3.4Material flow

The incubator network has a public technical service platform, including public laboratories, large general-purpose instruments, and general purpose testing platform,enterprises can hire these public instruments and equipment.Due to have more information of enterprises in the innovation cluster,enterprises engaged in R & Dcan share the laboratory, research and development equipment, etc...Universities and scientific research institutions have more experimental apparatus and good scientific research conditions,enterprises can obtain the necessary experimental equipment through cooperation with scientific research institutions in Colleges and universities.In addition, the agency through its own network resources can also help enterprises to obtain the required material resources.These pathways can achievematerial flow of innovation cluster incubation network.

3.3.5 Fund flow

In the process of innovation, the enterpriseswithin the innovation cluster needa lot of R & D investment, which cannot be separated from the support of the fund.Enterprise funds mainly have the following several sources:1)the government's special innovation fund, fund flows from the government to enterprises;2)bank financial institutions loans, fund flows from the banking financial institutions to enterprises;3)non-bank financial institutions such as venture capital funds and other investment,fund flows from non-bank financial institutions to enterprises. In addition, there are other forms of financial assistance to the domestic and foreign partners. Innovation between enterprises, universities and scientific research institutions, fund in the form of research funding flows from business to universities and research institutions.The flow of fund always runs through the whole process of innovation in cluster.

4 Establishment Incubation Network Model of Innovative Cluster

Based on the above analysis, this paper establishes a new incubator network model of innovative cluster, as shown in Figure 2. The incubator network model of innovation cluster is divided into three levels: core network layer, auxiliary network layer, peripheral support network layer.

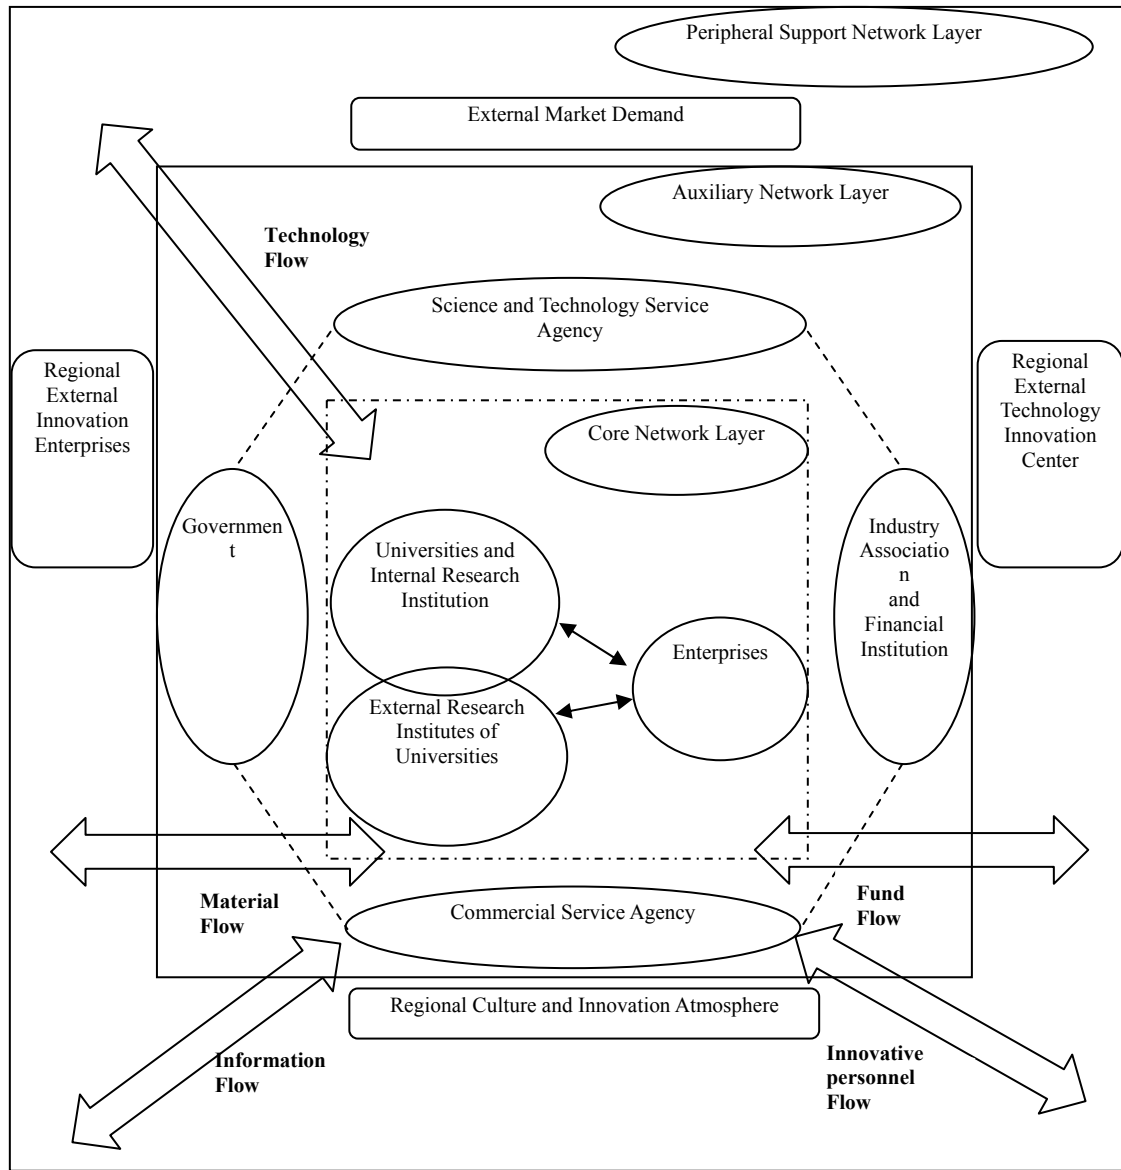

Figure 2 Framework Model of the Innovation Cluster Incubation Network

4.1 Core network layer

Core network layer is composed of the interaction between enterprises, university scientific research institutions and other innovation subjects. The incubation network has aggregation effect, it enables enterprises and institutions within the innovation cluster to share infrastructure and research and development services, to promote technological exchanges between the subjects of innovation. Incubation network in addition to provide enterprises with all kinds of basic services, also building bridge for communication and cooperation between enterprises and research institutions of universities. Incubation network has mastered the technology, production and market situation of enterprises in the cluster; it can promote enterprises and enterprises in the relevant areas, enterprises and scientific research institutions in universities to carry out collaborative innovation, to share information such as technology, production and marketing etc.

4.2 Auxiliary network layer

Incubator network layer the innovation cluster incubation network is composed of government, science and technology service agency, industry association, financial institution, Commercial service agency, the function of the auxiliary network layer in innovation incubation network is realized by connection with the core network. Government creates an atmosphere that is conducive to the formation of innovative industrial clusters by creating a policy environment for the development of innovative industrial clusters. Innovation service organizations can regulate the relationship between enterprises' competition and cooperation, which can promote the integration of knowledge within the network and the proliferation of innovative results. Financial institutions can provide the necessary financial support and guarantee for the innovation and development of enterprises. Through establishing contact with each other and forming network by universities, scientific research institutions, innovative service organizations, financial institutions and government, which is conducive to the effective docking of innovative project resources and innovation key resources, can better serve the enterprise in the innovation cluster, make up for the disadvantages of its innovation resources.

4.3 Peripheral support network layer

Peripheral support network layer refers to the culture and innovation atmosphere, external market demand, external technology innovation enterprises and center. In innovation and cooperative atmosphere of the area, between the various subjects to establish a higher degree of trust relationship, which can be driven by knowledge innovation incubator network in fast flowing and sharing, promote the innovation ability of the whole network. This will benefit of improving the entire network of innovation ability. The power of enterprise innovation is not only from the internal motive force, but also from the external market demand. Feedback from the external market to a certain extent has been clear about the direction for innovation. The innovation of the enterprise is only in view of the market demand, to ensure that innovation of practical, economical and efficient. Innovative cluster needs to communicate and exchange with innovation subjects outside of the cluster, learn the advanced concepts and successful business development experience, achieve results of the exchange and technological upgrading, in order to prevent the emergence of innovative rigid.

5 Conclusion

On the basis of the research of experts and scholars, this paper analyzes the coupling mechanism of the innovation cluster incubation network, and establishes the innovation cluster incubation network, Thus it is advantageous to improve the innovation ability of the whole cluster, from the industrial cluster upgrading to the innovation cluster. This has important theoretical significance and practical value to adjust the industrial structure, promote the development of industrial chain, change the mode of economic growth, and build an innovative country.

An Empirical Research on the Technology Feedback Effect of China's FDI in the EU*

Huang Ying, Ding Mengyan

School of Economics and Management, Wuchang Shouyi University, Wuhan, P.R.China, 430064
(E-mail: grace.00123@aliyun.com, susydm2013@163.com)

Abstract: Based on data of China's outward foreign direct investment (OFDI) in the EU from 1985 to 2013, the paper empirically studies the technology feedback effect (TFE) of China's FDI in the EU and impacts on TFE of technology gap, human capital, economic openness and financial development from the viewpoint of home country. The results show that China's FDI in EU has a positive spillover effect on domestic total factor productivity and moderate technology gap between China and EU countries benefits OFDI technology feedback effect. However, TFE of China's OFDI in EU is restricted by lack of advanced human capital stock, less in-depth economic openness and financial development.

Key words: Foreign direct investment; Technology feedback effect; Total factor productivity; Time series analysis

1 Introduction

Although the discussion on OFDI technology feedback effect (TFE) and its influencing factors have been perfected, but the views and conclusions are different. Few literature relates new trend of China's OFDI development especially China's technology sourcing FDI in developed countries such as the European Union and demonstrates the TFE and its influencing factors. In fact, investigation on situation and motives of Chinese enterprises' FDI by China's international trade promotion Committee in 2013 reveals new features of Chinese OFDI. Enhancing brand value, access to advanced technology and management experience have become major investment motives. The EU and North America are hot places to attract Chinese investment. 16% of the respondents will target at the United States as investment destination and 15% of them choose the EU countries. Whether technology feedback effect exists in the process of Chinese OFDI in the EU countries? Which factors can affect TFE and how? These are two key points of this study.

2 The OFDI Technology Feedback Effect and Its Influencing Factors

Chinese enterprises invest in the EU countries by whether green field or cross-border mergers and acquisitions, aiming at acquiring and absorbing advanced technology from leading EU enterprises. They innovate new technology and transform traditional techniques to enhance their strength, promote industrial upgrading and China's technological development. This is the OFDI technology feedback effect which has influencing factors as followed.

2.1 Technological gap

Technology feedback effect is based on a proper technical gap between the investing country and the host country. Chinese enterprises invest in EU for sourcing technology feedback. If technical gap is too wide, investing enterprise will not effectively absorb target company's advanced technology and not obtain technology feedback effect.

2.2 Human Capital

Human capital is an important guarantee for independent research and technological upgrading. The abundant human resource of good quality boosts investing country to quickly absorb new technology and brings about obvious technology feedback effect. Additionally, relevant researches have proved that human capital has the threshold effect. When human capital stock reaches a certain level, there will be TFE. Or else, enterprises may not effectively absorb TFE.

2.3 Economic Openness

Relevant researches have suggested that the technology feedback effect is proportional to investing country's economic openness. In an open economic environment, enterprises tend to integrate international resources, and learn advanced technology and management experience overseas. In addition, foreign companies continuously swarm into home country, intensifying competition with local

* This paper is supported by Scientific research project (B2014258) of Hubei department of education and Humanities and social science project (14G500) of Hubei department of education.

enterprises, which have to search for advanced technology to improve their competitiveness and nurture home country.

2.4 Financial Development

The efficiency of financial market affects resources allocation, thus affects absorption and utilization of technology feedback effect. If the investing country's financial market is efficient, enterprises can obtain sufficient fund with limited cost to carry out technology learning, absorption and further innovation. Therefore, financial market's good development is conducive to advanced technology absorption and feedback .

3 Data and Methodology

3.1 Model and data

Based on international R&D spillover model proposed by Lichtenberg and Potterie in 2001, the total factor productivity is decided by both domestic and foreign R&D capital stock. The following models can be set to examine the TFE of Chinese FDI in EU and its influencing factors.

Basic model:

$$LnTFP_t = \alpha + \beta_1 LnRDP_t + \beta_2 LnSOFDI_t + \beta_3 LnSIFDI_t + \varepsilon_t \tag{1}$$

The influencing factor model based on technological gap:

$$LnTFP_t = \alpha + \beta_1 LnRDP_t + \beta_2 LnTG_t \square LnSOFDI_t + \beta_3 LnSIFDI_t + \varepsilon_t \tag{2}$$

The influencing factor model based on human capital:

$$LnTFP_t = \alpha + \beta_1 LnRDP_t + \beta_2 LnH_t \square LnSOFDI_t + \beta_3 LnSIFDI_t + \varepsilon_t \tag{3}$$

The influencing factor model based on economic openness:

$$LnTFP_t = \alpha + \beta_1 LnRDP_t + \beta_2 LnOPEN_t \square LnSOFDI_t + \beta_3 LnSIFDI_t + \varepsilon_t \tag{4}$$

The influencing factor model based on financial development:

$$LnTFP_t = \alpha + \beta_1 LnRDP_t + \beta_2 LnFD_t \square LnSOFDI_t + \beta_3 LnSIFDI_t + \varepsilon_t \tag{5}$$

Based on model (1), TFP stands for China's total factor productivity; RDP represents the percentage of Chinese R&D spending accounting for GDP; SOFDI、SIFDI stands for R&D capital stock from Chinese outward FDI in EU and Chinese inward FDI from EU respectively; β_1 、 β_2 、 β_3 represents respectively the elasticity coefficient of Chinese TFP by domestic R&D activities, international R&D spillover from Chinese OFDI and IFDI.

Based on model (2) to model (5), TG、H、OPEN、FD stands for technological gap between China and EU countries, Chinese human capital, economic openness and financial development respectively. β_2 from model (2) to model (5) represents impacts on TFE of Chinese FDI in EU by technological gap, Chinese human capital, economic openness and financial development respectively.

3.2 Data source and processing

According to the China's FDI stock in EU at the end of 2013, the top six countries were: the UK, France, Germany, the Netherlands, Sweden and Italy. These six leading countries attracted 67% of Chinese total investment stock in the EU. Europe is still a negligible FDI source for China. During 2003 to 2013, China's inward FDI flow is mainly from the UK, France, Germany, Sweden, the Netherlands and Italy. Taking China's IFDI in 2013 for example, the six leading countries' share amount to 73% of the total EU's investment in China. Therefore, the UK, France, Germany, Sweden, the Netherlands and Italy are important FDI destinations and sources for China and the quantitative analysis is based on the six countries. The data sources and processing method are summarized in Table 1.

Table 1 Name, Implication, Resource and Processing Method of Variables

Variable	Variable Implication	Data Source	Processing Method
TFP	China's total factor productivity	China's Statistics Yearbook	$TFP = \frac{Y}{K^\alpha L^\beta}$
Y	China's real GDP	China's Statistics Yearbook	GDP at constant price with the base year of 1985
K	China's fixed capital stock	China's Statistics Yearbook	Perpetual Inventory
L	China's employment	China's Statistics Yearbook	Direct use
RDP	China's R&D intensity	China's Statistics Yearbook of Science and Technology	RDP=R&D expenditure/ GDP

SOFDI	Foreign R&D capital stock from China's OFDI in EU countries	WB Database China's Statistics Yearbook	$SOFDI = \sum_{i=1}^n \frac{OFDI_i S_i}{Y_i}$
SIFDI	Foreign R&D capital stock from EU countries' FDI in China	WB Database China's Statistics Yearbook	$SIFDI = \sum_{i=1}^n \frac{IFDI_i S_i}{Y_i}$
$OFDI_i$	China's FDI stock in i country in EU	China's Bulletin of Foreign Direct Investment	Direct use
$IFDI_i$	i country's FDI stock in China	China's Statistics Yearbook	Direct use
Y_i	i country's GDP	WB Database	Direct use
S_i	i country's R&D capital stock	WB Database China's Statistics Yearbook of Science and Technology	Perpetual Inventory
TG	Technological gap between China and EU countries	WB Database China's Statistics Yearbook	TG=China's labor productivity/ EU countries' labor productivity
H	China's human capital	China's Statistics Yearbook of Science and Technology	H=R&D personnel/ total population
OPEN	China's economic openness	China's Statistics Yearbook	OPEN=total imports and exports /GDP
FD	China's financial development	China's Statistics Yearbook	FD=total loans of financial institutions at year-end/ GDP

3.3 Model test and analysis

3.3.1 ADF test

Making ADF test to LnTFP、LnRDP、LnSOFDI、LnSIFDI、LnTG*LnSOFDI、LnH*LnSOFDI、LnOPEN*LnSOFDI、LnFD*LnSOFDI after first-order difference respectively, and the results are as Table 2.

Table 2 Stationary Test

Variable	Test Types (c,t,k)	ADF Test Value	Critical Values			Results

Notes: Test types(c, t, k) shows respectively whether there is constant term in ADF test(Intercept), time trend, and maximum lags. *, **, *** mean the value is critical value under the 1%, 5%, 10% significant level respectively.

The time sequence of original variables are non-stationary, however, their first-order differences are stationary. Therefore, these time sequences may exist cointegration relationship, namely there is a long term and stable relationship among them.

3.3.2 Cointegration analysis

Engle-Grange two-step method is used to make test to cointegration relationship among above variables.

The first step: model estimation——Ordinary least squares method

Making regression of model(1) to model (5) by EVEIWS 6.0, the results are as Table 3.

Table 3 Estimation Results of Technology Feedback Effect of Chinese FDI in EU and its Influencing Factors

Variable	Model (1)	Model (2)	Model (3)	Model (4)	Model (5)
C	-0.298461 [*] (-4.940761)	-0.265006 [*] (-5.406195)	-0.247459 [*] (-7.297182)	-0.401074 [*] (-7.610104)	-0.590849 [*] (-21.21000)
lnRDP	0.147437 (1.425099)	0.087937 (1.062827)	0.070236 (1.222580)	0.268521 ^{**} (2.568937)	0.598791 [*] (10.13463)

LnFD*lnUSOFDI					-0.018482 (-0.397679)
R ²	0.990459	0.993660	0.995008	0.987350	0.979898
Adjusted R ²	0.987949	0.992151	0.994009	0.984021	0.974873
F	394.5010	658.3032	996.5288	296.5926	194.9888
DW	1.652101	1.735698	1.772081	1.864400	1.809992

Notes: ^{*}、^{**} are the same meaning as Table 2.

The second step:Unit root test of residuals.

Using EVIEWS 6.0 software,we can get residual diagram and residual sequence ADF test.

Table 4 Test Results of Residual Stationary

Variable	Test Types (c,t,k)	ADF Test Value	Critical Values			Results
			1%	5%	10%	
Resid1	(c,0,0)	-3.987291 [*]	-3.737853	-2.991878	-2.635542	Stationary
Resid2	(c,0,0)	-4.462120 [*]	-3.711457	-2.981038	-2.629906	Stationary
Resid3	(c,0,0)	-4.287026 [*]	-3.737853	-2.991878	-2.635542	Stationary
Resid4	(c,0,0)	-4.379496 [*]	-3.737853	-2.991878	-2.635542	Stationary
Resid5	(c,0,0)	-4.354039 [*]	-3.724070	-2.986225	-2.632604	Stationary

Notes: ^{*} is the same meaning as Table 2.

Table 4 shows that all the above ADF values are less than critical value under the 1% significant level, thus residual sequences are integrated of order zero. There is cointegration relationship among dependent variable and independent variables.

4 Results

4.1 Technology feedback effect of Chinese outward FDI in the EU exists significantly

The estimation result of model (1) is shown in the second column of Table 3. DW statistic is 1.65 and there is no auto-correlation among variables. According to the result, Domestic R&D expenditure, Chinese inward FDI from EU, Chinese FDI in the EU are all significant factors of promoting total factor productivity(TFP) in China. The elastic coefficient of SOFDI to TFP is 0.093, that means Chinese FDI stock in the EU rises 1%, China's TFP will increase 0.093%. Therefore, Technology feedback effect of Chinese OFDI in EU exists observably. The elastic coefficient of SIFDI to TFP is 0.112, that means Chinese IFDI stock attracted from EU rises 1%, China's TFP will increase 0.112%, greater than the contribution of Chinese OFDI. The elastic coefficient of RDP to TFP is 0.147 and not significant, but it can still represent Chinese R&D investment has positive impact on the TFP growth.

4.2 Impacts of technological gap, human capital, economic openness and financial development on TFE of China's OFDI in the EU

Results of model (2) show that the elastic coefficient of cross term of TG and SOFDI is negative(-0.086517) and significant. Technological gap has a negative impact on TFE, namely TFE will

decrease as technological gap between China and EU countries widens. If the EU countries' technical level is certain, high domestic technology level namely narrow technological gap will bring about great TFE. Because domestic technology accumulation is conducive to knowledge absorption and innovation for investing enterprises. Chinese FDI in the EU is one of the channels to improve TFP, but the premise is Chinese enterprises should have a relatively high technical level.

Results of model (3) show that the coefficient of cross term of H and SOFDI is negative(-0.042031) and significant. China's advanced human capital is inadequate and has not yet reached the threshold of effective technology absorption, thus fails to play ideal positive impact on TFE through China's OFDI.

Results of model (4) indicate the coefficient of cross term of OPEN and SOFDI is negative(-0.067403) and significant. Therefore, economic openness has a negative impact on TFE of Chinese OFDI in EU. China implements open and free foreign economic policy in the long term, but China-Euro exchanges and cooperation in investment of technology intensive industries have not been deepened enough, thus weaken the technology feedback effect.

Results of model (5) indicate the coefficient of cross term of FD and SOFDI is negative(-0.018482) but not significant. Thus, financial development impose a negative impact on TFE. Chinese financial market is lack of efficiency to restrict the domestic enterprises' ability of absorbing overseas technology, weakening the technology feedback effect.

5 Conclusions

5.1 Basic conclusion

5.1.1 The TFE of Chinese OFDI in the EU exists significantly

Chinese OFDI in EU has a positive and significant effect on domestic total factor productivity. This represents that Chinese enterprises learn from and cooperate with technology leaders in EU through FDI, thus directly access to advanced technology, promoting China's technological progress. China's IFDI from EU contributes more to TFP than Chinese OFDI in EU. In addition, domestic R&D activities contributes more to TFP than R&D capital from Chinese IFDI and OFDI.

5.1.2 Technology gap between China and EU countries hinders TFE through Chinese OFDI

Technology gap hinders the absorption and reuse of advanced technology. As the technology gap widens, technical feedback effect of Chinese OFDI in the EU countries decreases. Therefore, moderate technology gap should be maintained between China and the EU to promote Chinese enterprises to acquire knowledge assets, nurturing domestic industries.

5.1.3 Human capital, economic openness and financial development significantly influence TFE

Human capital, economic openness and financial development do not play a positive role in promoting technical feedback of Chinese OFDI in the EU. Firstly, China's advanced human capital stock stays at a relatively low level and fails to reach the requirements of effective absorption of technical feedback effect. Secondly, China-Euro cooperation in investment of technology-intensive industries needs to be further deepened to improve Chinese enterprises' capacity of knowledge assimilation. Finally, the inefficient financial market restricts Chinese enterprises to absorb overseas technology.

5.2 Countermeasures and suggestions

The above conclusions reveal important policy implications to Chinese enterprises' FDI in the EU.

Firstly, Chinese enterprises should expand the scale of technology acquisition FDI in the EU. They should enhance awareness of technology acquisition, increase investment in overseas R&D and innovation activities, especially implement direct investment in European Union, the United States and other developed countries with rich R&D resources to actively obtain the latest international technology.

Secondly, domestic R&D investment is the main driving force for China's technological progress. China should attach great importance to scientific development, and increase R&D investment proportion to strengthen the technical level of Chinese enterprises.

Thirdly, China should focus on improving enterprises' capacity of technology absorption. On one hand, China should emphasize on cultivation and accumulation of high-tech talents and R&D personnel, to play the important role of human capital in promoting TFE of China's OFDI in EU. A more open foreign economic policy should be continuously implemented between China and EU countries to strengthen exchanges and cooperation among China-Euro multinational companies. China's financial reform should be deepened persistently to improve the efficiency of financial markets and resources allocation, and strengthen assimilation of EU R&D results. On the other hand, China should keep a moderate technological gap with the EU countries, and promote the investment, imitation and innovation of Chinese enterprises to realize technological catch-up.

On Impetus Mechanism for Strategic Emerging Industry in China

Fu Yaozhen

Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: fuyaozhen@whut.edu.cn)

Abstract: The strategic emerging industry in our country is small in scale but developing in strong momentum, obviously, its rapidity develops faster than overall level of industrial economy. Based on the analysis of some related research achievements, this paper has further explorations about dynamic mechanism of strategic emerging industry, it puts forward the innovation driving mechanism, demand driving mechanism, policy guarantee mechanism and competition driving mechanism, and puts forward to set up team for strategic emerging industrial cultivating project, to implement strategic emerging industrial cultivating project and to introduce a series of cultivating polices and measures for strategic emerging industry.

Key words: Tragic emerging industry; Impetus mechanism; Development measures

1 Introduction

Although the scale of the strategic emerging industry in our country is small, it develops in strong momentum and faster than the overall level of industrial economy. Our country continues to strengthen the macro guidance, increase the fiscal and taxation financial support, consolidate talent pool, accelerate reform of the system, Strengthen scientific innovation, cultivate market actively and promote international cooperation, which has been optimizing the resources and the market environment of strategic emerging industry and improving the institution mechanism continuously, the strategic emerging industries showing a booming trend everywhere in China. Every provinces and cities attaches great importance to develop the strategic emerging industries and grab the future industrial heights; to implement the strategy of innovation and focus on key industry core technology breakthrough innovation; Specific project implementation of the strategic emerging industry development, attract talent, finance guarantee, foster strategic emerging industry market Therefore, the research for the development of strategic emerging industry dynamic mechanism and policy measures, to promote the development of strategic emerging industry in China has theoretical and practical meanings.

2 Overview on Present Research Situation

Wang Xingxing(2011) put forward the impetus mechanism of strategic emerging industry development, which means that technology progress is the direct power, high-level industrial structure is the basic power and the transformation of the traditional industries is the real power. Yuan Zhonghua(2011) put forward and demonstrated that Institutional change is endogenous factors in the development of emerging industries, institutional change is the second elements just behind the material capital which can decide the growth speed of emerging industry. Taken the sewage industry as research object, though analysis the internal environment and external environment of strategic emerging industry growth, Qiao Xiaonan(2011) put forward the growth mechanism of strategic emerging industry, including the growing power system industry, the expansion mechanism of the industrial scale, the evolution mechanism of industrial organization and the promoting mechanism of industrial technology. Liu Deng(2011) analyzed the features and basic effects of the strategic emerging industrial policy, and learning the practice about the national industrial policy promoting the development of emerging industries from Japan, the EU, the United States and South Korea, then he put forward the idea how to play the positive function of industrial policy in the process of developing strategic emerging industry. Zhang Yuzhe(2011) systematized and evaluated the polices made to support the strategic emerging industry by each ministries and commissions from the 6 aspects of industrial technology policies, market foster policies, international cooperation policies, investment and financing policies, tax revenue policies. Cheng Yu (2011) took the wind energy industry as the specific research object, learned about the system and path of policies of the wind energy industry from Denmark, Germany, Britain, America and Holland. He suggested that in the development of wind power industry in China, firstly, we should not only attach importance to scientific and technological innovation, but also to build a strategic industrial system and regulation system; secondly, sufficient time and opportunity should be provided to emerging industries to learn and grow; finally, political and social identity should be strove for it. Li Shu thought that emerging industry development in our country is still in its infancy and faced with so many

problems and developing difficulties that needs the government’s guidance and support urgently, technology policies of strategic emerging industry should be made and implemented, and promoting the cultivation of product market, attaching great importance of talents training and promoting construction of industrial development corollary facilities and improving the external environment.

3 Impetus Mechanism of Strategic Emerging Industrial Development

There are four main aspects about powers of strategic emerging industrial development. At first, technology innovation and integration of inter-industry and intra-industry has promoted the development of emerging industry; second, the growth and changes of national strategic demand and market demand has pulled the growth of the emerging industry; third, the government’s preferential protection policy for emerging industry has provided strong guarantee for the development of emerging industry; forth, the competition between traditional industries and emerging industries has driven the development of strategic emerging industry. At the same time, the four powers are also linked to each other, technological innovation is the core of the emerging industry, industrial technology research and development need the support of policy funds, and advances of technology will increase the interior competition in the industry, however, the competition had forced the ascension of industrial technology in turn. In order to meet the national strategic demand and adjusting the industrial structure, a series of policies should be issued by the state to guarantee the emerging industry growth smoothly, and the emergence of new demand also led to new industrial competition.

3.1 Innovation driving mechanism of strategic emerging industrial development

Technological innovation is the fundamental motivation and intrinsic motivation for the development of strategic emerging industry, including product innovation, process innovation, enterprise management innovation and equipment innovation etc. Technological innovation has promoted the new product, the new technology, the new management and the new equipment coming into being, and then creates the high-tech enterprises. High-tech enterprises will generate industrial agglomeration from horizontal and industrial cluster from vertical, with enlarging scale of high-tech enterprise group and some new enterprises coming in at the same time, a complete industrial chain will be formed, finally, a strategic high-tech industry will be born. The promotion mechanism how technological innovation push strategic emerging industries is shown in figure 1.

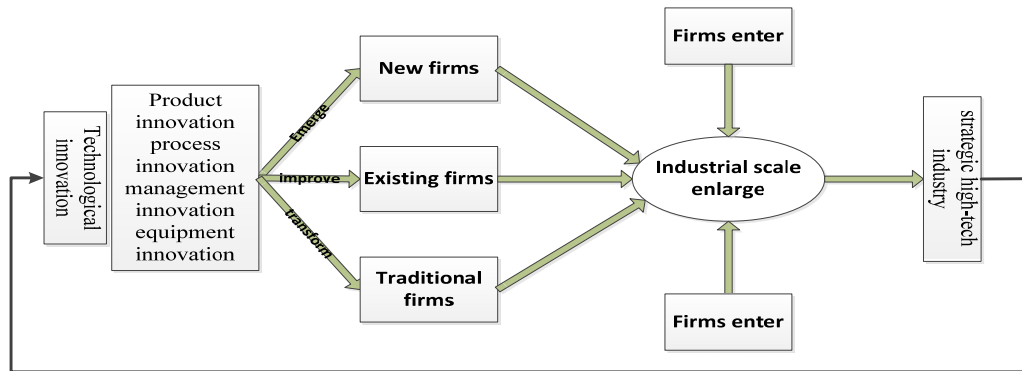

Figure 1 Innovation Driving Mechanism of Strategic Emerging Industry

In the process of industrial significant technological innovation, the most achievements depend on external power. In terms of large upfront investment, long-time cycle of R&D and great risks, enterprises would undertake too much risk if all depend on themselves in technological innovation. So, in the process of technological innovation, governments, research institutions, schools and the industry are working together. First of all, some scientific research institutes and colleges have a research of technological innovation, and then achieve certain scientific research achievements and patents etc. Second, enterprises do the innovation on technology and production, so as to improve its competitive advantage in the market. Then, technical reform by many enterprises cause changes in the industrial structure and promote the emergence and development of strategic emerging industry.

3.2 Demand-oriented driving mechanism of strategic emerging industrial development

The market demand of strategic emerging industry is derived from three aspects: national strategic demand, regional development demand and individual consumption demand. Adjusting domestic

economic structure according to the national needs for developing strategic emerging industry to facilitate the enterprises to transform, promote and enter. Enterprises perceive the potential individual needs in the market, then, strategic emerging industry will be formed via enterprises agglomeration and cluster. The regional development demand is in the middle of national strategic demand and individual consumption, which should not only be qualified for the national strategic plan but also be qualified for consumers' demand in market. The driving mechanism which demand does for strategic emerging industry is shown in figure 2.

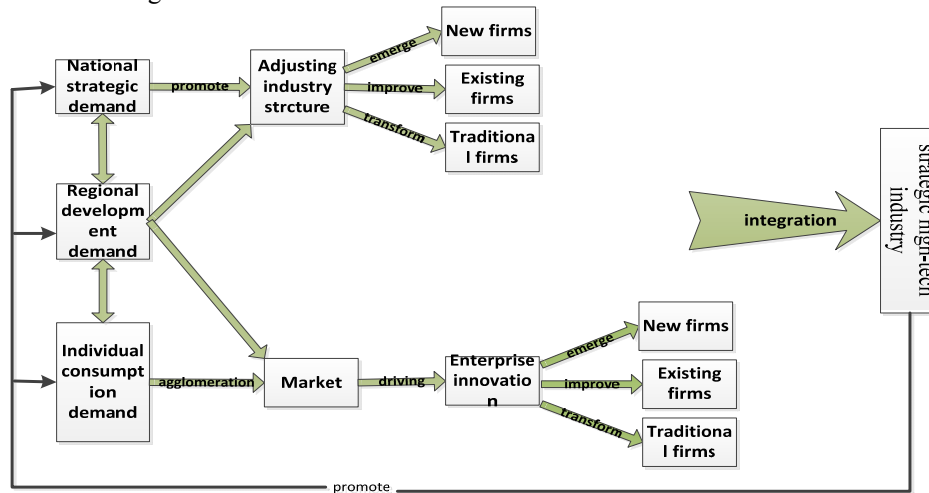

Figure 2 Demand-Oriented Driving Mechanism of Strategic Emerging Industry

3.2.1 Demand of national strategy

In order to improve the country's competitive advantage, we must serve the national strategic demand as traction and international scientific development as guidance to do scientific research about national fundamental research and strategic high-tech research. After the country formulating the strategic requirements, by the means of issuing a series of planning policies to adjust the country's economic structure and reduce the proportion of traditional industries in the national economy so as to increase the shares of strategic emerging industry. In accordance with the national strategic planning, there will be internal industrial adjustment. By the means of constant promotion of traditional enterprise, promote the existing small and medium-sized high-tech enterprises and absorb the new enterprises to expand the strategic emerging industry.

3.2.2 Demand of regional development

Regional development should not only be satisfied with demand of national strategy, but also the market needs in the region. On the basis of the nature of regional development requirements, there are two aspects in terms of developing regional strategic emerging industry: one is depending on the regional government to adjust the industrial structure; the other is satisfied with the demand of the regional market. The regional demand plays an a continuous role for demand of market and national strategy.

3.2.3 Demand of individual consumption

In consumption market, the consumers will have higher-level demand when they are satisfied with their existing demand, which makes companies to make innovations in technology and products in order to cater to the demand from consumers, and provide higher-level demand and service. The strategic emerging industry is a new industry occurring under the changes of demand in market. Companies will predict the direction of demand in the market according to the current demand in the market, and finally complete the development, production and sales through the process of establishing innovation strategy of technology and production, R&D and experiments. That shoes the basic principle of demand in the market pulling the industrial development.

The direction which the market corresponded to the strategic emerging industry is to realize the combination between technology and demand. Its appearance should be the situation of companies' independent decision-making and adaption to the market actively. Enterprises' satisfaction for the market led to the development of its industrial chain, and strategic emerging industry will be formed under the development of technological innovation.

3.3 Policy guarantee mechanism of strategic emerging industrial development

The national and local governments will issue different policies to promote and safeguard the development for strategic emerging industry in different stage of its development. In order to ensure the development of strategic emerging industry, the state and regions optimize the allocation of social resources and make it more conducive to develop emerging industries by the means of integrating the social resources and its redistribution, which is also the basic requirement of constructing “two-oriented society”

The four kinds of policies of inductive policy, incentive policy, service policy and supervising policy play a protective role in developing strategic emerging industry. In the early stage of this industry, the industrial scale has not be formed, so the state and local governments will issue incentive policy to promote the industrial technological innovation in order to improve the core competition of the industry, including policies of subsidies for technology innovation, tax reduction and exemption and so on. The service policy mainly plays an assistant role to help solve the problem of financing in developing strategic emerging industry. In the process of developing strategic emerging industry, the supervising policy performs the function of macro regulation and maintain the market order.

The four kinds of policies above are existing for developing strategic emerging industry, attracting new enterprises, promoting pre-existing emerging enterprises and transforming traditional enterprises. In order to optimize the allocation of social resources and ensure the development of strategic emerging industry, the government could take advantages of macro regulation. How the polices helping the strategic emerging industry is shown in figure 3.

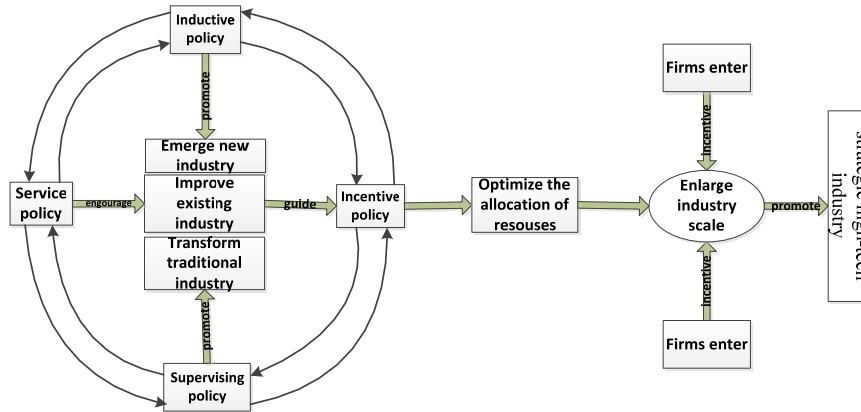

Figure 3 Policy Guarantee Mechanism of Strategic Emerging Industry

3.4 The competitive driving mechanism of strategic emerging industrial development

Technological innovation is the core of strategic emerging industry. The market needs promote the industrial development; the policies guarantee the industrial interests while the internal competitions in the market bring pressure to industrial development. Enterprises in the market will follow the steps of the market and update forward newer and more beneficial industry.

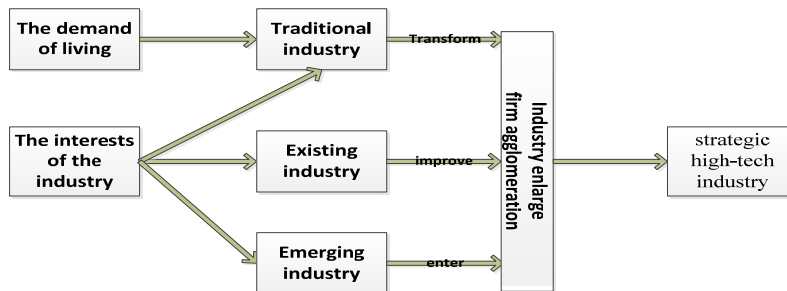

Figure 4 The Competitive Driving Mechanism of Strategic Emerging Industry

In order to survive, the traditional industries need to transform and update. Some traditional industries has occupied too many society resources but wasted a lot, that went against the national strategic plan. At the same time, these industries are facing the risk of staying out of the market. However, some enterprises would transform and update forward the strategic emerging industry

according to the resource and technology they have now in order to their further development.

Following is the driving mechanism which the competitions in market do for the strategic emerging industry: as the strategic emerging industry is a new industry, so the numbers of enterprises of this kind are relatively small, but the existing enterprises will transform and update for the industrial interests in the future. Someone who has technological basis will establish new enterprise and become one part in the strategic emerging industry under the calling of the state and the driving of the market. However, the original high-tech enterprise will develop faster in order to ensure their competitive advantage in the industry. How the competitive driving mechanism in the market pushing the development of strategic emerging industry is shown in figure 4.

4 Results and Conclusion

4.1 Set up strategic emerging industry development team

The development of strategic emerging industry is related to many problems, difficulties such as deployment of human resources, material resources and financial resources, also optimization and reorganization of resources make the general leader group very important to exist. Under the management of this organization, all the work carried out steadily and orderly, thus, it is particularly important to establish a cultivating engineering team for strategic emerging industry with functions and systems cleared and defined.

4.2 Implementation of cultivating project for strategic emerging industry

The cultivation of strategic emerging industry is a complex project which is related with every field in development. Under the era of the third Industrial Revolution and based on the analysis of choices of the strategic emerging industry, a set of feasible strategic new industrial cultivation plans in Hubei province could be came up with from many aspect such as tackling key problems from key industrial technology, cultivating from industrial innovation subject, developing with industrial carrier, supporting platform construction, transforming achievements and cooperation and communication.

4.3 Introducing a series of policies for strategic emerging industrial cultivation

The features such as pre-guiding, externality, indeterminacy and high risky of strategic emerging industry determines that market failure occurs at some time in the process of strategic emerging industrial development. The government needs to choose reasonable policies to develop strategic emerging industry and to adjust, stander and restrict according to the market in order to achieve the optimal allocation of industrial resources and strengthen industrial competitiveness. According to different emphasis, the policies of strategic emerging industrial cultivation can implement from fiscal and taxation policy, industrial policy, financial policy and talents policy.

Ethiopian Coffee Industry Strategy Formulation

Ibrahim Ibrahim Ismail

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: ibrahimisherif@hotmail.com)

Abstract : Like other many developing coffee producing countries Ethiopia mainly depends on its crop for foreign earning revenues, employment and consumption. The country gets in doubts and fear by the problem related to the coffee crop. The traditional production system lowers the level of productivity that requires industrial strategy formulation in order tackle the problem hindering the sector from developing. Strategies are on the hidden part of a successful business no matter where it is operating. A strategy is an actuality defined by Arthur, A., Thompson Jr. et. Al. (2007) is the management action plan for running the business and conducting operation. Data's are gathered from articles, books, annual company's bulletins, brochures and internet data's which where documented. Data's found at the Ministry of information was also accessed, and examined following the process study and re-study the raw data to develop detailed intimate knowledge was performed. The Ethiopian coffee industry should struggle to improve quality of coffee at the same time facing the hindrance of low quality during the process. The industry requires to upgrade the awareness and skills of all participant, improve input supply techniques for the best green and processed coffee to the world and requires technical assistance for development of domestic roasting, packaging and marketing.

Key words: Ethiopian Coffee industry; Coffee sector; Development; Strategy

1 Introduction

Industrial production is one of the most important activities in economic growth and development of a country. It plays a crucial role in creating employment opportunities, increasing production capacity, and reducing production cost through its direct and indirect impact on domestic activities. It contributes a lot for a countries development by producing goods by making it available on local and international market which is a major source of foreign exchange to finance import commodities which are not locally manufactured but vital importance for domestic production which is also highly significant. It also strengthens the capacity of a government to provide public goods by increasing government revenue. The manufacturing sector plays essential part in growth process. The sector has encountered serious development obstacles that lead to insignificant contribution for gross domestic product (GDP), due to financial constraints shortage of supply raw materials and shortage of trained manpower.

Many researches and prominent scholars have proved that Ethiopia is a birth place of coffee and coffee is a notable gift of this country to the world. Ethiopia has been exporting coffee almost for a century. Ethiopia is producing only Coffee Arabica, which is characterized by its good aroma, taste, better quality and premium price. No other countries in the world can produce only this high quality coffee may be few like Brazil and Colombia can produce huge volume of Coffee Arabica but still produce Coffee Robust, which is known in its inferior taste.

Ethiopia export depends heavily on few primary agricultural products like coffee, hides and skins, oil seeds and pulses which together form approximately 66.57 percent of the total foreign earnings. Out of this coffee export accounts 61.4 percent on averages for the foreign earning (NBE, 2008). Heavy dependency on coffee would continue in the future till the economy succeeds in diversifying its export structure. Despite the importance of the coffee industry, it couldn't generate enough to satisfy the foreign exchange needs of the country.

The research strongly believes that this research has significance for coffee industry in Ethiopia. I assume that the research will show strategic development from, from the perspective of both strategy formulation and implementation. It also shows how strategy can improve the performance of the industry, the practical guidelines on how to implement strategy successfully. On the other hand the research will focus on the coffee production of Ethiopia and measure the production and supply chain, by relying on to the historical and current data, this research will try to depict how coffee production should grow from time to time in Ethiopia.

2 Literature Review

2.1 Strategy overview

An industrial strategy is management's action plan for running the business and conducting operations. The crafting of strategy represents a managerial commitment to pursue a particular set of actions in growing the production, business, attracting and pleasing customers, competing successfully, conducting operations, and improving the industries financial and market performance (et Thompson jr.2007). In choosing a strategy, management is in effect saying, among all the many different businesses approaches and ways of competing we could have chosen, we have decided to employ this particular combination of competitive and operating approaches in moving the company in the intended direction, strengthening its market position and competitiveness, and boosting performance.: strategic choices a company makes are seldom easy decisions, and some of them may turn out to be wrong but that is not an excuse for not deciding on a concrete course of action. (et Thompson jr.2007).

Today's dynamic markets and technologies have called into question the sustainability of competitive advantage. Under pressure to improve productivity, quality, and speed, managers have embraced tools such as TQM, benchmarking, and reengineering. Dramatic operational improvements have resulted, but rarely have these gains translated into sustainable profitability. And gradually, the tools have taken the place of strategy. As managers push to improve on all fronts, they move further away from viable competitive positions. (Michael Porter1996) argues that operational effectiveness, although necessary to superior performance, is not sufficient, because its techniques are easy to imitate. In contrast, the essence of strategy is choosing a unique and valuable position rooted in systems of activities that are much more difficult to match.

2.2 Industry analysis in practice

Good industry analysis looks rigorously at the structural underpinnings of portability. A first step is to understand the appropriate time horizon. One of the essential tasks in industry analysis is to distinguish temporary or cyclical changes from structural changes. A good guideline for the appropriate time horizon is the full business cycle for the particular industry. For most industries, a three-to-five-year horizon is appropriate, although in some industries with long lead times, such as mining, the appropriate horizon might be a decade or more. It is average portability over this period, not portability in any particular year that should be the focus of analysis. The point of industry analysis is not to declare the industry attractive or unattractive but to understand the underpinnings of competition and the root causes of portability. As much as possible, analysts should look at industry structure quantitatively, rather than be satisfied with lists of qualitative factors.

The strength of the competitive forces affects prices, costs, and the investment required to compete; thus the forces are directly tied to the income statements and balance sheets of industry participants. Finally, good industry analysis does not just list pluses and minuses but sees an industry in overall, systemic terms.

3 Research Methodology

Relevant data was collected from text books, articles, magazines and internet, company Broachers, data which were documented. Furthermore, statistical data released by government or central statistics authority of Ethiopia, data's at ministry of information was accessed and examined following the process Study and re-study the raw data to develop detailed intimate knowledge was performed. Next, initial impressions were noted and data was grouped under the still-tentative categories. Finally certain conclusion were inferred, which were subsequently validated through interviews with experts in the field of study.

In order to better analyze this topic, I am going to make use of some research methodology suitable for data collection and analysis. Different methods is been applied by researchers for that matter. The primary and secondary data collection methods are among the most used applied ones. However specific technology might not be used in this research.

Primary data is an important way of collecting data. It allows the researcher to get first-hand information. However because of some reasons such as luck of data available about particular research, time and means, and also the broad macroeconomic coverage of the topic, I am not going to focus on primary data collection but we will consist some interview hold types

As of primary data the secondary data is also another way of collecting data that does not provide first-hand information but allows researchers to have access to data already available. In this case, the data that we are going to analyze will be taken from previous works done about strategic development about coffee industry and trends about the sector.

In detail way, we will focus on a case studies analysis approach. In fact there are many cases of

industries which have experienced on coffee making. Some of them have applied successful strategies while others could not make it in the challenging and competitive environment. Analyzing both cases will help us draw a conclusion and understand the reason hidden behind a success or a failure in the coffee industry. The internet books published will be our main source and data indeed all the cases will be found in bulletin and books. We will also make use of available protocols of some companies operating in coffee industry.

4 Strategy Formulation for Ethiopian Coffee Industry

4.1 Strategic thrust

4.1.1 Increase coffee productivity and production

As I mentioned earlier on the objectives, increasing the production volume requires improving productivity. Perhaps better yield can also act positively by enhancing economic profitability for coffee farmers. This will be achieved through processing out activities such as upgrading (rejuvenation) of existing farms by planting with improved varieties, improving husbandry practice, through better support by extension program, and intensification applying better pest sides.

Coffee productivity in Ethiopia is currently estimated 9.2 quintals/ hectares. In 2008/09 a total of 480,600 tones of coffee was produced. Ethiopia only produces Arabica coffee, which is widely believed to have originated. Generally coffee cultivation in Ethiopia is conventionally divided into four categories: forest coffee 8-10%, semi forest coffee 30-35%, garden/cottage coffee 50-55% and semi modern plantation 5-6% [MoARD, 2009]. the intervention of the combination listed above has the potential at least to double the current average volume. Increasing productivity will require a number of involvements like; better understanding and application of good agricultural practices by farmers. In the other hand creating alternative means of water system like irrigation channels Applying updated inputs such as fertilizers, insect sides and fungi sides, and most importantly replacing the old coffee trees which has been affected with pests.

Planting a new modern coffee farms could help boost the overall production. Since most of the country sub sides are suitable for agriculture practice and ideal weather for coffee plantation, I find it convenient to plant new coffee farms in expansion areas to get the benefit of coffee growth in a given period of time 2-3 year start up time.

4.1.2 Improve efficiency of the value chain

If the internal marketing system is improved coffee producers can get higher share of the export price. I suggest the main areas needs to be observed to insure better income for the farmers as follows:-

- 1) Reducing the complexity and length of the value chain to enable farmers outsource better markets.
- 2) Adopting transparency through market information system regarding quantity, quality price etc...
- 3) Identifying the current problem in terms of transactions like production costs, administrative handles, taxes and transport
- 4) Encouraging the private sector to be involved and engaged through the chain from seeding- processing- semi processing- packaging- exporting process.
- 5) Strengthen efficiency of cooperatives/buyers through capacity building
- 6) Government should subsidize the sector to boost the flow from farm to export time

The regulation and marketing strategies of the coffee sector should be revised time to time to encourage private sector involvement and to ensure the alignment with the changing business situation. To allocate further investment in the coffee industry, in areas of Inland Revenue (taxation), investors land owner ship requirements needs reform.

4.1.3 Overall coffee quality improvement

By producing better quality coffee it's possible to increase price premiums. This requires from the start (farmers) devotion to good agriculture practice, harvest and post-harvest practices after onwards by processing and labeling in the manufactures and improvements in the utilization of advanced processing equipment's.

This strategy can be acquainted with the opportunity of improving quality of Ethiopian coffee, through:-

- 1) Development of comprehensible quality standard through researches
- 2) Reasonable pricing not below or extremely above average at the farm level
- 3) Using advanced equipment's for gathering to avoid direct hand to crop bean contact.

- 4) Capacity building and support to the equipment of producers
- 5) Generalization of quality self-control by cooperative/ buyers using adequate tools (moisture meters, scales, tasters etc...)
- 6) Improving ECXs capacity in order to maintain and stipulate the new farmers and producers emerging

4.1.4 Explore new market opportunities

The further promotion of Ethiopian coffee in the world seeking for huge market like China could also bring many economic benefits as well as developing a bilateral trade economic partnership among the countries. Value addition can also be accomplished by producing and supplying ready products such as roasted beans, processed brewed coffee, packaged instant coffee on local and regional market as well as producing export standard to ship it abroad. The foreign currency and income which can be generated from the above activities can bring courage for new investors to be engage in the industry.

5 Discussion and Conclusion

As the study shows in today's world wide market, designing strategy in order to add quality value is a vital object for competitiveness. Therefore the Ethiopian coffee industry should struggle to improve quality and value addition. Thorough this topic, we have tried to explain how the industry constructs strategies, in order to satisfy the demand of the production and consumption at the same time creates value to the chain.

Ethiopia has a high quality of coffee at the same time facing the hindrance of low quality during the process, is the major constrain of the coffee industry which leads to a lower share compared to other coffee producing countries with less quality compared. From the analysis, poor handling and storage, quality matter awareness problems mainly by the farmers, poor coffee auction and inspection system, lack of quality inspection center, mixing of different grade coffee, poor agricultural practice, lack of input materials, poor harvesting/post harvesting practices, lower level of end processors, lack of new technology, poor blending practice and shortage of packing materials and industries are the main reason to provide low quality compared to the top producers like brazil, Vietnam and Indonesia.

Ethiopia mainly exports dry coffee without value addition due to lack of sufficient wet-processing plants and it only exports and supplies for local market insignificant amount of roasted and grounded coffee. Relatively the low price paid to the farmers gives a vast chance of many coffee producers shifting to other crops like sea sum, chat, horticulture comparatively seeking advantage. Hence if there are no ample rewards to the coffee farmers, there is a possible hazard that farmers may substitute this with relatively high value crops. This can be explained as uphold the sustainability of coffee production in Ethiopia.

The basic problems related to the Ethiopian coffee industry sector are quality and value chain that requires frequent planned up grading programs that are not enormously available. As a result based on the issues mentioned earlier, we propose solutions which can be used to develop quality and value addition in general boosting the industry.

Upgrade the awareness and skills of all the participants of the industry:- conducting trainings and quality management in the agricultural practices as plantation, cultivation, re plantation, distribution, protection, harvesting/post harvesting, handling and storing should be provided in an extensive way to the farmers and extension workers in order to establish quality control mechanisms.

Improve input supply techniques for the best green and processed coffee to the world:- all the participants specially the government should work hard on providing farmers with adequate input materials like fertilizers and pest sides in a massive way and also introducing new technology, new technology and tools. Strengthening the collaboration between research centers, extension service and farmers is the most essential factor to easily transfer technology. In addition restructure inactive task force and emphasize should be given to establish new national coffee extension service provide under ministry of agriculture and rural development (MoARD).

Technical assistance for development of domestic Roasting, Packaging and Marketing: in order to boost the industry the important element is to add value to the coffee chain. Ethiopian is mostly exported as green coffee beans. Aside from pulping, washing, fermenting, drying and roasting until some level. No processed of standard coffee takes place. Therefore, roasting and packaging of export coffee is a most important determinant required to add additional value to the Ethiopian coffee production and export. Thus, it is essential to initiate a program at national level to invite investors to invest and get engaged to advance the coffee processing.

Study on College Students' Entrepreneurship and Industry Selection

Wang Huimei, Li Heng

Wuhan University of Technology Huaxia College, Wuhan, P.R.China, 430223
(E-mail:girl1220@163.com, liheng120@163.com)

Abstract: Based on currently domestic economic growth slowed of pressure, employment situation has increasingly hard, most of students have more pressure in employment. So this paper is aimed at proposing a model which is used as guidance in how to choose the entrepreneurship industry. Model pointed out that there are four factors which need to be considered. The first is started funds of status, the second is industry competition situation, the third is currently market of trend, and the fourth is the profitability of the project. The college student entrepreneurs can chose an industry which is fit those four aspects. And this model will help the university student to analyze which industry is more suitable for college students' to start up a career, and helps students make more reasonable decisions and improve the probability of success.

Key words: College students; Entrepreneurship; Four-force model; Industry selection

1 Introduction

Over the years, domestic and foreign scholars have carried on research to the college student entrepreneurship. However, all of these studies are just to stay in the analysis of the current problems. Take the domestic scholar's research as example, at present, all scholars are studying on the relevant policies and education of College Students' entrepreneurship, the research of foreign scholars are in deeper level, they have studied the conditions of the entrepreneurs. However, these studies, especially the domestic research, only stay in the surface layer, the research level is not deep, there is no more standardized problem solution. Under the current economic slowdown, the pressure on the employment of college students began to bear the pressure, policy changes, making this pressure is becoming more and more important. At the same time, the pressure of college students' entrepreneurship also increased. Study data show that the proportion of current domestic college students entrepreneurship rate was 2.9%, this figure is very small, one hundred college graduates including graduate and doctoral students, only 2.9 choose to start self-employed, however, the 2.9 personal entrepreneurial success is 1.5%, that is to say, ten thousand college students, only 4 will be successful entrepreneurs, this ratio is quite low, 98.5% of the entrepreneurial college students failed. This paper selects the research topic is to better analysis of entrepreneurship students to find a way out, I hope this research can help students do pioneering work more for the venture industry choice, enhance the probability of successful entrepreneurs.

2 Survey and Model Construction

Accuracy principle based on the research, this paper before the design college students entrepreneurial intention questionnaire, access to the large number of references, research direction of the following five aspects: (1) entrepreneurial grade levels; (2) their own environment level; (3) gender hierarchy; (4) industry professional level; (5) the intention to select the level. The questionnaire was distributed in 200 universities and 188 questionnaires were collected, and 155 questionnaires were valid. Table 1 is a survey of the factors considered by college students' Entrepreneurship:

Table 1 Students Business Considerations

Considerations	Selected Number	Proportion
Start-up capital	153	98.7%
The competition in the industry	146	94.2%
The profitability of projects	137	88.4%
Current market trends	132	85.2%
National policies	122	78.7%
Whether the industry is currently a hot industry	103	66.4%
Project risk	97	62.6%
Difficulty of the composition of the entrepreneurial team	89	57.4%
The support of the people around him	67	43.2%

In this paper, through in-depth interview, most of the entrepreneurs will choose about one hundred thousand of the initial capital, and this part of the selection also determines a lot of entrepreneurial intentions, the college students did not dare to go into depth of large projects. Raise funds also to suppress the students thinking space in a certain extent. This paper argues that this is a real problem, we take the national challenge cup for example, 2014 Wuhan College of Technology Huaxia college has a number of students get the challenge cup award, got twenty thousand Yuan in start-up capital, this part of the start-up capital for today's entrepreneurs is so less, in this paper no relevant policies discussed here. Industry competition is another major factor in the consideration, the number of selected to reach 146, second only to financial options. Most of the respondents will carefully analyze the industry leader's present situation, it will be more reasonable to determine the location of the market situation. Competition also affects the entrepreneurial choice, the respondents will not go into these industries if these industries have the following characteristics: market is saturated or too much competition in the industry or in a business where the entrepreneur is too intense. About the project profitability and the current market trends, the two selected number is also very high, there were 88.4% and 85.2%, the four points are selected were the considerations more than 85%, so now we have to be a hypothesis, assuming that the four points are the factors of college students' entrepreneurial industry selection. According to this, the paper constructs the Four-force model for entrepreneurship industry selection for college students.

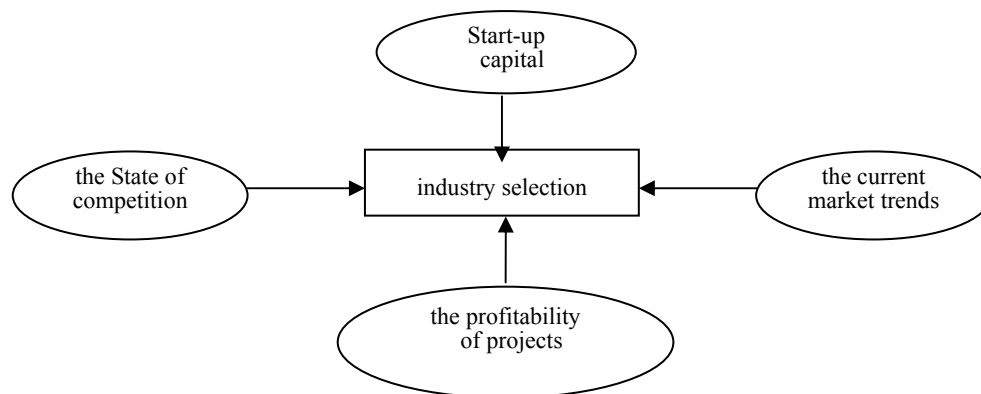

Figure 1 The Four-force Model for Entrepreneurship Industry Selection

Four elements of the Four-force model to explain:

(1) Start-up capital

Start-up fund raising difficulty plays a decisive role for entrepreneurs entrepreneurial choice, the more difficult to raise funds, the fewer number of funds, entrepreneurs choose industry concept will be more smaller, otherwise will be greater, and this directly determines the entrepreneurial orientation.

(2) The State of competition

In determining the business direction, entrepreneurs will be first decided to enter the industry is fierce competition, according to this factor, entrepreneurs will decide which industries to choose as a starting point, this is often considered, forcing entrepreneurs to select blue ocean strategy.

(3) The profitability of projects

After determine the direction of the business, the entrepreneurs will focus on the analysis of the selected project's profitability, the blue ocean strategy entrepreneurs will analyze the profitability of the project selected, entrepreneurs will also open a new path, in the selected project trying to find new profit growth point, if a project has a plurality of profit growth point, the entrepreneurs will gladly accept the choice of the project can be used as starting point.

(4) The current market trends

The market trends determine the flow of the hot money market, the compare the factors be warm effect, emerging market is full of infinite possibilities, the choice of market trends, will let the entrepreneurial college students more perfect their entrepreneurial projects.

When college students are satisfied to their own choice with the four points: start-up capital, the state of competition, market trends and profitability, they will choose to start entrepreneurial projects. This model is helpful to help college students to make the choice of the industry.

3 Using Four-force Model for Entrepreneurship Industry Selection

3.1 Commerce trade

The business industry contains a wide range of aspects, this article only selected two aspects of research, one is a single product industry, and the other is commodity industry.

Table 2 Analysis of Four-force for Commerce Trade

Four factors	Single product sectors	Commodity sectors
Start-up funding	Moderate	Moderate
Competitive situation	More intense	The fierce
Profitability	Moderate	Moderate
Market trends	General	General

From the table analysis, industry trade two small trade types of start-up capital requirements are relatively modest is one of the basic choice of the majority of entrepreneurs, and in its current form, the competition situation of the two kinds is more intense, has certain profitability, the current market trend is also more general, does not appear too big change. In summary, commerce industry choice small trade forum, many students entrepreneurs are able to withstand, the low barriers to entry, with appropriate profit ability, can meet the early entrepreneurs expected. This paper argues that small business industry for forum of capital requirements are not particularly high can choose, entrepreneurs of capital more sensitive can be relative to the choice of commodity trade as the initial choice, this paper suggests that money sensitive higher entrepreneurs, to choose a start-up as its business history the springboard, the main task of early on in the accumulation of capital, entrepreneurial stage to do, this may will reach the ideal pressure space more than expected, will also allow entrepreneurs to have a better state.

3.2 IT industry

IT Industry development is changing in recent years, policy support is also growing, economists are talking about the times, referred to as the age of the Internet, the age of big data, various types of financial reports frequently, we also selected two industry general discussion, on the same model, as shown in table 3:

Table 3 Analysis of Four-Force for IT Industry

Four factors	Software development	Web site construction
Start-up funding	Moderate	Large
Competitive situation	Moderate	Moderate
Profitability	Strong	Strong
Market trends	Great	Great

From the table analysis, industry trade two small trade types of start-up capital requirements are relatively normal, this industry is one of the basic choice of the majority of entrepreneurs, and in its current form, the competition situation of the two kinds of is more intense, has certain profitability, the current market trend is also more general, does not appear too big change. In summary, commerce industry choice small trade forum, many students entrepreneurs are able to withstand, the low barriers to entry, with appropriate profit ability, can meet the early entrepreneurs expected. This paper argues that small business industry for forum of capital requirements are not particularly high can choose, entrepreneurs of capital more sensitive can be relative to the choice of commodity trade as the initial choice, this paper suggests that money sensitive higher entrepreneurs, to choose a start-up as its business history the springboard, the main task of early on in the accumulation of capital, entrepreneurial stage to do, this may will reach the ideal pressure space more than expected, will also allow entrepreneurs to have a better state.

3.3 Service industry

The service industry which is discussed in this paper is actually the third industry category in the definition of economics. Following a study from the State Ministry of science and technology of China Science and Technology Development Strategy Research Institute China's key industrial science and technology competitiveness and development potential research group of 60 industry throughout the country, seven emerging industries, 31 provinces, autonomous regions and municipalities, and contains six countries, including the United States, a trend of economic development were studied.

Research shows that in 2013 the per capita GDP of our country is the level of the United States 40 years ago, the third industry accounted for over 70 years ago, and the United States is the level of the United States. Service industry has more than 20 trillion Yuan of RMBs market, even in a slowing of the growth of the secondary industry, increase efforts to develop the third industry can also maintain near and medium-term economic growth, after the current economic gross exceeds the United States to strengthen the position of the world's largest economies, must optimize the implementation of innovation driven strategy, become a center of innovation in the world. According to the above Four-force model of College Students' entrepreneurship industry selection, the paper analyzes the third industry:

Table 4 Analysis of Four-force for Service Industry

Four factors	The tertiary industry
Start-up funding	Moderate
Competitive situation	Moderate
Profitability	Strong
Market trends	Large

This paper argues that the country has not formed the third industry benign development mechanism, opportunity for development of the tertiary industry due to the impact of the Internet, there is no formation so fast, but the block like a piece of untapped jade is industries have a huge market potential, the tertiary industry's low barriers to entry, also has a relatively strong profitability, this paper suggests that there is no technical support business students who can choose the third industry entrepreneurship.

4 Conclusion

In this paper, we mainly study the entrepreneurial orientation and the operation scheme, it is for the college students' Entrepreneurship provides a feasible operation model and to the upcoming entrepreneurs or business students pointed out that a clear choice scheme and operation mode, so as to enhance their record industry conditions, try to improve college students' innovative undertaking success rate. In this paper, we first design a set of research questions related to the questionnaire. According to the recovery of the questionnaire statistics and analysis, it is concluded that a Four-force model for college students' entrepreneurship industry selection. This paper selects is representative of the industry and trade, IT industry and service industry are analyzed. This study hopes to help college students are more sensible to make business decisions.

Abstract: This study aimed to create typology of consumers, who differ in brand experience appeal and whether or not these experiential types moderate the relationship between behavioral outcomes such as customer loyalty, customer delight and word of mouth. This study used non probability sampling technique, particularly convenience sampling was used. Primary data were collected from 136 (n = 136) respondents of university students in China. Data analysis through cluster technique found that there are four types of consumers, such as holistic consumers, hedonic consumers, inner directed consumers, and utilitarian consumers. On the one hand, there are holistic consumers who are more inclined to all brand experience dimensions simultaneously, from sensory appeals which attracts their senses, creates affective bonds, and captures cognitive interest to the behavioral appeals that create strong behavioral commitment. On the other hand, there are utilitarian consumers who are much concerned with the benefits offered by brands. This study also found strong relationship between holistic and hedonic consumers than utilitarian consumers.

Key words: Brand Experience; Cluster Analysis; Customer Delight; Word of Mouth; Customer Loyalty

1 Introduction:

Today's market becomes more competitive than ever before. Now consumers have more choices of brands, even the internet and smart phones technology enable consumers to frequently shift to competing brands if existing brand is not doing well. Therefore, marketers start crafting strategies to differentiate themselves from competitors. Moreover, two decades ago in quest of excellence marketers and consumer behavior researchers awoke the importance of experiential and hedonic aspect of consumption. Consumption has begun to be viewed as feelings, fantasies and fun. Emphasizing that consumers can't be treated as computer like decision makers, now consumers look for the brands that provide unique and memorable experiences^[1].

Brand experience is new and exhilarating concept, conceptualized as "sensation, feelings, cognition and behavioral responses evoked by brand related stimuli that are part of brand's design, identity, packaging communication, and environment"^[1]. The traditional marketing only focused on the benefits of brands or what brand offers to customers as solution to their problem^[2], which is apparently a narrow focused approach due to the fact that the customer will be jumbled with brands that offer similar benefits at the same price. Another reason is that when consumers search for brands to shop, they experience with brand related stimuli^[3] that captures their sensations, feelings, cognition as well as behavioral responses besides benefits of brands^[1]. Previous research on service experience implied that providing emotional rich service experience can enhance the sales as well as affect the customer loyalty^[4]. Another research draw conclusion that differential experiential types can moderate the relationship between brand attitude and purchase intention^[5], but so far no study in consumer behavior and psychology scrutinize the relationship between experiential dimensions (sensory, behavioral, affective, and intellectual dimension), word of mouth and customer loyalty to create the typology of customers. Therefore, this is first study which mainly focuses on to explore and segment consumers in terms of experiential appeals. To create the typology of consumers in terms of high experiential consumers versus low experiential consumers that prefer different experiential appeals, as research implied that some consumers are more receptive to sensory and affective appeal than behavioral and cognitive appeal^[5]. Finally, this study investigated moderating effect of segments of experiential types among loyalty, customer delight, and word of mouth.

2 Theoretical Frameworks

The concept of experience has been explored in several ways such as product experience^[6], shopping experience^[7], service experience^[8], and customer experience^[9]. Recently brand experience

appeared as important marketing phenomena which raises the questions against traditional marketing approach, that only focused on benefits of brands, emphasizing that besides benefits of brands consumers also evoked to brand related stimuli which captures their sensations, feelings, cognition, and behavioral responses^[1]. Brand experience can be positive, negative, short lived and long lasting^[1, 10] which effect customer satisfaction and loyalty^[11].

2.1 Customer delight

Customer delight is consumer's positive response, when given product or service not only satisfies but furnishes unanticipated value and provide unforeseen satisfaction^[12]. The concept of customer delight resides in Oliver's expectancy theory: according to this theory, consumers compare their experience with expectation. If their experiences exceed the expectation, they feel positive which triggers customer delight^[10]. The concept of customer delight emerged in 1990, with the discussion of effective and experiential aspect of consumption^[13]. Research showed that customer delight is correlated with positive word of mouth^[14].

2.2 Customer loyalty

Customer loyalty is a profoundly held commitment to re-buy or patronize a preferred product or service consistently in the future^[15]. Moreover, loyal customer is not prone to switch to competing brands or patronize the competitors. Therefore, marketers tend to give more attention to retain the existing customers and increasing loyalty, as retaining existing customers is costing less than attracting new customers^[16]. For many decades, it was reported that satisfied customers are loyal customers. However, it was argued that customer delight is the most effective way to increase customers' retention ratio. Therefore, the actual way to increase loyalty and improve retention is not only to satisfy customers, but to delight them^[18].

2.3 Word of mouth

Word of mouth communication is kind of informal communication among people or group of people pertaining to the evaluation of goods and services. It is considered as a reliable source of communication rather than traditional marketing media^[17]. Word of Mouth has the potential to effect the customer's loyalty through social group influence, peer recommendations and brand reputations^[18]. In this research it is assumed that the relationship between customer delight, word of mouth and loyalty varies across different consumers groups.

3 Research Methodology

The questionnaire for this research consisted of two parts. First part comprised of four variables including brand experience, customer delight, word of mouth, and customer loyalty. The brand experience scale of Brakus (2009) was used in this study, which include sensory, affective, behavioral and cognitive brand experiences. A scale used by Beardon and Netemeyer (1999) was implemented to measure customer's word of mouth. Similarly, a scale used by You & Donthu (2001) was adopted to measure customer loyalty. All the items were measured on five point likert scale ranging from 1 strongly disagree to 5 strongly agree. Moreover, customer delight scale was taken from the study of Oliver & Verki, (1997)^[10]. Respondents were asked to choose one brand that they find most experiential brands hence each questionnaire referred to one specific brand. The carefully chosen brands were diverse in terms of experiential appeal. The brands selected for this study consisted of Apple, Samsung, Nokia, Motorola, and Sony Ericson from electronics products category. Whereas, McDonalds and KFC were chosen from fast food industry and finally, Coca-Cola from was chosen from beverage industry.

Questionnaires were circulated in universities and shopping centers of two big metropolitan cities of China including Beijing and Wuhan. The sample for this study was consumers of the above mentioned brands. The data were analyzed in SPSS 20 version, particularly; hierarchical cluster analysis, regression analysis and descriptive statistics techniques were performed.

4 Results and Discussion

4.1 Typology of Consumers with Differential Experiential Appeals

To address the first question of this study, a scale developed by Brakus 2009, was administrated to find the average rating of consumers for four experiential dimensions and in order to create the separate distinct group of consumers. To come up with the final decision of consumers, hierarchical cluster analysis with two to five range of cluster was given, with the help of agglomeration and dendograms four clusters were selected as most promising to represent the actual consumer category.

Table 1 The Four Clusters solution

Cluster no.	N	(%)
1	76	55%
2	21	15%
3	20	14.7%
4	19	14.6%
Total	136	100%

Table 2 Mean and Standard deviation of clusters

Cluster	Sensory	Affective	Behavioral	Intellectual
1	3.486 (0.615)	3.127 (0.952)	2.921 (0.873)	3.035 (1.091)
2	3.857 (1.058)	3.777 (1.060)	3.825 (0.979)	3.396 (1.049)
3	1.533 (0.789)	3.550 (1.472)	3.150 (1.025)	3.150 (1.301)
4	3.643 (1.142)	3.263 (0.953)	3.825 (0.850)	3.702 (1.103)

Cluster 1 consists of those respondents who are near to average in all experiential dimensions, they are looking for brands which catch their senses, induce feelings, sentiments and positive emotions. Moreover, this group of consumers is also attaching importance to brand which triggers their cognitive thinking. However, these consumers are not particularly interested in behavioral actions by the brands, because of the inner directed feelings of consumers. This group of consumers can be referred as “inner directed consumers”.

Cluster 2 includes group of consumers who attached more importance to the brand experience as a whole. This group of consumers is looking for the brand which captures their senses, induces favorable feeling and positive behavior as well as stimulates their cognitive senses. According to Schmitt (1999), these consumers are “Holistic Consumers”. They want to have experience as a whole rather than few couple of benefits.

Cluster 3 includes group of customers who are low in all experiential dimensions. Apparently this group of consumers is more diverted towards the functional benefits of the brand rather than the experiential aspects. This type of consumers is the opposite of cluster two, who are experiential consumers. Because they are more interested in the benefits of products, therefore, this cluster is called as “utilitarian consumers”.

Cluster 4 consists of group of customers with high scores in all experiential dimensions, particularly high score on behavioral and intellectual dimensions. This group of consumers looks for brand experience which captures the sensory gratification, induces the positive feelings, engages them aggressively and effects their physical actions. This group of consumer is called “hedonistic consumers”, which means pleasure, enjoyment and delight.

4.2 Regression Analysis

Table 3 Output of Regression Analysis in Four Clusters and Total Sample

Cluster	Dependent variable	Independent variable	Stand: coefficients	F-value	R2	P-value
Cluster 1	Customer Loyalty	WOM Customer delight	.321 .131	6.774	.113	.000 .001
Cluster 2	Customer Loyalty	WOM Customer delight	.302 .121	6.955	.136	.001 .148
Cluster 3	Customer Loyalty	WOM Customer delight	.292 .121	7.078	.139	.001 .114
Cluster 4	Customer Loyalty	WOM Customer delight	.319 .131	6.776	.114	.003 .113

To address the second objective of this study whether or not brand experience moderate the relationship between customer delight, word of mouth, and customer loyalty, regression analysis was

performed. In linear regression model the dependent variable was customer loyalty where as independent variables were customer delight and word of mouth ^[5]. Overall, the predictive power of customer delight and word of mouth is moderated by ($R^2=.156$) whereas significance level is ($P=.000$). Series of regression was also performed for individual clusters. The predictive power of the customer delight and word of mouth in cluster one to cluster four are ($R^2 = .113, 0.136, 0.190$ and $.114$) respectively. All beta coefficients were positive ranging ($\beta = 0.123$ to 0.319). Whereas, result showed that the relationship between customer delight, word of mouth and loyalty are stronger with $\beta = .270$ and 0.085 for word of mouth and customer delight respectively. Overall, the Beta coefficients for hedonic and inner directed consumers are greater than holistic consumers and utilitarian consumers.

5 Conclusion

Present research concluded that, there are group of consumers who prefer different experiential appeals such as holistic consumers are more attracted with all types of experiential appeals. Similarly, utilitarian consumers give more importance to the core benefits of the products. Hedonic consumers are rather interested in the behavioral and intellectual dimensions of the brand experience, which captures cognitive thinking and thoughts. Inner directed consumers are more concerned with inner feelings, sensations, intellectual dimension, and sensory gratification triggered by brand experience dimensions. This study has also implied that different consumer's segments have different effect on behavioral outcome such as positive word of mouth and customer delight which in turn affect customer loyalty.

Moreover, this study has academic as well as practical significance. Practically, this study is significant for marketers in terms of understanding the segments suggested in this study. Marketers can craft the strategies and brand experience dimension that appeal to specific group of consumers, such as hedonic consumers can be reached with esthetic design of products and packaging. Similarly, inner directed customers can be reached with creating emotions and sensory appeals. Holistic consumers can be targeted with sensory gratification as well as lucrative design of brands, packaging and environment where it is sold. Moreover, utilitarian consumers can be targeted by focusing on the benefits of brands offered by product. Academically, this study has contributed and extended theories in marketing literature by employing the consumer's segmentation on the basis of experiential appeals and how these different segments affect customer loyalty, word of mouth, and customer delight.

Future research should take large sample size to generalize the results. Second, this research was conducted in China; further study should work in other cultural context in order to generalize the results and to identify more clusters or segments of consumers. Third, this study used customer delight and word of mouth; future study should investigate the impact of other variables. Finally, it may be interesting to examine the impact of brand experience on brand equity ^[5].

Abstract: Starting from the historical cultural attributes of Chinese style paintings, the research on market-based operation modes of Chinese style paintings explores the historical and cultural factors affecting the market pricing mechanism, analyzes the art, cultural, historical and market values and the price formation carriers of the traditional Chinese style paintings, and proposes some pieces of advice based on the current development and the related data. The problems concerning the strategies of market operation mode are summed up. Advice concerning the main problems is proposed to ensure the strategies can be operated effectively.

Key words: Chinese style painting; Market operation; Synthetic factors; Academic values

1 Introduction

Chinese style painting market in this paper means the traditional Chinese style paintings based on the traditional Chinese style of drawing and their correlative handwriting works. At present, it is the biggest domestic artwork business with the largest quantity of transactions. The purpose of this paper is to sum up experience in management of Chinese style paintings in market, exploring its marketing law and strategy with the theory of modern business administration to direct the management of Chinese style drawings at market in the future. The development phase of china culture and art market analyzes the characters of Chinese style paintings as a commercial commodity, both the mental attributes of art work and the commodities. At present, Chinese style painting market and handwriting is in the process of general development. On one hand, the market has the huge potential and a lot of participants in it. On the other hand, the holistic level of management is comparatively low. Integrity and credit are comparatively poor, the outer environment of the market is unsound, and the intendance and harmony from government are not enough. It is considered in this paper that besides getting our marketing of culture art normative and intensifying the intendance, the managers who are doing the Chinese drawing business are expected to mainly get three things ready. Firstly, using the theory of modern business administration to integrate their management, positioning accurately, and realizing the marketing difference. Secondly, choosing the suitable distribution channels according to the strengths of their companies, Finally, pricing reasonably, ascertaining the basic pricing approaches of demand-oriented and competition-oriented, meanwhile, making good use of various index of Chinese art to supervise the price of drawing and handwriting.

2 The Background of Market Operation Mode of Chinese Style Paintings

Chinese style drawings play an important role in Chinese cultural art market. They underwent the same and tortuous process with the calligraphy, relics, oil painting, antiques and curios which can be collected and invested. Since liberation, the Chinese market of cultural art has experienced five progressive stages. The early phase is from the liberation to the mid-1950s before public-private joint run, whose basic features are that cultural relics existed, but are at the stage of maintenance. Doing business faithfully at this stage is very little.

The traditional Chinese calligraphy and paintings preserved before liberation are mainly owned by private collectors, Most operators are cultural businessmen wearing two hats—they are experts not only proficient in cultures, but also equipped with extensive professional knowledge as well as market economy awareness. These curio stores are mainly engaged in traditional Chinese calligraphy and paintings, bronze and other antiques and curios. At this time, buyers are mainly the minority of scholars interested in Chinese culture in addition to local museums. They are experts in a particular field or well-known investors. After experiencing the Anti-Japanese War and the war of liberation, many things waited to be done and were in a recovery period. For various reasons, they were eager to sell their

collected calligraphy. Compared with the demand of the market, the supply of the Chinese calligraphy and painting exceeds demand during this period, which leads to low price at this time. It was in this period that many people had got many exquisite embroidery at a low price.

With the development of our country's economy and the improvement of people's living standards, more and more people increasingly pay more attention to the spiritual consumption. Chinese paintings are favored by people, which drove the prosperity of the Chinese market. Behind this prosperity, some problems can not be ignored, including art market to the gallery as the main body of the primary market and to the auction markets as the main body of the secondary market. In recent years, the two relations are seriously distorted. The secondary market gradually outweighed the primary market. Except that secondary market trading, sweetheart deals had occupied the total turnover of more than half of Chinese art trading. In terms of market of Chinese painting, how to price the works of Chinese paintings, how to improve the market development of Chinese painting and whether the market pricing mechanism of Chinese style paintings is sound or not, are all the questions needing to be discussed.

The market-based operation mode of Chinese style paintings has developed up to present. Through the development of reform and opening up, people pay more attention to the enjoyment in their spiritual lives. Some people, who have got prosperous first, began to shift from investing industry to art. As a result, the market of Chinese style paintings has experienced an unprecedented prosperity. In other words, the Chinese drawing art capitalization is the development of the market of Chinese drawing artworks. It is an important symbol to enter a transition period. Contemporary Chinese drawing art capitalization is an essential element for The Renaissance, which brought more funds and resources effectively into the art market. This has promoted the development of the prosperity in art market and the economic development of human society effectively.

3 Focus on Market-Based Operation Modes

Chinese style paintings represented by Literati painting has a long history with two thousand years since the Eastern dynasty. With the development of domestic reforming and opening, especially with China's enter into WTO, Chinese style paintings business has expanded significantly. A variety of problems and contradicts have occurred. It is a strong require for us to conduct research and learn from foreign modern business administration concepts and models. The necessity of market research is to manage effectively and forecast scientifically. To forecast the future scientifically, we must grasp the market information timely and make our best to the market investigation. For quite a long time, Chinese drawing inherits his original techniques and style of Chinese drawing, but at the same time, its market operation is influenced by the west. The art market is selling calligraphy and painting works and providing related services, which is a place for selling and buying calligraphy and painting and the sum of the related exchange relationships. Its core is the original Chinese painting. Chinese style paintings market has the same operation mode with other general professional markets.

Chinese paintings price is always the most important core yet controversial issue of the development of Chinese market. On one hand, market prosperity and the development of Chinese style paintings caused the price rising. On the other hand, the prosperity and development of the Chinese art market and art prices are climbing rapidly. Price is no longer the painting value of the traditional Chinese style paintings work of realism, but with more and more moisture and implicit factors, coupled with the market price mechanism and withdrawing mechanism. The normal pricing mechanism is that value decides the price and academic status determines market position. In the real situation, however, a reversed transmission mechanism has abnormally been formed. That is, price decides value, while market position determines academic status.

4 Analysis of Market-Based Operation Modes of Chinese Style Paintings

Chinese art market can be mainly divided into three categories according to its types: Chinese calligraphy and paintings, porcelain miscellaneous, oil painting and contemporary art, which are also known as three parts of Chinese art. The total turnover of the three parts broke through 40.935 billion Yuan on 2011 spring auction, accounting for 95.55% of the total turnover in this quarter. However, the developments of the three parts have their own characteristics, and they are facing with different difficulties and challenges at the same time. With the competition in the market, the demand of customers and the changes in the external extent, we must rectify and adjust market combination timely to keep a good competition. In a word, marketing combination to the external environment must have sufficient resilience and sensitive ability.

As a “leader” of auction industry, Chinese calligraphy and painting is a type of artworks of Chinese features. Some artworks such as Chinese style paintings and calligraphy occupied half of the art market at the very beginning. Up to now, there are some auctions costing an arm and a leg in each auction market. Chinese style paintings and calligraphy has accounted for about 60% of the total turnover in the art trading in the first half of 2011, in which some modern painting has absolutely occupied the dominant position.

The vast majority is Chinese paintings, which have occupied the dominant position and also determined the possible trend of Chinese artwork market. In 2011, there are ten most valuable works, seven of which are Chinese style paintings and calligraphy. Mid-modern paintings account for six. The top two seats belong to Qi Baishi and Xu Beihong, The most striking is the picture of standing pine with Zhuanshu couplet on the top.

Despite that the global economy is unsatisfactory and affects the artworks in Chinese market to more or less extent, the Chinese style paintings market is still prosperous. Differing from the uncertainty of contemporary art collection and also from the small group collecting some porcelain miscellaneous, the group of Chinese style paintings maintains a steady state. More liquidity and firm collection are the target chased by buyers. Especially, modern painting has no problems such as very limited number of ancient painting and calligraphy, big risk in identification, and so on. Due to the fact that the status of well-known art has already been undermined and the number of the authentic works existed is moderate, the investment in this sector is the most operational and prosperous. However, in recent years, the Chinese style paintings and calligraphy is always facing with the troubles for forgery since China has no sound legislation and supervisory regime to regulate the art market transactions and these issues have not been effectively resolved. It has become more and more serious in recent years and forms a big potential risk in art market and a big challenge for Chinese style paintings and calligraphy to maintain the dominant position.

In the process of the establishment of the market pricing mechanism adapt to traditional Chinese paintings, value analysis and evaluation is the foundation, market price is an important reference, and the core is to establish a kind of market pricing mechanism that can integrate resources value evaluation standard and promote market pricing. In addition, Chinese market needs to rely more on Government and related policy laws and regulations. Of course, the cultivation of cultural environment and the corresponding market environment is also very important. Only in this way can we effectively construct value-and-market based price formation mechanism to promote the market healthy and orderly development of Chinese painting.

5 Environment Analysis on Market-Based Operation Modes of Chinese Style Paintings

The Chinese cultural art market is showing a trend of internationalization. With the rapid pace of the global economy and information integration as well as the growth and rising prominence in the international status in china, the historical value of Chinese traditional culture has increasingly been accepted by all over the world. The integration level of Chinese style paintings market with the world market has exceeded before whenever from the sorts of the cultural art, speed, or the range from the connection. Especially, after China’s entry into WTO, the internationalized pace is much quicker than before. The rapid development of the Chinese economy also accelerated this process as a catalyst.

Although China’s economy has been in a state of self -sufficient for a long time, the China’s management level is still low and the economy is still undeveloped. Compared with other fields, we attach more commodity economy to Chinese artworks. The reason for this is that we have a long history of curio, antiques, and calligraphy and management. Collectors can exchange and learn from each other and in the course of communication, the painting market and the commercial market are established. Meanwhile, we should bring the spirits of honest operation into the industry. The principle of honest is the foundation of selling Chinese traditional painting. However, because the painting market is in a rapid and extensive growth, compared with other industries, our speed of modern management is too slow, which account for the low lever of overall management in Chinese painting. The following is two main reasons for this:

1) Poor credibility, which is the main issue in current painting market.

Firstly, the counterfeit phenomenon is very common, and the counterfeit is anywhere, some forgery has little difference with genuine. They could not be identified by experts.

Secondly, connected transaction, namely, the auction company, painter, appraisal expert, galleries, critics, media, brokers, buyers and some related people are an interest group. They conduct the way of counterfeit or tacit collusion in order to cheat trust from customers and make illegal profits. For example, a few auction companies themselves buy some artworks, which are shown to be identified and have an identification Certificate, organizing people to write but not declare, or by publishing in picture albums to show their artworks, resulting in high-price from an ordinary painting. Some are hired as a prop to force up commodity price deliberately and rise the atmosphere.

Thirdly, dishonest propaganda and packaging for painters. At present, “masters”, “artists” in field of the Chinese calligraphy and painting are awarded everywhere.

Fourthly, forcing up commodity price. The common behavior is self-buying and self-selling, particularly existing in the oil painting industry. For example, a piece of oil painting in the gallery is about 100,000 Yuan, but will be sold for 600,000 Yuan at auction, actually bought from himself by Placards. After deducting 20% commission up and down, the total is about 120,000 Yuan. It is not the original 100,000 Yuan but 660,000 Yuan of price at the auction after he bought back and hung out in the gallery. Money laundering of artwork or corruption not only causes the market price distortions, but also transfers the fake into the real artwork. The usual modus operandi is offering a bribe to the bribed with a fake or not well-known works of artists, and these bribed are at auction. Bribers in the auction market purchase the artwork in high valence, achieving the purpose of bribery. Some auction companies cooperate with them for high profit, which results in foam in the market.

2) The low of operation ability.

Firstly, much attention is paid to sale skills rather than the notion of consumers' demand. A few shops of calligraphy and painting lead into modern consuming behavior. But they misunderstand sales as promoting or place emphasis of sales on promotion. The nature of modern marketing is to achieve the win-win between customers and companies by satisfying the demand of customers. The key of it is putting customers' demand on the first place. If the goal market is wrongly chosen, or the customers' demand is misunderstood, proficient sales skills can not earn long-term venue from customers.

Secondly, operation methods are too single. Modern marketing is a systematic work which is the theory of the marketing combination. That is, painting shops are supposed to meet customer needs through market research, orientate themselves and provide products consistent with the need of target consumers in order to absorb and retain customers by using the information and services needed. This is what Chinese cultural and artistic managers are lack of. Most of them remain in the stage of price competition. They have the same product with no features and no significant differences, leading to price competition. Another major problem is that the service has not done well. The service of presale, in sale and after sale generally is paid less attention to. They think it was finished after selling the product.

The formation and development of Chinese cultural market is a product of China's reform of economic system. Due to its cultural attributes, the pursuits of spiritual consumption will be enhanced only after the basic needs of necessities are met. Compared with other industries, the development of China's cultural market presents a certain hysteretic nature. In my view, although the development of China's calligraphy collection and transaction started very earlier, the development of the cultural market is still in its infancy.

6 Conclusion

Since the reform and opening up policy, our painting market is developing rapidly. But due to the managers, especially the creators of cultural artworks with different cultural spirits from the other industries and with the combination of the influence of the management mode of traditional paintings, their management level is still in primary stage. The managers need to get rid of the traditional management mode to improve their business efficiency. In order to take great advantages in competition, they need to guide themselves with modern marketing ideas and take road to internationalization.

Internationalization will be a new point to engine the process of gallery market. Its function is much more than an issue. Galleries market are bound to complete industry reshuffle in the round of extension, The new marketing strategy and operation arrangement is not an option any more, but is a necessary market-based operation mode. It is undeniable that the new structure of the theoretical research in Chinese style paintings market will open a door to standardize the art market, which helps to push forward important development of art market orderly and scientifically. More and more opportunities and platforms are being obtained because of the challenges and progress in Chinese art

market, which is the fulcrum for us to set up a new structure to operate the market mode.

Abstract: China's cement industry has entered the era of excess, and it is badly in need of the implementation of the strategy of transition based on a macroscopic point of view with the economy into the new normal. This paper analyzes the necessity of strategic transformation of Chinese cement industry, and puts forward the ways of strategic transformation: adjust the industrial structure, solve the problem of excess production capacity systematically; comprehensive promotion of cement kiln "coordination" technology, improve the level of energy conservation and emissions reduction; increase investment in technology research and development, strengthen enterprise innovation ability; promote industrialization and information fusion and business model innovation of cement industry.

Key words: Cement industry; Strategic transformation; Way

1 Introduction

As China's economic development into the new normal, investment slowdown, and cement demand growth has gradually slowed down, China cement industry in the next few years will enter the global overcapacity, low speed development of the era. Under this background, China's cement industry must carry out strategic transformation to realize transformation and upgrading.

The current researches of the development of China's cement industry is concentrated on the cement industry energy saving and emission reduction, cement industry overcapacity, cement industrial structure adjustment and cement industry collaborative disposal of municipal waste sludge, etc., such as Ren Chun, Jiang Mei (2014), thinks that the cement kiln of particulate and NO_x emission is the main environment problems, and to improve the emission control requirements in a timely manner according to the progress of the pollution control technology, and environmental protection requirements.^[1] Luo Zhongtao, Ma Baoguo(2011) proposed industry itself can use existing technical innovation and efficient CO₂ conversion technology to control the source and sink of carbon to achieve energy conservation and emissions reduction.^[2] Wang Liguo, Gao Yueqing (2013) proposed that China's cement industry should be taken to put an end to capacity expansion, speed up the excess capacity selection, rational promote the cement industry merger and reorganization, actively promote the cement industry chain extension, rational development measures such as cement kiln "coordination" project.^[3] Kong Xiangzhong (2012) argue that excess capacity is the normal operation of market economy, but should be adopted to strengthen the market guidance and macro-control, is advantageous to the enterprise merger and reorganization of the preferential policy, reduce the intervention of local governments to invest in cement, determined to speed up the backward cement capacity and play to the supervision of the industry association and self-discipline function.^[4] Lv Gui xin (2014) proposed the common severe overcapacity affected the healthy development of China's industrial structure adjustment and economic prominent contradiction, must be far or near, severely, build a long-standing mechanism to solve excess capacity.^[5] Jiang Minglin (2013) suggested that the cement kiln "coordination" as the national key support projects, build some cement kiln "coordination" model line, the preferential tax policy, and the relevant government departments issued "coordination" cement industry waste access rules.^[6]

As can be seen from the above literature analysis, At present, the research on the development of cement industry is more and more, which has positive significance for the healthy development of the cement industry. But on the macro level of cement industry in the research of strategic transformation is relatively less and therefore it is very important to study the strategic transformation of China's cement industry in the new situation of economic development.

2 The Necessity of Strategic Transformation of China's Cement Industry

2.1 Overcapacity forced China cement industry strategic transformation

China's cement production capacity has been in a serious surplus in recent years, as shown in table 1.

As can be seen from the table above, China's cement industry has excess from local to global excess phase, and cement production capacity will continue to increase with the new dry process cement production line of continuous construction. If all completed and put into operation, the cement production capacity will reach about 36 tons. Therefore, the serious situation of excess production capacity forced China's cement industry strategic transformation must be conducted.

Table 1 Cement and Cement Clinker Production Capacity and Capacity Utilization Rate of Nearly Five Years in China

Unit: one hundred million tons	2010	2011	2012	2013	2014
Cement production capacity	27.93	28.97	30.70	32.90	33.35
Cement production	18.68	20.63	21.84	24.14	24.76
Cement capacity utilization	66.87%	71.22%	71.14%	73.39%	74.24%
Clinker production capacity	16.67	17.18	18	18.6	18.95
Clinker production	11.52	12.81	12.79	13.62	14.18
Clinker capacity utilization	69.10%	74.59%	71.03%	73.20%	74.83%

(Data Sources: All cement production data from the National Bureau of Statistics, all production data and clinker production data from China Cement Net.)

2.2 The industry structure adjustment asks China's cement industry strategic transformation

The cement industry in China is faced with the adjustment of the technical structure, the organizational structure and the product structure. And This adjustment requires the Chinese cement industry to carry out strategic transformation. Technical structure adjustment, China's new dry process cement production accounts for the total output of cement ratio as shown in table 2.

Table 2 Chinese NSP Cement Production Accounts for the Proportion Of Total Output

Unit: one hundred million tons	2010	2011	2012	2013	2014
New dry cement production	14.9	18.6	20.31	22.93	23.77
Cement output	18.68	20.63	21.84	24.14	24.76
New dry cement production / Cement output	79.77%	90.15%	92.99%	95%	96%

Product structure adjustment, in 2013 the situation of China's low production of high-grade cement in Figure 1.

Figure 1 In the Case of Low-Yield High-Grade Cement in China in 2013

(Source: Digital Cement, Huatai Securities Institute)

2.3 Environmental protection and energy saving forced China cement industry strategic transformation

According to statistics, Cement smoke (dust) in the area of China’s land area is 8.45 times more than the world average, and Annual total emissions of about millions of tons, accounting for 39% of the national industrial dust emissions, high industry dust exhausting. China’s cement industry product structure and the particulate matter pollution are shown in figure 2.

Figure 2 Cement Industry Product Structure and Particle Contamination

(Source: China Building Materials Information Website)

In recent years, China has adopted a series of measures to promote energy saving and emission reduction of cement industry, cement industrial pollutant emissions continue to improve, but from the national standard, especially there is a big gap between the developed countries in the international standard and the grim situation of energy-saving emission reduction forced China’s cement industry must implement the strategic transformation

2.4 Technological innovation requires the strategic transformation of China’s cement industry

technology research and development and innovation. The core of the new development of cement industry is technology development and innovation. From the point of current situation, China cement industry technological innovation still exist a series of difficulties, including technology research and development division system, lacking of technological innovation, second generation of new dry process cement innovative research and development potential, the development of the technology of “collaborative disposal” in cement kiln is very weak. To get rid of these difficulties, we must speed up technological innovation, technological innovation requires the implementation of the strategic transformation of China’s cement industry.

3 Ways of China Cement Industry Strategic Transformation

3.1 Adjust the industrial structure, the system resolve the excess capacity

First, implement the strategy of large groups to speed up the adjustment of organizational structure.

Give full play to the big enterprise group, the leading role, implement the strategy of large group, to encourage and support competitive large enterprise groups play to its advantages, further develop and expand, by region to form a batch of advanced technology, strong big group, improve production concentration at the same time, the enhancement enterprise technology research and development capabilities, further reasonable layout of cement production structure, promote the structural adjustment of cement industry.

The second is to revise the VAT preferential policies to speed up the product structure adjustment. Comprehensive utilization of resources should be revised as soon as possible the cement product value-added tax preferential policies, gives the comprehensive utilization of waste production high quality cement and cement enterprise comprehensive utilization of industrial waste, the collaborative disposal of municipal waste and sludge production and high quality cement enterprise maximum benefits, for the production of low grade cement preferential discount rate reductions until cancelled. Also, on the basis of the extension of the cement industry chain, to consciously to guide consumption, promote high quality cement consumption, optimize the product structure.

Three is to actively resolve the existing capacity. First of all, according to the ministry of industry and cement industry access conditions to finish as soon as possible to all existing NSP cement production line for access to review, the eliminated a substandard product line. Secondly, encourage cement enterprises extends the industrial chain, the implementation of strategic transformation, to enhance the competitiveness of enterprises as the core, optimizing the allocation of elements such as technology, resources, market, actively expand the diversified economy, further deepening the fusion associated with construction and other industries. Finally, to encourage and create conditions for the strength of the cement enterprises go abroad, expand the international market, release of part of the capacity.

3.2 Comprehensive promotion of cement kiln “collaborative disposal” technology, improve energy saving and emission reduction level

One is the top-level design. Will use the cement kiln “coordination” city living garbage squarely on much starker choices-and graver consequences-in planning, in the first conditional NSP cement plant near the large and medium-sized cities, gradually replace the traditional backward form of incineration and landfill disposal of urban living garbage, and the research and development and promotion of the second generation of new dry process cement technology as cement industrial development direction of energy saving and emission reduction. At the same time, from the national level, formulate relevant laws and regulations and systems, such as municipal solid waste and sludge waste management measures and comprehensive utilization of refuse derived fuel management rules, regulations for the city garbage collection and pretreatment, collaborative disposal permit system, long-term supply guarantee system and pollutant emission monitoring system, etc.

Second, improve relevant policies. “Coordination” of cement kiln waste to give the necessary financial support. Proposed cement kiln waste special funds “coordination”, “coordination” for cement kiln technical renovation the necessary funding from the construction project, at the same time, encourage financial institutions to increase the “coordination” of cement kiln waste project credit support, arouse social capital actively into the project.

Third, multilateral coordination. The government needs to guide and supervision, and promote and organize living garbage classification collection and reasonable garbage disposal expenses; Companies need to be more rigorous scientific research and technical support, strict management system and real-time detection, to ensure the harmless and recycling of waste; Residents need to set up the concept of classified collection and paid disposal of living garbage.

3.3 Increase technology R & D investment, and enhance the enterprise innovation ability

One is to increase the country's investment in cement industry technology research and development. Proposal led by the national related department, set up a by various capital contribution of the second generation of new dry process cement technology research and development funds, special support cement industry technology research and development, and enterprise linkage, university-industry cooperation, formed the benign interaction. At the same time, to get the second generation of NSP cement r&d projects included in the 973 plan, 863 plan, science and technology support projects, supported by state funds.

Second is to encourage cement enterprises to increase investment in technology research and development. Call for some big companies active in research and development, a certain proportion of cement enterprise research and development funds to offer certain preferential tax, to a certain research and development achievements, offer certain subsidies, for using new technology to retrofit, offer

certain financial support energy saving and emission reduction. Encourage large enterprises set up r&d innovation center, the country to give a percentage of the necessary financial support, efforts to form independent innovation system, improve enterprise innovation ability.

Three is multiple level to carry out the second generation of new dry process cement technology research and development and research. Research institutions and enterprises can according to their own actual, from cement cleaner production technology, process control and terminal management and other aspects, in order to reduce energy consumption and pollutant emissions as the goal, to carry out the industrialization of technology, strive for the development of a number of major key and common technology, such as low carbon technology and waste resources recycling, waste less waste technology, energy saving save resources, poisonous and harmful material alternative technologies, ecological industry, clean energy, new technology, continuous innovation. At the same time, and constantly introduce, digest and absorb advanced foreign technology, clean production, and constantly in innovation, intensify popularization and application.

3.4 Promote industrialization and information fusion and the innovation of the commercial mode of cement industry

One is to promote industrialization and information fusion. We should set up the industrialization and information fusion technology innovation alliance, technical research, efforts to integrate cement industry equipment, technology, management, technology and information technology, and the conditional to pilot enterprises, on the basis of the pilot to summarize, in the industry to promote step by step. In addition, the proposal advocated by the government department, joint scientific research institutes and related enterprises set up industrialization and information fusion of national service platform, improve the level of industrialization and information fusion services.

The second is to actively use the "Internet +" thinking. The Internet is changing the traditional operating mode and management mode, "Internet +" thinking has got a lot of use in FMCG industry, part of the traditional manufacturing industry also gradually To try To use "Internet +" thinking on operations and sales, cement enterprises should also conform To the trend of The Times, take the initiative To upgrade using "Internet +" thinking, open the Online mall (huaxin cement has opened huaxin shopping mall and good effect), mobile payment account, WeChat pay, promotion and application of mobile terminal shopping platform, etc., with the help of the Internet using O2O sales model (Online To Offline, Online interactive marketing mode), the wider To promote their brands, spread the good word of mouth. In addition, you can try to use "Internet +" thinking combined with Internet of things technology, efforts to implement the intelligent of the production operation, the full use of big data, efforts to achieve cloud services, improve production efficiency and service level.

Three is to strive to open up both sides of the market. Structures, platforms, the two sides market is a kind of important age of the Internet business model innovation, cement industry both sides should also try to exploit market, promote the business model innovation. Large cement enterprises to "anywhere, anytime to provide customers with green energy-saving cement products and products" such as is the value idea, set up green energy-saving cement products and product supply and service platform, using the platform's appeal, invite customer related companies to join the platform, the platform of enterprise is facing the consumer (customer), but also facing the joined companies (merchants), customers and merchants value through the platform to establish network, realize the optimal allocation of resources, customers, merchants and platform enterprise benefit, as well as wider transmission enterprise reputation, further accelerate the speed of the cement industry transformation and upgrading.

4 Conclusion

China cement industry is facing a series of requirements, such as overcapacity, structural adjustment, environmental protection and energy saving and technological innovation, etc., we must carry out the strategic transition from the macro level. According to the current development of China's cement industry, we should implement the strategic transformation by adjusting the industrial structure, resolve excess capacity systematic, comprehensive promotion of cement kiln "collaborative treatment" technology, Improving the level of energy saving and emission reduction, increasing investment in technology research and development, enhancing the innovation capability of enterprises, promoting industrialization and information fusion and business model innovation of cement industry .

Abstract: This article uses multiple research methods, including literature research, survey and statistic, case study to analyze elderly's needs on wardrobes. Due to aging and degeneration of physical conditions of elderly people, common wardrobes cannot satisfy their needs of living environment of safe, healthy, productive and comfortable. In order to solve this problem, this study proposes a useable and systematic way: considering the living modes, family structures and lifestyles of elderly people, and combined with ergonomics considerations and design management theory to design internal structure, and spiral layouts of wardrobes. As a result, a customized manufacturing way is proposed to satisfy elderly's needs of barrier-free with low cost for companies and high personalization possibilities for elderly people. The originality of this study lies in barrier-free design of storage space of clothes for elderly people, which could also be considered as universal design for majorities.

Key words: Elderly people; Storage space of clothes; Barrier-free design; Product innovation

1 Introduction

Storage space for clothes is a form of spaces to organize and store clothes. From 1950s to today, due to the improvements of living modes and life quality and the changes of family structures, storage spaces for clothes go through the following forms: basic and simple boxes, single closets, combine-unit, wardrobe and modern united storage spaces for clothes. The progress of storage spaces for clothes reflects the progress of user-friendly design. Storage spaces of clothes are indispensable living environment for elderly people. Due to the degeneration of physical conditions of elderly people, there are increasingly limits with changing clothes for elderly people. Therefore, it is important to investigate physical conditions of elderly people and design barrier-free storage spaces for clothes for elderly people, which will benefit them through getting and changing clothes in a convenient, independent and safe way. Furthermore, the barrier-free designs also consider other members in families, which will contribute to a family environment of engaging and friendly.^[1]

1.1 Scope of definition

Barrier-free design can assist elderly people, disabled people and other vulnerable groups to move flexibly, to have a larger area to move, and to enjoy and engage in social activities. Universal design refers to designs that are convenient to all groups, regardless of gender, age and capabilities. Both of design principles aim to design for convenience of users. However, due to the difference of user groups, barrier-free design focuses on designing assistances for vulnerable groups, while universal design aims to create universal solutions that are suitable for all groups.

Storage spaces for clothes are a kind of space for organizing and storing. According to users' activity of storing clothes, such storage spaces can be divided into united wardrobe and cloakroom. Wardrobe is a closet to store clothes, while cloakroom is to use a room or an indoor space to create a space for store and change clothes.

1.2 Current research situation and progress in foreign countries

"Research of innovative design of clothes storage space for elderly people" is applied research based on the theory of ergonomics and design management. Ergonomics is a discipline that investigates the relationship between people and engineering systems and its environments. Following the notion of design management, different types of data have been organized and analyzed. According to the definition of association of ergonomics and human factors societies, ergonomics investigates multiple factors of people in environment, including anatomical, physiological, and psychological factors. Ergonomics aims

* Funded project: 2013 research grants for young teachers in high education in Henan Province (2013GGJS-226); 2014 Henan Province Technology Development Plan: soft science project (142400410198).

to reach the optimization situation by examining the relationships of people-machine-environment in different conditions, such as working, family, vacation through focusing on different parts: efficiency, health, safety and comfort.^[2]Ergonomics starts from 1940s and becomes a branch of technological science. Ergonomics has been developing through application. The design of storage of clothes belongs to the application of ergonomics. The research on storage space for clothes has been investigated before and resulted in standards in industries. In US, the book of Time-Saver Standards for Interior Design and Space Planning introduces different kinds of wardrobes, and the sizes of people's activity in different kinds of wardrobes, such as wardrobes that can be reached through stretch arms, lateral line wardrobes, and cloakrooms. In addition, the requirements of arranging clapboards and lights are also clarified. In Japan, the book of residential design information integration gives detailed statistical information and schematic diagrams of scale of houses, scale of body and size of clothes, modular space and activities of people.

1.3 Current research situation and progress in China

In China, the research of ergonomics starts relative late. It is still in development phase nowadays. As for storages spaces for clothes, the research of wardrobes is systematic. The research is conducted from users' perspective and functions and structures of furniture. In standards of architectures, light industry and wood industry, standards of concrete requirements regarding wardrobes includes the followings: Chinese national standards GB3327-82 and furniture standards of Chinese national light industry (second edition) GB/T3327-1997. Standards and technical specifications of furniture with storage purposes are in the book of collections of standards in wood industry: wooden products GB/T3324-407. The different requirements of spaces for male and female of using wardrobes are introduced in the book of collection of interior design materials. Requirements for small spaces for storing clothes are stated in the book technology of furniture design. The spaces that need for wearing clothes and shoes are introduced in the book of furniture design and manufacturing. Besides, Chinese adults body sizes and related sizes of furniture are introduced in the book of ergonomics and interior design.

1.4 Research gaps in previous research

However, with the changes of lifestyles, the requirements stated in books are unlikely to provide precise supports due to the following reasons. Firstly, in some requirements, the divisions of spaces are too general, which call for specification. Secondly, due to the enhanced diversity of kinds of clothes and quality, the scale of spaces that used to store clothes should be refined. From the perspective of user-friendly design, very few researches have been conducted to combine storage spaces for clothes and living environments. This research gap calls for more systematical research. The emphasis on investigating storage spaces for clothes for elderly people can contribute to more comprehensive data on ergonomics. The results could also guide the formation of standards and companies to better satisfy the needs of people.

2 Data analysis on needs of storage spaces for clothes for elderly people

The analysis is conducted in order to satisfy elderly people's life, to seek for potential needs among different user groups, to understand values and demographic features, to reflect the current situation of user groups, and to develop products.

2.1 Analysis of basic materials

Topic: needs of elderly people for store clothes

Location: home interviews in three different communities: great wall community (small-sized scale apartments), Sunshine Garden (medium-sized scale apartments) and Province (large-sized scale apartments), and field interviews in furniture shopping mall.

Table 1 Analysis of basic materialsTable

Type	Size (Square meters)	Number of people	Percentage	Overall percentage	Rateof empty nest
Small-sized	Below 49	42	15.11%	86%	80.00%
Medium-sized	50-79	93	33.45%		60%
Large-sized	80-119	105	37.77%		30%
Luxury-sized	120-164	23	8.27%	14%	10%
	above165	15	5.40%		5%
		total	278	100%	100%

Participants: age ranged from 60 to 90 years old through questionnaires. 300 questionnaires were

sent with 285 collected (95% response rate). 278 valid questionnaires are collected with 137 male and 141 female (97% valid rate).

Table 1 suggests that most of elderly people live in large-sized apartments that are small than 119 square meters, with a percentage of 86%. Only very limited people, around 14%, live in luxury apartments which are large than 120 square meters.

Based on elderly people’s living conditions, a separation is made between living alone (empty nest family) and living with family. For small-size apartments that are small than 79 square meters, the empty nest percentage ranges 60% to 80%. Elderly people who live in large apartments that larger than 80 square meters has a relative low rate of empty nest with 5% to 30%.

2.2 Correlation analysis between size of apartments and storage spaces for clothes

Figure 1 Correlation analysis between size of apartments and functions of storage spaces

Figure 1 indicates a significant difference with the apartment of 119 square meters. For apartments below 119 square meters, the storage spaces for clothes can satisfy basic needs of store clothes. Thus, wardrobe could be more suitable. For apartments above 119 square meters, the storage spaces can be used for more functions, such as display, organize and change clothes. Therefore, cloakroom can be used in this situation.

2.3 Elderly people hope that the location of storage for clothes can be improved in order to pick up clothes convenient

Figure 2 Elderly people hope that the location of storage for clothes can be improved in order to pick up clothes convenient

Figure 2 suggests that the reasons for inconvenience of current storage spaces include the height of storage spaces and the way of opening door of storage spaces.

2.4 Synthesis: analyze situations comprehensively

According to the analysis of questionnaire, the scope of this study is defined as to investigate wardrobes and cloakrooms. The target group is elderly people who suffer from the difficulty of picking up clothes. The main research subject is barrier-free design of wardrobes.

For empty-nest family, elderly people need to have a relative high ability to live independently. Therefore, when designing living environments, the differences of ages and physical conditions of elderly

people should be considered. Following the notion of barrier-free design to design storage spaces can make elderly people's life convenience, improve the ability of elderly people living independently and their confidences. In addition, when considering elderly people who are live with their family, the designs that are specifically designed for elderly people should not be inconvenience for other members in family. Therefore, the notion of barrier-free design and inclusive design can be combined to bring convenience for elderly people and avoid troubles for other members in family.

3 Designing innovative storage spaces for elderly people through barrier-free design principle

The design considered physical, psychological and clothes changes behavior of elderly people and the design improved the size of wardrobes, accessories, grounds, handrail, door and lights. By considering the principle of barrier-free, the needs of pick up and store clothes are satisfied.

3.1 Size of wardrobes

According to the flexibility of bodies, the group of elderly people can be divided into elderly people with healthy bodies and elderly people with disabled bodies. During designing, the size of bodies, functions are paid especially attentions to assist elderly people's activities.

3.1.1 Size of body for healthy elderly people and size of wardrobes

Because the height of elderly people reduces 2 cm comparing to the height in young age, the designs of outside, inside part and the depth of wardrobes have been changed. These small changes help elderly people pick up and store their clothes effectively and comfortably, which will not hinder other members in family to pick up clothes.

The inside parts of wardrobes can be divided into convenient parts, relatively convenient arts and inconvenient parts. The size of convenient parts ranges from 750mm to 1400mm. This space can further be divided into the following parts: reachable spaces with bending down that can be used to store foldable clothes, reachable spaces with standing that can be used to hang clothes, and reachable spaces by raising hands that can be used to store hats and bags. Relative convenient areas: the height of spaces that are below 750mm can be labeled as relative convenient spaces for elderly people. These spaces can be used to store shoes, umbrella and other things. The lowest layer should be higher than 250mm. Thus, elderly people do not need to bend down to pick up or lose balances. Inconvenient areas: the height of spaces that are above 1700mm can be labeled as inconvenient areas. These spaces are very dangerous for elderly people who need to use ladder to reach such spaces. Therefore, these spaces are used to store out-of-season clothes, such as quilts and clothes that do not use very often.

The depth of inside parts of storage spaces should be larger than the largest size of clothes with additional spaces. If the depth is too small, the doors cannot be closed and the clothes will be squeezed or damaged. If the depth is too large, the spaces will be wasted and it would be difficult for elderly people to pick up clothes. Therefore, the depth of inside parts of storage spaces should be around 550mm.

The outside parts of storage spaces should be like this, with a height of 1950mm, depth of 580mm and width of 1700 mm.

3.1.2 The body size of disable elderly people and size of storage spaces

For elderly people with paralysis of the lower limbs, the height of the visible area ranges from 639mm to 1300mm, this is used most frequently and most convenient for picking up things. Thus, for elderly people who use wheelchairs, the height of highest clapboard should not be larger than 1290mm and height of the lowest clapboard should be above 639mm, which is the same height as thigh. For wheelchair users, when they pick up things from wheelchair, the distance between hand and wall is around 500mm and the highest larger diameter is around 1300mm. As shown in figure3, the design that follows these guidelines will create the largest convenience for elderly people to pick up and store clothes.

As for family members of elderly people with paralysis of the lower limbs and healthy elderly people, the approach of inclusive design can be used to leave some spaces for other members to store clothes. In this way, the inconvenience and wastes of spaces are avoided.

Activity spacerangeof adults Activity spacerangeof elderly people

Usage space for wheel-chair users Suitable height for wheel-chair users

Figure 3 The require sizes for people with different activities

3.2 Cloakroom

As a new form of storing clothes, cloakroom does not provide people with spaces to store clothes according to different classifications, but also concealed spaces for changing clothes. Using this form could optimize the environment, arrange the layouts more properly, and improve the efficiency of using spaces and adaptability.

Most of time, the smallest size of cloakroom is around 4 square meters to store clothes and leave sufficient spaces for people to walk and change clothes. The stool used for changing clothes can be put under closet. The smallest space for elderly people to sit on and to put on shoes ranges from 1060 to 1160mm.

The width of spaces for crossing direction walking is around 450mm, and the width of spaces for walking forward is around 600mm. For elderly people with paralysis of the lower limbs, it requires larger spaces with a width between 900mm to 1500mm. As shown in figure4, if the size of apartments is not large enough, the design of cloakrooms may not be suitable.

Figure 4 The representation of the width of spaces required in spaces

3.3 Design of internal accessories

The internal accessories with inclusive considerations can be used in wardrobes for families with elderly people and young people living together.^[3] They can assist all family members to use the wardrobe together through using different spaces within the wardrobe, such as by pushing and pulling themoveable accessories and movable rotation frame.

Figure 5 design of internal accessories

Clothes rails in high places can be convenient for hanging clothes, enhance the efficiency of using space and suit for the height of elderly people. The movable rotation frame enables elderly people pick up clothes flexible when hanging clothes. For spaces which are lower than 650mm, drawers and baskets can be used to pick up things conveniently. The handle, button and handrail should be designed in different colors to indicate the differences. The edges should be covered by soft rubbers to avoid accidents. The clapboards should also be included to use spaces reasonably to arrange the spaces. These inclusive design details will be convenient for elderly people and family members (as shown in figure 5).

3.4 Door

The door should be easy to open and close, such as using sliding door to enable the movement of wheelchair conveniently. The handles of door should be selected with longer rotating arms. The spherical handles should not be considered. The height of handles should range from 900mm to 1000mm.

4 Conclusion

This study focuses on investigating storage spaces of clothes for elderly people through considering elderly people's physical and psychological conditions. With the involvement of barrier-free design principle, the results of this study can assist elderly people and their family members to pick up and change clothes. This topic represents the cares for elderly people. With the development of technology, the smart home devices will be more popular in the further. The storage spaces of clothes should also be smarter: they can pick up clothes for elderly people automatically according to weathers and activities of elderly people. The selected clothes will be presented on screen together with the model. Then elderly people can choose one. Such design will make elderly people's life more convenient and pleasant. This is a future scenario.

Level of Cooperation of Inter-Organizational Networks in New Product Innovations in Sri Lankan Manufacturing Sector SMEs

Krishantha Wisenthige

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wprishantha@yahoo.com)

Abstract: External networks of Small- and medium-sized enterprises (SMEs) is a great assets for its innovation processes to be able to competitive in the market with its large rivals. Based on a survey to 72 Sri Lankan manufacturing SMEs, this paper empirically explores the relationships between inter organizational networks and innovation performance of SME using the technique of structural equation modeling (SEM). The study finds that there are significant positive relationships between inter organizations networks of SMEs. The results indicate that there are significant positive relationships between cooperation with government organizations, business organizations, intermediary organizations, cooperation with research organizations and innovation performance. SME cooperation with business organizations is the most significant linkage out of four network actors and second most important actor is intermediary organizations.

Key Words: SMEs; Inter-organizational Networks; Innovation

1 Introduction

In the fast-changing and increasingly competitive global market, small- and medium-sized enterprises (SMEs), which exert a strong influence on the economies of many countries through their ability to innovate new products and processes, have been the engine of economic growth and technological progress (Bruque and Moyano, 2007)^[6]. Small and Medium Enterprises (SMEs) play a vital role in the economy of Sri Lanka which have been recognized as an important strategic sector contributing to economic growth, reducing unemployment, inequality and poverty (Ministry of Enterprise Development, 2008)^[2]. The SMEs in Sri Lanka are playing a significant role when compared with other “industrial and business” establishments in developing countries (Central bank 2014)^[1]. But a crucial question has risen in the process of advanced industrialization how and what will the countries’ SMEs adapt to run parallel to the changing economic environment to maintain their higher productivity and competitiveness in global markets. It is certain that SMEs need the support and resources from the external parties, who are not directly employed in the firm such as other firms, professionals, government, research organizations, supporting institutes, relatives and friends (Keast, R., Hampson, K., 2007)^[15]. If an organization can network with its suppliers, buyers and competitors, it will become a crucial ingredient to avoid competition and achieve the advantage. Through these network relationships, SMEs can identify their opportunities and try to raise their resources, competitive advantage, efficiency and profits by avoiding competition among them (Peres, W., Stumpo, G., 2000)^[18].

The global trend of “innovation” brings about challenges for SMEs in developing countries like Sri Lanka which try to reduce the gap between knowledge and technology of SMEs compared to the that of developed countries. Thus, as some studies from developing countries have underlined, innovation cooperation and interaction are becoming more and more important for SMEs in emerging economies and developing countries to promote their innovation abilities (Liefner et al., 2006)^[17]. Although the phenomenon on innovation of SMEs has captured the interest of many scholars, few studies have been recorded on studying the issue from the developing countries’ perspective. This uneven focus invites further investigation into the innovation of SMEs in Sri Lanka as one of the emerging economies in south Asia. In Sri Lanka, the manufacturing sector is playing a significant role in social development and economic growth (Central Bank, 2014)^[1]. Hence, it is necessary to explore the inter-organizational networks of manufacturing SMEs in Sri Lanka in order to help them improve their innovation capabilities. There is, to our knowledge, a paucity of studies on the role of inter-organizational networks on the innovation of Sri Lanka manufacturing SMEs. Using a structured questionnaire survey, this paper examines the innovation networking activities of a sample of 72 manufacturing SMEs in Sri Lanka which has obtained patents for its industrial innovations. The research objective is to identify the relationship between SME innovations and level of corporation of different network actors in the inter-organizations networks.

2 Literature Review

2.1 Concept of Business Networks

It is evident that a large number of researches in different disciplines such as organizational behavior, business economics etc., have studied business networks providing range of new ideas. It is clear that different researchers have analyzed the relationship between the business Networks and business development in different ways in terms of their respective disciplines. In literature, it is evident that the concept of business Networks has been used in four ways concentrating on (i) Nature of firm's economic and local development (ii) Technological innovations and managerial changes (iii) Marketing and international business (iv) Entrepreneurship and entrepreneurial networks. Literature on innovation indicates that over the last two decades, there has been a systematic and fundamental change in the way firms undertake innovatory activities. In particular, there has been a tremendous growth in the use of external networks by firms of all sizes (Hagedoorn, 2002)^[13]. Innovation is seen as a process which results forming of various interactions among different actors (Doloreux, 2004)^[10]. Inter-organizational and cross-sectoral networks, which facilitate the accelerated flows of information, resources and trust necessary to secure and diffuse innovation, have emerged as a key strategy (Dewick and Miozzo, 2004)^[8]. As SMEs command fewer resources, have less R&D, and generally face more uncertainties and barriers to innovation, networks provide a complementary response to insecurity arising from development and use of new technologies, while reducing uncertainties in innovation (Diez, 2002)^[9].

2.2 Inter-organizational Networks and Innovation

Existing literature on the relationships between network or innovation interactions and the innovation performance of firms has been reviewed and examined. Some researchers addressed that network cooperation or using a wide range of external actors and sources had a positive impact on innovation performance of firms (Brioschi et al., 2002)^[4]. Bullinger et al. (2004)^[7] suggested that universities, research institutes, suppliers, customers and other partners had a valuable impact on the knowledge and innovation creation process. (Doloreux, 2004)^[10] explicitly stated that cooperation with different partners on research and development (R&D) had a positive effect on innovation achievement. Similarly, using data from a longitudinal sample of Spanish manufacturing firms, (Diez, 2002)^[9] concluded that the greatest positive impact on the degree of innovation novelty came from collaborative networks comprising different types of partners. While Liefner et al., (2006)^[17] referred to the notion of social capital as networking, and indicated that R&D and networking (social capital) arisen as complementary driving forces of innovation outputs. Brioschi et al. (2002)^[4] noted that social interactions based on trust and cooperation played a major role in coordination of the activities among different SMEs. According to Hewitt Dundas (2006)^[14], the external resources and capabilities that SMEs could access through external innovation partnerships might provide them with the stimulus and capacity to innovate, while the lack of innovative partnerships had a negative impact on innovation. (Diez, 2002)^[9] noted that the advantages to be gained from localized networks were claimed to be particularly important for SMEs in helping offset the size-related advantages of larger firms. Some studies focus on the form of cooperation networks of SMEs (Doloreux, 2004)^[10]. Based on a study of SMEs in a small less developed country (Cyprus), Hadjimanolis (1999)^[12] suggested that inter-organizational linkages of networks could be vertical, horizontal or lateral consisting of enduring webs of relationships with customers, suppliers, associations, government, research institutions etc. Based on the previous studies by different scholars, this study was focused on investigating the role of four main network actors, government agencies, research organizations, business organizations and intermediary / business support organizations in innovation process of Sri Lankan SMEs.

2.2.1 Government Agencies (GA)

The role of the governments in stimulating and nurturing the innovation process is a controversial one. Some researchers argues that it is necessary for governments to implement policies at all levels that will enable companies to make their activities more innovative. Based on a survey from African SMEs, Biggs and Shah (2006)^[3] revealed that there were important links between formal governance institutions and SMEs performance and innovation. In addition, the role of government is usually embodied to support or establish public institutions or universities with the view to enhancing the knowledge and innovation base of the local economy. It is widely recognized that government policies have a strong bearing on the effectiveness of the role of universities and research institutions in the process of innovation. However, some studies indicate that the role which government played in innovation of SMEs is less than that could be expected (Doloreux, 2004)^[10].

2.2.2 Research Organizations (RO)

Generally, the innovative partners for cooperation between firms (firms in manufacturing industries such as electronic and light engineering equipment sector, ordinary machinery and special purpose sector, raw materials and chemical products sector) and research organizations are universities, colleges, technical institutes and research institutions. The modes of innovative cooperation between firms and research organizations are mainly of informal communication of skills and knowledge, technology trade or technology transfer, formal R&D.

2.2.3 Business Organizations (BO)

The relationship between business organizations and innovation performance has attracted much research interest (Diez, 2002)^[9]. Some researchers suggest that firms interacted with ones located at downstream and upstream in the value chain, are conducive to embodied innovation spillover through commercial trading and the value-adding process. Some studies indicate that inter-organizational cooperation including informal arrangements and formal long term strategic alliances can lead to incremental innovations and radical innovations Biggs and Shah (2006)^[3]. However, it should be noted that inter organizational cooperation in pre-competitive research is not always beneficial. Rather, the effectiveness of this network process depends on many factors, such as the overall strategy of the firm, its network capabilities and its innovation intensity.

2.2.4 Intermediary Organizations (IO)

Some authors have documented the important role that intermediary organizations played in innovation Bullinger et al. (2004)^[7]. (Doloreux, 2004)^[10] suggested that external relations formed with intermediary organizations for SMEs could be the source of new ideas for innovation and technological productivity. (Diez, 2002)^[9] indicated that intermediary institutions such as technology and innovation centers had been judged to be crucial for new local entrepreneurs. Usually innovation networks are often formed from a heterogeneous group of various actors including representatives of firms, technology centers and development organizations, and financing and training institutions, industry association, chamber of commerce and the ability to interact in these networks becomes a decisive success factor in promoting innovative capability (Doloreux, 2004)^[10]. In addition, from the viewpoint of policies, some intermediary institutions that are supported or funded by the government aim to provide innovation support for firms, especially for SMEs. For example, to promote innovative activities of SMEs, many intermediary institutions or organizations are established, such as “Productivity Centers”, “Technology Transfer Organizations”, and “Technology Business Incubator”, etc.

2.3 Conceptual Framework and Hypostasis Development

On the basis of literature review, the conceptual model developed and presented in Figure 01. The figure indicates the relationships between different inter organizational cooperation networks and innovation performance of SMEs.

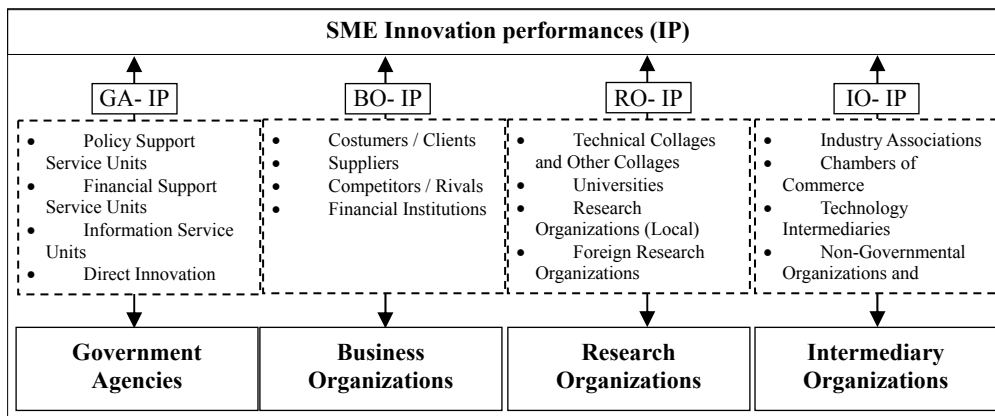

Figure 1 Conceptual Framework

Based on the conceptual model, it is supposed that there is a positive relationship between inter-firm cooperation network and SME innovation. Therefore, following hypothesis was developed to investigate the relationships between variables;

- H1- Level of cooperation between SMEs with Government Agencies, Business Organizations, Research Organizations and Intermediary Organizations are positively associated with SME Innovation Performances

3 Research Methodology

In order to investigate the relationship among selected variables, the sample was selected based on the data available with Sri Lankan Intellectual Property (IP) Office since this research is mainly focused on role played by different network actors in inter organizational networks in innovation process. The population of this study was all SMEs who have obtained the patents for their innovative products or services. In this particular study, structured questionnaire was used as data collections instrument and stratified random sampling was used as sampling technique where each year is considered as strata. There were 361 patents issued for local companies during period under consideration (2008 to 2012) and out of which; only 72 (25%) were taken by SMEs for its innovations. All 72 firms, 100 % sample survey was done and the response rate was 80 %. The questioner consist of 35 questions out of which 10 questions are focused on demographic information and other 25 questions are targeted on investigating the innovation behavior and relationships of the firms' innovations with inter-organizational actors. Since measurement of social relationships has always been a nagging and unresolved problem in relation to networks in these types of studies; respondents were asked some general questions about their networking activities. In order to obtain a better and deep understanding about the external organizations actors and their roles, respondents were given choices of answers based on 05 point Likert Scale from "very low to very high". Dependent variable, "Innovation Performance" was measured by getting the annual turnover of new products, new product index and modified product index. The measurement model with all items is analyzed as a confirmatory factor analysis. The covariance matrix for the items is used for the analysis, and parameter estimates are made under the maximum-likelihood method. The result of measure in this study, SPSS 21 is used as analytical software.

4 Findings and Discussion

This section present the finding of descriptive statistics and analysis of relationships of hypothesized variables. The result of the study is presented under the following two parts; as a measurement model for the five instruments and to define and measure the latent variables appropriately and consistently, and a causal model and to identify the interrelationships among the latent variables with a set of simultaneous equations.

Table 1 Result of Measurement Model

Latent variables	Observed variables	Standardize d parameter	t-statistic	Composite reliability	Average variance extracted
α_1 - Government Agencies (GA)	Policy Support Service Units (x_1)	0.76	9.25***	0.863	0.856
	Financial Support Service units (x_2)	0.94	12.71***		
	Information Service units (x_3)	0.78	9.50***		
	Innovation Support Projects (x_4)	0.83	11.60***		
α_2 - Business Organizations (BO)	Costumers / Clients (y_1)	0.95	12.79***	0.915	0.796
	Suppliers (y_2)	0.91	12.58***		
	Competitors / rivals(y_3)	0.74	8.75***		
	Financial Institutions (y_4)	0.84	11.85***		
α_3 - Research Organizations (RO)	Technical & other Collages (q_1)	0.77	9.37***	0.754	0.558
	Universities (q_2)	0.72	8.50***		
	Research Organizations (Local) (q_3)	0.95	12.85***		
	Foreign Research Organizations (q_4)	0.73	7.60***		
α_4 - Intermediary Organizations (IO)	Industry Associations (w_1)	0.82	11.35***	0.930	0.815
	Chambers of Commerce (w_2)	0.91	12.45***		
	Technology Intermediaries (w_3)	0.78	10.31***		
	NGOs and Development Partners (w_4)	0.86	11.95***		
α_5 - Innovation Performance (IP)	Annual turnover of new products (K_1)	0.81	11.25***	0.872	0.746
	New Products Index (K_2)	0.78	10.31***		
	Modified Product Index (K_3)	0.80	11.10***		

*Po0.05 level, **Po0.01 level, ****Po0.001 level (two-tailed).

The measurement model with all items is analyzed as a confirmatory factor analysis. The covariance matrix for the items is used for the analysis, and parameter estimates are made under the maximum-likelihood method. The result of measurement model is shown in Table 1, which indicates that the factor loadings in the measurement model are all greater than 0.70, leading to a conclusion that the reliabilities of individual items shown in Table 1 are within acceptable levels. Composite reliability coefficients for the constructs in the present model are all greater than 0.70, suggesting that a high

internal reliability existed in the constructs (Fornell and Larcker, 1981)^[11]. The average variance extracted (AVE) coefficients are all greater than 0.5, which suggests that the items are able to explain the variance in the constructs (Fornell and Larcker, 1981)^[11]. Discriminant validity shows the extent to which measures of a particular construct differ from others in the same model. For adequate discriminant validity, the diagonal elements of the correlation matrix should be greater than the off-diagonal elements (Fornell and Larcker, 1981)^[11].

Table 2 shows that the measurement model demonstrates adequate discriminant validity, implying that the various constructs used in the model belong to distinct and separate entities. Moreover, the measurement model shows acceptable fit values for RMSEA, CFI, GFI, AGFI, NFI and NNFI (see Table 3), revealing that the model does a good job in explaining the relationships between latent variables and observed variables.

Table 2 Discriminant Validity

	GA	BO	RO	IO	IP
GA	0.654				
BO	0.146	0.762			
RO	0.034	0.562	0.556		
IO	0.457	0.035	0.198	0.815	
IP	0.351	0.383	0.456	0.612	0.685

Fit indices of the causal model are calculated using: w/df=2.263, RMSEA (root mean square error of approximation)-0.079, NFI (normed fit index)-0.92, NNFI (non-normed NFI)-0.93, GFI (goodness-of-fit index)-0.85, AGFI (adjusted goodness-of-fit index)-0.83 and CFI (comparative fit index)-0.94. A rule of thumb for a model with a high degree of freedom is that a well-fitting model should have a w/df ratio of 2–5 (Kelloway, 1998)^[16]. An RMSEA value less than or equal to 0.8 indicates an acceptable fit (Browne and Cudeck, 1993)^[15]. Other fitness criteria such as NFI, NNFI and CFI are greater than 0.90 that indicates a reasonable fit of the model. Although the values of GFI and AGFI are higher than the recommended value of 0.90, the fit indices suggest that the model provides an adequate representation of the relationships among the variables in the proposed model. Overall, the fit indices suggest that the causal model fits the data fairly well and does a good job in explaining the relationships among the latent variables.

Table 3 Fit Statistics For Measurement Model And Causal Model

	Statistic Measurement Model	Causal Model
X2	178.27	219.57
df	95	97
X2/df	1.876	2.263
RMSEA	0.77	0.79
Goodness-of-fit index (GFI)	0.87	0.85
Adjusted goodness-of-fit index (AGFI)	0.85	0.83
Normed fit index (NFI)	0.93	0.92
Non-normed NFI (NNFI)	0.94	0.93
Comparative fit index (CFI)	0.95	0.94

Analyses of hypothesis can be made with an examination of the structural coefficients within the causal model. Table 4 provides the paths, the respective standardized parameter estimates and t-values. Predicts the paths from GA (Cooperation with Government Agencies), BO (Cooperation with Business Organizations), RO (Cooperation with Research Organizations) IO (Cooperation with Intermediary Institutions) and IP (Innovation Performance). As The path coefficients from GA to IP is positive and significant. Therefore results reveal that cooperation with government agencies for firms investigated can improve the innovation performances. Similarly the path coefficients of BO – IP, RO – IP and IO - IP are also positive and significant. It shows that cooperation of inter organizational networks has a positive impact on innovation performance of SMEs.

Table 4 Path estimates and hypothesis confirmation

Parameter path	Standardized coefficient	t-Statistic	ResultstoHypothesis
GA - IP	0.19	0.210*	Supported
BO - IP	0.52	0.625***	Supported
RO - IP	0.24	0.275*	Supported
IO - IP	0.22	0.225*	Supported

Note: These values are based on the causal model run on the covariance matrix. *Po0.05 level; **Po0.01 level; ***Po0.001 level (two-tailed)

5 Conclusion

On the basis of a sample of 72 manufacturing SMEs, this paper empirically explored the relationships between inter organizational networks and innovation performance of SMEs in Sri Lanka. The results indicate that there are significant positive relationships between cooperation with government organizations, business organizations, intermediary organizations, cooperation with research organizations and innovation performance. SME cooperation with business organizations is the most significant linkage out of four network actors.

6 Limitation of the Study and Suggestions for further Study

There were several limitations in the study. The empirical results were derived from a sample of Sri Lankan SMEs. Therefore finding might be country specific and cannot be generalized in to other countries. Other main limitation is that data only collected from SMEs which has obtained patents and these SMEs normally considered as best performing SMEs and network cooperation patterns and networks actors of other SMEs may not be in a similar pattern as this category and this need to be investigated in future research. Next, the data for this study are based on the perceptions and the experiences of the respondents, which may vary widely across industries, ownerships, and function and work experience of respondents within the firms. Further, the Likert scale used to assess the items of constructs in our study is indeed affected by flaws in measurement.

Hubei Academy of Social Sciences, Wuhan, P.R. China, 430070

(E-mail: 738379864@qq.com)

Abstract: The Third Plenary Session of the 18th Central Committee of the Communist Party of China put forward the concept of “innovative social governance system”. With the village Party branch at the core and the Villagers Committee as the governing body, village organizations play a vital role in the social governance at the grassroots level. After on-site investigation, the author found that problems such as ambiguous functions, insufficient funds, heavy debt on the villages, incapable leaders and a lack of backup talents widely exist in the village organizations. Accordingly, the author came up with approaches from the perspective of defining functions of the village organizations, guaranteeing funds operation and reinforces construction of the leading groups so as to ensure effective functioning of the village organizations and boost modernization of the social governance at the grassroots level.

Key words: Social governance; Perspective; Village organizations; Construction

1 Introduction

According to the Communiqué of the Third Plenary Session of the 18th Central Committee of the CPC, China will speed up the promotion of innovation in the social sectors, the equal access to basic public services and the efforts to form a scientific and effective social governance system.^[1] In the Chinese rural areas, the village organization framework has basically taken shape after years of painstaking exploration since the reform and opening up with the village Party branch at the core and the Villagers’ Committee as the governing body. Currently in Hubei Province, there are 17 cities, forest districts and municipalities directly under the jurisdiction of the Central Government with 26,137 administrative villages and 209,806 villager groups. The number of village cadres is 116,663, with 107,896 among them are Party branch secretaries as well as Village Committee directors, with each village having 4.14 averagely. As the essential bridge and tie connecting the government and the villagers, the village organizations shoulder significant responsibility for organizing the villagers to develop production as well as public welfare undertakings, upkeep social stability of the rural areas, and so forth. With the development of our economy and society, especially under the influence of tax-for-fees reform and urbanization, great changes have occurred to the operating environment and functions of the village organizations. With an eye on how the village organizations should adapt to the changing situations, convert from managing to governing and fully play their part in social governance at the grassroots level, the author conducted in-depth investigation, generated insights and put forth relevant solutions.

2 New Problems in the Construction of Village Organizations from the Perspective of Innovation in Social Governance

So as to ensure that the findings showcase the general situation of the village organization across the province, the author picked 10 villages located respectively in the plain area, hill area and mountainous area in Hubei as samples, among which are 3 big villages, 4 medium villages and 3 small villages. The findings show that construction of some village organizations is faced with serious problems mainly as below:

2.1 Improper work arrangement prevents service functions of the village organizations from full realization

Stated in the Organic Law of the Villagers Committees of the People's Republic of China, “the Villagers Committees are community level self-governance organizations for villagers to practice self-management, self-education and self-service.”^[2] Yet in actual work, Party organizations and government departments at all levels tend to exercise mandatory governance on the village affairs, sometimes even issues such as whether a village cadre should be kept or relieved of his position remain to be determined by the supervising departments. The village organizations can hardly implement self-governance in line with the actual situation of the villages and villager’s wills. What they can do is

“looking up”, or in other words, do as told by higher-level governments. In this case the Villager Committees are nothing but “administrative organizations to be”. Prior to the tax-for-fees reform, village cadres spent substantial time and energy pushing the villagers to submit grains and pay the fees for the purpose of accomplishing the task of turning in revenue. After the reform, the cadres are freed from the previous yokes. But the reality of passively “running errands” does not change much. Excessive administrative functions not just hinder the village organizations from performing self-governance and self-service, but also harden their operation. (Because the higher-level governments and departments trust the tasks to the village organizations without arrangement for or considerate arrangement for the overheads). Consequently, the village organizations are stuck in the dilemma with infinite responsibilities and finite capabilities. Seen from the surface, village organizations are attending to everything and are managing everything. But in reality they are not capable of tackling real problems and managing things well. Some “empty shell villages” are even paralyzed or semi-paralyzed. Under new circumstances, it has become a priority to convert functions of the village organizations, and convert them from the “omnipotent administrative organizations “doing everything and managing everything” to limited service organizations” doing necessary things and leave the unnecessary ones undone”.

2.2 Weakness in the generation of backup talents affects the performing of village organization duties

After the tax-for-fees reform, especially when the agricultural tax is cancelled, the main revenues of villages in Hubei Province consist of financial transfer payment, village collective revenues and “One Project One Discussion”. The investigation shows that Xiaohetou Village and Xifan Community have abundant funds and are running well. (Xiaohetou Village is at the outskirts of the city with 1.5 million RMB land compensation paid by the government; while Xifan Community is a village in the city with revenues contributed by factory and shop rental amounting to 2 million RMB.) Whereas the other villages hardly get along, whose total revenues, composed of financial transfer payment, village collective assets sub-contraction, “One Project One Discussion”, “begging for aims”(receiving financial support from the villagers who have made a fortune by doing business elsewhere), etc., totaling 0.444 million RMB, with an average of 55.5 thousand RMB for each village. Yet the expenditures amount to 0,6652 million RMB, with an average of 83.2 thousand RMB for each village. In total, the deficit is 0.2212 million RMB, with an average of 27.7 thousand RMB for each village. (See Table 1)

Table 1 Revenues of the Village Organizations

	Items	Total Amount of the 8 Villages	Average Amount of Each Village	Xiaohetou Village	Xifan Community
Revenues	1. Financial Transfer Payment	21	2.63	2.72	2.3
	3. Village Collective Assets Sub-Contraction Revenues	9.4	1.18	5	200
	4. One Project One Discussion	2	0.25		
	5. “Begging for Aims”	12	1.5	8	
	6. Land Compensation (for building roads)			150	
	Subtotal	44.4	5.55	165.72	202.3
Expenditures	1. Salaries & Subsidies for Village Organization Cadres	20.616	2.58	9	30
	2. Office Expenses	12.5708	1.58	7.35	
	3. Production & Operating Expenditures	15.17	1.90	7	
	4. Special Work (including inspections and evaluations, etc.)	8	1	7	13
	5. Village Public Welfare Undertakings	9.46	1.18	2.1	35
	6. Repayment of Debts	0.7	0.09		
	Subtotal	66.52	8.32	32.45	78
Total		-22.12	-2.77	133.27	124.3

The villages can barely guarantee sound operating, let alone the construction of small agricultural water conservancy projects, public facilities to keep the villages clean or public cultural and

entertainment services. Authority and influence of the village organizations are therefore impaired, and the villagers refuse to follow their orders. A village Party branch secretary told us that the villagers would not even attend the village meetings unless given towels, laundering detergent or stuff like that for free. Some village organizations are stuck in such predicament as with “sluggish collective economy, incapability of serving the villagers, and a lack of cohesiveness for the villagers.”

2.3 Heavy debts on the village organizations affect development and stability of the villages.

Village organizations in Hubei Province are constantly hit by heavy debts. Statistics from the Hubei Audit Office shows that by the end of 2008, the total debt amount of the village organizations in Hubei Province is 17.947 billion RMB, each village with 0.69 million RMB. Amongst all the 26137 villages across the province, 25,458 are indebted, accounting for 97.4% the total number. Nevertheless only 679 are debt-free, making up merely 2.6%. 29 villages are burdened with debt more than 10 million RMB and 82 with 5 -10 million. Those two types account for 0.4% off indebted villages. 5,250 villages are indebted with 1-5 million RMB, accounting for 20%; 6,833 with 0.5-1 million RMB, accounting for 26%; 13,774 with less than 0.5 million RMB, accounting for about 54%. Judging from the findings, among every 10 villages, only one is debt-free; and among the 9 indebted ones, the debt amount ranging from 0.3 million RMB to 3.17 million RMB. Debts on the villages have become a severe problem hampering the normal operating of the organizations, economic development and social stability in the rural areas.

2.4 Incapable leaders and a lack of backup talents hinder the working capability and cohesiveness of the village organizations

During the daily operation of the village organizations, people are apt to merely pay attention to “money”, while ignoring the subjective factor- “people”. Admittedly a short of money will affect the effective functioning of the village organizations. However, a lack of talents will even more hazardous. At present, village organizations are confronted with three major problems. First, low salaries can hardly help to keep the talents around. Annual pay for most of the village cadres in Hubei Province is 5,000 RMB or so, and for Party branch secretaries and head of the villages the amount is around 8,000 RMB. Clearly they are paid less than those working outside the villages. Hence some competent cadres choose being engaged in business over staying in politics. Second, generally the village cadres incapable and the villages lack righteous leaders. Currently, leaders work with fairness, not greedy or keen on taking advantage of others, and committed to developing the rural areas are in dire need. Third, there are too many aging cadres while young people are required. As most of the young farmers engage themselves in business and other jobs outside the villages, the local backup talents are far from sufficient. Some village organizations don’t even have successors for the vacancies, and the leading groups are not strong enough to deal with things.

3 Methods to Reinforce Construction of the Village Organizations and Fully Exercise Governance

3.1 Specify functions of the village organizations and ensure that they act within their power domain

Decision of the CCCPC on Some Major Issues Concerning Comprehensively Deepening the Reform points out that we should “properly handle the government-society relationship, speed up the separation of government administration from social management, and promote the social organizations to specify their power and responsibility, practice self-governance in line with the law as well as fully play their roles.”^[3] We should properly handle the relationship between village organizations and government according to the requirements of the “decision”. The government must change traditional management methods which relies on administrative command and control in social affairs, to build a service-oriented government. We should strengthen the public service and social coordination function, to create and provide a good policy environment for economic and social development.^[4] We should further streamline the village governance system, reasonably divide the duties of townships and villages, and convert the village organizations from “omnipotent administrative organizations” to “self-governing service organizations exercising”. Based on the Organic Law of the Villagers Committees of the People's Republic of China and the changing situations, village organizations shall mainly play their part in aspects such as serving the development of agriculture production and rural economy, keeping the villages clean, providing educational & scientific & cultural & entertainment services for the villagers, resolving conflicts and disputes, maintaining social stability in the rural areas, etc.

3.2 Guarantee operating funds of the village organizations and make sure they function with

sufficient funds

Village organizations shoulder lots of responsibilities in social governance at the grassroots level, and the government should give some financial support. Through analysis on the investigation and combine it with the reality in Hubei Province, the author found that each village would need 80,000 RMB for financial support so as to ensure normal operating of the village organizations. In detail it should be as follows: (1) Salaries& subsidies for village cadres. In accordance with the findings, salaries and subsidies for major cadres of the village organizations is around 8,320 RMB per year, for deputy cadres is around 5,540 RMB and for group heads about 2,000RMB. As to a middle-sized village, annual pay for a Party branch secretary (and village director) and 3 deputy cadres (and group heads) should total at 30,940RMB. (2) Office expenses of village organizations. Average should be 24,300RMB for each village, including office supplies 3,000RMB, utilities 800RMB, meeting 3,000RMB, newspapers& magazines 3,000RMB, maintenance 1,000RMB, preparation for inspection as well as for development of the organizations (mainly for development of the Party), study and training 1,500RMB, public security and peace keeping 4,000RMB, and hygiene 3,000RMB. (3) Production & Operating Expenditures (including construction of roads, water conservancy projects, farmlands, flood-relief, drought-relief, employment of caretakers, etc.) should be an average of 10,000RMB for each village. (4) Average cost for family planning in each village should be 10,000 RMB. (5) Average cost for emergency response in each village should be 5,000 RMB. The above five items amount to 80,240 RMB. If each village requires 80,000 RMB, then there should be in total 2.09 billion RMB transfer payment funds for all the 26,137 villages in Hubei Province.

Efforts should be made to clear the debts and by means of enforcing the transfer payment for the rural areas, increasing collective revenues of the village organizations, withdrawing the bonds, etc. to ease the pressure on the village organizations. Also w should strengthen the village collective economy by developing characteristic operation, property operation, innovative assets operation and cooperative economy between the villages and the enterprises, etc.

3.3 Carry out sound construction of leading groups in village organizations and solve the problem of “not act until being supervised”

Select capable heads of organizations, and support them with competent leading groups. Based on the criteria of “selecting those with both morality and ability, and appointing those truly capable” as well as on the principle of “democracy, competition, and priority to the talents”, by means of masses’ & Party members’ recommendations and directly election by the meetings for Party members, put the village Party members who have a good knowledge of politics, operation, management and are capable of leading the masses to fortune at the position of the village Party branch secretaries.

For villages with favorably conditions, they can actively explore the method for open election of cadres in the Villagers Committee and the village Party branch. Via the incentive system through competition, promote the capable young people with competence, knowledge and passion for working in the village as village cadres so as to consolidate the ruling foundation of the Party. Construct the incentive system of performance evaluation, reinforce supervision over the village cadres, and implement the system of report on work as well as of democratic evaluation and supervision to motivate the cadres. Take more strict measures towards the disposal of the corrupt cadres. Punish those with disciplinary violations and never tolerate their mistakes.

3.4 Complete village financial management and ensure the cadres carry out their jobs in conformity with the official documents

Enforce construction of village organizations financial management system, further specify to what extent are the operating funds under guarantee, relevant expenditures as well as payment terms, ensure safe use of the funds, and make the best of the funds in village social and economic development. Further complete the system of “putting the village finance under the control of the township”, and make the authorized financial agent more effective. On the one hand, we should conscientiously change the current situation of “focusing solely on the account books rather than the actual account status and not practicing auditing”. On the other, we should include all the revenues apart from financial allocation from the higher-lever governments in “putting the village finance under the control of the township”, and exterminate “private village vaults”. Reinforce supervision and implement the open system of village affairs. Ensure comprehensive and regular efforts are done. Meanwhile the radio, television and websites in the counties (cities) as well as townships should ensure rolling broadcast/report for the criteria, object, and amount of subsidies that will benefit the farmers, the minimum subsistence allowance, land compensation and other issues closely related to farmers’ benefits.

4 Conclusion

“Acting within the power domain, having capable cadres in charge of things, having sufficient funds to do things and carrying out jobs in conformity with the official documents” are the four driving wheels for the village organizations to exercise governances at the grassroots level. Respectively, they are the prerequisite, foundation, basis and guarantee. Only by realizing all the four can village organizations operate efficiently and boost the modernization of social governance at the grassroots level powerfully.

Tertiary Industry Output-Value Forecast

Shi Xi, Xu Hongyi

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 1216701275@qq.com)

Abstract: As an important part of national economy, the importance of the service industry has become increasingly prominent, the development of the service industry has become an important indicator of measuring the level of overall competitiveness and modernization of the region and an important engine of economic growth. In recent years, the development of China's service industry has shown a total big, fast, good quality situation, at present, our country is in economic restructuring and industrial upgrading critical period, the service industry plays a vital role. Therefore, this paper collected the output-value of the service industry during 1991 to 2012 as the basis, used the SPSS curve estimation method, estimated the service industry output-value during Thirteen Five. The purpose of this research was drawing a clear data on the future development of China's services industry, and providing the certain research support for formulating Thirteen Five plan.

Key words: The service industry; Output-value; Forecasting; SPSS

1 Introduction

From the beginning of the first Five-Year Plan to now, China has put forward twelve Five-Year Plans. The Five-Year Plan (FFYP) is aimed at scientifically determining the urgent tasks and major initiatives for future development of the next five years, which is of great significance for us to deal with the ever-changing environmental situation at home and abroad, undertake the important mission and responsibility in the national development, and see through the new circumstances in the development of the economy and society.

In the latest FFYP, the "12th five-year service industry plan" which occupies an important position, is a strong demonstration that China's service industry is developing rapidly and has made great achievements in recent years. From the reports in China Statistical Yearbook, we can see that: the value added of service sector increased at annual average growth of 11.9% during the 11th Five-Year Plan, 0.7 percentage points higher than the rate of gross domestic product (GDP); in 2010, the value added (17.4 trillion yuan) increased 9.9 trillion yuan or 1.3 times compared with the value in 2005. Fixed assets investment of service industry across the country totaled 49.6 trillion yuan, up 25.2%; its proportion of total investment in 2010 was 54.7%, rising by 1.1 percentage points over 2005. Employment in the service sector in 2010 reached 26,332 million, which was a total rise of 2893 million and an average annual rise of 578.6 million; besides the proportion of total social employment reached 34.6%, increasing by 3.2 percentage points over 2005.

Therefore, to develop the service sector is definitely of great significance, and its development has attracted wide attention. FFYP has clearly put forward requirements that we should significantly improve the level of socialization and professionalization in service industry, foster a number of major service business with innovative ability and high service levels. In this case, it is very important to know the service industry development in previous FFYPs, forecast the developmental level in the upcoming 13th FFYP, and understand the role that services sector plays in the country's total industrial development. To this end, based on the data from 1991 to 2012, this paper presents the output, growth rate and proportion of service industry during this period, besides we forecast the potential changes of service sector output and GDP from 2013 to 2020.

2 Datas and Methods

We collected the service sector output data and the corresponding data of GDP in 1991-2012, from a variety of statistical bulletins and China Statistical Yearbook. After finishing the basic data collection, we standardized the collected datas, aimed at laying the foundation for later analysis.

In this paper, we forecasted the service industry output and GDP in the period of 2013-2020 by using non-linear regression method with SPSS. Because we found that the data in the 20 years presented a curve change. Nonlinear regression curve estimation in SPSS contains eleven kinds of function models, including Liner, Quadratic, Compound, Growth, Logarithmic, Cubic, S, Exponential, Inverse, Power, and Logistic equation.

Thus, this paper firstly needed to select the most appropriate and most scientific models from this

11 kinds of function for the subsequent analysis. By SPSS software, the time is regarded as the independent variable X, service sector output and GDP is regarded as the dependent variable Y1, Y2, subsequently calculate the fit degree of each model, and then choose the most appropriate curve estimation model to predict the output value. The fit degrees of Y1 and Y2 are as follows:

Table 1 The Fit Degrees of Y1 and Y2

The fit degree	R Square(Y1)	F(Y2)	R Square(Y1)	F(Y2)
Linear	0.839	109.143	0.852	121.073
Logarithmic	0.838	108.320	0.851	120.136
Inverse	0.837	107.506	0.850	119.208
Quadratic	0.840	109.974	0.853	122.020
Cubic	0.841	110.814	0.854	122.977
Compound	0.989	1967	0.982	1159
Power	0.990	1998	0.982	1169
S	0.990	2029	0.983	1179
Growth	0.989	1967	0.982	1159
Exponential	0.989	1967	0.982	1159
Logistic	0.989	1967	0.982	1159

As we can see from the tables above, the R value of Compound, Power, S, Growth, Exponential and Logistic function models are greater than 95%, which means these models fit the data well. And Power function model can be excluded for its fitted curve. Therefore, we choose Compound, S, Growth, Exponential and Logistic the five function model to predict the value of service industry output value.

3 Results

This paper predicted the service output-value and the total output-value of China by using five kinds of function model, including Compound, S, Growth, Exponential and Logistic, and found that the Compound, Growth, Exponential and Logistic these four function model derived exactly while the S function model predictions or less, and therefore chose to use Compound, Growth, Exponential and Logistic four function model to predict the results of the final result, the forecast results in the following table:

Table 2 The Forecast Results of the Service Output-Value and the GDP In China During 2013-2020

years	the service output-value	GDP
2013	284563.9	618796.1
2014	333094.4	713196.0
2015	389901.4	821997.0
2016	456396.5	947395.9
2017	534231.8	1091925.1
2018	625341.5	1258502.7
2019	731989.3	1450492.4
2020	856825.1	1671770.9

The above table shows that: to 2020, output-value of the services industry will reach 85.68251 trillion yuan, the growth nearly reaches 4 times compared to 2010, it reaches 20 times compared to 2000, it reaches 144 times compared to 1990; and to 2020, the GDP will reach 167.17709 trillion yuan, GDP increases more than three times compared to 2010, more than 15 times compared to 2000, more than 88 times compared to 1990.

The output-value of the industry is able to demonstrate the development of the situation to some extent, but it does not show a very intuitive pace of development of the industry. Therefore, use of the above output-value forecast results, combined with already collected the output-value of 1990--2012, calculated 2013--2020 annual output-value growth rate, and thus calculate the average output growth from eighty-five plan to thirteen Five-Year Plan, the result is as follows:

Table 3 During the Eighty-Five to Ten Thirty-Five Average Output Growth

years	Five plan	average output growth of the service industry	average output growth of GDP
1991—1995	Eight five plan	27.75%	26.81%
1996—2000	nine five plan	14.16%	10.36%
2001—2005	ten five plan	14.13%	13.30%
2006—2010	eleven five plan	18.37%	16.87%
2011—2015	Twelve five plan	17.61%	15.45%
2016—2020	Thirteen five plan	17.05%	15.26%

As can be seen from the table: during Thirteen Five-Year period, China's service sector output growth is expected to reach 17.05 percent, China's GDP growth rate will reach 15.26%; from eighty-five to Thirteen-five, China's service industry output -value and GDP's growth showed a trend of fluctuations; China's service industry output growth and GDP growth rate showed less volatile during twenty-five plan to thirteen-Five plan, future development and national development of the service is likely to remain steady progress.

4 Conclusion

According to the research: to 2020, the output value of China's service industry will reach 85.68251 trillion yuan, the total output value will reach 167.17709 trillion yuan, the proportion of the service industry will exceed 50%. This also proves that: for at least the next five years, the output value of China's service industry will continue to maintain good growth. But generally the output value only can represent the amount of the service, and there is no consensus about the quality of the service, because of its intangible nature and diversity. Therefore, in the future stage, how to enhance the quality of service products is that we should solve an important issue.

This paper emphasizes two major factors for the development of the service industry: the scientific and technological content and humane care level, they determine the quality of service, good or bad. Scientific and technological level is objective, for the business or a service product, the most essential thing is the grasp and contain for the situation. Humanistic care is the essence of service, when the service business or service workers provide products, the first thing is to show the extent of their services to meet consumer demand, which is the degree of humane care. Moreover, in the era of the new technological revolution, the application of new technology for remote communications, nanotechnology, biotechnology electronics, renewable energy, information technology, digital, intelligent, 3D printing, is a new opportunity for long-term development of the service.

In short, China's service industry want to achieve a better development, we must make full use of achievements of domestic and foreign technological revolution, build a sound credit system, overcome the lack of good faith in order to improve service quality.

Abstract: With the increasing in the number of motor vehicles, road traffic accidents are raising year by year, and the seat belts can effectively protect passengers and alleviate the damage in a collision of road traffic accidents to a certain extent. This paper proposes a useful approach to address the issue of seat belt reminder in road traffic accidents. This proposed approach involves two levels of functions: (1) a fitting formula for calculating the number of life that can be saved in the traffic accident and (2) the use of traffic accident death compensation to determine the related economic losing that can be avoided by using seat belt owing to seat belt reminder. Based on the fatal data of driver in the traffic accident of China and the relationship of the seat belt using rate between the dead driver and the rate in our research, we verified that seat belt reminder plays a significant role in improving road traffic safety.

Key words: Seat belt reminder; Road traffic accidents; Effectiveness analysis

1 Introduction

The occurrence of road traffic accidents is frequent, which causes massive loss. There are 3429234 people dying in the road traffic accidents in China in 2014, and the number rises slightly year by year, comparing with 316043 in 2013, 302225 in 2012 and 29618 in 2011. In addition, the relevant data shows that the number of motor vehicle drivers has made a rapid increase in the number of 13 billion, a historical figures, in the end of 2014 in China, which makes China faces a more severe traffic safety situation. Therefore, it is urgent to take some measures to cut down the occurrence of road traffic accidents. The seat belt is a kind of anti-collision equipment, which is widely installed in the vehicles. It can effectively reduce the death toll of drivers in road traffic accidents. However, the seat belt using rate is not optimistic in China, and the traffic accidents emerge one after another due to the failure to use a seat belt.

The seat belt reminder can warn the drivers to use a seat belt to decrease the rate of death. Specific implementation technical requirements of seat belt reminder in motor vehicles are prescribed in the "Global Road Safety Cooperation" (GRSP) in 2004. The Japanese Transport Ministry requires that there must install seat belt reminder in the drivers' seat of motor vehicles in 2005. A law, "People's Republic of China on Road Traffic Safety Law", has been passed in 2003. It prescribes that drivers and passengers should use seat belts by regulations. Zhang Qiantong(2008)^[1], Qin Yu(2009)^[2], Li Yingchun(2009)^[3] all conduct field surveys and collect data of actual seat belt using rate in some areas of China and collected data. It shows motor vehicle driver rarely wear the seat belt, which is the important cause of frequent traffic accident. In view of this, this paper analyzes the effectiveness of seat belt reminder on reducing the death toll and economic loss in the traffic accidents, and expound the role of seat belt reminder in improving road traffic safety.

2 The Effectiveness of Seat Belt Reminder

The Chinese road traffic accident statistics show that the motor vehicle drivers' death toll of 2010 is 23076. However, in the actual road traffic accidents, the drivers' seat belt using rates of the death and the reality researches are different. Thus, the drivers' seat belt using rates in real survey can't be directly used to estimate the number of deaths who do not use a seat belt in road traffic accidents. In addition, the China road accidents statistical yearbook currently covers no statistics of road traffic accidents referring to the seat belt using rates, while the Japanese have already set these research for many years. Therefore, we take part of the data under the reference of the relevant research in Japan^[4]. Specific analysis process is shown in figure 1.

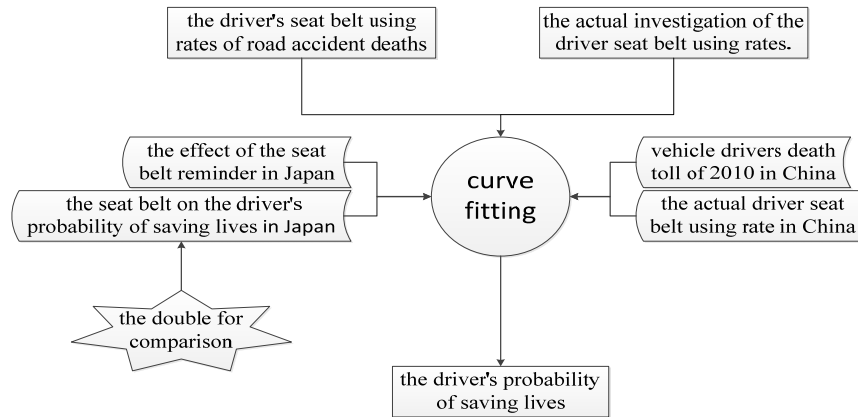

Figure 1 Effectiveness Analysis Process of Seat Belt Reminder

The curve fitting of seat belt using rate in the actual investigation and the death driver in road traffic accidents in Japan is:

$$y=0.9479x+0.5355 \tag{1}$$

Where x is the drivers' seat belt using rates of road accident deaths, y is the actual investigation of the driver seat belt using rates.

Assume the actual driver seat belt using rate was 65%, while in real life many second and third tier cities and towns far from 65%. Fit the data into the curve, then you can calculate that the traffic accident death of the drivers' seat belt using rate x is 12%. Therefore, the number of driver who died in a traffic accident not using seat belts A_{11} is:

$$A_{11}=A*(1-x)=23076*(1-12\%)=20307 \tag{2}$$

If installed seat belt reminder in the motor vehicles, it will alert the driver to use a seat belt, there will be people to use seat belts in the death driver,

$$A_{12}=A_{11}*E=20307*42\%=8529 \tag{3}$$

is the effectiveness of the seat belt reminder.

The death toll of not using seat belts in the road traffic accident is analyzed by double for comparison method in Japan, and draw the following conclusions: if all these people use seat belts, it can increase the drivers' survival rate by 42%. China has no detailed statistics and research in this field so far. In this case, according to research data of Japan, the probability of a seat belt to save the life of the motor vehicle drivers is 42%.

Thus, the number of drivers can be saved in the road traffic accidents of China in 2010 is:

$$A_{13}=A_{12}*42\%=8529*42\%=3582 \tag{4}$$

A series of calculations can be drawn from the above, by installing a seat belt reminder, 3582 drivers in the road traffic accidents will be saved, which is the 15.5% of the total number of deaths in 2010.

Seat belt can effectively reduce the casualties of passengers in road traffic accident. If the passengers use the seat belt under the seat belt reminder, then can give full play to the role of the seat belt, to a certain extent, and reduce the number of road traffic accident deaths. However, in the process of road traffic accidents, using a seat belt can't prevent the driver from death in the road traffic accidents. It can decrease the user's death rate in a certain degree^[5]. If a seat belt is installed in the motor vehicle, it will further improve the safety of the driver.

3 Analysis of Economic Loss

In a Japanese study, the amount of personal damage caused by traffic accidents has been calculated. In view of the accident situation (e.g., thrown out of the motor vehicles, damage caused by internal components and outer part of motor vehicles to human body), according to whether to use a seat belt carried out a detailed statistics. As the effectiveness of using seat belt, for each dead during the traffic accident, the economic losses can reduce 408000 yen. So if the seat belt using rate is increased by 1%, it can reduce the loss of 2.4 billion yen. If all the drivers are in accordance with the law to use a seat belt, is expected to reduce the loss of 67.4 billion yen.

In Chinese traffic accident statistics, whether to use a seat belt is not a statistical content. Therefore, in the cost estimation relate to reduce the number of drive deaths, according to whether or not using seat

belt to analyze the casualties caused by different damage is very difficult. In addition, the economic loss in the traffic accident statistics in China is just a vehicle damage caused by accident, not including the loss caused by the personal injury. So we only consider from the point of accident compensation, which mainly refer to the relevant policies of the death compensation. Specific analysis process is shown in figure 2.

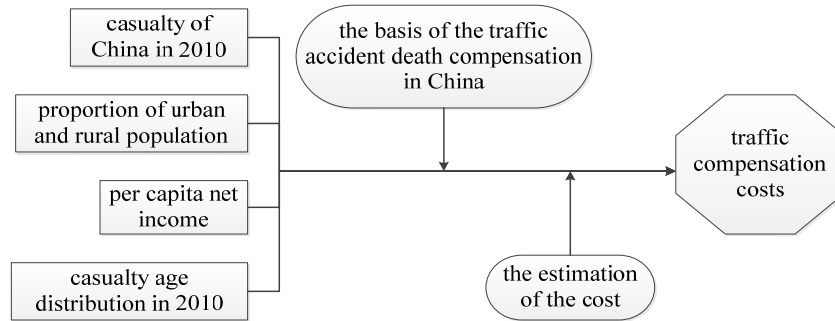

Figure 2 Effectiveness Analysis Process of Economic Loss

Conforming the traffic accident death compensation in our country, the economic losses of the 3582 people’s death can be calculated. The main basis of the traffic accident death compensation in China is as follows: according to the location of the court of appeal, the urban residents per capita disposable income or rural residents per capita net income multiplied by 20 years. More than sixty years old, the age reduction for each additional one-year-old year; more than 75 years of age by five dollars, people over sixty years old by 15 years in accordance with the compensation plan. China’s urban residents per capita disposable income is 19109 RMB in 2009, and per capita net income of rural residents is 5919 RMB. According to the 2010 statistics of road traffic accidents, regional distribution of deaths: rural residents accounted for 33% and urban residents accounted for 67%; the age distribution of deaths: sixty years old and below accounted for 83.53 percent of deaths and the deaths of over sixty accounted for 16.47%. Table 1 is the casualty age distribution in 2010.

Table 1 Casualty Age Distribution in 2010

	Death Toll		Injured People	
	number	percentage	number	percentage
Total	65225	100%	254075	100%
0-60	54487	83.53%	230292	90.64%
61-65	3352	5.14%	8746	3.44%
>65	7386	11.33%	15037	5.92%

By calculating the death of urban residents need to pay C_1 :

$$C_1 = \text{the number of people} * \text{proportion of urban population} * \text{per capita net income} * \text{effective compensation year} \tag{5}$$

$$= 3582 * 65\% * 19109 * (20 * 83.53\% + 15 * 16.47\%) \approx 897 \text{million}$$

Compensation for the death of rural residents C_2 :

$$C_2 = \text{the number of people} * \text{proportion of rural population} * \text{per capita net income} * \text{effective compensation year} \tag{6}$$

$$= 3582 * 33\% * 5919 * (20 * 83.53\% + 15 * 16.47\%) \approx 134 \text{million}$$

Total compensation C :

$$C = C_1 + C_2 = 879 \text{ million} + 134 \text{ million} = 1013 \text{ million}$$

Thus, if the seat belt reminder can save these lives in road traffic accidents, it will reduce 1013 million RMB in compensation terms.

The casualties caused by road traffic accidents and its aftermath subsequent economic, social problems are shocking. What it brings is a lasting and permanent effect. At present, people remain committed to cut down the frequency of traffic accidents and the economic and social problems it brought. The seat belt reminder has a positive effect in reducing the number of casualties in motor vehicles accident of China, also can generate considerable economic effects.

In summary, by installing the seat belt reminder, from the perspective of the drivers it can save more than 3000 lives and more than 1000 million RMB of traffic compensation costs. Therefore, the seat belt reminder has a great significance in reducing traffic accident casualties and the corresponding economic loss resulting in these accidents, so as to improve the situation of road traffic safety in China.

4 Conclusion

During the process of traffic accident, the use of the seat belt can't completely avoid the drivers death, but can reduce the drivers' casualty rate to a certain extent. In this way, by using the seat belt reminder, it can improve the seat belt use rate to cut down the risk of death ratio of the driver in the process of traffic accident.

The contribution of this study is mainly reflected in three aspects:

(1) This paper introduces the effectiveness of using seat belt in Japan to reduce the mortality of the accident, then the death toll of the accident of motor vehicles in China reduced by using the seat belt reminder is analyzed. So that increasing seat belt using rate is a good way to alleviate the number of casualties in traffic accidents.

(2) By applying 2010 traffic accident data in 2010 of China, by wielding the fitting formula, we can estimate the number of driver who died in the accident without using a seat belt. We can conclude that the seat belt reminder can improve the use rate of seat belt and the survival rate of driver after the use of the seat belt.

(3) On the basis of the number of life in the front seat of the 2010, according to the standard of road traffic accident compensation in China, the amount of economic losses can be estimated at more than 100 billion RMB. Thus, the seat belt reminder has a very good effect in improving the road traffic safety in China.

Great potential still exists to improve the performance of the proposed approach. First, part of the algorithm of this paper use Japanese corresponding analysis data to analyze the effectiveness of motor vehicles seat belt reminder of China. To implement a detailed analysis based on the data of China, the capital investment is too large and cycle time is too long. Further improvement of vehicle passive safety research and road traffic accident statistics in China is needed. Second, in addition to seat belt reminder, we also can improve seat belt using rates through some other ways, such as strengthening security education for drivers, enlarging the penalty of relevant personnel without using seat belt, etc. This paper may be helpful to further research, particularly that related to road traffic accidents.

Abstract: Accelerated changes in science and technology, media and economy, among others, are directly influencing society and hence, companies; so Corporate Governance which is the system by which organizations are directed, monitored and encouraged, involving the relationship between owners, Board of Directors, Officers and oversight bodies are in need to follow the trends. Good corporate governance practices need to transform principles into objective recommendations, aligning interests, in order to preserve and optimize the value of the organization, facilitating their access to resources and fostering resilience. Similarly private sector companies, public institutions in recent decades have been seeking mechanisms to reinvent themselves and modernize their management models. Large hospitals are increasingly seeking marketing innovations to serve its customers quickly and efficiently, for which there is a need to reinforce corporate knowledge from executives or administrators. According to the Code of Best Corporate Governance Practices of the IBGC, the principles and practices of good corporate governance apply to any organization, regardless of size, legal status or type of control. This paper seeks to identify how good governance could improve hospital management processes, and for that purpose key areas for improvement in current hospital management processes were focused, to understand how corporate governance stands in public administration and contribute to the discussion of corporate governance analyzing the state of the art on the subject. Nowadays is becoming in evidence in Brazil the increasing importance of the subject as well the relative lack of academic studies on Corporate Governance that is becoming more critical every day.

Key words: Corporate Governance; Public Hospital; Processes Management

1 Introduction

Hospitals, as it known today, were a consequence of a series of historical events. In the Middle Ages, hospital organizations were built as ways to give attention and support dying and helpless people (GONÇALVES, 1983; FOUCAULT, 1974), and had close ties to religious and charitable organizations.

In Brazil, hospitals followed the same pattern observed in European societies. The first hospital appeared in the sixteenth century with the creation of the Santa Casa de Santos, very much similar to the then existing hospitals and sanatoriums in France and Portugal (MIRSHAWKA, 1994; GONÇALVES, 1983).

We may identify in Brazil three main types of hospital organizations, namely, public hospitals, charitable and non-profit hospitals and for-profit hospitals (MINISTÉRIO DA SAÚDE, 2001).

However problems in the economic environment have reduced government revenues and the possibilities of resources, factors that added to society's pressures and hence the need for strategic management of public resources and performance evaluation, knowing that seeking best practices in Corporate Governance (CG) by the companies directly impacts the performance of organizations (ANDRADE et al, 2009; SILVEIRA et al, 2008). Moreover there is need now to seek competitive advantage and form strategic alliances with stakeholders. It is understood Stakeholders groups of individuals who affect or are affected by the achievement of organizational goals (FREEMAN, 1984).

So for this paper a series of interviews with leaderships was developed at a very large public hospital in Sao Paulo Brazil, to find out information regarding management problems and processes in Brazilian public hospitals, where good governance practices are still missing in management, and also identify best practices in Corporate Governance that may improve hospital management.

2 Corporate Governance

According to the IBGC (Brazilian Institute of Corporate Governance), Corporate Governance is the

system by which organizations are directed, monitored and encouraged, involving relationships between owners / members, Board of Directors, Officers and Control Bodies (Supervisory Board, audits and others). Good corporate governance practices convert principles into objective recommendations, aligning interests in order to preserve and optimize the value of the organization, facilitating their access to resources and contributing to its longevity and durability. (IBGC, 2015).

The basic principles of Corporate Governance are:

Transparency: It is the desire to inform addition to the mandatory information, or provide stakeholders what is of interest, resulting in a climate of trust, internal and third. Factors beyond the economic and financial must be taken into account, including intangible, that guide managerial action and leading to value creation.

Equity: It is characterized by fair treatment of all shareholders and other interested parties (stakeholders). Attitudes discriminatory policies are unacceptable.

Accountability: It is the accountability for governance agents of its activities in a transparent, impartial, and assume the consequences of their acts and omissions.

Corporate Responsibility: The Governance agents should ensure the sustainability of the organization, for their longevity and durability, taking into account the socio-environmental issues in the definition of businesses and operations.

Corporate governance has grown worldwide because it contributes to the longevity and sustainability of organizations, increases its value, generates more trust with all related stakeholders, attracts the best capital (quality and lower cost) and, thus lever healthy growth. The best corporate governance practices provide greater transparency and qualify the relationships between stakeholders, helping to reduce the risks and harmonize conflicts of interests present in all institutions.

Organizations that follow the principles of Corporate Governance professionalize its administration and management, extend the effectiveness of their controls, mitigate risks, improve their competitiveness and create a difference in the conduct of their business.

The board of directors is a collegiate body in charge of the decision making process of an organization in relation to its strategic direction. It is the main component of the governance system. It has the role of uniting the ownership and management, to guide and supervise the relationship of the latter with other stakeholders. The council receives powers of the partners is accountable to them.

3 Hospital Organizations

One of the main problems encountered in hospital information systems is the definition and method for measuring and analyzing services by the set of services available (serve mix) or the set of patients (case mix). In any case it is important to foster the use of indicators and information to compare the health organizations for bringing them to superior levels and competitive advantage through references (benchmarks) processes, practices and performance measures.

Moreover one of the more important challenges of Obama's government has being related to the reforms needed for his New Health Care Program. This is in particular due to the increase in health care costs in the United States, in the 60s and 70s and more even today, in which predominated after payment systems (per diem compensation system) and pay per procedure (fee-for-service) lead to the need restructuring forms of financing of health care, by deploying the Prospective Payment System - PPS, whose main objectives were to reduce hospitalization rate and minimize performing unnecessary procedures. This system defined a fixed amount to be paid to each hospital for serious cases.

The implementation of the PPS demanded the creation of a database to set the amounts that would be paid to establish the amounts that would be paid per patient. In the 60s, Yale University developed the Diagnosis Related Groups - DRG's (Homogeneous Diagnosis Related Groups - DRG), a system that relates the case mix of hospitals (proportional relationship between the different types of patients seen in a given service) to the type of technology used in health care and their corresponding costs.

Using DRG a considerable reduction in cost per high and significant decreases in average stays. Studies have shown the usefulness of DRG Construction of hospital performance indicators. DRG different versions have been developed and updated regularly, including to classify patients seen in outpatient clinics and long-term care services, currently being used as the basis for resource allocation and payments in several countries in Europe and Australia.

Several systems are aimed at organizational strategies with performance indicators and management focused on facilitating the use of information for those who must make the decisions. The Balanced Scorecard - BSC has been expanding in healthcare and diverse experiences have been leaked,

revealing both the potential of this methodology, the difficulties for its implementation in healthcare organizations.

The BSC provides the organizational alignment of individuals and interdepartmental initiatives, enabling efforts are directed to the areas that need more attention, using classified according to four categories indicators finances; customers; internal processes; learning and growth.

Research and Brazilian experiences reports also have shown the usefulness of building control panels to assess the performance of the actions developed in the different health care levels, including in public institutions.

Recently, we observe the trend of the merger of information technology (IT) to support improved quality of care practices (Quality Improvement - QI) and patient safety. To this end, the Agency for Healthcare Research and Quality - AHRQ is providing a free suite of software to facilitate the comparison of the performance of American hospitals.

Some hospital directors linked to the Coordinator of Health Metropolitan Region of Greater São Paulo SES of Sao Paulo, according to studies, with regard to hospital indicators prefer the so-called "classics" that is, indicators established by use, such as: occupancy rate, average stay and institutional mortality rate, among others. Regarding the selection of indicators, there is a consensus that is not carried out in accordance with the strategies of the institution, being chosen the indicators established by use, or in accordance with what is requested by the central level of the Secretary of Health, ie, follow prescribed standards without the customize to the needs of the institution's manager.

With regard to information systems, the directors indicate little investment since few hospitals are fully computerized. With respect to integrated information network, only two hospitals have the benefit. This generates an operating burden, once again, that the manual records systems require a high cost and high maintenance work.

In the view of the directors, there are no regular feedback mechanisms of the higher levels of SES to hospitals. It is believed that this information is applicable to the vast majority of Brazilian hospitals, both public and those held by private institutions.

Tailored information from survey of 24 hospitals in 2000, described in the article "Use of Information in the public hospital management."

4 Discussion and Analysis

The main purpose of the Hospital was to be a reference in teaching to new medical students of the Faculty of Medicine and Surgery of. It is a municipality of the State of São Paulo, linked to the Health State Secretariat for administrative purposes associated with the USP School of Medicine for academic purposes.

The hospital's mission is to be an institution of excellence recognized nationally and internationally in teaching, research and health care. The values and ethics: Having a behavior in accordance with the fundamental principles of the hospital and Public Management; Pluralism: Recognize and respect the diversity of people, functions and formations that make up the complex; Humanism: Act focused on similar, recognizing and valuing their desires and needs; Pioneering: To set an example in its area of operation using innovation as a tool; Social Responsibility: Compliance with the duties and obligations to the society at large; Institutional Commitment: Be committed to the *raison d'être* of the organization (education, research and care).

The Guidelines are the Integration: with all the hospital system; improvement, enhancement and integration of the processes of teaching, research and extension; Humanization: the patient care; improvement of human relations at all levels; Sustainability: economic, social and environmental, governance and participatory management; Internationalization: exchange with the knowledge of the outside; international relations; New Technologies: incorporation in teaching, research and assistance; Excellence in Education.

It's one of the largest in Brazil and occupies an area of 600,000 square meters with approximately 2,400 beds, it is 40,000 surgeries, 1.3 million outpatient visits, 66,000 hospitalizations, 2,500 scientific papers, 9 million meals, 480,000 diagnostic imaging, 370,000 emergency calls and 600,000 transplants, 8 accredited hospitals and national and international accreditation process, 15.3 million units of medicines produced annually, 662 million medical images stored avoiding the impression films (filmless) and 3.4 million diagnostic imaging exams. This structure contributed 2.5 million dollars in excellent services to society.

The concept of management is defined as active process of determination and direction of the path

to be followed by an organization to accomplish its objectives, comprising a set of analyzes, decisions, communication, leadership, motivation, evaluation, control, between two activities own management (Ansoff, 1997). In our case the bodies of the senior management are: the Executive Board, the Superintendent and the Board Clinic. The Advisory Board consists of full professors of the Faculty of Medicine. The Board set the basic guidelines of medical and hospital research activities of cooperation with the courses of the Faculty of Medicine; the Clinical Board has the authority to coordinate medical activities and support of teaching and scientific research in hospitals; and the Superintendent is the executive direction of the upper body that coordinates and controls the hospital administration activities. The superintendent is appointed by the Governor.

The definition of hospital Strategic Directions is made by the upper and middle management, at an event organized by the Center for Human Resources Management (NPM), with the participation of the State Department of Health, School of Medicine, members of the Board, Clinical Board, Boards of Directors, Supervision, Technical Centers, Central Ombudsman, Executive Boards and consultants.

The organization of work is being implemented in the hospital based on a matrix model structure whose transfer units linked to its structure the model designed for superior administration.

The matrix structure is multidimensional. Work units are the projects, the permanent bodies (functional) act as service providers in the projects. The organization in each project is temporary, giving greater versatility and optimization of human resources.

Some motivating factors were identified regarding implementing best practices in corporate governance and improve management processes and internal controls, develop indicators, improve information, increase performance and competitive advantage. In the current context there is a growing requirement for services in health, both private and public area, are organized to respond to people's needs and provide effective and compassionate care.

Three interviews were developed with the one that are directly responsible for areas related to improvements that are being implemented with the Corporate Governance at the hospital. It was used, in semi-structured interviews, questions about how the adoption of best practices in Corporate Governance in the hospital, improve current management processes and other aspects which would benefit.

The Management Center for People (NGP), created a sector of Corporate Governance by senior hospital management (Superintendent), where a team is managing the adoption and improvement of processes, management, information flows and computerized core systems.

According to the manager of Corporate Governance of the NGP, internal problems are being mapped such as lack of consolidated information, the absence of a computerized unified system for human resources, little control internal processes, workflows and poor transfer of information between the cores.

Given these facts, the manager mentions that changes are already taking place, such as the creation of an integrated system for management of information between the Management Center for People and other sectors of Human Resources (HR) of eleven buildings that make up a hospital complex, policies to control over twenty-two thousand employees, contracts administration and dismissals, creation of internal audits to improve the adhesion between the areas and the management and development of indicators to monitor and track the processes and projects.

The Specialized Center for Information Technology (NETI) is also adhering to best practices in governance with a greater focus on information technology. Was interviewed the infrastructure manager and services, which is positioned in favor of the use of governance to enhance and improve the organization, communication and definitions of roles and responsibilities, the NETI is modifying its processes, organization and workflows of internal teams, meetings weekly and accountability with the coordination of spending and transparency in the use of resources for projects, new indicators of progress and investments in the projects have been created and are managed by a new domestic sector that was created called IT Governance, mentioned another point the manager is that with the use of corporate governance, is organizing new strategic direction committees formally established, which assists in decisions relating to policy guidelines and monitoring of institutional management.

For the manager some points still need to be worked out, as the lack of a formal code of ethics, released and monitored the lack of a corporate policy of business continuity to the hospital as a compulsory rule.

The NETI is responsible for the vast majority of computer systems, infrastructure, services and telecommunications hospital, where he is subordinate directly to the Superintendent.

In the manager's view, the hospital is at a time when the nuclei belonging to matrix structure, are moving to meet, create and organize their internal processes and information based on best practices in

Corporate Governance, making this interconnection modify all form of administration and hospital management. Finally, the Corporate Governance has to be adherent to the hospital business, generating a systemic view of all the processes involved, so that generate consolidated and accurate information.

The last interview was developed with one of the Core Infrastructure directors, Procurement and Logistics (NILO), with the same focus of the above. The NILO is at a more advanced stage of the mapping of internal processes and flows, with this, indicators for measurement of logistics service levels of the hospital commonly used materials were developed. The core is the center of all transactions between warehouses of the other buildings of the complex, responsible for creating and managing new types of measurements of these locations, tracing curves improvements and discovering possible losses of material in inventory.

Processes have been developed to check and monitor service levels of other warehouses of the complex of buildings to increase transparency and traceability of deliveries of applications and stocks associated with computer systems that were unified in all the buildings. Indicators and information systems are also used in reporting the Superintendency of materials purchased by the buildings, stocks and use.

According to the director the best practices in Corporate Governance are bringing improvements and professionalizing from the top management, management and directors benefiting the entire chain of hospital services, that give place to benefits to all stakeholders and especially the patient who is currently much more demanding and informed of their rights and expect more and more quality care and effective for the hospital.

The current administration of the Superintendent of the hospital recognizes this need and right of the patient and is working to transform the hospital into a more humanized model and welcoming to its employees and patients. There coexistence and humanization of locations in buildings where socializing and activities related to life and self-help are offered.

The NILO together with the Superintendent of the hospital developed the Distribution Center project, where a pharmacy that provides medications for patients in the hospital now has a delivery service directly at the house, avoiding often shifts of patients with greater mobility difficulties. The benefits to the Distribution Center were also aimed at improving the control, visibility and optimization of inventories, reducing local and security problems in the storage of medicines and general products, reverse logistics for policy was also created and deployed.

5 Conclusion

By understanding how the hospital studied is reshaping and improving its internal processes based on the use of best practices in Corporate Governance, the main objective has been achieved. Corporate Governance in the hospital is a new form of management, a determination of the Superintendence for all buildings that make up the complex Hospital of the Faculty of São Paulo; and current management of the hospital directly represented by the Superintendent brought a new vision focused on Corporate Governance, and existing centers are reshaping to meet the guidelines of the Superintendence.
