In order to forecast and optimize the structure demand rationally, it's necessary to use the human resource structure optimization model to analyze, in which the commonly used models include fuzzy entropy model, structure optimization model based on work utility maximization, and coupling model based on personnel and task matching. Based on the fuzzy characteristics of enterprise teacher evaluation, fuzzy entropy can be used to measure; and the data needed by the model is relatively easy to obtain. The design and data source of the scoring table also covers expert opinions, which is more comprehensive. At the same time, the optimal solution of the model calculation is the proportional values of each structure optimization and does not require further calculation (Junfei Mei et al., 2013). This model is actually a multi-objective programming problem, considering the close relationship among many substructures, it is a more scientific structure optimization model.

The Zade fuzzy entropy $H(A)$ defined by Zadeh is used to measure the information of the enterprise teachers' structure, namely:

$$H(A) = -\sum_{i=1}^{n} U_A(x_i) p_i \ln(p_i) \tag{1}$$

Where $U_A(x_i)$ is the membership degree of x_i for a fuzzy set A, and p_i is an independent probability distribution of the possible state of the fuzzy event, and satisfies $\sum p_i = 1$.

Taking the age structure as an example, define the fuzzy set N to represent different age levels, the number of subsets is m, and the membership degree of element x_i is $U_N(x_i)$, so the fuzzy entropy of the age structure is:

$$H(N) = -\sum_{i=1}^{m} U_N(x_i) p_i \ln(p_i) \tag{2}$$

In the presence of constraint conditions, when the fuzzy entropy reaches its maximum value, the probability distribution of each element is the proportional parameter optimized for each subsystem.

4 Solution of the Model

In order to calculate the reasonable proportion of the enterprise teachers, the expert consultation method is used to obtain the degree of membership of various personnel. In this paper, through the questionnaire survey of full-time teachers of the Department of Human Resources Management of Wuhan University of Technology, the contribution degree of various types of enterprise teachers in the Human Resources Management professional is obtained. The specific results are shown in Table 1.

Table 1   Contributions of Enterprise Teachers

Age	Young(<35)	Mid-aged(35-50)	Old(>50)		
Contribution Degree	0.2182	0.5045	0.2773		
Educational Background	Junior College	Bachelor	Master	Doctor	
Contribution Degree	0.0909	0.3818	0.3955	0.1318	
Major	Human Resource Management	Enterprise Management	Business Administration	Management Sciences and Engineering	Others
Contribution Degree	0.4091	0.1773	0.2455	0.0845	0.0836
Graduation School	Alma Mater	Other Schools			
Contribution Degree	0.5636	0.4364			

The degree of contribution is taken as the degree of membership in the model (Junfei Mei et al., 2013). The reasonable age distribution of enterprise teachers is: young teachers account for p_{11}, middle-aged teachers account for p_{12}, elderly teachers account for p_{13}, and the fuzzy entropy of the age structure is as follows:

$$H(N) = -0.2182\, p_{11} - 0.5045\, p_{12} \ln p_{12} - 0.2773\, p_{13} \ln p_{13}$$

According to Janeys maximum entropy principle, build the target model:

$$\begin{cases} MaxH(N) \\ p_{11} + p_{12} + p_{13} = 1 \end{cases}$$

Using Lingo software to solve the nonlinear programming model:

$$p_{11} = 0.3218,\ p_{12} = 0.3472,\ p_{13} = 0.3311$$

The reasonably age structure of enterprise teachers is as 32.18% for young people, 34.72% for middle age, and 33.11% for old age, as shown in table 2.

Table 2 The Optimization of Enterprise Teachers' Age Structure

Age	Young (<35)	Mid-aged (35-50)	Old (>50)
Currently	34.62%	56.41%	8.97%
Reasonably	32.18%	34.72%	33.11%

Similarly, using the expert scoring table to construct the corresponding target model can solve the reasonable distribution of the educational background structure, major structure and graduation school structure of the enterprise teachers, as shown in table 3 to table 5.

Table 3 The Optimization of Enterprise Teachers' Educational Background Structure

Educational Background	Junior College	Bachelor	Master	Doctor
Currently	0	15.58%	79.22%	5.19%
Reasonably	17.00%	30.61%	30.80%	21.59%

Due to the limited number of samples, the proportion of enterprise teachers with doctoral degrees calculated based on the expert's score is high. In the future, we can absorb enterprise teachers with doctoral degrees as much as possible, but it will be difficult to achieve in a short period of time.

Table 4 The Optimization of Enterprise Teachers' Major Structure

Major	Human Resource Management	Enterprise Management	Business Administration	Management Sciences and Engineering	Others
Currently	12.82%	20.51%	48.72%	5.13%	12.82%
Reasonably	29.23%	21.65%	25.08%	12.09%	11.95%

Table 5 The Optimization of Enterprise Teachers' Graduation School Structure

Graduation School	Alma Mater	Other Schools
Currently	84.62%	15.38%
Reasonably	48.05%	51.95%

5 Conclusion

In terms of age structure, it can be seen that the enterprise teachers aged 35-50 in the majority, and there are fewer teachers over 50 years old. The enterprise teacher's talent pool established with the tutor as the link leads to its age distribution concentrated in a certain area. We can appropriately expand the attraction channels and establish a scientific talent introduction and withdrawal mechanism, constantly optimize the age structure of enterprise teachers, and maintain a reasonable age gradient.

In respect of the educational background structure, in view of the current over-concentration of the enterprise teachers' academic levels, it is necessary to expand the number of teachers with specific work experience and skills who are bachelor degree or junior college, and to recruit some well-known corporate managers and senior managers with master' degree. Enterprise teachers with different experiences and levels should form a certain echelon to ensure the gradual development of the team.

In terms of major structure, at present the profession of enterprise teachers is mostly enterprise management or business administration, which have a great effect on the auxiliary teaching of undergraduate Human Resource Management, and broaden the students' knowledge interface. However, there is a lack of teachers in Human Resource Management, and there are some deficiencies in the professional integration degree of the students majoring in Human Resource Management. Secondly, in order to cultivate applied talents, it is necessary to introduce appropriate amount of enterprise teachers major in management science and engineering so that students are not limited to theoretical knowledge,

but also have a corresponding technical background and promote the overall development of students. In order to continuously optimize the major structure, the number and quality of the teaching staff are adapted to the requirements of its teaching reform and professional development. In the follow-up of the introduction of policies, we must proceed from reality and treat differently. For Human Resources Management, we must "add the quantity as soon as possible, and gradually improve the quality"; for the related professions, we must "combine with the actual situation, taking into account the quantity and quality"; for individual profession, we must adhere to "rather go without than have something shoddy".

In the graduation school, due to the fact that the enterprise teacher talent pool is basically tied to the tutor, it leads to a simplification of the graduation school and the lack of communication between various teaching thoughts and academic ideas. In order to avoid the phenomenon of "inbreeding", on the one hand, we persist in the internal the strategy of combining with external attraction has been introduced to expand the sources of teacher resources and increase the introduction of other college graduates. On the other hand, we encourage and guide enterprise teachers of our school to participate in academic exchanges so as to continuously expand thinking and enrich academic ideas.

Abstract: Based on the theory of dynamic capabilities, this paper explores the role of organizational ambidexterity as a dynamic capability in the construction of network-building human resource practice and organizational performance. Inconjunction with the theory of upper echelons, this paper argues that behavioral integration plays regulatory role on network-building human resource practice and organizational ambidexterity. The study found that: (1) network-building human resource practice have a significant positive impact on organizational performance, organizational ambidexterity plays a part in mediating role; (2) behavioral integrationplay regulatory role on the network-building human resource practice and organization ambidexterity.
Key words: Network-building human resource practice; Organizationalambidexterity; Firmperformance; Behavioral integration

1 Introduction

As the Chinese economy enters the "new normal", the business environment of companies is increasingly turbulent and complex. How companies obtain dynamic capabilities to maintain their sustainable competitive advantages is an eternal topic. Scholars believe that organizational duality can be used as a strategic choice of an organization to improve organizational performance (Benner M J & Tushman M L, 2003). It can be said that organizational ambidexterity is a dynamic capability and provides a new research perspective for the organization's innovation and development.

With the development of economy, the traditional practice of human resources has become increasingly unable to adapt to changes in the market environment. Scholars have begun to conduct research and discussion from the perspective of social networks. The existing research results show that NBHRP (network-building human resource practice) can positively influence organizational performance. This article will study its impact mechanism from the perspective of organizational ambidexterity.

In view of this, based on the dynamic capability theory, this paper studies the impact of NBHRP and organizational ambidexterity on organizational performance, and uses TMT (top management team)behavioral integration as a regulated variable between NBHRP and organizational ambidexterity. The significance of this paper lies in: First of all, NBHRP is still in the initial stage of research. This article combines China's background and based on the theory of dynamic capabilities, and studies it from the perspective of organizational ambidexterity, enriching the research on NBHRP and providing it with a new perspective；Second, under the background of the era of innovation in China, Chinese enterprises still have unclear cognition of organizational ambidexterity, and the impact of innovative management models on organizational performance is not significant. Therefore, it is of great practical significance for Chinese enterprises to explore how to obtain dynamic capabilities and enhance sustainable competitiveness.

2 Literature Review and Research Hypothesis

2.1 NBHRP and organizational performance

The network of relations has a special status and important influence on the social actions of the Chinese. Compared with Western countries, the network of Chinese social relations is more complicated. Clollins and Clark started from the top management team and proposed NBHRP. They pointed out that NBHRP aims to build and develop social networks of top management teams and internal stakeholders and external stakeholders of organizations and discover specific network constructions (Collins C J & Clark K D, 2003). Human resource practice has a significant relationship with the organizational resources of the TMT social network, and will enable to achieve higher performance through the role of social networks within and outside the organization's members.

This paper believes that the construction of network-oriented human resource practice can provide enterprises with a non-simulated social relationship network, and through a series of encouragement and support staff to establish human resources management measures to maintain social relations, such as training, performance assessment, salary incentives, etc. More conducive to corporate resource information and ultimately improve organizational performance.So this article proposes:

Hypothesis 1: NBHRP have a positive effect on organizational performance

2.2 NBHRP and organizational ambidexterity

According to the research results of Tushman (Tushman M & Smith W, 2004), this paper defines organizational ambidexterity as the organization's commitment to achieve two types of disparate or even contradictory goals. In a complex and dynamic environment, a successful company can effectively operate its current business and have the ability to adapt to the characteristics required for future development.NBHRP is the establishment of social relationships between top management team members and internal and external stakeholders.

From the perspective of social networks, it can be found that the establishment of social networks is conducive to the acquisition of enterprise knowledge, information and resources.From the perspective of exploratory innovation, we can use the internal and external social networks to obtain the market's future demand trends, and be able to learn about environmental change information, so that the organization can have dynamic capabilities to adapt the changes in the environment and the market.From the point of view of exploitation innovation, the establishment of exchanges and relationships with internal and external personnel can enable the organization to clearly understand the current status and future potential of existing products, consolidate the market position of existing products or services, and achieve better short-term goals aims.So this article proposes:

Hypothesis 2: NBHRP have a positive effect on organizational duality

2.3 Organizational ambidexterity and organizational performance

Ambidexterity can simultaneously achieve the organization's short-term goals and long-term goals. Scholars believes that combining exploratory innovations with exploitative innovations will create a more favorable development environment for the company, which in turn will lead to good corporate performance (Birkinshaw J & Gibson C, 2004). From the point of view of dynamic capabilities, the dynamic capabilities of enterprises need the cooperation of exploratory innovation and exploitation of innovative two strategic ways, and this dynamic capability can help enterprises to obtain higher corporate performance (Eisenhardt K M & Martin J, 2000).

For enterprise exploratory innovation, itfocusses on the unknown areas. Explore new products or services to better meet the needs of consumers or new markets, so that enterprises can obtain unique competitive advantages in the short term, and then improve short-term financial performance. The innovation of exploitation focuses on the existing products or services of the company, improves and perfects it, and develops its potential competitive advantages, so that the company can maintain its long-term performance. From the perspective of dynamic capabilities, organizational ambidexterity is the ability of an organization to adapt to the environment and meet the survival and development of the organization, and it can bring a competitive advantage to the organization. So this article proposes:

Assumption 3: Organizationalambidexterity has a positive effect on organizational performance

2.4 The mediating role of organizational ambidexterity

Based on the perspective of resource-based theory and dynamic capability theory, organizing ambidexterity capability as a dynamic capability is the key to the organization's ability to maintain lasting competitiveness. The company encourages its employees to actively build a social network, and uses the social network to learn information resources that are beneficial to the organization to help enterprises form social networks that are difficult to imitate. In the process of their construction, they form an organization's sense of innovation and make the organization adapt to its dynamics, which helps performance grow (Patel P C, 2013). As a result, the practice of building human resources through network construction can form a unique social network relationship for the organization, and in the process of resource and information acquisition, it forms a dynamic capability that adapts to the changing environment in which the organization is located, namely the formation of exploratory and exploitation innovation capabilities help companies maintain their continued competitiveness to boost organizational performance.So this article proposes:

Hypothesis 4: Organizational duality has an intermediary role between NBHRP and organizational performance. The greater the degree of organizational ambidexterity innovation, the greater the positive impact of NBHRP on organizational performance.

2.5 The regulatory role of behavioral integration

Behavior integration will affect the formation of organizational dynamic capabilities. The main reason is that TMT members will create a learning behavior to promote the formation of dynamic capabilities in the process of joint decision-making and information sharing, which is beneficial for insight into the current environment, strategy, and to ensure that opportunity to ensure the implementation of the strategy. Coleman believes that cooperative behavior in the process of behavioral integration and mutual communication and joint decision-making will help the organization to solve the problem of duality. Therefore, from the perspective of dynamic capabilities (Tushman M, 2004), the TMT behavioral integration process can create dynamic capabilities and promote collaborative organizational ambidexterity in exploration and exploitation.

For NBHRP, the magnitude of the TMT's behavioral integration is also critical to the size of its internal and external networks. Because in the process of establishing social relations, information related to the organization will be learned from its network of relationships, and TMT members will better share, exchange, and cooperate information resources to make decisions that are more suitable for the organization. So this article proposes:

Hypothesis 5: Behavioral Integration Can Positively Regulate the Role of NBHRP on Organizational ambidexterity.

3 Model

In summary, the research model can be summarized as shown in Figure 1.
Figure 1　Logical Framework

4 Research

This article mainly uses online questionnaires to conduct research. The source of the research sample is domestic enterprises, mainly including the central regions (Hunan, Hubei and Henan) and the southeastern regions (Shanghai, Zhejiang, Jiangsu, and Guangdong), etc.The number of questionnaires collected was 251.After 22 invalid questionnaires were removed, 229 valid questionnaires were finally obtained, with an effective rate of 91.2%.

According to the sample data collected, the proportion of senior managers is only 7%, the proportion of middle managers is 35.8%, and the ratio of grassroots managers and ordinary employees is 23.6% and 33.6% respectively.

The questionnaire designed in this study includes five aspects: basic information, network construction-oriented human resource practices, organizational ambidexterity, organizational performance, and behavioral integration. Likert5 point scale was used to measure the acceptability of subjects to the description of questions.

This study will use SPSS 20.0 software to perform reliability test, descriptive statistical analysis, correlation analysis, regression analysis, etc. on the recovered data. First, a descriptive statistical analysis of the basic distribution of sample features is performed, mainly based on the background information of the companies in the sample and the frequency of the personal information of the individual. Second, a descriptive statistical analysis of the mean and standard deviation of each variable was performed. Correlation analysis was used to test the correlation between variables. Finally, hierarchical regression analysis was used to further examine the relationship between variables.

This paper uses Spearman correlation coefficient analysis in SPSS. Mean values, standard deviations, and correlation coefficients between variables for the main variables are shown in Table 2. The data shows that there is a significant correlation between variables ($P<0.05$).

Table 1   Mean, Standard Deviation, Correlation Coefficients of Major Variables

variable	mean	standard deviation	1	2	3	4
NBHRP	4.00	0.57	1.00			
Organizational ambidexterity	4.01	0.60	0.62**	1.00		
organizational performance	3.73	0.62	0.47**	0.51**	1.00	
behavioral integration	3.83	0.53	0.59**	0.59**	0.79**	1.00

Baron and Kenny (1986) used the method of research to examine the mediating effect of organizational ambidexterity on NBHRP and organizational performance and behavioral integration on the regulatory effects of NBHRP and organizational ambidexterity.And this paper mainly uses the analytic hierarchy process to conduct hypothesis testing.After controlling related variables in Model 2, NBHRP has a significant positive effect on organizational performance ($P=0.001$). Hypothesis 1 is established.In Model 3, organizational ambidexterity also had a significant positive effect on organizational performance ($P < 0.001$). Hypothesis 3 was established.In model 6, NBHRP has a significant positive effect on organizational ambidexterity ($P<0.05$). Hypothesis 2 holds,and it can be explained that organizational ambidexterity has some mediating effects between NBHRP and organizational performance. Assumption 4 is established.In the model 7, the hypothesis is validated by adding NBHRP interaction terms with behavioral integration on the basis of model 6. NBHRP interaction with the integration of behavior has a significant positive effect on organizational ambidexterity ($P < 0.05$), suggesting that behavioral integration regulates the positive impact of NBHRP on organizational ambidexterity. Hypothesis 5 holds.

Table 2   Hierarchical Regression Analysis of Each Hypothesis

variable	organizational performance				organizational ambidexterity

NBHRP*BI indicates NBHRP and behavioral integration interaction items

5 Conclusion

Under the background of China's relationship society, human resources practice needs to use the internal human resources of the organization to actively establish a social network with the relevant internal and external personnel to obtain information and resources that are beneficial to the organization, and then promote the improvement of organizational performance. NBHRPhelps employees to understand and understands existing products or services, and discovers potential market opportunities in the existing market based on the information they have learned, improve the organization's use of innovative capabilities. Organizational ambidexterity can weigh the innovation approach according to the external environment and its own conditions. This ability can significantly

promote the improvement of organizational performance. The results of this study, in practical terms, should continue to develop and improve the organization's sense of innovation and strengthen organizational ambidexterity.

This article has some limitations, mainly reflected in:It will have a certain impact on the results of data analysis, and the questionnaires cannot be guaranteed to be completed in a single form through online questionnaires;The scale of this study is the adoption of the existing maturity scale, but the scale of NBHRP and behavioral integration is the scale of the Western scholars applied, and the difference between Eastern and Western cultures and the degree of innovation will affect domestic companies. The investigation will also have an impact.

Future research prospects:The focus of its innovation method will not be different for different industries. Therefore, in the future research, it can be applied to the industry. Analysis of differences in the impact of characteristics on organizational duality and a deeper study of the mediating role of organizational ambidexterity; in the further study, the influence of various variables can be considered to improve the research.

Research on the Relationship Between Employee Involvement and Innovation Behavior of Science and Technology Employees

Xu Yan, Gui Ping
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 863235073@qq.com, guiping518@163.com)

Abstract: This paper conducts a questionnaire survey of 260 highly-educated employees in science and technology enterprises or innovative companies in Wuhan, and discusses the relationship between employee involvement, job involvement, and innovation behavior of science and technology employees. The results found: (1) Employee involvement has a positive impact on the innovation behavior of science and technology employees. (2) Employee involvement has a positive impact on job involvement. (3) Job involvement has a positive impact on the innovation behavior of science and technology employees. (4) Job involvement plays a mediating role between employee involvement and innovation behavior of science and technology employees. This study not only enriched the research on the mechanism of the impact of innovation behaviors of science and technology employees, but also provided guidance for enterprises to inspire the innovation behavior of science and technology employees.

Key words: Employee involvement; Job involvement; Employee innovation behavior; Science and technology employees

1 Introduction

In today's complex business environment, innovation is the key to an organization's survival and development (Sacramento, Fay & West, 2013). Organizational innovation depends on employee innovation, and employee innovation is an important source of organizational innovation (Yuan F, Woodman R W, 2010). Technological employees are the backbone of corporate human resources (Yao Liping, Jin Jin, 2008). In the age of knowledge economy, science and technology employees engage in production and create knowledge activities that can bring value-added knowledge capital to companies or organizations (Cui Xiangmin,Yang Dongtao, 2015).Therefore, in-depth research on the factors affecting the innovation behavior of science and technology employees is particularly important for promoting employees to create innovative ideas, implement innovative ideas, and enhance organizational innovation capabilities. In past, most of the literature on the factors affecting employees' innovative behaviors focused on individual-level variables, such as the impact of cognitive and attitude on employee innovation behavior (Cao Keyan, Dou Zhiming, 2015). In recent years, researches on the influence of organizational variables on employee innovation behaviors have emerged. For example, studies have shown that work complexity, work environment and other factors have a significant impact on employee innovation behavior, specially, more and more attention has been paid to the research on the influence of human resource practices on innovation behavior. Mansouris' research shows that effective human resource management practices help promote employees to exhibit more innovative behaviors (Nazanin Mansouri, 2016). Human resource management practice is a relatively large concept, and its subdivision is conducive to the in-depth study of the mechanism that affects the scientific and technological employees' innovative behavior. However, existing research is lacking in this aspect. Human resource management practices include employee involvemnt. Liu Songbo (Liu Songbo, 2013) found that employees' perceived level of participatory decision-making has a positive effect on their own innovation through empirical analysis. Chen Xiaoping (Chen Xiaoping, 2012) found that Employee involvement will increase their job satisfaction thus promote employees to work more. Zhang Ruijuan (Zhang Ruijuan, 2014) found that employee job involvemnt has a positive impact on employee innovation behavior. However, there is currently no study that combines employee involvement with job involvement and the innovation behavior of science and technology employees. There is little research on the innovative behavior of science and technology employees. Therefore, this article will use job involvement as a mediator variable to deeply discuss the mechanism of employee involvement in the innovation behavior of science and technology employees. It aims to enrich the research on the impact mechanism of the scientific and technological employees' innovative behaviors and at the same time provide guidance for the enterprises to inspire the innovative behaviors of the science and technology employees.

2 Theory and Hypothesis

2.1 Related concepts

Science and technology employee. Peter Drucker, the management guru, first proposed the concept of knowledge workers, "the person who masters and uses symbols and concepts and works with knowledge or information." In particular, knowledge workers include professionals, assistant professionals with deep professional skills, senior manager, etc. Their areas of work include research and development, product development, engineering design, etc. It can be seen that science and technology employees belong to the category of knowledge workers. Zhang Ming (Zhang Ming, 2016) found that most of the employees of science and technology are well-educated, have a good education background and qualifications, have business advantages in a certain professional field, have a keen insight into new knowledge and new technologies in a constantly changing competitive environment and have good learning ability.

Employee involvement. The earliest ideas of employee involvement dates back to the "Employee Advice System" written by Esatman in 1898. Afterwards, the American psychologist Mayo put forward the hypothesis of "social people". Managers who hold this hypothesis of human nature put forward the form of "employee participation management", so that employees can participate in research and discussion of corporate decision-making in varying degrees. Some scholars defined employee participation from the perspective of employees as the process of employee involvement in the formulation and implementation of management decisions, and through the interaction with management, the process of participating in and influencing management behavior (Chen Wansi, Yu Yanru, 2010) (Wang Limin, Yuan Qinghong, 2011). This article examines employee participation from an employee perspective.

Employee innovation behavior. Ambile (Ambile, 1998) believes that the individual's innovative behavior is a process in which people generate new ideas and implement new ideas, or new ideas to solve problems [10]. At present, most scholars support the definition of personal innovation behavior from a process perspective. Scott and Bruce (Scott and Bruce, 1994) divided individual innovation behavior into three phases: the generation of new ideas or solutions, the search for supporters of individual ideas, and the conversion of new ideas into products [11]. This study draws on Scott and Bruce's definition of innovative behavior.

2.2 Employee involvement and innovation behavior of science and technology employees

The social exchange theory believes that employees pay special attention to the resources and social interactions that are obtained from the organization. When the organization implements employee involvement and is perceived by the science and technology employees as the appreciation, recognition, and investment of the organization, a social exchange relationship is formed between the organization and the scientific and technical employees, rather than a pure economic relationship. Under this relationship, technology employees feel that they are needed by the organization and they are the masters of the company. Therefore, they will be more willing to cooperate, help each other, and share knowledge. They are willing to provide advice and suggestions for the development of the enterprise, which will inspire science and technology employees' creative behavior. The expectancy-valence theory holds that the motivation for people to take a certain action depends on their value evaluation of the action result and the estimation of the expected probability of the result(Zhang Hao, Fan Wei, Yu Weina,2014).The knowledge workers involvement incentive can satisfy self-fulfillment of the spiritual level needs of knowledge workers, promote them to contribute to the development of the enterprise to reward the enterprise, effectively strengthen the knowledge workers' expectations of innovation performance, and the development of innovation desire and sense of innovation can promote knowledge workers to adopt more innovative action(Liu Songbo, Dai Lingling, Li Yurong,2013). At the same time, the participation of science and technology employees in organizational management and business decision-making is conducive to strengthening organizational learning, which has a positive significance in improving innovative ability of science and technology employees and promoting their innovation behaviors. Therefore, this study proposes Hypothesis 1:

Hypothesis 1: Employee involvement has a positive impact on innovation behavior of science and technology employees.

2.3 Employee involvement and job involvement

Through combing existing literature, it is found that employee involvement can affect individual employee behavior and performance. The more employees participate in the organizational decision-making process, the more they can strengthen the trust between employees and managers.

Likert (1961) found that the higher the degree of job satisfaction, the greater the satisfaction of employees' self-fulfillment, the improvement of their work enthusiasm and the improvement of their performance. From the perspective of social exchange theory, the employee-organization relationship is the exchange relationship between the organization's input to employees and the employees' returns to the organization. In this kind of exchange relationship, when the enterprise provides employees with sufficient opportunities for employee involvement, the employees will feel the support and trust of the organization and generate a sense of responsibility that rewards the organization for its own interests and opportunities. It will drive employees to work hard to reward the organization's affirmation and support and show a high job involvement attitude. When the employee's participation opportunities provided by the organization do not meet the employee's expectations, they are deemed to have violated the reciprocal obligation. The employees will develop dissatisfaction and lack enthusiasm and enthusiasm for the work, thereby they will reduce their work commitment. In addition, Lawler et al. found that the participation of employees can improve the effectiveness of the organization. The performance of employee involvement can improve the morale, job satisfaction, and reduction of absenteeism and turnover intention of the employees .The higher the employee participation, the stronger the organizational commitment, the lower the turnover tendency (Zopiatis A, Constanti P, Theocharous A L,2014).In corporate management, managers should appropriately decentralize their rights, motivate new generations of employees to participate more in corporate management, make new generation employees feel that they are the masters of the enterprise, enhance their sense of participation, and reduce their turnover intentions, thus retain excellent talents and reduce business costs(Zhang Hao, Li Zeying,2017). Chen Xiaoping (Chen Xiaoping, 2012) found that Employee involvement can effectively reduce employees' willingness to leave and improve their job satisfaction, to a certain extent, increase job involvement. Therefore, this study proposes Hypothesis 2:

Hypothesis 2: Employee involvement has a positive impact on job involvement.

2.4 Job involvement and innovation behavior of science and technology employee

Dorenbosch (Dorenbosch, 2005) found that job involvement is a positive psychological state of work characterized by vigor, dedication and absorption. It is mainly represented by the following behaviors: the employees are fully absorbed in their work, are tirelessly willing to work hard for their own work and are courageous to accept the challenges in their work. These performances of science and technology employees contribute to the formation of their innovative behavior. At the same time, job involvement can motivate employees' enthusiasm and initiative, and employees' enthusiasm and initiative can help employees' innovative behaviors. According to Schaufeli et al.'s points, employees who are engaged in high levels of work are always persistent in pursuing challenges in their work and help stimulate their internal creative motives. In this highly motivated state, the possibility of individuals continuing to explore innovations has greatly increased. Shalley et al. found that in the state of high job involvement, employees always look for new ideas to promote new ideas and work hard to find ways to make new ideas work. Therefore, employees who are engaged in high levels of work are more likely to show strong work creativity. Huang Jun and Jia Yu (Huang Jun and Jia Yu,2016) also found through empirical research that job involvement contributes to the improvement of individual employee innovation behavior. Therefore, this study proposes assumptions:

Hypothesis 3: Job involvement has a positive impact on innovation behavior of science and technology employees.

2.5 The mediating role of job involvement

According to the above discussion, from the perspective of social exchange theory, employee-organizational relationship is the exchange relationship between the organization's input to employees and the employee's return to the organization. In this kind of exchange relationship, when the enterprise provides technology employees with full employee participation opportunities, the science and technology employees will feel the support and trust of the organization and generate a sense of responsibility that rewards the organizations for their own interests and opportunities. This translates into motivation to work harder and shows a high investment attitude. In the state of high work engagement, the scientific and technological employees always look for new ideas to sell new ideas and work hard to find ways to make new ideas work. Therefore, science and technology employees who are highly engaged in work are more likely to show strong work creativity. Therefore, this study proposes assumptions:

Hypothesis 4: Job involvement plays a mediating role between employee involvement and innovation behavior of science and technology employees. Hypothetical model diagram is shown in Figure 1:
Figure 1   Hypothetical Model

3 Methodology
3.1 Data collection and instrument
In this study, a questionnaire survey method was used to select employees of higher education in a number of science and technology enterprises or innovative companies in Wuhan as the survey objects. 260 questionnaires were distributed and 245 questionnaires were returned. After screening, 210 questionnaires were valid. The recovery rate was 94.2%, and the effective questionnaire rate was 80.7%.

3.2 Measures
Employee involvement scale. The employee involvement scale was derived from a scale compiled and edited by Pare et al. and compiled by Huang Jian. The scale includes 15 items. After testing, the scale's Cronbach's α coefficient is 0.898, and the reliability is good.

Job involvement scale. A short job involvement scale (UWES-9) developed by Schaufeli was adopted. The scale includes three parts: vigor, dedication and absorption. Each part has 3 questions and a total of 9 items. After testing, the Cronbach's α coefficient of the vigor part is 0.711, the Cronbach's α coefficient of the dedication part is 0.848, the Cronbach's α coefficient of the absorption part is 0.918, and the Cronbach's α coefficient of the scale is 0.931, and the reliability is good.

Employee innovation behavior Scale. The Innovation Behavior Scale uses 8 questionnaires that were revised by Zhang Zhengang et al. (Zhang Zhengang et al., 2016) on the basis of Zhou (Zhou, 2003) and Wang Yanfei et al. (Wang Yanfei et al., 2012) viewpoints combined with the actual situation of Chinese enterprises. After testing, the scale's Cronbach's α coefficient is 0.915, and the reliability is good.

The above scales are all based on Likert's five-point scoring method, which is based on "very inconsistent" to "very consistent" and is given 1-5 points.

Control variables. This study controls the science and technology employees' gender (male = 1, female = 2), age (22-25 years = 1, 26-35 years = 2, 36-45 years = 3, 46 and over = 4) and educated degrees (specialties and below=1, undergraduate=2, masters and above=3).

Table 1   Correlation Coefficient Matrix

Variables	Mean	standard	1	2	3	4	5	6
1 Gender	1.30	0.462	1					
2 Age	2.18	0.922	0.512	1				
3Educated Degree	2.36	0.650	0.254	-0.112	1			
4Employee Involvement	3.17	0.383	0.112	0.132	0.341*	1		
5Job Involvement	3.20	0.429	0.087	-0.271	0.332*	0.659**	1	
6Employee Innovation Behavior	3.17	0.506	0.075	-0.025	0.263	0.721**	0.658**	1

Notes: ***$p<0.01$; **$p<0.05$; *$p<0.1$. N=210.

4 Results
4.1 Correlation analysis
The mean, standard deviation, and correlation coefficients for all variables are shown in Table 1. From the correlation coefficient matrix table, we can find that employee involvement and job involvement are significantly related (0.695), job involvement and innovation behavior of science and technology employees are significantly related (0.658), and employee involvement is significantly related to innovation behavior of science and technology employees (0.721).

4.2 Hypothetical test

For hypothesis testing, SPSS 22.0 was used for multiple regression analysis in this study. This study assumes that employee involvement has a positive impact on innovation behavior of science and technology employees. Models 3 and 4 in Table 2 show the test results of this hypothesis. In Model 3, we examined the effect of control variables on the innovation behavior of science and technology employees. Model 4 shows that after controlling the control variables, there is a significant positive correlation between employee involvement and the innovation behavior of the science and technology employees. Hypothesis 1 is verified. This study assumes that employee involvement has a positive impact on job involvement. Model 1 of Table 2 examines the effect of control variables on job involvement. Model 2 shows that there is a significant positive correlation between employee involvement and job involvement after controlling for gender, age, and level of education. Hypothesis 2 is verified. The hypothesis 3 in this study assumes that job involvement has a positive impact on innovation behavior of science and technology employees. The model 5 in Table 2 shows that after controlling the control variables, there is a significant positive correlation between job involvement and innovation behavior of science and technology employees. Hypothesis 3 is verified.

Next, we test the hypothesis 4. This study uses the method of Baron and Kenny [16] to test the role of mediation. The model 6 in Table 2 shows that compared with model 4, after joining the job involvement variable, the correlation coefficient of employee involvement becomes 0.512, and the correlation with the innovation behavior of science and technology employees is reduced, and the significance is also reduced. At the same time, the regression coefficient of job involvement is 0.316, which is significant. This shows that after joining the job involvement variable, employee involvement has a lesser impact on innovation behavior of science and technology employees, and job involvement has partially replaced the effect of employee involvement on innovation behavior of science and technology employees. Therefore, job involvement plays a partial intermediary role between employee involvement and the innovation behavior of science and technology employees. Hypothesis 4 is verified.

Table 2   Regression Analysis Table

Variables	Job Involvement		Employee Innovation Behavior			
	Model1	Model2	Model3	Model4	Model5	Model6
Gender	0.346	0.357	0.158	0.170	0.085	0.057
Age	-0.353	-0.338	-0.015	0.001	0.233	0.108
Educated Degree	0.312	0.095	0.299	0.061	0.080	0.031
Employee Involvement		0.658***		0.720***		0.512**
Job Involvement					0.701***	0.316*
R^2	0.229	0.611	0.091	0.548	0.470	0.587
Adjusted R^2	0.171	0.571	0.083	0.502	0.416	0.533

Notes: ***$p<0.01$; **$p<0.05$; *$p<0.1$. N=210.

5 Conclusion

This paper studied the relationship between employee involvement, job involvement and innovation behavior of science and technology employees and drew the following conclusions: (1) Employee involvement has a positive effect on innovation behavior of science and technology employees. (2) Employee involvement has a positive impact on job involvement. (3) job involvement has a positive impact on innovation behavior of science and technology employees. (4) Job involvement plays an intermediary role between employee involvement and innovation behavior of science and technology employees. Therefore, in order to promote the innovation behavior of science and technology employees, the organization must pay attention to the employee involvement in the institution building, and at the same time, it must also play an intermediary role in the job involvement. This study not only enriches the research on the mechanism of innovation behavior of technology-based employees, but also provides guidance for companies to inspire the innovation behavior of technology-based employees. There are also deficiencies in this study, the sample selection area is not large enough, the selection of control variables is not deep enough, and future research can be improved in these areas.

Total Factor Productivity Growth in China's Hotel Industry under Environmental Constraints

Xiang Zikun, Wang Xuliang
School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 1161466238@qq.com, fightingcool@yeah.net)

Abstract: This paper incorporates environmental factors into the measurement framework of productivity in hotel industry. The Malmquist-Luenberger index is used to measure the green total factor productivity (TFP) of the hotel industry in 30 provinces of China from 2001 to 2015, and it is compared with the traditional TFP without considering environmental factors. The results show that the measurements of TFP in China's hotel industry will be influenced by environmental factors. Neglecting environmental factors will significantly overestimate the TFP level of the hotel industry, and technical progress of the hotel industry is the dominant factor for the green TFP growth. The green TFP in China's hotel industry presents a regional characteristic that are successively decreasing from east to west, and it shows large inter-provincial differences as well.
Key words: Hotel industry; Green total factor productivity; Environmental constraints; Regional difference

1 Introduction

Since the new century, China's hotel industry has achieved rapid development. From 2001 to 2015, the revenue of China's hotel industry has increased from 76.332 billion yuan in 2001 to 210.675 billion yuan in 2015, with an average annual growth rate of 7.52%. However, environmental issues such as carbon emissions caused by the rapid development of the hotel industry has become increasingly serious (Gastellani & Sala, 2010; Tsai et al., 2014; Huang Ying, 2015). Protecting the environment and reducing carbon emissions have become a rigid constraint on the economic growth in China's hotel industry, and an effective way to achieve the goals mentioned above is to improve the green total factor productivity(hereafter, TFP) in the hotel industry.

The previous literature mainly focused on measuring the traditional productivity of the hotel industry. Barros (Barros, 2005) used the DEA-Malmquist index method to estimate the TFP changes and its decomposition of 42 hotel companies in Portugal from 1999 to 2001. The results show that the TFP of hotel companies decreased by 15% annually, which is mainly attributed to the decline in the technology advancement index in most hotel companies. Sheng & Zhong (Sheng & Zhong, 2010) also used the DEA-Malmquist index to measure the traditional TFP index in China's inter-provincial hotel industry from 1997 to 2007. The study found that the TFP of hotel industry increased by 0.3% annually, and technical progress is the dominant factor driving its growth. Recently, researchers used the dynamic two state approach (Huang et al.,2012), the non-parametric technique of DEA (Oliveira & Pedro, 2013), the revenue function(Oliveira, 2013) and the modified two-stage DEA model(Huang et al., 2014) to estimate the traditional TFP changes in the hotel industry. However, such measuring methods neglect resource and environmental factors, and they could not effectively measure the real growth performance of the hotel industry. Based on this, we incorporate CO_2 emissions into the measurement framework of the TFP in hotel industry, and uses Malmquist-Luenberger index (hereafter, ML index) to re-calculate the TFP of hotel industry in China from 2001 to 2015, which is not only an effective expansion of the existing TFP estimation method of hotel industry, but also a more accurate measurement of the real growth performance in China's hotel industry.

2 Method and Data

2.1 Modeling an environmental technology

We assume that at every period $t(t = 1,..., T)$, the hotel industry in every province $k(k = 1,..., K)$ employs N inputs $x = (x_1,..., x_N) \in R_N^+$ to produce M desirable outputs, $y = (y_1,..., y_M) \in R_M^+$ and I undesirable outputs, $b = (b_1,..., b_I) \in R_I^+$. The environmental technology can be expressed as follows:

$$P^t(x^t) = \{(y^t, b^t) : \sum_{k=1}^{K} z_k^t y_{km}^t \geq y_{km}^t, m = 1, ..., M ; \sum_{k=1}^{K} z_k^t b_{ki}^t = b_i^t, i = 1, ..., I$$

$$\sum_{k=1}^{K} z_k^t x_{kn}^t \leq x_n^t, n = 1, ..., N ; z_k^t \geq 0, k = 1, ..., K\} \tag{1}$$

2.2 Directional distance functions

On the basis of environmental technology, the directional distance function can be defined as:

$$\vec{D}_0^t(x^t, y^t, b^t; g) = \sup\{\beta : (y^t, b^t) + \beta g \in P^t(x^t)\} \tag{2}$$

Where g is the direction vector, β is the maximum possible amounts of the desirable outputs' proportionate increase and the undesirable outputs' proportionate decrease with established input.

To solve the directional distance functions, a linear programming needs to be solved:

$$\vec{D}_0^t(x^{t,k'}, y^{t,k'}, b^{t,k'}; y^{t,k'}, -b^{t,k'}) = Max\beta \quad s.t. \sum_{k=1}^{K} z_k^t y_{km}^t \geq (1+\beta) y_{k'm}^t, m = 1, ..., M$$

$$\sum_{k=1}^{K} z_k^t b_{ki}^t = (1-\beta) b_{k'i}^t, i = 1, ..., I ; \sum_{k=1}^{K} z_k^t x_{kn}^t \leq x_{k'n}^t, n = 1, ..., N ; z_k^t \geq 0, k = 1, ..., K \tag{3}$$

2.3 The ML productivity index

Following Chung et al.(1997), the ML index is defined as the following:

$$ML_t^{t+1} = \left\{ \frac{\left[1 + \vec{D}_0^t(x^t, y^t, b^t; g^t)\right]}{\left[1 + \vec{D}_0^t(x^{t+1}, y^{t+1}, b^{t+1}; g^{t+1})\right]} \times \frac{\left[1 + \vec{D}_0^{t+1}(x^t, y^t, b^t; g^t)\right]}{\left[1 + \vec{D}_0^{t+1}(x^{t+1}, y^{t+1}, b^{t+1}; g^{t+1})\right]} \right\}^{1/2} \tag{4}$$

The ML productivity index can be decomposed into two components, namely efficiency change (EC) and technical change (TC):

$$EC_t^{t+1} = \frac{1 + \vec{D}_0^t(x^t, y^t, b^t; g^t)}{1 + \vec{D}_0^{t+1}(x^{t+1}, y^{t+1}, b^{t+1}; g^{t+1})} \tag{5}$$

$$TC_t^{t+1} = \left\{ \frac{\left[1 + \vec{D}_0^{t+1}(x^t, y^t, b^t; g^t)\right]}{\left[1 + \vec{D}_0^t(x^t, y^t, b^t; g^t)\right]} \times \frac{\left[1 + \vec{D}_0^{t+1}(x^{t+1}, y^{t+1}, b^{t+1}; g^{t+1})\right]}{\left[1 + \vec{D}_0^t(x^{t+1}, y^{t+1}, b^{t+1}; g^{t+1})\right]} \right\} \tag{6}$$

If $ML_t^{t+1} > 1$, $EC_t^{t+1} > 1$, $TC_t^{t+1} > 1$, it means the green TFP, efficiency change and technical change is on the rise. If $ML_t^{t+1} = 1$, $EC_t^{t+1} = 1$, $TC_t^{t+1} = 1$, it means there have been no changes in these three indexes. If $ML_t^{t+1} < 1$, $EC_t^{t+1} < 1$, $TC_t^{t+1} < 1$, it indicates that there have been decreases in these three indexes.

2.4 The malmquist productivity index

We also computed the Malmquist productivity index to measure the traditional TFP. The M index is defined as follows:

$$M(y^{t+1}, x^{t+1}, y^t, x^t) = \left[\left(\frac{D_0^t(x^{t+1}, y^{t+1})}{D_0^t(x^t, y^t)} \times \frac{D_0^{t+1}(x^{t+1}, y^{t+1})}{D_0^{t+1}(x^t, y^t)} \right) \right]^{1/2} \tag{7}$$

$$= EC \times TC$$

2.5 Data processing and resources

We obtained the input-output data on four variables for 30 Chinese province-level regions over the period 2001-2015 to measure the TFP of hotel industry.

The operating income of star-rated hotels is chosen as a proxy of the desirable output.

CO_2 is considered as the proxy of undesirable output in the hotel industry. Referring to the study of Patterson (2004), the CO_2 emissions of the hotel industry are calculated by using the following formula:

$$C_i^t = N_i^t \cdot l_i^t \cdot \alpha \tag{8}$$

Where, C_i^t represents the CO_2 emissions of the hotel industry of province i in year t; N_i^t represents the room bed number of star-rated hotels of province i in year t; α represents the CO_2 emission factor per bed per night. Following Patterson (2004), we set α to 2.458g/p visitor-night.

The number of employees in the hotel industry is chosen as the proxy of labor force.

The original value of fixed assets in the hotel industry is treated as the proxy of capital input.

Relevant data are collected from the Yearbook of China Tourism Statistics and its supplements.

3 Empirical Study

3.1 General characteristics of TFP change in China's hotel industry

Based on the ML index and M index specified above, the green TFP and traditional TFP index and their components are presented in table 1. As can be seen from Table 1, when the environmental factors are ignored, the average annual growth rate of TFP in China's hotel industry from 2001 to 2015 was 6.2%. In terms of the components of TFP (M), the growth rate of efficiency change (EC) and technical change (TC) were 1.5% and 4.6% respectively, which means that technical change contributes more to the growth of TFP than efficiency change, and technical change was the main source of the TFP change.

Table 1　The ML and M Productivity Indexes and Their Components in the Hotel Industry

Region	Ignore the environmental factors			Incorporate the environmental factors		
	EC	TC	M	EC	TC	ML
Total	1.015	1.046	1.062	1.018	1.029	1.047
East	1.012	1.066	1.079	1.014	1.036	1.050
Central	1.018	1.036	1.055	1.022	1.023	1.046
West	1.017	1.033	1.050	1.018	1.027	1.045

Notes: EC: Efficiency Change; TC: Technical Change; M: Malmquist index; ML: Malmquist –Luenberger index.

After considering the environmental factors, the average annual change of green TFP (ML) in China's hotel industry from 2001 to 2015 was 4.7%. The decomposition results indicate that the growth rate of efficiency change was 1.8%, and the growth rate of technical change decreased to 2.9%. It can be seen that if environmental factors are neglected, the average annual growth rate of TFP and technical change in China's hotel industry will be overestimated.

3.2 Regional characteristics of TFP changes in China's hotel industry

In the meantime, there exists significant regional differences in the growth rate of TFP in the hotel industry(see Table 1). When the environmental factors are neglected, only the hotel industry in the eastern region (East) witnessed a TFP growth rate (7.9%) that exceeds the national average (6.2%), and the TFP growth rate of the hotel industry in the central (5.5%) and the western region (5.0%) are below the national average. After considering environmental factors, the eastern region's TFP growth rate (5.0%) exceeds the national average TFP growth rate (4.7%). The TFP growth rate in the hotel industry of the central region (4.6%) and the western region (4.5%) are still below that of the national average.

3.3 Provincial characteristics of TFP changes in China's hotel industry

The calculation results of TFP in the hotel industry in 30 provinces of China from 2001 to 2015 are shown in Table 2. It shows that in both cases, the average growth rates of TFP index are greater than(or equal to) 0. From the perspectives of efficiency change and technical change, the technical change is the leading factor contributing to TFP growth in most provinces. In addition, in both cases, the growth rate of TFP in China's hotel industry showed large inter-provincial differences. When ignoring environmental factors, the hotel industry in Hainan experienced the highest TFP change of 13.3%, and the hotel industry in Qinghai witnessed the lowest TFP change of 0.1%. After taking into account of environmental factors, Hainan still witnessed the highest growth rate of TFP (10.2%), and Qinghai saw the lowest TFP growth (0.4%) again.

Table 2　The ML and M Productivity Indexes and Their Components in the Hotel Industry by Region

Region	Ignore the environmental factors			Incorporate the environmental factors		
	EC	TC	M	TC	EC	ML
Beijing	1.016	1.078	1.096	1.020	1.042	1.064
Tianjin	1.015	1.078	1.094	1.010	1.035	1.046
Hebei	0.986	1.034	1.019	0.984	1.032	1.016
Shanxi	1.023	1.013	1.036	1.025	1.024	1.050

4 Conclusion

Based on the panel data of 30 provinces in China over the period from 2001 to 2015, this paper employed the Malmquist-Luenberger index to measure the green TFP of hotel industry in China and compared it with the traditional TFP without considering environmental factors. The conclusions obtained are as follows: The measurement of China's hotel industry TFP would be influenced by environmental factors, and neglecting environmental factors would lead to an overestimation of the TFP in China's hotel industry. The leading factor contributing to the green TFP growth in the hotel industry is technical change rather than efficiency change. The green TFP in China's hotel industry presents a regional characteristic that are successively decreasing from east to west, and it demonstrates large inter-provincial differences.

In summary, this paper suggests that China should attach greater importance to the pollution emission problems in the hotel industry. In the future, the government can monitor the green growth performance of the hotel industry by constructing an evaluation system in which the core index is the green TFP. Meanwhile, the regional differences in the green TFP of the hotel industry in China can be gradually reduced by promoting exchanges and cooperation of the clean technology and management experience among different regions.

It is to be noted that there still exist several issues in this paper: 1) Limited by the availability of data, this paper does not consider other waste emissions, which may influence the accuracy of the measurement results. 2) This paper uses data at the provincial level, which is difficult to reflect micro-level tourism activities. After relevant data is available, the study on productivity in the hotel industry can be extended to the micro level.

Abstract: The human being is the true source of a competitive advantage. If so understood, it is necessary to break with some paradigms that guide the traditional management models. The current posture requires aptitude and willingness for change, whether in the forms of vision, action or thought. The objective of this study was to score some of these variables that should be perceived by the leader who wants to do a good job and aims to improve their skills to work with and for the groups. The research was based on productions that address this issue and what possible changes we may have in organizational environments. Everything is moving so that we have a scenario different from what we find today in organizational contexts. There will be a change in the conception of work, and with this there will be a need to review organizational practices, including the dynamics of groups and the relationship with the leadership process. This discussion calls into question the very concept of a group, and of course it is not exhausted here and, judging by the changes and future scenarios, it would not be audacious or reckless to say that they will never be exhausted. It is a continuous and uninterrupted path of discussion.
Key words: Leadership; Groups; Organization; Collective.

1 Introduction

The groups propose explicitly and implicitly to the consummation of a task that constitutes its purpose, interacting through structures of adjudication and assumption of roles. Massmann (2011) explores the central idea that it is necessary always to defend a point of view, so we cannot think about the individual without taking into account their different circumstances, their different moments and their influence in the construction of the roles assumed in their lives. Since our birth we are inserted in some group, the family is the first one and, among others, the organizations and their agents, in this study, leaders and leaders.

In companies, human interaction occurs at two distinct but concomitant and interdependent levels: that of task and the social-emotional (MOSCOVICI, 1994). The first is characterized by being that of the activities defined in a rational way and that allows its measurement by means of the evaluation of the agreed results. The socio-emotional level permeated by multiple sensations and feelings is determined by the coexistence and activities of the group or even influenced by the constant dynamics of the inclusion of new members or changes in the rules with which the group operates. Thus, it is a level that determines some basic knowledge of psychology, philosophy, sociology, as well as all the knowledge that cast glances on the complex task of living.

We live in constant relation, for it is precisely in the relation and conception of our ties to the people that we structure our thinking, we choose or inherit our values and we constitute ourselves as people. The procedure of interaction between human beings is present in all human organization and is what implies in the direction of the activities and their results (Nunes, Hoyos Guevara, 2018).

But to what extent are organizations, through their leaders, prepared and organized to understand group work with a source of competitiveness and as a process that feeds organizational culture? The objective of this article is to explore the processes of integration between leaders and leaders leading to the construction of a dynamic and participative collective work.

Carnielli and Epstein (2011) argue that we need to have good reasons for the accepted premises to be accepted, and these, in turn, should be more plausible than their own conclusions, seeking to defend the importance of collective work and what differences that each person has. It is understood that organizations, through their leadership, have to understand and be responsible for the variables that influence human interactions in order to, minimally, enable the individuals who are part of their teams to understand the functioning of the intricate intra and interpersonal dimension, that is, of the constant internal communication, the relations of alterity and the group dynamics. All these aspects constantly influence the groups, compromise all their members and delimit the possibilities of the organization.

2 Interdependence: Leaders and Teams

The relationship between leaders and leaders is a form of coexistence that more than a surrounded relation of rules, policies and other elements externalizes values that can be abstract or concrete. Perelman & Olbrechts-Tyteca (2014) define as concrete values those that are linked to a being, a group or even an object, when observed the singularity of these. Already the abstract value is presented in the contraposition of this absolute reality.

The relationship between leaders and leaders should be understood as a social process built on these values and personal characteristics, in accordance with institutional policies. This thought leads us to the idea of the authors mentioned when they suggest that when establishing links, it is possible to include also differentiated publics. The universal character is thus characterized so that the individual characteristics gain naturalness and can also feed the collective yearnings. Therefore, individual needs and desires are valued and the result of this process feeds the group concept.

Human coexistence is inherent in all of its existence, so we are affected by our ability to relate to others, individually or with groups. It is understood by interpersonal relations the relationship between people, understanding them and respecting their personalities. Within the business system, it can be said that there is technical organization and human organization, which are interrelated and interdependent.

Bergamini (2009) believes that the most accepted leaders, therefore more positively considered by the leaders, have previously chosen a model of leadership. One cannot improvise from one moment to another, the best way to direct people of a certain group. Good leadership requires understanding of the world in which the leaders live. When people work in an organizational community, it is necessary to feel that this community cares for them, and likewise expects their employees to be interested in their corporate destiny as well.

Human organization is not just a group, a team, a set of individuals, for each one has its own feelings, interests, desires, frustrations, physical and social needs related to its own life history. True human relationships are useful and important to practice, because they avoid misconduct, which were generated by dissatisfaction, maintaining individual and collective well-being.

Modern educational and management theories show a tendency to ascribe increasing importance to emotional factors and creativity in learning, leadership, and group participation. Emotions and feelings are now considered as essential as ideas and knowledge in any human situations and are constituted in facts or variables of a situation, no more neglected accessory elements. There is also a need to focus on the preparation to deal effectively with the role of the "social man" in the organization, that is, to respect and recognize its need for growth, autonomy and participation and achievement.

Human beings and companies are, in their daily lives, interdependent and therefore need to be willing to cooperate with each other constantly. The ideal of integration is to ensure that there are not two distinct entities but only two parts of the same whole. This awareness makes possible the existence of conflicts and ideas, beneficial and enriching, and not the existence of conflicts between people, evil and impoverishing. Thus, the need for a deeper understanding of these relationships and how power can construct or deconstruct these environments, that is, the extent to which the roles of leaders and leaders or dominant and dominated are configured.

3 Culture as a Factor in the Formation of Groups and Their Relation to the Leadership Process

Dias (2012) states that the issue of change is present in the discussions that involve organizational culture. Culture is seen as a process and, as such, is constantly changing. What has to be discussed is what variables should be changed or included so that the process goes by the expected path.

But there is always a blockage when we come across some organizational structures.

For example, the current trend is the disappearance of organizations with more cast structures, to give place to organizations with more flexible models. There is no formula for developing an ideal organizational culture under any circumstances, but in general there are some procedures that can be followed in business organizations that will favor their development.

The author supports some actions, among them: giving autonomy and increasing the decision-making power of leaders in order to encourage the emergence of innovative leadership in the organization.

But how can we define innovative leadership? We may not have a standard answer to this question, nor can we have it, but this study goes on to validate that the dynamics of collective work tend to create a strong relationship with culture and, therefore, aims to strengthen the leadership process thus

legitimizing the decisions of its leaders.

Schein (2009) states that when we examine culture and leadership, we realize that they are two sides of the same coin, so neither could be understood just by itself. It also emphasizes that if we could use a single argument to explain the role of leaders, it would be based on the ability to understand and work with culture. Reinforcing this concept establishes that the difference between leadership and management lies in the fact that the former creates and changes, the latter acts on culture, so culture is the result of a complex process of group learning, covering the emotional, behavioral elements, cognitive of the psychological functioning of its members, being partially influenced by the behavior of the leader.

Perhaps we will better understand this concept if we analyze how culture can emerge when forming groups.

Schein (2009) states that cultural formation occurs around efforts to deal with the anxieties characterized by shared basic assumptions that emerge at each stage of formation of a group that divides it:

Table 1   Stages of Evolution of a Group

Stage	Assumption	Socioemotional Focus
Formation of the group	Dependence: the leader knows what we should do	Self-orientation: focus on inclusion; power and influence; acceptance and intimacy; and identity and role
Construction of the group	Fusion: we form a large group, we like each other	Group as an idealized object: harmony; conformity and pursuit of intimacy. Members' differences are not valued
Group work	Work: we can play because we know each other and accept each other	Mission and tasks of the group: achievement; teamwork and order. Differences between members are valued
Maturity of the group	Maturity: we know who we are and what we want. We are successful, so we must be right.	Survival and comfort of the group: preservation of the group and its culture. Differences are seen as threats.

Source: prepared by the authors, adapted from Shein, 2009, p.63

We realize that in the first stage the members of a group are more concerned with their intrinsic looks, each taking care of their own feelings as if that were possible. In the second stage there is an apparent escape from the interpersonal conflicts, where the members seek an approximation between themselves and the slogan becomes solidarity. In the third stage there is an emotional change, where the union of efforts and experience leads to a degree of mutual learning. Already in the fourth and last stage is the preservation of culture and Shein feeds the thesis that culture, being a set of learned responses, will be as strong as the learning history that has arisen and accumulated, so the culture is fed by the solutions found by the groups as regards their identity.

Santos (2000) reinforces this tendency by affirming that culture represents the characteristic dilemmas of organizational systems from values that compete with each other and alternate in a coexistence typical of complex phenomena.

The organizational context is collective, with culture being a preponderant factor to delineate the existing relationships between leaders and leaders. These relationships are favored when the members of a group share similar values, converge with the understanding of the needs of the rules for social order, and practice practices that are legitimized in the group (MUZZIO, 2017).

The culture derived from the outstanding characteristics of the members of a group can highlight organizational differences. In this context it can be affirmed that culture is not something universal and previously determined (HOFSTEDE, 2001), therefore it must and must be considered when the concern of collective process construction is observed, observing the dynamics of the work groups and their members.

4 Value and Identity in the Formation of Groups and Leaderships: Perspectives and Scenarios

Several paths lead us to understand what can happen to the course of work, and consequently the interference in the structure and behavior of groups in these almost certain transformations. Redefining group involves redefining leadership models.

Nunes et al (2008) discuss that every individual has a cultural past that defines their habits and their identification within a socialization process. Starting from the premise that an organization is a large and complex social group, it seeks to understand the process of construction of the collective personality, not based on the descriptions and concepts attributed to it, but from the perspective of different experiences and experiences of the people, referring directly to the construction of the identity of the collective work developed.

There are several models in which these authors support this theory and one, specifically, seems to have a direct connection with the proposal of this study: the model of selective affinities. In it, the idea is that groups should have greater flexibility within organizations, as people seek an individual strategy of action, identifying with the other components of the group in different degrees of hierarchy. Perhaps this approach will lead us to a great reflection of how and what should be the relationships between leaders and leaders, since people, seeking to maintain their individual mobilities, begin to reject the idea that the impositions and restrictions that traditional models manifest can, in a way, slow down your personal goals. The conflict is generated and taken care of, it can be dysfunctional.

Organizational functions, when defining strategies aimed at autonomy, capacity for action and skill development, provide, perhaps without intention, but indirectly, means of affirmation and unequal identity, when the supposed treatment of equality between people prevails, emphasizing that human theories consistently assert that there are behavioral differences between people.

Individuals need self-identification, that is, to have access to the perception of their results, creating their own autonomous rationality. It is the set of individual particularities that leads us to construct the meaning of group work. It can then be said that the construction of collective work necessarily involves the understanding of the need to strengthen individual work. However, how to understand, accept and practice this?

One way is to understand the transformations that exist in the formation of the labor market. Barbosa Filho (2012) affirms that young people in Brazil are taking longer to start work, as it suggests that they are dedicating more time to study, so when they arrive they already do so with a greater range of knowledge, even if theoretical, one of the great challenges of Brazilian education.

Based on the study of Schwartz (1992), the author shows that the values of individuals in different contexts, which refers us to the different organizational profiles, must be analyzed taking into consideration three fundamental aspects: how the priority values of people are affected by their social experiences, how these same values affect their behaviors and their choices and, finally, how social structures can contribute or influence the definition of these values, due to different cultures. Evidence that the knowledge of these aspects helps us to understand the bases that structure the formation of a group, thus allows us to better analyze the different strategies that support the organization of collective work.

Schwartz (1992), in a research carried out with university students, contributes to the understanding of the formation of contemporary groups, establishing some values that young people take into account when they construct the identity of the work. The first is concern for self-improvement and self-fulfillment. In this item the motivational value of achievement is evidenced when success and personal self-realization are portrayed through the demonstration of competencies according to established social norms. The second value is the openness to change and the valorization of self-sufficiency, evidencing, among others, the sense of freedom, creativity and independence to choose one's goals. The third value is security emphasizing harmony, social stability and interpersonal and intrapersonal relationships. Finally, universalism when seeking identity with nature and its systems and, above all, the practice of social justice.

It should be noted that Nunes et al. (2008) affirm that individuals with more knowledge and more politicized tend to commit to organizational changes more effectively, if compared with people deprived of autonomy and critical sense. This assertion drives us to the continuing need to revise management models and the role of leadership is key to this.

5 Creating Group Value by Generating Competitive Advantage in the Leadership Process

The aim of this study was to approach the variables that a leader must realize in order to perform a good job and to improve his / her skills in order to know how to work in groups. It reinforces the idea that the relationship between leaders and leaders should be understood as a process of social interaction.

Based on these guidelines and understanding that value creation for the group tends to be one of

these variables; the discussion of how this practice can interfere in the expected results.

Value creation and competitive advantage are broad concepts, so it seems to us possible to associate with the concept of human capital.

Therefore, the measurement of human capital as a proposal to create value for the group can lead us to an understanding that this practice will generate a competitive advantage for the organization, if associated or even incorporated into the leadership model. Human capital refers to the competence, attitude and intellectual capacity of employees (Ross, 1998).

Brito & Brito (2012), in exploring the study by Drnevich et al, 2010, have already expressed some concern about the fact that several questions about the study of competitive advantage and what they generate remain unanswered: how can we effectively portray, model and measure it? How do organizational, competitive and environmental dynamics affect it? How does it develop?

The creation of values must be seen in different perspectives, especially by the perception of the company's stakeholders (LEPAK, SMITH, TAYLOR, 2007), since human capital covers the level of knowledge of each employee and is the main factor in the creation of intellectual capital of a company, being this source of innovation and strategic renewal (BONTIS, 1999).

The measurement of human capital as a value strategy, incorporated into the leadership model, generates or can generate competitive advantage. Brandenburger and Stuart (1996) argue that value creation is associated with the opportunity cost ratio, which allows us to incorporate various perspectives of strategic business approaches, and why not, make use of human capital measurement as one of them.

In current literature, it is not difficult to perceive a significant growth of interest in its measurement. Many companies have joined and made available to their investors managerial reports such as integrated report, annual sustainability report, social report and others. Today, the releases of these reports happen on a voluntary basis, since there is no legal requirement for their mandatory delivery. Regardless of the being compulsory, the companies started to show interest in these demonstrations sometimes due to the requirement of the stakeholders and to recognize the benefit to the brand through the intangible assets.

According to Mayo (2003), the way in which companies are evaluated has been undergoing progressive changes since 1990, when a greater value was assigned to the so-called intangible assets, which are knowledge, skills and the brand itself. According to the author, these assets are also called intellectual capital. Human capital, which is part of intellectual capital, is constituted by the people who construct this value.

Human capital is recognized as a pillar of the creation of intellectual capital and its main characteristic is that it can disappear with the exit of the employees of the companies, being thus a constant source of strategic renewal (Bontis, 1999).

In addition, through the valuation of intangible assets, human capital is seen as a new perspective, is no longer considered only as a cost and is now seen as an investment, since it is possible to measure and measure it.

The big question is how to measure intangible assets? Unlike the tangible assets that can be measured by consolidated accounting instruments, it was necessary to develop new means to measure intangible assets.

At first glance, there was a growing volume of research aimed at studying the measurement of these assets and many consultancies created their evaluation systems. Mayo, in his book "The Human Value of the Company", presents several approaches to measuring this type of asset.

The concern with this phenomenon is justified, therefore, determining the value of companies based on human capital is a recurring challenge in an economy that is growing based on knowledge and services.

Brito & Brito (2012) reinforce this idea when they argue that the concept of competitive advantage is not restricted only to the relation between competitor / competition, but that it is directly related to the creation of value.

It is a future challenge for these authors: to investigate which methods may be most effective in measuring human capital.

6 Leaders and Groups: How to Face the New Challenges for Collective Work

Based on the Sustainable Development Objectives (ODS), a program created by the United Nations in September 2015, which establishes 17 objectives anchored in three major divisions of sustainable

development: economic, social and environmental, Ernst et Samaan (2016)[1] developed a study on the Future of Work, seeking a more effective direction for the 169 goals established in Agenda 2030, a document constructed, guided and guided by the purposes and principles of the Charter of the United Nations. The main problem addressed is how the world of work will be in 2030 and as a reflection, what we are doing in our companies from the perspective of this very near future.

They say that the greatest challenges ahead are: rising demographic imbalances, the search for healthy environments, political uncertainties and growing inequality, and the great promises of technology.

Is it unlikely that the extrapolation of current trends is insufficient to meet the growing demand from leaders, or are we prepared to understand the direction of the changes that are taking place?

Everything is moving so that we have a scenario different from what we find today in organizational contexts. If there is a change in the conception of the work, there will be a need to review the organizational practices, including the dynamics of the groups and the relationship with the leadership process. Researchers are working on scenarios to reduce labor supply and increase the working population at working age, a new group profile is set up and the dynamics applied to them tend to be strengthened in this context. Some goals set out in Agenda 2030 strengthen this idea, as three of them establish the creation of sustainable economic growth and social inclusion, the construction of dynamic, sustainable, innovative and people-centered economies, as well as equal access to jobs, leaders and decision makers at all levels (emphasis added).

In a perspective of greater impact, Brown (2012) radicalizes and proposes three models for effective social change: the Pearl Harbor model, termed as catastrophic, when a dramatic fact fundamentally changes our way of acting and thinking (it refers to the Japanese attack , unexpected, on 06.12.41, during the Second World War); model of the Berlin wall when society begins to change in relation to some theme, usually after a long period of slow and gradual changes in thinking and attitudes, and the model of a sandwich when a strong movement of activist sectors presses a certain cause that is also backed by strong political leadership. According to the author, the former presents a greater risk, the second is slower and the third is the more attractive.

Dowbor (2017) reinforces the need to incorporate into the decision-making process of organizations the vision of a possible balanced, economically viable and socially just development (emphasis ours), could   find interorganizational barriers, because the leaders reduce their success, and why not say, from their teams, to a single criterion of success, the result purely and simply financially. This, by a natural inheritance, continues being the main instrument of power. It also emphasizes that, in order for us to have in fact a corporate governance, an indispensable premise in the construction of the collective, and the most effective and perhaps the safest route is transparency.

7 Conclusion

Revisiting the organizational history and theories discussed in this study, it is possible to affirm that the current trend is the disappearance of organizations with more cast structures, to give place to organizations with more flexible models. The great challenge is to learn to deal with some of the emerging blocks of this transition process. The interaction and integration between leaders and, consequently, the construction or reconstruction of the identity of the working groups is one of them.

It was sought to show that the construction of collective work necessarily involves the understanding of the need to strengthen individual work and one of the ways to achieve success is to give autonomy and increase the decision-making power of the leaders with the objective of encouraging the emergence of leaderships the organization.

Impossible to define emphatically what is innovative leadership, but the proposal is that we take a more focused look at the validation of group work, since it tends to create a strong relationship with culture and, therefore, strengthen the leadership process by legitimizing the decisions of their leaders.

But there is a great reflection: and now leaders, how to react (or act) so that their attitudes legitimize their power? And the leaders, how should they behave or react (or act) to such received stimuli? This discussion calls into question the very concept of a group, and of course it is not exhausted here and, judging by the changes and future scenarios, it would not be audacious or reckless to say that they will never be exhausted. It is a continuous and uninterrupted path of discussion.

arthur.dom@gmail.com, junq@pucsp.br)

Abstract: Corruption is a treat to well-being, as showed in this article. The study compares statistically the OECD member states and cross check with the countries where the universities that contribute to the ICIM (International Conference on Innovation and Management) are located. A statistically analyses of 39 countries using 13 selected indicators, some from the UNSDGs and others from the Observatory ORIBER[2], was applied seeking areas of the ICIM Proceedings that may be developing and deepening their research in order to contribute for a better global future.
Key words: Corruption; Well-being; Co-operation

1 Introduction

We are now living at an Age where things are becoming more instable, and where geopolitical problems increase threats in many areas, particularly concerning inappropriate use of accelerated technological breakthroughs, so timing for actions are becoming shorter and shorter, and Trust has being imploding (Trustbarometer, 2017)[3]. An example of this, are the everyday more common cyberattacks, as the one related to the Trump and Putin hidden alliances; as well as the problems related to climate change and ecosystem biodiversity, as the is the case of the 17% of Amazon Forest lost in the last 50 yrs. Fortunately, nowadays, it may be possible in this case to use drones to monitor the process as suggested by the WWF[4], and start thinking on Sustainable Recovery Goals (SRGs).

Considering 132 Countries that includes the ones we are interested one could see that Controlling Corruption may help to improve Innovation Conditions (Fig 1), something that reinforces the importance of the Worldwide Governance Indicators (WGI), World Bank (2017)[5].
**Figure 1   Global Innovation Index (GII) vs. Non-Corruption Perception Index (NCPI)
Normalized (0 -100), and the Higher the Better**

Moreover, a higher concern, particularly in this Digital Age, is the Increasing Concentration of (Wealth Stirati, 2016) and the Inequality Growing again; as indicated by the recent World Inequality Report (WIR, 2018). This is important since it may impact Innovation Development as may be seen in Fig 2.
Figure 2 Global Innovation Index (GII) vs GINI inequality Index (GINI)
Normalized (0 -100), and the Higher the Better
Source: Prepared by author*s*

What is most interesting to observe in this graph is the accelerated growth in Innovation starting at about 50 in the GINI Index, which is de case of Developing countries like Brazil and Colombia. What may be needed is new Economic Policy Framework that may foster a more Inclusive Development as recommended by the WEF[1].

Actually, It ś possible to analyse corruption from many points of view, as pointed by (Brei, 1996) with this topic usually focus on: Market, public interest, public opinion or even on regulation. In a wide form it is related to the violation of the moral, or the quest for advantage in disregard with the common well-being or others private life (Rogow&Lasswell, 1970). Corruption taint in many spheres of our daily lives, such as ethics, morals, business, relations to the law, corporates, governments and politics, that's why when unfolded any corruption, it generally causes an uproar trough the society. One of the thinking leaders on the area of Corruption and Culture is Richard Sennett from The London School of Economics who wrote the classical The Corrosion of Character where he already foresees thata regime "which provides human beings no deep reasons to care about one another cannot long preserve its legitimacy".

Corruption is deeply related to how it is perceived in its society, and as any social value, it changes geographically and chronologically, as the people that make up the society change and redefines what is acceptable or not. As (Granovetter, 2006) pointed the corruption concept emerges from the society, and its understanding should be not compared lightly trough communities. As a good example of how some countries with the same culture basis could approach differently was a paper presented in last year ICIM, Yunanda, Tareq, (Mahdzir, & Rahman, 2017, p. 1422)[2], in this short paper it ś show how the Islamic Banks interprets its social impact and how they disclose information following the Shariah.

Is noted by (David, 1986, pp. 19-34) that the laws and definitions, as the source of Power that drives the order in society is very complicated, and thus, when comparing the same aspect of a society it should be done by understanding the context and history of that aspect and how it is perceived in its society. As (Granovetter, 2006) described the corruption common understanding is very occidental oriented, this should be noted when analysing the indicators being used at the UN and other international organisations.

The OECD is an organisation that is focused on developing countries through an economic framework, the 37 current members are:

ICIM is jointly organized by the Wuhan University of Technology (China), the Yamaguchi University (Japan), the Tilburg University (The Netherland), the Pontifical Catholic University of Sao Paulo (Brazil)the University of Vaasa and Vaasa University of Applied Sciences (Finland), the UniversitiTeknologi Malaysia (Malaysia), and the University of Wales Trinity Saint David (United Kingdom). Its purpose is to provide opportunities for researchers to present their findings based on innovation and management as well as to create opportunity for the exchange and synthesis of new knowledge on innovation and technology management (ICIM, 2016)[1].

We use the definition of well-being, as the principles that guides a welfare state, which the following basic attributes: access to education, non-violent, healthy and economically sustainable. (Stiglitz, 2012, p. 193). These are the minimum requisites to the UNSDGs as well as the ORIBER (2013)[2]Guide(GPS). Correspond in fact to a bottom line for the development of other targets such as the UN SDG[3] 5.A.1 – "(a) Proportion of total agricultural population with ownership or secure rights over agricultural land, by sex; and (b) share of women among owners or rights-bearers of agricultural land, by type of tenure".

To women have access to being owners of agricultural land, and having the ways to keep it, it is needed an equal footing, and that can be achieved in educating girls, so they can manage land, reducing crimes and creating a economic background that helps everyone to thrive. Actually, this beside the Inequality problem are the basic challenges according to the WEF.

2 Theoretical Reference

A corrupt act is an attack of destruction of the common Rogow&Lasswell (1970), but such thing is not easily determined. In the United States bribery is illegal, but it was replaced by political campaign contributions (Stiglitz, 2007) that are legal, and the donating companies are investing in their candidates. Recently (Brazil, 2017) changed it laws, no. 13.488/17, to forbid that kind of contributions, but that only after public opinion was strong in the subject after to big corruption scandals (*Mensalão*, big monthly, and *Lava-jato,* car wash).

Nowadays, after the 2008 financial crisis, many governments adopted and austerity approach of regulation of public expenditure, but in many ways that contradicts public opinion that perceive governments as corrupt. (Piketty, 2014) point out that is needed a global regulation and a better distribution of wealth and tax, given the example of progressive tax laws and highly taxed heirdom. The main goal is to create more equal people, and thus strengthen democracy and the government efficiency. If the government is more efficient, the capital flow is directed to a productive motor, and is capable of effectively do a better world (Dowbor, 2017).

In this paper, we seeking in particular possible relationships between well-being and the lack of corruption, for this work were selected the following indicators:

1. Corruption (Cor)
2. Water and Sanitation (WaS)
3. Electric power consumption (kWh per capita) (EPC/pc)
4. Internet users (IU)

---

[1] ICIM Page, informations about the 2016 Conference - https://www.pucsp.br/icim/ingles/icims/index.html

[3] United Nations – Sustainable Development Goals (SDG)– The SDGs are the blueprint to achieve a better and more sustainable future for all people. https://www.un.org/sustainabledevelopment/sustainable-development-goals/

5. Level of violent crime (LvlVC)
6. Political terror (PT)
7. Press Freedom Index (PFI)
8. Access to Basic Knowledge (ABK)
9. Democracy Index (DI)
10. Global Innovation (GI)
11. Innovation Efficiency Ratio(IER)
12. Input Sub-Index(IIS)
13. Innovation Output Sub-Index (IOS)

The Corruption (Cor) deal with the perceived level of public sector corruption based on expert opinion. Water and Sanitation (WaS) is an indicator that considers 3 dimensions: access to piped water; rural access to improved water source and access to improved sanitation facilities.   The Electric power consumption (ECP/cp) measures the production of power plants and combined heat and power plants. The indicator of Internet users (IU) estimated number of internet users out of the total population, using the Internet from any device, last 12 months. The level of violent crime (LclVC) measures the impact of crime in government and/or business.   Political terror (PT) refers to the level of political violence and terror in a country. The Press Freedom Index (PFI) measures the degree of freedom that journalists, news organizations, and netizens enjoy in each country, and the efforts made by the authorities to respect and ensure respect for this freedom. Access to Basic Knowledge (ABK) refers to some dimensions: adult literacy rate, primary school enrolment, secondary school enrolment and gender parity in secondary enrolment. Democracy Index (DI) provides a context of the state of democracy worldwide. The Global Innovation (GI) provides metrics about the innovation performance of 127 countries and economies around the world, considering: Innovation Efficiency Ratio (IER) what shows how much innovation output a given country is getting for is inputs; Innovation Input Sub-Index (IIS) what is comprised of five components that enable innovative activities (institutions, human capital and research, infrastructure, market sophistication and business sophistication); and Innovation Output Sub-Index (IOS) provides information about outputs that are the results of innovative activities within the economy : knowledge and technology outputs and creative outputs.

3 Methodology

For the study were considered 39 countries including members of OECD and ICIM. Three Groups of countries were organized as follow:

•   **Members of OECD only:** Latvia, Belgium, Switzerland, Austria, Spain, Chile, Germany, Portugal, Estonia, Denmark, Norway, Canada, France, Australia, United Sates, Poland, Hungary, Greece, Turkey, Luxemburg, Czech Republic, Korea Republic of, Sweden, Colombia, New Zealand, Iceland, Israel, Mexico, Slovakia, Slovenia and Italy.

•   **Members of ICIM only:** Malaysia, China and Brazil

•   **Members OECD and ICIM:** Japan, Netherlands, United Kingdom and Finland.

Using *Minitab* as software data collected by ORIBER from many databases like the UN Data were analysed particularly concerning corruption indicators and well-being in the three mentioned groups. The selection of these 13 variables came through the development of the yearly studies analysis of ORIBER developed at the PUC/SP. It ś important to mention that for this study all the indicators considered were Normalized (0 – 100) and Positivized - the higher the better. For Luxembourg was used regression to estimate some missing values, for the case of: Electric power consumption, Level of violent crime, Political terror and Democracy index.

4 Results and Discussion

ANOVA analysis is a statistical method applied on this study to explore characteristics and relationship of the representative variables for the 39 countries considering the 3 Groups (OECD, ICIM and ICM+OECD). To apply this statistical technique - ANOVA the following steps were used: **(1)** Defining the 3 Categories concerning the 39 countries, **(2)** Analyses of the 13 variables for the model.

Figure 3 reinforces the idea regarding different levels of Corruption on the 3 Groups, and shows as well, that Innovation follows the same pattern, which may indicate differences on Level of Development.
Figure 3   ANOVA Analysis of Corruption and Global Innovation
Source: Prepared by authors

In the ANOVA analysis the outliers found were:
- WaS (Water and Sanitation) Latvia, Republic of Korea, Mexico and Colombia;
- EPC/pc (Electric power consumption (kWh per capita)) Iceland and Norway;
- LvLVC (Level of violent crime) Mexico and Colombia;
- PT (Political terror) Mexico;
- PFI (Press Freedom Index) Turkey,
- ABK (Access to basic knowledge) Latvia;
- DI (Democracy Index) Chile and Latvia.

Colombia, Latvia entered recent as members of OECD but were always in the bottom quartile, Mexico is struggling with drug cartels and has problems with water resources. Iceland and Norway are positive outliers with a much bigger EPC/pc than any other country; Iceland output per capita is more than double of the Finland. In Turkey, after the attempt of a *coup d'état,* were passed many laws restricting Press. Chile recently is struggling with its reforms of labour and education, but in general is going much better than the others; particularly regarding Governance.

The OECD+ICIM member are closes to achieve an effective battle against corruption, the OECD member usually are highlighted by resolving infrastructure problems like Water and Sanitation (WaS) and Electric Power (EPC), more than their access to basic knowledge strengths its democratic systems. Access to basic needs are linked to surviving, member that only are on ICIM are fighting against Political Terror (PT) and Press Freedom (PFI) and Violent Crime (LvIVC).

Broadly speaking the members of OECD+ICIM seem to be doing better in Corruption combat

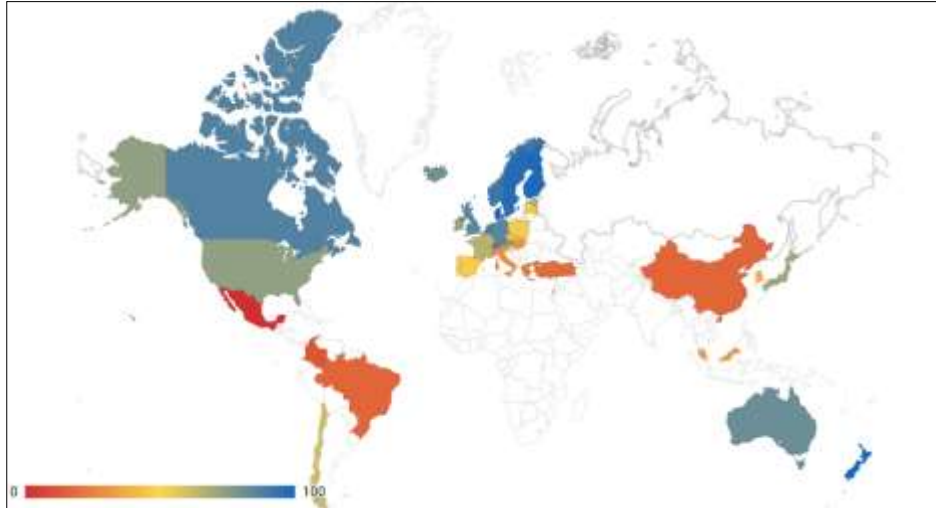
(Cor). The countries doing worst are the Ibero-american Mexico, Brazil and Colombia plus Turkey and China. Australia, Canada, New Zealand, Sweden and Finland are the countries with better economies, strong infra-structure and well developed as well as many indicators related to wellbeing; a good example for all. On the other hand, some countries of the ICIM group (Malaysia, China and Brazil) stand out in the Innovation Efficiency Ratio (IER) that shows how much innovation output these countries is getting for its inputs.


Figure 4   Corruption Map–levels of the Corruption Indicator for the 39 Countries of this Study
Source: Prepared by author.

When comparing the before analysed data with the map of where corruption is found, the countries that have the best performance in wellbeing are the same that effectively combat corruption. These results were the expected of the post 2008 crisis, since countries like Australia, Canada, New Zealand, Sweden and Finland have a more equalitarian society (Stiglitz, 2012, pp. 22-24), mostly concerning 3 drive forces: equality of education, equality of health and equality of opportunity. At the present stage of capitalism is hard to found balance, and we should do everything to close the gap between the many inequalities of the world. (Schwab, 2016) point out that no equality could be achieved if there are people that are still not touched by the first industrial revolution, without access to tapped water, and therefore, without a trustworthy source of clean water. There is no equality in education between people with access to electric power and people without, people with electricity can beyond light have more channels of information (radio, TV, digital stored encyclopaedias), and when we factor access to internet (and the quality of it), all these "basic needs" are still a greater challenge that deepens the inequality.

In the best performing countries, all of them have little inner inequality, that ends up minimizing external inequality, obviously these do not eliminate individual differences, but in a more equally field context where the fact that individual gains more by cooperating generates a positive feedback loop, creating a more generous horizon (the Sharing Society, the Circular Economy). As noted in the Iterated Prisoner's Dilemma (Stewart & Plotkin, 2013), as the populations grows, and the gains remains equal, strategies that are aligned to generosity and good behaviour thrive; and the Principle of Fraternity becomes alive.

(Schwab, 2016, pp. 6-7) points that at each industrial revolution some new basic things are needed, that helps develop not only the industry, but the society as whole as it happens since 1760 with the first industrial revolution, and access to water. On the second industrial revolution, electricity and liquid combustible were distributed as sources of power to engines, and more recently semiconductors and internet are the door to the third industrial revolution.   The lack of water, power and internet could be easily linked to corruption, mostly because they need public infrastructure, mainly hard infrastructure like aqueducts, water treatments, power grid and internet fibers; and the Infrastructure and Urban Development industry unfortunately involves a lot of money and end up having strong ties with corruption (WEF, 2017)[1], as was the case of Brazil lately.

Moreover since access to meet human needs and transparency are basic in the development of

---

[1] WEF Report - Available In: Http://Www3.Weforum.Org/Docs/Wef_Paci_Iu_Report_2017.Pdf

innovations, it is essential to invest in people, technology and mostly in Ethical Governance as mentioned recently in an Interview the Brazilian Political Scientist Ruben Ricci "Corruption occurs in countries that have high social inequality and in a state that is appropriated by elites" (Ricci, 2018)[1].

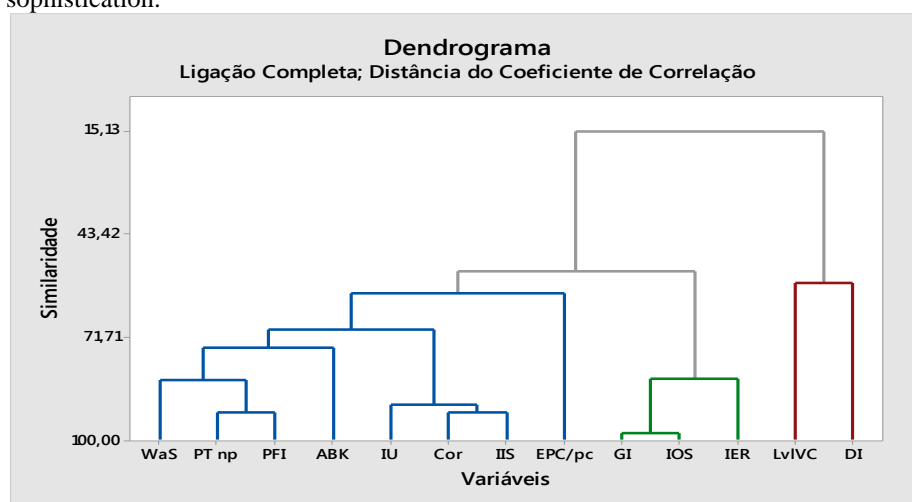
To reinforce these ideas figure 5 shows the overall relationship among the 13 variables.　So for example, the behaviour similarity between LvlVC and PT, on the extreme right of the graph(on red), seems to indicate that violence tends to happen together, being against individuals and/or institutions; and on the right hand of the graph(on blue), one could also see that there is a behaviour similarity among the well-being indicators (WaS, ABK, EPC/pc) on the one hand; and even more strongly similarity among Innovation (IIS), Corruption (Cor), and Internet Users (IU) on the other hand. All these seems to suggest the need for a more Systemic and Ethical Governance Framework that may foster Transparency, Press Freedom and Free Flow of Information that jointly could lead up to a more solid structure, enabling improving innovation in institutions, human capital, research, infrastructure, market and business sophistication.


Figure 5　Dendrogram of 13 variables

5 Conclusion

As noted in this article, control of corruption and infrastructure that creates a welfare state are deeply connected, but in a world of the post 2008 crisis an alternative to reducing the state is combating corruption and using the recovered resources to invest in strengthen a more Transparent and Democratic context that fosters development in Infrastructure, Knowledge and Liberty. Innovation is an important aspect in the search for solutions and development of new more Organic Ecossystemic paths.

Thinking in something like the Maslow Pyramid of Needs, one could start first by thinking on Access to Basic Needs such as Water, Sanitation, Electric Power and Internet that may help to reduce inequality, if associated with education and an organized society as recommended by Amartya Sen on his contributions to welfare economics, social choice theory and economics and social justice. Actually the steps needed for a more stable and resilient country passes by these factors too, and we could actually by comparing and learn from what other countries are doing or have done before as benchmarks.

In the best performing countries, they have very different sizes of the worst performing countries, especially China, Brazil, Mexico and Turkey. In all these countries many cultures with specific needs, in a vast geographic region that have very specific subset of its own difficulties. Maybe for these kind of countries the best approach could be a more decentralized approach, learning from countries that share similarities, and establishing cooperation agreements like the BRICS, but that may really work; although eventually some problems may arise as is the case nowadays with the EU with the BREXIT and in the

---

[1] Ricci is a brazilian political scientist, in an interview in 2018 is pointed that corruption is not the main problem, but iniqualities in society - Ricci, R. O Principal Problema Do Brasil Não　É A Corrupção, Mas A Desigualdade, The Main Problem In Brazil Is Not Corruption But Inequality, Ihu, 2016 Available In: Http://Www.Ihu.Unisinos.B r/159-Noticias/Entrevistas/561362-O-Principal-Problema-Do-Brasil-Nao-E-A-Corrupcao-Mas-A-Desigualdade-Ent revista-Especial-Com-Ruda-Ricci

US with Trump. As matter of fact as it was mentioned recently BRICS meet but the US is protagonist because of the Commercial war with China.

Nonetheless there are signs that things may be changing at our region. Colombia was accepted at the OECD and the agenda of the elected new President of Mexico Lopez Obrador includes a strong fight against Corruption plus strict Austerity Policies at the Public Level.

Innovation, Wellbeing and Control of Corruption could really help to foster sustainable development of the countries. Besides Climate Change, concentration of Wealth and Growing Inequality are today some of the greatest threats for the future of society. Moreover the solutions like the problems need to think in a   more Holistic approach and deal with many levels at the same time; so that we could tackle great inequalities starting with neighbourhood or villages, passing to cities and counties until we have a globally common landscape as a starting point, and the going down again. This equality is what make the societies in the better performing countries more resilient to crisis, but if there is not established a cooperation and a balanced playfield, today resilience will be tomorrow inequality; moreover we could not forget that Equality is just one of the Three Basic Principles the other ones are Freedom and Fraternity; and should also go along in the process. We all could help to build a better the future, the ones that got there first must signalize to the ones that are looking for their way, and the ones that are trying to get there should not lose hope, and keep trying.

The Impact of Inclusive Human Resource Practice on Performance: The Role of Emotional Exhaustion and Homesickness

Chen Kaijia, Chen Yun
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 1632524680@qq.com, 17908016@qq.com)

Abstract: In this study, faced up with employee diversification,in order to maximize the benefits of employee diversification and reduce its disadvantages, we propose ahuman resource practice that recognizes, respects and includes differences - Inclusive human resource practice(IHRP). In the conflict of diversification, with consumption of emotions and energy, it will inevitably lead to emotional exhaustion. Through the empirical study of 537 valid samples collected from multiple companies, drawing the following conclusions based on conservation of resource (COR): IHRP can improve job performance and reduce emotional exhaustion; homesicknessnegativelyregulates the relationship between emotional exhaustion and job performance.

Key words: Inclusive human resource practice; Emotional exhaustion; Job performance; Homesickness

1 Introduction

In recent years, with the continuous changes in the demographic structure, the diversification of values, the diversification of work`s waysand the continuous advancement of economic globalization, diversification of employees in the workplace has become an inevitable trend. Among diversified employees, owing to differences in one aspect or more aspects, misunderstandings and conflicts may arise during the process of their contact. These misunderstandings and conflicts consume the emotional resources of employees and cause certain emotional exhaustion. From the perspective of COR, emotional exhaustion can reduce employee job performance (Zhang Ruoyong, Niu Wanjing, 2015).

Although faced with the diversification of employees, there have been lots of studies that have proposed relevant studies on inclusiveness. However, at present, research literature on IHRP is almost none, scholars focused more on inclusive leadership (Nembhard, Edmondson, 2006; Shi Guanfeng, Liang Peng, 2015), Inclusive growth (Li Gang, 2011; Zhao Yuexian, 2011), inclusive innovation (Xing Xiaoqiang, Zhou Jianghua, 2015), inclusive human resources management (Midtsundstad, 2011; Gao Hong, 2012; Liu Jianping, 2015), etc. However, theseare all at the informal organization level, and as a formalized institutionalized organization, the existing research on IHRP has not yet been discovered. Therefore, this study proposes IHRP.

Although many existing studies relate to homesickness, it is not yet common to associate them with emotional exhaustion.Thus, the study has added homesickness to the research framework.

Theresearch aims to explore the mechanism of the impact of IHRP on performance through emotional exhaustion as a mediating variable and examine the boundary of the black box mechanism of homesickness as a moderator variable.The contributions of this study are mainly reflected in the following aspects: first, enrich and complement the theoretical research on oriented human resource practice, emotional exhaustion and homesickness; second, to promote the study of the black box mechanism and boundary conditions of employee performance in IHRP.

Based on the above analysis, this study proposes the following theoretical model:
Figure 1   Theoretical Model

2 Theory andHypothesis

In the study, the definition of IHRP byIntegrating previous literature on inclusive management is: a kind of human resource practice that recognizes, toleratesand respects differences. Concretely, which is to accommodate the differences in religion, culture etc., to fully consider the needs of different employees, to be fair and equitable; to recognize differences, tolerate differences, to stimulate and

maximize the value of differences and to pay attention to the sense of belonging and happiness of employees in the work process.

Emotional exhaustion is a state of fatigue that results from the overuse of individual emotional resources and their associated physiological resources and is an important component of job burnout (Maslach C., et al., 2001). Once emotional exhaustion occurs, employees often suffer from impaired self-esteem, nervousness and temperament, depression and anxiety (Chen Ruijun, Qin Qiwen, 2011), which in turn reduces employee job satisfaction, increases employee anti-productive behavior and turnover tendencies, and ultimately affects job performance (Zhang Ruoyong, Niu Wanjing, 2015).

According to COR, emotional exhaustion can reduce the job performance of employees. The consumption of such emotional resources needs to be supplemented in a timely manner, such as the support of organizations, the approval of leaders, positive feedback from customers, toget new resources such as self-esteem and sense of accomplishment (Wang M., Liao H., Zhan Y. et al., 2011).

IHRP insists on equal opportunities, fair distribution and development sharing among employees, and acknowledges the diversity, maximizes the value of diversification (Roberson, 2006), and pays more attention to employees' sense of belonging and happiness in their work process (Qiu Guobin, 2013), which promotes harmonious relationships between employees by shaping a good atmosphere of mutual cooperation and fairness (Havin, 2009), which provides employees with organizational support. Organizational support and approval can improve job performance and reduce emotional exhaustion. Based on this, hypotheses 1, 2, 3 are presented:

Hypothesis 1: IHRP is positively related to job performance.

Hypothesis 2: IHRP is negatively related to emotional exhaustion.

Hypothesis 3: IHRP improves job performance by reducing emotional exhaustion.

Individuals who experience homesickness is more likely to experience negative emotions and is more likely to suffer from affection (Van Tilburg, 1997). When individuals experience homesickness, they need to consume considerable resources to ease the pain and pressure caused by homesickness. (Shaffer, et al., 2012). For homesick individuals, emotional exhaustion is further aggravated, hypothesis 4 is presented:

Hypothesis 4: homesickness is positively adjusting the negative correlation between emotional exhaustion and job performance, making the negative relationship stronger when homesickness is high (than homesickness is low).

3 Research Design

3.1 Data collection

The study selectsmultiple regional companies as survey objects and covers numbers of industries such as information and communications. The data collection was achieved through the online distribution and recovery of questionnaires. The survey lasted for more than three months from November 2017 to February 2018. 552 questionnaires were retrieved. Effective samples were 537, effective rate: 97.2%, of which 56.6%were male.

3.2 Measurement of variables

We studied Lisa H.Nishii. (2013) and other studies. Based on the opinions of experts and respondents, a scale of 17 items was eventually formed. The three-factor model fits the following criteria: $\chi2/df=4.381$, NFI=0.935, CFI=0.936, IFI=0.949, TLI=0.940and RMSEA=0.079. In this study, Cronbach's alpha was 0.953.

Table 1   Rotated Factor Loads

Dimension	Title Item	Factor load
Job Allocation and Performance Compensation	The company uses flexible working hours and other more agile office methods	.634
	Employees can participate in the development of their salary structure and level	.824
	The company will adopt flexible salary incentive according to the requirements of post	.645
	I can choose the type of salary and the form of payment according to my own demand	.851
	The company will adjust salary level, structure according to employeefeedback	.729
	The recruitment of the company does not discriminate on the grounds of gender etc.	.763
Job Selection	Recruitment and selection will not affect the employment and promotion due to different personalities and professional backgrounds	.737
	Company recruitment selection will be based on specific job requirements and the use of flexible recruitment selection method	.741
	The company's recruitment and selection system is scientific and rigorous, the process is standardized and transparent, and the results are fair	.692
	Company recruitment and selection will be based on employee feedback to optimize and improve the recruitment program	.597

Continual Table 1

Dimension	Title Item	Factor load
Employee Development and Participation	The company provides employees with more opportunities for fair promotion	.630
	The company encourages employees to ask questions and make reasonable suggestions, even if they are wrong	.776
	The company encourages employees to mention work ideas and innovative ideas, and to tolerate innovation failure	.798
	The company provides a variety of communication feedback channels to encourage employees to participate in corporate governance	.785
	The company will empower employees to deal flexibly with their work within the scope of their work	.755
	The company will allow different stakeholders to participate in policies and voice.	.751
	The company encourages employees to participate in system development and issue complaints and feedback	.808

Emotional exhaustion: using Maslach and Jackson's scales (e.g., "My job makes me feel emotional exhaustion"). In this study, Cronbach's alpha was 0.963.

Job performance: job performance scales compiled by Zhao Fuqiang, Yang Shuyuan (2017) (e.g., "I often work overtime to ensure that the task is completed on time"). In this study, Cronbach's alpha was 0.956.

Homesickness: scales compiled by Stroebe, M., van Vliet, T., Hewstone, M., & Willis, H. et al. (2002) (e.g., "Missing your families"). In this study, Cronbach's alpha was 0.933.

In this study, our control variables: gender, age, native place, workplace, folk, religion, marriage, education.

3.3 Deviation test

Because questionnaires are filled out using the self-reporting method, homologous errors may occur, and common method deviations need to be tested. In this study, Harman's single factor test was used, that is, exploratory factor analysis was performed on all items together, and nine factors with eigenvalues greater than 1 were extracted from the unrotated factor analysis results. The cumulative interpretation explained 72.825% of the total variance, and the explanation of the largest factor to variance is 25.825%. There is no a serious problem of common method deviation.

3.3 Statistical analysis

The statistical analysis of this study uses SPSS20.2 and AMOS21.0. The specific statistical analysis includes: firstly, the reliability and validity of the questionnaire are tested by α reliability analysis and confirmatory factor analysis, and using factor model method to test the validity of differentiation between variables; secondly, through the descriptive statistics and correlation analysis of the main research variables, the direct effects between variables were tested; finally, the mediating effects of the variables and themoderator effects were tested by the hierarchical regression analysis of the variables.

4 Statistical Analysis

4.1 Reliability and validity test

The overall alpha reliability of the questionnaire was 0.851, and the lowest alpha of the variable questionnaire was 0.933 (Table 4 diagonal), indicating that the questionnaire was reliable. In this study, in order to improve the measurement validity of the questionnaire, some items were deleted (Chen, 2012). This study uses AMOS21.0 for confirmatory factor analysis, according to the factor load less than 0.5, there are more than 0.5 load on multiple factors and the maximum variance contribution rate, for IHRP, we delete the three items 2, 3, and 5. The discriminant validity of the study variables was tested by the factor model method. The fit of the four-factor model was the best, the single factor model has the worst fitting, indicating that there is no serious homology variance among the variables and has good discriminant validity.

4.2 Descriptive statistics

Variable correlation analysis (Table 2) showed that IHRP was significantly positively correlated with job performance, negatively correlated with emotional exhaustion, and negatively correlated betweenemotional exhaustion and job performance, making H1, H3 preliminary validated.

Table 2　Means, Standard Deviations, and Correlation Coefficients of Variables

	Mean	SD	1	2	3	4
1. IHRP	3.536	.815	0.953			
2.emotional exhaustion	2.565	.926	-.079	0.963		
3.job performance	4.074	.538	.429***	-.182***	0.956	
4.homesickness	3.162	.641	.128**	.473***	.137**	0.933

Note: 1) The diagonal data is the internal consistent reliability of the scale after partial item deletion by confirmatory factor analysis; 2) * indicates p<0.05, ** indicates p<0.01 and *** indicates p<0.001 (two-tailed test).

Table 3   Hypothesis Test

	Emotional exhaustion			Job performance			
	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6	Model 7
Gender	-.117**	-.1 16**	-.020	-.022	-.039	-.041	.000
Age	-.062	-.071	.022	.066	.056	.011	.040
Native place	-.070	-.071	.025	.030	.020	.012	.011
Workplace	.051	.054	.048	.036	.044	.058	.041
Folk	.045	.044	-.063	-.058	-.052	-.055	-.078
Religion	.047	.047	-.018	-.015	-.009	-.009	-.009
Marriage	.046	.043	-.014	.001	.007	-.005	.032
Education	-.026	-.035	.023	.069	.063	.018	.019
IHRP		-.086*		.441 ***	.429 ***		
Emotional exhaustion						-.145***	-.182***
Emotional exhaustion *H							.191 ***

Note: 1) * indicates p<0.05, ** indicates p<0.01 and *** indicates p<0.001 (two-tailed test); 2)In Table 3, H represents centralized homesickness and emotional exhaustion of the last row in table 3 is also centralized.
Figure 2   Interaction of Emotional Exhaustion and Homesickness on Job Performance

4.3 Hypothetical test

Direct effect test. According to the model 4 in Table 3, IHRP has a significant positive effect on job performance (β=0.441, p<0.001), supporting H1. According to model 2 in Table 3, IHRP is negatively correlated with emotional exhaustion (β = -0.86, p < 0.05), supporting H2.

The mediating effect test. Combining with model 4 and 5 in Table 3, the emotional exhaustion partially mediates the relationship between IHRP and job performance, supporting H3.

The moderator effect test. According tomodel7 of Table 3 and figure 2, we can see the homesickness negatively adjusts the relationship between emotional exhaustion and job performance. The higher the homesickness, the weaker the negative relationship between emotional exhaustion and job performance. failing to support H4.

5 Discussion

IHRP helps to reduce the disadvantages of diversified employees. Meanwhile, homesickness negatively regulates the relationship between emotional exhaustion and job performance. This may be the fact that hometowns are the source of energy replenishment when employees are homesick.It caninspire the spirit of hard work, which in turn supplements the energy consumption caused by emotional exhaustion; it may also be the result of internal interaction of variables.

6 Conclusion

The mainconclusions of this study: IHRP can improve job performance and reduce emotional exhaustion; homesickness negatively influences the relationship between emotional exhaustion and job performance. The contributions of this study are mainly reflected in the following aspects: first, enrich and complement the theoretical research on oriented human resource practice, employee emotional exhaustion and homesickness; second, a new human resource practice was put forward to provide ideas

for future research.Meanwhile weakness is unavoidable, the imitations of this study: (1) unavoidable common method bias, (2) limitations of the sample itself, (3) mediator variables may also be others.

Investigation of Freshmen's Subjective Well-being Condition and Its Improving Countermeasures: An Example of Wuhan University of Technology

Wang Yunque

Hospital, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 648449296@qq.com)

Abstract：Subjective well-being is the subject feeling of whether people are happy or not. The pursuit of happiness is one of the ultimate goals of human's behavior. The condition of freshmen's subjective well-being has an important effect on their physical and mental health, their future growth and development in their college life. This paper adopts the happiness index scale compiled by Campbell to investigate 200 freshmen respondents in a technology university in Wuhan University of Technology. This pater analyzed the condition of their life satisfaction, general affect and well-being, and then compared the differences among gender, origin, the status of the one child family as well as the subjective well-being. After that, this paper puts forward four detailed improvement countermeasures to improve the Subjective well-being condition.

Key words: Subjective well-being; Freshmen; Investigation; Countermeasures

1 Introduction

Happiness is one of the ultimate goals of individual and society to pursuit. Subjective well-being(SWB), which is one of the important comprehensive indexes for judging individual quality of life, refers to the overall evaluation of the quality of life by individuals according to their own standards (Suh et al.1996;Diener et al.1999). Subjective well-being is a comprehensive evaluation of life satisfaction and individual emotional state which sensitively reflects not only the attention to their quality of life and feelings (Diener, 2000; Wang et al, 2017), at the same time, also has a close connection with a number of important indicators of mental health, such as optimistic, adaptability, anxiety and depression and suicidal thoughts and behavior (Shek, 1993; Folkman, 1997;Gao & lv, 2018). College students are the future of society and the country. The state of college students' subjective well-being will have a positive influence on their physical and mental health as well as their growth and development. To investigate the status quo of freshmen who just enter the university from high school is not only advantageous to the students themselves, but also to the university teachers who can carry out the targeted improvement measures in the future university life. Those also will have important significance to help freshmen pass meaningful college life and improve their subjective well-being condition.

Based on a mature subjective well-being index scale, this paper investigates the freshmen of Wuhan University of Technology as respondents to get the state of their subjective well-being. After that, SPSS is used to analyze the relationship of the subjective well-being and their gender, origin, major, status of the one child family and state of the economy.

2 Data and Methodology

2.1 Measurement and data

Index of well-being is a commonly used tool for measuring subjective well-being. The scale was compiled by a PsychologistAngusCampbellin 1976, which mainly measured the present happiness degree of the subjects including the overall emotional index and life satisfaction. The scale uses Liket 7 level to measure. Index of general affect consists of 8 emotional items with a weight of 1.0.Index of life satisfaction is composed of a satisfaction project with a weight of 1.1(Campbell, 1976). The overall of subjective well-being happiness is the sum of weighted two scores. The scale is widely used and has systematized psychological measurement empirical research basement.

This paper takes the freshmen of Wuhan University of Technology in Wuhan as the respondents. 200 questionnaires were distributed and 154 questionnaires were collected. 141 of questionnaires were valid after 13 deficiency questionnaires excluded. The effective recovery rate was 70.5%. Among them, there were 86 male students accounting for 60.99% and 55 female students accounting for 39.01%; 34 liberal arts students accounting for 24.11% and 107 science and engineering students accounting for 75.89 %; 84 students from one child family accounting for 59.5% and 57 students from the non-only

children family accounting for 40.5%; 82students from the city accounting for 58.16% and 59 rural residents accounting for 41.84 percent.

2.3 Methodology

SPSS for Windows 21.0 is used. The methodology of independent group mean difference test and double variables correlation significance test are used to analysis.

Because the Index of well-being is a mature scale, the validity of this measure has been verified. About the reliability, the Cronbach's Alpha=0.886. According to 0.8 as the Cronbach's Alpha lowest standard (Bryman & Cramer, 1997), this measurement has good reliability.

3 Results and Discussion

3.1 The general state of subjective well-being

The results showed that the mean of the index of life satisfaction is 3.53 ± 1.279, the mean of index of general affect is 4.885 ± 0.5138 and the mean of the index of happiness is 8.37 ± 1.49 (see table 1).

Table 1　The General State of Subjective Well-being

	N	The min.	The max.	Mean	Standard deviation
Index of life satisfaction	141	1	7	3.53	1.279
Index of general affect	141	3.25	6.63	4.4885	.51385
Index of well-being	141	4.35	14.33	8.3736	1.49209

To further study the life satisfaction of those fresh students, we can find the proportion of clearly satisfaction attitude（more than 4 scores）is 19.1%，clearly not satisfied satisfaction attitude（less than 4 scores）is 48.2% and 32.6% fresh students are not very clear（4 scores）. From the table, it can be seen that the proportion of dissatisfied freshmen are more than satisfied, which indicates that most students are not satisfied with their life.

Index of general affect, which measures the subjective emotional experience of people in a certain period of time, can be divided into positive and negative emotions. It is also called happiness. The distribution of college students' index of general affect score shows: less than 4 scores is 13.5%; average to 4 scores is 5.7%; more than 4 scores is 70.9%; more than 5 scores is 15.6%. In general, college students' positive emotion (more than 4 scores) is in a dominant position, but there are only 15.6% students' positive emotion is obvious (more than 5 scores) which shows that most students just slightly dominant positive emotions.

In terms of subjective well-being, the number of students who feel very happy (more than 13 scores) is only 1.4% and the proportion is very small; who feel relatively happy (11.5-13 scores) is 1.4% and the sum of the two is only 2.8%. Those who were unhappy (less than 9 scores) accounted for 64.5 percent, indicating that the overall subjective well-being of college students was at a low level, means a low level of happiness.

Compared with other studies and same Campbell happiness scale used, the study of (Zhang & Zheng, 2004) shows that the average of index of happiness is 10.46 ± 1.79, which was quite different from this study survey data: 8.37 ± 1.49; the study of (Chen & Yang, 2003) shows that college students' overall satisfaction of life is moderately low, with only 1%(this study is 1.4%), and most students are in the middle (Chen, 2003).Most other researchers' measurements of happiness of college students generally indicate that their life satisfaction and overall well-being are moderate, or slightly epigastric , or slightly hyponastic. Generally, this investigation reflects the condition of index of happiness of freshman in this university is very low.

3.2 The horizontal comparison of subjective well-being

3.2.1 The Relationship of gender and subjective well-being

Measurement results show that the male college students' index of life satisfaction, index of general affect and index of well-being are slightly higher than that of female college students,but the boy and the girl in the two aspects of index of life satisfaction and index of general affect does not exist significant difference（P>0.05）.However, the difference is significant in the index of subjective well-being, as shown in table 2.

Table 2　The Comparison of Sexual Differences of Subjective Well-being

	Gender	N	Mean	Standard deviation	SE Mean	t	sig.
Index of life satisfaction	Male	86	3.70	1.364	.147	1.943	.054
	Female	55	3.27	1.096	.148		
Index of general affect	Male	86	4.5174	.56235	.06064	.836	.405
	Female	55	4.4432	.42819	.05774		
Index of subjective well-being	Male	86	8.5849	1.64478	.17736	2.129	.035
	Female	55	8.0432	1.15382	.15558		

Scholars have different research conclusions about the gender difference in subjective well-being of college students. For example, the study of (Li & Zhao, 2000) found that male students' subjective well-being level is significantly higher than female students'. (Yan et al. 2003) shows that female students' subjective well-being and life satisfaction is significantly higher than male students'. (Chen & Yang, 2003) shows that the life satisfaction of female students is significantly higher than that of male students. (Li, 2000), (Yan et al. 2003) and (Song, 2018) shows that there is no significant difference between male and female college students in general well-being. Duan (1996)found that there is no significant difference in investigated students' general well-being, but the difference is significant in negative emotion state: male's negative emotion is observably less than female's. From above, we can see that the relationship between gender and subjective well-being are not unified.Whether there is sexual difference in subjective well-being research can't simply be answered by "yes" or "no".If there is sexual difference in subjective well-being is indeed hard to make sure.

3.2.2 The Relationship of origin and subjective well-being

Measurement results show that although rural students' mean scores of life satisfaction, index of general affect and subjective well-being is slightly higher than urban students', there is not significant differences.P>0.05）(As table 3 showed)

Table 3　The Origin Differences of Subjective Well-being

	Origin	N	Mean	Standard Deviation	SE Mean	t	sig.
Index of life satisfaction	Urban	82	3.48	1.354	.150	-.615	.540
	Rural	59	3.61	1.175	.153		
Index of general affect	Urban	82	4.4558	.51684	.05707	-.890	.375
	Rural	59	4.5339	.51057	.06647		
Index of subjective well-being	Urban	82	8.2790	1.58145	.17464	-.887	.377
	Rural	59	8.5051	1.36047	.17712		

Other researchers' conclusions are not consistent with each other, such as (Zhang & Zheng, 2003) shows that college students' index of well-being has significant urban and rural differences in the total score and urban is higher than rural. But (He, 2000) shows that urban and rural difference has no remarkable effect on total well-being of college students which is consistent with this study.

The reasons for the differences in subjective well-being of freshmen in this study may be: On the one hand, the urban and rural difference is just one of the reasons that affect college students' subjective well-being. The subjective well-being of college students is affected by complex factors, which the difference of students' origin from maybe not obvious; on the other hand, from the life experience, the rural students who can be admitted to the university has been living a studying life. Many of them have been sent to schools in counties or cities since junior high school, and have close contact with urban students and civilization. The differences of their lifestyle, thinking habits, values, personality traits between urban students gradually narrowed. All in all, whether there is significant difference between urban and rural areas, the depth and width of research should be carried out.

3.2.3 The relationship of one-child family background and subjective well-being

The results showed that there was no significant difference in life satisfaction, index of general affect and index of well-being between singleton and non-singleton college students(P>0.05)(As table 4

showed).

There are few studies on the difference of subjective well-being of college students from the condition of only children family. The study of Chen & Yang (2003) showed that singleton students' life significant obviously higher than non- singleton students'. On the contrast, the study of Guo & Cao (2003) shows that non- singleton students' well-being level is distinctly higher than singleton students ($P<0.01$).This research is different from previous studies finding that freshmen's life satisfaction, index of general affect and well-being has no significant difference with whether they are singleton students or not.

Table 4   The Differences of the Only-child Status in Subjective Well-being

	Whether only child or not	N	Mean	Standard Deviation	SE Mean	t	sig.
Index of life satisfaction	Yes	84	3.50	1.349	.147	-.359	.721
	No	57	3.58	1.179	.156		
Index of general affect	Yes	84	4.4628	.54806	.05980	-.719	.473
	No	57	4.5263	.46094	.06105		
Index of subjective well-being	Yes	84	8.3128	1.54726	.16882	-.586	.559
	No	57	8.4632	1.41557	.18750		

3.2.4 The relationship between Major and subjective well-being

The result shows that there is no significant difference between arts college students and science college students in life satisfaction, index of general affect and subjective well-being ($P>0.05$) (As table 5 showed).

Table 5   The Relationship between Major and Subjective Well-being

	Major	N	Mean	Standard Deviation	SE Mean	t	sig.
Index of life satisfaction	Science	107	3.56	1.290	.125	.473	.637
	Engineering	34	3.44	1.260	.216		
Index of general affect	Science	107	4.4743	.53496	.05172	-.580	.563
	Engineering	34	4.5331	.44521	.07635		
Index of subjective well-being	Science	107	8.3911	1.51663	.14662	.247	.805
	Engineering	34	8.3184	1.43265	.24570		

Different researchers have come up with inconsistent results. For example, (Li & Zhao, 2000) shows that there is no obvious difference between arts and science college students in index of well-being. (Chen &Yang, 2003) shows that the life satisfaction of arts and science college students is not significant different, which is in line with the results of this study. Nonetheless, other scholars have offered different conclusions, (Jing &Zhang, 1997) shows that the score difference between the college students major in mathematics and Chinese in overall well-being is significant and the students major in mathematics have higher subjective well-being, but the study of Ying He (2000) shows that the overall well-being of arts college students is notably higher than that of science college students.

4 Conclusion

From the survey, we can found that: (1) the life satisfaction of freshmen in Wuhan University of Technology is not high in the field of life satisfaction and subjective well-being, while the index of general affect is higher. It illustrates that the freshmen are filling with positive and happy emotionafter very hard work in school time, but their expectations of college life are too high to deal with the contradiction between ideal and reality causing low life satisfaction and subjective well-being. It is the problem should be solved that how to improve their life satisfaction and subjective well-being. (2) The study found the subjective well-being of this university's freshmen are not significant difference in the aspects of their gender, origin, the only child family and major. This is consistent with relevant studies. This reflects that the countermeasures of improving the college students' life satisfaction can be almost

same.

People's level of Well-being is very important to the development of their life. According to the results of the survey, there are four important countermeasures to improve freshmen's subjective well-being. Firstly, positive psychology health education should be carried out regularly. Well-being is the combination of external environment and inner psychological quality. Good mentality and sound personality are the important sign of human's physical health as well as the basic premise of happiness. When people's heart is clear, their world is always full of sunshine and happiness is everywhere. Regular positive psychology education can make the students possess full of love, good feeling and constantly improve themselves to set up their healthy psychological state.

Secondly, humanistic quality should be continually cultivated. If college students want to improve their subjective well-being, they should actively learn the wisdom of their predecessors and try to improve their humanistic quality. People' humanistic quality makes people understand the existence, value and consciousness state of human. The level of humanistic quality will directly determine the level of human moral civilization and their ability to grasp happiness.

Thirdly, every studentshould be guided to set up their suitable goals. According to the objective theory of subjective well-being, subjective well-being will come into being after whether the needs and goals are fulfilled. The content of the target, the activity to achieve goals and the result of pursuitwill directly influence people's well-being. So we should help college students to set up their suitable goals.

Fourthly, let the students set up exercise habit. Lots of researches have shown that exercise can produce positive emotions, reduce depression and stress, and also contribute to physical and mental health. For college students, exercise habit is a useful way to improve their subjective well-being.

The condition of subjective well-being is very important to the college students, special to the fresh students who just enter into the university.This paper uses a mature scale to investigate life satisfaction, general affect and well-being condition of the freshmen in Wuhan University of Technology, and differences among gender, origin, the status of the one child family and major. Based the situation, four detailed improvement countermeasures were proposed.In the future, other factors, such as the differentpersonality, different grades of the students should be researched.

The Effect of Job Design on Science-technology Employees' Job Engagement: The Mediating Role of Psychological Capital

Zhuo Peipei, Gui Ping
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: ppzhuo1217@qq.com, guiping518@163.com)

Abstract: The influencing factors of scientific-technological worker'sjob engagement have received extensive attention, but there are few studies on how work design contributes to work engagement. This paper takes the 300 scientific and technical employees of a high-tech group company in China as the research object and explores how the work design influences the work engagement of science and technology employees. More specifically, we also focus on the intermediary role of psychology capitaland constructs a model for the intermediary relationship between work design, psychological capital, and workengagement for science and technology employees. The empirical research shows that psychological capital plays a role of mediating effect between the work design and staff's work engagement, and the work design has a significant positive effect on work engagement.
Key words: Science-technology employees; Jobdesign; Job engagement; Psychological capital

1 Introduction

Traditionally, job engagementhas been regarded as"self-matching between the self and the role inthe organization through self-management"，which is a multi-dimensional incentive concept reflecting employees' physical, cognitive and emotional involvement in work performance(Hu Shaonan & Wang Wei, 2014). Science-technology employees, as the core employees of the company, have the characteristics of scarcity, low substitutability, strong independence, high sense of innovation and sense of accomplishment. If they can maintain a high level of enthusiasm, dedication, and focus on their careers, it will be the key to the future development of the company. Therefore, how to effectively play those talents' role has become an important topic in the study of human resource management in modern enterprises, especially high-tech enterprises.

In this situation,academics and business managers have increasingly pay attention to various ways to enhance the engagement of scientific and technological employees. Most companies tend to adopt material incentives to increase the work effort ofthese staff, while ignoring the design of work processes and the work itself.Although Maslow's hierarchy of needs theory believes that the material can meet people's low-level demand, but the demand level of science-technology workers is quite big different from that of ordinary workers, whichisthe reason why material incentive effect on science-technology workers is very poor. Therefore, in order to improve the level of engagement in work, it is also necessary to focus on the nature of the work so as to realize the motivation of science-technology employees.At the same time, the level of work engagement is not only dependent on the work designinthe organization, but also closely related to the inner psychological state of the individuals(Hobfoll, 2011). Moreover, the relationship between work design and psychological capital has been proved by some existing empirical researchso that psychological capital may play an important intermediary role in the process of work design impact on job engagement.

As such, this paper contributes to the literature in two ways. First, we empirically test the direct impact of job design on science and technology employees' work engagement. Second, as discussed earlier, this study builds an intermediary effect model to explore the mediating effect of psychological capital on job design and job engagement.

1.1 Job design and job engagement

Job design (JD) refers to the decisions of specific work content and work process, including the identification of related tasks and activities and the assignment of tasks. Its importance lies in that it can describe the process and content of the organization's goal in detail and decompose the goal for each position, as well asplay a significant role in motivating employees (Lawler, Hackman & Kaufman, 2010).

In accordance withthe high work involvement modelof (Bennett and Bell, 2004), work design is aprofounddeterminant of employee work engagement.Besides, according to the most prominent theory about work design---the job characteristic model (JCM), proposed by (Hackman and Oldham, 1975), suggeststhat the five core dimensions ofJCM will affect the employees' experience of work meaningfulness and work responsibility, also provide internal driving force, satisfaction, needs,

motivation and other internal psychological feelings to the science-technology employees, all areinfluencing factors for improving the employee' work engagement.In addition, recent work has shown that autonomy and skill variety in the five-dimensional core characteristics of JCM can have significant impactonemployee'sexperienceof workmeaningfulness, and thuseffectively predict employees' job involvement level(Macey&Schneider, 2008).Another empirical study based on Job DemandsResources Model (JD-R) tests that the job characteristics themselves are crucial predictors of the work engagement, and there is a close positive correlation between the feedback and the control ability of work (a kind of autonomy) as well as the employee involvement (Li Jie, 2012). Moreover, the longitudinal study, Sun Lingxi (Sun Lingxi, 2013) and others conducted a follow-up survey of new science researchers and found that task integrity and job autonomy of JCM have a direct effect on work engagement, while the influence of skills variety, task significance and work feedback is not significant. Based on the above analysis, there may be a certain relationship between work design and work engagement of science-technology staff. Thus, we hypothesize:

Hypothesis 1: Job design is positively related to job engagement of science-technology employees.

1.2 Psychological capital and job engagement

With the development of Positive Organizational Behavior, Luthansand others put forward the concept of "psychological capital", which refers to an individual's positive psychological state in the process of growing up and developing, embodied in four dimensions: self-efficacy, optimism, hope, resilience.On the basis ofthe Psychological Resources Theory, psychological resources play a vital role in supplementing energy, stimulating motivation, maintaining work vitality, and regulating individual attitudes and behaviors.

Usually, employees with high psychological capital have abundant positive psychological resources and always work hard with a positive attitude.JD-R suggests that psychological capital, on the one hand is an endogenous psychological force that can be developed by an individual, which can provide energy support for the individual in the process of energy consumption such as continuous work requirements, thus lead to improvejob identification and stimulate their working motivation. On the other hand, it can also be used as a basic resource to regulate and manage other work resources and promote individual persistence to achieve positive results.However, there are few empirical studies on the relationship between psychological capital and work engagement, especiallymuchlessthe research involving the scientific and technological employees. At present, most studies focused on enterprise ordinary staff, hospital nurses, primary and secondary school teachers, all results have basically supported the positive relationship between psychological capital and employee work engagement (Chen Weizheng, 2012; Liu Chaoying, 2013; Mao Jinping, 2013). As a result, we hypothesize:

Hypothesis 2: The psychological capital of science-technology employees is positively related to their work engagement

With respect to the studies on the mediating effect of psychological capital mainly include the following. (Su Yong and others, 2011) argued that psychological capital can mediate the impact of other variables on employee behavior. His study on company's employees found that psychological capital plays an intermediary role in the relationship between job designand employee knowledge sharing behavior (Su Yong, Li Hui & Wang Wei, 2011). Research by NiuQiaohong(Niu Qiaohong, 2014) indicates that psychological capitalmediates the relationship between organizational support and nurses' work engagement. Thus, although there is no research on the role of psychological capital in the relationship between job design and work involvement,it is reasonable to think that psychological capital may have a mediating effect on this relationship. After all, Renn and Vandenberg (Renn and Vandenberg, 1995) examined the mediating effects of Critical Psycho-logical States (CPS)on the JCM and found that CPS do have a positive mediating effect between job design and workperformance.This provides a certain basis and ideological source for this study. Hence, we hypothesize:

Hypothesis 3: The relationships between work design and work engagement are mediated by psychological capital.

1.3 Job design and psychological capital

Work design and psychological capital are both considerable concepts in organizational behavior research, but at present, there is very little research on the relationship between them, only in a few literatures does the indirect reference to the influence of job design on psychological capital. For example, JCM suggests that material incentive resources are not the only factors affecting the individual behavior of employees, and JCM are more likely to believe that work characteristicsreflecting the meaning of work such as theimportance of work itself, will create mental encouragement for the employee and lead them to become more attentive and absorbed in their work. Besides, such

characteristics as challenging workwill have a significant impact on the self-efficacy of psychological capital.And if a job lacks these work features, employees will have more possibilities to experience negative internal emotions.Therefore, some certain characteristics of the work design will affect the individual's psychological state through the individual's perception, finally result in changing the level of employee's psychological capital. What's more, Hester (2006) pointed out that positive and valuable feedback, leadership recognition and care and other reasonable rewards can not only stimulate potential positive behaviors of employees, but also may transform employees' values. Consequently, we hypothesize:

Hypothesis 4: job design is positively related to psychological capital of science-technology employees.

Based on the above discussion and hypothesis, the basic relationship model of this study can be obtained, as shown in Figure 1.
Figure 1　The Model of Basic Relationship

2 Data and Methodology
2.1 Sample
The hypotheses were tested using data from samples of employees nested in automation control system manufacturer in China. A total of 300 employees from the company, who are engaged in scientific and technological activities and employees who are going to engage in scientific and technological activities in the future, were surveyed through the online questionnaires.Finally, 292 were actually returned, and 285 samples were actually available, an effective response rate of 95.0%. Among these valid questionnaires, 73.3 percent of the respondents were male while 26.7 percent of the respondents were female. The demographic characteristics of the respondents are presented in Table 1.

Table 1　Respondent Demographics

	N	%
Gender		
Male	209	73.3
Female	76	26.7
Age		
20-30 years	116	40.7
31-40 years	108	37.9
Over 40 years	71	21.4
Education		
Junior college or technical school	36	12.6
Undergraduate	135	47.4
Postgraduate or above	111	38.9

2.2 Variables
Job design characteristics are selected as independent variables, we drew from the Job Diagnostic Survey (JDS), created by Hackman and Oldham (Hackman and Oldham, 1975),to measure the three facets of job design,namely task identity, task autonomy and feedback from the job. Each facet consists of three items, a total of 9 items. Job engagementis selected as dependent variable. We measured employee engagement usingUWES scale developed by Schaufeli (Schaufeli, 2002) and referencing the Chinese version revised by Zhang Yiwen and GanYiqun (Zhang Yiwen and Gan Yiqun, 2005). The final scale includes three subscales of vigor, dedication, and absorption, a total of 17 items. Psychological capital is selected as an intermediary variable. We adopted the four-dimensional scale of Luthans'PCQ

after revising, namely: self-efficacy, hope, optimism and resilience, a total of 24 items. With regard to control variables, gender, age and education of the respondents were included since these factors may affect the results.

All survey items are scored using the Likert 5-point scale. The Likert 5-point scoring standard has the following meanings: 1 means "completely disagree" and 5 means "completely agree".SPSS software 22.0 is used in data processing. The analysis methods of data include: reliability and validity analysis, descriptive statistical analysis, correlation analysis, and simple and multiple linear regression analysis.

3 Results

3.1Reliability and validity analysis

The reliability and validity of the job design, psychological capital and job engagement scales are tested in this study, as shown in Table 2. The computed Cronbach's α for all the constructs is above 0.70 and the average variance explained for each construct exceeded 0.5, thisindicates the achievement of internal consistency among the measures and an adequate level of convergent validity.

Table 2 Results of Exploratory Factor Analysis

Constructs	N	Avg. factor loading (λ)	Cronbach'sα	AVE
Job design	9	0.808	0.853	0.611
Psychological capital	24	0.745	0.798	0.558
Job engagement	17	0.747	0.883	0.674

3.2 Descriptive statistics and correlation analysis

The mean, standard deviation, and correlation of the variables were analyzed using SPSS 22.0 software. The results are presented in Table 3. The data shows that there are significant correlations (p<0.01) between the three variables, work design characteristics, work engagement, and psychological capital of science-technology employees, which provides preliminary support for the hypotheses of the study.

Table 3 Descriptive Statistics and Correlation Analysis

Variables	Mean	SD	1	2	3
Job design	3.64	0.87	1		
Psychological capital	4.05	0.79	0.451**	1	
Job engagement	4.17	0.86	0.479**	0.503**	1

Notes: **p<0.05;*p<0.1 (Two-tailed). N=285.

3.3 Hypothesis testing

In this study, 285 questionnaires are used as samples. The main effect analysis is to test the relationship between job design, and job engagement through hierarchical regression. Besides, this paper also tests mediating effect of psychological capital on the relationship between job design and job engagement with regression equations. The results are presented in Table 4.

3.2.1 Main effect

As shown in Table 4, Model 3 is the relationship among control variables and work engagement. Model 4 introduces independent variable, work design. The result indicates that work design is significantly positively related with science-technology employees' work engagement (β=0.335, p<0.01), so Hypothesis 1 is supported.

3.2.2Mediating effect

As discussed earlier, we already know that work design is significantly positively related with work engagement. And in order to test the mediating effect, we still need conduct three steps. First, we test whether the mediator is significantly affected by the independent variable. As shown in table 4, Model 2 is the regression model of the independent variable on psychological capital, and the result indicates that job design is significantly positively associated with psychological capital (β=0.361, p<0.01). Therefore, Hypothesis 4 is supported.

Second, we test whether the mediator has a significant impact on the dependent variable. Model 5 has shown a significant positive relationship between psychological capital and work engagement (β=0.543, p<0.01), which means the higher level of psychological capital the science-technology employees have, the more work engagement there will be. So Hypothesis 2 is supported.

Third, we put the mediator into the equation meanwhile and test whether the independent variable still significantly affects the dependent variable. Model 6 is generated based on Model 4 by introducing a mediating variable and the result indicates that job design is still significantly positively associated with job engagement ($\beta=0.202$, $p<0.01$), while psychological capital is significantly positively related with job engagement ($\beta=0.476$, $p<0.01$), so psychological capital partially mediates the relationship between job design and job engagement. Consequently, Hypothesis 3 is supported.

Table 4   Hierarchical Regression Results

Variables	Psychological capital			Job engagement		
	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6
1. Control variables						
Gender	-0.070[*]	-0.240	-0.088	-0.003	0.023	-0.027
Age	-0.160	-0.020	-0.199	-0.072	0.049	-0.051

Notes: ***$p<0.01$;**$p<0.05$;*$p<0.1$ (Two-tailed). N=285.

4 Conclusion

Through a questionnaire survey, this study explored and confirmed how work design affects the work engagement of science-technology employees. The results show that if organizations ensure jobs provide individuals with job design characteristic, such as work identity, autonomy, feedback and so on, then people will get high level of psychological capital, leading to be more engaged at work.Therefore, this requires the organizations not only to seriously study, excavate, and shape the psychological capital of the science-technology employees in the process of employee recruitment, training, and assignment of employees, but also to fully consider the incentives for the scientific and technical employees when organizing the work design. In this way, organizations can better motivate the science-technology employees to engage at their work.

In addition, this study also has some limitations. First of all, during the research designing, due to time and funding constraints, this study mainly used cross-sectional data. If data can be obtained at different time period, the research model can be more accurately validated. Secondly, this study adopted online questionnaires, researchers did not provide detailed explanations for the questions that were filled out in the questionnaires. Soit cannot be completely excluded that individual survey respondents have reservations about the actual ideas of the items. Therefore, in order to ensure the rigorous research, this study should have tested and controlled the above situation during data processing. In the future, if the resources are sufficient, it is recommended that the follow-up study take a wider range of samples, so as to further discuss and verify the model.

(E-mail: 2531221680@qq.com, yxzpl@126.com, 934494213@qq.com)

Abstract: Modern organizations are increasingly relying on organizations for innovation and innovation. Researching the shared mental model, organizational innovation, and organizational performance and the path of influence between them can help to improve the many problems in improving performance in business practice. This paper explores the mechanism of interaction between organizational innovation and organizational performance, and establishes a theoretical research model that shares the mental model as an intermediary. At the same time, a large sample empirical method was used to analyze the enterprise data collected by the questionnaire using spss20.00, and the hypothesis and model established in this paper were verified. The results of the study show that the team shared mental model plays a regulatory role between organizational innovation and organizational performance. Under the adjustment of the shared mental model, management innovation and organizational innovation are significantly positively correlated with organizational long-term performance and organizational long-term performance. The interaction between management innovation and organizational innovation has a wireless relationship with organizational long-term performance and short-term performance.
Key words: Work team; Shared mental model; Organizational innovation; Organizational performance

1 Introduction
1.1 Sharing mental models
The concept of the mental model comes from cognitive psychology. According to the definitions of Rouse and Morris, the mental model refers to the cognitive subject can use the inertial psychological mechanism or established in cognitive activities(Rouse and Morris,1986). The cognitive framework describes, interprets, and predicts cognitive objects to improve the efficiency of cognitive activities. Xu Hanyi et al. summarized the shared mental model into a four-dimensional structure such as a concrete underlying architecture and an upper abstract framework based on the same heterogeneity and dependence theory (Xu Hanyi et al,2008). The domestic researcher Yang Yaping defines the mental model as the way of thinking and psychological formation of people, others, organizations and the world at different levels due to heredity, living habits, knowledge background and personality attitude (Yang Yaping, 2012). Zhao Tingsheng et al. agreed on the definition of shared mental model as "what to do, how to do it, and who to do it" in order to coordinate their work to adapt to the work of the team and meet the needs of the members of the group(Zhao Tingsheng,2016). Scholars have different definitions of shared mental models, but they all emphasize the meaning of "sharing". Domestic scholars raise the mental model from the individual level to the team level.

1.2 Organizational innovation
Representatives at home and abroad have different expressions about the connotation of organizational innovation. Among foreign scholars, Daft first proposed that organizational innovations in strategy, management structure, products, technology, and work flow constitute organizational innovation (Daft, 1978). Damampour believes that organizational innovation should be divided into technological innovation and management innovation. Technological innovation refers to innovation in products, technologies, manufacturing processes, etc. Management innovation refers to organizational structure and management system, etc. Innovation (Damampour, 1991). Chinese scholars Tao Qiuyan et al. classified organizational innovation into exploration-based innovation and utilization-type innovation(Tao Qiuyan et al, 2018).Tao Qiuyan conducted theoretical discussions and experimental analysis on the relationship between the two and organizational performance. Zeng Ping studied the relationship between trust atmosphere and organizational innovation with high-tech enterprises in Guangdong. The research results show that if the trust atmosphere is stronger, the contribution of organizational innovation will be greater(Zeng Ping, 2014).Zeng Ping explained in detail the relationship between organizational innovation and other variables, further extending the definition of organizational innovation. Based on the needs of research purposes, this paper adopts the criteria for

dividing the contents of organizational innovation and adopts Damanpour's viewpoint. It is believed that there are two types of organizational innovation: technological innovation and management innovation.

1.3 Organizational performance

In the fierce market competition, innovation can enhance the level of corporate performance. Wang Faxian believes that scientific performance management is conducive to giving full play to the enthusiasm of employees to create performance for enterprises and improve their comprehensive competitiveness (Wang Faxian, 2016). Xie Hongming et al. (Xie Hongming et al, 2006) found that the research on enterprise data in South China found that the technology and management innovations in organizational innovation have a significant positive impact on organizational performance.Xie Hongming further classified organizational performance through practical investigation.Sun Wei and others（Sun Wei and others，2015）used team interdependence as a control variable to explore the mechanism of sharing mental models on team performance.Colin & Krumwiede (Colin & Krumwiede，2010) took service companies as the research object, and the results showed that service-oriented companies can promote the two kinds of innovative behaviors, gradual and abrupt, which can make the company obtain better market performance , And then have better financial performance. Xie Wei and Colin et al further explores the impact of different innovative approaches on organizational performance under different conditions.

2 Research Model and Research Hypothesis

2.1 Research model construction
Figure 1   Models of Organizational Innovation and Organizational Performance under the Condition of Shared Mental Models

We divide organizational innovation into two dimensions: technological innovation and management innovation. We also divide organizational performance into two dimensions: short-term performance and organizational performance. Finally, we will share two types of mental models with higher degree of consistency and lower degree of consistency. The companies are divided into experimental group and control group, and they compare the two situations in which the regulatory variables are different, and explore the mechanism of the interaction between different dimensions of the two variables under the control of the shared mental model.

2.2 Research hypothesis

Organizational innovation can not only make the organization more resilient and flexible, but also contribute to the improvement of organizational performance. This has been confirmed by many scholars' empirical studies (Robinson Yamin & Gunasekaran, 1997).Organizational innovation is mainly divided into two aspects: management innovation and technological innovation. Management innovation can improve the flexibility and efficiency of organizational operations, and then improve organizational performance. Technological innovation is the core competitiveness of enterprise development in the new period and can bring high profits to enterprises.

Organizational performance is a true reflection of the effectiveness of the organization's operations. It is an effective output of the organization in order to achieve different levels of goals (Wu Zhengjie and Song Xianzhong, 2011). Traditional organizational performance measurement focuses only on short-term performance, but does not involve long-term performance. This position divides organizational performance into two dimensions: short-term performance and long-term performance. It fully considers the impact of organizational performance in different time periods and proposes the following assumptions.

H1a: Under the influence of the shared mental model, management innovation is positively related to the organization's short-term performance.

H1b: Under the influence of the shared mental model, technological innovation is positively related to the short-term performance of the organization.

H1c: Under the influence of the shared mental model, the interaction between management innovation and technology innovation is positively related to the short-term performance of the organization.

H2a: Under the influence of the shared mental model, management innovation is positively related to the long-term performance of the organization.

H2b: Under the influence of the shared mental model, technological innovation is positively related to the long-term performance of the organization.

H2c: Under the influence of the shared mental model, the interaction between management innovation and technology innovation is positively correlated with the long-term performance of the organization.

3 Research Process

This study uses a domestic management consulting firm as the research object of the experimental group. Its shared mental model has a high degree of consistency. At the same time, the high-tech communication companies are used as the control group's research objects, and their shared mental models are less consistent. Management consulting companies require smooth team communication and high execution power, which inevitably requires the support of shared mental models with a high level of consistency. The high speed of communication equipment updating and technological innovation of high-tech communication companies requires teams to have high creativity, which inevitably requires team members to have innovative thinking, so the level of team consistency is low. It is appropriate to explore the relationship between team innovation and team performance using these two types of companies as research objects.

A total of 20 enterprise teams participated in the study, including 10 subjects in the experimental group and 10 subjects in the control group. Invited all members of the team to participate in the survey, a total of 268 people, theteam size of about 11 people. The actual recovery sample was 238, and the recovery rate was 88.9%.

Data was collected using a questionnaire survey. With departments as the unit, the investigators will be convened in a conference room to answer questions during normal business hours. Between the answers, researchers uniformly explain the purpose of the survey and fill in the requirements. The questionnaire was sent to the researchers by the administrative staff after they were collected.

4 Research Results

This paper uses Pearson correlation analysis to test the correlation between variables. The specific means is to use SPSS22.0 to test the relevance of organizational innovation and organizational performance under the shared mental model adjustment to determine the rationality of the research hypothesis and the overall theoretical model.

This section focuses on the two cases of sample data sharing, the higher degree of consistency of the shared mental model, and the lower degree of consistency of the shared mental model. Regression analysis was conducted separately to test the consistency of organizational innovation in the shared mental model. The impact on organizational performance. A total of six models were included. The explanatory variables were still dependent on organizational performance. In Models 1 and 4, only management innovation is taken as the explanatory variable, and Models 2 and 5 are based on technological innovation only as an explanatory variable to examine the two management innovations and technological innovations. The two dimensions of management innovation and technological innovation share the mental model. The effect of adjustments on short-term performance and long-term performance was examined. In Models 3 and 6, the interactive items of management innovation and technological innovation were used as explanatory variables to examine the influence of interaction between two dimensions of organizational innovation on organizational performance. The regression analysis results are as follows:

Table 1   Results of Regression Analysis on Organizational Innovation and Organizational Performance when the Shared Mental Model Consistency Level is Low

	Short-term performance			Long-term performance		
	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6
Age of organization	0.072	0		0.073	0.047	0.121
Nature of organization	-0.047	-0.091	-0.049	-0.031	-0.07	-0.035

Continual Table 1

	Short-term performance			Long-term performance		
	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6
Management Creativity	0.393***			0.437***		
Technological Creativity		0.450***			0.490***	
MC×TC			0.121			-0.021
R²	0.18	0.224	0.014	0.19	0.223	0.019
Adjusted R²	0.145	0.22	0.012	0.19	0.227	0.018
F	12.245***	18.662***	1.774	16.442***	18.742***	1.117

The results of Model 1 and Model 2 show that when the consensus mental model is low, there is a significant positive correlation between management innovation and technological innovation and short-term performance. That is, organizational innovation and short-term performance are significantly positively correlated. Therefore, the two dimensions of organizational innovation are significantly related to short-term performance when the level of consensus of the shared mental model is low. In addition, the results of Model 3 show that there is no significant correlation between the interaction items of management innovation and technology innovation and short-term performance.

The results of Model 4 and Model 5 show that when the level of consensus of the shared mental model is low, there is a significant positive correlation between management innovation and technology innovation and long-term performance, that is, organizational innovation and long-term performance are significantly positively correlated, so the two dimensions of organizational innovation are significantly related to performance when the shared mental model is low in consistency. In addition, the results of Model 6 show that there is no significant correlation between the interaction term of management innovation and technology innovation and long-term performance.

Table 2   Results of Regression Analysis on Organizational Innovation and Organizational Performance when the Shared Mental Model Consistency Level is High

	Short-term performance			Long-term performance		
	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6
Age of organization	0.062	0		0.075	0.041	0.117
Nature of organization	-0.042	-0.087	-0.034	-0.037	-0.067	-0.031
Management Creativity	0.421***			0.456***		
Technological Creativity		0.456***			0.523***	
MC×TC			0.094			-0.018
R²	0.15	0.214	0.021	0.14	0.220	0.017
Adjusted R2	0.145	0.22	0.012	0.174	0.218	0.019
F	14.331***	17.625***	1.443	18.225***	18.532***	1.214

The results of Model 1 and Model 2 show that there is a significant positive correlation between management innovation and technological innovation and short-term performance when the shared mental model has a high degree of consistency. That is, there is a significant positive correlation between organizational innovation and short-term performance. Therefore, organizational innovation Both dimensions are significantly associated with short-term performance when the level of consensus of the shared mental model is high. It can be concluded that regardless of the level of the shared mentality level, under its regulation, organizational innovation is positively related to organizational performance. It can be concluded that the H1a and H1b assumptions are true.

In addition, the results of Model 3 indicate that there is no significant correlation between the interaction items of management innovation and technological innovation and short-term performance

when the level of consensus of the shared mental model is high. Combined with the above table, it can be concluded that the H1c assumption does not hold.

The results of Model 4 and Model 5 show that when the level of consensus of the shared mental model is high, there is a significant positive correlation between management innovation and technological innovation and long-term performance, that is, organizational innovation is significantly positively correlated with long-term performance. When the level of shared mentality is high, the two dimensions of organizational innovation are significantly related to performance when the shared mental model is low, and it can be concluded that the assumptions of H2a and H2b are established. In addition, the results of Model 6 indicate that there is no significant correlation between the interaction term of management innovation and technology innovation and long-term performance, so it is assumed that H2c is not established.

5 Conclusion

The research on organizational innovation and organizational performance based on the organizational shared mental model is a very complex and challenging task. Organizational innovation has become an important source for organizations to constantly improve their internal performance and ensure their sustainable development, especially in sharing. The mental model is also a new way of organizational research, making this work more meaningful in the times.

This study examines the theoretical background, the definition of related concepts, the analysis of basic principles, the presentation of the assumptions, the construction of models, the design of questionnaires, the examination of data, and the evaluation of empirical results. This study has obtained some relevant conclusions and viewpoints. The following summarizes these relevant conclusions and viewpoints as a summary of several preliminary results of this study, and is also the answer to the key hypothesis originally proposed in this study.

1) The team sharing mental model plays a regulatory role between organizational innovation and organizational performance.

2) Under the effect of the shared mental model, management innovation and organizational innovation are significantly positively correlated with the long-term performance of the organization and the long-term performance of the organization.

3) Under the moderating effect of the shared mental model, the interaction between management innovation and organizational innovation has a non-wireless relationship between organizational long-term performance and organizational short-term performance.

Multi-Inclusive Human Resource Practice, Perceived Organizational Support, and Work Performance: The Moderating Role of Authentic Leadership

Xiang Hudie, Chen Yun
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 2504149015@qq.com, 17908016@qq.com)

Abstract: In this study, we investigated the mediating effects of perceived organizational supporton the relationship betweenmulti-inclusive human resource practice and employee work performance. In addition, we proposed the moderating effect of authentic leadership on the relationship between multi-inclusive human resource practice andperceived organizational support. According to the study, the influence of multi-inclusive human resource practice on employee work performance is mediated byperceived organizational support.When organizations implementmulti-inclusive human resource practice, employees' perceived organizational support will increase and their performance will increase.Moreover, whenauthentic leadership is at a high level, employees will have perceivedmore organizational support.Therefore, companies that want to promote the implementation of multi-inclusive human resources practices must improve the authenticity of leadership.
Key words: Multi-Inclusive human resource practice; Perceived organizational support; Authentic leadership; Work performance

1 Introduction

What kind of human resource management system is adopted by enterprises to upgrade the performance of the new generation of employees is an important issue faced by corporate managers? Although studies have shown that some other human resources systems, such as high-commitment human resource practices (Liu Zonghua etal., 2015), can improve employee performance, research on the mechanisms of multi-inclusive human resource practices affecting employee performance is still scarce.

With the acceleration of economic globalization, the organizational environment of companies is undergoing changes. The diversity of employees' racial, gender, and age levels and their deep diversity of values, interests, skills, and job preferences have become a prominent feature of the workplace.Poor management of diversity can lead to workplace conflicts, hostility, confrontation, and high turnover rates, which pose a serious challenge to organizational management.The academic community is developing inclusive leadership (Zhu Yu and Qian Shuting, 2014), team tolerance (Jansenet al., 2014), inclusiveness (Nishii, 2013), and inclusive management practices (Tanget al., 2015) and other topics for research.There are many documents on inclusive leadership between China and the West, involving theoretical discussions, empirical studies, and literature reviews.Researches on the practice of inclusiveness have yielded many valuable results abroad, and the country has just begun to emerge (Tanget al.,2015). There are few relevant documents.

For a long time, China has always emphasized and encouraged the promotion of the concept of inclusiveness and implementation of inclusive practices.It is of great value to grasp the concept, formation and function of the multi-inclusive human resource practice to promote the theoretical research and practical application of inclusiveness in the context of Chinese organizations. Diversity and inclusive management is a global issue. According to Deloitte's 2017 Global Human Capital Trends Report, issues concerning diversification and consistency will remain a challenge and a challenge for many companies.Fairness, equality and inclusion have caused widespread concern at the CEO level throughout the world.It can be seen that inclusive research is an internal demand for organizations to effectively manage diversity and is an important hot topic in the field of management.

The perceived organizational supportis an overall view of how employees view their contributions and care about their interests (Eisenberger and Stinglhamber, 1986). If employees perceive the organization's commitment and support to them, they will change their behavior and attitude to reward the organization (Rhoades and Eisenberger, 2002). Therefore, based on the perspective of social exchange, this study examines the mediating role ofperceived organizational support in the relationship between multi-inclusive human resource practices and employee performance, and aims to reveal the mechanism of multi-inclusive human resource practices on employee performance, and Improving

employee performance has important management implications.

2 Literature Review
2.1 Multi-Inclusive human resource practice
Bennett et al. (Bennett et al.,1994) first began to focus on inclusive practices and proposed inclusive human resource management practices that included the provision of employee assistance programs to provide rehabilitation opportunities to illicit drug users.Decision influence, access to sensitive job information, and job safety are three indicators of work environment tolerance (Pelled et al., 2010). In a multicultural coexistence organization, inclusiveness means equality, fairness, and full participation so that members of different groups can not only get equal access to decision-making opportunities and power status, but also be encouraged to work actively (Holvinoet al., 2004). Eliminating the barriers of full participation and contribution by employees, understanding, respecting and appreciation of workplace diversity, emphasizing and utilizing the knowledge and experience of different employees, and maximizing the potential of employees and teams are important aspects of organizational inclusion practices (Roberson, 2006). Tang et al. (Tang et al., 2015) found out that employees adapt to organizations, tolerate unintentional errors, and tolerate different perspectives is a unique inclusive practice of Chinese organizations. Different scholars have definedmulti-inclusive human resource practices based on different research objects and situations.This paper believes that multi-inclusive human resource practices incorporate the notion of inclusion in the activities of human resource management to form a fair recruitment, diversified training, fair performance appraisal system, diversified remuneration packages, and multiple promotion channels.

2.2 Perceived organizational support
Eisenberger (Eisenberger, 1986) defines the constructiveperceived organizational support: The organizations perceived organization's evaluation of its contribution and its concern for well-being will form a comprehensive overall understanding of the organization's support for employees.In addition, Millin (Millin, 1997) extended the concept of perceived organizational support and felt that the perceived organizational support should not only include the connotations proposed by Eisenberger (Eisenberger, 1986), but should also include instrumental support, ie, employees' needs at work. Information support, personnel training, material equipment support, etc.Scholars at home and abroad have defined the concept of perceived organizational support from different perspectives.The following are several representative definitions.

Table 1　Definition of Perceived Organizational Support

Author	Dimension
Witte(1991)	It is believed that the perceived organizational support is based on the employee's participation in reflecting the relationship between the employee and the organization. It is also the employee's feelings about the organization. The high-level perceived organizational support can make the organization members feel a sense of obligation, and thus promote the increase of employee's work input.
Xu Xiaofeng et al. (2005)	The first is whether employees feel the importance of their contribution to the organization, and the two is whether employees feel about whether the organization is concerned about their happiness.
Ling Wenshuo (2006)	Refers to employees' perceived support for their work, interest in their interests and recognition of their value.
Bai Yuxi (2010)	The employees feel the organization attaches importance to their contribution to the work and the degree of organization's concern for their employees. It includes organizational support for employees' work, concern for employees' interests and identification of employees' value.

Based on past research, this article defines the perceived organizational support as the perception of whether or not the organization agrees with itself.Through this recognition, organizational rewards, personal development, and job support are supported. Employees also use this feeling to balance their loyalty and contribution to the organization.

2.3 Work performance
Bemardin believes that work performance is the result of an employee's work based on his or her own job responsibilities or task activities (Wang Fang et al., 2001).Ling Wenyi and Peng Ze and others have pointed out in their research that the employee's work performance is a combination of time, methods, and results. It is the employee who, within a predetermined deadline, uses certain methods to

produce results in order to complete tasks reserved for the company (Yang Jie et al., 2004).Scholars have paid close attention to work performance for a long time. However, no consensus has been reached yet on what exactly is performance.The following are several representative definitions.

Table 2   Definition of Work Performance

Author	Dimension
Kene (1976)	Employees perform a record of the results achieved at the time of work, or the benefits of achieving the goal, within a specified period.
Boyatzis (1982)	Perform specific actions to achieve job requirements and maintain or meet the conditions, policies, and procedures of the organization's environment.
French & Seward(1983)	The degree to which a program of action achieves its goals, and the performance projects used by the general empirical research institutes often vary according to the research objectives. The main reasons for this are the different organizational goals and structures of each industry, and the adoption of different goals.
Murphy (1990)	A set of actions related to the goal of a person in the organization or organizational unit in which he works.
Borman and Motowidlo (1993)	All behaviors related to the goals of the organization, and this behavior can be measured by the degree to which the individual contributes to the goals of the organization.

3 Hypotheses Development
3.1 Multi-inclusive human resource practice and work performance

Devanna (Devanna, 1984) and others believe that: "Performance is a function of all human resource elements. Human resource management mainly affects individual performance and therefore productivity and organizational performance" (Devanna et al., 1984). Zerbe et al. (Zerbe et al., 1998) studied the impact of various human resource management measures on employees' service behavior and used aviation personnel as a sample. It was found that employees' self-reported service behavior was directly affected by the satisfaction of human resource management measures. This affects the personal performance of employees (Zerbe et al., 2010). The diversity of inclusive human resources practices emphasizes the importance of employee diversity.Most of the employees' performance comes from the employee's individual factors. The characteristics of the employees interpret the performance to the greatest extent. Therefore, certain characteristics of the employees should be strengthened through selection, performance management and training (Sun Qiaoling, 2008). According to the value model of human resources, human resources practice activities will affect the behavior and attitude of employees, and the results directly affect the daily performance of employees (Dyer and Reeves, 1995). Employees' motivation, skills upgrading, work environment improvement and other human resource management activities can improve employee capabilities and generate the behavioral modes required by the company's strategy, that is, employees' job performance changes (Becker and Huselid, 2006). Multi-inclusive human resources practices provide employees with an inclusive working environment, provide training for employees, and treat them fairly in terms of recruitment and performance-based compensation. Based on social exchange theory, employees will improve their performance-rewarding organizations.So put forward the following hypothesis:

Hypothesis 1:Multi-inclusive human resource practice is positively related towork performance.
3.2 Perceived organizational support as a mediator

Based on the theory of social exchange, employees contribute hard work and make contributions to the organization in exchange for the organization's compensation to employees (Rhoades & Eisenberger, 2002); the organization's "active treatment" of employees, the exchange of employees' positive attitudes, emotions, and behavior toward the organization. The perceived organizational support works by satisfying employees' needs for the organization and can express the willingness of the organization to provide material support and other support to employees (Eisenberger et al., 1986). According to the principle of reciprocity, if an employee perceives that the organization cares about its welfare and values its contribution, it will generate a sense of responsibility for the return organization and take action to help the organization reach its goal (Eisenberger and Stinglhamber, 1986).

Human resource practice is an important source of perceived organizational support (Farh et al., 1997). The multi-inclusive human resources practice consists of five dimensions: fair recruitment, diversified training, fair performance appraisal system, diversified compensation and benefits, and

diversified promotion channels.Previous studies have found that human resource practices such as job enrichment, participation in decision-making, performance management, compensation, and training significantly affect organizational support(Farmer et al., 2003), which in turn affects employee behavior.The perceived organizational support satisfies the emotional needs of employees. According to the social exchange theory, employees will reduce turnover and improve their work performance to reward organizations (Allenet al., 2003). Based on this, the following assumptions are made:

Hypothesis 2: Perceived organizational support mediates the relationship betweenmulti-inclusive human resource practice and employee work performance.

3.3 Authenticleadership as a moderator

In reality, whether human resource management practices can actually affect employees' perceived organizational support and work performance depends on their perception and interpretation of human resource management practices. Leadership is the person responsible for the human resources management function. Leadership style and methods directly influence the interpretation of human resources policies by employees. In other words, employees will use their leadership behaviors and methods to interpret human resource management practices in different contexts and respond flexibly (Zhang Hao et al., 2015). The support and identity obtained by the employees are more from their direct leadership than the organization. Therefore, the subordinates will direct their leaders' attitudes toward them as the key to whether the company supports them (Eisenberger et al., 2002). The authentic leadership will seek opinions from subordinates when making any decisions. This kind of exchange of opinions and feelings will promote the establishment of mutual trust and trust between superiors and subordinates. The establishment of such relationships can promote subordinates' self-development to some extent. This, to a certain extent, also allows employees to feel the organization's concern and help for its development and, in turn, feel the support of the organization. At the same time, authentic leadership can create a true and supportive atmosphere in the whole team or organization, so that subordinates have a certain degree of improvement in the sense of organizational concern, and the corresponding sense of support is strengthened to a certain extent, so the input of work will be increased accordingly.

Hypothesis 3: Authentic leadership moderate the relationship betweenmulti-inclusive human resource practice andperceived organizational support, and the relationship between multi-inclusive human resource practice and perceived organizational support is stronger when authentic leadershipis at a high level.

4 The Construction of a Research Model
Figure 1   The Concept of FullRelationship Model

5 Conclusion

This study reveals the mechanism and boundary conditions for the positive impact of multi-inclusivehuman resource practices on employee work performance.Specifically, multi-inclusive human resources practices can improve employees' perceived organizational support and further enhance their job performance.Although the above-mentioned mediation mechanism is particularly important, the role of authentic leadership leaders cannot be ignored.Employees'perceived organizational support and work performance are influenced by and interacted with multi-inclusive human resource practices and authenticleadership.Under the guidance of high-level authentic leadership, multi-inclusive human resource practices have a stronger influence onperceived organizational support and employee job performance. At the same time, the mediating role of perceivedorganizational support is stronger.Therefore, this does not mean that good human resource management practices will certainly stimulate employees' perceived organizational support and enhance their job performance.Good human resource management practices also need to match the appropriate leadership style, and the two

complement each other.These findings not only connected for the first time the research field of multi-inclusive human resource practices, authenticleadership and perceived organizational support, and employee work performance, but also made theoretical contributions to them.

The Effect of Perceived Internal Corporate Social Responsibility on Employees' Constructive Deviant Behavior: A Review of Literature

Zelalem Gebretsadik Estifo, Luo Fan
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: naturezedo@yahoo.com, zelalemgebretsadik@qq.com, sailluof@126.com)

Abstract: Currently there are various empirical research on destructive deviant behavior that dwells on behaviors that threaten the well -being of an organization and its members. Despite researcher's attention on this part, constructive deviant behavior which plays a significant part in creating positive organizational change has not yet been well investigated. To fill this gap, this review paper proposes a conceptual framework which portrays predictor, mediator and moderator of constructive deviance behavior in an organization. Several sources were utilized for identifying literature relevant for this particular study. These included numerous sources like Google Scholar, web of science hub, Ebscohost, Emerald Insight, JESTOR, Sage Journal online, Science Direct, Springer, Taylor and Francis online, Wiley-Blackwell, Directory of online Journal (DOAJ) and Social Sciences Citation Index. Besides, manual searches in a number of academic journals have been conducted. In framing the conceptual model, researchers depend on social exchange theory.
Key words: Constructive deviant behavior; Destructive deviant behavior; Perceived organizational support; Internal corporate social responsibility; Social exchange theory.

1 Introduction

Constructive deviance is defined by Galperin (Galperin, 2002) as intentional behavior that disregards significant organizational norms and consequently adds to the wellbeing of an organization, its members, or both. Different past researches in constructive deviant behavior stated that positive organizational change can be accomplished as a function of it (Galperin & Burke, 2006; Vadera, Pratt, & Mishra, 2013).

Internal corporate social responsibility is fundamentally concerned with internal organizational activities of management toward the welfare of employees beyond the strategic and legal bounds of organization (Low & others, 2016). Besides, Turker (Turker, 2009a) suggested the internal corporate social responsibility as a psychological endowment for the workplace. The level of HR practices as internal CSR allows employees to perceive the organizational support and respect the organization. Along these lines, the results of the study by Rasool & Rajput (Rasool & Rajput, 2017) suggest that practicing internal CSR can induce the positive attitude and behavior among employees for the management. Observing the significance of internal corporate social responsibility, various studies (Glavas & Kelley, 2014; Glavas, 2016; Newman, Nielsen, & Miao, 2015) have endeavored to explore the micro CSR in connection to internal corporate social responsibility and explored how the corporate social responsibility affects employee attitudes and behaviors (Rupp & Mallory, 2015). Nevertheless, most of these studies do not investigate the relationship of employees' perceptions of internal CSR on constructive deviant behavior of employees. Hence, this review paper endeavors to construct perceived internal corporate social responsibility as a predictor of constructive deviant behavior under the lens of social exchange theory.

2 Internal Corporate Social Responsibility and Perceived Organizational Support and Constructive Deviant Behavior

2.1 Internal corporate social responsibility and perceived organizational support

Internal CSR fulfills the psychological needs of employees within the organization (Aguilera, Rupp, Williams, & Ganapathi, 2007). Rhoades & Eisenberger (Rhoades & Eisenberger, 2002) contended that perceived organizational support rises up out of internal CSR practices. Perceived organizational support is the result of organizational activities toward employees. Workers assess the perceived organizational support against the care of organization shown for employees (Rasool & Rajput, 2017). Employees who find high levels of perceived organizational support response through positive conduct, which enables the organizations meet their goals and achieve set targets (Eisenberger, Huntington, Hutchison, & Sowa, 1986).

Workers distinguish the perceived organizational support through the regard and care they get from

the organization (Krishnan & Mary, 2012). (Eisenberger et al. 1986) recommend that a firm ś various approaches to treating their HR impact worker perception of perceived organizational support. Further, Rhoades, Eisenberger, & Armeli (2001) argue that "perceived organizational support is reinforced by favorable work experience that employees believe reflect voluntary and purposeful decisions made by the organization". Along these lines, it is especially the discretionary character of internal corporate social responsibility (ICSR) that may flag the company's watch over their employees' well-being, thus expanding their perceived orgizational support (Kroh, 2014).

According to (Turker, 2009b), the internal CSR is connected with a physiologically and psychologically endowed working environment. Today, employees are more intrigued to comprehend the role of internal CSR for their own particular welfare and interest rather than for society and external stakeholders (Abd-Elmotaleb, Saha, & Hamouda, 2015). The social exchange theory portrays that people respond in view of what they get, and employee perception of internal CSR declares about how much an employer cares about the employee. Perceived organizational support is a key precursor of employee attitude in the social exchange theory and gets the immediate impact of internal CSR (Glavas & Kelley, 2014). In view of the above argument, we propose that internal corporate social responsibility practice that address employees demand beyond the legal requirement fosters perceived organizational support.

2.2 Perceived organizational support and constructive deviant behavior

Perceived organizational support refers to employees' "global beliefs concerning the extent to which the organization values their contributions and cares about their well-being" (Eisenberger et al., 1986). Eisenberger, Fasolo, & Davis-LaMastro (Eisenberger, Fasolo, & Davis-LaMastro, 1990) recommended that employee's perception of organizational support may play a vital role in determining work attitude benefiting the organization. The more the employees perceived being supported by their organizations the more probable they participate in constructive deviance (Chen, Eisenberger, Johnson, Sucharski, & Aselage, 2009; Farmer, Tierney, & Kung-Mcintyre, 2003).

Moreover, research by Christian & Ellis (Christian & Ellis, 2011) demonstrates that perceived organizational support plays a significant role in explaining the likelihood of employees to engage in constructive deviance. In a similar vein, Eisenberger et al. (Eisenberger et al., 1990) proposed that constructive deviance may be strongly influenced by perceived organizational support. According to social exchange theory, perceived organizational support reciprocates the positive outcome behavior.

2.3 Internal corporate social responsibility and constructive deviant behavior

The review of the previous research on the connection between CSR and employee internal (intrinsic) motivation demonstrated that there is a positive relationship between CSR initiatives embraced by the organization and its employee satisfaction, self image, teamwork, loyalty, retention, trust, psychological need of belongingness, employee morale and commitment (Aguilera et al., 2007; Viswesvaran, Deshpande, & Milman, 1998).

More about this, Skudiene & Auruskeviciene (Skudiene & Auruskeviciene, 2012) Confirmed that internal and external CSR activities positively correlate with internal (intrinsic employee motivation. Explaing further, Skudiene & Auruskeviciene (Skudiene & Auruskeviciene, 2012) pinpointed that intenal CSR was found strongly related to internal (internsic) employee motivation than all the external CSR dimensions. Intrinsic motivation refers to a drive to become involved a particular task because it is inherently interesting or enjoyable (Ryan & Deci, 2000). Studies invoking an intrinsic motivation mechanism argue that individuals are likely to engage in constructive deviance as they take risks, explore new cognitive pathways, and are playful with ideas and materials (Oldham & Cummings, 1996). In this paper, we argue that internal corporate social responsibility practice increases constructive deviance by means of uplifting employee internal (intrinsic) motivation.

3 Corporate Hypocrisy as A Potential Moderator

Corporate hypocrisy is a stakeholder's belief that a firm has failed to deliver on its promises (Wagner, Lutz, & Weitz, 2009). Up until this point, the literature has concentrated on the misalignment between words and deeds of organizations. That is, when firms say something different in their CSR policies and communications than they actually implement. This word-deed mismatch then evokes perceptions of hypocrisy (Wagner et al., 2009). Scheidler, Edinger-Schons, Spanjol, & Wieseke (2018) accentuated that a deed-deed jumble is by a wide margin harming to an organization. That is, hypocrisy perceptions among employees may likewise emerge when companies practice what they preach in one CSR dimension, but do so less in others (Scheidler et al., 2018). Without a doubt corporate hypocrisy

happens when a company demonstrates concern for the wellbeing of individuals outside of organizational boundaries (via external corporate social responsibility (ECSR) engagement) but not within. External corporate social responsibility activities (ECSR) are directed at societal or environmental causes and primarily benefit external stakeholders (Brammer, Millington, & Rayton, 2007). On the other hand, internal CSR activities (ICSR) are those CSR investments that are directed at enhancing employees' physical and psychological working environment (Turker, 2009).

In view of the knowledge from Jones et al. (Jones et al., 2018), we incorporate inconsistency in CSR practices that favor external stakeholders as a moderator of CSR impacts. To summarize, we suggest that CSR strategies with larger levels of external corporate social responsibility activities (ECSR) contrasted with internal corporate social responsibility activities (ICSR) summon corporate hypocrisy perceptions and the subsequent perception negatively moderate the association between internal CSR pratcice and perceived organizational support.

4 Methodology

Several sources were used for distinguishing written works pertinent for this specific study. Various electronic databases accessible at our university's library such as EBSCOhost, Web of Science, Science Direct, Wiley online library, ABI/Inform Global, and Nature were utilized to scan for supporting materials and resources. In addition, different sources like Google Scholar, Emerald Insight, JESTOR, Sage Journal online, Springer, Taylor and Francis online, Wiley-Blackwell, Directory of online Journal (DOAJ) and Social Sciences Citation Index were investigated. Moreover, manual searches in a number of high profile academic journals have been conducted. The keywords used for this inquiry were constructive deviant behavior; destructive deviant behavior; perceived organizational support; internal corporate social responsibility; and social exchange theory. To mention some of the top journals where by manual search conducted; Academy of Management annals, Academy of Management journals, Academy of Management learning and education, Academy of Management Perspective, Academy of Management Review, the Journal of Organizational Behavior, the Journal of Vocational Behavior, Organizational Behavior and Human Decision Processes, and Personnel Psychology.

5 Conceptual Model Development

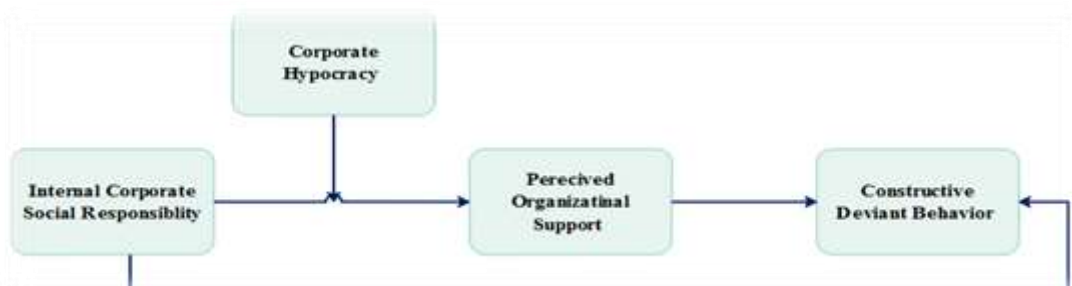
Relaying on the above discourse, a conceptual framework is developed to demonstrate the connection between internal corporate social responsibility and constructive deviant behavior using corporate hypocrisy and perceived organizational support as moderator and mediator respectively. To put in a nutshell, we at present do not have a sufficient comprehension of whether and how internal CSR affects employee's constructive deviant behavior and, the mediation and moderation effect in this relationship. We therefore, proposed the accompanying conceptual model (figure 1)


Figure 1   The Direct and Indirect Effect of Internal Corporate Social Responsiblity on Employee's Constructive Deviant Behavior

Based on the aforementioned literature review and our conceptual model, the following propositions are framed for future investigations:

a) Internal corporate social responsibility practices are positively related to perceived organizational support

b) Internal corporate social responsibility practices are positively related to constructive deviant behavior

c) Perceived organizational support is positively related to constructive deviant behavior

d) The relationship between internal corporate social responsibility and constructive deviant

behavior is mediated by perceived organizational support

　　e) Corporate hypocrisy negatively moderates the association between internal CSR practice and perceived organizational support

6 Conclusion

　　This study intends to examine how internal corporate social responsibility practice helps an organization to foster constructive deviant behavior in the workplace. To the best of our insight, no previous study has investigated the link between internal corporate socially responsible practice and constructive deviant behavior of employees. Being the first of its type, this study tries to add to the existing HRM literature by developing a theoretical understanding of the effects of internal corporate social responsibly practices on fostering constructive deviant behavior at work. In order to explain the conections of the variables in the proposed model, the writers relies on social exchange theory. To this end, a conceptual model is developed as a foundation for further investigation of this uncharted territory. Despite the fact that the connection between internal CSR and constructive deviant behavior has been developed in this conceptual model, it has some limitation. First, it ought to be tried to see whether it is valid or not. Second, different elements (factors) that influence constructive deviant behavior need also to be explored. These limitations besides constitute direction for future research.

Research on Compensation Mechanism of Rural Human Capital Gap from the Perspective of Targeted Poverty Alleviation through Entrepreneurship

Cheng Yong, Zhou lingyue, Peng Huatao
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 490042748@qq.com, 694172500@qq.com, 416295790@qq.com)

Abstract: Based on the theory of rural human capital and targeted poverty alleviation through entrepreneurship, this paper, aiming at the situation of human capital deficiency, attempts to put forward the hypothesis of the compensation mechanism of rural human capital gap in the view of targeted poverty alleviation through entrepreneurship, analyze the influence path that the mode of entrepreneurial poverty alleviation exerts on rural human capital gap and measure the influence through empirical research to reveal the compensation mechanism of rural human capital gap from the perspective of targeted poverty alleviation through entrepreneurship, thus provides policy suggestions for improving the compensation mechanism of rural human capital gap.

Key words: Targeted poverty alleviation through entrepreneurship; Human capital; Compensation mechanism

1 Introduction

In the context of knowledge-based economy and information society nowadays, human capital has extraordinary significance for poverty alleviation in developing countries and backward areas. China is a great agricultural country. In China's poor rural areas, low-level human capital and human capital gap are considered to be one of the main factors leading to poverty (PengChunning, 2016). Most of the young and middle-aged laborers with relatively higher education and skills in rural areas have turned to looking for jobs in urban cities instead of doing farm work at home. Most of the rural students have migrated to cities and developed regions through attending colleges. This migration will inevitably lead to the outflow of human capital and decline of the overall quality of human capital in poor rural areas, which will ultimately affect the long-term development of rural economy and agricultural modernization, thereby aggravating rural poverty (Tobias et al, 2013; Tatiana A. Thieme, 2015).

Although unremitting efforts have been made by the government in the past few decades, poverty is still a common rural phenomenon in China. Since traditional methods of poverty alleviation such as national policies, cash grants and charitable causes lack corresponding profit-driven mechanisms to attract peasant-workers and rural college students to participate in rural economic development, it is difficult to effectively solve the poverty problem caused by the lack of rural human capital. Under this background, targeted poverty alleviation through entrepreneurship can break through the limitations of traditional methods of poverty alleviation, encourage migrant workers and college students to return to their hometowns, and help to eliminate rural mental poverty and poverty caused by skill deficiency (Cho et al, 2016). In terms of the existing research results, scholars have carried out a relatively comprehensive study on the concepts, modes and mechanisms of targeted poverty alleviation through entrepreneurship, as well as human capital theory and basic characteristics (Usman, A. S, Tasmin, R , 2015; Yan Ya et al, 2013), but little research has combined targeted poverty alleviation through entrepreneurship with rural human capital gap, and little research has analyzed rural human capital gap from the perspective of targeted poverty alleviation through entrepreneurship; or the methods of previous research are mainly based on qualitative analysis, and lack of more rigorous empirical research to explore the mechanism of influence between targeted poverty alleviation through entrepreneurship and rural human capital (Asaju K, 2012). Therefore, how to compensate for rural human capital gap by means of the mode of entrepreneurial poverty alleviation according to the situation of rural human capital deficiency has not yet been effectively solved. Based on this, this paper, aiming at the situation of human capital deficiency, attempts to reveal the compensation mechanism of rural human capital gap in the view of targeted poverty alleviation through entrepreneurship, so as to establish an effective compensation mechanism to compensate for the poverty caused by the human capital gap in rural areas and accelerate the building of a moderately prosperous society in rural areas as well as enhance coordinated development between urban and rural areas.

2 Theoretical Bases and Research Hypothesis

2.1 The mode of entrepreneurial poverty alleviation and rural human capital

According to the theory of human capital, the biggest obstacle to the development of rural poverty-stricken areas comes from the shortage of human capital. Li Shan, Wang Xiaodongand other scholars believe that targeted poverty alleviation is surely conducive to the cultivation and accumulation of human capital in poverty-stricken counties. Under the background of "mass entrepreneurship and innovation", poverty alleviation has achieved remarkable results through entrepreneurship. Mostly, local governments act as the lead and lift farmers in poverty-stricken areas out of poverty through poverty alleviation modes such as science and technology, industry and tourism development, which effectively compensates for rural human capital gaps in education, training, medical care, and population migration. Specifically, the poverty alleviation modes not only help impoverished people break away from poverty by increasing their per capita income, but also promote the construction of rural health care, medical care and other infrastructure; furthermore, they can improve the education conditions as well as education level of rural impoverished population, and improve the skills and overall quality of the poor by increasing practical agricultural technical training, vocational education training, and skill training targeted to the young in poor areas. Based on the above analysis, this study proposes the following hypothesis:

H1: Targeted poverty alleviation through entrepreneurship has prominent positive influence on the compensation for rural human capital gap.

2.2 Entrepreneurial intention

According to the empirical research on targeted poverty alleviation in poverty-stricken areas, Zhong Wangli and Guo Hongdong (Zhong Wangli and Guo Hongdong, 2010) concludes that farmers in underdeveloped areas have more strong entrepreneurial intention than those in developed areas since the former hope to change their backwardness through entrepreneuring.status quo. Entrepreneurial intention is considered to be a key factor affecting the effectiveness of targeted poverty alleviation through entrepreneurship. The poor individuals involved in entrepreneurial poverty alleviation may have different willingness to start a business. Some of them merely hope to maintain their living standards at mean level through entrepreneurial poverty alleviation activities without the expectation for long-term development (Christensen LJ, Parsons H, Fairbourne J, 2010). At the same time, Yadav & Goyal (Yadav & Goyal, 2015) and other scholars believe that the mode of targeted poverty alleviation through entrepreneurship can stimulate farmer' entrepreneurial intention, which will break the traditional ideas of feeling contented with poverty and looking down upon entrepreneuring and then compensate for human capital gap spiritually. Therefore, based on the above analysis, the study puts forward the following hypothesis:

H2: Entrepreneurial intention partially plays an intermediary role in the positive influence that targeted poverty alleviation through entrepreneurship exerts on the compensation for rural human capital gap.

2.3 Entrepreneurial ability

According to the theory of capability poverty, the most significant factor affecting the relationship between entrepreneurial poverty alleviation and rural human capital compensation is entrepreneurs' entrepreneurial ability. One of the main challenges of rural human capital compensation is entrepreneurial ability that matches entrepreneurial opportunities. At present, the trend of entrepreneurial poverty alleviation indicates the importance of entrepreneurial education and training for increasing entrepreneurial ability such as creativity and innovation (Bradley, 2012).Asan effective factor compensating for rural human capital, entrepreneurial lability can promote and encourage the poor to gain entrepreneurial skills by stimulating their entrepreneurial potential, so as to generate a group of well-trained human resources to meet the needs of poverty alleviation. Therefore, it is necessary for the government to set up relevant mechanisms and modes for entrepreneurial poverty alleviation in order to provide targeted supplements to entrepreneurial capabilities for entrepreneurial farmers, and hence to create more choices and solutions to the improvement of the overall human capital gap in rural areas. From the above, this study proposes the following hypothesis:

H3: Entrepreneurial ability partially plays an intermediary role in the positive influence that targeted poverty alleviation through entrepreneurship exerts on the compensation for rural human capital gap.

2.4 Entrepreneurial resources

Based on the factor endowment theory, promoting the compensation for rural human capital gap

requires the support from entrepreneurial resources and favorable factors at the time of promoting entrepreneurial poverty alleviation. On the one hand it needs the support from the entrepreneurs' own resources such as friends and family; on the other hand, it also needs the support from external resources such as government and non-governmental organizations, educational institutions and other private institutions(Jiang Jianyong, Qian Wenrong, Guo Hongdong, 2013). A sound mechanism of entrepreneurial poverty alleviation can not only accelerate poverty alleviation, but also create positive social impact. Entrepreneurs can build a better sense of social cognition and social responsibility; furthermore, they may also be more inclined to start a business on the basis of self-confidence. Namely, the enrichment of entrepreneurial resources can enhance the entrepreneurial intention of people in poverty-stricken areas (Santos FM, 2012). The main body of entrepreneurial poverty alleviation is the poor, but the poor people are extremely short of start-up and working capital essential for entrepreneurship, and need to obtain capital through microfinance and other means. Therefore, above all, this study proposes the following hypothesis:

H4: Entrepreneurial resources partially play an intermediary role in the positive influence that targeted poverty alleviation through entrepreneurship exerts on the compensation for rural human capital gap.

According to the theoretical basis and research hypothesis above, this paper builds a conceptual model, as shown in Figure 1. It links entrepreneurial poverty alleviation, rural human capital, entrepreneurial intention, entrepreneurial ability, and entrepreneurial resources together to explain how entrepreneurial poverty alleviation compensates for rural human capital through its implementation mode and how entrepreneurial intention, entrepreneurial ability and entrepreneurial resources play their roles in this process.
Figure 1   Conceptual Model

3 Research Design

3.1 Research sample

This study takes the peasant households involved in entrepreneurial poverty alleviation in the poverty-stricken counties of Hubei Province as the object, and adopts random sampling method to hand out questionnaires in LuoTian, Qichun and Ying Shan County (three national key poverty-stricken counties in Huanggang City, Hubei Province). To ensure the accuracy of the survey results, the entrepreneurial farmers and peasant entrepreneurs should be taught how to fill out the questionnaires and be interviewed in depth in the process of issuing them. When selecting subjects of the survey, we try to cover the entrepreneurial farmers who are engaged in the first, second, third industry or integrated industrial development as much as possible to ensure more convincing and accurate results of this survey. The survey has distributed 180 questionnaires to entrepreneurial farmers in Huanggang City and collected 148 copies 138 of which are valid questionnaires. The recovery rate and effective rate of the questionnaires are 82.2% and 93.2%respectively.

3.2 Variable measurement

This study primarily adopts the scale put forward by Faliang Y U, Chen L (Faliang Y U, Chen L, 2013) to measure entrepreneurship poverty alleviation and adds elements of Chinese context to it. The scale consists of 5 question items each of which is scored by 7 points, and is evaluated by the entrepreneurial farmers. The reliability coefficient (Cronbach α) of the scale is 0.794, which indicates its good reliability. To measure entrepreneurial intention, the study adopts the scale of Martin Obschonka et al and Francisco Linan et al and selects the dimensions of belief control and exemplary role model, which is also assessed by entrepreneurial farmers. The scale consists of 4 questions, and its reliability coefficient is 0.789. In terms of entrepreneurial ability, the entrepreneurship scale developed by Thomas W.Y. Man et al (Thomas W.Y. Man et al, 2002) is adopted. Consisting of four items with a reliability coefficient of 0.782, the scale can measure the abilities including opportunity identification, social relations and resource integration. Entrepreneurial resources are measured by the scale designed by Martin Obschonka et al (Martin Obschonka et al, 2012) which takes the characteristics of

entrepreneurial farmers into consideration and then selects three dimensions of financial resources, human resources and social resources. The scale includes four items and its reliability coefficient is 0.782. Lastly, to measure human capital, the study employs the definition of rural human capital and the scale put forward by Asaju K (Asaju K, 2012) which includes seven items in the three dimensions of education and training, health care, and population migration, with the reliability coefficient of 0.798.

Previous studies have shown that age, gender, education and entrepreneurial time may affect entrepreneurial poverty alleviation, entrepreneurial intention, ability, and resources. Therefore, this study takes age, gender, education, and entrepreneurial time as control variables separately.

4 Hypothesis Testing Results
4.1 Descriptive statistical analysis

Table 1 summarizes the mean, standard deviation, and correlation coefficient of the variables. From it, we can conclude that the entrepreneurial poverty alleviation and entrepreneurial intention (r=0.478, p<0.01), entrepreneurial ability (r=0.496, p<0.01), entrepreneurial resources (r=0.398, p<0.01) rural human capital (r=0.435, p<0.01) show a significant positive correlation. Also, entrepreneurial intention (r=0.513, p<0.01), entrepreneurial ability (r=0.349, p<0.01), and entrepreneurial resources (r=0.499, p<0.01) are significantly positive correlated with rural human capital. In addition, there is no significant correlation between gender (r=0.114), age (r=0.123), entrepreneurial time (r=-0.134) and the mode of entrepreneurial poverty alleviation, which indicates the modes of entrepreneurial poverty alleviation that entrepreneurs of different genders, ages, and entrepreneurial time choose are of little difference.

Table 1 Mean, Standard Deviation and Correlation of Major Variables

Variable	Mean	Standard Deviation	CM	CY	CZ	CN	NR	Gender	Age	Edu	Year
CM	4.9957	1.14840	1

Year	2.16	.785	-.134	-.094	-.091	-.029	-.077	-.093	-.020	.120	1

4.2 Hypothesis verification

To verify the hypothesis, we adopt the method of hierarchical regression to measure: (1) the impact on the intermediary variables (entrepreneurial intention, entrepreneurial ability and entrepreneurial resources): we introduce control variables, and then measure the impact of independent variables (the mode of entrepreneurial poverty alleviation). (2) The verification of mediate effects: we introduce control variables, and then measure the influential effects of independent variables (the mode of entrepreneurial poverty alleviation). Lastly, we introduce intermediary variables (entrepreneurial intention, entrepreneurial ability, and entrepreneurial resources). The results of the hierarchical regression analysis are listed in Table 2.

Table 2 Results of Regression Statistics

Variable	CY	CN	CZ	NR

From the results shown in Table 2, it can be concluded that the mode of entrepreneurial poverty alleviationhas a significant positive impact on rural human capital ($\beta=0.434$, $p<0.01$), which verifies hypothesis 1. At the same time, after the variables of entrepreneurial intention (CY), entrepreneurial ability (CN)and entrepreneurial resources (CZ) are added, the standardized coefficient of the impact that entrepreneurial poverty alleviation (CM) exerts on rural human capital (NR) declines; namely, the positive impact declines thatthemode of entrepreneurial poverty alleviation (CM) has on rural human capital (NR). Or in other words, entrepreneurial intention, entrepreneurial ability and entrepreneurial resources each partially plays an intermediary role in the positive influence that targeted poverty alleviation through entrepreneurship exerts on the compensation for rural human capital gap. Therefore, hypothesis 2, 3, and 4 are all verified. Based on the above results, we can come to a conclusion that targeted poverty alleviation through entrepreneurship has prominent positive influence on the compensation for rural human capital gap, and that entrepreneurial intention, entrepreneurial ability and entrepreneurial resources each partially plays an intermediary role in the positive influence that targeted poverty alleviation through entrepreneurship exerts on the compensation for rural human capital gap.

5 Conclusion

Taking peasant households who participate in entrepreneurial poverty alleviation as the object, this paper focuses on the compensation mechanism of rural human capital gap in virtue of entrepreneurial poverty alleviation based on the opinions of domestic and foreign scholars, and draws the following conclusions through analysis of empirical data:

(1) The conclusions of this study verify the positive impact of entrepreneurial poverty alleviation on compensation for rural human capital gap. From previous experience of targeted poverty alleviation, the scarcest factor in anti-poverty process in poor rural areas of China is human capital. Compared with those in developed urban areas, people in rural areas generally receive relatively lower-level education with backward ideas. Rural areas possess low stocks of human capital of education and knowledge, and lack capabilities of self-development. Entrepreneurial poverty alleviation focuses on self-development; on the one hand, it stimulates the entrepreneurial enthusiasm of the poor and returned migrant workers through policies and financial support to improve the flow of rural human capital; on the other hand, it helps the poor to enhance their techniques and management skills to increase the stock of rural human capital.

(2)Entrepreneurial intention partially plays an intermediary role in the positive influence that targeted poverty alleviation through entrepreneurship exerts on the compensation for rural human capital gap. People's ideological concept as the will of survival and developing way has a dynamic positive effect on the compensation for rural human capital gap. At present, the widespread poverty in rural areas of China is not only an economic phenomenon, but also a phenomenon indicating people's backward thoughts and ideas. Due to the poor regional information, the poor have long been bound by traditional concepts. With a weak sense of self-development and innovation, they are resistant to high-risk entrepreneurial activities. In this case, the mode of entrepreneurial poverty alleviation can rely on financial support and technical support to stimulate the initiative and entrepreneurial enthusiasm of the poor through, to foster their entrepreneurial intention, and to eliminate the conceptual poverty and mental poverty, thus compensating for the rural human capital gap.

(3) Entrepreneurial resources partially play an intermediary role in the positive influence that targeted poverty alleviation through entrepreneurship exerts on the compensation for rural human capital gap. In the process of this study, it can be found that most farmers participating in entrepreneurial poverty alleviation have strong intention of entrepreneuring. However, most of them say that the biggest problem in the process of entrepreneurial poverty alleviation is lack of sufficient entrepreneurial resources. Guided by the government, entrepreneurial poverty alleviation aims at the impoverished peasant households whose information have been kept on file, and sets up a "petty loan specially for entrepreneurial poverty alleviation" to provide financial support for entrepreneurial farmers, which stimulates the entrepreneurial enthusiasm of the poor, returned migrant workers and college students. As a result, they will turn to engage in the second and third industry, which may compensate for rural human capital gap.

(4) Entrepreneurial ability partially plays an intermediary role in the positive impact of the mode of entrepreneurial poverty alleviation on the rural human capital gap. The young in rural areas are generally at a disadvantage in terms of knowledge structure, skill level and entrepreneurial ability. Entrepreneurial Poverty Alleviation can teach the poor knowledge and technology related to the entrepreneurial industry depending on "Science and Technology Commissioner", "Maker Space", "Internet + Poverty Alleviation" and other modes of poverty alleviation, which improves individual survival and developing capabilities and grades the quality of rural human capital.

Foreign Investment Changes and Regional Differences in China's Hotel Industry

Wang Shuli, Xiang Zikun
School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: wangsl@whut.edu.cn, 1161466238@qq.com)

Abstract: Based on the inter-provincial data of China from 2001 to 2015, this paper systematically analyzed the historical evolution of foreign investment in China's hotel industry since the beginning of the new century from aspects of the number and the operating income of foreign-funded star hotels. Then we studied the regional differences of foreign investment and their trends in the hotel industry. The results show that from 2001 to 2015, the level of foreign investment in China's hotel industry was relatively stable overall, and it has shown a slight decline in recent years. The level of foreign investment in the hotel industry in China's sub-regions demonstrates large regional differences. The number of foreign-funded star hotels and the ratio of the operating income of foreign-funded star hotels to the operating income of the entire hotel industry in the eastern area are much higher than that of the central and western areas. At the same time, the regional differences of foreign investment in China's hotel industry have shown an upward trend as a whole during the sample period, while it has been on a downward trend in recent years.
Key words: Hotel industry; Foreign investment; Historical evolution; Regional differences

1 Introduction

The hotel industry is one of the earliest industries in China to attract foreign investment, and it is also one of the major tourism sectors attracting foreign investment (Zhang et al., 2012). The booming development of China's hotel industry is inseparable from the introduction of foreign investment. In 1982, Beijing Jianguo Hotel cooperated with Hong Kong Peninsula Hotel Group to build the first joint-venture hotel since the founding of new China. The cooperation marks the beginning of the introduction of foreign investment into China's hotel industry. The opening up of the hotel industry introduced advanced management experience and business philosophy to the hotel industry, which promoted the booming development of the hotel industry in China (Hung, 2013). During this period, the consumer demand grew fast, which has driven the rapid expansion of the hotel industry, and the foreign investment scale in the hotel industry has continued to grow in China (Mao & Yang, 2016). Previous literatures mainly focused on studying the location selection of foreign investment in the hotel industry (Yang et al., 2012; Yang et al.,2014; Assaf et al., 2015), ownership structure (Hsu et., 2012; Jiang et al., 2014), determinants of foreign investment flows (Falk, 2016) and foreign investment spillovers in the hotel industry (Mao & Yang, 2016). However, the evolution tendency and regional differences of foreign investment in China's hotel industry have not been given priority to in the existing literatures. Then what is the historical evolution pattern of the foreign investment in China's hotel industry? What are the differences among the three regions in foreign investment in China's hotel industry? What are the reasons for the volatility and spatial differences in foreign investment in China's hotel industry? This paper will answer the above questions in order to clarify the development tack and regional characteristics of the foreign investment in China's hotel industry, and provide support for further research in related fields.

2 The Historical Evolution of Foreign Investment in the Hotel Industry

The completion of China's first joint venture hotel in 1982 marked the beginning of the introduction of foreign investment into China's hotel industry. Shortly afterwards, multinational hotel groups such as Accor, Hilton and Marriott entered the Chinese market(Jiang et al., 2014). Relevant statistics shows that as of 1988, 26 multinational hotels have entered the Chinese market, and they operate and hold the equity of more than 60 hotels in China. With the continuous deepening of reform and opening up, multinational hotel groups have successively settled in areas with high economic level or rich tourism resources in China through franchising and management contracts. The foreign investment in the hotel industry has grown rapidly, and the policy dividend has gradually been released (Wu et al. 1998).

Considering the availability of data, we analyzed the number (NUM), room occupancy rate(ROR),

operating income(OI) and fixed asset(FA) of foreign-funded star hotels in China (see Table 1), in order to clarify the historical evolution of foreign investment in China's hotel industry.

Table 1   The Operation Status of Foreign-funded Star Hotels in China

Year	number(NUM)	room occupancy rate (ROR) (%)	operating income (OI) (in millions yuan)	fixed asset (FA) (in millions yuan)
2001	592	64.40	24887.31	70334.03
2002	686	65.41	26973.19	79100.58

Mean	563	61.36	27085.06	74012.54

It is to be noted that the raw data in this paper are collected from the Yearbook of China Tourism Statistics and its supplements.

As shown in Table 1, it can be seen that China's entering into the WTO in 2001 promoted the development of foreign investment in China's hotel industry. In 2002, the number and the room occupancy rate of foreign-funded star hotels steadily increased. Comparing it with the data of other years, it can be found that the number of foreign-funded star hotels reached a peak in 2002. In 2003, affected by the SARS virus, the overall decline in the hotel industry in China makes the number of foreign-funded star hotels decrease to 531 in one year. In the meantime, the hotel occupancy rate dropped sharply from 65.41% to 56.72% during SARS. In 2005-2007, due to the rapid development of China's economy, the number of foreign star hotels increased year by year, while the occupancy rate of foreign-funded star hotels did not show a growth trend, and even showed a slight decline. This may be attributed to the rapid expansion of the hotel industry, which has made the supply of hotel rooms exceed the market demand (Falk, 2016).

From 2008 to 2009, influenced by the global financial crisis, some multinational hotel groups withdrew from the Chinese market, which led to a slight decline in the number of foreign-funded star hotels in China. At the same time, owing to the decline in consumer demand in China's domestic hotel industry, the room occupancy rate also fell sharply for the first time since 2003. After 2011, thanks to the improvement of local brand effect, the number of China's domestic chain hotels has soared, and the market share of domestic chain hotels has increased correspondingly. Meanwhile, the slowdown in the growth rate of economy and resident income of China resulted in a continuous decline in the number of foreign-funded star hotels. As a result, the room occupancy rate of foreign-funded star hotels has also slightly declined since 2011.

In the meantime, the operating income of foreign-funded hotels remained in the range of 20 to 35 billion yuan, and the fixed assets remained in the range of 50 to 85 billion yuan during the sample period, which was in a relatively stable state. The trend of the changes in operating income and fixed assets were similar. The three minimum values appeared in 2004, 2009 and 2013 respectively, which means that the changes of operating income and fixed assets are periodic. As a industry with relatively high opening level, the hotel industry is significantly affected by the policies and macro environment. In 2003, the SARS virus' outbreak had a negative impact on the operating income of China's hotel industry. The fixed asset also decreased in the following year. The global financial crisis of 2008 had a direct impact on the operating income of China's foreign-funded star hotels as well. After 2012, China's economic growth rate slowed down and entered into the "new normal" phase, which greatly influenced the

operating income and fixed assets of foreign-funded star hotels in a negative way.

3 The Regional Difference of Foreign Investment in the Hotel Industry

Based on the classification standard of the China Statistical Yearbook and the availability of data, we divided China mainland into three regions: eastern region; central region; west region.
Figure 1   The Number of Foreign Star Hotels in China's Three Major Regions, 2001-2015

Figure 1 depicts the trend of the number of foreign-funded star hotels in China's three major regions from 2001 to 2015. Figure 2 reports the trend of the foreign participation degree in the hotel industry (the ratio of the operating income of foreign-funded star hotels to the total operating income in the hotel industry) in China's three major regions from 2001 to 2015. It can be seen from Figure 1 and Figure 2 that the eastern region is the main area attracting foreign investment in the hotel industry.
Figure 2   Foreign Participation Degree in the hotel industry of China's Three Major Regions, 2001-2015

The number of foreign-funded star hotels and the degree of foreign participation of the hotel industry in the eastern region are significantly higher than those in the central and western regions. The possible reason is that foreign investors investing in China tend to choose areas with more preferential policies and higher economic development levels so as to reduce the cost of transnational operations and take advantage of the huge market demand (Wei et al., 1999). Contrary to this, the central and western area of China is confined by the relatively low level of economic development, so it is more difficult for them to attract foreign hotels to invest in local hotel industry. According to the Yearbook of China Tourism Statistics (supplement), foreign hotels did not enter the central and western regions until 1985, and the central region did not have the first international hotel (Tianan Holiday Hotel) until 1991. In addition, during most years of the sample period, the number of foreign-funded star hotels and the foreign participation degree of the hotel industry in the central region were slightly higher than those in the western region, which may be attributed to the relatively developed economy in the central region.
Figure 3   The Changing Trend of Regional Differences in Foreign Investment of China's Hotel Industry

In order to investigate the changing trend of regional disparities of foreign investment in China's hotel industry, we calculated the coefficient of variation of the number of foreign-funded star hotels (CV1) and that of the foreign participation degree in hotel industry (CV2). It can be seen from Figure 3 that during the sample period, the coefficient of variation of the number of China's foreign-funded star hotels showed an overall upward trend. Specifically, from 2001 to 2009, it showed a downward trend; from 2010 to 2012, it showed an upward trend, and from 2013 to 2015, it showed a downward trend again. The coefficient of variation of foreign participation degree in China's hotel industry was also on the rise. Specifically, from 2001 to 2010, it presented a fluctuating upward trend; after 2010, it showed a downward trend year by year. In summary, during the sample period, the regional disparity of foreign investment in China's hotel industry presented an overall upward trend, and there has been a declining trend in recent years.

4 Conclusion

This paper investigated the historical evolution of foreign investment in China's hotel industry since the new century by analyzing the number, the operating income and the fixed assets of foreign-funded star hotels in China from 2001 to 2015. On this basis, we studied the regional differences of foreign investment in the hotel industry, and employed the coefficient of variation to analyze the evolution of regional differences. The conclusions of this paper are as follows: During the sample period, the foreign investment in China's hotel industry remained relatively stable, but the number of foreign-funded hotels presented a declining trend in recent years. China's hotel industry's foreign investment presented large regional heterogeneities. Specifically, the number of foreign-funded star hotels and the foreign participation degree in the hotel industry of the eastern region are significantly higher than the central and western Region. The study on the changing trend of regional differences found that the regional gaps in foreign investment of China's hotel industry were enlarging during the sample period, but have narrowed in recent years.

The policy implications of this paper are as the following: China should fully recognize the importance of foreign investment in the hotel industry to the local economic growth. The government can attract multinational hotels to invest in China by formulating appropriate taxation and subsidies policies. In addtion, the central and western regions should further enhance the foreign investment level of the hotel industry by introducing preferential investment policies, thus gradually narrowing the gaps in foreign investment and economic development level of the hotel industry among the three regions.

It is to be stressed that there is still room to extend the study in this paper. Future studies can consider the provincial differences of foreign investment in the hotel industry. In addition, more methods can be used to analyze the regional differences of foreign investment in the hotel industry.

Abstract: The general purpose of this study is to understand (from the standpoint of Business Administration teachers in higher education) what is required to have lessons of good quality that provide students with an effective return in terms of learning. A qualitative research methodology was employed which was of an exploratory character and descriptive nature; this involved a bibliographical and documentary analysis, together with in-depth interviews, following the guidelines of a semi-structured study, with twelve teachers who came from both public and private institutions. After the study had been undertaken, it was found that what characterizes a good teacher is that he has have a good grounding in didactics and knowledge of the subject being taught. This involves practical work in the classroom with regard to the subject in question, and preferably based on his own professional experience. The teacher should also know how to make use of new technical resources so that classes can allow the students to take part in a more active way. However, it was also clear that a good class does not only depend on the teacher but also on the willingness of the students to learn and the availability of good teaching material. As well as this, it is essential for the academic staff to be supported by the teaching institutions in both the public and private sector.
Key words: Standards of higher education; Public and private institutions; Business administration course; Teaching skills

1 Introduction

Education in Brazil has been discussed in several areas of knowledge and in different spheres (basic, education, secondary school and higher education). This has given rise to thoughts about both ideal standards and the real standards of education found in the Brazilian educational system. The studies concerning higher education have shown that there are serious *gaps* between the requirements of the market, scientific training and the teaching and institutional activities carried out in the *praxis* (Garonce & Santos, 2012; Gomes & Moraes, 2012; Silva, 2013; Vieira, 2013). As a result, there are losses to the students who seek to have their rights to education ensured and a chance to obtain a better position in the workplace. Globalization and the revolution in information and communications have led to a society that is in constant change and requires changes in the educations system as well (Peng *et al.*, 2014). Modern society expects teaching of a high standard with modern methods and not the concept of education described by (Paulo Freire, 1997) as "banking", in which the teacher leads students to rote memorization of the content they give (Gil, 2009).

Thus, it is important for the teacher to have a solid grounding in the subject that he/she is willing to teach but also, there are other factors that must be taken into account to create a pleasant atmosphere in the classroom. The rapid growth of Teaching Institutions causes a deficiency in the training of these professionals. The structural factors and support for teaching and learning have also been impaired by the contingencies of this new market (large educational groups). They are effects that, in the long term, can lead to the mechanization of teaching and learning, at the expense of critical reflection and production of new knowledge.

For this reason, this article seeks to investigate (from the point of view of teachers involved in Business Administration courses), what is necessary in order to have a quality class, with practical and reflexive techniques that allow emancipation of the student.

2 A Theoretical Framework
2.1 Achieving high standards in higher education

The expansion of higher education in Brazil and in other developing countries has shown some

significant numerical indicators (Gomes & Morais, 2012). However, the rise in numbers in terms of places/enrollments does not give an accurate reflection of the quality of the teaching being provided (Carvalho, 2013). There are objections regarding the capacity of the current teaching and learning models to train professionals to have a reflective/critical stance, as a result of a lack of changes in the school curriculum or a change in discourse with regards to a modernized system for practice (activities) (Saraiva, 2011).

In this context, the higher education institutions have effectively turned into business centers, which conceive, produce and advertise education as a *commodity*. This affects the training standards as a whole and has implications for both students and the rest of society (Saraiva, 2011; Carvalho, 2013). The radical change of the educational sector is one of the consequences of globalization, especially in the emerging markets (Carvalho, 2013). It has arisen because of market planning, social networks, new tools for teaching and learning and the effects of these changes on patterns of human behavior (Castells, 2000; Dowbor, 2001; Freeman, 2005; Simic & Carapic, 2008; Touraine, 2007).

The situation outlined here is embedded in the dual context of theory (thinking) and practice (doing) (Marcelo, 2013; Nassif, Grobril, & Bido, 2007). It concerns new economic paradigms in teaching and the decentralization of scientific reflection in an immediate practical application (Faria & Figueiredo, 2013). This is in response to the changes in the market and the modern application of knowledge and information in the face of operational requirements (technical know-how) (Silva, 2013).

The central feature of ´doing´ (to the detriment of ´knowing`) has caused a breakdown in the process of starting a dialogue (the communicative aspect of education) which is the driving-force behind the continuous flow of teaching and learning (Freire, 1981). As a result, the willingness to share knowledge by building bridges between the educator and the learner (the `I´ and the other) is being replaced by operational mechanisms of immediate application, without any critical reflection (doing) (Hermann, 2014). Thus, the modern critic - whether with regard to education for practice (the market) or reflective education (emancipation) - is introduced into the area concerned with questions regarding the quality of higher education and teaching/learning (creativity, appropriation and the use of skills and knowledge) (Carvalho, 2013).

It is worth stressing that the quality of education (or lack of it) is closely bound up with the advent of ´mass´education in educational systems (Gomes & Moraes, 2012). A good deal of harm is caused to teaching standards by giving prominence to mass education systems. What emerges is a species of half-baked training and undue stress on ´content´which leads to the commodification of education and the insertion of commercial character in educational and cultural training (Silva, 2013) .

For this reason, in a form that is diametrically opposed to this marketing tendency, the quality of higher education is guided by some intrinsic and extrinsic features with regard to the role of the teacher (Garonce & Santos, 2012). However, the quality of teaching can only be revealed by bringing together a set of activities, resources and actors involved. The essential requirements of a school (material resources, technologies, physical conditions and people), the technical domain (theory and practice), the pedagogical scope and environmental areas of interaction (real, virtual, internal or external), are the key features for the development and acquisition of new kinds of knowledge (Nogueira & Bastos, 2012).

According to the MEC (Ministry of Education), the government body responsible for education in the country, the minimum standards of quality are the variety and minimum amounts of essential inputs to the development of the teaching-learning process. This body defines the twelve principles that should be the foundation of education, one of them being the assurance of standard of quality. (Lorenzo and Knop, 2011) understand that to measure the quality of higher education, assessment processes are necessary, such as the one introduced in the 1990s, known as Provão, replaced in 2004 by ENADE (Examination of National Students Performance), with the purpose of measuring the knowledge given to students during their graduation.

(Mainardes and Domingues, 2013) in a survey conducted in Brazil in the IES of Joinville-SC, spoke about the key attributes of the Administration graduation courses which contribute the most for the course to be considered of high quality by students. According to the authors, the environment where the course happens, the quality of disciplines, the learning incentive and student engagement are the elements that define the perception of quality of the Administration course by students.

Some authors like Garance and Santos (2012) and Magalhães, Oliveira and Duarte (2014), claim that the role the teacher plays in the classroom is still regarded as one of the only factors important to have a good higher education. However, it is necessary to categorize the systemic concepts of quality in higher education. The poor working conditions of the teaching staff and the institutional constraints in the availability of physical, technical and didactic resources, among other factors, have caused the

teacher to play the role of an antagonist to ensure success or be regarded as the protagonist who is responsible for the school failings in higher education (Rodriguez, 2008).

It should be stressed that there has been a complete swing of the pendulum from the paradigm of coercion (the authority of the teacher) to the paradigm of the democratized environment with participation in teaching and   learning (by companies, the family, society, class institutions and so on) (Fortaleza, 2007).   This analysis simulates efficiency through integration of the different parts and the dialogue between the academic world and other institutional players in their particular social sector. By itself, it seems to be a transforming force in the academic environment, which acts as a space for plurality, diversity and equitable rights (Hermann, 2014).

However, on a broaden field of vision the legitimizing of democratic educational space offers an opportunity to give flexibility to teaching and learning in the most rudimentary areas of knowledge. This meets the demands of economic groups focused on education or diploma marketization, without any teaching or learning (which are certifiers of knowledge) (Carvalho, 2013).

This implies that the teacher has a unique responsibility for teaching and learning standards. As a result, the following points can be confirmed: a) a dialogic process based on ethical principles for the creation of a shared world (between the teacher and learner) (Hermann, 2014), b) a sense of enthusiasm and commitment on the part of the teacher to carry out more complex teaching activities (Fortaleza, 2007), c) the instrumental and technological interface in the support   for what is known and for what still has to be found (Marcelo, 2013) the attitudes, didactics, relationships, knowledge and experience   the teacher manages to transmit to students (Kühl, Maçaneiro, Cunha, & Cunha, 2013; Veres, Hetesi, & Vilmanyi, 2009), e) also, the media scene which is incorporated in the teaching/learning process (Garonce & Santos, 2012).

However, as mentioned earlier, we should stress the fact that the quality of teaching and learning are supported by a set of institutional, political and economical factors (that go beyond teaching responsibilities), that need to be taken into account when addressing the question of standards in higher education. For Lorenzo and Knop (2011), the quality perceived by the student is related to tangible factors such as library, computer lab, the physical structure of the IES and its appearance. Another factor is the reliability of the preparation to the job market and their involvement in the class. It is important to note that quality is related to the expectations of the student in relation to the institution and teaching. In this regard, the pedagogical teaching resources (Gomes & Moraes, 2012), the policies of concession of vacancies in higher education courses and new forms of marketing of education are evident (Carvalho, 2013).

Hence, when seeking to assess the quality of teaching and learning in higher education, we find that these challenges are related to teaching skills and the quality of the class. This problem is connected to its means and ends by links that isolated produce fragmented results. Attention should be drawn to the theoretical notes that signal that there is a set of ordered activities in every area which are designed to render educational services that can improve the quality of higher education.   Moreover, it should be underlined that this is not the abolition of the responsibilities of the teacher, but the finding of the full completeness of all players that are involved in the educational process of quality.

2.2 Teaching skills

The concepts of skills and abilities are recurrent both in the professional and educational fields (Viera, 2013). The complexity and demands of the business market, linked with globalization, brings out the need to focus on professional skills to obtain a competitive advantage. In this sense, there has been a narrowing of the relationship between knowledge and learning as new factors in the preparation of professionals that are suited to this historic period. In this context, a semantic kinship relation can be inferred between the words *competence* and *competition, which* derive etymologically from the Latin *competere*, which means that when someone wins, another person loses, when they are linked to each other. However, this relationship is the opposite when we are dealing with knowledge because the person who teaches has nothing to lose but on the contrary, renews their knowledge. The words *to compete* and *competence* need to be broadened in the university campuses to "seek with", by endowing the teacher with a pivotal role in the training of qualified and competent professionals (Nassif, Hanashiro & Torres, 2010).

However, what are the attributes that can describe a competent teacher? By describing the strategies needed for the training of teachers, Nassif, Hanashiro and Torres (2010), recommend that the teacher should display the characteristics of an entrepreneur by being flexible with regard to changes and accepting innovations in an investigative and critical spirit, with a capacity to contextualize the reality of the studied situation so that the knowledge can be conveyed. In the view of Viera (2013), the

teacher needs to have the qualities that are analogous to those of a corporate body and be able to work in a team to carry out interdisciplinary projects. This entails having responsibility and autonomy and being able to handle the pupils in an organized way by making use of differentiated and reflexive kinds of pedagogical practices. It also requires making use of technology, ensuring the involvement of students, encouraging them to learn and awakening the desire to conduct research, which requires them to manage the continuous learning process. Perrenoud (2000) categorizes 10 essential teaching skills for each chapter of his book: a) organizing and supervising learning situations; b) following the progress made by the learners; c) conceiving and creating devices for differentiating instructions; d) involving the students in their learning and class work; e) working in teams; f) taking part in the school administration; g) keeping parents informed and involving them in the life of the school; h) making use of new kinds of technology; i) carrying out responsibilities and facing up to the ethical dilemmas that arise in the profession and j) administering their own continuous education.

The need for continuous updating can be put into effect by the use of new kinds of technology for teaching, producing more teaching material in every area and overcoming the problem of a lack of empirical experience on the part of the students of Business Administration. This way, the use of current case studies must be linked to practices that can create discussion among groups of students and ensure interaction in the classroom (Sobrinho, Pinto, & Disidério, 2014).

However, broadening the range of the subjects and discussion is not always desirable for the students unless they are aware that the teacher is knowledgeable and able to convey what he/she knows (Sobrinho, Pinto, & Disidério, 2014; Viera, 2013). The knowledge of the teacher is put to test by the pupils who have a wide range of technological apparatus available to hold the teacher to account. In is here that the competence required by the teacher plays a role, as it involves his capacity to find matters of interest that can attract the students (Sobrinho, Pinto & Disidério, 2014).

Magalhães and Patrus (2013) state that there is no single way of characterizing what a good teacher is but rather, there are different types of good teachers that fit different student profiles. Despite this, the authors have attempted to characterize Business Administration teachers by providing a summarized model with three dimensions. Two of these dimensions are adapted here, as illustrated in Table 1.

Table 1   Dimensions and Categories for Analyzing What Constitutes a Good Teacher

Dimensions	Categories
1) **Training**	a) Academic training;
	b) Knowledge and
	c) Experience
2) **Didactics and Personality**	a) Planning;
	b) Execution;
	c) Teaching strategies;
	d) Assessment techniques and
	e) Relationship with the students

Source: drawn up by the authors on the basis of Magalhães & Patrus (2013)

It should be stressed that Table 1 only shows the dimensions that depend on the teacher but in practice, we know that the question of whether or not one is regarded as a good teacher also depends on a number of external factors. These include the availability of suitable educational resources, technical support, training in the use of new forms of technology in the classroom and the way the course coordinators and managers of higher education institutions view the students and their complaints regarding teachers. Some teaching institutions regard their pupils as clients in which everything is possible if they complain, whereas others believe that the students are both clients and a product too, since the students educated in the school will pass on their opinions outside the school, if they think they have not been taught in an appropriate way. This risks affecting the reputation of the school and hence influencing the standards of new students who will seek to enroll in courses in the future (Carvalho, 2013).

(To Viera, 2013), Nassif, (Hanashiro and Torre, 2010), interdisciplinarity is an essential feature of teaching as a result of globalization and the combining of common areas, which ensures that knowledge can be integrated in the interests of research. If knowledge is consolidated rather than being broken up into separate subjects, students will have greater independence and will be able to reflect on empirical questions in general terms, by broadening their critical awareness of events and adapting their learning to their personal experiences (Nassif, Hanashiro, & Torres, 2010).

Some universities fail to recognize the value of teaching skills as a competitive differential and

only make an assessment of a teacher´s career, their requirements and their ability to convey knowledge, since they are simply concerned with professional qualifications to meet the needs of the job market. But giving a good lesson does not only consist of preparing the students well or having the necessary knowledge or practice and being able to master the subject; competence involves having will and power. A determination to teach combined with the power of transmiting knowledge are the intrinsic features required before a teacher can be regarded as competent (Nassif, Hanashiro, & Torres, 2010; Viera, 2013).

3 Methodology

The general aim of this study is to understand (from the point of view of a teacher of Business Administration courses) what is necessary in order to have a quality class with an effective return in terms of learning for the students. For this work, we decided to conduct a qualitative research with an exploratory character and descriptive nature. This choice of a qualitative approach was due to the wide diversity and plurality involved in the conceptualization of the teaching skills and characteristics of a good class. (Godoi e Balsini, 2010) claim that the qualitative work allows an understanding of the agents involved, not seeking for regularity, but the motivations for their actions. (Creswell, 2014) states that the main purpose of conducting qualitative research is to attempt to understand a particular social situation.

Because of the gaps in the literature on this subject and the need to understand what happens in the classroom in the applied social sciences courses of higher education, the study adopted a descriptive approach (Alves-Mazzotti & Gewandsznajder, 1999). In addition, Triviños (1987, p. 110) states that descriptive studies "[...] aim to deepen the description of a particular reality".

The procedure adopted was to conduct a field research in order to empirically investigate the phenomena in the place of its occurrence and to demarcate the features requiring explanation (Vergara, 2007).

Primary and secondary sources were taken into account for the data collection. The primary data were obtained by means of in-depth interviews with twelve teachers doing a degree course in Business Administration, six of whom attended State universities and six were at private universities. The sample comprised seven women and five men with ages ranging from 29 to 53. They had an average of 14 years working in the area of teaching – two of them had PhDs, nine had a Master´s degree and one was doing a Master´s degree course. The data collected together with the main people involved were essential for interpreting the phenomenon.

A semi-structured interview schedule was employed to guide the research within the subject in hand and this provided the interviewees with a degree of flexibility in their answers in a way that allowed new questions to be asked and an interpretation to be made of the research findings. Since it entailed conducting research of a qualitative nature, at the outset there was no a priori definition of the exact number of interviews (Godoi & Mattos, 2010). The decision about the interviewees was defined by the criterion of convenience (Gil, 2002; Vergara, 2007).

The interviews were conducted in August and October 2015, and, on average, lasted for 30 to 40 minutes; they were recorded and transcribed. Secondary data were derived from a bibliographical review which involved carrying out a systematic form of research with published material in books and articles which provided the basis for a theoretical/methodological framework for the study (Vergara, 2007). This material led to further questions that underpinned the interviews.

4 Results

According to the results obtained, the majority of the respondents regarded the didactic method of the teacher and his/her knowledge of the subject as being essential requirements to ensure that the lesson flows in a natural way and to hold the students´ interest. Another factor considered important and brought up by (Kuhl *et al*, 2013) is the teacher's experience on the topic that is being addressed. Reporting of practical situations, particularly those experienced by the teacher, greatly helps the students in their learning. In addition, all the teachers who were interviewed believe that it is also important for the teacher to know the purpose of the subject being taught and which skills need to be developed in the students. Then, the teacher is able to define the strategies he is going to adopt and what resources are needed to teach each lesson.

Apart from the importance of aligning strategies with the students (through language), there are other key factors needed to ensure a good lesson like: appropriate teaching environment (suitable equipment and facilities, classrooms with reasonable numbers of students, good acoustics and teaching

material of high quality), interface between the different subjects and communication between the teachers, as well as a continuous attempt on the part of the teacher to make improvements in didactic and pedagogical areas. Evidence of this was also shown in other studies such as those of Carvalho (2013), Garonce e Santos (2012), Hermann (2014), Nogueira and Bastos (2012) and Nassif, Hanashiro and Torres (2010). With regard to the question of behavior, the research found that teachers must be patient, have emotional control, be persuasive, know how to relate with the students and show commitment and enthusiasm. This corresponds to what has already been described by Magalhães and Patrus (2013) and Viera (2013).

In Table 2 we present a summary of what teachers reported in interviews to be the necessary teaching skills for an adequate administration course, their main challenges and difficulties found.

Table 2   Necessary Skills, Challenges and Main Difficulties for Teachers

Necessary skills for teachers	Challenges	Main difficulties
- Must have domain of the technical knowledge; - Must have good communication; - Must be in continuous update; - Must have commitment with students and institution; - Must have some practical experience regarding the subject they are teaching.	- Carrying out activities in the classroom that relate theory and practice - Organizing events with professionals - Constantly improve the teaching didactics - Being able to attract students attentions to classes	- Low qualifications of new students - Little investment in technology by educational institutions - Lack of resources for the training of docents - Classes with many students, which makes it difficult to learn (some teachers have reported having more than 70 students per class).

Source: drawn up by the authors

It is understood that it is in the dialogical process that the teaching activity and learning occurs. As a result, education is a contextualized communication in a specific sense for each subject (student) or group (class). The story of students ´lives, their experiential and relational knowledge are part of the bulk of the students ´skills and teachers must use them to ensure better results in the educational process.

There was the perception of respondents that the combining of resources (human, technological and structural) is essential to achieve good results when teaching business administration degree courses. These resources can allow higher education to expand but require attention with regard to the question of quality since an increase in offer does not necessarily mean maintaining or improving standards.

At the outset of this study, it was expected that there would be different answers from the teachers in public and private institutions. However, apart from the fact that the classrooms in the private sector had more students, it was found that the problems facing the teaching staff were very similar. All of them complained of the following: that the students had failings that were the outcome of their time in primary and secondary school; that the teachers had to put up with behavioral problems in the classroom; that the students were always consulting the Internet or their mobile phones during the lessons and not paying attention to the subjects being taught by the teacher; that the students were unwilling to study outside their scheduled lessons;   and that there should be a greater recognition of the value of teaching. Some teachers call this the "Google generation", as the students believe that everything is available on the Internet and that there is no need to read or pay attention during the lessons. What is clear, as one of the teachers pointed out, is that learning "is a two-way street: the teacher must be good at teaching and the students must be good at learning...".

All the teachers were unanimous in stating that the new technologies for teaching have an adverse effect (by scattering the students about the classroom), but that they also have a good side: so long as the teachers know how to work with these new teaching platforms, they can make the classes more interesting and encourage the students to be more involved. As one of the teachers interviewed put it:

"The technology can be an aid or a hindrance. Unless we know how to introduce the technology into the classroom, it can end up causing harm because the students will use it to look at other things like WhatsApp, Facebook,..., but on the other hand, you can use it in the classroom to access material on one´s own cell phone device. You can encourage students to use WhatsApp, including for

communicating with the rest of the students in the classroom, but you must set limits, such as having a schedule for when the tool can be used or not ...".

At all events, learning to use these new kinds of technology requires time to be spent by the teachers and financial resources. The teaching institutions are not always willing to give support with regard to this or remunerate the staff for the time devoted to preparing lessons or contacting the students through e-mail, etc outside their working hours.

Another point that was noted is that carrying out effective lessons and obtaining the respect of the students does not only depend on the teachers. It also requires basic facilities being available in the institution and support given to the teachers by their superiors in the school hierarchy on matters such as whether or not to attach importance to complaints made by students about a type of lesson, the marks awarded in assessment tests etc. Some teachers stated that it was difficult to give marks that fail students or to require them to read more. This only confirms the dilemmas some of them face: "the teachers feel they are put under pressure not to have high failure rates ...", "...there is pressure from the institution. If these students begin to fail, they will leave the school and this is in nobody´s interests ...".   In reality, this is a problem that affects some of the private institutions more seriously, because some of the students who are failed switch to other institutions that are competitors in the market. When the school adopts a policy of failing the minimum number of students possible, and said students become aware of this, they tend take advantage of the fact. As Carvalho (2013), and Gomes and Moraes (2012) point out, globalization and mass educational systems impair the quality of teaching.

The public teaching institutions of Brazil are considered the best by students, as they are also the fullest, and they are free. If students decide to go to other private institutions because they have failed in their exams, they will suffer not only in terms of the level of recognition of the diploma but also in financial terms, because they will have to pay for a course in a private institution.The entire set of teachers analyzed said they liked teaching and felt they had a talent for it. This is one of the factors considered important by Magalhães and Petrus (2013) to ensure that a teacher is able to succeed in conveying knowledge. Some of the teachers had previously worked in other professions such as in offices of private companies or consultancies but today are wholly devoted to teaching activities which generally offer a fairly lower salary than what they had earned when carrying out those previous responsibilities.

5 Conclusion

This study has made some notes on the quality of teaching and skills of teaching professionals in the area of Business Administration in Higher Education. The literature addresses issues such as the precarious conditions of teaching, new kinds of technology as magnifiers of teaching activities and the new profile of students, among other factors.

Among this set of features and from the interviews that were conducted, it was clear that didactics and knowledge of the subject are seen as important for the results to be effective in order to stimulate and develop the skills of the students. However, they must be associated with a set of supporting tools, which enhance the results in interactions and improve the quality of teaching activities. In addition, it was clear from the interviews that if the students are unwilling to learn, it is difficult for the teacher to be able to teach effectively. Today, the task of teaching is becoming increasingly more difficult since the students feel tempted to "escape" from the subject of the classes and consult electronic resources, which are easily available. How can a teacher compete with these resources and ensure that their lesson can be more interesting? This is the main challenge of our current world. Some, however, believe that the use of these kinds of technology in lessons can make the students feel more involved and help to achieve better results.

It is a consensus among teachers that the use of new teaching technologies can make classes more dynamic and interesting but at the same time can disrupt the learning process for the students, because it can cause dispersion in class. These new technologies require more time for the teachers to train and also more investment by educational institutions, public or private.

The learning process is a two-way street, as one of the interviewed teachers said, not only the teacher has to be good at teaching, the student also has to be good at learning. In this scenario it is clear that low qualification of students entering the university is one of the main difficulties reported by several teachers. It is recommended that future research projects seek to integrate the attitudes of the teachers and learners and carry out an assessment of the kind of activities that could be of value to each of the categories examined. This could lead to a better understanding of this phenomenon within the

context of interaction.

A Research on Cross-cultural Adaptation of International Students in Universities of Wuhan

Guo Ziyue, Wu Weiping, Zhao Yilan, Zhang Jinxuan
School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: guoziyue@whut.edu.cn, wuweiping@whut.edu.cn, zhaoyilan@whut.edu.cn,
zhangjinxuan@whut.edu.cn)

Abstract: The research for cross-cultural adaptation is of vital importance and has a strong practical value. The empirical research of questionnaires and interviews involves four dimensions, ranging from living, learning, communication to culture. The results show that international students' cross-cultural adaptation is good in general. They show good integration capacity in communication and language environment. But some difficulties still exist, such as: inadaptation to the content and form of teaching, hard to comprehend Chinese culture, unused to accommodation environment etc. Therefore, we propose four specific suggestions for the education and management institutions of international students.
Key words: Cross-cultural adaptation; International students; Universities; Wuhan

1 Introduction

According to the Ministry of Education of the People's Republic of China, half million international students from 204 countries and regions were studying in Chinese universities in 2017. The number of international students is increasing, and China has become the largest studying abroad destination of Asia. The problem of cross-cultural adaptation not only affects the learning and living conditions of international students, but also affects their cognition of China. In addition to the theoretical research, empirical research in colleges and universities are increasingly rich in recent years. But empirical research on international students in Universities of Wuhan is inadequate. Comprehensive analysis about current cross-cultural adaptation is insufficient. Therefore, the problems of international students also affect Wuhan's connection with the world and its image in the world.

Based on the current cross-cultural adaptation theoretical framework, this study focuses on multiple dimensions and takes international students in universities of Wuhan as the research subject. Feasible advice will be put forward for education and management institutions of universities in Wuhan.

2 Literature Review

Cross-cultural adaptation research began in the early 20th century in the United States. American anthropologist Redfield, Ralf Linton and Melville Herskovits put forward the cross-cultural adaptation concept.It refers to the two groups from different cultural background having a lasting and direct cultural contact which causesthe original cultural patterns change. (RedfieldR, LintonR, Herskovits MJ, 1936) After 1980s, the study of cross-cultural adaptation entered the golden age. Berry proposed two-dimension acculturation strategy and four adaptation strategies of cross-cultural adaptation. The two-dimension strategy refers to the attitude and behavior of immigrants on cultural maintenance and host-group relationship. Four different adaptation strategies are assimilation, integration, separation and marginal organization. (BerryJW, 1997)In the 21st century, the research methods of cross-cultural adaptation have become more abundant and the research scope is continually expanding. Most people agree with Ward's view that cross-cultural adaptation can be divided into two dimensions: psychological adaptation and sociocultural adaptation. (WardC, 1996)Psychological adaptation refers to mental health and life satisfaction in cross-cultural contact. Sociocultural adaptation refers to an effective way to adapt to local society and to contact with local social members, based on the measurement of difficulties experienced in local society. This research is carried out on the basis of this theory.

Since the 21st century, researchers of China gradually enriched the study of cross-cultural adaptation. The main content focused on 3 aspects. The first aspect is cross-cultural adaptation theory, construction and tests of cross-cultural adaptation models(Sun J, 2010; Chen G M, Yu T, 2012; Li J, 2016; Peng R Z, Wu W P, 2017) The second aspect is the interaction between mental health and culturalenvironment (Lei W M, 2013; Zhong J B, Gao J, Xie G, 2013; Song F N, Chen X L, 2014; Zhi X, Qian M, 2017) The research focused on foreign groups' change caused by intercultural exchanges from the perspective of anthropology and sociology. The last was mainly about the psychological reaction of foreigners in the new cultural environment and the social integration. The research focused on the changes of individual values, attitudesand behaviors in

different regions. (Zhong G H, Xie AB, Xu M D, 2013; Ya Li, 2017)

3 Data and Methodology
3.1 Subject
The subjects are randomly selected from 7 universities of Wuhan. 90 pieces of questionnaire were issued. 86 of them were recycled and effective. Subjects are undergraduate and graduate students majoring MBA, Art and Design, Computer Science, Materials Science, Civil Engineering, International Economy and Trade and so on. The proportion of sample represents the proportion of subjects.
Figure 1   Basic Information of Subject

3.2 Method
3.2.1 Quantitative research
The questionnaire of the research consists of five parts: the first part is the personal information of international students, including gender, nationality, major and resident time in China. The second part is the learning dimension, including the purpose of studying abroad, and the status of activities after class etc. The third part is the communicative dimension, including the frequency of contacting with the Chinese students, the main way to improve Chinese, whether cross-cultural communication barriers can be negotiated, whether nonverbal means can be used and so on. The fourth part is the life dimension, including the evaluation of life, the future employment plan, the source of happiness and so on. The fifth part is the cultural dimension, such as the adaptation of table manners and festivals, the understanding of Chinese long literature, and the identification of core socialist values with Chinese characteristics.

This questionnaire consists of 30 questions, which are graded according to the Lecter Scale from "strongly disagree" to "strongly agree".
3.2.2 Qualitative research
Based on 30 questions of the questionnaire,ten questions are designed to further explain the causes of present cross-cultural adaptation condition.Face-to-face talk, QQ and WeChat are used for interview between researchers and interviewees. The interview involves different habits and customs, social atmosphere, employment plans, scholarshipetc.,which makes up for the inadequacy of the questionnaire.
3.3 Data analysis
The questionnaire data is analyzed by SPSS 18.0. In order to ensure the validity and reliability of the methods and result, quantitative data of questionnaire and qualitative data of interview are analyzed comprehensively.

4 Result and Discussion
4.1The content and teaching form should be reformed.

Table 1   Learning Dimension

Variable factor	Number of sample	Maximum	Minimum	Mean
ic1	86	5	1	2.31
ic2	86	5	1	2.08
ic3	86	5	1	2.15
ic4	86	5	1	1.98

ic1=courses of major is difficult; ic2=knowledge of major is useful;ic3=like the courses of major; ic4=feel satisfied with the teaching level and methods

Table 2　Proposal for Teaching Department

Proposal forTeaching Department	Percentage
Adding more practical knowledge to the courses	26.4%
Organizing more academic activities	11.5%
Improving the level of teaching facilities	5.7%

The mean of ic1, ic2 and ic3 are under 2.5.and It shows the majority of international students feel unsatisfied with the teaching methods and the content of the courses. The highest option ofthe proposal for teaching department is adding more practical knowledge to the course, accounting for 26.4%.The second is organizing more academic activities, accounting for 11.5%. The lowest option is improving the level of teaching facilities, which takes up 5.7%, such as the library and classroom environment, multimedia hardware, etc. Therefore, it can be concluded that teaching hardware facilities in universities of Wuhan are of high level.

Through the interview, it is found that the practicability of some courses is not high enough. "In my opinion, some courses are just not up-dated. They are unable to meet the reality needs. Some are useless to future study and work." The teaching department in Universities in Wuhan should improve the practicability of the courses.Strengthening the construction of academic exchanges and creating a more open academic environment are also long-term and indispensable tasks.In MBA course in Wuhan University of Technology, international students are arranged in divided classes without Chinese students. "I hope there could be more Chinese students in our class.The balance between international students and Chinese students will be better." A student from computer science major said. Other international students also expressed that the number of international students in the class should be equivalent to that of Chinese students, rather than teaching international students separately from Chinese students.

Faculty plays a vital role in spreading Chinese culture. The incompatibility with Chinese faculty and teaching methods has greatly strengthened the sense of estrangement among international students. So the awareness of differences, respect for different culture, fully understanding the customs and religious beliefs from different countries and regions must be cultivated.

4.2 Integrate international students into Chinese communicative environment

Table 3　Communicative Dimension

Variable factor	Number of sample	Maximum	Minimum	Mean
ic5	86	5	2	2.98
ic6	86	5	2	3.09

ic5=can negotiate with people from different cultural backgrounds when confronted with conflicts;ic6= can continue communicating by non-linguistic ways when confronted with communication barriers

As the residence time in China goes by, international students can seek proper solutions by themselves when confronted with cross-cultural conflicts and misunderstandings, such as using nonverbal communication, gestures, realizing the differences between two cultures, negotiating more smoothly. The most important way to improve Chinese is communicating with Chinese people, followed by Chinese language training course. The lowest proportion is self-study.

The best way to eliminate the language barrier of international students is to increase various opportunities of communication with Chinese. "I felt Chinese students are sometimes indifferent to us",a student from Bangladesh said. We found that a large number of international students were clearly estranged from the Chinese students' social circle. Therefore, international students are more inclined to communicate in the groups from the same or similar cultural circle, and cannot fully lend themselves to Chinese communication environment. Therefore, it's essential to increase Chinese courses for international students. More Chinese students should be scheduled into the class to establish one-on-one helping relationship. It maximizes the opportunities for international students to integrate into Chinese communicative environment.

4.3 Obstacle and happiness in life

Table 4　Life Dimension

Sector	Percentage
Life in China is rich and colorful	52.9%
Plan to work in China in the future	28.7%
Go back to own country	42.5%
Positive attitude brings happiness	19.5%
Good career development and life plan brings happiness	16.1%
Excellent academic performance brings happiness	15%
Homesickness is the biggest obstacle	11.5%

As for the choice of employment country, 42.5% choose their own country. It is found that students who choose to work in China are more optimistic about potential economic development and wage level of China or have a deep interest in Chinese culture. However, most of the international students who choose to return to their homeland do not adapt to China's social and cultural environment, and are strongly eager to return to the original life and interpersonal communication circle. The top three factors that contribute to the happiness of international students are positive attitude, good career development and life planning, and excellent academic performance. For international students, the biggest obstacle in life is language barrier, followed by homesickness.

In order to simplify the management of international students, the majority Universities in Wuhan arrange separate dormitories for international students. It broadens the gap between them and Chinese students as well as reduces the opportunities for them to integrate into Chinese daily routines. Therefore, administrative departments should improve the conditions for the joint management of Chinese and international students, instead of taking one-size-fits-all living management. For the international students who prefer to live with Chinese students, the department should provide the corresponding accommodation.

It is necessary to hold folk activities in different countries and regions. "There is almost no feeling of belonging to China society", as an international student said. Thus, creating the cultural atmosphere from their hometown helps to alleviate the serious homesickness. It will further influence their choice of working place in the future. Making them feel at home will greatly enhance the sense of belonging to Chinese society.

4.4 View of Chinese tradition and characteristics

Table 5　Culture Dimension

Variable factor	Number of sample	Maximum	Minimum	Mean
ic7	86	5	1	2.53
ic8	86	4	1	2.47
ic9	86	5	1	1.41
ic10	86	5	1	3.20

ic7= be accustomed to Chinese festival customs; ic8= gradually accustomed to Chinese table manners (such as being urged to drink as much as possible) and feel less reluctant; ic9=feel less violated when Chinese ask you about your privacy(age,salary,marital status and so on); ic10=know and agree with Core Values of Socialism with Chinese Characteristics (prosperity, democracy, civility, harmony, freedom, equality, justice, the rule of law, patriotism, dedication, integrity, friendship)

International students are not accustomed to Chinese tradition, such as table manners and festival customs. The core values of Chinese society have not been deeply rooted in international student's minds.

More experiential activities are effective to expand channels for international students to understand Chinese tradition. "The Chinese Corner activity is held almost once a month.It is inefficient for us to learn more about Chinese culture actually." University-level associations should be more active in organizing Chinese cultural experiential activities to meet the international students need, such as literature works, folk appreciation, interpersonal etiquette etc. It also helps to convey imperceptible effects of Chinese cultural characters to them.Immersing them in a strongerChinese culture atmosphere, the more rapid and more specific understanding of the Chinese tradition and characteristics will they get.

5 Conclusion

This research enriches the empirical data on cross-cultural adaptation of international students in universities of Wuhan.With the increasing number of international students, the education and management must be adjusted and reformed according to the present situation. The suggestions from four aspects above will be useful for the education and management institutions of universities in Wuhan to further enhance integration of international students.In the future, more empirical data about international students in Wuhan's universities are expected to enrich this research, and more practical advice should be provided to the relative institutions for creating better eternal cultural environment.

A Research on the Relationship Between Intercultural Contact and Intercultural Competence

Wu Weiping, Li Ting
School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
(Email: wuweiping@whut.edu.cn, 564468475@qq.com)

Abstract: As the development of globalization, intercultural contact with people from different countries and cultures become more and more frequent. Hence, it is necessary to research on the intercultural competence development of college students who are the main group of intercultural contact. Using the literature research method, this article reviews the relative studies on intercultural competence in domestic and foreign firstly, then explores the components of intercultural competence and the paths of intercultural contact, and reveals how these intercultural contact paths play a positive effect on these components of intercultural competence finally. It can not only provide some reference of intercultural competence research, but also give the guidance for colleges to create more contact opportunities in improving intercultural competence of students.
Key words: Globalization; Intercultural competence; Intercultural direct contact; College students; Literature research method

1 Introduction

With the development of globalization and the increasing cooperation and communication with other countries in the 21st century, intercultural communication activities become more and more frequent. As a major group of intercultural contact, college students have more and more opportunities to contact people from different cultures. Therefore, it is necessary to study their intercultural competence and discuss the impact of the intercultural contact on intercultural competence, which provide some reference for the development of intercultural competence through the exploration of the research theory and practice.

2 Studies on Intercultural Competence

Domestic research on intercultural competence begin in the early 1970s. And it mainly involves these aspects. Firstly, some scholars explore the understanding of intercultural competence from different perspective. For example, for the constituent elements, the issue of which competencies are considered as an important part of intercultural competence is discussed. Although scholars have different views on the understanding of intercultural competence, the common elements (cognition, emotion and behavior) can be summarized. Secondly, the relationship between intercultural competence and foreign language teaching is discussed. For example, scholars explore how to cultivate the intercultural competence of college students in terms of teaching modes and intercultural competence dimensions (You & Lin & Chen, 2017). The application of modern science and technology to intercultural foreign language teaching classroom is strongly advocated. Through the training of the intercultural competence of foreign language teachers in universities, it has laid a solid foundation for the cultivation of international talents. Thirdly, the assessment of intercultural competence is investigated. There is not much literature on the assessment of intercultural communication competence in CNKI, which mainly focus on the following aspects. The first key to coming up is that, scholars at home and abroad have not reached consensus on the connotation and constituent elements of intercultural competence, and universally accepted assessment tools have not yet emerged, but the academic community has reached the three important consensuses (Deardorff, 2006). Firstly, intercultural competence is measurable. Secondly, the assessment of intercultural competence must be conducted from different perspectives, adopting multiple quantitative and qualitative methods. Third, intercultural competence assessment must take into account many factors such as the assessor, assessment object, assessment purpose, assessment application, specific scenarios, social conditions, history and so on. And others develop the measurement scale of intercultural competence that is suitable for Chinese university students based on the dimensions of intercultural competence. Chinese College Students' Intercultural Communication Competence Measurement Scale is constructed by the combination of Knowing (knowledge, consciousness, and critical thinking ability) and Doing (attitudes, skills and strategies) (Gao, 2014). And the evaluation model of college students' intercultural

competence is constructed from the perspective of language subjectivity. The intercultural assessment scale has gradually matured from the initial exploration stage to the ICC evaluation scale that is suitable for the Chinese students with good reliability and validity. Fourthly, the importance of cultivating intercultural competence is discussed from an interdisciplinary perspective. In teaching Chinese as a second language, the goal of popularizing Chinese language and spreading Chinese culture is achieved by urging students to improve intercultural competence.

3 Components and Models on Intercultural Competence

Interest in intercultural competence emerges in the literature in the 1950s. Thereinto, many scholars regard *The Silent Language* published by Edward Hall in 1959 as the foundation stone for intercultural communication. In order to understand intercultural competence in depth, this article analyzes and combs the components and models of intercultural competence.

First of all, theoretical conceptualizations of intercultural competence seem to be diverse in their disciplines, terminologies, and academic and practical objectives, as reflected in the variety of terms such as intercultural competence, intercultural effectiveness, cross-cultural awareness, international competence, global competitive intelligence and intercultural adaptation that trace back to the 1970s (Fantini, 1999). And for the detailed connotation of intercultural competence, scholars describe and define it from different perspectives. (Ruben, 1976) argues that to understand and assess individuals' behaviors, it would be necessary to employ "measures of competency that reflect an individuals' ability to display concepts in his behavior rather than intentions, understandings, knowledge, attitudes, or desires". Successful intercultural communication is a decent and effective act that take place in a certain context, with rich knowledge, reasonable motivation, and skillful actions (Lusting & Koester, 1996). The definition is presented as: an individual's ability to communicate and interact across cultural boundaries (Byram, 1997). (Spitzberg, 2000) considers intercultural competence broadly as appropriate and effective behaviors in a particular context. (Wiseman, 2004) sums up previous research results and believes that after decades of research, the academic community has gradually reached a consensus that intercultural competence specifically refers to the knowledge, motivation and skills needed to communicate with people properly and effectively from different cultural backgrounds. Intercultural competence is defined as "a complex of abilities needed to perform effectively and appropriately when interacting with others who are linguistically and culturally different from oneself" by Fantini (Fantini, 2006). And ICC is described as the following: the appropriate and effective management of interaction between people who, to some degree or another, represent different or divergent cognitive, affective, and behavioral orientations to the world (Spitzberg & Chagnon, 2009). Later, Peng (2015) states that based on their intrinsic and external qualities (such as: knowledge, attitude, skill and awareness), communicators can effectively and appropriately communicate and interact with people from different cultural backgrounds in the context of intercultural communication. And the two core elements can be concluded, special context and effectiveness, appropriateness.

Then, the discussion of the constituent elements of intercultural competence is presented. Some scholars agree that intercultural competence should include motivation, knowledge and skills. Chen (1989) tends to the four parts: personality strength, psychological adaptation, communication skills, cultural awareness. From the perspective of social skills, Martin and Hammer (1989) believe that ICC include communicative function behavior, verbal and non-verbal behavior, and conversation control behavior (Martin & Hammer, 1989). (Byram, 1997) proposes a widely accepted five-factor composition: attitudes, knowledge, skills (the skills of interpreting and relating; the skills of discovery and interaction), critical cultural awareness. (Deardorff, 2006) adopts the Delphi technique to seek common ground, and selects 22 items of intercultural competence that are more than 80 percent of their identity. And he notes three dimensions of ICC that depict the movement between attitudes, skills, and knowledge and comprehension at the individual level and the internal and external outcomes at the interaction level. (Fantini, 2006) provides a comprehensive list of related terms in literature to describe intercultural competence including intercultural competence, cross-cultural awareness, intercultural sensitivity, ethno relativity and global competencies. While Lustig and (Koester, 2007) approve motivation, knowledge and action. Wu, Fan, and (Peng, 2015) find that ICC involve six main factors: knowledge of self, knowledge of others, attitudes, intercultural communicative skills, intercultural cognitive skills, and awareness in the Chinese context. Besides, other elements have also been identified as contributors to ICC, including positive attitude toward other cultures, and empathy (Arasaratnam, 2015), personal spiritual wellbeing (Sandage & Jankowski, 2013), knowledge of other cultures (Pettigrew & Tropp,

2011), and curiosity (Deardorff, 2006), among others. As above noted, the dimensions of ICC such as knowledge, attitudes, skills, and awareness are considered as the main indispensable components of ICC.

  In addition, the broad concept of intercultural competence has led to a range of models that have served as the basis for different approaches to its assessment. It mainly can be divided into three types: component model, development model and empirical model. (1)Component model, a widely accepted model of intercultural competence include the five parts: attitude, knowledge, the skills of interpreting and relating, the skills of discovery and interaction, and critical cultural awareness (Byram, 1997). Fantini (2000) puts forward that ICC should involve abilities related to knowledge, attitude, skills and awareness. (2)Development model, Lysgaard (1955) describes the intercultural psychological adaptation process as a U-shaped curve, which is divided into six phases: honeymoon period (novelty of different cultures), conflict period (discomfort with cultural differences), humor period (optimism for different cultures), synchronization period (adaption to the various norms of different cultures), contradictory period (feeling contradictions before returning home), and re-adaptation period (re-adapting to national culture after returning home). And the Developmental Model of Intercultural Sensitivity (DMIS) presents six stages (Ethnocentric Stages: Denial, Defense, Minimization and Ethnorelative Stages: Acceptance, Adaptation, Integration) of the DMIS is used to assess the communicators' intercultural experience (Bennett, 1993). (3)Empirical model, in the 21st century, it has become a trend to test the validity and applicability of these assessment models in practice. Through the investigation of 23 internationally intercultural communicators and 24 U.S. higher education managers, and the Pyramid and Process Model is put forward, which should include attitudes, skills, and knowledge and comprehension at the individual level and the internal and external outcomes (Deardorff, 2006). Besides, Wu, and Fan, and (Pengm, 2015) conduct an empirical study among Chinese college students by the questionnaire of quantitative research and interview of qualitative research, then establish a systematic and operational model of Chinese college students' ICC, with the related six main factors: knowledge of self, knowledge of others, attitudes, intercultural communicative skills, intercultural cognitive skills, and awareness, in the Chinese context. And Wu, and Fan, and (Peng, 2015) put forward the ICC Model, which is presented by the following figure 1 clearly.

Figure 1 Wu's ICC Model of Chinese College Students(2015)

4 Paths of Intercultural Contact

  Research on the paths of intercultural contact, the first thing should do is to know something about intercultural contact. In terms of contact, there are cross-cultural contact, intercultural contact and intergroup contact. Generally speaking, overseas scholars regard the former two as the same. In overseas studies, "intergroup" usually refers to two or more groups or communities from different cultural backgrounds that to a large degree, it can be referred as "intercultural contact" (Zhang, 2012). So the discussion of intergroup contact also can be seen as the discussion of intercultural contact. First of all, the characteristics of intercultural contact can be presented, then to explore the paths of intercultural contact according to its characteristics.

  Many researchers widely investigate how intercultural contact can reduce intergroup prejudice under certain conditions, then put forward Intergroup Contact Hypothesis. This hypothesis thinks that the four favorable conditions can effectively reduce intergroup prejudice, that is "equal group status

within the situation; common goals; intergroup cooperation; and the support of authorities, law, or custom". Based on the hypothesis, the characteristics of intercultural contact is explored. (1) Generalization, it means that positive contact with members of an outgroup can reduce prejudice towards the entire outgroup (Wright et al., 1997). (2) Secondary transitivity, it refers to the positive effects of contact with an outgroup extending to ingroup and another outgroup that has not involved in contact (Pettigrew, 2006). (3) Unequivalence, it means that intercultural contact has different influences on different status groups that the attitude of superior group change more than inferior group (Tropp & Pettigrew, 2006).

In addition, as for the characteristics of generalization, researchers initiate a series of detailed discussions in an effort to extend the effectiveness of intercultural contact theory from the three aspects. (1) Cross-context generalization, some studies have shown that the accumulated positive effects can only change the attitude toward the other group if only the best context is repeated. For example, the United States advocate the abolition of racial segregation in order to provide the best interethnic contact. (2) From individuals to groups generalization, different scholars have put forward different strategies for how to make the positive effect of contact generalize from interpersonal level to intergroup level. Hewstone and Brown (1986) advocate salient categorization strategy that when a group member has a salient identity, contacts will treat the member as a group representative, thus producing a positive intergroup effect. (3) From outgroup to other group generalization, it is regarded as the highest form of generalization. (Pettigrew, 1997) conducts the large scale of investigation on European that those individuals with interethnic friendships who are obviously friendly to all outgroups.

Then based on the characteristics of intercultural contact and related practice exploration, the intercultural contact paths are also presented. Some scholars divided it into direct contact and indirect contact. Direct contact also includes oral or written interaction with native or non-native speakers who speak target language, generally speaking, that is direct oral contact and direct written contact. Positive direct contact is considered a shortcut to reduce prejudice and interethnic conflicts (Allport, 1954). While the finiteness of direct contact urge researchers to explore the other ways that can reduce prejudice. So the intercultural contact theory begins to extend indirect contact. Indirect contact mainly includes the two types: indirect interpersonal contact and indirect cultural product contact. At the same time, it also involves contact with target language through various mass media (such as: TV, internet, movie, magazine, newspaper and so on) and popular social platforms (such as: QQ, Wechat, E-mail, BBS, Video conference, Blogs and so on).

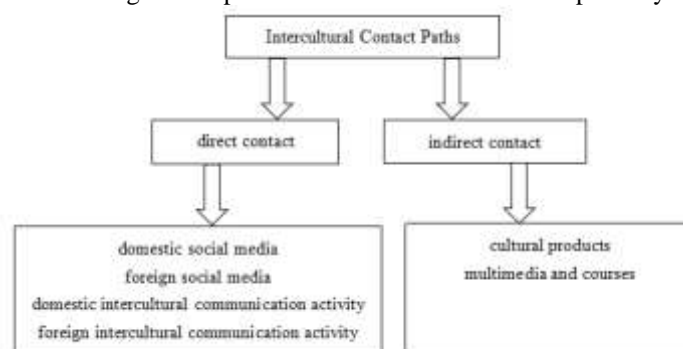
In addition, some scholars systematically and comprehensively explore the paths of Chinese college students' intercultural contact according to the actual situation of China. It includes two main pathways and six sub-pathways (Peng & Wu, 2016). One of the pathways is direct contact, involving the four sub-pathways such as domestic social media, foreign social media, domestic intercultural communication activity and foreign intercultural communication activity. Another main pathway is indirect contact, which includes the two sub-pathways, such as cultural products and multimedia and courses. And the reliability and validity of the intercultural contact scale is verified by EFA and CFA, which includes six dimensions and 31-item scale. And the paths of intercultural contact can be presented by figure 2. Then based on Peng's intercultural contact scale, (Li, 2017) proposes that the intercultural awareness of teachers should be included in the pathways of improving the intercultural competence among college students. Scholars seek to further reveal the impact of intercultural contact on intercultural competence through the exploration of intercultural contact pathways.


Figure 2   Peng's Intercultural Contact Paths of Chinese College Students(2016)

5 The Relationship between Intercultural Contact and Intercultural Competence

Based on previous research, intercultural contact pathways can be divided into two main dimensions: direct contact and indirect contact. And most of the existing literature focus on the exploring of how direct contact (overseas experience, social platforms, international conference and traveling abroad) has an impact on intercultural competence. For example, Kormos & Csizér (2007) investigates the effects of studying abroad from the perspective of Second Language Acquisition and states that intercultural contact is beneficial to improve the initiative of intercultural communicative among students. (Cushner & Chang, 2015) explores the impact of overseas experience on intercultural competence development. Besides, many scholars focus on the intercultural sensitivity of students with overseas experience by a series of empirical studies. The impact of social platforms (QQ, Wechat, E-mail, BBS, Video conference, Blogs and so on) on intercultural competence is also discussed. For example, MOOs mainly focus on the creation of identities and negotiation (O'Dowd, 2003). (O'Dowd, 2007) conducts online communication in the Irish and American Cooperation Classroom with the help of social platforms (E-mail, BBS, Video conference), the results show that virtual intercultural contact can promote the development of intercultural competence of students. Additionally, some researchers demonstrate that blog interaction has a positive effect on the intercultural competence of students (Melopfeifer, 2015).

In addition, some Chinese scholars have conducted research on issues of direct contact, such as students with intercultural experience, intercultural contact through web-based channel. For example, Wang Tianjun (2010) in his M.A. thesis investigates the intercultural contact among students at Fudan University with foreigners and find that Chinese college students show great interest in intercultural contact. Huang Yuanyuan (2012) conducts a comparison on non-English major students between having intercultural experience and no overseas experience, and find that international exchange program can facilitate the improvement of students' ICC. Additionally, some researches show that intercultural contact through web-based channel also has a positive impact on intercultural competence. For instance, through providing the real intercultural communication context, the international telecollaboration course has significant effects on students' interaction confidence and interaction enjoyment, the two components of intercultural sensitivity. And through the investigation of Zhejiang foreign students, it verifies Wechat plays an important role in improving the students' intercultural communication ability.

The research on the impact of intercultural indirect contact on intercultural competence is relatively less, which mainly involve reading literature and watching English movies. For example, Liaw (2006) conducts a research on the efficacy of an online learning environment, which show that it is beneficial to foster EFL students' intercultural competence. And an empirical study on EFL classroom of the language program at a public university, and data are collected to show that learners can acquire cultural knowledge, develop critical intercultural skills, and create positive attitudes through the reading literature (Rodríguez, 2013). And exposure to foreign cultural products and cultural relics can help learners change their attitude towards foreign cultures (Kormos & Csizér, 2007). English movies and songs are used to enhance students' interest and curiosity toward foreign cultures (Miu, 2018).

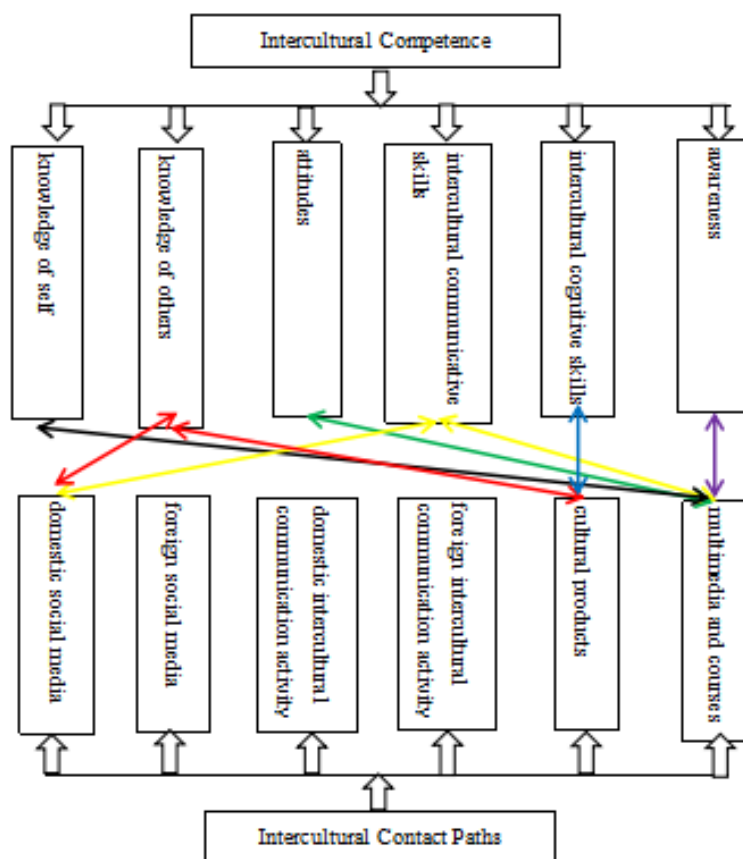
Additionally, Chinese scholar (Peng, 2016) conducts a more comprehensive research on the relationship between intercultural competence and intercultural contact paths form the situation of Chinese college students. Intercultural competence includes the six main factors: knowledge of self (KN1), knowledge of others (KN2), attitudes (AT), intercultural communicative skills (SK1), intercultural cognitive skills (SK2), and awareness (AW). And intercultural contact paths involve the six dimensions: domestic social media (DSM), foreign social media (FSM), domestic intercultural communication activity (DICA), foreign intercultural communication activity (FICA), cultural products (CP), multimedia and courses (MMC). Based on the components and models mentioned above, Peng's research uses the structural equation approach to test and analyze the fitness of each dimensions, and then the relationship between intercultural competence and intercultural contact is clear. And the result show multimedia and courses can improve knowledge of self and intercultural attitudes; domestic intercultural communication activities and cultural products is beneficial to knowledge of others; domestic intercultural communication activities and multimedia and courses can facilitate the improvement of intercultural communicative skills; cultural products are useful to intercultural cognitive skills; last, multimedia and courses has a positive effect on the development of intercultural awareness. And the detailed relationship can also be presented by figure 3.


Figure 3   The Relationship between Intercultural Competence and Intercultural Contact

6 Conclusion

Based on the reviewing of domestic and foreign scholars' research on the intercultural competence and intercultural contact, knowing what is intercultural competence, how to assess intercultural competence and which intercultural pathways can be obtained, then further explore the correlation between intercultural competence and intercultural contact pathways and finally reveal that the positive impact of intercultural contact on intercultural competence. Through the discussion above, it is of great theoretical significance to provide theoretical references for intercultural competence research. And also provide the references for colleges in creating positive intercultural contact for college students' intercultural competence development. However, compared with foreign research, some limitations are also obvious in China. Firstly, the research on intercultural competence and intercultural contact in China's national conditions is relatively rare. Thirdly, most of the research all focus on the direct contact, while the analysis of the impact of indirect contact on intercultural competence is less. And direct contact is mainly based on overseas experiences and web-based channel, while the other contact pathways (such as: international conference, traveling abroad et al.) are mentioned rarely. Indirect contact is mainly based on online reading and English movies, while the research on indirect interpersonal contact is rare. So future research on this area can be further explored from these perspectives to make up the researching gap. At the same time, the research on intercultural contact just exists in China at the starting stage, and hoping that this article can stimulate the interest of domestic and foreign scholars in this field.

Executive Incentive, R&D Investment and Corporate Performance of Listed Companies in GEM

Fu Wenchao
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail:15623454836@163.com)

Abstract: Based on the relevant data of listed companies on the GEM(Growth Enterprises Market) of 2012-2016, this paper studies the relationship between executive incentives, R&D investment and corporate performance, and uses R&D investment as a regulatory variable to explore the regulatory role of R&D investment. The empirical results show that executive equity incentives, executive compensation incentives, and senior executive promotion incentives have a positive effect on corporate performance. R&D input negatively regulates the relationship between executive incentives and corporate performance.This paper divides executive incentives into three dimensions, and tests the negative adjustment effect of R&D investment, which may offer some advices about the level of R&D investment.This will benefit the growth and development of listed companies on the GEM.
Key words: Executive incentive; R&D investment; Corporate performance; Listed companies on GEM

1 Introduction

Driven by innovation-driven development strategy, new technologies, new formats, new models, and technological innovation have become the backbone of economic development. China is working hard to actively build an innovation-oriented country and vigorously develop innovative science and technology enterprises. In modern corporate governance, the role of executive incentive mechanisms has become more and more significant, especially in science and technology innovation companies, where executives play a crucial role in the decision-making of R&D and innovation. Through the research on companies listed in GEM of China, we have explored a governance approach that is consistent with the development of companies listed in GEM. Although the level of corporate governance in China is constantly improving, how to implement executive incentives to improve corporate performance requires more discussion. Based on the data of companies listed in GEM of China, this paper studies the relationship between executive incentives and corporate performance, and uses R&D investment as a regulatory variable to examine the regulatory role of R&D investment in the relationship between executive incentives and corporate performance.

2 Theoretical Analysis and Research Hypothesis

Innovation is the source of a company's rapid development. To achieve outstanding operating results and achieve sustainable growth, we must pay attention to the implementation of technological innovation. In modern enterprise management, the right to operate and ownership are separated. (Jensen and Meckling, 1976) argue that one of the important reasons for the agency cost is the inconsistency between the company's residual value claim and control. According to principal-agent theory and signal transmission theory, corporate executives may violate the company's goals for their own benefit. In order to promote the unification of the interests of the principal and the agent, the owner encourages the managers by giving up the equity or raising the salary level and providing promotion opportunities. (Liu Zijun, Liu Zhiqiang and Liao Jianqiao, 2011) discussed the gap between the executive compensation and its impact. The conclusion show that the salary gap is significantly positively correlated with the company's performance.(Xu Juanjuan, 2016)found that there is a significant positive correlation between the implementation of equity incentives and CEO equity incentive intensity and company performance.And (Chen Zhiguang, 2002) found that the annual compensation of senior executives was significantly positively correlated with corporate performance. However, when companies implement executive compensation incentives, R&D investment requires a large amount of capital investment. Therefore, R&D investment may negatively affect the relationship between executive compensation incentives and corporate performance. If an enterprise increases the proportion of senior management holdings through equity incentives for senior executives, the senior management will naturally become one of the owners of the enterprise. The senior management will consider the interests of shareholders more and pay more attention to the long-term interests and long-term development of the enterprise. The R&D investment of the company is a long-term investment, which will bring about the growth of the

company's future interests, which will increase the long-term return of the senior management. Therefore, the R&D investment may have positive effect on the influence of the executive equity incentive and corporate performance. If the company implements promotion incentives for senior executives, executives can gain greater control over the company's decision-making operations, and there is a sense of "ownership" in corporate governance, and R&D investment activities are indispensable for companies listed in GEM of China. The activities of these R&D investments will effectively reduce the cost of their products, increase the market share of the products, and improve corporate performance. Therefore, R&D investment executives have positive adjustments to the relationship between promotion incentives and corporate performance. In summary, the following assumptions are made in this paper:

H1: R&D investment has a negative regulatory effect on the relationship between executive compensation incentives and corporate performance

H2: R&D investment positively adjusts the relationship between executive incentives and corporate performance

H3: R&D investment has a positive effect on the relationship between executive promotion incentives and corporate performance

3 Research Design
3.1Sample selection and data sources
This paper uses companies listed in GEM of China from 2012 to 2016 as the base sample. The following principles were followed in the selection of study samples: (1) to exclude companies that were specifically treated during the study period; (2) to exclude companies that could not completely obtain relevant data. According to the principle of data selection, the sample finally obtained 2245 observations. The listed company data comes from the CSMAR database. In addition, in order to eliminate the influence of extreme value, this paper uses stata12.0 to process Winsorize at 1% level before and after fiscal data, and uses stata12.0 data processing and analysis software to test the regression model empirically.

3.2Variable definitions
(1) The explained variable. In this paper, corporate performance indicators are used as explanatory variables. They are mainly divided into two categories: The first category is financial indicators, including return on assets, return on net assets, and return on operating cash assets. The second type is market indicators. It is represented by Tobin's Q value and stock's annual return rate. This paper uses ROA as a company performance indicator.

(2) Explanatory variable. Executive incentives are explanatory variables. In this paper, executive incentives are divided into senior executive equity incentives and senior executive compensation incentives as well as executive promotion incentives. The proportion of senior management holdings: The proportion of senior management holdings is the ratio of the total number of shares held by directors, supervisors and senior executives. Because of the greater influence of directors, supervisors and senior executives in corporate governance, they feel that companies The strategic development of the future, and responsible for the development of the company's business executives responsible for the management, the shareholding ratio in this paper is abbreviated as MSR. Executive Compensation: The executive compensation of this paper is defined as the natural logarithm of the sum of the directors, supervisors, and executive compensation as an indicator of executive compensation incentives, which is simply LnPay. At present, there are relatively few research literatures related to promotion incentives. In the few literatures, GAP is mainly used as a substitute for promotion incentives.

(3) Moderator variable. By sorting out relevant research documents at home and abroad, it can be found that the selection of R&D expenditure indicators is relatively uniform, and R&D expenses are used to quantify R&D investment. The relative number of R&D expenditures is numerically equal to the ratio of R&D expenditures invested by the company in the current year to the company's main operating income for the year, which is abbreviated as R&D.

(4) Control variables. Asset-liability ratio: numerically equal to the ratio of total ending liabilities to total assets at the end of the period, which is abbreviated as LEV. Total asset turnover: numerically equal to the ratio of operating income to the ending balance of total assets, which is abbreviated as CASHFLOW. Enterprise size: It is measured by the natural logarithm of the number of employees at the end of the period, which is simply SIZE. The above variable definitions are shown in Table 1:

Table 1　Variable Definitions

	Variable Name	Variable Symbol	Variable Definitions
The explained variable	Corporate Performance	ROA	Net profit / total assets
	Executive Stock Incentive	MH	Total number of shares held by senior executives / total number of shares
Explanatory variable	Executive Compensation Incentive	LnPay	Natural logarithm of the total remuneration of directors,supervisors, and executives
	Executive Promotion	GAP	The natural logarithm of executive pay and non-core executive pay gap
Moderator variable	Investment costs	R&D	R&D expenses / main operating income
	Asset-liability ratio	LEV	Total liabilities / total assets
	Business scale	SIZE	Natural logarithm of the number of employees at the end of the period
Control variables Continual Table 1	Variable Name	Variable Symbol	Variable Definitions
	Total assets turnover ratio	CASHFLOW	The ratio of operating income to the ending balance of total assets

3.3Model design

This paper is based on the motivation of executives of 724 listed companies in GEM. The relationship between R&D investment and corporate performance is the focus of research. The impact of executive incentives on corporate performance, executive incentives on corporate R&D investment, and R&D investment on corporate performance. This paper we use the lag one period of ROA data to solve the endogenous problem, and we use control variables such as business scale. For the listed companies on the GEM, the size of the company is an important factor in the research.

(1) Executive compensation incentives, R&D investment and corporate performance

$$ROA = a_1 + b_{11}LnPay + b_{12}R\&D * LnPay + c_i \sum control + \varepsilon_1 \qquad (1)$$

(2) Executive Equity Incentives, R&D Investment and Corporate Performance

$$ROA = a_2 + b_{21}MH + b_{22}R\&D * MH + c_i \sum control + \varepsilon_2 \qquad (2)$$

(3) Promotion of senior executives, R&D investment and corporate performance

$$ROA = a_3 + b_{31}GAP + b_{32}R\&D * GAP + c_i \sum control + \varepsilon_3 \qquad (3)$$

In the above model, a_i is a constant term,b_{11}、b_{12}、b_{21}、b_{22}、b_{31}、b_{32} represent the degree of influence of each explanatory variable on the interpreted variable, and ε is a random error term.

4 Empirical Results and Analysis
4.1 Descriptive statistics

Table 2　Descriptive Statistics

	N	MAX	MIN	MEAN	Std.Dev
ROA	2245	0.188835	-0.87796	0.0555401	0.044362
MH	2245	0.6571539	0	0.1840381	0.1877276
LnPay	2245	16.3987	13.78361	14.98032	0.5454006
GAP	2245	14.31249	11.343	12.72583	0. 595787
R&D	2245	36.47	0	7.036182	6.070896
SIZE	2245	8.978282	5.003946	6.774327	0.8139357
LEV	2245	0.68893	0.03319	0.2737642	0.1585178
CASHFLOW	2245	1.434713	0.098986	0.4610886	0.2306789

From the descriptive results we can see:

(1) It can be seen from the descriptive results of corporate performance that the performance of companies listed in GEM during the period of 2012-2016 was a minimum of -0.87796, with a maximum value of 0.188835, indicating that most companies still have Certain profitability, some companies have weaker profitability, which has a certain relationship with the industry nature and scale of companies listed in GEM of China.

(2) Through the descriptive statistics of the proportion of shares held by MH, it can be seen that there is a big gap between the maximum value of senior executives and the minimum value of the stocks of companies listed in GEM. Generally speaking, the senior executives of companies listed in GEM have a higher shareholding level. It indicates that the stocks held by senior executives in companies listed in GEM are widespread.

(3) From the descriptive statistics results of R&D investment, the maximum R&D expenditure ratio of companies listed in GEM is 36.47, the minimum value is 0, and the average value is 7.036182, indicating that companies listed in China mostly focus on R&D investment. In terms of technological innovation, a small number of companies have insufficient awareness of R&D investment.

4.2 Regression analysis

We first control the factors that affect corporate performance, including the size of the company, total asset turnover, and asset-liability ratio. The model regression results are shown in Table 3 below.

Table 3   Regression Analysis

	Model1 ROA	Model2 ROA	Model3 ROA
MH		0.001*** (3.38)	
LnPay	0.000*** (7.49)		
GAP			0.000*** （7.37）
GAP*R&D			0.000*** （-3.50）
LnPay*R&D	0.000*** (-4.02)		
MH*R&D		0.004*** (-2.90)	
LEV	0.000*** (-18.88)	0.000*** (-6.63)	0.000*** （-18.50）
SIZE	0.918 (0.10)	0.006*** (-2.78)	0.302 （1.03）
CASHFLOW	0.000*** (15.32)	0.000*** (4.08)	0.000*** （15.04）
N	2245	2245	2245
R-squared	0.2151	0.2000	0.2144
Adj R-squared	0.2133	0.1982	0.2126

Note: The values in parentheses are t values, * for p<0.05, ** for p<0.01, and *** for p<0.001.

In Model one, the result shows that H1 is validated. It shows that while companies implement executive compensation incentives for senior executives, R&D and innovation activities require a large amount of capital investment. Both of them have certain conflicts in terms of funding requirements.

In Model two, the result is in contrast to the previous H2. The reason for this result may be that their anti-risk capabilities are weak, while technological innovation requires a large amount of capital investment. The proportion of shares, the lagging effect of R&D investment will still cause the R&D investment to have a negative impact on the relationship between executive equity incentives and corporate performance.

In Model three, the result shows that H3 is invalid. The reason for this result may be that the scale of the company is not large, even if the company implements promotion incentives for senior executives, but this measure brings about the improvement of corporate performance is not enough to affect the lag effect of R & D investment.

5 Conclusion

From the above analysis, executive incentives for equity incentives, executive incentives, and senior executive incentives can improve corporate performance. For companies, technological innovation capabilities as the company's core competitiveness cannot be ignored, the company's R&D investment is essential for technological innovation. In theory, as the intensity of R&D investment increases, companies will achieve good results in technological innovation, leading to increased production technology. However, due to the fact that most of the companies listed in GEM of China are small and medium-sized enterprises, their anti-risk capability is weak, and R&D investment has a certain lag effect. Therefore, when R&D investment is used as a regulatory measure, it must be based on the scale and operation of the company. Conditions to reasonably determine the level of investment, combined with executive incentives, and ultimately achieve the goal of improving corporate performance.

Research on Vocational Accomplishment Cultivation of Maritime Students Based on Semi-militarized Management

Yu Xuekuan, Yang Zhiyong
School of Energy and Power Engineering, Wuhan University of Technology, Wuhan, P.R.China, 430063
(E-mail: yxk@whut.edu.cn, yangzhiyong@whut.edu.cn)

Abstract: The author has made an investigation for students of 2016-2017Marine squadron. The main content of this research include professional awareness, professional ethics and vocational ability. This paper surveys and analyzes the status of current professional careers of sailing students through questionnaire surveys and interviews, pointing out that the semi-militarized management of maritime colleges and universities is a management method between military management and general management. It has positive significance in the promotion of students' professional qualities and further proposes ways and paths to cultivate professional qualities.
Key words: Semi-militarized management; Professionalism; Navigation; College students

1 Introduction

Professional literacy is a key factor in the employment competitiveness of students majoring in navigation. The problems encountered in the professional consciousness, professional ability and professional ethics of maritime students need to be solved urgently. Present studies mostly pay attention to what vocational traits anemployeeor High vocational college studentsshould have but fewexplore about students majoring in navigation.

Through investigation and research, this article takes Wuhan University of Technology as an example.

the research object is for students majoring in marine engineering, sending out 600 questionnaires, retrieving 596 questionnaires and 585 valid questionnaires. Finding that marine students have low occupational sensitivity, professional ideological instability, professional industry identity and sense of belonging is not strong, employment diversity, occupational sensitivity is low, and professional career planning awareness is weak, etc., further proposed based on semi-militarization Management professional literacy training strategy.

1.1 Professional literacy connotation

Professional literacy is the behavioral norms that humans need to abide by in social activities, is the internal requirements of the profession, and is the overall quality that a person manifests in his career [1]. It is the sum of relatively stable, long-term morality, ideas, behaviors, and abilities that people show in long-term professional activities. It includes professional ethics, professional skills, professional knowledge, professional image, professionalism, career ideals (Zheng Ruitao, 2015).

Marine oceangoing work is a highly professional and challenging career and has high requirements for practitioners' professional quality. In the journey of building a strong shipping country, maritime institutions need to correctly understand the current status of students' professional qualities, continue to strengthen the professional accomplishment of nautical professional students, cultivate a group of international standards, meet the requirements of international conventions, have high comprehensive quality, and have a strong sense of safety and environmental protection. Market-competitive, high-quality, integrated maritime talents promote the development of the shipping industry.

1.2 Professional literacy status

1.2.1 Weak professional awareness

Professional awareness is a comprehensive reflection of the psychological components of people's identity, evaluation, emotion, and attitude (Yin Fengxia, 2015). It is the individual's fundamental attitude and attitude towards the profession, and it is the combination of occupational awareness and professional activity. The formation of professional consciousness is not accidental, but it is a gradual process from blurring to clarity, from fantasy to reality, from superficial to profound. Taking Wuhan University of Technology as an example, through the survey of marine engineering students and graduation employment tracking, some students have low professional sensitivity, unpredictable professional thinking, lack of professional industry identity and sense of belonging, job diversification, occupational sensitivity. Professional career planning and other characteristics are low and poor.

In the past five years, the first volunteer acceptance rate of Wuhan University of Engineering

students has reached above 97%. In 2017, the first voluntary acceptance rate of freshmen is 100%. However, when students apply for professional selection, more students are going to read in the future. Less than 10% of Graduate students or who are employed on land really intend to engage in ocean navigation work. Only 16% of students choose major because of professional interests as shown in Figure1.
Figure 1   the First Consideration of Colleges When Selecting School

It is not difficult to find out the employment trends of marine engineering projects from the statistical analysis in recent years that the proportion of graduates engaged in ocean shipping has decreased year by year, and more and more students have chosen graduate study. Combining the marine engineering major aims to cultivate the professional knowledge of ship power and turbine systems, in line with the Manila Amendments to the International Seafarers' Training, Certification, and Duty Standards Convention (STCW 78/95) and the requirements of China's Seafarer Crew Competency Standards. The qualifications of marine engineers are qualified, and they can be used for the training of advanced technical personnel such as turbine operation, maintenance, ship supervision, supervision, marine management, and ship inspection in various enterprises and institutions of ship transportation and marine engineering. The professional awareness of students needs further improvement.

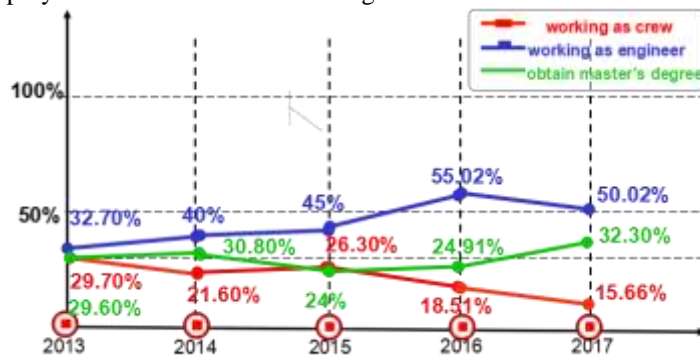
Graduates can be engaged in ocean and offshore turbine management work of the vessel in shipping enterprises and institutions, also be engaged in the maintenance-related work in the shipping department, harbor superintendence, ship inspection and other related enterprises. In addition, graduates can also in shipyard, Marine diesel engines factory, mechanical engineering or related units. Latest five years graduate employment situation as shown in figure 5.


Figure 2   Statistics of Graduates Employment in the Last Five Years

1.2.2 The awareness of professional ethics is not strong

Professional ethics is a certain spiritual realm that is embodied in certain behavioral norms and reflected in professional activities (Dai Yulan, 2015). It is a code of conduct that all practitioners should follow in their professional activities, including behavioral requirements, ethical responsibilities, and obligations. Although the professional ethics of sailing students has been greatly improved, the distance from the seafaring talents still exists. Although the professional ethics of mainstream majors of marine majors are positive, healthy, and progressive, there are still some students' sense of responsibility, collective consciousness, honor consciousness and professional dedication becoming weaker. Money worship, hedonism, individualism, utilitarianism is more and more obvious.
Figure 3   Understanding Level of Professional Ethics

Regarding to the level of understanding of professional ethics, 56% of the students only heard a little, 26.9% of the students knew better, and 15% did not understand the professional ethics at all as shown in figure 3. It shows that undergraduates do not have enough knowledge of professional ethics and the concepts of college students' professional ethics need to be strengthened.
Figure 4   The Necessity of Ethics Education

In terms of professional ethics education, 43.2% of students believe that professional ethics education is targeted at undergraduates and college students, 36.5% of students think that professional ethics education is targeted at junior college students, and only 10.6% of students think that professional ethics education is targeted at Undergraduate students. In figure 4 it shows that most college students think it is necessary to carry out professional ethics education. The focus is on college students. However, the situation of professional ethics education in undergraduate colleges is not optimistic.

1.2.3 lack of professional ability

Professional competence is the ability of an individual to accomplish certain career tasks by classifying the knowledge, skills, and attitudes who has learned in a particular class of professional activities or situations (Yin Fengxia, 2015).Professional capabilities include professional and management skills, learning ability, innovation ability, emotional management ability, and expression communication skills. In the evaluation of professional competence, 41.1% of the students are not confident in their professional ability, and 24.2% of students are not confident in their professional ability as shown in figure 5.
Figure 5   Self-assessment of their Professional Competence

In the job search process shown in figure6 the most competitive factors accounted for 21.2% of the academic performance, 20.1% for professional skills, 16.8% for practical training experience, and 16% for student cadres. The percentage of professionals who chose to obtain relevant vocational skills certificates accounted for 21.9%. It shows that in the process of students' job hunting, professional ability is reflected in all aspects. College students pay more attention to academic performance, professional skills, practical training, and student work. However, there is still a long way to go from the professional skills that students already possess.
Figure 6   the Most Competitive Factor in Employment Selection

2 The Significance of Semi-militarized Management for Nurturing Vocational Literacy

The semi-militarized management of maritime colleges and universities is a management model. It refers to the management methods of non-military units with reference to military management units, and the management mode is between military management and general management (Wang Haipeng, 2018). The semi-militarized management of maritime colleges and universities is an important measure and approach for the cultivation of advanced maritime talents. The aim is to cultivate students with good political quality, organizational discipline, teamwork spirit, professionalism and leadership of the sailing students. Make students becoming highly qualified marine specialized talents with international competitiveness in terms of "strong adaptability, strong working spirit, and strong sense of innovation".

Semi-military management helps to strengthen students' political orientation, train students to obey orders and obey commanders' obedience, cultivate students' hard-working, courageous and hard-doing will, develop solidarity and cooperation, form a rigorous and pragmatic work style, cultivate students' habits and habits, cultivate students' awareness of love and respect for their jobs, cultivate students' spirit of hard work and entrepreneurship, broaden students' international perspective, improve the students' professional psychological quality, improve the students' comprehensive quality.

3 Professional Literacy Training Strategy

3.1 Combining semi-military management with theoretical practice education

1）Further optimize the teaching curriculum. Focusing on students' professional literacy needs, colleges and universities should further revise their professional training plans and programs, improve the strength of teachers, ensure the ratio of teachers and students in navigational specialties, optimize design professional introduction, professional courses, sailing career planning, maritime psychology, cross-cultural communication courses, etc. Teaching content should enrich students' knowledge and broaden their horizons. At the same time, in the teaching of professional courses, professional ethics education, professional awareness awakening education, cooperative spirit education and struggle spirit education are constantly penetrated to improve students' professional ethics.

2) Continuously strengthen students' cognition education for industry and profession. Strengthen the education of ideals and beliefs of college students, raise awareness of responsibility for the country and society, and combine personal ideals with the country's future and national cause. Through professional education, atmosphere creation, role models, featured activities, etc., improve the effectiveness of various thematic activities, create a soft environment from the perspective of the second classroom, guide students to establish a love of industry, professional concepts, clear learning objectives, enhance the professional awareness of students.

3) Construct a theoretical and practical curriculum system. Exploring the inter-class teaching and practice cross-teaching mode, the professional quality education runs through the students' daily

education. It not only highlights the students' explicit professional literacy education, but also pays attention to the students' implicit professional literacy education. The basic curriculum emphasizes the combination of in-class teaching and extra-curricular practice, ability development and quality enhancement, internalization and externalization. In the fun activities, situational training and other processes to optimize student professional qualifications, enhance the professional quality of students, enrich students' professional emotions.

4) Strengthen the joint training of schools and enterprises. The company has improved the practice training base for students. The school invites corporate alumni to enter the campus to carry out vocational lecture education, and schools and enterprises cooperate to develop students' professional quality development training. Further promote the joint training of schools and enterprises. Adhere to the combination of maritime culture construction and the cultural construction of shipping companies, integrate social enterprise resources, strengthen cultural exchanges and cooperation between schools and enterprises, form a joint force, and jointly educate people. Give full play to the advantages of nautical culture construction activities, enrich and improve the carrier of maritime culture construction, and further promote the school through the "Navigation Forum", "Navigation Festival" and "Navigation Skills Competition", "Navigation Summer Camp" and corporate title activities. Enterprises jointly cultivate and promote the improvement of students' professional quality.

3.2 The combination of semi-militarized management and self-management

1) Strengthen the semi-militarized management. In combination with reality, maritime schools and colleges use the management methods of military academies and universities to build practical and semi-militarized management models. Through the daily life and rest system, students' habits and behaviors will be strengthened and their habitual education will be strengthened to raise students' awareness of discipline and self-discipline. Through the military militia discipline system, continuously improve students' professional etiquette awareness. Through collective classes, collective training, and collective activities, students' awareness of teamwork and collaboration are enhanced. The effective implementation of these systems makes students' behaviors and thoughts resonating with the industry culture and experience the professional culture in person so that students can gradually understand, use and consciously abide by the quality requirements of the industry, so that the professional quality can be well cultivated.

2) The combination of institutional management and cultural atmosphere construction. Further strengthen the creation of a maritime culture atmosphere. Efficient use of ideological and political education positions will be incorporated into the year-round weekly meeting, situation and policy education and teaching, and students will be provided with ideological and political education that is targeted, effective, and culturally distinctive. Let students feel the charm of seafaring culture, let students establish a solid ideal and belief, and enhance the passion of seafaring culture. As the system construction, navigation colleges constantly create a nautical atmosphere and strengthen the construction of maritime culture. On the one hand, it needs to increase investment to provide a strong material basis. For example, the construction of marine teaching buildings, navigation museums, navigation fitness training centers, and water training bases, and the use of the "Xinghai" and "Fuhai" internships have provided powerful guarantees for marine students. The sense of professional identity of students has been enhanced, and the sense of mission of students dedicated to the shipping industry has been strengthened. On the other hand, teachers and students need to brainstorm and work together. For example, teachers and students actively collect iconic slogans, outstanding alumni and other forms of deeds, etc., and actively arrange campus environments with industry characteristics. Furthermore, in terms of creating classroom atmosphere, professional teachers must integrate the cultural characteristics and corporate spirit of the industry into classroom teaching. Strengthen the construction of industry culture from institutional culture, material culture, behavior culture, spiritual culture and other dimensions.

3) Further improve students' self-management skills. Through the establishment of platforms, thematic education, community organizations, etc., to enhance students' self-management awareness. Inspire students' collective awareness, competition awareness and awareness of urgency, so that students continue to become self-discipline, self-reflection, self-education, self-improvement in learning and life, and constantly cultivate and enhance self-management capabilities.

4) Further improve the scientific level of student management. Through the rational establishment of class organizations and sound class systems, the construction of classes is strengthened. Different levels, hierarchical management, play an overall role. Identify student party members, activists who join the party, cadres of cadets, and general responsibilities, play an exemplary lead role, highlight the

leadership role of student party members and key student cadres, give full play to the backbone of general student cadres and activists who join the party, and emphasize the general classmates' organization. Concepts and collective consciousness. Adhere to the problem-oriented and goal-oriented combination, through the target mechanism, assessment mechanism, supervision mechanism, reward and punishment mechanism to improve student management work of planning, pertinence and awareness.

3.3 Combination of semi-militarized management and services

1) Strengthen professional psychological quality training. The goal of nautical student graduate training is to engage in ocean-going work. The working environment is complex and closed. The cultural differences among seafarers, different lifestyles, and monotonous life make the crew's psychological problems prone to develop. The cultivation of psychological quality requires long-term training, nurturing and strengthening. Therefore, colleges and universities must strengthen the psychological health education of college students. Through psychological health education lectures, psychological knowledge tests, psychological fun activities, etc., it guides students to recognize the importance of mental health for growth and enable students to actively learn mental health knowledge. The combination of mental health knowledge popularization and mental health counseling, regularly conduct individual student psychological counseling interviews to identify problems and solve problems in a timely manner.

2) Strengthen career planning guidance. Career planning refers to the individual's combination of his or her own situation, immediate opportunities and constraints, setting career direction and career goals for himself, selecting career paths, determining education plans and development plans, and determining action time and action plans for realizing career goals. Nautical colleges and universities should strengthen students' professional cognition during career planning courses, professional introductions, and professional course education, and form a preliminary understanding of seafarers. By creating a maritime culture atmosphere, students develop good professional values. Through career planning and design competitions, students are encouraged to explore professional interests and professional characteristics and guide students in career planning.

3) Strengthen professional etiquette training. Workplace etiquette is a standard of behavior defined by people in professional activities. It has certain binding force on individual behaviors in the workplace, such as demeanor and grooming. Colleges and universities should continue to instruct students to enhance professional etiquette training such as dress etiquette, conversation etiquette, e-commerce etiquette, and catering etiquette through online admonishment, special lectures, and community activities, and guide students to learn how to use etiquette in a proper manner. Knowing, understanding, and saluting. Through the semi-militarized management of the military and military discipline system, students' professional etiquette is further strengthened.

4 Conclusion

The semi-militarized management of maritime colleges and universities serves as a management method between military management and general management. It is an important measure and approach to cultivate advanced seafarers. It will help cultivate students with good political quality, organizational discipline and teamwork spirit, and enhance the professionalism and leadership ability of the sailing students. Make students become highly qualified marine specialized talents with international competitiveness in terms of strong adaptability, strong working spirit, and strong sense of innovation.

This paper surveys and analyzes the status of current professional careers of sailing students through questionnaire surveys and interviews, pointing out that the semi-militarized management of maritime colleges and universities is a management method between military management and general management. It has positive significance in the promotion of students' professional qualities and further proposes ways and paths to cultivate professional qualities.

Fully understanding the significance of semi-militarized management, further optimizing semi-militarized management. We should continue to strengthen the professional accomplishment of nautical professional students and cultivate a group of high-quality integrated maritime professionals who can meet the requirements of international conventions. They have high comprehensive quality, a strong sense of safety, environmental protection and international market competitiveness, which can promote the development of the shipping industry.

Literature Review on the Impact of Intercultural Contact on Intercultural Competence of College Students

Wu Weiping, Liu Mengling

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wuweiping@whut.edu.cn, 572751420@qq.com)

Abstract: Eversince the birth of the term, intercultural competence, it has been a hot issue in the fieldof linguistics both at home and abroad.Substantial research on intercultural competence has hence been carried out and turned out to be fruitful. The present paper，after employing the method of literature investigation, reviewsthis research field related to the definition of intercultural competence and intercultural contact, and the relationship between them. Some analysis of concepts and implications for English teaching are presented as well. Thus, this paper aims at stressing that it is necessary for college English teachers to integrate intercultural contact with English teaching.What's more, this paper also hopes to give some insight into later scholars who carry out cultural research.

Key words: Intercultural competence; Contact hypothesis; Intercultural contact; Review

1 Introduction

With the development of economic globalization, China has more chances to engage in international affairs, and the huge potential of the Chinese market hasattracted a large number of foreign-funded enterprises to invest. Meanwhile, there are an increasing number of intercultural activities. However, in the model of traditional college English, more emphasis has been put on the cultivation of students' language knowledge so that college English teachers neglect the development of students' intercultural competence. For the reform of personnel training model in college, it is urgent to cultivate international talents who analyze some issues with international lens and are equipped with good intercultural communicative competence. What's more, with the popularization of the Internet, more and more college students have opportunities to interact with foreigners and contact with cultural products from other countries. Based on this, these different intercultural manners and paths have largely influenced the intercultural communicative competence of college students while there are a few studies on it, especially the research on the influence of intercultural indirect contact. Therefore, this article will comprehensively review the theory of intercultural competence, intercultural contact and intercultural indirect contact and relevant research in order to give some sights for later scholars to carry out research activities in this field.

2 The Study of Intercultural Competence at Home and Abroad

2.1 The study of intercultural competence abroad

For the purpose of cultivating international talents, domestic and foreign scholars have made great progress in intercultural research. In order to define the ability of international talents who can adopt to the international market, scholars have made a series of explanations on it, such as intercultural communicative competence, intercultural competence, intercultural sensitivity, cultural competence, global capabilities, and intercultural regulation (Chen & Starosta, 1996; Byram, 1997; Fantini, 2000; Porter, 2004: Deardorff, 2004; Yang Yang, 2009; Xu Lisheng, 2011; Behrnd & Porzelt, 2012).Although the expressions of these terms are different, scholars stillhold the same view on the detailed contents of these terms.

When it comes to the definition of intercultural competence,intercultural competence, as a special interpersonal communicative capability, should include five basic elements, namely, motivation, knowledge, skill contextand effect (Spitzberg&Changnon, 2009). Furthermore, intercultural competence requires adequate knowledge, appropriate motivation and well-trained actions (Lustig& Koester, 2007).Spencer-Oatey and Franklin define this as the ability of communicators from different cultural backgrounds to implement effective and appropriate verbal or non-verbal communication behaviors and to deal with the psychological and communicative consequences of communicative behaviors (Spencer-Oatey&Franklin, 2009). Perry and Southwell point outthat intercultural competence refers to the ability of people with different cultural backgrounds to interact effectively and appropriately(Perry&Southwell, 2011).Johnson et al. defined the intercultural competence from the perspective of international business. Intercultural competence in international business means that an

individual can use a set of knowledge, skills, and personal attributes to succeed in working with people from different cultural backgrounds in different countries (Johnson et al, 2006). From the above discussion, it indicates that intercultural competence needs to be reflected in certain contexts and emphasizesthe characteristics of communicating with members of other cultures. Then, the achievement of intercultural communication needs to equip interlocutors with the motivation, knowledge, and some skills of communication. And finally, interlocutors show a series of behaviors that are consistent with the social norms.In order to draw an objective conclusion, intercultural scholar Deardorff, after collecting internationally renowned intercultural communicators' opinions on intercultural competence, findsthat the definition of intercultural competence with the highest academic acceptance is that communicators can carry out appropriate and effective communication activities based on their own intercultural knowledge, skills, and attitudes in anintercultural environment (Deardorff, 2006). In other words, under intercultural circumstance, it is necessary for communicators to master the cultural knowledge of other countries, to put the attitude right, and then to use appropriate language and non-linguistic skills in order to complete communicative activities.This coincides with the previous view. However, intercultural activities are not only the expression of external behaviors, but also the changing process of communicative mental activities.Therefore, in order to further elaborate and evaluate intercultural competence, Deardorff proposes the famous intercultural competence model ---- pyramid model in her recent research.

DESIREDEXTERNAL OUTCOME
Behaving and communicating effectively and appropriately (based on one's intercultural knowledge, skills and attitudes) to achieve one's goals to some degree

DESIRED INTERNAL OUTCOME
Informed Frame of Reference/Filter Shift
Adaptability (to different communication styles & behaviors; adjustment to new cultural environments);
Flexibility (selecting and using appropriate communication styles and behaviors; cognitive flexibility);
Ethno relative view;
Empathy

Knowledge & Comprehension:
Cultural self-awareness;
Deep understanding and knowledge of culture (including contexts, role and impact of culture & others' world views);
Culture-specific information;
Sociolinguistic awareness

Skill:
To listen, observe, and interpret
To analyze, evaluate, and relate

Requisite Attitudes:
Respect (valuing other cultures, cultural diversity)
Openness (to intercultural learning and to people from other cultures, withholding judgment)
Curiosity and discovery (tolerating ambiguity and uncertainty)

Figure 1   Pyramid Model of Intercultural Competence (Deardorff, 2006, 2009, 2017)

This model shows the communicators' psychological process and hierarchically explains the level of competence to be achieved in different stages.In her model, there is necessary attitude at the bottom of the tower, knowledge and understanding and skills at the second level. Moreover, the relationship between knowledge and understanding and skills is interactive (Deardorff, 2006&2009). From Deardorff's pyramid model, attitude is placed in the first place, aiming at emphasizing that intercultural competence training should start with attitudes in that positive attitude can promote the mastery of intercultural knowledge and skills. And then, a series of knowledge and skills will further intrigue interlocutors' positive intercultural attitude. Therefore, positive attitude is an effective guarantee for intercultural activities.Regarding the understanding of the term, knowledge, the knowledge not only

refers to linguistic knowledge, but also includes domestic cultural knowledge and the cultural knowledge of target language. In intercultural communication activities, it is very necessary to stress the mastery of the cultural knowledge of target language because it can avoid the inappropriate behavior of communicative activities and directly affect their success. As for domestic cultural knowledge, it should be pointed out that communicators are representatives of the entire group behind them and influence other people's judgments on them in the process of communication. Therefore, they need cultural knowledge as a support to promote their own culture.The so-called skills mainly refer to the communicators' ability to handle cultural conflicts and differences in intercultural activities. They use some linguistic or non-verbal strategies to achieve the purpose of communication.Knowledge and skills are interactive. When knowledge is not enough, communicators will take advantage ofsome skills to make up for deficiencies in knowledge to complete communicative activities. This model puts forward some feasible suggestions for the assessment of intercultural competence, but intercultural activities are very complex in nature. The individual's intercultural competence does not always follow this model. In contrast to this model, Byram combines cultural teaching with intercultural competence. He proposes that intercultural competence consists of three elements, including, knowledge, skills, and attitude (Byram, 1997). Furthermore, this model has further differentiated the intercultural competence and intercultural communicative competence.In his model, intercultural communicative competence coversintercultural competence. After being equipped with basic intercultural competence, communicators still need to use the abilities of language knowledge, discourse and sociolinguistic knowledge that interact with each other, finally, cultivating the intercultural communicative competence. This model systematically explains the intrinsic relationship of each part of the intercultural communicative competence and has an impact on the curriculum of foreign language teaching. Intercultural competence is a concept often used by foreign scholars, but scholars also use the term "intercultural communicative competence" to express a series of behaviors in intercultural activities.For example, Ting-Toomeyintegrates theory with practice, arguing that intercultural communicative competence refers to the method by which the communicators can use intercultural knowledge to communicate sensitively and consciously (Ting-Toomey, 2007). After reviewing previous research findings, Wiseman believes that intercultural communicative competence refers to the knowledge, motivation, and skills needed to properly and effectively communicate with people from different cultural backgrounds (Wiseman, 2004). In Gudykunst's view, intercultural communication is defined as communication with people from different national cultural backgrounds, and scholars also limit this communication to the level of face-to-face communication (Gudykunst, 2003). Therefore, on this basis, Gudykunst (Gudykunst, 2004) proposes that intercultural communicative competence consists of three indispensable elements, namely, knowledge, motivation, and skills (Gudykunst, 2004). Spitzbergdefines the intercultural communicative competence as follows: "In general, intercultural communicative competence can be understood as a type of impression that this behavior is appropriate and effective in a particular context (Spitzberg, 2000). Imahori and Lanigan argue that intercultural communicative competence refers to the appropriate motivation, knowledge, and skill levels when native speakers and foreigners communicate. And then, these elements lead to effective interrelationships (Imahori& Lanigan, 1989). Regardless of intercultural competence or intercultural communicative competence, the above arguments correspond to Chen and Starosta's opinion thatintercultural competence emphasizes the importance of context in particular (Chen& Starosta, 2007). It is the result of the mutual influence of human beings and the social environment. Individuals cannot work alone to demonstrate the level of their intercultural competence.What's more, attitude, knowledge, and skillsare important elements consisting of intercultural competence.

2.2 The focus on intercultural competence at home

Although the domestic research on the intercultural competence started relatively late, it also makes some great progress.In the early days, domestic scholars also put forward different views on intercultural competence and intercultural communicative competence.Zheng Lihua proposes that intercultural competence mainly refers to the ability to communicate and cooperate with foreigners(Zheng Lihua, 2005).Liu Qisheng believes that intercultural competence is the ability to use language fluently (Liu Qisheng, 2004). That is to say, an individualis able to communicate in a foreign language context.Similar to foreign studies, the two statements all refer to the characteristic that people conduct communication activities with people from different cultural backgrounds.Regarding intercultural communicative competence, Wen Qiufang believes that intercultural competence ispart of intercultural communicative competence and that communicative competence is intertwined with intercultural competence to jointly form intercultural communicative competence (Wen Qiufang, 1999).

This view coincides with the model of intercultural communicative competence proposed by Byram (Byram, 1997). Chen Xin points out that, on the basis, intercultural communicative competence refers to the linguistic competence, pragmatic competence, and the ability of communicative practice necessary for thecompletion of communication in the process of intercultural communication (Chen Xin, 2004). Bi Jiwan believes that the focus of intercultural communicative competence lies in the three concepts, namely, intercultural competence, social cultural competence and intercultural communicative competence (Bi Jiwan, 2005). Zhang Hongling's opinion is that the ability of intercultural communicative competence can be defined as the fact that an individual masterssome cultural and communicative knowledge and employstheir knowledge to practical intercultural environment. Meanwhile, a person holds the attitude of tolerance and appreciation towards different cultures when coping with these challenges (Zhang Hongling, 2007). Chen Guoming argues that intercultural communicative competence is an ability to take appropriate and effective actions in a given environment and receive desired responses, including intercultural sensitivity, intercultural awareness, and intercultural skills (Chen Guoming, 1997). (Jia Yuxin, 1997) regards intercultural communicative competence as an organic entity, and believes that intercultural communicative competence includes the basic system of communicative competence, emotion and relationship, plot competence and communicative strategies (Jia Yuxin, 1997). However, with the continuous development of research, later scholars tend to understand the two as the same concept.Yang Ying and Zhuang Enping point out that the intercultural communicative competence is equal to the intercultural competence. They are the same concept because it is conducive to focusing on the development of communicative competence, intercultural awareness, thinking ability, verbal and non-verbal strategies in the process of intercultural communicative competence development (Yang Ying & Zhuang Enping, 2007). Furthermore, Hu Wenzhong is for this view, saying that these views aforementioned are theoretically valid. Given that most of the relevant academic literature does not distinguish between the two competnce, he tends to regard the two as the same ability. (Hu Wenzhong, 2013). However, in foreign language teaching, intercultural learning cannot be confused with intercultural communicative competence. (Wen Qiufang, 1999) thinks that the emphasis in foreign language teaching is to enable students to have the ability to handle cultural differences because of the cultural differences in intercultural communication, and to develop their language skills, pragmatic and strategic abilities, the sensitivity to cultural differencesand tolerance and flexibility in dealing with cultural differences (Wen Qiufang, 1999). It is undoubtedly overly simplistic to equate cross-cultural teaching with the entire content of cross-cultural competence in college English.Hu Wenzhong also points out that intercultural communicative competence consists of three parts, namely, knowledge, motivation, and skills (Hu Wenzhong, 2013).This means that communicators equip themselves with the ability of cognition, emotion, and behaviors, which is a big challenge for students to accomplish. Therefore, the intercultural communicative skills of Chinese students lag far behind their language skills (Chang Xiaomei, Zhao Yushan, 2012; Hu Yan, 2012, etc.). Integrating intercultural competence into English teaching has always been a hot topic in the reform of foreign language teaching in China, because in the traditional English teaching classroom, more emphasis is placed on the learning of language knowledge. As a result, there are a number of discussions about intercultural teaching models. (Hu Wenzhong and Gao Yihong, 1997) divide the purpose of foreign language teaching into three parts, including micro, meso, and macro levels. The first focuses on the language ability of students, which contains the development of language skills, such as pronunciation, vocabulary, grammar, and discourse knowledge, listening, speaking, reading, writing, and translation; The second, the communicative competence, which refers to the development of pragmatic competence, such as social language ability, discourse ability and strategic ability; The last one, the cultivation of social cultural competence, which includes language proficiency, pragmatic competence, and the ability of identification (this concept refers to the capability ofcomprehension, assessment, and integration). This training mode is based on language knowledge and finally accomplishes the goal of training students' intercultural competence as the course goes on (Hu Wenzhong & Gao Yihong, 1997). (Sun Shu-nu and Xu Li-sheng, 2013) emphasize that, from the perspective of constructivism, computer is used as a teacher-assisted tool to set specific cultural context and allow students to learn independently (Sun Shu-nu & Xu Li-sheng, 2013). Huang Wenhong uses empirical research to explore the cultivation of intercultural communicative competence in procedural cultural teaching, aiming at intriguing the enthusiasm of students and allowing students to actively participate in cultural teaching activities(Huang Wenhong, 2015).Li Yan and Zhang Weidong introduce the CDIO education concept into the intercultural competence training system and theoretically analyze the design of intercultural competence teaching (Li Yan& Zhang Weidong, 2013). Gu Xiaole, after discussing the model of

intercultural competence training in China, proposesanintercultural communicative competence and practice model, hoping to combine theory with practice and provide teaching ideas for the development of cross-cultural communicative competence of Chinese college students (Gu Xiaole, 2017). Domestic intercultural research is an extension of research abroad. On the basis of the actual situation in China, it integrates intercultural teaching into the classroom and cultivates students' language communicative skills.

Foreign research on intercultural competence makes full use of the mobility of population. Some developed countries need lots of labors from other developing countries, so international enterprise has the need to solve different cultural conflicts in order to achieve the mutual goal. Therefore, foreign research is closely related to business, and then extends to the language teaching.

Domestic research, different from foreign investigation, often links English teaching with the development of intercultural competence. With the policy of One Road, One Belt, it is very urgent for English teachers in college to change their teaching models and to incorporate intercultural competence into the class. In other words, college students, as the pillar of this country, should have the awareness to improve their intercultural competence. Thus, college teachers need to guide them.

3 The Study of Intercultural Contact
3.1 The concept and study of intergroup contact theory

With the acceleration of the global integration process, the people of the world are gradually living in the same village ---- the Earth. However, various ethnic groups are still relatively isolated.Frequent exchanges and contact are very necessary for us toachieve the purpose of mutual understanding. Only in constant contact can all groups of people be familiar with each other, become close and finally, establish a good friendship.Since the Second World War, the United States, as a multi-ethnic country, has deeply realized that it must make efforts to solve the internal contradictions amongethnic groups and eliminate prejudice among various ethnic groups, to realize the unification of the entire countryand to prevent the occurrence of separatist activities. For this, as early as the 1950s, social psychologist Robin Williams carried out a research on the social contacts and ethnic attitudes of four towns in different regions of the United States (Williams, 1964). It is shown that the contact between the mainstream whites and members of one or more relevant minorities can significantly reduce prejudice against these minority groups. The research of Robin Williams and others lays the foundation for the formation of intergroup contact theory.Finally, in 1954, the famous American psychologist Allport proposed intergroup contact theory in his classic book *The Nature of Prejudice*.In his view, positive contacts between members of different groups can improve intergroup relationships and reduce negative group biases.Specifically, the main content of his intergroup contact theory is that, under best conditions, the main way to reduce intergroup bias is to contact with external groupsthat people do not belong to. The best intergroup contacts must meet the following four conditions, namely, equal status, common goals, inter-group cooperation and the support of authorityand law. Based on the Allport's contact hypothesis, other scholars conduct detailed studies on the four conditions and interpret them as follows: (1) Equal status: In intergroup contact, both groups are expected to have equal status (Cohen & Lotan, 1995), and the contact with outsiders in an equal atmosphere will be more productive (Brewer & Kramer, 1985). (2) Common goal: With the positive attitude and clear goal, the two groups need to pay their joint effortsto reduce prejudice by means of contact.For example, in a team composed of athletes of different races, team members must cooperate with each other to achieve the common goal of winning. Meanwhile, the realization of this common goal has also strengthened the process of cooperation (Chu & Griffey, 1985).(3) Intergroup cooperation: The common goal plays a vital role in a situation in which there is a cooperative relationship, not a competitive relationship between groups (Gaertner et al., 1999). (4) The support of authorityand law: Both groups are more likely to contact with each other with the support form authority and government. Such contacts are also more effective (Landis, Hope, & Day, 1984; cited in Pettigrew, 1998).The four conditions aforementioned are all proposed on the basis of the best contact conditions.As research goes on, Pettigrew and Tropp (2006) proposes that intergroup contact does have the effect of reducing intergroup bias, but the best conditions for intergroup contacts proposed by the intergroup contact theory are not necessary conditions for good intergroup contacts (Pettigrew & Tropp, 2006). The existence of these conditions is indeed conducive to better inter-group contacts. The support of authority and law is the most important elementof them. However, without these conditions, intergroup contact can still play a role in reducing intergroup bias. (reference to Li Sensen, Long Changquan, Chen Qingfei, Li Hong, 2010). Although this analysis raises questions about Allport's

optimal contact context, it also proves that contact does reduce group bias and regulate inter-group relationships. In addition to the exploration of the context of contact hypothesis, some scholars have discussed the mechanism of contact to reduce prejudice.For example, Dovidio believes that the mechanism for reducing bias in intergroup contact theory includes four aspects: interdependence among groups, intergroup interactions, emotional factors, and cognitive factors (Dovidio, 2003). Among them, Sherif et al. (Sherif, Harvey, White, Hood, & Sherif, 1961; cited in Dovidio et al., 2003) believes that the interdependence among groups has a direct effect on attitudes and behaviors among groups.Positive intergroup interaction can also enable both groups to face the entire external community in a positive manner (Dovidio et al., 2003) and to adapt to the new environment. Emotional factors include both positive and negative emotions. The meta-analysis of Pettigrew and Tropp proves that such emotional factors as media play an important role in the course of reducing bias.(cited in Li Sensen, Long Changquan, Chen Qingfei, Li Hong, 2010). Pettigrew points out that understanding others is an important step in intergroup contact to improve intergroup relationships (Pettigrew, 1998). Even though the intergroup contact hypothesis has been proved to have some effects on reducing intergroup bias, it also has its limitations.Amir suggests that contact under optimal contact conditions would reduce bias, but he also emphasizes that such reduction is unlikely to influence the entire group.Furthermore, Amir believes that contact under adverse conditions may increase prejudice and intergroup tension (Amir, 1969&1976).Forbes, a political scientist, believes that intergroup contact can only reduce biaswhen the analysis is conducted to individual (Forbes, 1997). (Stephan, 1987) acknowledges that intergroup contact may potentially reduce bias, but he stresses thatthe influence of intergroup contact on prejudice is complex (Stephan, 1987).The above scholars believe that the communication itself is very complicated, and the theory that is verified in individuals does not have the same effect on the entire group.What is more, in real life, people rarely have the desire tointeract.In the United States, for example, blacks and whites still live in their own communities, go to different schools, and have their own social networks.Based on this phenomenon, scholars have expanded the forms of intergroup contact from the initial face-to-face contact directly to the subsequent indirect contact, and finally included the indirect contact in the form of imaginary contact.In this regard, Taylor, Pham, Rivkin, & Armor find that psychological imagination has a positive effect on academic and athletic performance (Taylor, Pham, Rivkin, & Armor, 1998). Turner et al. proposed that imaginary intergroup contact has a positive effect on intergroup attitudes. In a series of strategies to improve intergroup relationships through contact, imagining contact as the first step in continuum contact will more effectively mitigate and reduce prejudice (Crisp & Turner, 2009). Yu Haitaoholds that imaginary contact is more indirect in nature than contact forms such as face-to-face contact and extended contact (Yu Haitao, 2013). Its indirectness not only makes imaginary contact challenging, but also enhances the practicality of imagining contact and expands the scope of application of intergroup contact theory.

3.2 The oversea focus on intercultural contact

The intergroup contact theory itself belongs to the category of social psychology. With the background of the United States, it is characterized by inter-culture because of its birth for the purpose of solving the conflicts among races. Foreign scholars have always conducted a lot of research on intercultural contact.Smith designs an experiment before the intergroup contact hypothesis is formally put in place. He makes a group of white students from Columbia University conduct a series of social contacts with the leaders of the New York black community over the weekend. The results show that college students who had social contact with black people has improved their attitudes towards blacks and are more willing to communicate with them.Deutsch M. and Collins M. E investigate cross-racial apartments and apart-mixed apartments, and find that white people living in a mixed-living community are more likely to engage in cross-racial communication with blacks.Similarly, Nesdale and Toddcarry out a survey on the intercultural contact of 76 Australian and international students in a dormitory at an Australian university.Through interventions, they find that the intercultural contact of the same dormitory would affect the students' intercultural knowledge and the degree of openness (Nesdale &Todd, 2000). R.T. Halualani interviews80 students from a multicultural university in the United States and askes students to describe their definition of cross-cultural contacts by means of qualitative method.The results show that the atmosphere of a multicultural university has an impact on students' cross-cultural awareness (R.T. Halualani, 2008). Van Laar, Levin, Sinclair, & Sidanius, 2005; Shook &Fazio find that students of different races or beliefshelp reduce prejudice among groups by virtue of living in the same dormitory, regardless of whether they are randomly assigned or willing to choose. And the attitude toward roommates will gradually improve with the increase in grades.This direct contact with roommates is helpful to reduce not only cultural bias against roommates but the prejudice

against students of other races if a school or dormitory has students of other races (Van Laar, Levin, Sinclair, & Sidanius, 2005; Shook & Fazio, 2008). And their hold more tolerance to other ethics (Pettigrew &Tropp, 2000; Van Laar et al., 2005). This shows that if the learner has always lived with people from other cultural backgrounds, his attitude toward other groups that his roommates does not belong to will also be improved. When he interacts with people from more cultural groups in real life, he can quickly adopt to the new cultural context. In this process of psychological adjustment, foreign roommates acted as an intermediary, and learners extended personal direct contact experience to other groups.In addition to the above intercultural contact on multicultural campuses, foreign scholars have also combined intercultural contact with second language acquisition in order to explore the impact of cross-cultural contacts on learning attitude and motivation.Studies by Clément and Kruidenier have shown that positive and enjoyable contact experiences can enhance the self-confidence of language learners, and thus increase learners' lasting learning motivation on second language learning (Clément and Kruidenier, 1983). Noels et al. examines the relationship between intercultural contact and the learning self-confidence of second language acquisition in terms of identity and psychological adjustment (Noels et al., 1996). The studies of Clément et al. also confirm that frequent and positive contact not only can improve the confidence of language use, but also can affect the language learners' identity and accelerate their cultural adaptation process in multi-group context (Clément et al., 2001; cited from Xu Zhixin, 2017). At beginning, Drnyei and colleagues explore the impact of intercultural contact on second language learners' motivation and behavior (Drnyei& colleagues, 2006). They conduct a survey on language learning, including more than 13,000 Hungarian 13-14-year-old foreign language learners in 1993, 1999 and 2004, respectively. On the basis of survey results, they construct the attitude-motivation chart. This chart describes the impact of cross-cultural contact on language propensity and motivational learning behavior of foreign language learners in the context of language globalization.In fact, language and culture are intertwined. Culture can cultivate the learners' interest in language learning from the perspective of culture teaching. Students can acquire languagewhile also instilling cultural knowledge. This has implications for foreign language teaching.

3.3 The focus on intercultural contact at home

Domestic research on intercultural contact is relatively rare. In this regard, well-known intercultural researcher Hu Wenzhong proposes that direct contact with local culture and direct communication with native speakers is the most effective way to improve intercultural communicative competence (Hu Wenzhong, 1999). Liao Cihui and Li Xiangqi link cultural contact with language contact to explain the types and mechanisms of American English evolution.They define the cultural contacts as follows: Cultural contact refers to the process of changing one's or both cultural systems due to the contact of different culture and traditions.This kind of cultural contact can be divided into three types, namely,acculturation, assimilation, andAmalgamation.Accumulation refers to the fact that when two groups come into contact, one group directly or indirectly intervenes in another group's material civilization, traditional customs, beliefs, and language. Assimilation refers to the process in which different individuals or groups of national traditions are integrated into the dominant culture of the society. Usually, they are immigrants or isolated minorities.Thorough assimilation is rarely seendue to contact with major cultureand the inclusion of major culture in their lives. And they lose most of the original cultural features and embrace new culture. Therefore, the changes are so large that they cannot be distinguished from the other.Amalgamation refers to the fact that when the two cultures come into contact with each other, the cultural factors of each other are combined in the mixing process instead of being eliminated (Liao Cihui&Li Xiangqi, 2009). Chen Hui, Che Hongsheng and Zhu Min comment on the intercultural adaptability of people living abroad.In the study, they talk about the problem of cultural distance (Babiker, Cox and Miller, 1990). The culture distance hypothesis predicts that the greater the culture distance between the occupant's culture and the country of residence is, the more difficult their cultural adaptability is (Chen Hui, Che Hongsheng &Zhu Min, 2003). Then, in intercultural communication, communication between communicators who are in Asian cultural circle is more effective than that of Asians and Europeans.Wang Tianjun uses qualitative analysis method to study the development of intercultural competence of Chinese students and international students in China by observing students of Fudan university.The study is different from other studies focusing on Chinese students' intercultural communicative competence. From the interaction between international students and local Chinese students, itis found that the longer international students stay in China, the higher their Chinese language ability is and the more adaptability to Chinese culture (Wang Tianjun, 2010). Peng Renzhong and Wu Weiping use empirical analysis to explore the intercultural contact paths of Chinese college students.The study finds that Chinese college students' intercultural contact can be summarized

as two types, namely, direct contact and indirect contact (Peng Renzhong & Wu Weiping, 2016). Xu Zhixin analyzes the structure of college students' English learning behavior from the perspective of intercultural contact. He draws on the following conclusions: (1) Learners believe that intercultural contact can improve learning motivation; (2) Intercultural contact can help learners to understand English native speakers; (3) Intercultural contact can ease learner communication anxiety (Xu Zhixin, 2017).

4 The Focus on the Relationship between Intercultural Competence andIntercultural Contact

At first, the contact hypothesis is proposed to eliminate intergroup prejudices, aiming at the constant understanding between different ethnic groups in the process of communication, establishing a good inter-group relationship, and eventually resolving conflicts and conflicts and reaching consensus.In the early days,intercultural researcher Hu Wenzhong proposes that direct contact with local culture and direct communication with native speakers is the most effective way to improve intercultural communicative skills (Hu Wenzhong, 1999). In the study of Hungarian students' language learning, Kormos and Csizér define theintercultural contact as follows: For most students, intercultural contact includes not only direct and indirect contact with native speakers or non-native speakers of the target language, but also the contact with cultural products of target language (Kormos & Csizér, 2007). What's more, the research results show that intercultural contact promotes students' intercultural competence development and improves the motivation of language learning.This set of intercultural contact theoryis used by Peng Renzhong and Wu Weiping to study pathways for Chinese college students' intercultural competence. After dividing ways of direct contact and indirect contact, a factor analysis method is adopted to explore the impact of six key factors on the intercultural competence of college students, namely, domestic social media, foreign social media, domestic intercultural activities, foreign intercultural activities, cultural products, and multimedia and multimedia courses. The validity of table and the analysis of final results are as follows

Table 1   Reliability Analysis of Chinese College Students' Cross-cultural Contact Scale
(cited from Peng & Wu, 2016)

Dimensions	The number of items	Combination reliability (CR)	Average extraction variance (AVE)	*Cronbach's a* dimension	entity
Domestic social media（DSM）	8	0.898	0.525	0.881	0.892
Foreign social media（FSM）	3	0.865	0.682	0.869	
Domestic intercultural activities（DICA）	6	0.858	0.504	0.836	
Foreign intercultural activities（FICA）	6	0.869	0.527	0.836	
Cultural products（CP）	5	0.888	0.614	0.894	
Multimedia and multimedia courses（MMC）	3	0.821	0.605	0.823	

Table 2   Correlation Coefficient Table of six Chinese College Students' Intercultural Contact Pathways
(cited from Peng & Wu, 2016)

	Domestic social media	Foreign social media	Domestic intercultural activities	Foreign intercultural activities	Cultural products	Multimedia and multimedia courses
Domestic social media	1					
Foreign social media	0.514	1				
Domestic intercultural activities	0.338	0.288	1			
Foreign intercultural activities	0.454	0.386	0.254	1		
Cultural products	0.075	0.063	0.065	0.056	1	
Multimedia and multimedia courses	0.051	0.044	0.042	0.039	0.670	1

From the two tables, it shows that direct contact or indirect contact has a certain influence on the improvement of the cross-cultural competence of Chinese college students, but the difference lies in the

degree of influence of every pathway (Peng Renzhong & Wu Weiping, 2016). Intercultural contacts can also intrigue students' interest in English learning and promote the mastery of language knowledge (Xu Zhixin, 2017). And then, the improvement of language knowledge ability can also improve students' intercultural competence.

The intergroup contact theory that comes into being in America is from psychology. It is characterized by communication among different peoples by means of verbal or non-verbal behavior. In the process of scholars' investigation, they enrich the way of contact and combine intercultural study with this theory. What's more, there are different contexts in different countries. However, no matter how the contexts change, it aims at solving cultural conflicts and reaching the goal of peace. Even though it is applied to English teaching to cultivate global talents, it serves for effective communication. Furthermore, today's campus has more international students than before. The contact with other countries is also helpful to erase conflicts in college.

5 Conclusion

It is rarely seen that some research on the influence of intercultural contact on the intercultural competence of Chinese college students.After elaborating the details of intercultural competence and intercultural contact, thisarticle has also combed the relationship between the two.It is convinced that intercultural contact doesplay an important role in promoting intercultural competence of college students.Therefore, in today's foreign language teaching class, English teachers should take some measures related to intercultural contact to cultivate intercultural competence of college students. Although this paper has reviewed a lot of literature, it does not analyze some ways of intercultural contact on the impact of intercultural competence of college students. In the future, scholars can deeply investigate this.

Influence of Perceived Organization Support on Airport Staff's Safety Performance: Deviation Behavior as a Mediator

Xu Yang, Luo Fan, Xu Huijuan
School of Management, WuhanUniversity of Technology, Wuhan, P.R.China, 430070
(E-mail: 793825157@qq.com, sailluof@126.com, 1656733817@qq.com)

Abstract: This paper aims to find out the factors which affect safety performance of airport staff, discuss the influence mechanism of how perceived organization support acting on safety performance of airport staff. It studies on the impact of perceived organization support on safety performance and mediating effect of deviation behavior, SPSS 19.0 is used to do data analysis after recycling questionnaire data. Research result indicates that: Perceived organization support has a significant positive influence on safety performance, perceived organization support has a significant negative influence on deviation behavior, deviation behavior has a significant negative influence on safety performance,deviation behavior plays a significant partly mediating effect between perceived organization support and safety performance.
Key words: Airport staff; Perceived organization support; Safety performance; Deviation behavior

1 Introduction

With air travel increasingly welcomed by public, civilians' attention to aviation safety is continued rising as well. As a result, aviation insecurity incidents were highly exposed because of the widespread media coverage. The operation of the airport is very important for the development of the aviation industry. The safety problems of the airport can't be underestimated, and psychological safety of staff has a direct impact on the safety accidents (Yan Guiqing,2013).

At present, scholars pay much attention to the influence of perceived organization support on employee work performance, such as the summary of researches on the influence of perceived organization support on the performance of knowledge workers (Teng Ya, 2015). Safety performance of employees is divided into safety result and safety behavior, and to a great extent, safety performance of employees affects the safety performance of enterprises (Christian. M. S. Bradley. J. C. Wallace J C.et al, 2009). Foreign scholars have been maturing their research on safety performance. Domestic scholars have studied the relationship between perceived organization support and safety performance (Liu Zude, Wu Fei, Chen Yang, et.al, 2016). Workplace deviation behavior is a kind of spontaneous behavior, if members of the organization violate the existing system of policies, which will make the benefits of members of organization or the organization itself damaged, this behavior is defined as deviation behavior, including absenteeism, late, negative work, verbal attacks on colleagues, framed colleagues, verbal abuse and others (Robinson. S. L. Bennett. R, 2000). Domestic scholars haven't pay much attention to the influence of devotion behavior on safety performance, especially for deviation behavior as a mediator between two variables.

The purpose is to explore the impact of perceived organization support of airport workers on safety performance. Deviation behavior is selected as a mediator. It is aimed to provide reasonable and effective suggestions to improve the safety performance of airport.

2 Theoretical Basis and Research Hypothesis

2.1 Perceived organization support and safety performance

Employees form an overall feeling about whether the organization cares about their own well-being and whether their contributions to the organization are valued. Social exchange theory shows that employees who are motivated by perceived organization support will make more autonomous behaviors as rewards in support of the organization (Rhoades L, Eisenberge R., 2002). Foreign scholars have carried out a large number of empirical studies on enterprises and employees. The results show that perceived organization support has a significant influence on work performance of employees (Schermerorn. J. R. Gardner. W. L. Martin. T. N, 1990). Employees who think that organizations value and reward their contributions will perceive the organization's support which can be conducive to maintaining a better mental state, and improving their work performance, so we can see that perceived organization support has a positive influence on the work performance of employees (Eisenberger. R. Rhoades. L. Cameron. J, 1999).

Safety performance falls into the category of work performance. Safety performance can be

classified as safety result and safety behavior. Safety result refers to tangible results such as unsafe incidents or accidents. Safety behavior refers to employees' performance behavior (Christian. M. S. Bradley. J. C. Wallace J C.et al., 2009). This paper takes the airport staff as study object, and discusses the safety performance of airport staff. It is concluded that safety performance is the consequence of individual safety behavior. We argue that perceived organization support will have a positive influence on employees' safety performance. The following research hypothesis is proposed:

H1: Perceived organization support has a positive influence on safety performance.

2.2 Perceived organization support and deviation behavior

Previous studies have shown that perceived organization support has an impact on individual behavior. When employees feel perceived organization support, they will choose to enhance organizational citizenship behavior in return (Eisenberger. R. Armeli. S. Rexwinkel. B, 2001). Improving perceived organization support has good predictability on organizational citizenship behavior (Ling Wenquan, Yang Haijun, Fang Liluo, 2006). So the improvement of employees' perceived organization support has a positive influence on organizational citizenship behavior (Wei Jiangru, 2010). In addition, increasing perceived organization support can reduce the rates of employee turnover (Rhoades. L. Eisenberger. R, 2002). Social exchange theory also argues that employees can reap their work performance by retiring as a way of retiring in return for perceived organization support(Rhoades L,Eisenberge R, 2002).What's more, perceived organization support theory shows that, once employees feel that the organization values their contribution and employee welfare is concerned by the organization, they will increase the sense of organizational responsibility and tend to make various behaviors conducive to the development of the organization (Eisenberger. R. Huntington. R, 1986). The research shows that increasing of perceived organization support leads employees to make emotional commitment to the organization, and makes employees feel a sense of belonging (Chen. Z. X. Eisenberger. R Johnson. K. M.et al, 2009), which can reduce the generation of negative behaviors such as employee absence and negligent work (Tian Xizhou, Xie Jinyu, 2010), and it has a negative impact on employee's negative behavior (Rhoades. L. Eisenberger. R, 2002). We argue that the promotion of perceived organization support is conducive to reducing the incidence of employees' deviation behavior and has a negative effect on deviation behavior. The following research hypothesis is proposed:

H2: Perceived organization support has a negative influence on deviation behavior.

2.3 Deviation behavior and safety performance

Existing studies have shown that employees' unsafe behaviors will have an impact on safety performance (Yang Xiao, Luo Fan, 2017). Foreign scholars have proposed an effective method to solve the occupational safety and health challenge, which uses behavioral methods to improve the safety performance of employees in order to reduce the occurrence of employee unsafe behaviors. This method has great guiding significance on reducing the incidence of unsafe incidents (Krause. T. R. Seymour. K. J. Sloat. K. C. M, 1999).

Domestic scholars discuss the relationship between behavior and employees 'safety awareness, and propose the following views: As for enterprises which have better safety culture system, managers can effectively prevent employees' unsafe behaviors through behavioral corrections. In addition, safety awareness does not directly affect employees' safety behaviors, but indirectly influences them through mediators such as work pressure and safety knowledge (Zhang Jiang- shi, Fu Gui, Liu Chaojie, et.al, 2009).

After continuous theoretical and empirical researches, the influence of employee's unsafe behavior on safety performance of enterprises has been confirmed by domestic and foreign scholars. Deviation behavior belongs to unsafe behavior.We propose that reducing employees' deviation behavior can effectively improve their own safety performance.The following research hypothesis is proposed:

H3: Deviation behavior has a negative impact on safety performance.

2.4 Mediation test

When employees perceive the importance and support from their enterprise, they will give rise to the return of perceived organization support to the enterprise so as to enhance the organizational citizenship behavior (Eisenberger. R. Armeli. S. Rexwinkel. B, 2001), reduce their negative behaviors, deviation behaviors, regulate their own safety behaviors and ultimate their own safety performance and even improve the safety performance of enterprises.

Domestic scholars have less researches on the relationship between perceived organization support and safety performance, especially the research referring to deviant behavior of employees which is a mediator. It is aimed to explore the influence of airport staff's perceived organization support on safety performance, and select the deviation behavior as a mediator to explore the mechanism among the three

variables. The following research hypothesis is proposed:

H4: Deviation behavior has a mediating effect in the influence of perceived organization support on safety performance.

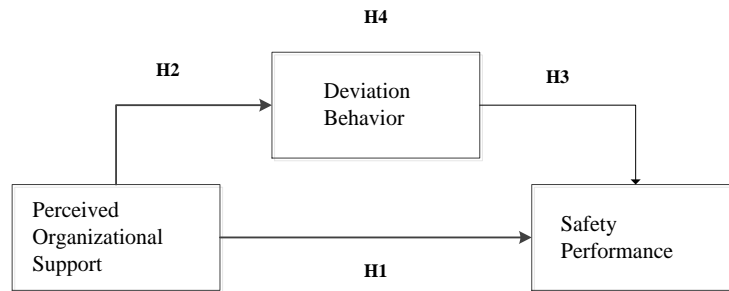
The theoretical model of this study is shown in Figure 1:


Figure 1   Research Hypothesis Model

3 Research Methods

3.1 Sample analysis

This study takes airport staff as the research object to study the influence of perceived organization support on safety performance and the mediating effect of deviation behavior in the mechanism. Questionnaire distribution channels mainly were mail commission and network questionnaire. A total of 230 questionnaires were distributed, and 210 questionnaires were finally returned, the questionnaire recovery rate reaches 91.3%. There are 190 questionnaires valid and effective questionnaires is 90.5%.

The proportion of men interviewed is 77.9%.The largest proportion of the population is 20-30 years old, accounting for 59.5%. The number of tertiary education holders is higher than that of other academic staff members, accounting for 40.5%."4 - 10 years" accounts the most. In terms of job categories, 53.6% of respondents were professional technicians.

3.2 Variable measurement

The 36-item perceived organization support questionnaire developed by Eisenberger et al has received extensive attention which is adopted in this paper. However, due to the large number of entries in this scale, Eisenberger's six-item short form was proved to be a good fit by meta-analysis (Eisenberger. R. Armeli. S, 2001). The reliability of perceived organization support scale is 0.832.

The scale of deviation behavior which was developed by Robinson et al. includes two dimensions of organizational deviation behavior and interpersonal deviation behavior (Robinson. S. L. Bennett. R. J, 2000), which includes eight question. The reliability of deviation behavior scale is 0.861.

This paper adopts the safety behavior scale (Neal. A. Griffin. M. A. Hart. P. M, 2000) for the safety performance measurement scale. The reliability of safety performance scale is 0.872.

4 Research Results and Analysis

4.1 Correlation analysis

In this part, Pearson coefficient, the correlation between the five variables were analyzed, and the results are shown in Table 4.1.

Table 1 Correlation Analysis

		Perceived organization support	Interpersonal deviation behavior	Organizational deviation behavior	Safety participation behavior	Safety compliance behavior
Perceived organization support	Pearson	1	-.530**	-.418**	.576**	.519**
			.000	.000	.000	.000
	N	190	190	190	190	190
Interpersonal deviation behavior	Pearson	-.530**	1	.577**	-.550**	-.476**
		.000		.000	.000	.000
	N	190	190	190	190	190
Organizational deviation behavior	Pearson	-.418**	.577**	1	-.517**	-.443**
		.000	.000		.000	.000
	N	190	190	190	190	190

Continual Table 1

		Perceived organization support	Interpersonal deviation behavior	Organizational deviation behavior	Safety participation behavior	Safety compliance behavior
Safety participation behavior	Pearson	.576**	-.550**	-.517**	1	.531**
		.000	.000	.000		.000
	N	190	190	190	190	190
Safety compliance behavior	Pearson	.519**	-.476**	-.443**	.531**	1
		.000	.000	.000	.000	
	N	190	190	190	190	190

**. Significant correlation at .01 level (bilateral).

Correlation analysis shows that there was a significant correlation between three variables. Perceived organization support is significantly and positively correlated with safety compliance behavior and safety participation behavior. Perceived organization support is significantly and negatively correlated with interpersonal deviation behavior and organizational deviation behavior. Safety compliance behavior and safety participation behavior are significantly positively correlated with interpersonal deviation behavior and organizational deviation behavior. This is in line with the previous theoretical assumption that employees perceive that the company's emphasis and support on their contributions will generate returns to the organization for perceived organization support so as to enhance the organizational citizenship behaviors and reduce their own negative behaviors and deviation behavior, which tends to be more safety, ultimately improving their own safety performance and even the safety of businesses.

4.2 Regression analysis

Regression analysis aims to analyze variables of gender, age, education level, years of working, work category. Analysis results are shown in Table 4.2:

Table 2　Regression Analysis

Variables	Safety performance		Deviation behavior	
Controlled variable	Model 1	Model2	Model1	Model2
Gender	0.121	0.069	-0.165	-0.169
Age	-0.233	-0.095	0.106	-0.020
Education	0.113	0.049	-0.155	-0.141
Years of working	0.367	0.226	-0.163	-0.056
Work category	-0.049	0.008	0.013	-0.052
Dependent variables				
Perceived organization support		0.403***		-0.497***
Deviation behavior		-0.337***		
R2	0.115	0.500	0.075	0.308
ΔR2		0.385		0.233
F	4.093**	22.282***	2.574*	11.664***

*. Significant correlation at 0.05 (bilateral); **. Significant correlation at the .01 level (bilateral); ***. Significant correlation at 0.001 level (bilateral).

SPSS 19.0 software is adopted to get the regression analysis, the results show that:
(1) Perceived organization support has a significant positive influence on safety performance, P <0.001, H1 is supported;
(2) Perceived organization support has a significant negative effect on the deviation behavior, P <0.001, H2 is supported;
(3) Deviation behavior has a significant negative effect on safety performance, P <0.001, and H3 is supported.

4.3 Mediation effect analysis

SPSS 19.0 is used to verify the mediating effect of deviation behavior between perceived organization support and safety performance.

(1) Whether the regression coefficient C of the influence of perceived organization support on

safety performance is significant?

(2) Whether the regression coefficient A of the influence of deviation behavior on perceived organization support is significant?

(3) Whether the regression coefficient B of the influence of safety performance on deviation behavior is significant?

(4) Whether the regression coefficient C 'of the influence of safety performance on perceived organization support and deviation behavior is significant. If the coefficient C'is not significant, then deviation behavior has a complete mediating effect. On the contrary, if the coefficient C' is significant and | C '| <| C |, deviation behavior has a partial mediating effect.

The results are as follows:

The regression coefficient C is 0.403, P <0.001, which is significant. The regression coefficient A is -0.497, P <0.001, which is significant. The regression coefficient B was -0.337, P <0.001, which is significant. The regression coefficient C' is 0.268, P <0.001, which is significant, and the regression coefficient decreases from 0.403 to 0.268, indicating that the deviation behavior has a significant partial mediation effect. This confirms H4: Deviation behavior has a mediating effect in the effect of perceived organization support on safety performance.

5 Conclusion

5.1 Analysis results

We take the airport staff as the research object to study its influence on the safety performance under the mediation effect of deviation behavior.

(1) Perceived Organization Support has a positive influence on Safety Performance. Perceived Organization Support has a significant influence on the Safety Performance of airport staff. Employees think that organizations value their contributions and reward their contributions, perceive the support of organizations and promote the performance of their work effectively（LIU Zonghua, LI Yanping, MAO Tianping，2015）. It helps to maintain a better mental state, enhance the safety of work, and enhance its own safety performance.

(2) Perceived Organization Support negatively affects Deviation Behavior. Perceived Organization Support has influence on the performance of airport workers, and Perceived Organization Support may choose to enhance Organizational Citizenship Behavior in return. In addition, the improvement of Perceived Organization Support will reduce the turnover rate of employees. The improvement of Perceived Organization Support will encourage employees to make emotional commitment to the organization, thus reducing the negative behaviors such as employee absence and negligence. In the meantime, airport staff will reduce their own Organizational Deviation Behavior and Interpersonal Deviation Behavior, avoiding Deviation Behavior from absenteeism, lateness and negative work, verbal attacks on colleagues, fraudulent efforts by colleagues, and verbal abuse of others.

(3) Deviation Behavior negatively affects Safety Performance. Deviation Behavior of airport staff will lead to some unsafe incidents, or even major accidents, such as Organizational Deviation Behavior from negligent sabotage, intentional persecution of public facilities and other acts will affect the smooth progress of airport security, which will not only affect the airport staff's safety performance, but also affect the overall safety performance of the airport.

(4) Deviation Behavior plays a part of the intermediary role in the influence of Perceived Organization Support on Safety Performance. Employees who perceive the importance and support of their contribution to the enterprise will generate return on perceived organization support to improve organizational citizenship behavior and reduce their own negative behavior and deviation behavior, and ultimately to make their own safety performance and even the safety performance of enterprises improved.

5.2 Suggestions

5.2.1 Stimulate the airport staff's Perceived Organization Support

Emotional managers need to communicate with the airport staff in time to inquire about their recent work status or confusion, take the initiative to solve their problems, make it feel the organization for his emotional support. In the material may be appropriate to give staff encouragement. By enhancing employees' sense of perceived organization support, employees' perceptions of emotional and material support come from the initiative provided by enterprises instead of being forced to improve the job satisfaction of airport workers(Tan Xiaohong, Qin Qiwen,Pan Xiaofu,2007)and make more contributions to the airport dedication.

5.2.2 Pay Attention to the Influence of airport staff's Deviation Behavior on Safety Performance

Airport managers should emphasize team building in reducing deviation behavior. Firstly, establish a sound system of work to ensure that the work started in an orderly manner to promote the consistency of the team. Secondly, the team should be stimulated awareness of cooperation, so that employees unimpeded exchange of information, coordination of staff behavior and improve the cohesion within the airport staff.

5.2.3 Improve the safety performance of airport staff

Firstly, the company out to create a safe atmosphere. For example, setting up safety warning signs in the working area of the airport to enhance their own safety awareness by strengthening the guidance on safety behaviors of airport staff so that they can comply with airport safety procedures and ensure their safety during work so as to enhance their own safety performance. The second is to build airport safety culture. For example, establish and improve the safety education system, carry out the safety concept to the airport staff, combine the theory and practice to convey the latest safety knowledge and lessons learned. An employee's understanding of safety improves their willingness to comply with workplace safety procedures and motivates them to proactively improve safety programs.

5.3 Research prospects

The innovation point of this paper is to strengthen the influence mechanism of perceived organization support on safety performance, and fill in the gap of the study of the deviation behavior as the mediator between the two variables.

In the future research perspectives: First of all, this study defines safety performance as an individual level, considers safety performance as an individual safety behavior and its consequences, according to which safety performance is divided into two dimensions: safety compliance and safety participation. Future research can define safety performance as a tentative study at the organizational level. Secondly, the self-assessment method adopted in this study for measurement of perceived organization support, deviation behavior and safety performance can be combined with self-evaluation method and others' evaluation method in the future study to measure the three variables again to make the measurement more accurate. Finally, the impact of airport staff support on safety performance may be affected by regulatory variables, such as the management level of the airport. Future research may be further investigated by incorporating regulatory variables.

Factors Contributing to Employee Motivation Through Leaders' Emotional Intelligence Competence

Rasoanirina Maroy Prisca, Sun Zehou
School of Management, Wuhan University of Technology, Wuhan, P.R.China 430070
(E-mail: nirmar3@hotmail.com, szh-63@163.com)

Abstract: Emotional intelligence of a leader may play a significant role in employee's motivation and the overall success of an organization. The goal of this study is to find the factors of leaders' emotional intelligence that contribute to employee motivation within an organization. From the review of existing literature, the following five factors were identified to influence employee output: Self-awareness, Self-regulation, Motivation, Empathy and Social skills. A questionnaire was designed to capture the above factors, and this was administered to 375 secondary school teachers and their leaders, selected from eight institutions in the capital of Madagascar. These schools were selected since they were seen to be a representative sample due to their size and location. SPSS version 20 was used to perform correlation and regression statistical analysis. Results of the study revealed that there was positive impact of social skills, self-emotion and self-awareness on employee motivation.
Key words: Emotional intelligence; Motivation; Leadership; Factors

1 Introduction

Nowadays, emotional intelligence is attracting the public and private sphere, particularly since the relationship between emotional intelligence, employee's motivation and employee's performance has been clearer than ever. Emotional intelligence is an essential factor liable for determining success in life and psychological health seems to play essential part in shaping the contact between employees in their working environment. In the complicated environment of public and private organizations, change has to be managed in a very careful manner. Managers benefit greatly from emotional intelligence in coping with such unpredictable situations in the workplace. Managers are able to better understand and read emotional intelligence in others through the use of emotional intelligence. Emotional intelligence affects organizational areas as varied as selection of employees, teamwork, employee development.

In todays' context, motivation of employee is much essential for the success of any organization and leadership. Emotional intelligence is also a great contributor within different factors. Emotional intelligence plays a vital role in the development of an organization (Njoroge & Yazdanifard, 2014). Organizational performance and effectiveness greatly depend on leadership success.

The role of education in developing mental and physical faculties cannot be understated. For a teacher, it is a paramount to not have in depth knowledge of their subject, but also have the ability to convey this information to their students effectively. Educational institutions are bereft without the guiding hand of teachers. Teachers are of utmost important for an educational system. Trained teachers are much more likely to use emotional intelligence in imparting knowledge to students.

In order for educational institutions of Madagascar to function properly and provide a high standard education to students, it is important for them to identify the need for developing activities that improve emotional intelligence competence of the teachers and their leaders and equip them with the skills to deal with issues that requires high emotional intelligence. Ultimately, this will lead to the development of a stable and grounded society. The ability of an individual to respond favorably to working under pressure is significantly improved through having high emotional intelligence. In the light of this, it is necessary to conduct the study on the factors affecting employee's motivation through leader's emotional intelligence in the higher education institutions. There is a room for research in this particular area, mainly in the context of Malagasy public and private educational institutions.

2 Literature Review

Emotional intelligence has long been studied in the western countries. Emotional intelligence means an understanding for mental and physical growth and in various studies it is inter linked with job satisfaction, power to lead and achievement (Ruvalcaba-Romero, Fernández-Berrocal, Salazar-Estrada, & Gallegos-Guajardo, 2017). It is considered as an ability which has power to manage relationships and this term was used first time by Salovey in 1997 as cited by (Mayer, Caruso, & Salovey, 2016). Emotional intelligence is a combination of two types of intelligences i.e. inter personal and intra

personal intelligence. Some scholars consider that intra personal intelligence means an understanding about one's own capabilities, stimulation and passion (Mayer, Salovey, & Caruso, 2000). The power which demands abstract thinking in order to achieve and identify passion and the skill to be awarded about the fact that how the senses and emotions affect the understanding and motivation (Goleman, 2006).

Emotional intelligence is   inter linked with emotions, social abilities and different type of attitude in motivating individuals to manage themselves and other human beings in order to have cooperation with different type of difficulties in various situations (Roeser, 2012). Emotions and environment can't be parted to understand the basic abilities and to manage them for getting complete personal development.

By studying different researches, it was explored that these emotional competences develop from general level to more complicated level and with the development of human growth, they become better in implementation and functioning with various type of concern such as family and business. It is not easy to evaluate emotional intelligence and its components which were given by the different theories (Duncan et al., 2013).   Rauf, Tarmidi, Omar, Yaaziz, and Zubir (2013) found that emotional intelligence described an ability which is interlinked with those demonstrated competencies which are considered as basic requirement for constructing self-understanding, social management and psychological awareness to implement sufficient frequencies to be effective in various situations. In the current situation, emotional intelligence is evaluated as a factor which involves awareness about inner state and recognition of different resources, self-management, awareness about society and purposeful usage of different social skills (Schutte & Malouff, 2011). Accordingly, they established that emotional intelligence is inter related with social competencies and abilities that evaluate how effectively individuals understand their ability and demonstrate themselves, having awareness about others' feeling and try to handle different type of challenges with managed level of pressures, stress and routine of the daily life. On the other hand, emotion in relation with social intelligence effectively influence personal involvement, personal management and different environmental pressures with a natural and relax manner (Picard et al., 2004).

In a study conducted by (Batool, 2013), it explored the correlation between emotional intelligence and leadership for its effectiveness. On the basis of results, positive significant relationship was found between emotional intelligence and leadership.

2.1 Motivation

Motivation is a word originated from the Latin which means "Motives" and motives means a moving cause, which is the process of activating properties which are involved in psychological motivation of forces to arouse behavior acting either on or within a person. Along with the fact that motivation is an important component to instruction and learning, one standard definition for the hypothetical construct of motivation does not exist. A process that gives energy and directions along with sustained behavior involves motivation which is motivated behavior and it is described as guided, directed and sustained (Pratama & Corebima, 2016). Motivation state is often described as guided, directed and goal oriented. It can be described as an internal state of an individual that helps to arouse, directs and maintains behavior. It is called internal process which activates, guides, and maintain someone's behavior over time. Motivation provides energy for doing something or for desired results.

2.2 Five areas of emotional intelligence in leadership

For leaders, Emotional intelligence is an important variable for success and achievement. There are five areas of competencies and skills which are helpful in leadership performance. These areas are self-awareness, self-regulation, motivation, empathy and social skills (Goleman, 2006).

First, self-awareness is an individual' thoughts, feelings, goals, strengths and weaknesses to guide decisions and how these can affect the people of the surroundings. Self-awareness deals with how to behave with humility with other people of surroundings. A leader can improve his self-awareness by observing and slowing down his thoughts. The second is self-regulation which can be defined as the way to manage as well as direct an individual's emotions in different circumstances. In the view of Goleman, this element shows flexibility and personal accountability of the leader with commitment. It can be enhanced through observation of values and code of ethics. It is important for a leader to be accountable and have self-control even in a challenging situation. The third and important element is motivation. Motivated leaders may work consistently to their extreme standards. If any leader is self-motivated, he or she will make the employees motivated as well. Optimistic attitude leads to a betterment and positive work output. The next element contributing to social intelligence is described as empathy. Leaders with such quality think and put themselves to any others' situation. They listen from all perspectives and have

a constructive feedback. Empathy is of great importance to get respect and loyalty from the employees. This characteristic can be enhanced by putting a leader to someone else's position and feeling, i.e. the body language and response of the feeling. Social skills are the last element regarding social intelligence competence which deals and manages about other people's emotions for movement in desired direction. Such type of leaders are great communicators. This can be improved through learning conflict resolution, better communication skills, as well as praising others.

2.3 Model of the emotional intelligence

Model for the emotional intelligence was presented by (Goleman, 2006). Accordingly, there are five areas as self-awareness, self-regulation, social skill, empathy and motivation. These competencies are not innate rather are learned capabilities. These should be developed by outstanding performance. He argues that all the individuals have general abilities by birth which determine their emotional competencies.

Another concept explains that emotional intelligence is a combination of mental abilities, physical competencies and other skills which have power to influence success in cooperating with situational requirement and stress (Duncan et al., 2013). Emotional intelligence is a cognitive capability that is different from intelligence but it is closely related with general intelligence. Similarly, emotional intelligence was initially known as the power to monitor one's own feeling and reactions of others.

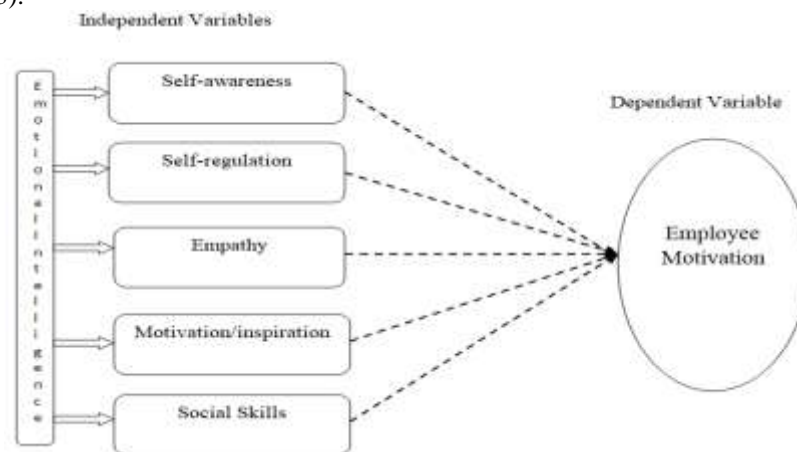
The ability to monitor one's own feeling and reactions of others also helps students to discriminate themselves from others. The usage of this capability guides them in keeping optimistic thinking and action. It is assumed that four inter related capacities are combined to build up emotional intelligence and these forces are known as capabilities which are helpful to understand one's own and other emotions (ERÖZKAN, 2013).


Figure 1　Research Model

Based on the above model, the following hypotheses are made:

H_1: Self-awarenesspositively influences employees' motivation,

H_2: Self-regulationpositively influences employees' motivation,

H_3: Empathypositively influences employees' motivation,

H_4: leader's Motivation/inspirationpositively influences employees' motivation,

H_5: Social Skillspositively influences employees' motivation.

3 Methodology

The current study was based on positivist paradigm. Quantitative data was used in this paper. Primary data was collected by administering questionnaires with 5-point likert scale questions. Convenient sampling technique was used for this research. 500 questionnaires were distributed to secondary school teachers and heads of institutions. The response rate was over 70%, 375 questionnaires were completed and returned. Descriptive statistics, correlation and regression methods were used to analyses the data in SPSS version 20.

4 Presentations and Analysis of Results

4.1 Correlation result

Table 1 below illustrates the results of Cronbach's Alpha, descriptive statistics and Pearson correlation analysis for the study variables. A Cornbrash's Alpha value of 0.7 implies an acceptable

level of internal reliability. In table 1, the results of the Cronbach's alpha analysis confirmed high correlation and reliability among items under each construct. The table also shows that the mean values for the variables are from 3.03 to 4.30, suggesting that the levels of Emotional intelligence of a leader's impact on employee's motivation are ranging between these values. The correlation coefficients for the relationship between the dependent variable (i.e., employee's motivation) and the predictors were less than 0.90, which signifies that the data was not affected by any severe problem of collinearity (Hair et al., 2005). Participants in the research reported a mean level of employee's motivation of 4.21. Bivariate correlations of four of the predictor variables with employee's motivation were statistically significant and in the hypothesized direction. As illustrated in table 1, Self-awareness was positively related to employee's motivation and highly statistically significant$(r = .734, p < .01)$. Thus, the first hypothesis (Hypothesis 1) was supported by the research. Similarly, Self-regulation in the emotional intelligence of the leaderin the selected schools was also positively correlated with employee's motivation with a statistically significant value $(r = .285, p < .05)$. Consequently, the second hypothesis was also supported by the research. However, the third, hypothesis was not supported as the correlation coefficient between Empathy and employee's motivation was negative and statistically insignificant $(r = -.164, p > .05)$. Further in this paper, reasons why are suggested.

Furthermore, motivation/inspiration and Social Skills in the intelligence of the leaderin the selected schools were also positively correlated with employee's motivation with statistically significant values of $(r = .307, p < .05)$ and $(r = .559, p < .01)$ respectively. Consequently, the fourth and fifth hypotheses were also supported by the research.

Table 1   Cronbach's Alpha, Descriptive Statistics and Correlation Results for the Study Variables

Variable	Mean	SD	Pearson correlation matrix					
			1	2	3	4	5	6
1 Employee Motivation	24.25	4.72	(.912)					
2 Self-awareness	20.02	3.96	.734**	(.853)				
3 Self-regulation	22.05	4.212	.285*	.432*	(.797)			
4 Empathy	22.18	4.546	-.164	.058	.101	(.937)		
5 Motivation/inspiration	21.39	3.976	.307*	.311	-.052	.113	(.820)	
6 Social Skills	20.42	3.742	.559**	.241**	.203	.184	.231*	1

Note: N = 375, Significant level: $*p < .05$, two-tailed, p <0.01** (2-tailed). Source: Authors computation from SPSS. Values in parenthesis are Cronbach's Alpha values.

4.2 Regression results

In a bid to reaffirm the test on the contribution of leaders' emotional intelligence competence on employee motivation, a regression model was assessed using the variance explained (R^2 measures) and the level of significance of the beta coefficients. Table 2 shows the model results. The results indicate that the effect of Self-awareness on employee motivation $(\beta_1 = .45, p<0.01)$ and Self-regulation on employee motivation $(\beta_2 = .13, p<0.05)$ are statistically significant. Thus, hypotheses *H1* and *H2* are supported. However, the beta coefficient of the variable representing empathy was not found to be statistically significant for the study $(\beta_3 = .03, p>0.05)$. Thus, hypothesis *H3* is rejected. The result further shows that the beta coefficients for Motivation/inspiration $(\beta_4 = .09, p<0.05)$, and social skills $(\beta_5 = .27, p<0.01)$ are statistically significant. This confirms hypotheses *H4*, and *H5*. The R^2 of the variables indicates that the model explains 72.63% of the variance in employee motivation.

Table 2   Result of the Regression Output

Model	Unstandardized Coefficients		Unstandardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	3.85	.42		9.27	.000
Self-awareness	.45	.06	.43	7.06	.000
Self-regulation	.13	.05	.15	2.44	.016
Empathy	.03	.11	.02	.29	.769
Motivation/inspiration	.09	.05	.12	1.94	.049
Social Skills	.27	.07	.25	3.85	.000

Note: N = 375, R^2 = .7263, Significant level: $*p < .05$, two-tailed, p <0.01** (2-tailed). Source: Authors computation from SPSS

The tables show the significant effect of emotional intelligence factors on employees' motivation. The results show that all the factors except for empathy have positive effect on employees' motivation. The most influencing factors are self-awareness followed by social skills and self-regulation.

5 Conclusion

Leadership plays a vital and significant role in any organization. Emotional intelligence and motivation are two important variables of contemporary research which contribute to the success of any organization. The current study found that four out of the five factors of emotional intelligence regarding leadership influence employees' motivation. These factors are self-awareness, self-regulation, motivation, empathy, social skills. The results of the present study imply that there is a significant relationship between leaders 'emotional intelligence and employee's motivation and performance in the secondary schools in the capital city of Madagascar. Whether employees or leaders, they all have great motivation towards teaching. In addition, when emotional intelligence is included in the leadership, it greatly enhances the employee's motivation which is needed for the progress of any nation.

This study is helpful for top managers in making decisions regarding inquiry of different dimensions which lessen employee's motivation to improve institution's performance working in the educational institutions. Better employee's job performance can be accomplished through identifying the factors which can create trouble in normal schedule of psychological working. In order to maintain and generate enthusiasm and motivation, they must be able to predict how to respond in different situations, changes, events and effectively handle these reactions. Top management must positively resolve the conflicts and maintain and create a sense generation to resolve disagreements, ensure trust and cooperation. Positive attitude and thinking can lead to the ideas to ensure trust and cooperation through an organization.

Emotional intelligence is an important area of human behavior, needs a lot of research study in developing countries like Madagascar. As emotional intelligence directly affects the employee performance in an organization. The abilities and decision-making power related to manage the contingence circumstances, which can arise out of blues.

- Further research study can be done on a sample of larger size for improved understanding of emotional intelligence among employees of educational institutions
- The study was conducted only in Antananarivo, further research can be conducted in other cities of Madagascar
- Research can also be carried out sector wise to check emotional intelligence impact on employee's motivation and job performance in various sectors in Madagascar.
- Further research can be conducted to see emotional intelligence effect on different dependent variables such as job satisfaction, organizational productivity, employee morale, organizational climate, employee training.

Countermeasures of Strengthening the Advanced Typical Model Education for College Students under the Network Environment

Wang Cong

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: congwang@whut.edu.cn)

Abstract: The widespread use of Internet along with the rapid development of Internet + pattern have both enriched and deepened the advanced typical model education among college students in both form and content. Based on the current situation of network culture education in colleges and universities, this paper believes that the concept of the network innovation of the advanced typical model education lags behind, mingled multiple values in society and rising self-consciousness of college students have all had negative influences on the actual effectiveness of the advanced typical model education. Hence, on the basis of traditional advanced typical model education, this paper puts forward some suggestions on using technology to strengthen the network education platform to guide students to improve their information discriminability and create positive campus atmosphere for them, with a view to promoting the new development of the advanced typical model education in colleges and universities.

Key words: Network environment; College student; The advanced typical model; Education countermeasure

1 Introduction

The Central Committee of the Communist Party of China on Strengthening and Improving Ideological and Political Work Several Opinions pointed out that we must pay attention to the application of the advanced typical model to influence and to spur the masses, forming a good ethos of advocating the advanced, learning the advanced, and striving to be advanced in the whole society. From this we can see that carrying out the advanced typical model excavation and cultivation among college students in colleges and universities can form a great atmosphere of common progress on campus to a great extent, enabling the majority of students to forge ahead, have the spirit of dedication and commitment. At the same time, it is also conducive to guide the majority of students in colleges and universities to learn the advanced typical models' deeds and then strive to catch up. This will be of great significance in strengthening and improving the ideological and political education of college students. (Fan Qingwen, Zhen Mi, Jin Bo, 2017)

"Expressway" of information provides us with all accesses to any information at any time, offering us endless knowledge. As network has gone deep into all aspects of the social life, the impact on social and ideological education has been more profound. The wide use of the Internet has not only enriched content of conducting the advanced typical model education for the educators, but also enriched the self-study content for the educated. Taking forceful measures to actively educate college students about the advanced typical model under the network environment is an inevitable direction for ideological and political educators in universities who are supposed to adapt to new situations and to solve rising problems, as well as an inevitable trend to digitalize the advanced typical model.

In response to the problem of "the advanced typical model education among college students", the academic community has proposed various theoretical perspectives based on different research perspectives. Some scholars put forward the value implication of college students' advanced typical models based on the cultivation perspective of college students' socialist core value system; (Hu Yunan, Luo Yinguang, 2013) some scholars put forward the innovation training pattern of the advanced typical model for college students based on the training and education pattern of the advanced typical model for college students. (Zhou Changming, 2013) Some scholars proposed that we must accurately grasp the discipline of cultivating the advanced typical model of college students, in which way we need to conduct effective guidance and to form an organic loop of "excavate the typical model - set the typical model - promote the typical model – learn from the typical model - care for the typical model - update the typical model". (Song Fangting, 2013) Based on the current situation of the advanced typical model cultivation of college students, some scholars explored the underlying causes of restricting the cultivation of advanced typical model of college students through questionnaires, proposing corresponding countermeasures and suggestions for the innovation of advanced typical model education for college students. (Lu Gang, Fan Jinfeng, 2016) Some scholars analyzed and compared the patterns of the advanced typical model education of college students and proposed a more targeted and effective

model education. (Yao Chunlei, Hou Wei, 2012) Some scholars put forward the research on the advanced typical training mechanism of college students based on social learning theory. (Zhang Jianqing, 2015) Last but not least, based on the theory of acceptability, scholars paid attention to the cognitive psychology of college students and let college students get comprehensive development and promotion under the inspiration and demonstration of the advanced typical models. (Xu Mingyu, Zhang Houjun, 2014)

In general, the research achievements of the academic community in the problem of the advanced typical education among college students has provided important academic resources for the selection of the topics, the construction of research ideas, and the focus of the research perspective.

2 Conception and Connotative Meaning of the Advanced Typical Model Education among College Students

Generally, a typical model is a representative person or project, which refers to be typical among the same kind of things. A typical model performs and describes the substantive characteristic, the growing trend and the rule, vividly illustrating the theory and theoretically embodying the practice. A typical character grows up in specific social environment which is also the specific relation in reality, and is influential. However, a typical character tends to surmount the limitation of time to be eternal. "An advanced typical model is anthropomorphized to be some core value of society. Its thoughts and actions, typical deeds bear the orientation of the mainstream value in society, represent the demand of the outlook on world, life and value, is visible philosophy. (Pan Yuteng, Chen Zhaoyang, 2011)

By utilizing the advanced typical models' behaviors, the advanced typical model education makes the abstract moral theory and the obscure moral propaganda anthropomorphic, specific and actual. Hence, this is a mode to drive college student groups around to enhance their self-knowledge, absorb inside information and conduct themselves. With the rapid development of information society and the wide application of new media, network has shown its significant effects as the platform and carrier, on people's thought interaction and information sharing. Network has also greatly expanded the communication channels in our society, which made it more convenient for the life of citizens. However, network is also a contradictory unity and a double-edged sword. With the explosive growth of the Internet's information amount and the tremendous effect of the superimposed public opinion, negative features showed, of which network perspectives become uncontrolled and out-of-order, information on the Internet is flooding and complicated as well as the content of information is difficult to distinguish the genuine and fake. All of these have created resistance on efficiently educating college students on the advanced typical model under network environment.

3 Dilemma the Advanced Typical Model Education among College Students Faced in the Network Environment

The domains of "Internet + (Internet Plus)" have been widened over these years, which has gradually been moulded as a brand new social life form and had profound influence on people's real lives. Accordingly, college student groups account for 90.3% among those with Internet access and the trend continues to grow. With the coming new 5G era, network project coverage of high schools will be in a new upsurge. The virtuality and versatility nature of the network has had promoted the development of campus culture construction of high schools, but also had impact on the advanced typical model education among college students running smoothly.

3.1 the advanced typical model education among college students lacks innovation

As the Internet has incorporated college students' life, the number of "net-worm" in college students has been increasing. According to CNNIC (China Internet Network Information Center), weekly time spent on network is abouttwenty-seven hours. Faced with such a large campus network frequency of use, the effectiveness of the advanced typical model education appears to be little. The first reason is that some colleges and universities ideological and political education workers are indifferent about the advanced typical model education, or insufficient or inappropriate to adopt the advanced typical model education. They have not reasonably integrated the advanced typical model education into the network information interaction platform, making the advanced typical network education float to the surface and form. Secondly, due to the influence of market-oriented economy, the hardware input and software development of colleges and universities in the advanced typical network are not enough, making the advanced typical network publicity of college students more than enough and unable to effectively support the effect and goal of educational propaganda.
Figure 1   Data of Weekly Time Spend on Network of Undergraduates

Today's college students have undergone great changes compared with the past, and the state of the advanced typical model education has also undergone a marked change. However, the advanced typical model education in colleges and universities still lags behind the requirements and needs of the development of the times. "Virtual reality is a new application of human perception and operation capabilities. It is a human-machine interface technology that simulates human visual, auditory, and dynamic behaviors in the natural environment with high fidelity, which makes the educated focus on the virtual environment of simulation. In particular, advanced virtual reality technology can mobilize all sensory organs of the educated and provide an immersive experience for the educated." (Yang Liyan, Wang Qi, 2007) In the actual education process, it is easy to theorize and educate the value spirits of the advanced typical models, and while raising the specific advanced typical spirit to an abstract theoretical height, it also makes the advanced typical model education contents dogmatic and formatted. As a result, the advanced typical model training in universities has become theoretical learning and indoctrination learning, which has weakened the original vivid, flexible, and diverse advanced forms of education and results.

3.2 College students' advanced typical education environment is dispelled by multiple values

Before the popularization of the Internet, the source of information for the educated people, in other words, university students, were mainly the integrated education environment of the "trinity" of society, schools and families. The arrival of the Internet era has changed the state of the original education environment, bringing challenges to the credibility of school educators in terms of the diversity and complexity of the content and the widespread penetration of the media. This has caused impact on the advanced typical model education environment of college students.

On the one hand, the large number of network information, the rapid update frequency and the information sharing of borderless and non-local areas have all made college students in an over-informed space and an over-informed state, which has increased the difficulty of screening the typical model education information in resources for college students within enormous information. This has thwarted the enthusiasm and adaptability of the typical model education, making it difficult for college students to devote themselves fully to the advanced typical model learning, which indirectly affects the operation and controllability of the advanced typical education under the "three-in-one" education environment. On the other hand, the breadth and depth of network information content and the novelty of multi-media packaging technology have greatly stimulated the interest and enthusiasm of college students in exploring online content, making it possible for university students to devote a lot of time to browsing these complex web content. Thus, the time and depth of participation in typical model education information are correspondingly reduced. The purposeful and planned advanced typical education environment is naturally at a disadvantage, compared with the huge, random, and novel cyberspace. The typical model education received by college students requires long-term identification and cognition before they can finally settle into their own intrinsic value. In this process, it is very easy to be interfered with and hindered by the network information which reduces the effectiveness of typical model education.

4 Countermeasures of Strengthening the Effectiveness of Advanced Typical Model Education for College Students under the Network Environment

4.1. Strengthen the network platform and innovate the typical model education concept

With its high extent of openness, strong interaction and rich information resources, the Internet provides an excellent platform of advanced typical model education for college students. As one of the main groups in the network society, college students have deep and complex relationships with the network culture in their ideological and behavioral activities, as well as the controllability of their psychological values. The deep involvement of the Internet in the field of ideological education in colleges and universities has led to an unprecedented expansion of the space for the typical model education based on the Internet, and has made typical model education more effective. Therefore, we must pay attention to the exploitation of new areas of the advanced typical model education under the network environment, actively build an online education platform, innovative educational concepts and create a new image of typical model education.

First of all, from the technical view, we will increase the system maintenance and daily supervision of the typical model education websites. The key to establishing a network typical model education position is whether a typical model education website can attract college students' clicks and concerns and whether it can guide the physical and mental development and personal growth of college students. Therefore, the staff of the typical model education website must increase technical input, introduce talented people and promote the spread of mainstream value culture through the vivid and interesting educational content, in which way they can capture the interests of college students to enrich the content of education.Secondly, strengthen the site integration and improve coordination. In recent years, many colleges and universities have established their own typical model education websites and information platforms, but the problem of following the trend also become more serious, resulting in blind construction and repeated construction. In this regard, on the basis of giving full play to their respective advantages, relevant units must strengthen cooperation, improve overall strength, ensure the development prospects of typical model education websites, increase the authority of typical model education websites and increase the effectiveness of model education websites to make the typical model education network platform really run.

4.2 Regulate the network environment and improve the ability of college students to identify information

When the information network is a double-edged sword that affects the further development of college students' advanced typical model education, one of the most important measures to reduce their adverse effects and improve the effectiveness of education is to improve the college students' ability of identifying and absorbing information. In today's era, the typical model education must be centered around college students. Through demonstrations and incentives of advanced typical models, the main theme is promoted and disseminated. Clearly define the main mission of the typical education, build the main position of the typical education network, then we can achieve the purpose of the advanced typical education for college students under the network environment.

To improve college students' ability to identify and filtrate online educational information, we need to start from two aspects. The first is to mobilize external forces, strictly control the sources of information, and do a good job of "firewalls", so as to minimize the spread of bad information, and to fully integrate the advantages of different information filtering software in order to maximize results. Secondly, ideological and political workers in universities should establish awareness of network propaganda. Teachers should explain and interpret the advanced typical model spirit through their own teaching art and personality charm, so that students can fully feel the sublimity of the typical model spirit. Strengthen their own ideological tendencies, establish positive political attitudes, strengthen the internalization of mainstream values, and use their own example to demonstrate positive examples to college students are promoted. At the same time, it is necessary to use the advantages of the network to carry out typical model publicity and education from various network demonstration platforms to guide students positively and positively.

4.3 Create campus atmosphere and improve the typical model education form

Burrhus Frederic Skinner believes that people and the environment are inseparable. The environment has shaped people so people's thinking and behavior are closely related to the objective environment. Changes in the environment will affect the adjustment and change of people's value orientation. Environment can determine people's thinking and behavior. University is the second "weaning period" of life. During this period, the state of college students' ideology is unstable, and it is

easy to contradict lectures in classes and instinctively resist the rigid contents of political education. On the contrary, because of its strong curiosity, people around college students and the environment around them have great attraction and influence. Therefore, in the typical model education for college students, we should pay attention to the campus environment where college students live in, and strive to adopt some specific social scenes and create a cultural atmosphere, so that they can receive imperceptibly model education, so as to achieve a result with half the effect.

5 Conclusion

In short, in the context of the Internet at that time, in response to the requirements of the development of the era, we focus on highlighting the age of the Internet and enhancing the effectiveness of the advanced typical model education under the network environment for undergraduates, guiding them more in line with the needs of the times and realities of development. It will help to improve the science and practicality of college students' ideological and political education, further expand the space for the development of typical model education, realizing the new development of the advanced typical model education for college students under the network environment.

In the future, we will also conduct more in-depth discussions on the concept innovation, subject structure, strategy analysis and mechanism research for strengthening the advanced typical model education among college students in a network environment, thus leading to forward-looking thinking.

Abstract: This study explored the mediating effect of self-esteem between personality and mobile phone addiction in college students. Eysenck Personality Questionnaire-Revised Short Scale for Chinese (EPQ-RSC), Mobile Phone Addiction Tendency Scale, Rosenberg's Self-Esteem Scale were administered to 591 college students. Results showed that extraversion was negatively associated with mobile phone addiction, and positively associated with self-esteem; Neuroticism was positively associated with mobile phone addiction, negatively associated with self-esteem; Self-esteem was negatively associated with mobile phone addiction. Extraversion, as well as neuroticism, could not only predict mobile phone addiction directly, but also by the mediating role of self-esteem indirectly. The present study can advance our understanding of how personalities affect mobile phone addiction.

Key words: Personality; Extraversion; Neuroticism; Self-esteem; Mobile phone addiction

1 Introduction

As the core media of Internet, mobile phones play an increasingly important role in people's lives. While mobile phones bring convenience to people, they also produce many negative effects. Mobile phone addiction refers to a new type of behavioral addiction to the mental and behavioral problems caused by the excessive dependence and abuse of the mobile phone (Chen, Liang, Mai, Zhong, & Qu, 2016). It is found that mobile phone addiction can affect self-regulated learning ability and interpersonal relationship, and bring about a series of adaptive behavioral problems (Sarwar, & Soomro, 2013). In recent years, mobile phone addiction has attracted the attention of researchers·They have carried out empirical studies on it, especially on the influence factors of mobile phone addiction (Toda, Monden, Kubo & Morimoto, 2006). Some researchers focus on the cognitive effect on mobile phone addiction (Wilmer, Sherman, & Chein, 2017), and some pay attention to the type of content which the mobile phone users addicted (Jeong, Yum, &Hwang, 2016).

Besides, personality is an important variable which may predict the behavior of mobile phone use and some studies have already explored the relationship. It found that extraversion and neuroticism were most closely related to mobile phone addiction. As far as extroversion is concerned, studies showed that people with higher extroversion score have more problematic mobile phone usage behaviors (Bianchi& Phillips, 2005). Igarashi et al. believes that highly extroverted people are cheerful and sociable, and they have a strong desire to communicate with their peers (Igarashi, Takai, & Yoshida, 2005).

However, previous research has also centered primarily on the direct association between mobile phone addiction and personality, and the underlying mediating mechanism (i.e. how personality influences mobile phone addiction) and moderating mechanism (i.e. when personality influences mobile phone addiction) involved in thisassociation are largely unknown. To fill these gaps, the presentstudy constructed a mediation model to test themediating role in the relation between mobile phone addiction and personality among Chinese college students. The findings would advanceour understanding of how personality could cause mobile phone addictionand how to protect adolescents from theimpacts of excessive mobile phone use.

Self-esteem is another important variable inaddiction area (Liu & Wang, 2011). Anumber of studies on self-esteem have found that low self-esteem is closely related to many kinds of addictions, such as alcoholism, drug addiction, Internet addiction, gambling addiction, and sexual behavior addiction, and so on. The mechanism of self-esteem and mobile phone addiction is similar to Internet addiction disorder (Chen, Liu, &Zheng, 2010). Low self-esteem individuals have more problematic mobile phones using.Self-esteem is significantly correlated with neuroticism and extraversion, which has been confirmed in many studies (Zheng& Gu, 2012). As a result, we chose the variable of self-esteem as the mediation factor and examined how personality affects mobile phone addiction through it. (See Figure 1)
Figure 1　Conceptual Model

2 Methods
2.1 Participants
A total of 591 college students(53.8% girls) completed our survey that was designed to collect information including demographic variables，mobile phone addiction，personality，self-esteem. Participants ranged in age from 18 to 21 years (M=18.87, SD=0.75).
2.2　Procedure
We adopted the convenience sampling to select the target school. In the target school (a comprehensive university), we used cluster random sampling method to choose three to four majors in each school from freshman to grade 3. Students in the target majors were invited to participate in the survey in classrooms. The authenticity, independence and integral nature of all answers as well as the confidentiality of the information collected were emphasized to all participants by well-trained psychology graduate students. Participants completed the survey after informed consent was obtained from the schools, teachers and participants.
2.3　Measurements
2.3.1 Mobile phone addiction scale
The Mobile Phone Addiction Scale was used in this study (Xiong, Zhou, Chen, You, & Zhai, 2012). It assesses four factors related to mobile phone addiction including withdrawal symptoms, prominence behavior, social comfort, mood changes. Participants rated 16 items on a five-point scale (1=never, 5=always). Higher scores indicate greater smart phone addiction. The MPAS has been used in Chinese adolescents with good reliability and validity. Cronbach's for the MPAS was 0.88.
2.3.2 EPQ-RSC
The EPQ-RSC was used to assess personality (Qian, Wu, Zhu, & Zhang, 2000). Including four subscales of extroversion (E), neuroticism (N), Psychoquality (P), and polygraph (L), each subscale of 12 projects, with 48 items. This study only selects two subscales of extroversion (E) and neuroticism (N). The Cronbach's alpha of extroversion (E) and neuroticism (N) subscales were 0.74 and 0.78 respectively.
2.3.3 SES
The self-esteem scale was compiled by Rosenberg, consists of 10 items, and the score is graded by 4 grades. The higher the score, the higherthe self-esteem level is.
2.4 Statistical analyses
All the statistical analyses were conducted with SPSS 19.0 software package.

3 Results
3.1 Preliminary analyses
The one-way analysis of variance indicated that mobile phone addiction showed no grade and major differences. The descriptive statistics and correlation matrix were presented in Table 1. The correlation coefficient between neuroticism and the dimensions of mobile phone addiction is 0.317-0.423(p< 0.01). The correlation coefficient between extroversion and the dimensions of mobile phone addiction is between -0.092-0.295(p< 0.05). The correlation coefficient between extroversion and mobile phone addiction was -0.173(p< 0.01). The results showed that extroversion was negatively correlated with mobile phone addiction, and positively correlated with self-esteem, neuroticism was positively correlated with mobile phone addiction, and negatively correlated with self-esteem. And self-esteem was negatively correlated with mobile phone addiction.
3.2 Testing for the proposed model

Table 1   Descriptive Statistics and Inter Correlations Between Variable

ariables	M	SD	1	2	3	4	5	6	7	8
1 MPA	2.4774	0.596	1							
2 self-esteem	3.2603	0.424	-0.331**	1						
3 extroversion	1.6191	0.234	-0.173**	0.352**	1					
4 neuroticism	1.3785	0.259	0.423**	-0.424**	-0.252**	1				
5withdrawal	2.7659	0.713	0.876**	-0.251**	-0.098*	0.344**	1			
6 prominence	2.2503	0.735	0.821**	-0.257**	-0.125**	0.352**	0.573**	1		
7 social	2.2955	0.744	0.704**	-0.290**	-0.295**	0.317**	0.469**	0.475**	1	
8 mood	2.3850	0.744	0.804**	-0.302**	-0.092*	0.367**	0.597**	0.613**	0.481**	1

Note.N = 591. *p < 0.05. **p < 0.01.

Extroversion, self-esteem and mobile phone addiction were significantly correlated; Neuroticism, self-esteem and mobile phone addiction were significantly correlated. This satisfies the precondition of the analysis of the mediating effect. The mediator effect model M between personality (extrovert, neuroticism) and mobile phone addiction was established by using self-esteem as the intermediary variable, extrovert and neuroticism as the independent variable and mobile phone addiction as the dependent variable (Figure 2).

The 12 items of extraversion and neuroticism subscales were packaged into two factors by random combination. Each factor contained 6 items. The 10 items of self-esteem scale were packaged into two factors, each containing 5 items. Listel 8.70 was used to fit the model. The fitting index were $^2/df =$ 3.40, NFI=0.97, $NNFI$=0.96, CFI=0.98, IFI=0.98, GFI=0.97, $RMSEA$=0.064. The fitting indexes were very good, indicating that the model is fit well.

Figure 2 showed that extroversion and neuroticism had significant predictive effect on self-esteem, and the path coefficients are 0.34 and -0.48 (t=5.69, $P<0.001$; t=-7.80, $P<0.001$). The negative predictive effect of self-esteem on mobile phone addiction is significant, and the path coefficient is -0.23 (t=-2.80, $P<0.01$). After adding self-esteem as an intermediary variable, the predictive effect of extroversion on mobile phone addiction was no longer significant (t=1.52, $P>0.05$), while the predictive effect of neuroticism on mobile phone addiction was still significant (t=6.24, $P<0.001$). The results showed that self-esteem played a complete mediating role between extroversion and mobile phone addiction, and played a part role in mediating between neuroticism and mobile phone addiction, accounting for 20.0% of the total.
Figure 2   The Mediating Effect Model of Self-esteem betweenPersonality and Mobile Phone Addiction

4 Discussion

In this study, extraversion and mobile phone addiction were significantly negatively correlated, which is different from foreign research results.

The reasons may be in the following aspects: first, the outcome variables of research on personality and mobile phone use in foreign countries are either the problematic mobile phone use or one aspect of the mobile phone use(such as short message)(Bianchi,& Phillips, 2005), not mobile phone addiction.It's normal that extroverts are more likely to socialize, have more friends and networks, and use more text messages and mobile phones, but that doesn't necessarily mean that extroverts are more likely to become addicted to their phones. Second, the results are consistent with the relevant findings of Internet use.

Amiel et al. found that introverts express their "true selves" through online social interaction, while extroverts prefer to express their "true selves" through real-life interactions (Amiel& Sargent, 2004). Third, extraversion is negatively correlated with loneliness, and loneliness can significantly predict Internet addictionand mobile phone addiction (Zhou& Yao, 2011; Liu, Xu, &Hu, 2009). The more introverted people, the less real communication. As a result, they are more likely to immerse themselves in the virtual world. Therefore, extraversion significantly negative prediction of mobile phone addiction is acceptable and understandable

The results of the mediating effect test showed that self-esteem played a complete mediating role between extroversion and mobile phone addiction, and played a partial intermediary role between neuroticism and mobile phone addiction. First of all, it shows that the cognitive-behavior model of Internet addiction can also be used to explain the mobile phone addiction, which verifies the hypothesis of this paper. That is neuroticism and introversion as the susceptibility qualities are the far end of factors affecting mobile phone addiction while low self-esteem, as a kind of non-adaptive self-evaluation, is the proximal factor of mobile phone addiction. At the same time, it also shows that self-esteem has a different effect on the relationship between mobile phone addiction and extraversion and neuroticism. The social metering theory of self-esteem holds that self-esteem is an internal reflection of the good or bad interpersonal relationships, and that self-esteem is important not because of its own special intrinsic value, but because self-esteem plays an important role in helping people maintain good relationships with others(Zhang&Li, 2009).

From the point of view of interpersonal interaction and interpersonal relationship, extraversion is more closely related to interpersonal interaction than neuroticism. Extraversion tends to positively predict interpersonal trust, while neuroticism negatively predicts interpersonal trust. Highly extroverted individuals have better interpersonal relationships, gain more social support, have more positive emotions, while the neurotic individuals are less able to adjust their emotions and are often in a bad mood state. Therefore, extroverts are especially sensitive to interpersonal relationships, and the poorer their interpersonal relationship is, the lower their self-esteem level.

5 Conclusion

This study focused on the influence of personality (extroversion, neuroticism) and self-esteem on mobile phone addiction, and explored the correlation between these factors and the intermediary role of self-esteem between personality and mobile phone addiction in order to clarify the influence mechanism of personality on mobile phone addiction. The results showed that extroversion, neuroticism and self-esteem can significantly predict mobile addiction, extraversion and self-esteem had a significant positive correlation, and neuroticism and self-esteem had a significant negative correlation. That is, the more extroverted individuals, the higher the level of self-esteem, the lower the level of their addiction to mobile phones; the higher the score of the individual neuroticism, the lower the level of self-esteem, the higher the level of their addiction to mobile phones. Excepted for Extraversion, the other results were consistent with the related research results (Bianchi& Phillips, 2005; Zheng&Gu,2012).

This result indirectly supports the social metering theory of self-esteem, and has important implications for the influence of interpersonal relationship on mobile phone addiction. The limitations of the present study should be noted. First, this study is a survey research. The results should be interpreted with caution in terms of causality. Future studies may conduct experimental research to strictly confirm the causal relationships among these variables. Second, the self-report method restricts the validity of the data due to social desirability and other biases. Therefore, future research may try to collect data from multiple informants (e.g., adolescents, parents, teachers, and peers).

Research on the Relationship Between Personality Traits and Subjective Well-being of Collepe Students: Focusing on College Students in Wuhan

Li Fan

School of Mechanical and Electrical Engineering, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 2273244883@qq.com)

Abstract: The relationship between personality traits and subjective well-being(SWB) of university students is studied with the method of questionnaires and university students in Wuhan as subjects. Within the research area of the five dimensions of personality traits and the six factors of SWB, a correlation analysis and a regression analysis on the questionnaires are given and a structural equation model is established based on statistical principles. The results suggest that the SWB of university students is overall medium-high, and it has showed significant differences in the family structure facet and the marginal significance in the university grade facet. In terms of the variables of personality traits, the Openness dimension has suggested significant differences in the gender facet, and the Conscientiousness dimension and the Agreeableness dimension in the student-source place facet, and the Neuroticism dimension and the Agreeableness dimension in the family facet, and the Agreeableness dimension and the Openness dimension in the university grade facet. The overall SWB of university students is significantly related to the five dimensions of personality traits, which has demonstrated a profound meaning for guiding the improvement of the SWB of university students.

Key words: University students; Personality traits; Subjective well-being; Happiness

1 Introduction

What is happiness? This has always been an interesting topic that draws attention from the public. Aristotle, a famous thinker of ancient Greek times, once said: "Happiness is the meaning and the purpose of life, the whole aim and end of human existence"(Bertrand Russell, 2009). From ancient times to the present, discussions about happiness have never been stopped, and numerous scholars have proposed a concept called "subjective well-being" based on long-term researches. This is a pleasant subjective feeling brought by the element "happiness" to the bottom of people`s hearts (Wang Xinyi, 2018). SWB is one of the most important topics in the field of positive psychology. The study of SWB began in 1950s, and as psychologists have continued to study on SWB, they find that personality traits are the main factors affecting SWB, and are regarded as the best resources for prediction (Diener.E, 1999).

However, the complexity of personality leads to its uncertain definition yet. Generally, it can be described in the following ways:

a. Additive definition. It comes from ancient Roman times and psychologists believes that personality is the sum of the characteristics shared by individuals. This definition is helpful to determine the extension of personality and to explore the characteristics including in personality. Due to personality is not simply the sum of many traits but the organic integration of various traits, this definition is preliminary. It is possible to extend the concept of personality.

b. Generalization definition. This definition emphasizes the organization and completeness of various attributes of personality that constitute the elements of the overall personality, which are the components of personality. This definition emphasizes the organization and integrity of various characteristics of personality, which is much advanced than the additive definition.

c. Rational definition. The definition describes that personality traits are rational and being ordered in a certain manner so that they can be clearly organized and have a good internal identity. This definition regards the various characteristics of personality as being organized and arranged according to a certain hierarchical structure, so as to make the personality characteristics distinct and have inner unity. All things in my own experience that belong to "me" and are related to "me" are regarded as the contents of my own, confusing the boundaries between consciousness and matter, and treating many things of consciousness as material.

d. Adaptive definition. This definition is affected by Darwin's evolutionary theory, and regards personality as a special form of adaptation formed in the process of achieving harmony with the

environment of the individual. This definition focuses on the relationship between the individual and the environment and the adaptive ability of the personality, which is meaningful. However, it is not comprehensive to limit the human pattern to adaptation. This definition emphasizes the function of personality, and does not point out the inherent characteristics and essence.

e. Differentiation definition. It highlights the uniqueness of the individual but not the same as individual difference. (Beizhi Talent Research Institute, 2015).

Studying on the relationship between personality traits and SWB of university students has important theoretical and practical meanings for the completion of such domestic research theories and for contemporary university students to rationally handle their pressure and challenges. On the one hand, the domestic research on this topic has not yet reached the world-class level. Researchers usually study the impact of objective factors such as health state and social support on SWB, and seldom do they study that of subjective factors on SWB. On the other hand, university students shouldering the heavy responsibility for national development and the hope of future and society are confronted with strong pressure like job hunting and emotional attachment problems that have made a significant influence on the expectations for happiness of university students. Therefore, this study suggests diverse ways for university students with different personality traits to reasonably manage life pressure so as to achieve inner peace and harmony, which finally improves their SWB. And it also provides some suggestions and methods for university administrators to give different guidance help for university students with different personality traits when dealing with various events, leading them to become mentally healthy talents adaptive to modern society.

2 Research Methodology
2.1 Research method of SWB
Diener's definition of SWB is currently accepted by most researchers. It is characterized by subjectivity, integrity and stability (Diener E, 1984). Diener distinguished the external factors influencing subjective happiness from the internal factors, but the study found that the external factors did not have so much influence. Thus, the subsequent research focused on the internal factors, namely, the internal construction of individuals determines how life events are perceived, and thus affects the happiness experience. The current mainstream research theories are: Target Theory, Activity Theory, Expectancy Theory, Judgment Theory, etc. Considering that SWB is a relatively complex and non-objective concept, scholars often use the self-report inventory to measure individual SWB. With the deepening of research on SWB in recent years, domestic researchers have begun to introduce foreign measurement tools for study. However, due to the existence of certain cultural differences, foreign scales are not fully applicable to the Chinese people, thus causing the localization of foreign measurement and compilation by many researchers (Zhang Xinggui, 2004). Based on the previous studies (Qiu Lin, 2003), it is suggested that the self-report inventory is much more rational and also the General Well-Being schedule(GWB) is most frequently used to measure one`s happiness because of its relatively high reliability and validity. Consequently, this paper also adopts it to investigate and research the SWB of university students.

2.2 Theories of personality traits and their common research methods
Theories of personality traits focus on the characteristics contained in the proprium and the self as well as how they are formed with the self-development, including the following theories (Peng Tongling, 2011): G.W. Allport' theory of personality traits. In Allport' opinion, traits are the basis of personality and the basic construction unit of psychological organization, which have established the academic status of personality psychology in the United States and established a set of personality psychology theories. However, his personality theory lacks systematization and integrity, and ignores the social root of personality. The "trait" he describes is only a hypothetical thing and there is no statistical standard. Cattell's personality traits theory. Cattell agreed with Allport' argument that personality traits are divided into common traits and personal traits, but Cattell did not overemphasize the role of individual traits, and accommodated the influence of environmental factors on personality. Eysenck's theory of personality traits. This theory based on actual data from the personality test. After analyzing the factors of a large number of personality test data, Eysenck classified all personality traits into two dimensions with continuity. These two dimensions of continuity are emotional stability and introversion. However, he combined the personality type pattern and the trait pattern organically, which was more comprehensive, more systematic and more hierarchical than the previous personality theory. Guilford's theory of personality traits. It is a unique pattern of all kinds of traits, while personality traits are

identifiable and persistent characteristics that vary from person to person. Different traits can be observed from different angles. the five factor model——Agreeableness, Neuroticism, Openness, Extraversion, and Conscientiousness. The five factor model of structure is closer to the real dimension of personality, which can be said to be a strong support for psychological counseling and provide a theoretical basis for formulating intervention measures for developmental counseling.

As is described in the previous section, this paper mainly uses measurement as research methods. Measurement tools are generally divided into two categories: one is the self-report inventory with a clear structure, and the other is to a projective test with an unclear structure. The self-report inventory is easy to handle and its scoring system is also simple, and thus most scholars use it as the measurement for personality. This paper is decided to use the brief version of the Chinese Big Five Personality Inventory given that it is convenient and simple with relatively high reliability and validity. The NEO Personality Inventory was compiled by McCrae and Costa in 1987, and later scholars Wang Mengcheng and Dai Xiaoyang prepared a simplified version of the Chinese Big Five Personality Inventory based on the NEO Personality Inventory. It includes 40 items and has good reliability and validity with its psychological characteristics superior to foreign counterparts.

2.3 Specific research methods and tools

The object of study is university students in Wuhan, and the data are acquired through questionnaires. The first step is to set up the composition of participants, and then questionnaires are distributed among the selected university students in Wuhan via stratified random sampling. 510 questionnaires are handed out and 470 are recovered, 442 of which are valid with an 86.7% effective recovery rate. The basic composition of the study object is shown in Table 1.

Table 1   Composition of Participants（N=442）

Item	Classification	Amount	Percentage
Gender	male	235	53.17%
	female	207	46.83%
Grade	freshman	125	28.28%
	sophomore	125	28.28%
	junior	90	20.36%
	senior	102	23.08%
Major	liberal arts	184	41.63%
	science	258	58.37%
Student-Source place	urban city	271	61.31%
	rural area	171	38.69%
Family Structure	single-parent	31	7.01%
	non-single-parent	411	92.99%

The two test variables in this research are personality traits and SWB, and the GWB is adopted to assess the subjects` understandings of happiness (Zhang Xuejun, 2002; Xu Zhen, 2011). This questionnaire is divided into six sections and scores on the six factors of SWB, which are energy, worries about health, frustrating or pleasant mood, relaxation and tension, control of emotion and behavior, and satisfaction and interests in life. The Chinese scholar Duan Jianhua revised the scale in 1996, of which the correlation coefficient between the score of a single question and the total score ranges from 0.48 to 0.78 and between the subscale and the total scale from 0.56 to 0.88, and the α coefficient is 0.91 for male and 0.95 for female. This shows the scale has good reliability and validity (Li Meng, 2013). The scale has two scoring systems, one is additive and another is reverse. Specifically, question 1, 3, 6, 7, 9, 11, 13, 15, 16 is scored reversely, that is, questions from the right to the left of the scale accounts for 1 point, 2 points.... Finally, the more one scores, the higher level SWB reaches.

2.4 Test procedure and data processing

With the assistance of the university teachers, the author gives questionnaires to students in the classrooms, asks them to answer the questions and reads the instructions and precautions in front of them with the different grades and disciplines of tested students taken into consideration. The time for test is 20 minutes, and it should be answered anonymously on site. After the test, the questionnaires are collected in the classrooms.

Then the questionnaires are sorted out to screen out invalid ones. And the valid ones are input to the computer, and the data from questionnaires are counted with the method of descriptive statistics through SPSS19.0. Lastly, the data are analyzed and a structural equation model is established with the usage of T-test, regression analysis and correlation analysis through AMOS17.0.

3 Findings
3.1 Overall SWB of university students
The descriptive statistics of the overall SWB of university students tested are shown in Table 2 based on their GWB scores. It is indicated that regarding dimensional factors of SWB of university students, the overall SWB averages 78.92 points, and its minimum is 46 points and maximum 117 points while the norm for domestic overall SWB is 71 points for female and 75 points for male. Therefore, the overall SWB of Chinese university students are much above the norm. Additionally, the score rank of each factor is shown in the following table.

Table 2　Overall SWB of University Students

Item	Max	Min	M	SD
Satisfaction and Interests in Life	6.00	1.00	3.04	1.05
Worries about Health	16.00	2.00	11.13	2.43
Energy	30.00	6.00	17.50	3.81
Frustrating or pleasant mood	28.00	4.00	18.81	4.14
Control of Emotion and Behavior	17.00	5.00	11.97	2.19
Relaxation and Tension	26.00	9.00	16.41	3.07
Overall SWB	117.00	46.00	78.92	10.96

3.2 Demographic differences in SWB among university students
In this study, first, the subjects are divided into two groups based on their majors whether they are literal arts or science to study their SWB scores, and the data differences between the two groups are analyzed by independent sample T-test, of which the results are shown in Table 3. From the Table results the conclusion that there are little differences in the SWB of university students in spite of their different majors(p>0.05).

Table 3　Differences in SWB of University Students and Its Factors due to Their Majors

Item	Science（n=258）（M±SD）	Liberal Arts（n=184）（M±SD）	Sig	T
Satisfaction and Interests in Life	3.05±1.04	3.02±1.07	0.737	-0.336
Worries about Health	11.17±2.50	11.07±2.33	0.654	-0.449
Energy	17.74±3.82	17.15±3.78	0.104	-1.628
Frustrating or pleasant mood	18.82±4.25	18.97±3.99	0.708	-0.374
Control of Emotion and Behavior	11.90±2.22	12.06±2.14	0.447	0.761
Relaxation and Tension	16.46±3.19	16.35±2.90	0.726	-0.351
Overall SWB	79.14±11.23	78.61±10.60	0.616	-0.501

Second, the subjects are divided in to the female group and the male group to study their scores through independent sample T-test so that the impact of gender on SWB can be observed, of which the results are shown in Table 4. Thus, it is summarized that gender has a slight influence on the SWB of university students(p>0.05).

Table 4　Differences in SWB of University Students and Its Factors due to Their Genders

Item	Female（n=207）（M±SD）	Male（n=235）（M±SD）	Sig	T
Satisfaction and Interests in Life	3.06±1.04	3.02±1.06	0.683	-0.409
Worries about Health	10.94±2.37	11.29±2.47	0.124	1.542
Energy	17.36±3.57	17.61±4.01	0.491	0.689
Frustrating or pleasant mood	18.93±4.18	18.84±4.11	0.821	-0.226
Control of Emotion and Behavior	11.82±2.08	12.10±2.27	0.177	1.352
Relaxation and Tension	16.53±2.90	16.31±3.22	0.452	-0.754
Overall SWB	78.63±10.69	79.17±11.21	0.608	0.514

Third, the subjects are divided into two groups based on the location of their families whether they live in rural areas or urban cities to study their SWB scores via independent sample T-test, of which the results are shown in Table 5. it suggests that the SWB of university students from rural areas is not

obviously different from that of students from urban cities(p>0.05).

Table 5　Differences in SWB of University Students and Its Factors due to Their Family Structures

Item	Non-Single-Parent（n=411）（M±SD）	Single-Parent（n=31）（M±SD）	Sig	T
Satisfaction and Interests in Life	3.06±1.05	2.68±0.94	0.048	-1.981[*]
Worries about Health	11.18±2.47	10.35±1.70	0.016	-1.184[*]
Energy	17.57±3.86	16.49±2.92	0.125	-1.535
Frustrating or pleasant mood	18.98±4.20	17.58±2.86	0.016	-1.818[*]
Control of Emotion and Behavior	11.99±2.21	11.55±1.88	0.270	-1.104
Relaxation and Tension	16.39±3.06	16.77±3.19	0.499	0.677
Overall SWB	79.18±11.11	75.42±8.18	0.021	-1.848[*]

(Note: the symbols of "*", "**" and "***" refer to "<0.05", "<0.01" and "<0.001" respectively)

At last, to study the differences of SWB of university students in university grade, four groups including freshman, sophomore, junior and senior students respectively are tested and the one-factor analysis of variance is performed on their scores, of which the results are shown in Table 6. As is suggested in the Table, the factor of university grade plays an unimportant role in the SWB of university students(p>0.05), while it exerts a different influence in the factor of worries about health for SWB(F=2.356，P=0.071) , which results that the difference in SWB caused by university grade is close to the marginal significance.

Moreover, the posttest indicates that the difference in SWB of the senior group is much obvious than that of the other groups.

Table 6　Differences in SWB of University Students and Its Factors due to Their Grades

Item	Freshman（n=125）M±SD	Sophomore（n=125）M±SD	Junior（n=90）M±SD	Senior（n=102）M±SD	T
Satisfaction and Interests in Life	3.11±1.05	2.97±1.11	3.00±1.05	3.06±0.973	0.443
Worries about Health	11.29±2.44	11.30±2.36	11.30±2.26	10.57±2.60	2.356
Energy	17.46±4.04	17.51±3.97	17.71±3.76	17.33±3.39	0.162
Frustrating or pleasant mood	18.80±4.07	19.02±4.34	19.00±4.41	18.70±3.74	0.149
Control of Emotion and Behavior	12.34±2.26	11.75±2.12	11.80±2.17	11.92±2.16	1.790
Relaxation and Tension	16.20±2.94	16.58±3.12	16.70±3.20	16.22±3.07	0.730
Overall SWB	79.20±11.28	79.13±11.16	79.51±11.02	79.79±10.32	0.486

3.3 Overall situation of personality traits of university students

The analysis on the overall situation of personality traits of university students is shown in Table 7. It is suggested that the average scores in each dimension of personality traits of university students are very close, among which the scores in the Agreeable dimension are relatively higher while the scores in the Neuroticism dimension the opposite.

Table 7　Overall Situation of Personality Traits of University Students

Item	Amount	Average	Standard Deviation	Number of Items	Average Score per Question
Neoroticism	442	26.91	5.74	8	3.36
Conscientiousness	442	32.31	5.84	8	4.04
Agreeableness	442	33.73	6.32	8	4.22
Openness	442	32.67	5.99	8	4.08
Extraversion	442	30.45	6.10	8	3.80

3.4 Demographic differences in personality traits among university students

First, the subjects are classified into two groups based on their majors whether they are literal arts or science to study their SWB scores, and the differences in their score on personality traits between or

science to study their SWB scores, and the differences in their score on personality traits between two groups are analyzed by independent sample T-test. From the data in Table 8 results the conclusion that scores in each dimension of personality traits are similar in the university major facet(p>0.05).

Table 8 Differences in Personality Traits of University Students and Its Dimensions due to Their Majors

Item	Science（n=258） M±SD	Liberal Arts（n=184） M±SD	Sig	T
Neoroticism	3.39±0.75	3.33±0.67	0.353	-0.930
Conscientiousness	4.02±0.72	4.05±0.74	0.682	0.410
Agreeableness	4.21±0.83	4.22±0.74	0.862	0.173
Openness	4.09±0.76	4.07±0.74	0.832	-0.212
Extraversion	3.77±0.75	3.86±0.77	0.200	1.284

Second, the subjects are classified in to the female group and the male group to study their scores on the personality trait scale through independent sample T-test, of which the results are shown in Table 9. The data from the following Table proves that the differences of gender in the Openness dimension reach the significant difference(p<0.05), which indicates that the male and the female behave differently in the Openness dimension, and furthermore the male Openness is higher than the female through the comparison of their average scores. However, any obvious difference is not observed in other dimensions(p>0.05).

Table 9 Differences in Personality Traits of University Students and Its Dimensions due to Their Genders

Item	Female（n=207） M±SD	Male（n=235） M±SD	Sig	T
Neoroticism	3.34±0.65	3.38±0.77	0.526	-0.635
Conscientiousness	4.01±0.72	4.06±0.74	0.491	0.689
Agreeableness	4.23±0.77	4.20±0.81	0.722	-0.357
Openness	4.01±0.73	4.15±0.77	0.042	2.035[*]
Extraversion	3.85±0.72	3.77±0.80	0.263	-1.122

Third, the subjects are classified into two groups based on the location of their families whether they live in rural areas or urban cities, and the differences in their scores on the personality trait scale are analyzed via independent sample T-test. From Table 10 results the conclusion that in terms of the Agreeableness and the Conscientiousness dimensions, universities from different areas are dissimilar, and particularly the Agreeableness and Conscientiousness of students from rural areas are much higher than that of students from urban cities, showing a significant difference(p<0.05), however, with regard to the Neuroticism, the Openness and the Extraversion dimensions, no obvious difference is observed.

Table 10 Differences in Personality Traits of University Students and Its Dimensions due to Their Student-Source Places

Item	Rural Area（n=171） M±SD	Urban City（n=271） M±SD	Sig	T
Neoroticism	3.38±0.72	3.36±0.71	0.793	-0.263
Conscientiousness	4.14±0.70	3.97±0.74	0.017	-2.401[*]
Agreeableness	4.38±0.76	4.11±0.79	0.000	-3.598[**]
Openness	4.05±0.72	4.06±0.77	0.394	-0.854
Extraversion	3.82±0.74	3.80±0.80	0.848	-0.192

Fourth, the subjects are classified in to the single-parent group and the non-single-parent group due to their family structure, and their scores are analyzed through independent sample T-test. The results are shown in Table 11 that single-parent students score higher than non-single-parent students do in the Neoroticism dimension while the former scores lower than the latter in the Agreeableness dimension, a significant difference between the two.

Table 11   Differences in Personality Traits of University Students and Its Dimensions due to Their Family Structures

Item	Non-Single-Parent（n=411）M±SD	Single-Parent（n=31）M±SD	Sig	T
Neoroticism	3.34±0.73	3.63±0.48	0.030	2.176[*]
Conscientiousness	4.04±0.74	3.94±0.61	0.455	-0.748
Agreeableness	4.25±0.79	3.78±0.66	0.001	-3.231[**]
Openness	4.10±0.76	3.86±0.47	0.089	-1.704
Extraversion	3.82±0.78	3.65±0.55	0.223	-1.220

At last, the subjects are classified into freshman group, sophomore group, junior group and senior group due to their different university grade, and the one-factor analysis of variance is performed on their scores. The results are shown in Table 12 that there are significant differences in students of dissimilar grade in the Agreeableness and the Openness dimensions($p<0.05$), and specifically statistical scores in them are F=9.402，$P<0.05$ and F=3.536，$P<0.05$ respectively, however, there is no obvious difference in other dimensions. Moreover, the posttest indicates that scores of the junior and the senior are similar while that of the others opposite in the Agreeable dimension, and scores of the freshman are obviously different from that of the junior and the senior in the Openness dimension.

Table 12   Differences in Personality Traits of University Students and Its Dimensions due to Their Grades

Item	Freshman（n=125）M±SD	Sophomore（n=125）M±SD	Junior（n=90）M±SD	Senior（n=102）M±SD	F	Comparison Among Grades (Obvious Part)
Neoroticism	3.45±0.85	3.35±0.66	3.41±0.60	3.23±0.69	1.816	
Conscientiousness	4.12±0.72	4.04±0.78	3.99±0.72	3.98±0.70	0.823	
Agreeableness	4.49±0.78	4.24±0.83	4.00±0.75	4.04±0.69	9.402**	1>2>3,1>2>4
Openness	4.24±0.77	4.12±0.83	3.96±0.66	3.97±0.66	3.526*	1>3>4
Extraversion	3.87±0.86	3.82±0.79	3.74±0.71	3.77±0.64	0.576	

4 Analysis and Discussion

Based on statistical theories, the six factors affecting scores on SWB and the overall SWB mentioned above are considered as the statistical variable to analyze and predict the SWB of university students in several dimensions with the usage of regression theories.

4.1 Analysis on the overall SWB of university students

The descriptive statistics of the overall SWB of university students show that regarding the SWB variables, the overall SWB averages 78.92 points, and its minimum is 46 points and maximum 117 points while the norm for domestic overall SWB is 71 points for female and 75 points for male, which indicates that the overall SWB of Chinese university students are much above the norm. The major reasons for that conclusion are that university students are free from heavy college entrance pressure and homework burden so that they can enjoy their colorful campus lives both academically and culturally. And among the score rank of the factors, the factor of frustrating or pleasant mood scores relatively higher, which is a reflection of daily life of contemporary university students. Furthermore, university students care more about their moods, holding that their happiness depends on whether they are in good or bad mood. And generally speaking, mood is of great importance for one`s happiness. And it can be concluded from the analysis above that university students scores lowest on the factor of satisfaction and interest in life, which suggests that unsatisfactory feelings for current life of university students directly cause the decrease of SWB. The reason for this result, in the author`s opinion, is attributed to the fact that such pressures on contemporary university students as academic pressure, job-hunting, pressure and emotional pressure are overwhelming and competitions is increasingly fierce, which make the majorities of them exhausted and unsettled, thus leading to a lower score of SWB.

Gender has a slight impact on the SWB of university students. The possible reason for this result could be gender differences are narrowing down and they are related to emotional characteristics of the male and the female. Generally speaking, the female is more emotionally diversified than the male, which indicates that the female can experience more sense of happiness and satisfaction that the male

while in the meanwhile they are more emotionally vulnerable. Consequently, the differences in the overall SWB of university students are not obvious in the gender facet.

Both in the major and the grade facets, differences in SWB are not obvious. Still one point has to be stressed that SWB of students reaches the marginal difference in the factor of worries about health, and the posttests suggest that SWB of the senior is significantly different from that of the lower grades, for which the reason is that they are facing graduating, academic and job-hunting pressures and they work harder in their daily lives and thus they consider health more important and hold that a healthy body is the basis of consistent striving.

In the student-source place facet, the data analysis suggests that the overall SWB of university students from rural areas and urban cities is relatively similar. The possible reason for this result is that life in rural areas is improving and children in rural areas have access to everything that children in urban cities have, resulting the similar overall SWB. However, the former scores lower in the factor of satisfaction and interests in life than in other factors, which indicate that current university students are not satisfied with themselves and their lives, and they always have more desires, leading to a lower SWB. University students from urban cities scores slightly higher than those from rural areas in the factors of worries about health, control of emotion and behavior, and relaxation and tension. Perhaps, this can be ascribed to students from urban cities enjoy a relatively richer material life and focus more on their mental improvements, thus resulting in their higher scores than students from rural areas in these factors.

In the factor of energy, students from rural areas scores slightly higher than those from urban cities because it is possible that children in rural areas often help their families do some farm work and even walk an along way to school, which are like exercises so that the former has a vigorous energy while the latter lacks exercises and thus their physical condition drops and their SWB scores lower.

In the family structure facet, the overall SWB of university students differs obviously. Children in the single-parent family constantly feel that their lives are incomplete, because they lack the love from both parents. No matter how much love their single parents give them, they feel the insecurity in their lives and even hold a hostile attitude to society. They could not be raised in a healthy environment, and it can exert a great influence on children and the diverse influence could continue to exist in their university life and even worse, their whole life. That`s why children in the single-parent family score lower on SWB.

4.2 Correlation analysis and discussion on personality traits and swb of university students

The correlation analysis suggests that the statistical variables of the overall SWB is obviously correlated to those of personality traits. In particular, the overall SWB is negatively correlated to the Neoroticism dimension. If students' scores higher in the Neoroticism dimension, most of their emotions are negative emotions like depression and anxiety which will affect SWB without timely control and adjustment. The overall SWB is positively correlated to the other four dimensions, namely, if students' scores high in these dimensions, their SWB is better (Yang Xiujun, 2003). Therefore, every individual should positively cultivate good personality traits and try to shape themselves into a healthy and active individual in order to easily enjoy more happiness.

4.3 Regression analysis on personality traits for swb of university students

The one-dimensional regression analysis on SWB and several dimensions of personality traits shows that three of five dimensions of personality traits match the regression model, which are the Neoroticism dimension that is most effective for a reverse prediction of SWB with an 10.8% explanation rate, the Conscientiousness dimension and the Agreeableness dimension that are less effective for a direct prediction of SWB with an 7.5% and an 2.3% explanation rate respectively, and the three dimensions added together reach an 20.6% explanation rate for SWB. It is suggested that the integrated dimensions of the three can exert a desirable influence on SWB, in which case the lower scores on the Neroticism dimension are, the higher SWB will be. In fact, one`s personality usually tends to be stable. Although congenital genetic factors play an important role in that process, one`s acquired environment and education level also have a great impact. Therefore, good personality traits should be cultivated and people should keep calm and optimistic instead of being sensitive, anxious or depressed when dealing with obstacles and pressures, which is conducive to the improvement of happiness.

5 Conclusion

5.1 Conclusion

First, the overall SWB of university students is medium-high.

Second, SWB of university students has showed significant differences in the family structure facet and the marginal significance in the university grade facet. In terms of the variables of personality traits, the Openness dimension has suggested significant differences in the gender facet, and the Conscientiousness dimension and the Agreeableness dimension in the student-source place facet, and the Neuroticism dimension and the Agreeableness dimension in the family facet, and the Agreeableness dimension and the Openness dimension in the university grade facet.

At last, the overall SWB of university students are closely correlated to every dimension of personality traits, and personality traits have shown a significant regressive effect for SWB and it can be used for the prediction of SWB.

5.2 Outlook

First, this research has only tested students of several universities in Wuhan. Therefore, it is inevitable that the sampling is uneven and the data distribution is not balanced, which may lead to regional limitations on results. However, the data collection area can be expanded to verify the conclusions of this research in later studies so that it can make the conclusions more universal and representative. In addition, limited by objective conditions, data collection has not provided one-on-one instructions for the subjects, most of which answer their questionnaires at different times and under dissimilar circumstances, thus causing certain errors.

Second, the SWB of university students has multiple influences and relations among the factors affecting it are intricate. Although it is mainly attributed to personality traits, this research only focuses on the study on personality traits in which case there must be weaknesses and more directions should be selected to study SWB.

At last, educators need to further study and ponder over how to apply the conclusions of this research to practical demands, that is, how to cultivate university students of different personality traits in order to improve their SWB.

University Students' Entrepreneurial Intention and Entrepreneurial Behavior: The Moderating Effect of Sense of Social Support

Liu Yuting
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: liuyuting5@sina.com)

Abstract: With the more support of country to university students' innovative undertaking in China, this paper addresses the effect of sense of social support on the relationship between university students' entrepreneurial intention and entrepreneurial behavior. Data were collected from 250 college students. Through the analysis of SPS22.0, the results suggested as the follows: (1)Entrepreneurial intention had a significant and positive impact on entrepreneurial behavior.(2)The sense of social support includes government support, school support, family support and social organization support.(3)All of the four dimensions of sense of social support were positively related to university students' entrepreneurial intention **and** entrepreneurial behavior relationship ,but their impacts were different.
Key words: Entrepreneurial intention; Entrepreneurial behavior; Sense of social support; Moderating effect

1 Introduction

Entrepreneurship is an important engine to promote social and economic development. Undergraduate entrepreneurship not only relieves the employment pressure of some college students, but also enables young people to fully develop their creativity.

In the middle of the last century, research on entrepreneurial behavior focused on a more general aspect (Penrose, 1959).After entering the 21st century, the definition of entrepreneurial behavior is more microscopic than before (McMullen, Shepherd, 2006; Kwatko, 2001; McMullen, Shepherd, 2006). On this basis, domestic scholars further defined the research object.Considering the particularity of university students, entrepreneurial behavior is seen as entrepreneurial preparation behavior(Chi Leidan,2010). In the study of entrepreneurial intentions, many scholars have discussed the definition of entrepreneurial intention in different ways (Bird, 1988; Krueger, 1993; Douglas, Fitzsimmons, 2008; Thompson, 2009; Fan Wei, Wang Zhongming, 2006; Jian Dandan, 2010).This paper agrees with the concept given by (Thompson, 2009) that entrepreneurial intentions are the psychological beliefs that individuals make plans for the creation of new businesses and the implementation time of plans is uncertain.The reason is that the entrepreneurial intention here is influenced by various external factors such as society and family.

Although the research indicated that the individual's entrepreneurial intention has a significant prediction of entrepreneurial behavior (Fan Wei, Wang Zhongming, 2006), there is still room for research.According to (Sun Zhiming's, 2011) survey, among the 1000 students from five different universities, the number of students who had considered entrepreneurship and did participate in self-employment after graduation was only 1.04% of the total number with entrepreneurial intention. It proves that the intention of individual entrepreneurship is not only derived from the entrepreneurial impulse of personal originality, but also influenced, to a large extent, by the surrounding social factors.Therefore,this paper introduces the sense of social support to explore the impact on college students' entrepreneurship of social support for different levels and dimensions.

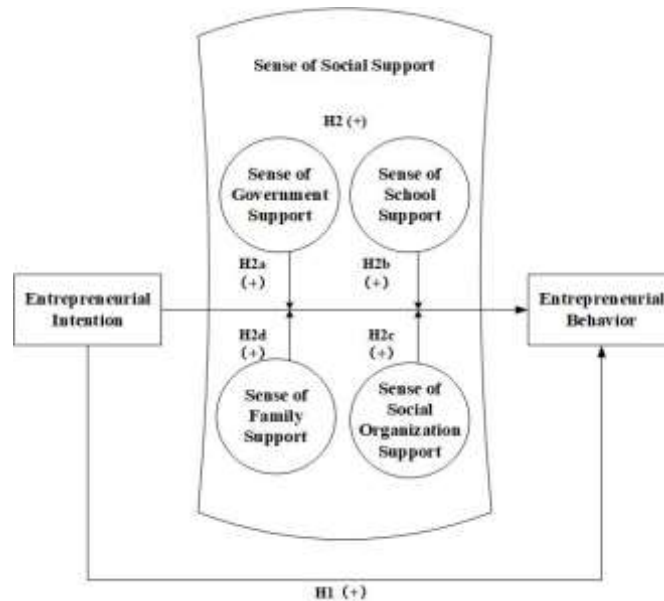
2 Research Model and Hypothesis
2.1 Research model


Figure 1   Conceptual Model

Figure 1 presents the conceptual model. The model presents entrepreneurialintentionwas positively related to university students' entrepreneurial behavior, and sense of social support plays a moderating role between entrepreneurial intention and entrepreneurial behavior It also posits the sense of social support as a moderator for entrepreneurial intention and entrepreneurial behavior relationship.

2.2 Entrepreneurial intention and entrepreneurial behavior

In the field of psychology, the most direct predictor of behavior is usually thought to be intention (Krueger, Reilly, 1993).Therefore, scholars have referred to the relevant achievements in the field of psychology, namely "in many cases, the known intention can well predict the unknown behavior, especially for some complex, invisible and unobservable behaviors". Finally it is concluded that entrepreneurial intention is the most direct objective predictor of entrepreneurial behavior, and this view has been widely accepted.What we can't ignore, however, is that the influence of entrepreneurial intention on entrepreneurial behavior is also restricted by various objective conditions. Even though intention can predict behavior to a large extent, it cannot indicate that entrepreneurial intention will definitely lead to entrepreneurial behavior.

Thus, the study formulated a hypothesis as follows:

Hypothesis 1. Entrepreneurial intention will positively affect entrepreneurship behavior.

2.3 Sense of social support

The concept of social support must be clarified before we define the sense of social support. Reviewing the existing studies, scholars used to study social support from different perspectives.Some scholars defined social support from the perspective of psychology (Gottlieb, 1981), while others define it from the perspective of sociology (Malecki et al., 2002). Domestic scholar (Liao Hejun, 2004) divided social support into institutionalized social support and non-institutionalized social support from the perspective of social support sources.Institutionalized social support, on the one hand, is the expression of national will. On the other hand, it comes from social for-profit and non-profit organizations while non-institutionalized social support is provided by family members, lovers, colleagues (classmates), teachers and other groups.In the context of social support, the domestic scholar (Wang Yanfei, 2004) has divided social support into four categories: physical support, emotional support, information support and partner support.

Based on the concepts of Liao Hejun and Wang Yanfei, this paper regards social support as a four-dimensional structure, which includes four dimensions: government support, school support, social support and family support.

2.4 Sense of social support and its moderating effect

So far, the research has shown that social support operates in two ways: the main effect model and the buffer model.The main effect model of social support holds that social support has a broad sense of gain effect, which means that individuals will not change in any situation, whether they are supported or

not.A good support system enables people to strive for better settlement of difficulties and to earn more social bonuses (Cohen, 2004).The buffer model points out that only when individuals are under pressure, will social support play a positive buffer role and protect individuals from being harmed by adverse factors.

Entrepreneurship is a potentially stressful thing.If an individual can feel enough support to start a new bussiness, he/she will not regard the entrepreneurial event as an unbearable pressure event, so he/she is more likely to put his/her entrepreneurial intention into practice.Even if the individual believes that a startup event is full of pressure,strong sense of social support will also prompt them to make a second evaluation of pressure, so as to avoid bad emotions generated by individuals.Based on the above analysis, the following hypotheses are proposed:

Hypothesis 2. Sense of social support will positively moderate the relation of entrepreneurial intention and entrepreneurial behavior.

Hypothesis 2a. Sense of government support will positively moderate the relation of entrepreneurial intention and entrepreneurial behavior.

Hypothesis 2b. Sense of school support will positively moderate the relation of entrepreneurial intention and entrepreneurial behavior.

Hypothesis 2c. Sense of social organization support will positively moderate the relation of entrepreneurial intention and entrepreneurial behavior.

Hypothesis 2d. Sense of family support will positively moderate the relation of entrepreneurial intention and entrepreneurial behavior.

3 Research Methods and Procedures
3.1 Design of research variables

There are three variables: entrepreneurial intention, entrepreneurial behavior and social support. They all used a 5-point Likert scale to measure responses to each item, ranging from 1(very little) to 5(a great deal).

Entrepreneurial intention. Considering that the research object of this paper is college students, this study, based on the *Individual Entrepreneurial Intention Scale* compiled by Thompson (2009), slightly modified and adjusted it to obtain a measure scale of entrepreneurial intention of college students with 8 items.

Entrepreneurial behavior. Yu Fumao and Zeng Ming (2015) designed a scale consisting of four items for entrepreneurial behaviors of college students which covers the preparation degree of entrepreneurs at four levels.This study extends the preparatory activities in the above scale to cover entrepreneurial activities and entrepreneurial activities that have been implemented. And eventually we obtained an entrepreneurial behavior scale with five items.

Social support. We used the *Perceived Social Support Scale* compiled by Jiang Ganjin (2007).The scale, with 12 items from four dimensions, measures the support that entrepreneurs have learned from governments, schools, social organizations and families.

3.2 Investigation subjects

The survey objects of this paper include two parts, one is the undergraduate students in Wuhan University of Technology, most of which have no entrepreneurial experience but some have already had entrepreneurial intention.The other part is the members of some entrepreneurial teams of Wuhan University of Technology.

3.3 Data collection

In order to ensure the validity and reliability of data in this study, some preliminary investigation was conducted, generating 35 usable responses. Through the analysis of SPSS22.0, each scale's Cronbach's α was over 0.8. Thus, each measurement item can be determined to have reliability.However, in the reliability analysis of the entrepreneurial intention scale, we find the Cronbach's α is higher than the original reliability coefficient after deleting the a7 and a8 items. Therefore, a7 and a8 items of the scale were deleted.In the formal survey stage, 218 questionnaires were recovered in total, of which 202 were valid and the effective recovery rate was 80.8%. After screening 58 unsatisfactory questionnaires, 144 questionnaires were finally obtained. Screening includes two cases: (1) Sample without entrepreneurial intention; (2)Social recruiters in the sample.

4 Data Analysis and Hypothesis Testing
4.1 Reliability and validity analysis

The study selected Cronbach's α to measure the reliability of each scale. Through the analysis of SPSS22.0, all scales' Cronbach's α were at 0.8 or more. Thus, each measurement item can be determined to have reliability. This study adopted content validity and discriminant validity. All items were based on published scale, modified with the actual situation, and got an adjustment through the preliminary investigation. So we can think data had a good content validity. Confirmatory factor analysis results showed KMO is greater than 0.8, and Bartlett's test (P<0.001) was significant. All the factor loading coefficient were between 0. 48 ~ 0.861. Hence, we determined that the measuring items of the study meet the criteria of the discriminant validity.

Table 1   Regression Analyses for TestingModerating Effect

Variable	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10
Constant	2.27***	1.824***	2.830***	2.085***	1.950***	1.980***	17.392***	5.392**	6.401**	7.319***

EI: Entrepreneurial Intention;GS: Sense of Government Support; SS: Sense of School Support; FS: Sense of Family Support;SOS: Sense of social organization support;   * p<0.05. ** p<0.01. ***p<0.001.

4.2 Correlation analysis

The study selected Pearson correlation coefficient to test the relationship between variables. Through the analysis of SPSS22.0,the correlation coefficient between entrepreneurial intention and entrepreneurial behavior is 0.554, and it is significant at the level of 0.01, which means that there is a strong positive correlation between the two. Therefore, hypothesis H1 in this study has been verified.There is also a significant correlation between the four dimensions of social support (p<0.01), and the correlation coefficient is above 0.4, which indicates that the four dimensions are strongly positively correlated.

4.3 Regression analysis

Test of main effect.Data (Table 1) shows thatthe entrepreneurial intention of college students has a significant positive influence on entrepreneurial behavior (β=0.554, the adjusted R square is 0.301), and the regression coefficient reaches a significant level (Sig=0.000<0.05,F=62.718). Therefore, it can be concluded that the fitting degree and explanatory power of college students' EI-EB model are relatively good. So hypothesis 1 is verified again.

Test of moderating effect.The regression coefficient of the interaction terms of social support and entrepreneurial intention of college students reached a significant level (Sig=0.01<0.05) and R square change was 0.052, indicating that the sense of social support moderates the relation of entrepreneurial intention and entrepreneurial behavior. Therefore, hypothesis 2 was verified.

The results (Table 1) show thatthe interaction regression coefficients of the four factors of social support are significant (Sig=0.000<0.05,Sig= 0.047<0.05,Sig=0.01<0.05,Sig=0.01<0.05).In addition, we also found that R square change with sense of school support, family support and social organization support was 0.019, 0.032 and 0.032 respectively, while R square change with sense of government support was 0.102. Obviously, compared with the first three factors, the sense of government support plays the most significant role in regulating the relation of entrepreneurial intention and entrepreneurial behavior.

5 Conclusion
5.1 Conclusions

From the perspective of social support, this paper discussed the influence of entrepreneurial intention on entrepreneurial behaviors under the different levels of sense of social support. The main conclusions are as follows:

(1) The entrepreneurial intention of college students plays a significant positive role in the entrepreneurial behavior. It can be concluded that the stronger entrepreneurial intention, the higher probability of entrepreneurial behavior.

(2)Data suggests that all of the four dimensions of sense of social support positively moderate the relation of entrepreneurial intention and entrepreneurial behavior.

(3) Among the four dimensions of sense of social support, the moderating effectof government support is the most significant. This is probably because the government's favorable policies (such as tax incentives, support funds, etc.) can provide much-needed financial support for the initial entrepreneurs, which will help entrepreneurs start their own businesses.However, the actual financial or material support brought by sense of school support, by contrast, will be greatly weakened.

Therefore, the entrepreneurial activities of college students require close cooperation from the government, schools, families and social organizations, especially the government.

5.2 Limits of research and future research direction

This study has several limits according to research environment.

First, the sample of the research has certain limitation. This study only chose students of Wuhan University of Technology as the research object, they are not able to represent the total college students. We need to expand the research objects to Hubei province and even the whole Central China.

Second, in this paper,the control variables such as family background, personal professional and educational level have not been dealt with too much, which should be considered on the next step..

Third, this study only introduced the sense of social support as a moderating factor in the process of Entrepreneurial intention - Entrepreneurial behavior. But actually, there are still many variables that may work, such as resource conditions, entrepreneurial environment and so on. These variables can be introduced in the future to further deepen and enrich our study.

Abstract: In order to explore the effect reduplication names on interpersonal perception and attitudes, this study carried out two experiments to examine the relationship based on the stereotype content model, meanwhile tested the moderation of gender characteristics. The results show that: (1) reduplicated names will make people feel that the evaluation objects are more like children, warmer, but less competent. (2) the influence of reduplicated names on interpersonal perception is moderated by the gender characteristics of the names. For feminine names, the influence of reduplicated names on warmth and competence perception will be weakened. The present study can advance our understanding of how and when reduplicated names influence the interpersonal perception and attitude. Limitations and implications of this study are discussed. More related factors of reduplicated names will be explored in the future.
Key words: Reduplicated names; Interpersonal perception; Attitude; Gender

1 Introduction

Everyone has a name, and it's a symbol that distinguishes us from others, but it's not just a simple symbol. When we were born, our parents racked their brains to set up a good name for us, hoping to have a good life. It is true that people's name characteristics have an important impact on academic achievement, social behavior, mental health, interpersonal perception and attitude and on (Kalist & Lee, 2010; Erwin, 1993). In terms of interpersonal perception and attitude, researchers found that name titer, gender characteristics, ethnic characteristics (Zhao & Biernat, 2017), difficulty of identification and difficulty of pronunciation can play an important role (Laham, Koval, & Alter, 2012). Although previous studies have found many valuable research findings, no one has examined the effects of reduplication names on interpersonal perception and attitude so far. There are widespread reduplication names in China. Therefore, it is of great practical significance to study this problem. Based on the stereotype content model, the influence of reduplicated names on interpersonal perception and attitude is investigated, and the moderating effect of gender characteristics on names is examined.

1.1 The influence of name characteristics on interpersonal perception and attitude

There is a common saying in China that "people are like their names", which means that there is a certain degree of consistency between individual names and their psychological characteristics. People's first impression of other people often begins with the name, they will infer the psychological characteristics of others according to the characteristics of the individual name, and thus have a certain impact on interpersonal perception and judgment (Song & Schwarz, 2009). A review of the previous literature shows that although the influence of various names on interpersonal perception and attitude has been explored, no study has been conducted on the role of reduplicated names.

1.2 The influence of the name characteristics of the reduplication on the interpersonal perception

Children themselves are more likely to use reduplication, and people are more likely to use this form of speech when communicating with children. It can be seen that the phonetic characteristics of the reduplication are closely related to the children, and those who use the reduplication name may be considered more like children and have the psychological characteristics of children. According to the stereotype content model, although there are many contents of interpersonal perception, it can be classified into two aspects: warmth and competence (Fiske, Cuddy, Glick, & Xu, 2002). According to previous studies, children or individuals with characteristics of children (such as faces) give people the impression that they are warmer and less competent. For example, the baby face subjects are often considered to be kind (Gorn, Jiang, & Johar, 2008), honest and trustworthy (Zebrowitz & Montepare, 2008), but at the same time they are not competitive enough to be leaders (Poutvaara, Jordahl, & Berggren, 2009; Wei, Wang, Zhou, Feng, & Ding, 2016).

1.3 The influence of reduplication on the interpersonal perception: the moderating effect of gender characteristics

According to the above inference, the repetition of names may affect the warmth and competence of interpersonal perception. Is this effect applicable to all types of names? According to the theory of gender schema, people will form behavior norms corresponding to their own gender in the process of socialization, and enter the corresponding gender roles and also form some stereotypes about gender (Eagly & Karau, 2002; Qian, Zhang, 2000). Based on traditional gender roles, men often play the role of resource acquisition, while women often play the role of caregivers. These two roles emphasize different characteristics; for the resource recipients, competence is more important; for caregivers, warmth is more important. Therefore, in terms of the characteristics of gender roles, men will be required to be highly competent, while women will be required to be highly warm.

2 Assumption

Gender stereotyping studies have found that men are often considered to be highly competent and low warm, while women are often considered to be high warm and low competent. To sum up, compared with men, women can give people the feeling of high warmth and low competence. At the same time, reduplication can also make people feel high warmth and low competence. Therefore, for the feminine names, the influence of reduplication on interpersonal perception may be weakened. Accordingly, we come to the assumption that:

H_1: Reduplicated names make people feel more childlike, warmer, but less competent.

H_2: The influence of reduplicated names on interpersonal perception is moderated by the gender characteristics of the names. For feminine names, the influence of reduplication on warmth and competence perception will be weakened.

3 Method

3.1 Experiment1 The influence of the reduplicated names on the interpersonal perception

Participants and Procedure.

This experiment used single factor between-subjects design (non reduplicated VS reduplication). One hundred and fifty-nine undergraduate students (83 men and 76 women) from Hubei province participated in the study and randomly assigned to this two groups. The mean age was 18.30(M = 18.30，SD = 0.76).

First, participants were asked to imagine that "your class will turn to a new student. You only know the name is XX, imagine this person, then evaluate this person." The reduplicated name is "Li Weiwei" and the non reduplicated name is "Li Wei". Referring to previous studies, a project is used to measure the perception of children with 1-7 points. Such like" In real life, some people are more like children, some people are more like adults, and what about XX feels like". The lower the score is, the more like the child; the higher the score, the more the man looks like an adult. Referring to previous studies, four items were used to measure warm perception, and four items were used to measure competence perception. The higher the score is, the higher the awareness of warmth and competence. The internal consistency coefficient of warm perception is 0.85, and the internal consistency coefficient of competence perception is 0.86.

3.2 Experiment 2 the influence of reduplicated names on interpersonal perception: the moderating effect of gender characteristics

Participants and Procedure.

This experiment used two factors between-subjects design, every factor has two level of reduplication feature (reduplication VS non reduplication) and gender characteristic (male VS female). Two-hundred and sixty-three undergraduate students (124 men and 139 women) from Hubei province participated in the study and were randomly assigned to four groups. The mean age was 18.17(M= 18.17, SD = 0.75).

The procedure of the experiment was the same as that of experiment 1. They would see the name first, then let them evaluate the person. For example, the name is the male reduplication name "Zhang Taotao" and the male non-reduplicated name "Zhang Tao" and the female reduplication name "Zhang Tingting" and the female non-reduplication name "Zhang Ting". The subjects valued with 1-7 points, the higher the score is, the higher the awareness of warmth and competence.

The measurement of interpersonal perception is the same as experiment one. The coefficient of internal consistency of warm perception is 0.86, and the internal consistency coefficient of competence perception is 0.88.

4 Results

4.1 Experiment 1

The results of independent sample T test showed that reduplicated names made the subjects feel more childlike, warmer, but less competent than non-reduplicated names (see Table 1). It verified H_1, indicating that reduplicated names would make people feel that the evaluation objects were more like children, warmer, but less competent.

Table 1   Difference in Interpersonal Perception between Reduplicated and non-Reduplicated names

name	Child perception($M \pm SD$)	warm($M \pm SD$)	competent($M \pm SD$)
reduplicated	4.21±1.71	4.86±1.00	4.36±0.98
non reduplicated	4.84±1.58	4.48±1.11	4.83±0.92
t	-2.43*	2.27*	-3.07**
Cohen's d	-0.39	0.36	-0.49

Note：$^{*}p <0.05$; $^{**}p <0.01$.

4.2 Experiment 2

For warm perception, the results of two factor variance analysis showed that the main effect of the reduplication characteristics was significant ($F_{(1,259)} = 7.13, p < 0.01, \eta_p^2 = 0.027$), the main effect of sex characteristics was not significant ($F_{(1,259)} = 0.06, p > 0.05$), and the interaction between the reduplication and sex characteristics was significant ($F_{(1,259)} = 4.16, p < 0.05, \eta_p^2 = 0.016$). The results of simple effect analysis showed that there were significant differences in the warmth perception of male names, reduplication and non reduplication names ($F_{(1,259)} = 10.98, p < 0.01$; $M_{reduplication} = 5.01, SD = 0.80, M_{non-reduplication} = 4.47, SD = 0.86, \eta_p^2 = 0.041$), and the difference in warmth perception between female names, reduplication and non reduplicated brand names was not significant.($F_{(1,259)} = 0.20, p > 0.05$; $M_{reduplication} = 4.75, SD = 0.97, M_{non-reduplication} = 4.67, SD = 1.05$).

For competence perception, the results of two factor variance analysis showed that the main effect of the reduplication characteristics was significant ($F_{(1,259)} = 6.90, p < 0.01, \eta_p^2 = 0.026$), the main effect of sex characteristics was not significant($F_{(1,259)} = 2.99, p > 0.05$), and the interaction between the reduplication and sex characteristics was significant($F_{(1,259)} = 4.29, p < 0.05, \eta_p^2 = 0.016$). The results of simple effect analysis showed that there were significant differences ($F_{(1,259)} = 10.92, p < 0.01$; $M_{reduplication} = 4.05, SD = 0.99, M_{non-reduplication} = 4.59, SD = 0.93, \eta_p^2 = 0.040$), and there was no significant difference in the warmth perception of female names, reduplication and non reduplicated brand names($F_{(1,259)} = 0.15, p > 0.05$; $M_{reduplication} = 4.49, SD = 0.78, M_{non-reduplication} = 4.54, SD = 1.01$).

The result of study two verified H_2, and the influence of reduplication name on interpersonal perception was moderated by the gender characteristics of the name. For feminine names, the influence of reduplication on warmth and competence perception will be weakened.

5 Conclusion

Based on the stereotype content model, this study designed two experiments to examine the effects of the name characteristics of the reduplication on the interpersonal perception and attitude, and explored the effect boundary.

Firstly, this study extended the research of name characteristics to the field of speech structure characteristics and discussed its functional boundaries. It's the first time to investigate the influence of the phonetic features of the reduplication in the name on the interpersonal perception and attitude, which expands the category of the study of the name, and provides a new direction for the future research. On the other hand, we also examined the functional boundaries of the reduplication effect of names, and found that the feminine names weaken the reduplication effect. In real life, people's names often have many characteristics at the same time. It is of great significance to investigate the interaction of these characteristics. However, previous studies often focus on the role of certain characteristics of names, such as gender, race, difficulty of identification and difficulty of articulation (Zhao, & Biernat, 2017; Laham, Koval, & Alter, 2012; Yang & Ren, 2016). The interaction of multiple name features on interpersonal perception and attitude can be examined in future.

Secondly, this study introduced the stereotype content model into the field of name feature research. The stereotype content model points out that warmth and competence are the two basic dimensions of

interpersonal perception, and people judge others from these two aspects at the first meeting.

Previous studies have shown that many factors such as social structure (such as status and relationship), country, race, sex, expression and other factors have an impact on warmth and competence perception. The characteristics of other people's names often affect our first impression, which is theoretically reflected in two aspects: warmth and competence. However, previous studies have seldom studied the role of name characteristics from the perspective of stereotype content model. In the future, we will examine the interaction of reduplicated name features on interpersonal perception and attitude. Such like the type of work.

Research on the Influence of Online Shopping Customer Experience on Repurchase Intention

Dong Yue, Cheng Huan
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 657991655@qq.com, 690142152@ qq.com)

Abstract: The rapid development of the Internet has led to the rapid development of online shopping. As a subversion of traditional shopping methods, online shopping has more uncertainties. Now scholars are paying more and more attention to the customer experience of online shopping. Although scholars have realized the influence of customer experience, there are few studies on customer experience, customer engagement and customer repurchase intention. In this study, through empirical research on 114 college students in three universities, it is found that there is a significant positive correlation between customer experience and customer engagement and customer repurchase intention; at the same time, customer engagement plays a partial intermediary role between customer experience and customer repurchase intention.Our research enriches the literature on customer fit and provides useful insights for e-commerce management practices.
Key words: Online shopping; Customer experience; Customer engagement; Customer repurchase intention

1 Introduction

In recent years, with the rapid development of the Internet, e-commerce has grown rapidly. E-commerce hasbecome one of the most important channels for people to spend on shopping(Csikszentmihalyi,1977). According to the data from the Industry Research Institute, the online shopping market in China reached 6.3 trillion yuan in 2017, an increase of 30.3% compared to 2016, and the growth has rebounded. With the online and offline integration of the shopping market and the stable development of the industry, it is expected that the transaction volume of China's online shopping market will reach 7.7 trillion yuan in 2018.

Different from the traditional shopping methods, online shopping as a new way of consumption cannot provide customers with intuitive experience(Holbrook,1982), resulting in a decline in customer satisfaction, making the customer repurchase intentions greatly reduced. However, with the development of experience economy and experiential marketing, all major websites have started to focus on customers, focusing on the user experience, and improving the sales level by improving customer experience.

2 Theory and Hypothesis

2.1 Customer experience and customer fit

Yan Xiaosi (Yan Xiaosi, 2017) studied the theme marketing activities of shopping centers and divided the customer experience into emotional experiences, cognitive experiences, sensory experiences, and social experiences. Through empirical research, it was proved that they had a positive impact on customer fit, but only at different levels of relevance. Although this is a conclusion drawn under a specific situation, it is also applicable to online shopping (Vivek et al., 2011). In the era of experience economy, online consumers need more than just products, information and services on the website, but also want a better experience. The experience in shopping not only includes the experience of website cognition, but also the experience of the service in the process, the experience of the product and the experience of the brand and emotion will all influence the satisfaction of the customer and continue to purchase things on the website (Gentile et al., 2007). So, we propose the following assumptions:

Hypothesis 1: Performance pay has a significant effect on job involvement and its sub-dimensions.

H1a: Affective experience has a direct positive effect on customer fit

H1b: Cognitive experience has a direct positive effect on customer fit

H1c: Sensory experience has a direct positive effect on customer fit

H1d: Social experience has a direct positive effect on customer engagement

2.2 Customer Agreement and Customer Repurchase Intention

The customer agreement will not only make the customer have a valuable identity, emotional bias, and brand loyalty to online shopping, but also will publicize the word of mouth on the website (Brodie

et al.,2011). The next time there is the same need, the first consideration is the website. Therefore, the following assumptions are made regarding the customer's fit and the customer's repurchase intention:

H2: Customer fit has a direct positive effect on customer repurchase intention

2.3 Customer experience and customer repurchase intention

For shopping websites, providing customers with a good consumer experience is a key factor affecting customer satisfaction (Chen Ying, Z2013). Compared to ordinary websites, those sites that use multimedia technologies such as music, animation, and application imaging can better provide consumers with sensory enjoyment (Doorn et al., 2010), enhance customer perception of websites, and make the following assumptions:

H3a: Affective experience has a direct positive effect on customer repurchase intention

H3b: Cognitive experience has a direct positive effect on customer repurchase intention

H3c: Sensory experience has a direct positive effect on customer repurchase intention

H3d: Social experience has a direct positive effect on customer repurchase intention

From the above analysis of the relationship between customer experience, customer fit, and customer repurchase intention, it can be seen that the customer fits the intermediary to the relationship between the two. The following assumptions are made:

H4a: Customer fits mediation between emotional experience and customer repurchase intention

H4b: Customer fits mediation between cognitive experience and customer repurchase intention

H4c: Customer fits mediation between sensory experience and customer repurchase intention

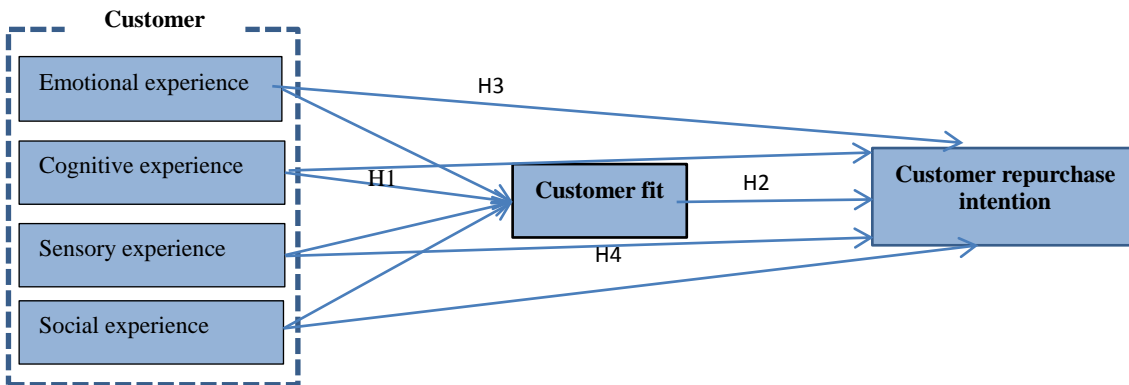
H4d: Customer fits mediation between social experience and customer repurchase intention


Figure 1   Hypothetical Model

3 Methodology

3.1 Data collection and instrument

According to the research purpose, this study is based on college students. Because this age group has the highest Internet penetration rate and is more likely to purchase online(Vivek et al.,2012), they are familiar with the online shopping environment and expect the student group to represent the target population. Using a convenient sampling method, we distributed electronic questionnaires to undergraduates from three universities, and distributed a total of 123 copies, and collected 114 copies. After eliminating 10 invalid questionnaires, the effective rate of questionnaire recovery was 78.2%.

3.2 Measures

Customer experience. This study made some modifications to the scale of customer experience in Sashi's research(Sashi,2012). Finally, a scale with 12 items was used to measure customer experience. The emotional experience was measured using 3 items, the cognitive experience was measured using 2 items, and the sensory experience and social experience were measured using 3 and 4 items, respectively. Adopt Likert5 (1 = completely disagree, 5 = completely agree).

Customer fit. Regarding the customer agreement, we mainly refer to the study of Vivek (Vivek, 2009) and Doorn (Doorn, 2010) on customer fit, and set up three items for testing. Adopt Likert5 (1 = completely disagree, 5 = completely agree). The Cronbach Alpha coefficient of the scale is 0.928.

Customer repurchase intention. Using the phrase "When I have the same needs again, I would like to repeat shopping on this site," this item is measured.

Control variables. In this study, gender, age, educational background, and income were selected as control variables to exclude the potential impact of these variables on online shopping reconfiguration

(Kong Dong at el.,2016).

3.3 Data analysis

Correlation analysis, as can be seen from Table 1, there is a significant correlation between emotional experience, cognitive experience, sensory experience, social experience, customer engagement, and customer repurchase intention. And, emotional experience, cognitive experience, sensory experience, social experience and customer engagement (b = .459**, .545**, .632**, .645**), customer engagement, and customer repurchase intention (b There is a significant positive correlation between =.649**).

Table 1 Correlation Coefficient Matrix

variable	Mean	S.D.	1	2	3	4	5	6	7	8	9	10
gender	1.37	.489	1									
age	2.00	.520	.000	1								
education	1.92	.359	.170	.145	1							
monthly income	2.45	.645	.320*	.242	-.077	1						
Emotional experience	2.9912	.78456	-.203	-.044	.125	-.206	1					
Cognitive experience	3.6842	.86541	-.197	.030	.048	.090	.673**	1				
Sensory experience	3.4737	.92230	-.278	-.019	-.020	-.033	.736**	.734**	1			
Social experience	3.4079	1.01579	-.311	-.102	-.002	-.111	.739**	.812**	.725**	1		
Customer fit	3.4912	.94515	-.363*	-.147	.038	-.163	.459**	.545**	.632**	.645**	1	
Customer repurchase intention	3.42	1.004	-.159	-.155	-.055	.035	.477**	.480**	.549**	.641**	.649**	1

For hypothesis testing, the statistical analysis software spss22.0 was used for regression analysis. The standardized regression coefficients obtained from Table 2 are 0.720 (P<0.05), 0.830 (P<0.001), 0.899 (P<0.001), and 0.921 (P<0.001). It can be seen that these four dimensions are consistent with the customer agreement. There is a significant positive correlation, assuming H1a-H1d is verified.

Table 2 Regression Analysis

variable	Customer fit					Customer rebuy experience	
	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6	Model7
gender	-.389**	-.253**	-.157	-.109	-.082	-.212	.148
Age	-.168	-.142	-.140	-.128	-.057	-.195	-.040
Education	.129	.019	.033	.088	.061	.021	.099
monthly income	.012	.102	-.152	-.061	-.017	.152	.141
Continual Table 2	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6	Model 7
Emotional experience		.720**					
Cognitive experience			.830***				
Sensory experience				.899***			
Social experience					.921***		
Customer fit							.924***
R^2	.169	.644	.805	.909	.922	.068	.778
AdjustedR^2	.068	.588	.744	.895	.909	-.045	.743
F	1.678	11.560***	26.365***	63.849**	75.240***	.604	22.394***

From Table 3, it can be seen that the regression coefficients of emotional experience, cognitive experience, sensory experience, social experience, and customer experience are respectively from the original 0.605, 0.790, 0.865, and 0.870 (P values less than 0.01). The decrease was 0.540 (P<0.01),

0.678 (P<0.01), 0.714 (P<0.1), 0.503 (P<0.1). Moreover, the regression coefficients of customer fit model 6 to model 9 are 0.890, 0.832, 0.613, and 0.724. This means that after the customer's fit is added, the four dimensions of the customer experience will have less influence on the customer's repurchase intention

Table 3　Regression Analysis

variable	Customer rebuy experience								
	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6	Model 7	Model 8	Model 9

F	.604	4.331***	11.604***	19.557***	18.220***	18.913***	18.305***	19.163***	18.445***

*p<0.05,**p<0.01,***p<0.001

4 Conclusion

This study empirically explores the relationship among the three variables of customer experience, customer engagement, and customer repurchase intention. The customer experience is divided into four dimensions for independent analysis. Finally, there is a positive correlation between such variables. This study further explores customer experience in depth. It not only has significant implications for enriching relevant theories in the marketing field, but also learns some psychological and physiological changes after the customer experience, and improves the fit between the customer and the company and the performance of the company.

However, this study also has certain limitations. The research is based on online shopping, which has certain limitations and has no strong reference for other industries. Moreover, this study only meets the customer's mediation variables, and does not consider too much of the customer's own essential factors. Such as, the adjustment of customer personal characteristics, demographics and other aspects. Therefore, future scholars can further study the influence of regulatory variables on this basis.

Study on Influencing Factors of Career Growth of Employees

Jian Lijun, Pin Yun
School of Management, Wuhan University of Science and Technology, Wuhan, P.R.China,
430080
(E-mail: 283063023@qq.com, 744421719@qq.com)

Abstract: The study constructs and tests a four-dimensional structure model of career growth, and develops a scale of career growth. Based on the reviewing and generalizing of the correlated literature,it analyzes the links and differences between career growth and other related concepts. The original data is required through interviews and semi-structured questionnaires.By reference to the relevant foreign research scales, the initial scale of career growth is made through several steps, including cataloguing, summarizing and revising. The formal scale is constructed through the research methods of the items analysis, exploratory factor test and other methods and so forth.Confirmatory factor analysis approach is adopted to verify the four-dimensional structure model of career growth.The results indicate that career growth is a four-dimensional concept, including career goal progress, professional ability development, promotion speed and remuneration growth.
Key words: Career growth; Employee; Career development; Career success; Scale

1 Introduction

The problem of career growth has been widely concerned. Ragins and Sundstrom(Ragins and Sundstrom, 1989) pointed out that employees' career growth is affected by a series of factors, including organizational factors, employee relationship and employee's own factors. Study on the influencing factors of occupation growth focuses on behind it, including demographic variables. However, it is found that there is a great difference in the understanding and operation of this concept by the students. For example, Chay and Aryee (Chay and Aryee, 2013) used two questions to measure career growth. Ellstrom (Ellstrom, 2012) believe that ability is the most stable variable for predicting employee career growth. Choy and Savery (Choy and Savery, 2014) believe that promotion and horizontal mobility can promote employees to achieve career growth. Fresh environment, more learning opportunities and interpersonal interaction are the elements to promote employee growth.

However, the current study specifically on the growth of the concept of occupation. The purpose is to conceptualize the term of career growth through empirical research, and to determine the structural dimensions and specific measurement indicators of career growth.

2 Introduction of Research Methods

2.1 Analysis of career growth and related concepts

The study of career growth can be divided into two main contents: the career growth within the organizationand the process of work conversion.employees should be responsible for their own career planning, and organizations should do their best to support the growth of their employees. There are two aspects of the concept of career growth. First, career growth is an incremental concept, and its corresponding stock concept is a career success. Second, career growth can be divided into organizational career growth and job conversion career growth.

At present, the academic circles pay more attention to the standard and the specific measurement of career success. Career success is divided into two categories: objective success and subjective success. They include: Status and title (rank position), material success (property, income), social reputation, renown and influence, knowledge and skills, friendship and social network, health and happiness.

2.2 Analysis of scale evaluationof career growth

This paper reviews the relevant concepts of the definition, structure and measurement, we found that there are some related links between the various concepts and vividly, but they have their focus on research, occupation success mainly analyzes accumulation based on a series of occupation experience, occupation opportunities focus on the internal career growth rather than present situation;

As for the measurement of career success, most scholars believe that job promotion and income should be chosen as a measure of objective success, and career satisfaction and career success should be chosen as the criteria of subjective career success. On the measurement of professional opportunities, it mainly involves the income, the employment opportunity, the training opportunity and the speed of promotion. To sum up, we should pay attention to the four parts of promotion speed, salary growth,

ability development and career goal development related to subjective perception.

3 Empirical Analysis of Structure Model of Employee Career Growth
3.1 Research method
The study is to identify and evaluate the problems of career growth, and further conclude the links between options, and determine the structural dimensions of career growththrough interview and questionnaire. The questionnaire consists of 15 items by Likert5 point method.
3.1.1Test objects
This study uses 15 questions compiled by the staff occupation growth measurement table of questionnaire survey in Guangdong Shenzhen and Zhongshan, Zhejiang, Hangzhou and Ningbo, Hubei, Kunming, Henan, Yunnan source of Zhengzhou and Luoyang, Fujian, Fuzhou, Changsha ten city 10-25 enterprises selected. Survey a total of questionnaires 1300copies, 1190 copies, 1000 valid questionnaires.
3.1.2 Statistical processing
The exploratory factor analysis was analyzed by principal component analysis, and the factor rotation adopted the maximum orthogonal rotation, and the calculation tool was SPSS13.0. The computational tool used for confirmatory factor analysis is Lise l8.70.
3.2 Data analysis
3.2.1 Project analysis
The first step of the index identification is the internal identification, which is called the project analysis. The analysis method of project is each participant in each questionnaire item and total score, and according to the level of the sort, take out of the top 27% for high score after 27% for low group, significant test level of two groups were tested in each score differences on average. Finally, check each question on whether the high score and low score has the difference. The discrimination analysis showed that each item has reached a significant level (such as Table 1), representing the scale problem has the ability to distinguish between high score and low score. The correlation between the items and the total score reached a significant level of 0.001, and the correlation coefficient was higher than0.03, the problem of discrimination is good, high internal consistency.

Table 1   Project Analysis Result

Title number	decision value(t)	correlation with total score(r)	standard deviation	Title number	decision value(t)	correlation with total score(r)	standard deviation

3.2.2 Exploratory factor analysis
1209 valid samples were randomly divided into two halves. Half of the samples were used for exploratory factoranalysis (n=604), and the other half were used as confirmatory factor analysis (n=605). The difference test shows that there are no significant differences in gender, age, working life, education, and post in the two parts of the sample(shown in Table 2).

Table 2   Factor Structure and Factor Load of Each Item

Title	Factor load			
	career goal progress	professional development	promotion opportunity	reward growth
Q1 job has made me further away from my career goals	.879	.145	.186	.126
Q2 job related to my career goals and career aspirations	.846	.232	.017	.023
Q3 work has laid the foundation for career goals	.768	.243	.024	.064
Q4 work with better development opportunities	.755	.197	.246	.121

Title	Factor load			
	career goal progress	professional development	promotion opportunity	reward growth
Q5 work to master new skills related to work	.209	.834	.176	.126
Q6 work masters new knowledge	.179	.812	.246	.018
Q7 work prompted more work experience	.169	.706	.017	.169
Q8 work has stimulated my professional ability	.134	.853	.023	.195
Q9 the job promotion speed of the working is faster	.097	.094	.835	.247
Q10my job promotion is very likely	.158	.009	.667	.241
Q11 my job is more ideal than the original unit	.026	.208	.604	.298
Q12 occupation increase fastercompared to colleagues	.006	.108	.716	.265
Q13 my salary increase faster	.148	.127	.235	.864
Q14 salary continued to be raised a great possibility	.034	.176	.216	.763
Q15 salary increase faster compared to colleagues	.069	.062	.196	.834
Explanatory variable(%)	27.1	20.5	17.8	10.7

The data were tested by Bartlett sphere test with a test value of 3069.063 and p=0.000, indicating the possibility of sharing factors among items. The KMO value of the sample is 0.872, indicating that the data sample is suitable for factor analysis.

3.2.3 Confirmatory factor analysis

The sample of confirmatory factor analysis was 605. The variable load situation of the confirmatory factor analysis is shown in Table 3 which shows the variables have sufficient convergence validity.

Table 3   Thegoodness of Fit of the Structural Equation Model

X2/df	RMSEA	GFI	AGFI	NNFI	NFI	CFI	PNFI	PGFI	IFI
0.062	0.94	0.92	0.96	0.95	0.94	0.98	0.83	0.75	0.98

3.2.4 External identification andreliability analysis

In order to fully identify the scale, we first examined the correlation between four dimensions of career growth, and tested the correlation between career growth and career success. It is necessary to analyze the correlation between the two. This study used Greenhaus to measure career success, and analyzed the correlation between five items of career satisfaction and four dimensions of career growth, as shown in Table 4.

In order to ensure all topics were in a high degree of consistency, the study followed the Cronbach's α reliability, and the spearman sub-reliability analysis. The Cronbach's α coefficient of career goal progress, professional ability development, promotion speed, and reward growth is respectively in table 5.

Table 4   Correlation Between Career Growth and Job Satisfaction

	1	2	3	4	5	6	7	8
1. the success ofcareer								
2. progress of overall goals	0.681							
3. satisfied income	0.605	0.670						
4. satisfied promotion	0.543	0.613	0.732					
5. satisfied skills learned	0.443	0.503	0.512	0.526				
6. Career goal progress	0.382	0.456	0.367	0.375	0.472			
7. Professional development	0.246	0.247	0.083	0.257	0.396	0.447		
8. Promotion speed;	0.378	0.433	0.367	0.512	0.338	0.334	0.267	
9. Reward growth	0.352	0.385	0.382	0.432	0.334	0.456	0.268	0.483

Table 5   The Internal Consistency Reliability and Split Half Reliability of Subscales

Subscales	internal consistency reliability	half reliability	Subscales	internal consistency reliability	Subscales
occupation development goals	0.864	0.842	promotion speed	0.788	0.765
occupation ability development	0.838	0.786	Reward growth	0.784	0.734

4 Conclusion

Based on the above research, we can draw the following conclusions: employee occupation growth is a parallel to four factors, there is no causal relationship between the four factors, is related to the four factors including occupation goal progress, ability development, promotion speed and wage growth; Employees' understanding of career growth is associated with changes in people's professional values. The psychological contract between organizations and employees has changed.

In the new environment, employees must get long-term employment opportunities and market competition force through different organizations of knowledge, skills and experience. On the other hand, in the absence of boundary occupation career period, people of their own occupation success criteria began to change, the subjective satisfaction, the realization of personal occupation target has become one of the main goals, and occupation target progress, or that the current work associated with their occupation target become an important occupation content.

Study on the Effect of Electronic Communication during Nonwork Time on Employees' Proactive Behavior

Cheng Huan, Zhang Guanglei
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 690142152@qq.com, zhangguanglei@whut.edu.cn)

Abstract: This paper starts from the theory of ego-depletion and studies the influence mechanism of electronic communication on employee'sproactive behavior during nonwork time, examining the mediating role of morning depletion in this relationship and the moderating role of employees' collectivism tendency. Data from 170 employees and their supervisors indicates that the affective tone of electronic communication has a significant negative impact on employees' next morning depletion and has a significant positive effect on proactive behavior. Morning depletion mediates the relationship of affective tone and proactive behavior; employee collectivism tendency moderates the relationship between morning depletion and proactive behavior, and moderates the indirect relationship between affective tone and proactive behavior via morning depletion.
Key words: Electronic communication; Proactive behavior; Ego depletion; Collectivism tendency

1 Introduction

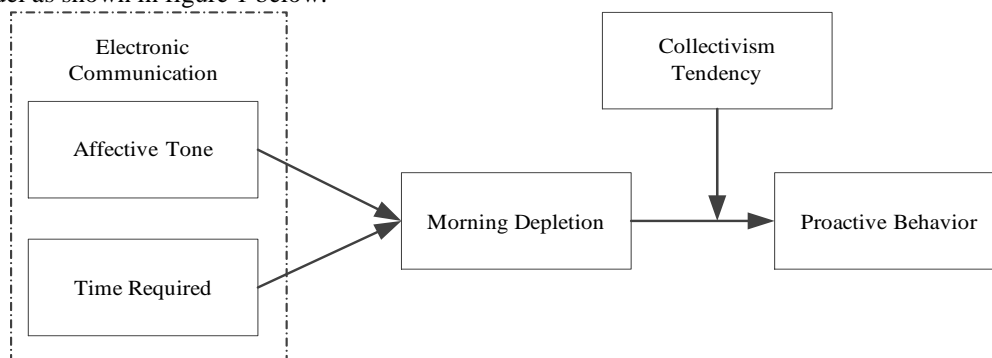
Electronic information technology is changing the way people live and communicate (Derks, van Mierlo & Schmitz, 2014). On one hand, instant messaging can promote the establishment of employees' relationship networks, thereby improving individual job performance (Ou, Sia & Hui, 2013); on the other hand, communications technology make it difficult to separate life from work (Butts, Becker & Boswell, 2015). Electronic communication is a form of electronic communication and consists of language (affective tone) and non-verbal (time required) elements, it can stimulate people's emotional reactions and stress experiences. Employee proactive behavior is an important extra-role behavior. Positive emotions can motivate employees' initiative and encourage employees to engage in more proactive behaviors(Fritz et al, 2009); but stress sources such as time pressure and situational pressure always reduce employees' proactive behaviors. According to the ego depletion theory, electronic communication during nonwork time brings positive or negative emotions and time pressure to employees, which may affect their sleep and hinder the process of supplementing resources, causing next morning depletion and reducing people's willingness to engage in proactive behaviors. In this process, higher collectivism tendency makes employees think of themselves as part of the organization, leading to higher attachment, mission and responsibility. Therefore, the tendency of collectivism may weaken the effect of depletion on employees' proactive behaviors. Specifically, this study proposes a model as shown in figure 1 below:


Figure 1   Research Model

2 Theoretical Background and Hypotheses

2.1 The influence of electronic communication on active behavior during non-working hours

Electronic communication during nonwork time brings convenience to people, but also brings a series of negative effects, such as work-family conflict (Jarvenpaa & Lang, 2005; Butts et al, 2015) points out that the affective tone and time required for electronic communication have an impact on employees' emotions.Research shows that positive emotions motivate individuals to take action. On the

one hand, it leads individuals to actively invest in problem solving and responsibility-taking behaviors (Ohly, Sonnentag & Pluntke, 2006); on the other hand, positive emotions can also promote individuals' willing to take risks that may be brought by proactive behavior. Positive affective tone will prompt people to invest in proactive behavior, but the time required to conduct electronic communication and accomplish tasks will bring time pressure and negative emotional impacts, which will hinder employees' proactive behavior. In summary, we put forward the following hypothesis:

Hypothesis 1: Affective tone (a) of electronic communication during nonwork time positively affects employees' proactive behaviors; Time required (b) has a negative effect on employees' proactive behaviors.

2.2 The mediating role of morning depletion

The theory of ego depletion believes that mental energy is indispensable to self-execution; mental energy is limited, and only a limited number of self-controls can be performed in the short-term; the process of self-control is the process of consuming mental energy and it takes some time to recover after consumption (Baumeister, Muraven & Tice, 2000). Sleep is particularly important for supplementing individuals' self-control resources, but work activities often interfere sleep (Barnes, Wagner & Ghumman, 2012). Late night work will prevent employees from getting adequate rest and restoring exhausted resources. On the one hand, electronic communication during nonwork time brings time pressure, which will destroy people' sleep. On the other hand, positive emotions lead to high quality sleep and "build" resources, promote investment and reduce ego depletion. When an individual depletes, the energy required for self-activity is in a state of shortage, making it difficult to control oneself and fail to produce a series of proactive behaviors. Based on this, we put forward the following hypothesis:

Hypothesis 2: Morning depletion mediates the relationship between electronic communication during nonwork timeand employees' proactive behavior.

2.3 The moderating role of collectivism tendency

Collectivism manifests itself as a collectivism tendency on a personal level. As a work value at the individual level, it has a profound influence on employees' thinking patterns and behaviors. Employees with a collectivism tendency often attach themselves to organizations to establish self-identity and have emotional and cognitive dependence on their organizations (Felfe, Yan & Six, 2008). The collectivist's goal is based on collective interests. Based on the emphasis on the overall interests, individuals with high collectivism tendencies tend to be more able to execute. Based on the theory of ego depletion, employees experiencing morning depletion cannot display a series of positive behaviors due to the loss of self-control resources, while those with high collectivism tend to regard themselves as members of the collective and have more positive energy and behaviors. Therefore, the following hypothesis are made:

Hypothesis 3: The collectivism tendency of employees moderates the relationship between morning depletion and proactive behavior. The higher the employee's collectivism tendencies, the weaker the negative relationship between morning depletion and proactive behavior.

Hypothesis 4: The collectivism tendency moderates the indirect relationship between electronic communication during nonwork time and proactive behavior via morning depletion. When the level of collectivism tendency is high, the mediating effect is weak.

3 Method

3.1 Procedures and sample

The data comes from multiple companies in multiple regions in China. The research objects are the company's employees and their direct supervisors. The participants completed the initial survey at time one, which included background information and collectivism tendency. A week later (time two), participants measured their electronic communication the night before and morning depletion in the morning at 8 am, and the day's proactive behavior at 5 pm. Finally, 170 valid questionnaires were recovered, the effective recovery rate was 85%.

In terms of the sample, 50.9% of males and 49.1% of females are in this survey; 33.1% of married persons; most of the respondents are under 30 years of age, accounting for 75.7%; the average working time per week in 40-50 hours is most, accounting for 49.7%.

3.2 Measures

1) Electronic communication. This study used the two-dimensional scale of Butts et al (2015).

2) Morning depletion. This study used the 5-item scale of Twenge et al (2011). Self-assessed by the employees on the Likert 5-point scale (All of the following continuous multi-items scales were

measured using the 5-point scale, "1" to "5" means from "strongly disagree" to "strongly agree"). α = 0.83.

3) Proactive behavior. This study used the 8-item scale of Parker et al (2010), which was evaluated by the supervisor. α = 0.92.

4) Collectivism tendency. This study used the 6-item scale of Doney et al (1998). α = 0.92.

5) Control variables. We controlled for age, gender, marital status, working hours and responsibility. Responsibility was measured using the 10-item scale of Goldberg (1999). α = 0.94.

4 Results

4.1 Measurement model testing

Before testing our hypotheses, we first performed a series ofconfirmatory factor analyses (CFA) using Amos 22.0to assess the measurement validity of our proposedmodel.The CFA results suggested that our four-factor model produced acceptable fit:χ^2(106) = 1464.172；RMSEA = 0.066；TLI = 0.883；CFI = 0.908；SRMR= 0.057.

4.2 Hypotheses testing

Table 1 shows the mean, standard deviation, and correlations of the variables. Table 2 shows that affective tone has a significant positive effect on proactive behavior (M5, β =.17, p < .05), and the required time has no significant effect on proactive behavior (M6, β = -.08, p > .05). Hypothesis 1a is supported; for the mediating effect, referring to the Bootstrap method, the sample size was chosen as 5000. In the 95% confidence interval, the result did not include 0 (LLCI = .0634, ULCI = .2031). Hypothesis 2 was supported.

Table 1 Descriptive Statistics and Correlations

n=170, ** p<0.01, * p<0.05
Figure 2　The Moderating Effect of Collectivism Tendency on the Relationshipbetween Morning Depletion and Proactive Behavior.

For Hypothesis 4, using the Bootstrap method for conditional mediation tests. The data shows that under the high collectivism tendency, the indirect effect of electronic communication (affective tone) on proactive behavior (through morning depletion) is 0.0744, 95% confidence interval does not include 0 (LLCI = .0247, ULCI = .1442); at the low level of collectivism tendency, the indirect effect is 0.1684, 95% confidence interval does not include 0 (LLCI = .0852, ULCI = .2735); and the indirect effects of high and low collectivism tendency have significant differences, 95% confidence interval does not include 0 (LLCI = -.0940, ULCI = -.0124). Therefore, Hypothesis 4 is supported.

5 Conclusion

This study is based on the paired data of 170 employees and supervisors obtained through multi-time surveys. Based on the theory of ego depletion, we find that the affective tone of electronic communication during nonwork time has a significant negative impact on the next morning's depletion; morning depletion has a significant negative effect on employee's proactive behavior; affective tone has a significant positive effect on the employee's proactive behavior, and morning depletion mediates their relationship; collectivismtendency moderates the relationship between morning depletion and proactive behavior, and moderates the mediating effect of morning depletion.

According to the research results, the following practical recommendations are proposed:

Firstly, the organization should provide certain training and guidance for the use of employees' electronic communication, including proper communication style, correct expression of emotions, and

reasonable time application.Secondly, we can use various ways to careemployees, encourage employees to participate in social activities, and increase communication and contact between the superior and subordinates in order to promote mutual understanding, forming a good atmosphere for communication.

Research limitations:

Firstly, electronic communication includes different channels, such as mobile phones and computers. We does not distinguish the effect of different channels. Secondly, although the longitudinal study design of multi-temporal, multi-source data (employees and supervisors) was used in this study to overcome the limitations of cross-sectional studies, we could not learn the causal relationship between variables.

Future research directions:

Firstly, different forms of communication tools may have different effects on employees' emotional experience and physiology. Therefore, future research can measure the influence mechanism of different communication tools on employees' proactive behavior.Secondly, future studies should confirm the causal relationship between variables by rigorous research design.

Proposing a New Model on Asymmetric Outcomes
of Helping Behaviors at Work in Multi-stakeholder Perspective

Natalia Loseva
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: loseva_natalya@mail.ru)

Abstract: Organizational citizenship behaviors (OCB) with a particular emphasis on helping behaviors at work are getting increased attention of researchers. Although much of the early empirical research in this domain was directed at the individual level of analysis, more recently, researchers have focused their attention on identifying the outcomes of group-level or unit-level OCBs. Also till now most of the research was focused whether on benefits or on costs of exhibiting helping behaviors. We propose to look at asymmetric outcomes of OCBs and helping behaviors at work (positive and negative) for multiple stakeholders (organization and individual). Also we propose cases under which OCBs may more likely result in negative outcomes, in other words, in what cases refusal to provide help will increase employee well-being, life satisfaction level and positive organizational outcomes.

OCB and helping behaviors are mostly related by researchers to employee well-being. We propose to move attention of management research from job satisfaction and employee well-being concepts to concept of life satisfaction which is an ultimate goal of human existence and proposed to be a better predictor of number of organizational outcomes (i.e., job performance, organizational commitment, turnover, etc.)

Key words: Helping behaviors; Decision-making; Life satisfaction; Organizational citizenship; Organizational outcomes

1 Introduction

Imagine that your colleague has asked you for help at work. You consider yourself not competent enough in this field, or you do not have enough time available (therefore assistance may influence your job performance). What would you do? Would you agree to provide help or say "no" to the help-seeker? What would you feel if you are lacking resources but still decided to provide help: satisfaction or stress or maybe discomfort? Would you be stressed about the quality of help you provide while lacking resources? How would it influence your job satisfaction? Would you feel yourself a happier person after making that decision? Would it influence your job performance and commitment to the organization?

Why in some cases refusal to provide help is the best way to increase employee well-being, life satisfaction level and outcomes for the organization?

In this conceptual paper we provide a model to answer this question.

2 Literature Review

2.1 "Dark" and "bright" sides of individual level OCB and helping behaviors in multi-stakeholder perspective

Organizational citizenship behavior (OCB) refers to discretionary acts that promote organizational functioning by supporting the social and psychological environment in which task performance occurs (Organ, 1997).

According to Podsakoff, et al., 2014 this Organ's definition of OCB assumes that these behaviors are: (1) positively related to organizational performance and (2) not necessarily related to outcomes for the individuals exhibiting them. Therefore growing body of research concentrates nowadays on the potentially important effect of these behaviors on group-level and/or unit-level outcomes. In the recent meta-analysis Podsakoff et al (2009). found that the correlations between OCBs at the unit level and organizational productivity, profitability, product quality, efficiency, turnover, and reductions in waste tended to be positive. Therefore, it seems that OCBs are important for the organizational success (Podsakoff, et al., 2014).

However we tend to think that individual level outcomes of OCB are still a matter of a great importance either for employee well-being or for an organization. Employee well-being includes such constructs as job satisfaction, career satisfaction, perceived job stress, perceived competence etc. Ellingson, Gruys, and Sackett (1998) reported an uncorrected job satisfaction-job performance correlation of .30 (.32 if corrected for internal consistency or .44 if corrected for interrater reliability)

(Judge, et al., 2001). Therefore we can make a conclusion that individual level outcomes of OCB positively correlate with organizational outcomes and in some cases they are prerequisites of an organizational success.

We focus our theorizing on interpersonal OCB (i.e., OCB-I or helping; (Williams & Anderson, 1991) due to its prevalence in organizations (Grant & Hofmann, 2011).

OCBs reflect to behaviors employees enact in the workplace that are not formally specified in their job descriptions but are thought to have implications for organizational functioning. Helping others at work is a characteristic marker of OCB, and culturally valued behaviors that help promote functioning in organizational systems including the workplace (Smith, et al., 1983). It is not surprising then that researchers have mostly focused on positive outcomes of OCBs while neglecting to consider potential negative outcomes and how these can impact the organization and its members.

However, in past years scholars have questioned the prevailing belief that OCB is uniformly beneficial, instead suggesting that it may have a "dark side" (Bolino, et al., 2013). For example, OCB may have detrimental effects on performance and long-run career outcomes for individuals who perform more of this behavior than others (Rubin, et al., 2013). These competing streams of research highlight a fundamental tension that exists in the OCB literature exemplified by the question: Is OCB good or bad? (Bhatnagar & Manchanda, 2013).

We suggest modifying that question: in what cases and for whom OCB good or bad, and why?

Speaking about "For whom OCB are good or bad?" the literature overall has rarely specifically considered when these behaviors might be good or bad for different stakeholders.

Reynolds, C.A., et al., 2015 suggests a multi-stakeholder perspective of organizational citizenship with positive and negative outcomes of OCB for different stakeholders (individual, co-workers and organization). For instance, positive outcomes for individual are career success and perception of control, negative: increased workload and stress, lower job satisfaction; positive outcomes for an organization: increased organizational commitment and improved performance, negative: insubordination, reduced performance, etc. (Reynolds, et al., 2015).

Therefore we propose investigating OCB and helping behaviors through multi-stakeholder perspective   (organization and individual) and both sides ("bright" and "dark") to understand for whom, whyand in what cases OCB are good or bad and what are the reasons why they may have good or bad consequences.

2.2 Decision-making process in helping behaviors

Every decision we make based on decision-making process. Decision-making is regarded as a cognitive process resulting in the selection of a belief or a course of action among several alternative possibilities. Every decision-making process produces a final choice.

Recent researches on OCB are drawing from theories of resources: conservation of resources theory (Koopman, et al., 2016), resource drain theory (Deery, et al., 2017).

According to resource drain theory (Edwards &Rothbard, 2000) personal resources such as time and energy are finite and resources expended in one domain are not available in another. In the work environment, individuals are often required to undertake a number of roles and tasks. The time, attention, and energy devoted to completing tasks in one work domain will, however, reduce the resources available for tasks in another domain. Resource drain can occur in the face of competing responsibilities and multiple role demands, which can result in stress-related outcomes such as burnout and work-family conflict. In the context of finite resources employees must therefore make decisions about how they allocate their time. Both in-role and extra-role behavior compete for the limited time resources available to employees (Deery, Rayton, Walsh & Kinnie, 2017)

Therefore every decision-making process includes the choice of an alternative (in our case: to help or do not help) based on availability of personal resources.

Our question is: why in some cases when individual is experiencing lack of resources (time, competence, desire to help, energy, etc.) they still chose to exhibit helping behavior?

Previous research on estimating the likelihood of saying ''yes'' to help requests has demonstrated that helpers often agree to provide assistance because of the discomfort they associate with refusing to help (Bohns, et al., 2011).

We insist that decision to help based on lack of resources is influenced by discomfort associated with refusal and affects employee well-being and organizational outcomes. In other words, if individual is lacking resources it is better to refuse to provide help, it will increase employee well-being level and positive organizational outcomes.

Also we would like to find an answer to the following question: why some people are experiencing

high discomfort associated with refusal to provide help when having lack of resources while others may not experience that discomfort? What are the factors that mediate the discomfort?

2.3 Life satisfaction vs Employee well-being

Although the management literature has largely ignored the concept of life satisfaction, the life satisfaction literature has similarly tended to ignore the work domain. According to Erdogan, B., et al., (2012) the scant attention paid to the concept of life satisfaction in the management field is a critical research gap (Erdogan, et al., 2012).

Instead of including to our model well-developed concept of employee well-being or "happy worker", we would like to use a broader concept of life satisfaction or "happy person".

The bottom-up approach regards life satisfaction as a function of satisfaction with life domains (Pavot&Diener, 2008) such as work, family, health, and leisure.

Erdogan, B., et al., (2012) suggested a Process Model of the Relationship between Work-Related Antecedents and Life Satisfaction. They define proximal mediators of work domain to life satisfaction and its outcomes for the organization　(Table 1).

Table 1　Process Model of the Relationship between Work-Related Antecedents and Life Satisfaction (Erdogan, Bauer, Truxillo & Mansfield, 2012)

Proximal mediators of work domain to life satisfaction	Outcomes of life satisfaction
Quality of work life	Organizational performance
Job satisfaction	Organizational comittment
Career satisfaction	Turnover intentions
Perceived job stress	Turnover
Feeling of self-worth	
Perceived competence	
Perceived control	

Interestingly, Erdogan, B., et al., (2012) suggests to consider life satisfaction as a predictor of number of organizational outcomes as job performance, organizational commitment, turnover intentions and turnover. Jones (2006) showed that the correlation of life satisfaction with performance was stronger than that of job satisfaction, and life satisfaction predicted these behaviors beyond job satisfaction and organizational commitment (Jones, 2006).

3 Research Gap

Recent competing streams of research highlight a fundamental tension that exists in the OCB literature exemplified by the question: Is OCB good or bad? (Bhatnagar & Manchanda, 2013).

We suggest modifying that question: in what cases and for whom OCB good or bad, and why?

Speaking about "For whom OCB are good or bad?" the literature overall has rarely specifically considered when these behaviors might be good or bad for different stakeholders (Reynolds, Shoss & Jundt, 2015).

Therefore we propose investigating both sides of OCB and helping behaviors ("bright" and "dark") through multi-stakeholder perspective (effect on organization and individual). It will provide understanding for whom, whyand in what cases OCB are good or bad and what are the reasons why they may have good or bad consequences.

Also OCB and helping behaviors were mostly associated with employee well-being (job satisfaction, etc.). We suggest taking into consideration a broader and newer for management field concept of life satisfaction which is the ultimate goal in human existence and antecedent for number of organizational outcomes (performance, commitment, turnover, etc.).

The issue we would like to address in this research paper: What are the reasons that in some cases helping behaviors make individuals satisfied with their career and life and lead to positive organizational outcomes (i.e. higher organizational commitment, performance and lower turnover intentions) and in others cases - they lead to the asymmetric outcomes for an individual and organization?

We propose the following model (Figure 1) to explain when OCB and helping behaviours may lead to asimmetric outcomes (positive and negative) for different stakeholders (the individual (employee) and organisation).

4 Research Methodology

Helping behaviours and discomfort associated with refusal to provide help will be measured by adapted story design used by Newark, 2017 (Newark, et al., 2017). Example items include "Imagine that [you are/a colleague of yours is] an event manager preparing to mail out information about an important upcoming event. [You are/Your colleague is] running behind schedule, and so [you ask a colleague if he or she would help you/asks you if you would help him or her] stuff and address envelopes. [Your colleague agrees/You agree], etc.

Constructs related to employee well-being (job satisfaction, career satisfaction, perceived job stress) and organizational outcomes (job performance, organizational commitment, turnover and turnover intentions) will be measured by management questionnaries.

To measure life satisfaction as recommended by Erdogan, B., 2012 we are planning to utilize the five-item Satisfaction with Life Scale (SWLS) by Diener et al., 1985 (Erdogan, Bauer, Truxillo & Mansfield, 2012).

5 Conclusion

To conclude our idea we would like to emphasise that helping others which is considered as positive action that leads to many positive outcomes is not always the best way to do in order to enhance employee well-being, life satisfaction level and organizational outcomes. In some cases (like making decision to help on the basis of discomfort of saying "no"), decision do not help would lead to higher job and career satisfaction, life satisfaction of the individual, lower job stress and higher outcomes for the organization.

We would like to test this idea in the future research.

Consequences of Downward Envy: A model of Employees' Counterproductive Work Behavior and Impression Management

Zhang Qiuhong
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 906592636@qq.com)

Abstract: It is common for leaders to develop downward envy towards their subordinates when they have excellent quality and leadership potential. We invoke theory and research on the social functional view of envy to propose a novel theoretical framework of supervisory leader envy of direct reports. Supervisor-subordinate dyads provide support for the theses that (1) when leaders cause downward envy against subordinates, they will develop abusive supervision or self-improvement. (2)When subordinates perceive leader produces downward envy and take down abusive supervision, employees are more inclined to take counterproductive work behavior in response to the downward envy, when the subordinate perceived leadership create downward envy and use self-improvement, subordinates tend to lead impression management to respond. This paper provides a complete explanation of the theoretical framework of leadership and subordinates by proposing two different paths.
Key words: Downward envy; Abusive supervision; Counterproductive work behavior; Self-improvement; Impression management

1 Introduction

Envy is one of the social emotions that prevails in everyday life. It refers to the kind of contradiction or negativeness emotions that an individual produce when a person lacks another's superior quality, achievement, or property (Parrott & Smith, 1993). The existing research literature focuses on the flaws between co-workers or subordinates to supervisors. There is no formal theoretical reference for explaining how leaders manage and treat the direct subordinates when they experience downward envy (Duffy, Shaw, and Schaubroeck, 2008. Yu & Duffy, 2016). This is because there are many advantages in being in a leadership position, including controlling the allocation of resources, sharing exchanges with other power holders, obtaining valuable rewards, etc. (Vecchio, 2007; Yukl, 2012), so they may not be able to have such feelings toward their own subordinates, but at the same time, studies have shown that when subordinates have a certain leadership potential, are good at innovation, have strong social and managerial abilities, and are sought after by other employees, the leaders may feel threatened by their own status, thus creating downward envy.

The literature on envy described the strategy of coping with envy as two strategies: "decrease the level of others" and "elevate one's level." First of all, the enviers may express their own pain by destroying and injuring their own targets (Smith & Kim, 2007). For example, they put them in an unfavorable position and reduce the gap between themselves and others. The envied may berespond to this behavior by adopting a series of measures. For example, they will reduce their own work performance or intentionally or unintentionally violate organizational norms, making themselves look less outstanding to reduce the likelihood of being envied by leaders (Jensen, Patel, &Raver, 2014). In addition, some scholars have shown that envy will increase the motivation for individuals to pursue self-improvement, and that envy may increase job performance (Schaubroeck & Lam, 2004), increase work motivation (Cohen-Charash, 2009), and strengthen the links with the beheaded (Vecchio ,2005), they reduce the gab with envied by increasing their own strengths (Dineen et al, 2017; Yu & Duffy, 2016). At the same time, the envied can reduce their leadership downward envy in order to improve their environment. They will engage in impression management behaviors, such as concealing ideas that may appear before the leader or crediting individual achievements to their leaders (Nickerson, 2014), this is typical ingratiation in impression management.

Therefore, this paper proposes a theoretical framework that explains how leaders use two different strategies to express the downward envy of subordinates and how subordinates respond to downward envy. According to the existing literature, this article defines the downward envy feeling that the leader thinks that the subordinate has something he wants but lacks, resulting in a sense of suffering and inferiority. The behaviors that leaders can generate as a result of downward envy include abusive supervision that reduces the level of others and self-improvement in self-enhancement. Employees respond to the abusive supervision of leaders due to downward envy through counterproductive work behaviors, and respond to leader self-improvement through image management.

The main contribution of this article is to reveal how employees respond to downward envy. Existing theories and studies have not shown the possibility of leaders experiencing and expressing envy, Descriptive evidence suggests that downward envy in the workplace may have perverse consequences. Recent research suggests that envied may have different responses, ranging from pleasure at their achievements and strengths to fear of the envious. In order to explore the subordinate on how to deal with downward envy, we quoted the social functional view of envy. We found that how employees respond to downward envy was linked to abusive supervision and self-improvement of leader.

2 Literature Review

2.1 Envy

Envy is one of a complex emotions existing in a wide range oflife. It is a kind of uncomfortable psychological complex emotions such as hate, hostility, sadness, revenge and so on through social comparison. From the perspective of social function, both passive and positive emotions have the function of social security, when individuals lack strength in an important area compared with others, they will constantly monitor their societyEnvironmental information and various efforts have been made to counteract the stigma caused by blemishes (Hill & Buss, 2006). The existing research on envy includes: From the perspective of gender differences, Gold (Gold, 1996) found that men are more likely to be embarrassed than women. From a cognitive process point of view, Crusius (Crusius, 2012) found that self-control ability is related to the expression and intensity of envy. At the organizational level, Li Qianqian (Li Qianqian, 2013) studied the negative relationship between corporate employees' envy in the workplace and organizational citizenship behaviors. In summary, the relevant literature is mostly focused on the psychological level. Envy is based on social comparisons. In the organization, individuals will experience comparisons with colleagues and other groups of colleagues, and are more prone to envy. Therefore, it is worth to study envy in the organization.

2.2 Abusive supervision

Abusive supervision refers that subordinates perceive leaders' persistent linguistic or non-verbal hostile behaviors, but do not include physical contact violations (Tepper, 2000). Abusive supervision will cause continuous damage to the subordinate's feelings, which will lead to subordinates' dissatisfaction. This kind of dissatisfaction has a great destructive effect, such as employee turnover tendencies. The existing research on abusive supervision includes: From the perspective of cognition, employees' awareness of leadership abusive supervision will change employees' perceptions and influence their work behavior. Yan Aimin (Yan Aimin, 2010) studied the relationship between abusive supervision and employee deviation based on social exchange theory and social identity theory. From a sentimental perspective, Aryee et al. (Aryee et al., 2008) showed that abusive supervision led to emotional exhaustion of subordinates, which in turn reduced the peripheral performance of subordinates and reduced their extra-role behavior. Wang Hongqing, Peng Jisheng studied the negative effects of abusive supervision on employee mentality (emotional commitment, emotional exhaustion). In summary, the existing research is based on the outcome variables of abusive supervision. There is less research on the antecedents of abusive supervision. In this paper, the downward envy is added as the leading factor of abuse supervision.

2.3 Counterproductive work behavior

The study of counterproductive work behavior originated from Kaplan's investigation of employee misbehavior in the workplace. It refers to the behavior of employees deliberately damaging the interests of others or organizations in the workplace, including attacks within the organization, anti-social behavior, violations of law, and other actions. Current antecedents of counterproductive behavior include individual variables, such as personality traits, individual cognition variables, situational variables, including organizational factors, and leadership factors. It is widely believed that the abusive supervision of leaders has a positive effect on employees' counterproductive work behavior. Detert et al. (Detert et al., 2007) found that empirical research shows that there is a significant positive correlation between leadership abusive supervision and employee counterproductive work behavior. Outcome variables include impact on organizations and individuals. Bowling and Beehr (Bowling and Beehr, 2006) pointed out that employees' work stress may cause counterproductive work behavior, which in turn significantly affects employees' job satisfaction and organizational performance variables.

2.4 Self-improvement

Self-enhancement is universal in human society; it is a motive to pursue positive self. Motivation for self-improvement causes individuals to have a positive self-biased attitude. Alicke (Alicke, 2003)

proposes that individuals think their own perspectives, characteristics, and their future are better than others. Dong Yan (2005) proposes that individuals strive to maintain and promote self-esteem in social comparisons. he hopes to have a sense of satisfaction and effectiveness through self-improvement. In a word, self-improvement is an important self-motivation, which makes individuals produce a positive bias in the process of self-cognition and evaluation. The definition of self-improvement in this article is: Self-elevation is a universal self-motivation. It encourages people to have a positive tendency to think that they are better than the average person. This bias may be affected by the situation.

2.5 Impression management

Impression management isa process in which people try to control others to form an impression on themselves (Rosenfeld, 1995). People control other people's opinions and behaviorsby controlling other people's information.Individuals will use appropriate image management strategies based on context, and then influence others' opinions on him in social interactions. The impression management strategy includes self-promotion, ingratiation, intimidation, exemplification,supplication.Studies on impression management include: In terms of job performance, Wayne (Wayne, 1990) found that a leadership-centered impression management strategy can positively predict job performance; in organizational citizenship behavior, Guo Xiaowei (Guo Xiaowei, 2006) found that an impression management strategy can significantly enhance supervisors assessing employees' organizational citizenship behavior.In summary, impression management is an individual's desire to be able to be treated in his own way in any situation in the organization. In this context where the organization suffers from downward envy, leadership uses self-improvement, and employees apply an impression management strategy. Put yourself in a relatively safe environment.

3 Hypothetical Development

Being in a leader position has higher rights, status, and material advantages. They can arbitrarily allocate control resources, manpower, and material resources. When their subordinates have rich social networks and capabilities and certain influence, leadership will produce a kind of feeling-threatened, because individuals often like to see themselves better (Leary, Tambor, Terdal, & Downs, 1995) and perform an act designed to preserve and enhance self-worth (Crocker & Park, 2004). Leadership experience downward envy and self-motivated opinions are attacked. Therefore, leaders will respond to reduce and eliminate gaps between envied. As mentioned above, leaders may adopt ways to destroy and reduce the advantages of others. Duffy (Duffy, 2012) pointed out that the envy person would undermine the perceived advantage of the envied target through social silence, and Gino & Pierce (2009) reduced the advantage of the deafness through unethical behavior. A large number of studies have shown that abusive supervision will hurt the target person, because they use a method of howling, accusing, and exclusion of subordinates. According to social exchange theory, abusive supervision can bring helplessness, frustration, and alienation to employees, which in turn leads employees to take revenge in the form of counterproductive work behaviors. Therefore, this paper proposes:

Hypothesis 1: Downward envy leads to employee counterproductive work behavior through leadership abusivesupervision.

The second response of leaders in coping with downward envy is self-improvement, aiming to increase their ability and level to reduce the gap between them and the envied ones. For example, Cohen-Charash (Cohen-Charash, 2009) proposed that envy people will work hard to obtain the success that comparable to their envy of individuals. Because leaders will pay social costs when using abusive supervision, such as their credibility is reduced, employees' counterproductive work behavior will bring certain losses to the organization and cause certain negative impacts on other employees. Therefore, leaders should use Self-improvement opportunities, participation in advanced training programs, and the use of various resources to promote career development, studies have shown that individuals who participate in these activities can achieve rewards and status enhancement (Day, 2000). At the same time, employees adopt image management strategies, such as concealing ideas that may appear in front of leaders or crediting their personal achievements to their leaders (Nickerson, 2014). On the one hand, they are conducive to satisfying leaders' sense of self-improvement and on the other hand, to change the leadership's perception of him, avoiding being too successful to suffer from leadership's downward envy. Therefore, this paper proposes:

Hypothesis 2: Downward envy leads to the impression management behavior of employees through leadership self-improvement.

4 Model Construction

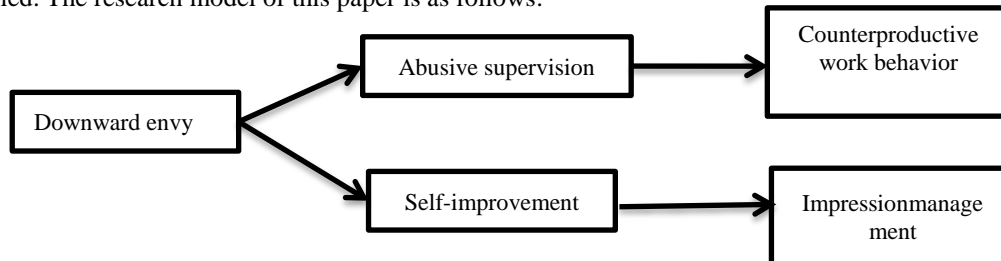
Leading officials have become downward envy by their subordinates. They will reduce the gap between their subordinates and treat their subordinates through the two strategies of "decreasing others' levels" of abusive supervision and "enhancing self-improvement". When employees feel the abusive supervision of leaders, counterproductive wokbehaviors will be taken to cope with the downward envy of leaders. When leaders take self-elevation actions, employees will adopt an image management strategy, hoping to be viewed positively by the leaders in the context of the organization rather than by envied. The research model of this paper is as follows:


Figure 1   The Model of Downward Envy

5 Hypothesis Testing

The paper selects 120 leadership - subordinates matching data, a total of three times of the data collection, at time 1 complete of the evaluation of personal statistics and downward envy, at time 2 subordinate evaluation the abusive supervision and self-improvement, at time 3 subordinates complete own counterproductive behavior and impression management behavior, the interval is two weeks. Questionnaire after statistical analysis, the results showed that there was a significant relationship between the downward envy of the abusive supervision and self-improvement behaviors. The abusive supervision mediated the relationship between the downward envy and counterproductive behaviors, self-improvement mediated the relationship between the downward envy and management behavior, P values are less than 0.05, and the research hypothesis is testing.

6 Conclusion

This study explored two different paths that employees responded to leadership downward envy, explainingwhen subordinates have a specific reaction, downward envy cause employees' counterproductive work behavior through abusive supervision, and downward envy leads to the impression management behavior of employees through leadership self-improvement. This article explores the behavior of leadership downward envy through two adaptive behavioral responses, namely, elevating one's self level and lowering one's self level, and expanding the related research on the envy in the organization, that is, envy does not produce bad results; secondly, the research on abusive supervision in work organizations has been promoted. In the past, abusive supervision was used as an antecedent variable. Few studies have investigated the antecedents of abusive supervision. This paper explains the causes of abusive supervision through downward envy. Third, this article enriches the research on impression management. Impression management is intended to be viewed positively by others in any situation in the organization. This article employs an impression management strategy designed to reduce the likelihood of downward envy.

Research on the Causes and Countermeasures of Entrepreneurial Mentors Negative Mentoring Behavior

Hao Yuchang, Wang Chao
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 1369786255@qq.com, 408468369@qq.com)

Abstract: Under the background of national innovation-driven development strategy and encouraging "innovation and entrepreneurship", the role of entrepreneurship mentors in promoting innovation and entrepreneurship has attracted more and more attention. However, the focus is mainly on the positive aspects of the guidance effect of the entrepreneurial mentor, not paying sufficient attention to the negative guidance behavior in the mentoring relationship, this paper makes a systematic study on the causes and solutions of the negative guidance behaviors of entrepreneurial mentors. This paper first elaborates four aspects of the negative guidance behavior of entrepreneurial mentors, then analyses three bad results the negative guidance of entrepreneurial mentors may result in. On the basis of this, this paper deeply analyzes the four causes of the negative guidance behavior of the entrepreneur mentor, and finally proposes three targeted countermeasures to reduce the negative guidance behavior of the entrepreneur mentor. This paper enriches the research on the guiding behavior of the entrepreneurial mentor, and provides a theoretical research foundation for the research of mechanism exploring and systematic prevention of the negative behavior of the entrepreneurial mentor.
Key words: Entrepreneurship mentor; Negative guidance; Causes; Countermeasures

1 Introduction

With the rising of innovative entrepreneurial zeal in China from "torch mentors action plan" of the National Ministry of   Science and Technology and "national excellent innovative teacher talent pool" construction of the Ministry of Education, to the government's entrepreneurial management departments at all levels, the communist youth league, universities, incubator, the gen space, and other institutions have established an entrepreneurial mentor support system, to guide the business practices of entrepreneurs. Many researches shows that entrepreneurship mentors have a positive influence on entrepreneurs in many aspects, such as career support, social psychological support and role models. Entrepreneurial guidance to entrepreneurs can effectively increase the survival rate of venture enterprises and contribute to its development (Sullivan R, 2000). Therefore, in the construction of entrepreneurial promoting environment of the world, entrepreneur and entrepreneurial company's mentors is an important part of the entrepreneurship supports environmental construction (Long et al., 2013). Now, entrepreneurship guidance activities have begun to receive big attention from scholars, and entrepreneurship mentor research has become an important topic in the field of entrepreneurship research (Liu Feng et al., 2016). A large number of scholars have conducted studies on guiding function, guiding relationship and influencing factors of guiding effect of entrepreneurship (El Hallam H&St-Jean, 2016).

However, the current study focuses on the positive guiding effect of entrepreneurial mentors, ignoring that mentors in the entrepreneurship practice exists negative guidance. Some scholars have found that the negative guidance behavior of the entrepreneur mentor will lead to the failure of the entrepreneur to improve his skills, and entrepreneurs may even suffer emotional damage (Eby, 2010). At present, a small number of foreign scholars have noticed some phenomena that are contrary to the original guiding purpose in the guidance process of entrepreneurial mentors. There is a lack of systematic research on the representations, causes and solutions of the negative guiding behavior of the entrepreneurial mentor. This paper takes the negative guidance behavior of the entrepreneur mentor as the research object, discussing the representations and reasons of the negative guidance behavior of the entrepreneur mentor and the countermeasures to reduce the negative guidance effect of the entrepreneur mentor.

This paper is divided into five parts. After proposing the research object, this paper describes the manifestation of the negative guidance behavior of the entrepreneur mentor, and then analyzes the possible results of the negative guidance behavior of the entrepreneur mentor. Based on the reasons of negative guidance behavior of the entrepreneur mentor explored, the corresponding countermeasures are proposed.

2 The Appearance of Negative Guidance of Entrepreneurial Mentor

The negative guidance behavior of the entrepreneurial mentor refers to the behavior that hinders the effective implementation of the guidance in the mentoring relationship and has a negative impact on entrepreneur' psychological and behavioral mode. In the practice of entrepreneurship guidance, there are four appearances of the negative guidance of entrepreneur mentor.

(1) Entrepreneurial mentor conceals the key information needed for entrepreneurship to entrepreneurs. It is one of the responsibilities of an entrepreneurial mentor to complete the entrepreneurial guidance process, and an essential element for entrepreneurial guidance. However, some entrepreneurial mentors are too focused on their own development and are afraid to create more competitors for themselves. In the process of guidance, the entrepreneurial mentor intentionally conceals the key information needed to start a business for entrepreneurs, which leads to negative guidance.

(2) Entrepreneur mentor provide wrong guidance. The wrong guidance behavior of the entrepreneur mentor to the students refers to the fact that the entrepreneur mentor lacks knowledge in some aspects, however, in order to maintain his own authority or fear losing face, he still guides the entrepreneur, which leads to the wrong guidance for the entrepreneur.

(3) Entrepreneurial mentor interferes in entrepreneurial behavior of entrepreneur too much. Some entrepreneurial mentors are so strong that they place too much emphasis on their own ideas which did not think about the willingness of entrepreneurs or make decisions for entrepreneurs, making entrepreneurs lack of training and difficult for entrepreneurs to grow up.

(4) Entrepreneurial mentor insult entrepreneurs. In the process of communication and interaction between the entrepreneurial mentor and the entrepreneur, the entrepreneurial mentor may damage the spirit and body of the entrepreneur with language or behavior which is beyond the psychological and emotional acceptance of the entrepreneur and make the entrepreneur feel insulted. There are also some abusive languages or bad gesture which makes the entrepreneur feel embarrassed. More seriously, the entrepreneurial mentor conducts sexual harassment to the entrepreneur.

3 The Bad Effects of Negative Guidance of Entrepreneurial Mentor

Negative guidance of entrepreneurial mentor may have influences on entrepreneur in both behavior and psychology. The negative effects on the psychology of entrepreneurs are mainly reflected in the pressure and negative emotional impact, the perception and cognition impact, and the influence of attitude intention on entrepreneurs. The bad influence on entrepreneurs' entrepreneurial behaviors leads to entrepreneurs being at a loss and making mistakes frequently in the process of entrepreneurship.

3.1 Create psychological pressure and negative emotions for entrepreneurs

The negative guidance behavior of the entrepreneur mentor will make the guiding relationship between the entrepreneur mentor and the entrepreneur abnormal, and dealing with this relationship will deplete the emotional resources of the entrepreneur, thus increasing the psychological pressure of the entrepreneur. Moreover, negative guidance will make entrepreneurs shrink psychologically, leading to negative emotions such as depression, anger, anger and sadness (Kumar, 2014).

3.2 Cause bad perception and cognition to entrepreneurs

Entrepreneurs must have a positive attitude and perseverance to succeed. The negative guidance behaviors of the entrepreneur mentor in terms of intentional rejection and abuse of authority, weaken the guiding effect on career support and psychological support. At the same time, it can reduce entrepreneurs to positive perception of self. Moreover, entrepreneurs will attribute this experience to their own lack of ability and personality problems, and reduce their own cognition, so that they will easily give up in the process of starting a business, finally leading to the failure.

3.3 Results in bad influence on the attitude and intentions of entrepreneurs

The influence of negative guiding behavior on the attitude and willingness of entrepreneurs can be divided into two aspects. On the one hand, it will reduce positive attitudes and intentions. In an entrepreneurial mentoring relationship, if entrepreneurs to accept guidance from mentors are positive, he will give a positive evaluation on the whole process of guidance, making entrepreneurs owning higher satisfaction, and this experience will further stimulate the student own growth becoming a mentor in the future. However, negative mentoring experiences will reduce the satisfaction of entrepreneurs in the whole or part of the dimension (Haggard, 2012), and to some extent weaken the tendency of entrepreneurs to become mentors (Green&Jackson, 2014).

On the other hand, it leads to the negative attitude and willingness of entrepreneurs. When the negative guidance has an impact on entrepreneur to a degree that is not acceptable in spirit and

psychology, the entrepreneur will not continue to maintain such a guiding relationship, thus causing the entrepreneur to end the mentoring relationship.

3.4 Cause a bad effect on the behavior of entrepreneurs

The behaviors of entrepreneurs include the identification of entrepreneurial opportunities, entrepreneurial management, learning behaviors and organizational citizenship behaviors. Negative guidance behavior will make entrepreneurs producing aversion to mentors, thus entrepreneurs will reduce dependence and trust on entrepreneurs. Moreover, they even think that the mentor can't give full play to the guiding function and meet their own needs, which leads to a significant reduction in entrepreneurs' learning behaviors (topa&pez-larrazabal, 2016). Meanwhile, the negative guidance behavior leads to negative emotions of entrepreneurs, which in turn inhibits them from organizing civic behaviors in their original organizations (Bushardt et al., 2016).

4 Causes Analysis for Negative Guiding of Entrepreneurial Mentors

In order to give effective guidance to entrepreneurs, entrepreneurial mentors should have good theoretical and knowledge background, rich entrepreneurial experience, correct matching between entrepreneurial mentors and entrepreneurs, and correct guiding behaviors of entrepreneurial mentors. There are four main reasons leading to the negative guidance: the ability gap between the two parties, the mismatch between the two, the lack of professional skills of the mentor, and the specific personality traits of the entrepreneurial mentors and entrepreneurs.

4.1 The ability gap between entrepreneurial mentor and entrepreneur

Entrepreneurial mentors are usually elite people who have made some achievements in the management of enterprises, and the entrepreneurs who receive their guidance don't have any foundation in entrepreneurial experience (Ashforth, 2016). Entrepreneurs choose entrepreneurship guidance. First, they hope to learn the entrepreneurial skills and experience of entrepreneur mentors through guidance；Second, they expect the entrepreneur mentor to introduce relevant resources needed for entrepreneurship, such as contacts or capital. Given these motivations of entrepreneurs, they place themselves low in face of a mentor, and this can fuel the arrogance of the mentor and cause manipulative behaviors of entrepreneur mentor. manipulative behaviors will lead to entrepreneurial mentor's excessive motivation and even enslavement on entrepreneur to achieve goals unrelated to the guidance process, such as self-improvement and other negative behaviour.

4.2 Mismatch between entrepreneurial mentor and entrepreneur

The mismatch between entrepreneurial mentor and entrepreneur is reflected in gender mismatch, background environment mismatch and other aspects. When it comes to gender matching, entrepreneurial mentors tend to choose people of their own gender to establish mentoring relationships. Only gender matching according to the same gender principle can give full play to the effect of entrepreneurship guidance. However, not all mentoring relationships follow the principle of voluntariness，there are a lot of bad matching between entrepreneur mentor and entrepreneur in entrepreneurial practice; In terms of background matching between entrepreneurship mentors and entrepreneurs, people with different background environments are bound to differ greatly in personality traits, attitudes, values, beliefs and interests, and this will directly lead to a different way of handling things, thus increasing the chances of conflict and leading to the negative guidance.

4.3 Entrepreneurial Mentor's lack of mentoring skills

Effective entrepreneur guidance requires good professional quality, communication and interaction skills, and the ability to analyze and solve problems of entrepreneur mentor. If there is a lack of guidance skills, it is very easy for a mentor to conduct negative guidance. In a survey, 12% of people believe that the negative guidance they encounter is related to the lack of guidance skills of the mentor.

4.4 The specific personality traits of mentor and mentee

The personality traits of entrepreneur mentor and entrepreneur do not match each other, which will easily lead to negative guiding behaviors. For example, entrepreneurs with narcissistic personality traits are extremely sensitive to negative evaluation information. When entrepreneurial mentors have critical feedback and suggestions to entrepreneurs, they will think that this is unfair and offensive to them, which leads to the failure of their instructions to be recognized and implemented; entrepreneur mentors with Machiavellianism personality, tend to take the way of deception, concealing entrepreneurs to control interpersonal interaction with entrepreneurs, which easily cause entrepreneurs to have negative perception of the wrong guiding behavior of entrepreneurial mentor. Meanwhile, the entrepreneurial mentor neglects to provide professional development and psychological guidance for entrepreneurs.

causing entrepreneurs negative psychology of alienating their entrepreneurial mentors.

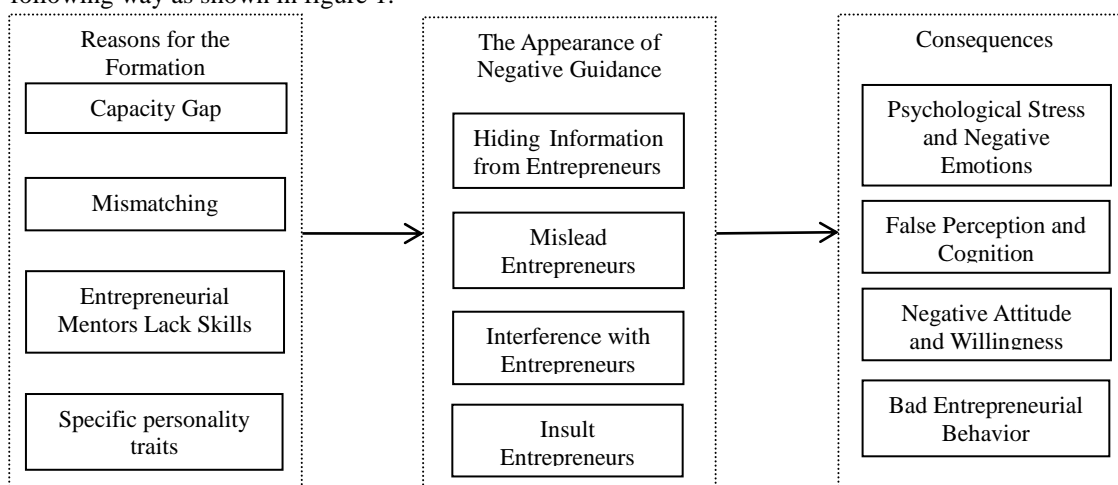
Based on the analysis of the causes and results of the negative guidance behavior of the entrepreneur mentor, the negative guidance behavior of the entrepreneur mentor is generated in the following way as shown in figure 1.


Figure 1   Reasons, Representations and Results of Negative Guidance of Entrepreneurial Mentors

5 Countermeasures to Decrease Negative Guiding of Entrepreneurial Mentors

According to the above analysis on the causes, representations and results of the negative guidance behavior of the entrepreneurial mentor, it can effectively reduce the negative guidance behavior of the entrepreneurial mentor from the following three aspects.

5.1 Improve the ability gap between entrepreneurial mentors and entrepreneurs

First of all, the management organizations of the entrepreneurial mentor and the entrepreneurial mentor should recognize that there exists negative guiding behavior in the relationship between the two parties or the behaviors of entrepreneurial mentor. Secondly, the management department of entrepreneurial mentor needs to strengthen the supervision of the guidance process of entrepreneurial mentor. The third way is to provide an effective feedback channel for entrepreneurs to feedback problems and guiding situation. Fourthly, there should be an exit mechanism. When entrepreneurs believe that there are bad guiding behaviors in mentor and entrepreneurial mentors cannot improve effectively, the guiding relationship between entrepreneurial mentors and entrepreneurs should be dissolved.

5.2 Strengthen the matching between entrepreneurial mentor and entrepreneur

The formation of the guiding relationship should not be based on the principle of the organization's coercive force, and it should be based on the comprehensive evaluation of both parties in various aspects of personality and values to make effective matching between the entrepreneurial mentor and the entrepreneur. When the matching degree is more appropriate, the satisfaction of the guiding relationship will be higher.

5.3 Improve the mentoring skills of entrepreneur mentor

First of all, relevant departments set the entry threshold for entrepreneurship mentors and conduct qualification certification for the mentor's guiding skills to ensure the quality of the selected mentor resources; At the same time, the corresponding training institutions should be set up to provide targeted guidance for different purposes of guiding in different processes of entrepreneurship. Secondly, the content of the training should also include publicly informing them of the possibility and various forms of negative mentoring, as well as managing the boundaries of the mentoring relationship.

6 Conclusion

Entrepreneurial mentors play an important role in the process of mentoring, but the current study focuses more on the positive aspect, with less attention paid to negative guiding behavior research. This article, based on the macro environment of innovation, starting from the real phenomenon in reality, first discusses four aspects of negative guiding behaviors of mentors, then analyzes four kinds of bad effects on mentees led by negative guiding behaviors, and then dug the reason in four aspects. On the basis of

these work, the countermeasures for the service institutions and mentors to reduce or even to avoid the adverse consequences of negative guidance are put forward from three aspects. This paper will be a reference for reducing the negative guidance behavior of the entrepreneur mentor and improving the positive guidance effect of the entrepreneur mentor in the future.

It can be seen that research in the theoretical circle about qualitative aspects of the problem has achieved fruitful results, indeed this provide a theoretical reference basis for the study of related problems on the mentors, but the research about internal mechanism and evolution path in "cause-representation-result" is insufficient. In the future, more contributions should be done to offset this limitation. First, the antecedent variables that produce negative instructional behavior should be further explored; Second, In the special social and cultural atmosphere of China, the moderating effect of the negative guidance behavior of the entrepreneurial mentor on the outcome, such as traditionalism, moderate value, should be discussed.

The Predicaments and Countermeasures of the Professional Development of University Administrators

Zhu Fan

(Personnel Department, Wuhan University of Technology, Wuhan, P.R.China, 430070)

(E-mail: hgzf@whut.edu.cn)

Abstract: This study examines the process of the evolution of the role of university administrators in China. Based on the surveys and analysis of relevant data, literature and interviews, this study summarizes the predicaments are faced by the professional development of university administrators in China. And put forwards some countermeasures such as strengthening role function orientation, attaching importance to top-level design, strengthening professional knowledge training and so on, to improve the management level and the efficiency of running a university.

Key words: University administrator; Professionalization; Predicament; Countermeasure

1 Introduction

China's research on the professional development of university administrators began in the late 1970s and early 1980s. Since the 1990s, China has successively introduced some measures to promote the professionalization of teachers, and then carried out the reform of teacher appointment system in the scope of colleges and universities. Studies on the professionalization of university administrators have appeared in various academic journals. Dong qi put forward in (Thinking on the professionalization of university management) that the goal of the professionalization reform of university administration personnel in China is to establish a standardized, coordinated and high-quality and efficient management system centering on teaching and scientific research by adjusting and optimizing the functional structure, power, responsibility, organization layout and leadership system. We need build a high-quality management team and improve the system of employment, assessment, rewards and punishments. Xue Xiaoping pointed out in (The discussion on the professionalization of university management team) that the reform goal of China's university administration personnel specialty is to establish five mechanisms, namely, to operate efficient organization mechanism, self-restraint management mechanism, employment mechanism to stimulate competition, guarantee strong distribution mechanism and control sensitive supervision mechanism. Some researchers also paid positive attention to the education staff system in the practical exploration of the professional construction of university administrators, which generally focused on the summary of school experience, achievements and existing problems. Through reading these articles, we can find that the difficulties and influencing factors of the professional construction of administrative personnel in Chinese universities are not deep enough. Foreign researches on the professional construction of administrative personnel in colleges and universities have been carried out at an early stage with high attention and wide coverage, including how to improve the professional knowledge and ability of administrative personnel in colleges and universities, the educational structure of members of professional associations, professional training, professional ethics. For example, the professional development of the staff of the university (Staff Development, SD for short) took the lead in the United States and gradually expanded to universities in many countries Charmaine Streharsky's "12 steps Toward Ethical Leadership -- A 12 Steps Plan" published in the Journal of Administration elaborated 12 steps to establish professional ethics ideas for university administrators. Published in Administrative Science Quarterly, Administration and administrator, this paper discusses in detail the roles and responsibilities of Administrative personnel in colleges and universities.

2 The Connotation of Professional Development of University Administrator

In Chinese, the term "professional" includes at least two layers of meaning: One is sociological significance, namely "professional occupation"; the other is meaning of higher education, referring to "specialized studies". Development refers to the constant updating and continuous changes of things. In this process, there are both quantitative and qualitative changes; there are both positive and negative changes. The core of the professional development of university administrators is that they regard management as a profession and carry out conscious, continuous and systematic development processes. Its connotation consists of three aspects. Firstly, the professional development of university

administrators is an autonomous process. It must have individual active and conscious active participation and efforts, have the right vision, clear goals, and also need scientific planning. Secondly, the professional development of university administrators is a continuous process. In the new era, new knowledge and new ideas emerge in an endless stream. In practice, university administrators need to continuously learn new knowledge and skills to improve university management capabilities, and eventually grow from a "management novice" to a "management expert". This process is both long-term and continuous. Thirdly, the professional development of university administrators is a systematic process. This is reflected in the professional development of university administrators not only includes the process of enhancing individual professional knowledge, professional competence and professional ethics, but also includes the necessary conditions for institutional guarantees and platform construction provided by the organization to support this process.

3 The Status of Professional Development of University Administrator

At present, the research on institutional improvement of university administrator's development mainly focuses on performance appraisal, salary system, career planning, job burnout and job satisfaction. However, there are relatively few studies devoted to the professional development of university administrators. Exploring the path of professional development and constructing a professional development system for university administrators is the trend of research, and it is the most important task to promote the construction of university administrators. Through questionnaires and interviews, a survey about professional development cognition of 272 managers from 9 universities in Hubei province was conducted, the status and demand of professional development was also investigated. It was found that 89.3% of administrators believed that professional development is required. As to the professional standards of administrators, 77.2%, 92.3%, 83.8.9%, and 88.2% of managers believed that political correctness, understanding education, major proficiency along with good management are essential respectively, see figure 1.When it comes to the status of their own professional development, 22.1% of managers believe that their own specialization is strong enough to be qualified for the job; 36.8% of the managers think that they are professional in general and could basically meet the needs of their work; 41.1% of the managers think that their specialization is not good enough to meet the needs of the work, see table 1.

Table 1　Survey About Professional Development Cognition

Options	Percentage (%)
Strong specialization and could be qualified for the job	22.1
General specialization and could be basically qualified for the job	36.8
Insufficient specialization and could not be qualified for the job	41.1
Figure 1　Professional Standards of Administrators

4 Dilemma of University Administrators' Professional Development

In recent years, service school management has been promoted, and university administrators have been positioned as "service personnel", which has weakened the scientific management. Providing a good service does not mean doing a good job of management because management is a professional profession. In America, university administrators are positioned as professional occupations. University administrators must grasp systematic advanced education knowledge and management expertise, master the professional skills of university management, understand the college spirit and culture, accept professional education and training along with integrate into relevant professional organizations. University administrators have their own professional independence; they are neither controlled by the professors nor directed by the state department of education. They are experts in admissions, personnel

policy, book management, budgeting and public relations. They are responsible to the board of directors and master the authority and responsibility by establishing an administration. In China, there are still many institutional defects in the professional development of university administrators.

4.1 The administrators specialized development foundation is weak

At present, China's university administrators have low educational background, low professional title, wide academic sources, uneven levels of professional knowledge, and poor overall professional knowledge. In management position, some of the older administrators have outdated knowledge. Some of the new undergraduate or postgraduate students are fresh blood whose knowledge structure is single owing to the recruitment preference of excellent academics. Even in some important middle-level or senior management positions, teachers who do well in teaching or research in universities are often selected. There are also some management positions for family members of employees in university who have not been systematic trained with management knowledge of colleges and universities. Education and management talents account for less than one third of the professional structure, only basically cover all disciplines. With the rapid development of information society, the information level and the operation ability of modern office equipment of administrators is low. When more and more attention is paid to scientific management and management theory which is guidance on practice while administrators' research level of management activities is low. In a society that values innovation and creativity, the creative ability of university administrators is stagnant.

4.2 Promotion and development channels of administrator is singleness

According to the job classification methods on the staff of state administrative organization, administrative staff in China universities are divided into departmental, division, and staff levels. According to Provisional Regulations on the Staff System in colleges and universities, grades 1-5 are senior staff, 6-8 are mid-level staff, and 9-10 are junior staff. In fact, the division of these two ranks clearly bears the official standard thought, and the establishment of the staff hierarchy is marked by strong administrative management. The higher education law of the People's Republic of China stipulates that administrators of colleges and universities should implement the educational staff system. After the promulgation of the Provisional Regulations on the Staff System in colleges and universities, five universities, including Wuhan University, carried out pilot work of staff system. Education staff system has entered the "Summarizing and deepening Stage "since 2004, however, only 16 universities have so far entered the "new round of pilot work". The pilot experience has not been worked to the whole nation and is not satisfactory. In the case of a smooth promotion, it will take 24 years to reach the tertiary level (the level of the main hall) for a fresh graduate who is engaged in management work for colleges and universities. In the same situation, it will take 21 or 18 years for fresh postgraduates and doctoral students. Simultaneously, if a doctoral graduate is in the teaching position and follows the principle of progressive promotion, he only needs 7 years to become a professor. Moreover, qualifications such as the level of management cadres and years of service are the key considerations in the actual promotion of the staff, which seriously undermines the enthusiasm of professional development of non-leadership employees and young managers.

4.3 The Assessment and evaluation system is not scientific

Evaluation is the main content of the appraisal of university administrator, and it is also an important foundation for encouraging and stimulating the career development of university administrator. At present, the assessment of university administrator is divided into two types: annual assessment and assessment of employment period. However, there is no detailed index system in the two assessments and both assessments lack a detailed index system. The gap between the qualified grades and the outstanding grades of the appraisal is too large and it lacks the hierarchy of transitions. "Character, ability, attendance, and achievement" or "character, ability, attendance, achievement, and honesty" are the evaluation indicators of most universities, "excellent, qualified, basically qualified, and unqualified" are the grades of the assessment results, the employees of the department are the organizers and subjects of the assessment, and "read the summary first, then draw the hook" is the method of the assessment. The non-quantitative, procedural, temporary and inter-departmental characteristics of university administrator are ignored by this assessment system, and it's impossible to accurately measure the actual performance of management personnel. Comprehensive and multi-angle assessment methods (system) such as duality performance evaluation method, contextual performance assessment method and 360-degree performance evaluation system are lacked. In addition to the defects of the appraisal system, the assessment results of the management personnel are not perfect with the promotion system of the appraisers' job promotion, training opportunities, promotion channel, Salary and treatment. These have also made the appraisal system of university administrator exist in name only.

4.4 Lack of a sound exit mechanism for university administrator

In foreign countries, the flow of teachers between colleges and universities is frequent, both the normal flow of personnel between schools and the flow of retired personnel. In the 1990s, Tsinghua University first started the reform of the personnel system in China, and proposed the "non-upgrade or go" program, which broke the traditional concept of teacher tenure; Peking University, China Agricultural University, Renmin University of China, Zhongshan University, etc. more and more universities have also explored one after another. The exit mechanism of college teachers is not only for full-time teachers in universities, but also for administrators in universities. At present, the main managerial model of university administrator is identity management, which has not truly transformed into post management. The flaws in the performance appraisal system make the management personnel of colleges and universities in the state of "can't enter only", that is, there is no constraint of the appraisal mechanism, and there is no early warning of the withdrawal mechanism, which is not conducive to effective evaluation and encouragement of university administrator. As a conclusion, it is a general trend to deepen the personnel system of colleges and universities, such as strengthening job management, implementing flexible and diverse pay systems, exploring teachers' exit mechanisms, and establishing scientific talent selection, use, and evaluation mechanisms which conform to the laws and characteristics of education.

4.5 Defects in the salary system

Currently, there are two different types of compensation for managers: one is the implementation of the salary system for professional and technical personnel, including professional and technical positions, salaries and allowances; the other is the implementation of the salary system for education employees, including job salaries and job targets. In this kind of salary system, the salary level of education staff is lower than that of corresponding professional technical positions. Colleges and universities can only allow managers to "walk on two legs" and "highly enjoy" one category of salary. This kind of salary system seems to give more choices to the administrators of colleges and universities. Actually, an independent classification system was not formed. This kind of salary system makes it impossible for college administrators to have a clear understanding of their career development. "They have to spend a lot of time preparing for the promotion of higher-level titles, but they can't put the whole body into management work, which affects the improvement of management level. Those who have devoted all their responsibilities to management positions do not receive reasonable remuneration, which is not conducive to attracting and stabilizing high-level personnel to perform management work. Taking Guangdong Province as an example, the income level of university administrator is still quite low, which is not matched with the amount of education investment and the level of competency paid by personnel.

5 Countermeasures for Professional Development of University Administrators

5.1 Strengthening the administrative management function localization

From the construction process of world-class university, scientific administrative management system and excellent administrative management team are an important support to promote the universities' development. The administrative management of universities directly serves teaching and scientific research, and plays the role of organization and decision-making. The quality of administrative work has a direct impact on the level and efficiency of school running. With the general trend of administrative reform in domestic colleges, universities should further take good services as a center of gravity of the administrative work, strengthen the administrative management localization, and promote the development of administrative personnel in the professionalization direction.

5.2 Paying attention to top-level design

The leaders of colleges and universities should fully realize the importance of managers' professionalization development, and put managers and teachers on the same important strategic positioning. The construction of a first-class university not only requires the first-class faculty, but needs the first-class management personnel. Therefore, the cultivation of managers with high quality is a guarantee to improve the level of education in colleges and universities. However, it is easy to be ignored in the process of higher education reform. On the premise of the unified understanding, existing management posts must be set scientifically at first. Only through objective analysis of different management positions and finding out the causes of the problem with management personnel quality, could one design a top-level system of managers' professionalization development. Secondly, colleges and universities should strictly follow the recruitment system of management personnel, and do a good

job of recruitment at the source. Some management positions not only require the applicant to have a higher degree, but also require the applicant to have excellent comprehensive quality and work experience. Paying attention to the matching of the professional background and the management positions when management personnel recruitment enables to achieve the goal of the management personnel professionalization development from the source, which makes it possible to adapt to job requirements and improve the efficiency of management work. At present, there is still a lack of channels for the training of management talents in colleges and universities. The internal employment departments of colleges and universities should seriously analyze the recruitment positions, and publicize the recruitment standards and hard constraints. In actual recruitment work, it is of great significance to creating a clear written rules of examination and interview score, knowing the candidates' basic ability to work and testing applicants' ethics level and education related legal knowledge as appropriate.

5.3 Strengthening the training of professional knowledge

Regular professional training and practice is an important means of management personnel professionalization development. However, the managers of colleges and universities have great difficulty in further expanding their professional knowledge from their own perspective because of the repeatability characteristic of the working itself. Therefore, the personnel department should carry out professional knowledge training regularly for its work. In simple terms, the training of standardizing the daily work process should be held at first, which could make the managers set up the consciousness of service for the majority of teachers and students and improve the teachers and students experience in the working process. For example, the training of good office etiquette enables the management personnel to keep the generous manner, civilized language and friendly attitude in the work. Gradually, there is formed a rigorous steady work atmosphere, which can infect other colleagues imperceptibly. Secondly, the training of specific professional knowledge is also needed, which dependents on the scientific analysis of positions and the specialized guidance of experts, so that managers can learn the advanced professional skills regularly to improve their comprehensive quality.

5.4 Focus on career development planning

From the comprehensive perspective of the strategic development of colleges and the development of employees, the career development of university administrators should follow the principle of people-oriented, combining individuals and organizations. At the same time, colleges need to pay attention to and strengthen the service consciousness of administrators, help them to make role definition and career planning, to realize the win-win of individual and organizational development. Nanyang Technological University attaches great importance to the long-term planning for the career development of administrators, emphasis on integrating individual development with the strategic development of university organizations，strive to set clear goals for the personal career development of administrators and then further strengthen their recognition and sense of belonging to the organization. In terms of specific work in employee training, Nanyang Technological University attaches great importance to the training of specific ability and design specific training courses, help the staff to obtain the necessary business knowledge and working experience in a planned and purposeful way. At the same time, attention is paid to arouse the consciousness of independent development of administrators, employees are allowed to freely participate in various training courses and projects inside and outside the school according to their needs. This kind of "goal-oriented" career planning and "bottom-up" training mode is worth learning and using for reference in Chinese colleges.

5.5 Innovative performance appraisal system and rewards and penalties system

The reasonable appraisal reward and punishment system can effectively improve the enthusiasm of administrators in colleges and it is also an important guarantee for the development of professional quality of managers. First of all, specific performance appraisal system should be designed in colleges to manage work, evaluation indexes that are recognized in all respects can be given by experts with rich management experience. The management responsibility system should be improved based on the work performance appraisal, according to the responsibilities of various management positions and the development requirements of professional quality. The management work shall be implemented to specific people and the work performance shall be taken as the basis for rewards and punishment of relevant personnel on a regular basis. Second, universities should strengthen the rectification progress after the evaluation and give schedule when necessary, the assessment results should be combined with the professional quality requirements, so that managers can actively improve their working ability according to the assessment results. In addition, colleges should strengthen the training of managers, opportunities for development should be created for some outstanding personnel and personnel in key

position, and they should be put in positions where they can realize talents.

6 Conclusion

　　With the further reform of education, the development of professional quality of management team is beneficial to the improvement of teaching quality, technology level and logistics service quality of colleges, which is also conducive to carry out various works in colleges. Colleges and universities should attach great importance to the construction of professionalization of managerial personnel, and stimulate the enthusiasm of managers to promote their own quality professionalization around role functions, professional training, assessment and evaluation and performance incentives, so that they can contribute to the reform of education, the development of technology and the improvement of teaching level.

Analysis on the Relationship Between the Working Values and Turnover Intention of the New Generation of Employees in China

Ma Nana, Xuan Yafa
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 1534195117@qq.com, 1045624661@qq.com)

Abstract: This study examines the relationship between work values and turnover intention of the new generation of employees. In addition, we also creatively proposed organizational commitment as a mediator variable. The research indicates that there is a significant negative correlation between the working values of the new generation of employees and turnover intention.Organizations can make the organization's values and employees' values consistent by improving the richness and interest of the work, so as to reduce the organization turnover rate. In addition, the study also shows that the new generation employees have strong personalities. Therefore, their commitment to the organization is also different. This should also be the focus of the organization.
Keywords: New generation employees; Working values; Organizational commitment; Turnover intention

1 Introduction

The new generation refers to the group of Chinese born in the 80s to 90s of the 20th century. Because of their different concepts, consciousness, and personality from the traditional society, they are called the new generation (Wang Congying, Yang Dongtao, 2017). As the new generation employees and their parents have different life experiences, values, and ideologies, their attitude towards the profession is also very different. In the process of inauguration of the new generation, there is no sense of mission and loyalty to the professions that no fathers do. If they feel that the position does not match their own values, they can leave immediately.

Moreover, employee turnover has always been the focus of organizational managers and researchers (Hom, Mitchell, Lee, & Griffeth, 2012), which is highly valued by the management community and the most investigated organizational behavior.Frequent employee turnover will not only increase the organization's labor costs and instability, but it may also lead to leakage of business secrets and loss of key customers, which will have a negative impact on the sustainable development of the company (Park & Shaw, 2013). According to a survey, the cost of leaving an employee is high, and the average cost of replacing a departing employee is 21% of the average employee's annual salary.

At present, the research on the resignation of employees in the academia is very mature, but the research on the new generation of employees is still in its infancy. There is little research on the relationship between the work values and turnover intention of the new generation of employees.The main purpose of this paper is to explore the mechanism of the new generation employees' work values and turnover intentions, so as to provide a theoretical reference and guidance for Chinese enterprises to avoid the departure of new generation employees.

2 Literature Review

2.1 Work values

The concept of work values was first proposed by Super. He defined work values as job-related expressions that reflected the individual's internal needs and the job traits he pursued when he was engaged in activities (Super, 1970). However, different scholars have different definitions of working values from different perspectives. Scholar Super (Scholar Super,1970) considered the work value as the work-related goal expression from the perspective of demand, reflecting the individual's internal needs and the work traits pursued when engaging in activities. Wollack (Wollack, 1981) argued that work values were an expression of attitude toward general work. Elizur (Elizur, 1984) went on to further research by Wollack. From the perspective of psychology, it was considered that the work value was the value judgment of the individual about the work behavior and the certain results obtained in the work environment. It was an internal ideology that directly affected the behavior. Chinese scholars also studied the values of work. Scholars Ling Wenzhao and Fang Wei, Yu Hua and Huang Xiting started from the definition of values themselves. They believed that work values were the values, attitudes and beliefs that people showed in their professional lives.

Different researchers have different opinions on the division of work value structure. Rokeach

(1980) and others believed that valuescan be divided into ultimate valuesand instrumental values. The former is the ultimate state pursued by individual efforts, while the latter is to achieve the former's behavioral pattern.From the perspective of demand satisfaction, Super divides work valuesinto three dimensions: intrinsic work values,external work values, and extrinsic rewards.The intrinsic work valuesare the satisfaction and sense of value brought about by the nature and content of the work. External work valuesrefer to the value of work results to others and the society. Chinese scholars Jin Shenghua and Li Xue divided work valuesinto objective valuesand instrumental values. In the study of the mechanism of the work valuesand performance of the work of the new generation, Hou Xifang and other scholars divided work valuesinto the five-factor structure of utilitarian orientation, intrinsic preference,interpersonal harmony, innovationorientation, and long-term development. This research divides the dimensions of work valuesand selects the values of the intrinsic work valuesand external work valuesin the most classic Super work value dimensions.

2.2 Organizational commitment

The organizational commitment was first proposed by Becker in 1960. He defined organizational commitment as a tendency to maintain "consistency of activity" due to employees' "unilateral input" to the organization(Hu Weipeng, Shi Kan, 2004).Organizational commitment is a psychological and behavioral commitment to work towards the goals of the organization, based on the organization's identity. There are different standards for the division of organizational commitment dimensions. Several typical classification criteria are shown in Table 1:

Table 1   Division of Organizational Commitment Dimensions

dimension	Scholar	Dimension Content
One-dimensional	Becke（1960）	Continue commitment
	Porter（1982）	Emotional commitment
	Winter（1980s）	Normative commitment
Two-dimensional	Meyer（1984）	Continue commitment,Eemotional commitment
Three-dimension-al	Meyer、Allen（1991）	Emotional commitment, Normative commitment, Continuous commitment
Five-dimensional	Ling Wenjun（2000）	Economic commitment, Opportunity commitment, Normative commitment, Ideal commitment, Emotional commitment

Table 2 shows the evolution of scholars' division of organizational commitment dimension. As for the division of the organizational commitment dimension, different scholars consider the method of division from different perspectives. This research mainly adopts the most typical three-dimensional division of Meyer and Allen (1991). It divides the organizational commitment into emotional commitment (for organizational goals and value identity, and willing to work in the organization to continue to strong desire), normative commitment (out of sense of responsibility and obligation to the organization is willing to stay in the organization's commitment), and continuous commitment (employees think that changing work requires more time and effort, preferring to stay in the original organization to continue working).

2.3 Turnover intention

Employee turnover refers to the behavior in which individuals within the original organization system terminate the employment relationship with the organization and leave the organization. Employee departure can be divided into active and passive departure. The employee's initiative to leave has a great influence on the development of the company. Turnover intention, as a precursor to employee departure, refers to workers in a particular organization for a period of time, after some consideration, intention to leave the organization.

Different scholars have different perspectives on the former dependent variable of the turnover intention. The Chinese scholar Li Ping analyzed the influence of the five personality on the intention of leaving the company through empirical research from the perspective of Big Five personality. Xie Baoguo, Bai Guanglin and others studied the mechanism of employee turnover intention from the perspective of the occupational plateau. Summarizing previous research, the research on the dependent variables of turnover intention is mainly in the following aspects: social statistics, personality factors, human resources management system and leadership factors.

3 Hypotheses Development
3.1 Work values and turnover intention

Vandenberghe's research found that when a person's work values and organizational values do not match, there is a thought of leaving the company. The worse the match with organizational values, the greater the employee's turnover tendencies. Different generations have different work values. Compared with "pre-80" employees, the work values of "after 80" employees, namely the new generation of employees, have a greater impact on turnover intention (Huang Zhongwei,2016).The work values of different dimensions have different influence on employee turnover intention. According to Hertzberg's two-factor theory, work incentive factors are divided into hygiene and motivational factors. The employee's inner working values are related to the motivational factors, while the external working values mostly include the components of the hygiene factors. Compared with hygiene factors, motivational factors have a greater impact on employees. The hygiene factors are only to maintain employees' work in the organization, and the satisfaction of motivational factors will give employees greater satisfaction and recognition of the organization. On the contrary, if motivational factors are not met, employees will be more dissatisfied with the organization and are more likely to have the idea of leaving the organization. Therefore, the following hypotheses can be made:

Hypothesis 1: Work valuesarenegatively related to turnover intention.

Hypothesis 1a: Intrinsic work valuesarenegatively related to turnover intention.

Hypothesis 1b: External work valuesarenegatively related to turnover intention.

Hypothesis1c: Intrinsic work values have a greater negative impact on turnover intention than external work values.

3.2 Organizational commitment as a mediator

At present, there are more studies on the relationship between work values and organizational commitment in the academic community. Different dimensions of work value structure or different factors have different effects on organizational commitment (Zhou Shengfang, 2007). Based on a sample from Singapore, Putti analyzed the relationship between work values and organizational commitments and found that intrinsic work values are more relevant to organizational commitment than external work values. Liu Kai (2016) investigated the new generation of employees of the company and studied the relationship between different work values and organizational commitment in different dimensions and found that skill-oriented work values had a significant impact on economic commitment. Work values such as inner preference, innovation orientation, interpersonal harmony, and long-term development had a significant impact on normative commitment and emotional commitment. There is a very significant positive correlation between work values and organizational commitment (Chen Cancan, 2016). As a new generation of employees, because of their strong personality, the pursuit of career ideals is not simply salary performance, but more job satisfaction and self-realization. Compared with job security, benefits, status, etc., the innovative and interesting work is more attractive to employees. The following hypotheses can be made from this:

Hypothesis 2: Work valuesarepositively related to organizational commitment.

Hypothesis 2a: Intrinsic work values and organizational commitment are stronger in positive relationships than external work values.

The organizational commitment as an antecedent variable of turnover intention has been universally recognized by scholars. However, their perspectives on the relationship between organizational commitment for turnover intention are different (Xia Xiaozhu, 2015). Price (Price, 1997) proposed a departure intention path model in which individual variables and structured variables contribute to turnover intention through organizational commitment. Later studies confirmed that there was a significant negative correlation between organizational commitment and turnover, that is, the higher the organizational commitment, the lower the turnover intention (Cui Xun, 2003). Meyer (Meyer, 2002) separately analyzes the impact of organizational commitment on emotional commitment, sustained commitment and normative commitment on the impact of turnover intention. Research shows that the three dimensions are negatively related to turnover intentions, of which emotional commitment is the most significant.There is a need for further research on the relationship between the various dimensions of organizational commitment and turnover intention.The following hypotheses are proposed:

Hypothesis 3: Organizational commitmentisnegatively related to turnover intention.

Inaddition, we can conclude from relevant studies on the values of employees' work values, organizational commitment and turnover intention.

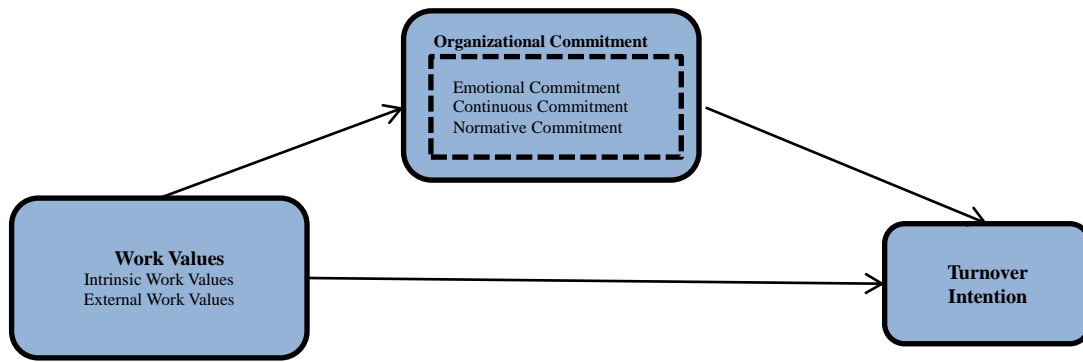
Hypothesis 4: Employee organizational commitmentmediates therelationship between work values and turnover intention.


Figure 1　The concept of full relationship model

4 Data and Methodology
4.1 Data collection and instrument
According to the research purpose, this paper takes the new generation of employees in many enterprises in China as the research object, and collects data by means of electronic version questionnaire. A total of 330 questionnaires were distributed and 312 questionnaires were collected. After screening, 286 valid questionnaires, the questionnaire recovery rate was 94.5%, and the effective questionnaire rate was 86.7%.
4.2 Measures
Work values. The measurement of work values is mainly based on the revised questionnaire prepared by Hirozaku Yoshikawa, which is revised by Li Jianmei and Gu Feifei. Internal work values and external work values are measured by four items respectively, using Likert5 (1=completely dissatisfied, 5= Fully satisfied). In this study, the Cronbach's α coefficients of the two sub-scales of internal work values and external work values are 0.936 and 0.925, respectively, and theCronbach's α coefficient of the total scale is 0.855.

Organizational commitment.The measurement of organizational commitment mainly refers to the three-factor organization commitment scale proposed by Allen & Meyer (1990), which includes three dimensions: emotional commitment, continuous commitment, and normative commitment. The emotional commitment is measured in four items, and the continuous commitment and the normative commitment are measured using three items. Use Likert5 (1 = no match, 5 = fully match).The Cronbach's α coefficient of the scale is 0.824.

Turnover Intention. The measurement of the intention to leave is mainly based on the scale of Li Weiting (Li Weiting, 2013), and then modified to get 4 items to measure the variable. Use Likert5 (1=completely disagree, 5=completely agree). The Cronbach's α coefficients of the scale is 0.877.
Control variables. In order to rule out the interference of other factors, this study controls the gender, marital status and education level of the new generation of employees.

5 Results
5.1 Correlation analysis
Descriptive statistics and correlation analysis were performed on the sample data using SPSS 22.0. The mean, standard deviation and correlation coefficient of each variable are shown in Table 3. Internal work values and external work values are significantly positively correlated with the three dimensions of organizational commitment, and are significantly negatively correlated with the turnover intention. Moreover, the three dimensions of organizational commitment are also significantly negatively correlated with turnover intention. These results provide the necessary preconditions for the analysis of the relevant hypotheses of this study.

Table 2　Correlation Coefficient Matrix

Variables	Mean	Standard deviation	1	2	3	4	5	6	7
1 Gender	1.15	0.366	1						
2 Marital status	1.92	0.270	-.410	1					

Continural Table 2

Variables	Mean	Standard deviation	1	2	3	4	5	6	7
3 Education	2.18	0.644	.551	-.373*	1				
4 Intrinsic Work Values	3.0769	1.028	-0.12	0.160	0.048	1			
5 External Work Values	2.9359	0.959	-0.084	0.425	-0.087	0.834**	1		
6 Organizational Commitment	3.1218	1.083	-0.148	0.362	0.043	0.523**	0.450**	1	
7 Turnover Intention	2.8462	0.964	0.069	-0.531	0.198	-0.243*	-0.235*	-0.118**	1

Notes: **$p < 0.01$; *$p < 0.05$.

5.2 Hypothetical test

The table below shows the results of work values, organizational commitment, turnover Intention, and regression analysis of control variables. Available from Model 5 and Model 6, Hypothesis 1 and Hypothesis 1a, 1b, and 1c are validated, that is, both intrinsic work values and external work values are significantly positively correlated with turnover intention (b=-0.521, P<0.001; b = -0.341, P < 0.001), and the intrinsic working values are more negatively correlated with the intention to leave. Model 2 and Model 3 examined the extent to which intrinsic work values and external work values affected the organizational commitment after controlling the control variables. The standardized regression coefficients obtained from Table 4 were b=0.729 (P<0.001); b=0.647. (P < 0.001), from which it can be seen that Hypothesis 2 is verified. This study assumes a negative correlation between organizational commitment and turnover Intention, which is available from Table Model 7, and Hypothesis 3 is validated. For the test of the mediation effect of organizational commitment, from Model 5, Model 6, Model 8 and Model 9, it can be analyzed that the organizational commitment has a partial mediating effect between the work value and turnover Intention, and thus the hypothesis 4 is verified.

Notes: The above coefficients are standardized regression coefficients. ***$p < 0.001$;**$p < 0.01$; *$p < 0.05$.

6 Conclusion

This study examines the impact of the new generation's work values on turnover intention and increases organizational commitment as a mediator. Through empirical research, the following conclusions are drawn: (1) the work values of the new generation of employees have a positive impact on turnover intention; (2) the organizational commitment of the new generation of employees has a negative impact on their turnover intention; (3) the new generation of employees There is also a positive relationship between the work values and organizational commitments; (4) The organizational

commitment of employees partially mediates the relationship between work values and turnover intention. This research not only enriches the research on employee turnover, but also has certain reference for enterprises. To reduce the turnover rate of employees, enterprises must not only proceed from the organizational level, but also consider the personal factors of employees. However, this study only considers the mediating effect, and does not consider the influence of boundary factors. Later research can proceed from this perspective and conduct further research.

A Study on the High Turnover Rate of New-generation Knowledge Employees

He Heng, Liu Jiashun
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 595524830@qq.com, liujiashun@whut.edu.cn)

Abstract: In the era of knowledge economy, the new-generationknowledge employees as a "new power" gradually become the main force of society construction. They have a higher level of knowledge and more innovative ability, but their frequent turnover has become a major management problem. Effective management of the new-generationknowledge employees has become an urgent problem for enterprises. Based on the high turnover rate of the new-generationknowledge employees, this paper analyzes the characteristics of the new-generationknowledge employees, and explores the reasons for the high turnover by the literature research method, and puts forward the corresponding countermeasures of human resource management from the perspective of human resource management in order to meet the challenges facing the new generation of employees in the enterprise management.
Key words: New generation; Knowledgeable staffs; High turnover rate; Recommendations

1 Introduction

In the era of knowledge economy, the new-generationknowledge employees have gradually entered the workplace, and plays an increasingly important role in the development of enterprises. However, from the bad performance of this generation of employees in the workplace, such as"flash" phenomenon, higher turnover rate, etc. According to the survey on the departure of a new generation of employees in a unit in 2013, only 32.7% of the employees have worked for more than 3 years,only 47.6% worked 1-3 years,and 19.7% worked less than one year,most of the new-generationemployees are in a state of frequent job-hopping;according to the investigation of the graduate school graduates by the McKeith Institute, in 2015, about 98% of university graduates chose to voluntarily leave their jobs within half a year. The overall turnover rate was as high as 34% within six months, and the turnover rate was as high as 26.5% in 2016.According to a survey conducted by a website, the turnover rate of new-generation employees in China is as high as 60%, and about one-third of new generation employees are switching jobs more than 5 times per year.According to the above survey, the new-generation employees are usually characterized as frequent job-hopping, which greatly threatened the stability in the workplace. If this problem is not handled properly, it will lead to lower efficiency and restrict the development of enterprises and employees.Therefore, it is imperative to solve this problem.

2 Literature Reviews

2.1 Key concepts

2.1.1New-generation employees

In China, the concept of the new-generation employees is relative to the labor force before the reform and opening up. It is pointed out that workers born in the 1980s, 1990s, and later. There are similarities between the new generation of employees in China and the "baby boom" in the United States. (HJ Krahn & NL Galambos, 2013) The Baby Boomers, on the one hand, are reservoirs of the corporate elite, occupying key positions in the organization; on the other hand, this group has become an organization's "decayed wood" by squeezing the pension and pension systems of enterprises, hindering more creative creativity.

2.1.2 Knowledge employees

The concept of "knowledge workers" was put forward in the book "landmarks of tomorrow" by the father of management Peter F. Druker in the 1950s: "Knowledge workers are using symbols, concepts, people who work with knowledge or information." Follow-up many scholars on the definition of "knowledge-based employees" also have their own emphasis, but the consensus is focused on two aspects: firstly, knowledge-based employees are good at knowledgelearning;secondly, knowledge-based employees are good at applying their studies creatively to achieve organizational goals.(Wang Hanbin,Yang Xiaolu, 2011)

Therefore, this article defines the knowledge-based employees as mental employees having strong learning and innovation capabilities, which can create value for the company in the work process and

can continuously improve their own KSA.

2.1.4 Factors influencing the turnover intention of the new-generation knowledge employees

Although scholars at home and abroad hold different views on the classification and classification of the factors affecting turnover, overall, they can be divided into four aspects: individual factors, organizational factors, work factors, and macro-environmental factors.Based on the improved Price-Mueller (Price-Mueller,2000) model and Yang Xiaolu (Yang Xiaolu, 2012) maturity scale macro-environmental factors include relative responsibilities and opportunities; individual factors select employee personality characteristics and job participation; organizational and work factors include self-sovereignty, fair distribution, work monotony, salary levels, promotion opportunities, job stress, social relations, leadership styles, social support, and career development.(Fang Tao, Jiang Tao, 2013)

3 The Characteristics of the New-generation Knowledge Employees

Compared with the previous labor force in China, the new-generation knowledge employees have the following five characteristics.(Li Yaqian, 2014)

(1)Strong self-management awareness.Based on the particularity of its growth environment, this generation of employees pays more attention to the independence of their lives and work, prefers self-management, is unwilling to be constrained, and sometimes shows poor communication, listening, and stress-relief capabilities.

(2)Strong self-learning awareness.They were born in an age of informatization and fierce competition. They have been well educated since childhood, and they have developed a sense of continuous learning new knowledge and constantly charging themselves.

(3)Prone to innovation and challenging work. The new generation of knowledge workers is no longer in order to meet the needs of physiology, safety and other relatively primary needs in terms of work needs. They are eager to achieve self-worth, tend to prove their ability and improve their own KSAthrough more difficult work, and gain respect and recognition from others.

(4)High turnover rate. Whenthe company is still unable to meet their needsthey are more likely to jump out of the original unit and find a higher platform.They are more concerned about whether their talents are fully utilized. and whether self-worth is recognizedby society. Therefore, the group is also more likely to leave the organization to seek other platforms due to the psychological fluctuations caused by inconsistency between organizational evaluation and self-evaluation.

(5)Occupational anchor effect is obvious. The career anchor effect of the new-generation knowledge employees is embodied in the narrow range of anchorage and the longer anchoring effect. The narrow scope of the anchorage is related to the higher professional access threshold. The sunk cost for the professional makes this generation more inclined to work hard along the goals set in the early career; the longer anchoring effect is due to the relative stability of the professional anchor itself and the firm belief of the new generation of knowledge workers in their own career goals.

4 Reasons for the High TurnoverRate of New-generation Knowledge Employees

After analyzing the relevant domestic and foreign research, through analyzing and summarizing the antecedents, mediators and outcome variables and combining the unique characteristics of the new-generation knowledge employees,(Cao Xiaolong, Huang Jiawen, 2013) the reasons for the high turnover rate of the new-generation in China at present include the following points:

4.1 There is a "generation gap" between the traditional management methods and the new-generation

Traditional management methods tend to be centralized, autocratic and authoritative. People's management tends to be power-centered, employees only need to obey, only have the lower level needs, but the new-generation employees pay more attention to the independence of their lives and work, tend to manage themselves, and emphasis the realization of higher-level needs in their work. Therefore, applying traditional management methods to the new-generation will inevitably lead to many contradictions and problems.

4.2 Corporate incentive mechanism lacks competitiveness

The purpose of the incentive is to fully mobilize the creative and autonomous initiative of employees, complete the task with high efficiency and high efficiency, but the traditional incentive model does not take effect on the new-generation employees, because the new-generationknowledge workers emphasis the work itselfwhen seeking work.Therefore, when there is a big gap between the work environment and expectation, they often trend to leave their jobs.

4.3 Ignoring the realization of the value of the new-generation knowledge employees

When looking for a working platform, the new-generation knowledge employee'semphasis on their future development space and whether they can achieve their own value, get the recognition of others, if the platform cannot meet their needs, they will tend to leave the job.They advocate freedom and have their own unique values, but also emphasis on the matching of organizational concepts or cultures to their own.Changes in the organization's internal policies or management concepts, or when employees find themselves unable to get a self-fulfilling platform, can easily lead to their departure.

4.4 Heavy working pressure and poor compression capability of employees

Most of their work is in the technical and management categories. And most of what they do is technology and management, these types of work are more difficult, and require not only strong professional skills, but also the ability to solve problems. Also need a strong compressive ability.(Zheng Q G & Ding W H, 2011) However, due to the particularity of the growth environment, they often show independence in their work, do not want to be constrained, and show poor resistance to pressure in the face of difficulties. High-intensity work pressure can be regarded as a huge challenge for the new-generationknowledge employees.

4.5 Low level perception and low corporate loyalty

Employees' job satisfaction and enthusiasm are largely influenced by the manager's leadership style. This generation of employees' understanding of leadership is not based on the role of the leader, but is judged by the leader's workability and personal charisma. Based on their unique values, leadership is often a symbol of ability and personality rather than power. Therefore, the new generation prefers charismatic leadership. It is also their low level perception that often gives people a self-illusion and lack of team spirit. In addition, the loyalty of the new generation of employees is more about the work and the profession than the enterprise. When they are looking for a working platform, they emphasis on the future development space and the realization of their own value.

The above are the main factors leading to the departure of the new-generation employees. However, due to the individuality of the separation, the manager of the company should dialectically analyze and treat the separation.

5 Practical Implications

Enterprises can reduce the high turnover rate of the new-generationknowledge employees from the following two levels:

5.1 Corporate level

5.1.1 Improve recruitment system

There is a high turnover rate among employees, which is due to the unreasonable recruitment channels and system.When undertaking recruitment, it must do a proper investigation to fully understand the talents required by the company, as well as the professional appeals and values of the new-generation employees; providing real and accurate information during the recruitment process. Behavioral and occupational assessments to ensure that people are matched and reduce employee turnover after entry.

5.1.2 Improve work autonomy

Enterprises should give full play to the work enthusiasm of the new-generationemployees and mobilize their autonomy. The new-generationemployeeshave high requirements for work autonomy and great desire for career growth opportunities. (FangWenjie, 2014) In order to meet the individual needs of them, the company can set up some challenging projects in terms of work;design some distinctive elements that are more in line with them in the aspect of welfare and inprofessional growth use of entertainment, open and interactive training mode.

5.1.3 Creating an appropriate corporate culture atmosphere

The higher the degree of matching of values between the employees and the organization, the higher the employee's recognition and sense of belonging to the organization will be.(Wang Xiaoli, 2010) At this time, the employees will be more willing to provide better services to the organization. The new generation of employees has the characteristics of strong autonomy, self-management awareness, and a challenging and novel work atmosphere. Therefore, companies can build a warm and diversified corporate culture that suits their needs in line with the characteristics of this generation. The construction of corporate culture enhances employees' sense of belonging and identity, thereby reducing the turnover rate.

5.1.4 Broaden communication channels

Due to the special growth environment of the new generation of employees, they often show poor communication skills and have a weak sense of hierarchy. The respect for the superior is also out of the leadership has a higher ability and literacy. Therefore, using a varietyof communication methods to build a non-hierarchical and barrier-free communication platform. In order to overcome the horizontal communication difficulties of the new generation of knowledge workers and solve the problem of vertical generation gaps, enterprises should build a barrier-free, non-hierarchical platform for emotional release and guidance communication.

5.1.5 Emphasis on the Professional Development of Employees

Enterprises should provide reasonable suggestions for career development planning according to their own abilities and characteristics of new-generation employees, so that they can fully exert their autonomy and initiative on their career paths, recognize their career development paths, and avoid some irrational turnover due to confusion.

5.2 Staff level

5.2.1Fully recognize yourself

Due to the special growth environment of the new-generation, they are labeled with selfishness, low pressure resistance, and strong liquidity. Therefore, the new-generationemployees must fully understand and establish themselves when they are looking for a job. Establishcorrect valuesand accurately position your own professional demands, so as to find a suitable platform for their own, to avoid irrational resignation after entry.

5.2.2 Enhance responsibility awareness and compression capability

From related research, it is known that when employees can't balance their work and family pressure well, they will easily be willing to leave. For the new-generation employees, with the development of society, their pressure will be increasing, so they mustenhance their ability to deal with pressure from all sides, instead of adopting a negative and evasive approach.But there is also a common phenomenon in the workplace: after participating in training to improve their own ability, some employees will choose to change jobs in search of better development. It also makes enterprises worry about the integrity of the new generation of employees. So they alsoshould increase their sense of responsibility. This is both responsible for themselves and for family members.

5.2.3 Do career planning

Making a detailed and reasonable planning for your career development will certainly make your job searching more clearly, and it will also help you find a platform that is more suitable for your own development, rather than feel confused and puzzledfor your future development.

6 Conclusion

Excellent talent reserves have always been the driving force behind the survival and development of enterprises.(Li Yaqian, 2014) Talents are always the core strength of the company's development and growth, and the key to retaining talents lies in the way and method of human resource management, which is consistent with the characteristics of the times and the needs and characteristics of employees. The new generation of knowledge workers is the group with the most characteristics of the new era. They generally accept higher education, have professional knowledge and skills, and at the same time they are individualized, pursue freedom and dare to break through. Because of their unique personality and values, workplace performance is significantly different from other generations of employees,(Jiang Weiwei, 2014) and their arrival will inevitably bring new challenges to organizational management. Current human resource managers must recognize that traditional management methods may not be suitable for the management of new generation knowledge workers. Only by actively changing the management method, better cooperating with the new generation of knowledge-based employees, and constantly adapting to the management methods of the times cannot be eliminated.

Abstract: This article uses comparative research methods,holds that in order to actively guide college students to establish correct academic outlook and values, and cultivate learning ability of students which in accordance with sustainable development,it is very necessary that Chinese colleges and universities construct the "student based" core concept as the guidance,set up a professional organization to provide college students with education training, consulting, management and supervision and other comprehensive services, guided by the core concept of student-oriented and the academic needs of college students. By establishing unimpeded communication and problem solving channels, the academic development service system with services, education and management for university students can be developed, which is guided by colleges and universities, and based on the academic development service organization,supported by the university service department and complement with other social forces.
Key words: College students; Academic development; Service system; Academic development service system

1 Introduction

College students are the most energetic and creative groups in the society and is the backbone of undertaking the mission of promoting social development. Academic achievement is the foundation for the development of college students and the cornerstone for their future success. The academic development of students is an important index to reflect the educational level and the quality of talent cultivation (Yan and Gao, 2016). Donald Kennedy, a former President of Stanford university once said: "The supremacy of universities lies in providing mankind with an intellectual platform for improving culture, creating culture, continuing life and protecting human sustainable development (Kennedy, 2005)."Attaching importance to the academic development of college students is an important function of colleges and universities, an important work for colleges and universities to implement the strategy of talent power and to provide talents for social construction.

In recent decades, famous international universities have formed service systems to promote the academic development of college students, such as the ASAP of Princeton university, which is a specialized agency that includes academic guidance and counseling, specific course support, writing and research services to promote academic development of college students. Harvard University has set up a special organization called Student Affairs Center to promote academic development of college students. The purpose of the agency is to help students in their studies by providing advice, guidance and resources to ensure that college students get all-round development in an inclusive environment and on their way to succeed. Most of the Chinese colleges and universities have set up a functional department responsible for organizing, managing and monitoring teaching activities for college students—the Academic Administration Office; a functional department responsible for college students to solve psychological problems, improve psychological quality and promote the mental health development—the Mental Health Education Guidance Center; a functional department responsible for providing employment service and guiding college students to do well in career development planning—the Employment Guidance Service Center. In the work of these functional departments, academic development services for college students are sometimes involved. However, since these departments have their fixed functional and transactional work, there is no fixed personnel and energy to carry out targeted and efficient research and guidance activities for academic development of college students, it is necessary to study this problem.

2 The Connotation of Academic Development Service System for College Students
2.1 College students' academic development

College Students' academic development refers to the university students under the guidance of the national education policy and the college curriculum teaching syllabus, under the guidance of the teachers, by means of participating in the course of learning, scientific research, social practice, professional practice and other activities，college students complete the credits required by the training program, and complete the graduation thesis (design) and graduation reply, and graduate successfully and finally get the degree. In the process of complete their studies, learning ability, innovation ability, practice ability and competitive ability of sustainable development can be improved in many aspects, and form the core competitiveness of the individual. With the passage of time and the growth of college students, the learning career of college students keeps moving forward regardless of whether they continue their studies or work after graduation. The attitude, expectation and values of their studies will affect their future development.

2.2 Academic development service system for college students

Academic development service system for college students refers to under the guidance of the core concept "student-oriented", colleges and universities set up a professional organization based on academic needs for college students, and organize professional personnel to provide college students with education training, consulting, management supervision and other comprehensive services following the development law of peoplein the process of promoting the overall development of college students. By establishing unimpeded communication and problem solving channels, the academic development service system for college students is formed which is dominated by colleges and universities, and based on academic development service organization and service departments of colleges and universities, and supplemented by other social forces and integrated with services, education and management. This system includes five factors: professional service institutions, high quality academic development instructors, scientific and efficient service means, systematic service content and network service platform.

3 Requirements to Construct Academic Development Service System for College Students

3.1 Professionalization of service subject

Academic development service system is led by universities, and staff of related functional departments, professional teachers, retired teachers, good students, education experts and scholars in the society and other kinds of people form a professional service system (Yu, 2012). Since the object of the service is college students with different academic problems, it is necessary to conduct formal and systematic professional training for employees, and these professionals need to possess professional spirit, not only can realize the importance of school work of college students, but also need to have a high professional level, which can analyze academic development difficulties respectively, and put forward guidelines to promote academic development of college students.

3.2 Modernization of service means

The academic development service system should include an open service platform with modern service means and unlimited time and space. With the intervention of multimedia and network technology, the information service platform is set up to adapt to the personalized academic development of students. On the basis of existing websites, colleges and universities have established a column to promote the academic development of college students, which lists services such as academic guidance, consultation, resource support and expert appointment. In this column, video and lecture notes of open class, writing instruction and practical guidance are available for students to learn independently (Xue and Cheng, 2010). Students can register an account and pose questions on it, and choose counseling section and expert who can provide advisory services in their need. Moreover, they can also choose online consultation, telephone or face-to-face consultation.

3.3 Systematization of service content

Based on the analysis of the connotation of college students' academic development and the essence of education service, and the needs of college students' academic development as the research object, investigate and analyze the academic needs of Chinese college students, and determine that the academic development service system needs to revolve around the internal and external learning, scientific research, social practice, professional practice and so on, and confirm the service content, including providing related services such as school development planning guidance, curriculum resources, essay writing guidance, professional selection guidance, scientific research guidance and other services of improving learning skills of students (Gao,2013). At the same time, academic

development of every student is a dynamic process, therefore, the content of academic development service should be adjusted according to their academic situation at different stages. Service personnel must be good at making scientific forecast for academic development of students, and providing operational advice to their academic development plans combining environmental change and academic development of students.

3.4 High efficiency of service level

Carl Rogers, the father of humanistic psychology once said: "The goal of education should be promoting the study and change of the whole person." The purpose to establish academic development service system for college students is to provide high quality and high efficiency service to promote the academic development of college students. Academic development service for college students confronted with students with different specific situations. Some students are unable to adapt to the academic environment, and some students are lack of academic motivation, and some students are unable to face academic failure correctly, and some students are lack of learning resources. Therefore, it is necessary to carry out high efficient service (Yu and Dong, 2005).

4 International Experience for Reference

4.1 Establishing academic development service institutions

The development of the new period brought opportunities and adjustments to undergraduate education. Princeton University, a leading research university in the world has established a deparment named "Academic Success at Princeton" (ASAP). The purpose of the establishment is to provide students with learning resources, and improve learning ability, research ability and writing ability for students and solve their academic problems. Harvard University has set up the "Student Affairs", which aims to enhance contact between staff and students and add attention to students, and provide academic services and learning resources to improve students learning ability, and build an inclusive growth environment for students to achieve successful experience and promote their comprehensive and full development. Stanford University set up an institution called "The Office of The Vice Provost for Undergraduate Education" (VPUE). It was established in 1995, to promote undergraduate education and the collaboration between teachers and students, colleges and functional departments of entire university, and integration of resources, to fully realize liberal education. The goal is to promote interaction between teachers and students, and develop new curriculum and innovate teaching methods, and provide academic programs and suggestions for college students, and improve their learning ability and help them realize their dreams.

4.2 Build a systematic academic development service system.

The ASAP of Princeton university which consists of an expert team composed of deans and department head, provides academic development services, including academic consultation, health consultation, learning method guidance, specific curriculum resource support and writing and research guidance. The Student Affairs Office at Harvard University offers a range of services that promote academic development, including academic guidance, supervision of student progress, financial assistance, supervision of academic policies and processes, provision of academic counselling and curriculum resources, and development proposals for diversity and containment. The VPUE department in Stanford University provides services including general education courses, targeted writing coaching, professional introduction seminar, undergraduate research support, overseas training courses, academic guidance, learning skills guidance and other services to promote the development of education. The academic advisory department of Oxford University aims to help students solve academic problems and excavate students' learning potential by providing free and confidential services. University staff, parents, students and community staff provide individual counseling, workshop guidance, group counseling and self-help resources for students with need. It also provides a series of special reports to help students improve their learning skills, and stimulate their thinking, and solve academic problems such as academic procrastination, exam phobia and exam anxiety, and promote college students to adapt to college life and achieve a better development.

4.3 Building a network service system

The ASAP institute at Princeton university offers course resources by the column "Course-Specific Support" , including online courses for different majors, free one-to-one tutoring and academic guidance provided by experienced undergraduate tutors. In order to enable the first-class teaching team to serve students outside the classroom, the center for teaching and learning at Stanford University strengthens network platform construction and set up MOOC learning forum by adopting a diversified service

approach and working with two excellent software development teams. After students register, they can get various learning services. A large number of online courses and non-course modes are provided on learning forum, and students can study independently. If students have academic difficulties, they can also ask for help on learning forum. At the same time, the students who are excellent in study can also help other students through learning forum. By constructing such a mutual learning forum, Stanford University provides students with an open learning platform, and is committed to provide students with the high quality resources, and improve their learning ability and promote their academic development.

5 Conclusion

The investigation shows that the factors affecting the academic development of Chinese students are mainly composed of students, teachers and teaching (Wang, 2014). There is a significant positive correlation between professional advantages and professional interests of college students (Chen et al.,2009). A national longitudinal survey of 6139 female college students shows that the current student loans has produced an inhibitory effect on Chinese female college students academic development on the whole (Huang and Zhang, 2017). At the same time, in theoretical research, university workers always attached great importance to academic problems of college students, and have conducted the related research from the perspective of college funding (Li, 2018), tutor (Hu et al., 2017), academic development counseling (Wu and Xu, 2016), academic pressure, academic ability, academic mood, academic failure and academic planning (Wang et al., 2011). However, the cognition and practice of academic development education for college students are not systematic, and a mature academic development service theory system has not been formed. Therefore, Chinese colleges and universities need to set up a specialized department to provide academic development service for college students. Academic development plan is helpful for college students to make proper self-orientation and promote education management (Cao, 2014). Under the new situation, in order to actively guide college students to establish correct academic view and values, and cultivate students to have the learning ability of sustainable development, it is an urgent need to strengthen the study of college students' academic development services in theory and provide new ideas for developing university students' academic education in China.

Evolution of Development Path of Young Innovative Talents Driven by Postdoctoral System Innovation

Ji Yunjie
Human Resource Department, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 20640939@qq.com)

Abstract: Postdoctoral system is an important part of national innovation-driven development strategy. Postdoctoral training is an important source of young creative talents. At present, the development of China's young innovative talents is facing the problems of unsuitable talent competition, poor mobility of personnel, mismatched management system, and shortage of supporting resources. In order to improve the post-doctoral development path, this article adopts policy interpretation, integrates postdoctoral policy keywords, postdoctoral fund project performance evaluation indicators, postdoctoral job satisfaction indicators, and constructs a postdoctoral development path Bayesian index system, including treatment, assessment, teamwork, protection, innovation, employment. Six key nodes found that the post-doctoral employment situation is not optimistic. The postdoctoral treatment is gradually improving, and the cultivation and evaluation of postdoctoral innovation ability needs to be further improved.
Key words: Postdoctoral system; Innovation-driven; Young creative talent; Path; Evolution

1 Introduction

With the increasing specialization and complexity of scientific research, the requirements for personnel engaged in scientific research are getting higher and higher. The postdoctoral fellow as the group of young scientific research talents with the most innovative vitality and development potential has become the main force of international scientific research. Many of the original research results have postdoctoral contributions.

The postdoctoral platform has become a reserve pool and reservoir for young talents in colleges and universities. As the state and station-based units continue to increase the position of treatment and optimize management methods, the post-doctoral system has greatly enhanced the competitiveness of outstanding young talents. By the end of 2015, there were 3,011 postdoctoral mobile stations in 460 colleges and research institutes across the country, covering a total of 110 primary disciplines in all 13 disciplines. The number of postdoctoral research stations established by major companies reached 3,595. Since the establishment of the post-doctoral system, China has recruited more than 150,000 post-doctoral students. By 2017, more than 88,000 people have been stationed (Bai Bingyang, 2017). Helbin (Helbin, 1998) shows that factors such as low wages, no benefits, contempt by their department and institution, longer research deadlines, and anxiety about future careers have a significant negative impact on postdoctoral job satisfaction. In China, with the continuous improvement of the market economic system and the gradual deepening of the personnel system reform, the external environment of post-doctoral talent training has undergone tremendous changes, and some deep-seated problems of the postdoctoral system have gradually been exposed, which restricts the in-depth development of the postdoctoral career (Wang Chuanyan, Ren Chao, 2016). Miller (Miller, 2012) used a binary sequence regression model to study and found that the size of the research interests and the degree of matching, and the frequency of interactions with the coordinator had a positive and significant effect. The shorter the first post-doctoral career, the pursuit of teachers' research career, and the low income. The postdoctoral job satisfaction of the country as well as the high appraisal of the coordinating mentor is relatively high (Gerlese S. Åkerlind, 2005; Fan Wei, Liu Wenlan, 2013).

In general, China's postdoctoral research on talent innovation has developed rapidly and has achieved a series of progress and results. On the one hand, it has quickly cultivated high-quality research talents with international perspective and innovative qualities in a short period of time, making high-level university teachers available (Xue Eryong, 2012; Liu Yun, Yang Fangjuan, 2017). There is a certain reserve; on the other hand, the quality of post-doctoral innovative talents training has been improved, and the cooperation and exchange between high-level international talents at home and abroad have been promoted. However, the improvement of postdoctoral policy and the development and implementation of young creative talents are at the initial stage both in theoretical exploration and practice, and there are still some deficiencies (Yao Yun, 2017; Liu Yun, Yang Fangjuan, 2017). In

reviewing its development history, it is necessary to soberly understand the current difficulties and difficulties and actively explore the development path (Zhang Muchu, 2017).

2 Basic Situation of Postdoctoral Research in China

Postdoctoral career is a transitional phase between the completion of a doctoral degree and the acquisition of a long-term fixed career (Stephan P, 2005). With the gradual improvement of the postdoctoral system and the continuous deepening of the reform of personnel system in colleges and universities, the scale of postdoctoral researchers in China has gradually expanded and become an important force in the field of academic research. According to statistics, as of 2014, China had a total of 78807 postdoctoral researchers. The average annual growth rate of postdoctoral enrollment from 2000 to 2014 was 12.3%. In 2016, the number of post-doctors reached 18244 and the number of outbound stations reached 10599.
Figure 1   Statistics on the Number of People Entering the Station for Postdoctoral Researchers in Each Year

The number of post-doctoral stations in each year of China has steadily increased, excluding the initial period of 1985-1990. Since 1990, the average growth rate has been 17.88% and the variance is 0.109. Through the linear correlation analysis, the number of arrivals in each year was obtained as: $y = 24.957x^2 - 274.05x + 859.26$, and the fitting residual was $R^2 = 0.9968$.
Figure 2   Statistics on the Number of Outbound Postdoctoral Researchers in Each Year

The number of postdoctoral stations leaving China in each year is basically stable, excluding the initial period of 1985-1990. Since 1990, the average growth rate has been 20.27% with a variance of 0.191. The growth rate of the number of outbound stations in each year has a certain fluctuation, showing negative values, indicating that some postdoctoral staffs have postponements. Through the linear correlation analysis, the number of arrivals in each year was obtained as: $y = 14.088x^2 - 141.14x + 374.2$, and the fitting residual was $R^2 = 0.9958$.

In recent years, the top three disciplines with the largest number of postdoctoral station researchers

have been engineering, science, and medicine, accounting for 39.51%, 22.8%, and 10.05% of the national postdoctoral enrollment, respectively, compared to the fewest recruits. The disciplines are military science, arts, and philosophy, accounting for only 0.64%, 0.54%, and 1.05% of the total number of people enrolled in the year. Because the gap between the number of disciplines is extremely large, it is doomed that the promotion of postdoctoral related policies cannot be exhaustive, but only selectively fund research of key disciplines, a nd the transformation of relevant results.

3 Postdoctoral Innovation Drives Talent Development Path

3.1 Postdoctoral innovation drivers

By tapping the potential of young talents and creating conditions to help them come to the fore, and then promote the release of the entire talent team, it has become an important implementation path for the "two-class" construction of universities. However, the development of young talents in colleges and universities is still faced with many difficulties due to reasons such as the competition for talented people, poor mobility of personnel, mismatch of management system and shortage of supporting resources (Thunnissen M, Boselie P, 2013; Xue Eryong, 2012; Fan Wei, Liu Wenlan, 2013).

Huang Yuanqi (Huang Yuanqi, 2018) obtained 56 key postdoctoral policies from 1998 to 2015, extracted 24 subject words, and obtained 24 high-frequency words. After co-word clustering, he formed five clusters of management system reforms, establishment of stations, personnel training, institutional planning and management, life and scientific research protection, representing the main focus of post-doctoral policy at this stage.

Table 1   Postdoctoral Policy High Frequency Keywords

Keywords	Frequency	Keywords	Frequency	Keywords	Frequency	Keywords	Frequency
station	☆☆☆	workstation	☆☆☆	enterprise	☆☆☆	academic exchange	☆☆☆
funding	☆☆☆	recruit	☆☆	evaluation	☆☆	rover	☆☆
declare	☆☆	system	☆☆	innovation	☆☆	protection	☆☆
funds	☆☆	input	☆☆	personnel management	☆☆	achievements	☆☆
cultivate	☆☆	planning	☆☆	promotion	☆	quality	☆
management System Reform	☆	excellent postdoctor	☆	apartment	☆	experimental unit	☆

After a semantic analysis of the latest postdoctoral policy documents, it was found that talent, innovation, reform, uniqueness, importance, and comprehensiveness were the most frequent words, reflecting that postdoctoral policy is now entering an in-depth reform period, highlighting the training of young talents and focusing on innovation, advance to the characteristic development model requires the comprehensive improvement of the postdoctoral system.

3.2 Based on Bayesian postdoctoral talent development path evolution model

The Bayesian network nodes represent random variables. Directed edges between nodes represent the causality between nodes and express the strength of the relationship with conditional probability. A node variable can be an abstraction of any problem, suitable for expressing and analyzing uncertain and probabilistic events, and can be inferred from incomplete, imprecise or uncertain knowledge or information.

In order to construct the Bayesian network model, we first need to select relevant important variables, and then classify them according to the target variables, mediation factors, interventions, implementation factors, control factors, and additional influences, and perform parameter learning. The "target variable" is the final variable that you want to influence through management or intervention; the "intervention variable" is the measure that is implemented to reach the target variable and can be considered as various management decision-making choices; the "mediation factor" is the linking target variable and intervention variable. The intervening factors, that is, the intervention variable must transmit its effect through mediating factors, while the mediating factors have a direct impact on the target variable; the "control factor" is an exogenous variable that does not change with intervention, and it has an effect on both the mediating factor and the target variable; "Implementation factor" is a variable that directly influences whether an intervention or a decision is successfully implemented. The effect will affect the target variable through an intermediary factor. "Additional impact" is a variable that changes with the intervention and the target variable, and is an additional result outside the target. For

the system There are no active influences on other factors within. Through the learning of indicators and the analysis of policy texts, the post-doctoral development path Bayesian nodes are shown in Table 2.

Table 2   Postdoctoral Development Path Bayesian Node Selection

	Node classification	Node selection	Hierarchy	Abbreviation
1	Implementation factor	treatment	Middle	TR
2	Intervention variable	Evaluation	Middle	AS
3	Intermediary factors	Team	High	TE
4	Additional effects	Protection	Middle	GU
5	Controlling factor	Innovation	High	IV
6	Target variable	Employment	Low	EM

After the Bayesian structure is initialized, the condition tree Bayesian network model and the parameters of how to learn the model under a given model structure are formed, but the structure of the model needs to be automatically learned from the data. It is necessary to find the closest joint distribution of conditions, that is, to maximize the conditional log-likelihood based on the input data.

In order to obtain the optimal conditional tree Bayesian network model efficiently without the need to display the tree structure of the enumeration finger order, this problem is converted into a weighted directed tree with the largest sum of edge weights in the graph.

4 Postdoctoral Development Path of Evolution

This paper uses the weights of employment, assessment, teamwork, safeguards, innovation, and treatment in policy papers and expert scoring as inputs for Bayesian path evolution.
Figure 3   Evolution of Postdoctoral Innovation Driven Policy

By calculating the maximum similarity loglik = 0.5543, indicating that the results of this study still have some uncertainty. The probability distribution of innovation nodes (IV) is (low, medium, high) = (0.4125, 0.2874, 0.3001), indicating that there is still much room for improvement in the current state of postdoctoral innovation. The probability distribution of the treatment node (TR) is (low, medium, high) = (0.0357, 0.4188, 0.5455), which indicates that the current postdoctoral degree is universally recognized for the level of treatment, but there is nearly a half probability that the post-doctoral treatment has yet to be improved. The probability distribution of the employment node (EM) is (low, medium, high) = (0.4059, 0.0957, 0.4985), indicating that the post-doctoral employment situation is not optimistic, a considerable probability is that the post-doctoral employment level is low, and there is also a partial probability that the post-doctoral employment level is better, but the low degree of recognition of employment at the middle level reflects the polarization of post-doctoral employment. It is neither satisfactory nor very satisfactory.

5 Conclusion

The improvement of postdoctoral policy and the development and implementation of young creative talents are at the initial stage both in theoretical exploration and in practice. The scale of postdoctoral researchers in China has gradually expanded and become an important force in academic research. Future China postdoctoral policy will more closely integrate the needs of social development, promote marketization and internationalization to promote the cultivation and flow of talents, promote postdoctoral innovation and entrepreneurship, and enable postdoctoral policies to play a role in

cultivating high-level innovative young talents and promoting innovation in mass entrepreneurship. Bigger effect. At present, the development of young innovative talents is facing the problems of unskilled competition for talents, sluggish flow of people, mismatched management systems, and shortage of supporting resources. Post doctors themselves also face social constraints, a low sense of belonging, and a high pressure on their lives. In order to solve such problems and improve the post-doctoral development path, China has introduced several policies in succession. Based on the key words of postdoctoral policy, this article constructs the post-doctoral development path Bayesian index system, including six key nodes of treatment, assessment, team, security, innovation, and employment. Through computational simulation, it is found that post-doctoral employment is not optimistic, and post-doctoral treatment is positive. Gradually improve, the cultivation and evaluation of postdoctoral innovation ability needs to be further improved.

Research on Optimal Matching of the Two-way Choice Between Entrepreneurial Mentor and Entrepreneurs

Wang Chao, Hu Qianwen
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 408468369@qq.com, 237671988@qq.com)

Abstract: Theoretical research and practice have showed that the entrepreneurial mentor plays an important role in the growth of entrepreneurs and the development of entrepreneurial enterprises. The optimal match between the entrepreneurial mentor and entrepreneurs is the basis of the mentoring function of the entrepreneurial mentor. However, the current research about operational optimal match between them is relatively scarce. Based on the related mentoring theoretical research, this paper uses Gale - Shapley algorithm to construct a set of optimal matching model of the two-ways choice between the entrepreneur mentor and the entrepreneur. The application of this method in an entrepreneurship mentoring platform reflects that this method is suitable.

Key words: Entrepreneurial mentors and entrepreneurs; Optimal matching; Gale-shapley algorithm; Two-way choice

1 Introduction

"Entrepreneurship" is a very hot topic nowadays. According to the data of The Global Entrepreneurship Monitor (GEM), China's early entrepreneurial activity index is high, but the survival rate of enterprises is low. The study found that providing entrepreneurial guidance for entrepreneurs can effectively improve the survival rate of entrepreneurial enterprises and make them develop continuously. A survey in the United States also found that the failure rate of enterprises that did not receive business guidance reached 55 % within 4 to 6 years, but the failure rate would decline to 20 % after receiving business guidance. Therefore, the support of entrepreneurship instructors is an important part of entrepreneurship assistance in the entrepreneurship promotion strategies of various countries. The matching between the entrepreneurial mentor and the entrepreneurs is the first step in the process of providing guidance to entrepreneurs by the entrepreneurial mentor. The results of mutual choice between the entrepreneurial mentor and the entrepreneurs are crucial to the entrepreneurs and their entrepreneurial achievements, and they also have some influence on the entrepreneurial mentor at the same time. It will have a positive effect on the achievement of entrepreneurial achievements, the realization of guidance functions and the teacher-pupil relationship when the entrepreneur mentor and the entrepreneur achieve a stable and effective match. Many entrepreneurship support institutions in China, such as incubators in universities and government-built entrepreneurship support institutions, have mostly failed to recognize the importance of matching entrepreneurs with entrepreneurs, or just simple one-way matching, which makes the matching between entrepreneur's mentor and entrepreneurs not optimal.

At present, the research on the matching problem between the entrepreneur mentor and the entrepreneur focuses on the research on the influencing factors of the matching between the entrepreneur mentor and the entrepreneur. For example, Ragins et al and Allen study illustrated the relationship between the gender of the entrepreneurial mentor and the willingness to guide (Ragins, 2000). The research of Allen and Eby illustrated the difference of entrepreneurs' gender perception of guidance function (Allen&Eby, 2004). Ragins and Cotton studied the influence of the gender combination of mentors and students on the matching effect (Ragins&Cotton, 1999). The research of Allen and Gravells illustrates the influence of the age and education level of the entrepreneur mentor and the entrepreneur on the matching (Gravells, 2006). Allen, ST - jean and Audet studied the influence of the tutor's personal experience on matching (St-Jean&Audet, 2009). The research results of Dougherty show that tutor status affects the result of teacher-pupil matching (Dougherty, 2013). The research of Ensher and Murphy shows that the race matching results of mentors and students would affect the quality of mentoring relationship (Ensher&Murphy, 1997). It can be found that the matching problem between the entrepreneur mentor and the entrepreneur is mostly qualitative research, and the simple matching method of single factor is considered in current research situation. The operational method of how to match in combination with factors which seriously affected the guiding effect of entrepreneurs is scarce. In this paper, the Gale - Shapley algorithm will be used to construct the optimal matching model of the two-way choice between the entrepreneur mentor and the entrepreneur, so as to get the stable matching that accords with Pareto optimality.

This paper consists of four parts. After introduction of research background, the principle of Gale-Shapley algorithm is introduced. Based on the theory research results of motoring affection and relationship, Gale-Shapley algorithm is used to build a scientific model for the matching between the entrepreneur mentor and the entrepreneur. The entrepreneurial mentor and entrepreneur of an entrepreneurial guidance platform are taken as an example to make a match, and get a stable and optimal match in both directions. Finally, the future research is prospected.

2 Introduction to Gale-Shapley Algorithm

Gale - Shapley algorithm is an algorithm invented by American Mathematicians Gale and Shapley to find stable matching, also known as Deferred-acceptance Agorithm, which is referred to as " GS algorithm". It was first used to study the university admission and stable marriage problems. Subsequently, scholars began to attach importance to the bilateral matching problem studied it from different angles. A lot of researches were achieved, such as the match between buyers and sellers, the enrollment problem of universities and colleges, and the match between employees and positions, etc. Shapley and Roth won the Nobel Prize in economics for their contributions to the stable market matching theory and market practice in 2012.

Gale and Shapley published the foundation stone of bilateral matching theory as "College Admissions and the Stability of Marriage" in 1962. Matching experiments on both men and women in the marriage market and students and schools in enrollment were conducted in the paper and obtained stable matching results. When matching, the male and female guests in the wedding market were regarded as the collection of both parties in the trading market. The ladies set was supposed as $W=\{w_1, w_2, \cdots\cdots, w_i\}$ and the men set was supposed as $M=\{m_1, m_2, \cdots\cdots, m_j\}$. If the information of each participant was disclosed, each participant ranks the satisfaction of another party member according to their own preferences. Every woman w_i has a satisfaction ranking for all men in M, and every man m_j has a satisfaction ranking for all women in W. On this basis, it can produce stable matching results of "men's best" or "women's best" no matter which party first according to the principle of preferential matching.

The concrete algorithm is to simplify the matching between two parties in market transactions from the perspective of mathematical science into mapping from one set of elements to another set of elements with the help of computer programming technology. The condition of "stability" is that some elements in the two sets would not be interested in elements in the other set except those matched with others. Then we get a satisfactory and stable match between the two sides through deferred - acceptance algorithm.

The match between the entrepreneur mentor and the entrepreneur is the process that the entrepreneur mentor searches for the entrepreneur who meets the preferences, and at the same time, the entrepreneur searches for the ideal entrepreneur mentor. In short, they need pairing and matching. It is more suitable to compare the pairing and matching between the entrepreneur mentor and the entrepreneur to love and marriage. Therefore, we can map and solve this brand-new problem based on mature marriage model, and use game theory to solve the most stable matching problem of entrepreneurial project team.

3 Construction of Matching Model between Entrepreneurial Mentor and Entrepreneurs

The so-called stable match refers to that the entrepreneur matches the corresponding entrepreneur mentor, and they both think each other is the best. They will not fire or abandon each other in the match between the entrepreneur mentor and the entrepreneur. If one or both parties are not the most satisfied objects of the other party, it must be ensured that the entrepreneur can no longer find a better entrepreneur mentor than the one currently matched. All the objects in the two sets of entrepreneurs and entrepreneurial mentors would not be interested in other objects in the other set except those that have already been paired with themselves, then it forms a stable choice and pairing.

The influencing factors of entrepreneurs' choice of entrepreneurial mentors include: demographic characteristics (gender, age, position, race, etc.) of entrepreneurial mentors, guidance direction of entrepreneurial mentors, personality of mentors, past guidance experience of entrepreneurial mentors, guidance level of entrepreneurial mentors (including the position of mentors), etc. The influencing factors of entrepreneurs' mentor selection include demographic characteristics (gender, age, education level, race, etc.), entrepreneurs' personality, entrepreneurs' major (direction and field of entrepreneurship), entrepreneurs' past entrepreneurial experience, etc. All the above information must enable both parties to fully learn. Only when the information is sufficient and symmetrical learned, can the entrepreneurial

mentors and entrepreneurs rank their preferences correctly. Therefore, both parties should master the information in order to make a two-way choice between entrepreneurs and business mentors.

Before using GS algorithm to match, the following assumptions must be made:

Hypothesis 1: the mentors and entrepreneurs who participate in the matching should always keep their rational and clear preferences.

Hypothesis 2: every entrepreneur has only one entrepreneur mentor.

Hypothesis 3: the mentor has determined the number of entrepreneurs to bring before matching.

Hypothesis 4: both parties can sort each other accurately.

It is natural for entrepreneurs to apply to the most satisfactory business tutor. If entrepreneurs can't match their favorite mentors, they should settle for second place and contact the second satisfaction, and so on. It is in line with the mentor's interests to constantly choose his favorite among the entrepreneurs who throw offers to him. Then all the parties involved in the pairing have chosen their favorite and most satisfactory pairing objects within the range of choices, which is also the inevitable result of market game.

4 The Application of the Matching Model of Entrepreneurship Mentors and Entrepreneurs

We suppose that the *A entrepreneurship guidance platform* is a service platform organized jointly by the department of human resources and social security and the department of education in the *A District of the city W*, employing experts in the field of science, technology, finance, management and other well-known entrepreneurs to form a team of entrepreneurship mentors to provide entrepreneurship guidance and service for the entrepreneurs so as to reduce their entrepreneurship costs and risks. Its main daily affairs include the basic maintenance of the platform, expert consultation (policy consultation, expert guidance, entrepreneurship ability assessment, etc.), policy propaganda and acceptance, measures of innovative work and so on.

Assuming that *the A entrepreneurship guidance platform* needs to match the best entrepreneurs with 6 entrepreneurship mentors, according to the introduction of the platform, there are 3 mentors who can guide 2 entrepreneurs each cycle at the same time, so there are 9 entrepreneurs in each cycle to receive guidance on the platform, and the mentors are numbered as M_1, M_2, M_3, M_4, M_5, M_6, the entrepreneurs are numbered as P_1, P_2, P_3, P_4, P_5, P_6, P_7, P_8, P_9. Among them, M_1, M_2 and M_3 can guide two entrepreneurs at the same time, marked as M_1', M_2', M_3 'to show the difference. The following information of entrepreneurship mentors is announced in the *A entrepreneurship guidance platform*: basic information, past experience, the busyness degree of entrepreneurship tutor work, entrepreneurship direction, guidance style and so on. The information of entrepreneurs is announced as follows: the past entrepreneurship experience, the qualifications and majors of the entrepreneurs, the character of the entrepreneurs, the basic characteristics of the entrepreneurs, and the direction of the entrepreneurs' entrepreneurial companies.

After the above information is published on the A platform, the entrepreneurship mentors' preference for entrepreneurs and the entrepreneurs' preference for entrepreneurship mentors are presented from high to low as follows:

$$\begin{cases} M_1'(P_1, P_6, P_3, P_2, P_4, P_5, P_8, P_7, P_9) \\ M_2'(P_2, P_3, P_1, P_8, P_5, P_6, P_4, P_9, P_7) \\ M_3'(P_8, P_6, P_7, P_9, P_5, P_1, P_2, P_4, P_3) \\ M_4(P1, P_2, P_5, P6, P_4, P_3, P_9, P_7, P_8) \\ M_5(P_6, P_3, P_7, P_9, P_8, P_5, P_4, P_2, P_1) \\ M_6(P8, P_1, P_7, P5, P_6, P_9, P_3, P_2, P_4) \end{cases}$$

$$\begin{cases} P_1(M_1', M_4, M_2', M_5, M_3', M_6) \\ P_2(M_1', M_3', M_2', M_6, M_4, M_5) \\ P_3(M_2', M_5, M_6, M_4, M_3', M_1') \\ P_4(M_5, M_4, M_3', M_6, M_2', M_1') \\ P_5(M_5, M_4, M_6, M_3', M_1', M_2') \\ P_6(M_2', M_3', M_6, M_4, M_1', M_5) \\ P_7(M_3', M_1', M_4, M_2', M_6, M_5) \\ P_8(M_1', M_5, M_3', M_6', M_4, M_2') \\ P_9(M_1', M_4, M_3', M_6, M_2', M_5) \end{cases}$$

This paper use Gale-Shapley algorithm to match them, allowing the entrepreneurs to choose the entrepreneurship mentors.

In the first round, P_1, P_2, P_8 and P_9 choose M_1', and the group (M_1', P_1, P_2) is formed according to the preference of M_1'; P_3 and P_6 choose M_2', forming (M_2', P_3, P_6); only P_7 chooses M_3, forming (M_3, P_7); no one chooses M_4; M_5 is chosen by P_4 and P_5, forming (M_5, P_5); no one chooses M_6; therefore, the result of the first round is (M_1', P_1, P_2), (M_2', P_3, P_6), (M_3', P_7), (M_5, P_5), leaving P_4, P_8, P_9 unchosen.

In the second round, P_4 chooses M_4, who hasn't been chosen yet, thus forming (M_4, P_4); P_8 chooses M_5 according to his preference and M_5 refuses P_5 and chooses P_8, forming (M_5, P_8); P_9 chooses M_4 but fails to be chosen. Therefore, after the second round, there is only P_5 and P_9 left.

In the third round, P_5 chooses M_4 according to his preference and M_4 refuses P_4 and chooses P_5, forming (M_4, P_5); P_9 chooses M_3' who happens to have a quota left, forming (M_3', P_7, P_9). There is only P_4 left.

In the fourth round, P_4 chooses M_3' but fails to be chosen since M_3' has already taken two entrepreneurs.

In the fifth round, P_4 chooses M_6, forming (M_6, P_4).

The matching process of GS algorithm can be described by table-dispatching method shown in Table 1. Among them, "*" indicates the choice of people in this round who failed to match in the previous round.

Table 1   The Process of Table-dispatching of GS Algorithm

	\multicolumn{5}{c}{Round}				
	1	2	3	4	5
P_1	*M_1'	M_1'	M_1'	M_1'	M_1'
P_2	*M_1'	M_1'	M_1'	M_1'	M_1'
P_3	*M_2'	M_2'	M_2'	M_2'	M_2'
P_4	*M_5	*M_4	M_4	*M_6	M_6
P_5	*M_5	M_5	*M_4	M_4	M_4
P_6	*M_2'	M_2'	M_2'	M_2'	M_2'
P_7	*M_3'	M_3'	M_3'	M_3'	M_3'
P_8	*M_1'	*M_5	M_5	M_5	M_5
P_9	*M_1'	*M_4	*M_3'	M_3'	M_3'

After five rounds of selection by Gale-Shapley algorithm, the matching between entrepreneurship mentor and entrepreneur is complete. The results are as follows: (M_1', P_1, P_2), (M_2', P_3, P_6), (M_3', P_7, P_9) (M_4, P_5) (M_5, P_8) (M_6, P_4).   In this way, the *A entrepreneurship guidance platform* can get the best matching between the entrepreneurship mentor and the entrepreneur on the basis of the entrepreneurs' first selection.

5 Conclusion

This paper introduces and practices the Gale-Shapley algorithm stable matching theory and its practice method, applying it to the matching of entrepreneurship mentors and entrepreneurs on the *A entrepreneurship guidance platform*. With the example of the double selection and pairing of 6 entrepreneurship mentors and 9 entrepreneurs, we assume that each entrepreneur should choose and throw "offer" to the most satisfactory entrepreneurship mentor first, and every entrepreneurship mentor examines all the current pairing opportunities, and "temporarily accepts" the most satisfactory offer and rejects the offer of other entrepreneurs. All the entrepreneurs who have not matched the entrepreneurship mentors will match the "sub satisfactory" mentors in the next round, and the stable group is realized after repeated pairing over and over again.

In the practical application, under the condition mentioned above, the *A platform* can use the computer design system to number the entrepreneurship mentors and entrepreneurs. The system will assign each mentor for a period of time to understand each number's information (anonymously) and to sort the numbers according to their preference, and each entrepreneur corresponding understands the information of each number (anonymously) and sorts them according to the preference. The system will assign each mentor for a period of time to understand each number's information (anonymously) and to sort the numbers according to their preference, and each entrepreneur corresponding understands the information of each number (anonymously) and sorts them according to the preference. Through the programming of the computer system, the Gale-Shapley algorithm can be applied automatically to match the entrepreneurs according to their choice. The matching results can be translated from the

numbers into the names and displayed by the system. In this way, entrepreneurs and entrepreneurship mentors can get their own matching results from the computer to achieve the best matching of the two-way choice between them under the condition of the entrepreneur's first selection.

The conclusions of this paper can effectively solve the matching problem of entrepreneurship mentors and entrepreneurs in reality. It realizes a faster, more practical and more stable matching method, thus improving the efficiency and quality of the resource optimization. In the future research, intelligent optimization algorithm can be designed, and the corresponding matching system can be developed to achieve the more efficient matching.

Research on Effect of the Power Distance on Employee Innovative Behavior: The Moderating Role of Leader-member Exchange

Su Shufen

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: sushufen01@163.com)

Abstract: As the competition of organization is increasing intensely, the enterprise's development requires employees to drive innovation spirit and innovation behavior. How to improve the staff's innovation behavior have become the common topics of scholars and managers? This research investigates the effects of power distance on employee innovative behavior, and introduces leader-member exchange to verify its regulatory effect. The study uses questionnaires and statistical analysis to carry on the investigation, involving about 189 employees and their immediate supervisors, and the conclusions are as follows: supervisors' power distance negatively predicts employees' generation of innovative idea; supervisors' power distance positively predicts employees' implementation of innovation ideas; and leader-member exchange moderates the relationship between power distance and employee innovative behavior. This study discusses the practical significance of leader-member exchange in power distance and employee innovative behavior.

Key words: Power distance; Employeeinnovative behavior; Leader-member exchange; Innovative ideas

1 Introduction

With the arrival of the knowledge economy and the increasingly fierce market competition, innovation has become the internal demand and external driving force for the development of the enterprise[1]. The employee innovation behavior has been the cornerstone of organizational innovation and has received extensive attention from domestic and foreign scholars. However, in the past, the research on innovation behavior did not systematically examine the impact of the power distance within the organization on employee innovation behavior. Power distance as a cultural value can affect the attitude of the leader or employee. According to the attitude-behavior consistency theory, the attitude must determine corresponding behavior. Researchers have pointed out in the latest research that power distance, as a cultural value orientation, can have a significant impact on employees' work attitude and behavior. This research attempts to promote the research on effect of the power distance on employee innovative behavior in China. In addition, innovative behavior requires organizational personnel to cooperate with superiors and superiors. This article is based on China's situation and introduces a leader-member exchange (LMX) to explore whether this variable can affect the relationship between power distance and employee innovation. This research explores the power distance from the individual level and defines the power distance as the individual's acceptance of the unequal distribution of power and status in the organization.

2 Theoretical Basis and Hypothesis

2.1 Power distance and employee innovative behavior

The concept of power distance was first proposed by the Dutch management psychologist Hofstede[2]. Later, the scholars found that even in the same culture, there are differences in the power distance of organizations or individuals. Therefore, the study of power distance has gradually expanded to the organizational and individual level. Clugston et al. define the individual-level power distance as the individual's acceptance of power inequality organizations and institutions. Supervisors high on power distance will continue to elicit employees to engage in submissive roles, frustrating employees' efforts to exert their own power(Kiesler, 1983; Shechtman & Horowitz, 2006). Supervisors low on power distance are more likely to consult with their employees before making decisions (Cole, Carter, & Zhang, 2013), share power, and allow employees to make autonomous choices (Earley & Erez, 1997).

Personal innovation behavior refers to the novel ideas that can be applied to the practice during the work process, as well as a new way to solve the problem (Amabile, 1987). In recent years, scholars have more defined employees' innovative behavior from the perspective of the process. The simplest is a two-stage model. Lu Xiaojun et al. found that individual innovation behavior is divided into creative generation behavior and creative execution behavior[3]; more detailed divisions such as Kanter think that innovation behavior is divided into a three-phase process. This research refers to Robert and

Christopher's point of view, defines the employee innovative behavior as the employee's plan for generating innovative ideas or solving problems in the work process, and strives to put it into practice. It consists of two stages: the creation of innovative ideas and the implementation of innovative ideas. The creation of an innovative ideas means that individual seeks and discovers opportunities for innovation in order to enhance the organization's products, technologies, work processes, and services. The implementation of innovation ideas mean that individuals mobilize resources, persuade and influence others to support innovation, and regularize innovation into the daily operation of enterprises through their efforts[4].

The relationship between power distance and employee's innovative behavior: Researchers have put forward the negative correlation between power distance and the generation of creative idea[5], because individuals with high power distances cannot treat others equally, which inhibits members in creative idea creative level[6]. However, due to the need to focus and control resources during the implementation phase of the creation idea, and then ensure that the viewpoints are quickly put into practice and converted into new products, only a high power distance can promote the completion of this process. Given these arguments, this research proposes that:

Hypothesis 1: There is negative relationship between power distance of supervisor and creation of employees' innovative ideas.

Hypothesis2: There is positive relationship between power distance of supervisor and implementation of employees' innovative ideas

2.2 Leader-member exchange

In the 1970s, Graen et al. pioneered the leadership-member exchange (LMX) based on exchange relations (Dansereau et al.,1976). Leadership-member exchange theory refers to a leader's corresponding to a subordinate, and a unique relationship formed between leader and subordinate in work practice and represents the quality of their social exchange relationship. LMX makes it easier for employees with good relationship with supervisors to obtain superior support and resources, so they will work harder and take on more tasks to not live up to the trust of their leaders, which weaken the negative effect between power distance of supervisors and creation of employees' innovative ideas. Besides, it strengthens the positive effect between power distance of supervisor and the implementation of employees' innovative ideas. Based on upon, this research proposes that:

Hypothesis 3: leader-member exchange moderates the relationship between power distance of supervisor and employee innovative behavior.

Hypothesis 3a: leader-member exchange moderates the relationship between power distance of supervisor and creation of employees' innovative ideas.

Hypothesis 3b: leader-member exchange moderates the relationship between power distance of supervisor and implementation of employees' innovative ideas.
Figure 1   The Research Model

3 Method

This research uses the literature method to review the theory and practice of power distance, employee innovation behavior, and the up and down leadership-member exchange relationship. It gradually builds the conceptual model and research hypotheses, designs questionnaires, and conducts empirical research.

Supervisors indicated their power distance using the individual-level power distance scale developed by Dorfman and Howell[7]; Employees indicated their innovation behavior using the Kleysen and Street two-stage model developed by Huang Zhikai et al., which is more suitable for China's

situation. A total of 12 item scales were revised into five grades that were self-assessed by employees; For LMX using LMX-7 scale (1=Strongly Disagree to 5=Strongly Agree) developed by Graen and Uhl-Bien (1995) and contained seven items.The scale has been validated with good reliability in studies in the Chinese context. Additionally,this research controlled Investigator's age, education, andgender.

4 Results

Theresearch conducted an online questionnaire to collect data from the company's superiors and employees. 207 questionnaires were collected, and 189 valid questionnaires were collected. Prior to testing our hypotheses, we conducted a conducted exploratory factor analysis，confirming that our scales were distinct, and all items provided statistically significant loadings on their intended latent constructs.

Table 1 is the correlation coefficient of each variable. Results of the regression analyses are reported in Table 2. In model 2, independent variables (β=-.446, P<0.01), LMX was added to model 3, and independent variables (β=-.471, P<0.01). After adding interactive items to Model 4, the main effect independent variables (β=-.422, P<0.01). As a result, Hypothesis 1 was supported.

Nest, In model 6, independent variables PD（β=.903,P<0.01, LMX was added to model 7, and independent variables（β=.885,P<0.01）. After adding interactive items to Model 8, the main effect independent variables（β=.897,P<0.01）As a result, Hypothesis 2 was supported..

Further, After adding the PD×LMX interaction term in model 4, the explanatory power was improved (ΔR^2=0.112, ΔF=30.985, P<0.01) and the coefficient in front of the interaction term was positive and significant. Thus, as a result, Hypothesis 3a was supported. After adding the PD×LMX interaction term in model 8, the explanatory power was improved (ΔR^2=0.004，ΔF=4.250，P<0.05),and the coefficient in front of the interaction term was positive and significant. Thus, as a result, Hypothesis 3b was supported.

Finally, as shown in Figure 2, the level of LMX will moderating the relationship between power distance and employee innovation behavior.

Table 1　Variable Descriptive Statistics and Correlations

Figure 2   LMX Moderation

5 Conclusion

First, the power distance negatively influences creation of employees' innovative ideas and positively predicting the implementation of the employee's ideas of innovation. Second, the leadership-member exchange can strengthen the relationship between power distance and creation of employees' innovative ideas, and ease the relationship between power distance and implementation of employees' innovative ideas.The findingshighlight the important effect of power distance and leadership-member exchange between supervisors and employees, andsuggest that enterprises should pay more attention to relationship culture and strengthen vertical communication in organizations. This study rarely involves higher-level superiors, and relevant research hypotheses can be tested on a larger scale in the future.

A Membership Program and a Complain Website: How Sport Clubs Manage Experiences of their Members

Christian Gomes e Souza Munaier, Alexandre Luzzi Las Casas, Arnoldo de Hoyos Guevara
Pontifícia Universidade Católica de São Paulo – PUCSP
(E-mail: christian@4goal.com.br, alacasas@terra.com.br, dehoyos@pucsp.br)

Abstract: To win and keep fans, the football clubs maintain programs of advantages, also called Loyalty Programs. These programs have gained importance for the finances of the institutions existing in Brazil, in fact 73 associations that have already created their programs, raising 1,301,339 consumers. However, these programs do not always meet the expectations of the fans. The purpose of this study was to analyze the level of satisfaction and attendance of their complaints by the institutions involved in Loyalty Programs. Six programs were analyzed from the perspective of service marketing and customer satisfaction-supporter management. The study considered the proposals of the specifics programs and collected data on complaints and solutions given on the "ReclameAqui" (Complain *Here*) website. One of the results is that among the clubs studied, Atlético-MG, Corinthians and Palmeiras showed the best results in their efforts to solve problems.
Key words: Football; Loyalty programs; Service marketing; Reclame Aqui(Complain Here)

1 Introduction

Providing services is to have, as the ultimate goal, customer satisfaction through the interaction of several layers of business relationship. Satisfaction with the product, if the service in focus is linked to some material good, satisfaction with the way the service is rendered, regardless of whether it involves a product or not, satisfaction with the price and advantages identified in the transaction. "The American Marketing Association defines services as being activities, advantages or even satisfactions that are offered for sale or provided in connection with the sale of goods (Las Casas, 2015). And to provide these services with the target audience, the passionate about football (soccer, in USA) is even more complex, as it aims to meet the demands of products or amenities

To enhance their business relationship with their potential customers, clubs have created their benefit programs, which have been acquired and evaluated by fans thereafter. Online forums are already consolidated as democratic and effective tools for consumers to express their impressions about experiences in post-consumerism. The theme of this article is the management of customer satisfaction and we investigated the Advantages Programs of 6 major clubs of the Brazilian Championship Series - namely: Flamengo-RJ, Corinthians-SP, Palmeiras-SP, Atlético-MG, Cruzeiro-MG and Botafogo-RJ - and the degree of satisfaction registered by the consumer via the site "ReclameAqui", a portal that receives 15 million accesses per month.

The objective of this study is to verify if there is a correlation between management of unsuccessful experiences of members of the benefit programs of the clubs under analysis and the number of members in each of them, as well as the desire of the consumer to continue doing business with the clubs after experience. As unsatisfied supporters can cancel their participation, it is assumed that those who remain in the program are having their expectations met.

Initially, we will describe the concepts about services marketing, football and the financial volume generated by sports in Brazil. Then, we will collect the post-consumer complaint data from 6 advantages programs of Brazilian clubs, data obtained on the "ReclameAqui" website. Finally, we will try to analyze which clubs are the best that relate to their members, which ones relate worse and if the good or bad business relationship impacts on the desire of its members to continue in the Program.

The contribution of this article is to reveal which clubs are really concerned about the satisfaction of their fans and propose alternatives to improve this relationship. Although some studies have already analyzed the site ReclameAqui, there is no one specifically directed to the satisfaction of the fans that belong to the Programs Sócio-Torcedor (Fan Member).

2 Theoretical Framework
2.1 The football business in Brazil

Despite an elitist beginning of football in Brazil, restricted to the highest castes of society in the early 20th century, football became extremely popular among Brazilians, becoming the most practiced sport by

Brazilian men (IBGE, 2017) and motive of enormous passions. A five-time FIFA World Cup Champion, the Brazilian national team is recognized as one of the world powers. Sports marketing sponsored around R $ 665 million in 2013 (Souza, 2014), "confirming football as the mode that receives the most money in the country, concentrating 68% of the funds invested by the sponsors in the year" (p. 10).

2.2 The most popular teams in Brazil

According to survey conducted by the IBOPE Research Institute, it is possible to measure the number of Brazilian affiliations to their clubs. In the ranking of the fans, Flamengo, Corinthians, Sao Paulo, Palmeiras, Vasco, Atlético-MG, Cruzeiro, Grêmio, Internacional and Santos appear as the ten associations with the biggest fans of Brazil (2017), as shown in table 1. This institute organizes the digital ranking of the clubs, taking into consideration the relevance of the digital accounts of the associations and how many followers in the social media online universe, as we see in figure 1. Note some inversions of placement in the digital ranking in relation to the ranking of the number of fans, including the placement of Chapecoense among the ten most relevant clubs digitally even that the club from Santa Catarina does not appear among the 15 biggest fans group. The commotion generated by the tragedy that occurred in December 2016, when the plane that took Chapecó-SC's team to Colombia for the South American Cup final crashed, produced a genuine empathy for the Brazilians to the *Arena Condá* team.

Table 1   The 15 clubs with the Largest Number of Fans in Brazil

1	Flamengo	32.5 million
2	Corinthians	13.6 million
3	São Paulo	27.3 million
4	Palmeiras	10.6 million
5	Vasco	7.2 million
6	Atlético-MG	7 million
7	Cruzeiro	6.2 million
8	Grêmio	6 million
9	Internacional	5.6 million
10	Santos	4.8 million
11	Fluminense	3.6 million
12	Bahia	3.4 million
13	Botafogo	3.4 million
14	Vitória	2.6 million
15	Sport	2.4 million

Source: IBOPE 1(2017)

Figure 1   Digital Ranking of Fans
Source: IBOPE 2 (2017)

2.3 'Socio' membership program

The great Brazilian football clubs have created their relationship programs with their fans, offering them solutions and facilities in the purchase and guarantee of ticket purchases, as well as financial advantages and amenities in the consumption of products and services of commercial partners of the clubs. The website "Movement for a Better Football" (*Movimentopor um FutebolMelhor*, in Portuguese) brings together the member-fan programs of 73 Brazilian clubs, adding, according to the portal itself, 1,301,339 registered members. Each club administers the program itself. The ranking updated in June 2018 is presented in table 2.

Table 2 The top 15 Clubs in Membership Numbers		
1	Corinthians	142.575
2	Palmeiras	124.845
3	São Paulo	123.555
4	Internacional	120.616
5	AtléticoMineiro	112.756
6	Cruzeiro	109.679
7	Sport Recife	78.774
8	Flamengo	43.277
9	Fluminense	43.250
10	Botafogo	37.095
11	Coritiba	36.106
12	Vasco Da Gama	28.516
13	Santos	25.112
14	Remo	24.748
15	Ponte Preta	21.664

As maintained by Martins and Las Casas (2017), the club loyalty program promotes the consumption incentive for the rewards offered to affiliated supporters and provides insight into the fan profile of their fan and allows for enhanced financial planning with other sources of revenues from the club's business relationships between partners and partners. "It is reasonable to consider that the loyal supporter follows the club more through the media, attends more regularly at the stadium, is more exposed to sponsor brand communications and club product offerings, and provides data needed for use in other clubs marketing actions "(pp. 48-49)

Source: Por Um Futebol Melhor website

2.4 Service marketing and ReclameAqui website

Basic rule of any Service Marketing manual is the conviction that it is up to the company to meet the needs of customers through their products or services. And monitoring the degree of customer satisfaction or dissatisfaction, learning why your customers abandon their services or consuming their products can enable new strategies and increase delivery. Jato, Lucas, Farina, Tentrin and Garcia (2008) show that consumers, once dissatisfied, can act in different ways.

"(1) Complain with the store or the manufacturer; (2) stop buying the brand or store; (3) promote negative word of mouth communication; (4) complain to private or governmental bodies; and (5) initiate legal proceedings "(p.65)

At the time of the aforementioned study, the Internet revolution was taking its first steps and the word of mouth complaint, listed as item number 3, had not been typified in the form of online complaints. The option of complaining in the store or with the manufacturer was a tendency to appeal at first, before leaving to buy the product. Discussion forums, complaints and compliments are in the online environment, and are available democratically and accessible from a few clicks. And if there is the consumer registering their experiences with the companies, there should also be service providers and suppliers, set to the online universe or not. Customer relationship capabilities in this new arena can be instrumental to the success of these operators in this new phase of Relationship Marketing. The portals designated for the interactions between consumer complaints and the company's response opportunity gave a strong voice to the people.

The ReclameAqui site does not qualify as a complaint site. It is presented as a search site. And he believes that 92% of Internet users who access www.reclameaqui.com.br do so to evaluate the company before making the purchase. The data of access to the site are registered in Table 2 and give the dimension of the importance of such spaces have for the current relations between consumers and companies.

Table 2   Data Collected From the Site ReclameAqui

42,000,000	Page views/ monthly
3'11"	Visiting time on site
56%	Male audience
44%	Female audience
15,000,000	registered consumers
120,000	Companies registered

Source: site ReclameAqui

The site presents its way of evaluating and punctuating the companies through a criterion with factor as defined in Table 3:

Table 3   Distribution of Factor Per Site Elements

Response Rate	Factor 2
Average Ratings (Consumer Rating)	Factor 3
Solution Index	Factor 3
New Business Index (Would you do business again?)	Factor 2

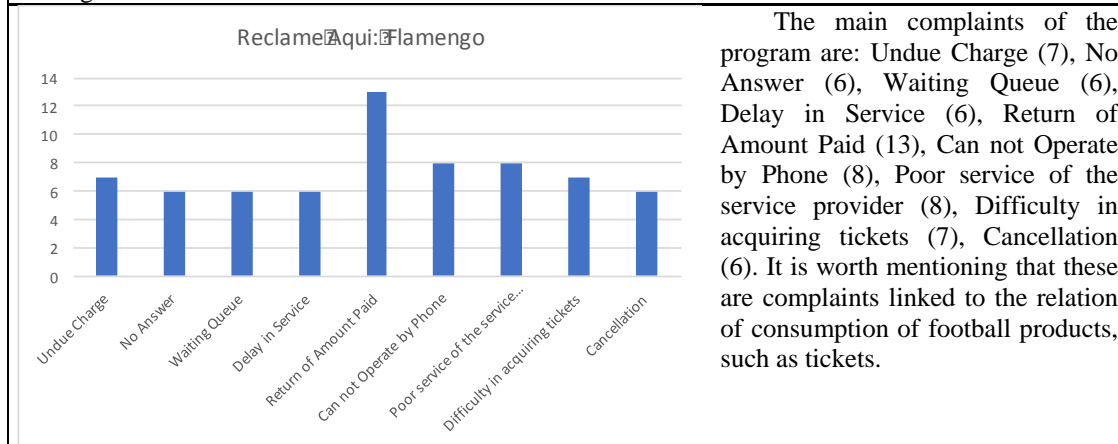
Source: Site of Reclame Aqui

Thus, up to 10 points per company are distributed, being rated as "optimal" the company that reaches between 8 and 10, 'good (between 7 and 7.9),' regular '(between 6 and 6.9),' bad '(between 5 and 5.9), and' not recommended 'for all those who score below 5. "This formula is only applied if the company goes through 2 previous evaluations: it has a response rate higher than 50%. If you have a response rate of less than 50%, it is automatically categorized as "not recommended", says the site.

3 Selection and Presentation of Observed Programs

Six professional men's football clubs from 3 different states were selected. All of them with huge crowd. Flamengo and Corinthians are named by IBOPE 1 (2017) as the most popular clubs in Brazil. We saw, in figure 1, the digital ranking of Brazilian clubs prepared by IBOPE 2 (2018). "The survey is published monthly by IBOPE Repucom and aims to follow the development of the digital bases of 40 clubs with the largest number of followers in the country." Flamengo, Corinthians, Palmeiras, Cruzeiro, Atlético and Botafogoappear, in this order, among the 13 first placed in the ranking. In their respective Fan Programs, the six teams have different IBOPE 1 (2017) and IBOPE 2 (2018) rankings. In Minas Gerais, Atletico has more affiliates than Cruzeiro. Both have more successful Socio-supporter programs than Flamengo, the most popular club in Brazil. Flamengo maintains the lead of its regional rival, Botafogo. Among the clubs analyzed here, Botafogo is the only one that maintains the same performance in the three rankings: the worst. The data of the clubs' relationship programs with their supporters will be observed below in the order of their ranking in IBOPE 1 (2017).

3.1 NaçãoRubroNegra – Flamengo

Review Period: 6/23/2015 to 6/22/2018	Complaints: 211
Complaints answered: 0%	Average response time (in hours): missing
Would do business again: 23.8%	Solution index: 28.6%
Rating: 1.62	


The main complaints of the program are: Undue Charge (7), No Answer (6), Waiting Queue (6), Delay in Service (6), Return of Amount Paid (13), Can not Operate by Phone (8), Poor service of the service provider (8), Difficulty in acquiring tickets (7), Cancellation (6). It is worth mentioning that these are complaints linked to the relation of consumption of football products, such as tickets.

Figure 2   Complaints of the NaçãoRubroNegra

3.2 FielTorcedor – corinthians

Review Period: 6/23/2015 to 6/22/2018	Complaints: 862
Complaints answered: 84%	Average response time (in hours): 1039
Would do business again: 68.3%	Solution index: 72.4%
Rating: 5.87	
Figure 3　Complaints of the FielTorcedor

The main complaints of the program are: Return of the amount paid (24), Off-air site (16), Problems with completing the purchase (49), Misleading advertising (35), Poor service in SUPPORT (17), I cannot cancel (27), Duplicate collection (12), Login-Password (79), Wrong product (13), Registration difficulty (35). As the main reasons for complaint, this program has technological deficiencies, such as site, registration and login.

3.3 Avanti palmeiras – palmeiras

Review Period: 6/23/2015 to 6/22/2018	Complaints: 1,169
Complaints answered: 100%	Average response time (in hours): 249
Would do business again: 62.6%	Solution index: 71%
Rating: 4.88	
Figure 4　Complaints of the Avanti Palmeiras

The main complaints of the program were: Wrong product (13), Problems in completing the purchase (51), Login-Password (18), Queue to access the site (17), Poor service in SUPPORT (38), Double charge (16), Difficulty in acquiring tickets (14), I can not cancel (17), Misleading advertising (79), Offsite - Slow (32). Complaints regarding technology tools (websites, duplicate charges), and dissatisfaction with the consumption of football products, such as tickets, appear.

3.4 Galo na veia – atlético-MG

Review Period: 6/23/2015 to 6/22/2018	Complaints: 405
Complaints answered: 98%	Average response time (in hours): 1,106
Would do business again: 75%	Solution index: 83.5%
Rating: 6.97	
Figure 5　Complaints of the Galo naVeia

The main complaints of the program were: Off-air site - Slow (10), Problems in completing the purchase (21), Misleading advertising (13), Delay in execution (9), I can not cancel (17), Login Password (13), Poor service of the service provider (7), Reimbursement of the amount paid (13), Quality of service rendered (9), Duplicate collection (5). Higher prevalence of problems in interaction with technology and perception of the value of service delivery.

3.5 Sócio do futebol – cruzeiro-MG

Review Period: 6/23/2015 to 6/22/2018	Complaints: 104
Complaints answered: 1%	Average response time (in hours): 265
Would do business again: 29.4%	Solution index: 29.4%
Rating: 2.82	

The main complaints of the program were: Wrong product (2), Poor service provider service (5), Quality of service provided (6), Abusive value (5), Improper billing (3), Non-compliance with marked places (1), Reversal of amount paid (4), Low quality (3), Difficulty in acquiring tickets (3). It is worth registering that the search in the *ReclameAqui* was with the term "CruzeiroEsporteClube", because "Sócio do Futebol" does not generate any result

Figure 6   Complaints of the CruzeiroEsporteClube

3.6 SouBotafogo – botafogo-RJ

Review Period: 6/23/2015 to 6/22/2018	Complaints: 58
Complaints answered: 3.4%	Average response time (in hours): 90
Would do business again: 0%	Solution index: 0%
Rating: 0	

The main complaints of the program were: Delay in service (1), Quality of service provided (2), Misleading advertisement (2), Poor service provider service (2), Improper billing (1), Reversal of amount paid (5), Freight amount (1), Cancellation (3), Does not attend (1), Delay in execution (2). It is worth registering that the search in the Reclame Here was with the term "BotafogoFutebol e Regatas", because "SouBotafogo" does not produce any results.

Figure 7   Complaints of the Botafogo de Futebol e Regatas

Overall is possible observe that most problems identified by the supporters are connected with technological aspects and return of amount paid. Another recurrent claim is about service qualities. Even that those datas are important it is required to analyze the alternatives solutions taken by the clubs.

4 Data Presentation and Quantitative Analyzes

Table 4   Data collected for this article

CLUB	Number of Affiliates	Market Share	Rating *ReclameAqui*	% Complaints Answered	Solution Index	Response Hours	Would Do Business (%)
Atlético	112756	1.61%	6.97	98	83.5	1106	75
Botafogo	37095	1.09%	0	3.4	74.9	90	0
Corinthians	142575	1.05%	5.87	84	72.4	1039	68.3
Cruzeiro	109679	1.77%	2.82	1	29.4	265	29.4
Flamengo	43277	0.13%	1.62	0	28.6	*	25

The Minitab 2018 program was used for data analysis and treatment. Table 4, shows the data still "in natura", where we can observe the absence of the "Hours for the response" data of Flamengo-RJ. This "Missing Value" will be treated as recommended by Las Casas and Guevara (2010), initially placing the average of the indicator in the programs and then promoting statistical regression. Then, data before doing the regression data were normalized and positivized (from "Hours for response" to "Speed in response"), as could be seen in Table 5.

Table 5 Descriptive Statistics: Number of Affiliates, Market Share, Rating ReclameAqui, % Complaints Answered, Solution Index, Response Speed, Would Do Business Again (%)

Variável	N	N*	Média	EP Média	DesvPad	Mínimo	Q1	Mediana	Q3

Response Speed	100,0
Would Do Business Again (%)	100,0

4.1 Analysis of variable groupings

Figure 8 allows us to see at what level of similarity the clusters are formed, and the composition of the clusters of the final partition. The dendrogram indicates the variables degree of similarity. Group 1 showing highest degree of similarity.

Table 6 Analysis of Variable Groupings: Number of Affiliates, Market Share, Rating ReclameAqui, % Complaints Answered, Solution Index, Response Speed, Would Do Business Again (%)

Step	Number of Groupings	Level of similarity	Level of distance	Grouped	New grouped	Number of obs. at the new grouped		Final Partition	Variables
1	6	99,4010	0,01198	3	7	3	2	Grouping 1	Number of Affiliates, Rating ReclameAqui, Complaints Answered, Would Do Business Again
2	5	94,7799	0,10440	3	4	3	3		
3	4	87,9436	0,24113	1	3	1	4		
4	3	65,7290	0,68542	2	5	2	2	Grouping 2	Market Share, Solution Index
5	2	64,7639	0,70472	1	2	1	6		
6	1	7,6917	1,84617	1	6	1	7	Groupings 3	Response Speed
Figure 8 Dendrograma of the Groups of Indicators

It is noticeable in all programs that attending customer discontent is not a priority. Therefore, the indicators observed here have a very low correlation with the waiting time of the customer dissatisfied in obtaining their return. This situation will be considered in the conclusions of this article. In the same way, the percentage of fans of the Membership Program of its club (Market Share) also presents low correlation

to the other items, as well as "solution index". Table 7 shows statistically the strong correlations between the indicators analyzed.

To analyze the correlation between the selected indicators, the "Pearson Correlation" will be used.

Table 7   Correlation: Number of Affiliates, Market Share, Rating ReclameAqui, % Complaints Answered, Solution Index, Response Speed, Would Do Business Again (%)

	Number of Affiliates	Rating ReclameAqui	Complaints Answered
Rating ReclameAqui	0,860		
	0,028		
Complaints Answered	0,759	0,896	
	0,080	0,016	
Would Do Business Again	0,853	0,988	0,919
	0,031	0,000	0,010

The results are interpreted as follows:
● 0.9 for more or less indicates a very strong correlation.
● 0.7 to 0.9 positive or negative indicates a strong correlation.
● 0.5 to 0.7 positive or negative indicates a moderate correlation.
● 0.3 to 0.5 positive or negative indicates a weak correlation.
● 0 to 0.3 positive or negative indicates a negligible correlation

As could be seen correlation between " Complaints Answered " and "Number of Affiliates" is lowest a not very precise (p=0.080).

5 Analyzes, Conclusions and Limitations

As shown in Figure 9, Atlético, Corinthians and Palmeiras (in this order) present a better relationship in the correlation between the rating received on the site "ReclameAqui" " Complaints Answered ". And this observation leads us to look at Figure 10, which records the same strong correlation between " Complaints Answered " and "Would You Do Business Again" with your club. For Keller and Kotler (2006), the number of clients who experience a negative experience and who can do business again with the company, provided that their complaints are answered, is between 54 and 70%. "The percentage rises to astonishing 95% if customers feel that the complaint was answered quickly" (p. 153). When they published the book, they argued that clients talked to five people on average about the good treatment they received from the company that solved the problem. Today, experiences are shared for as many people as the customer has in their network of virtual relationships.
Figure 9 Rating ReclameAqui X Complaints Answered	Figure 10 Complaints Answered X Would You Do Business Again

It is important to point out that Cruzeiro, Flamengo and Botafogo cannot exonerate themselves from responsibilities or from ignorance of the best uses of Internet communication channels. The three clubs with the worst performance in terms of unsatisfied customer interaction are protagonists in social media. Their accounts have, adding Facebook, Twitter, Instagram and Youtube, millions of followers, as seen in figure 1. Who has the online prominence that these clubs have, not giving satisfactory return to their complaining consumers can be seen as a commercial negligence.
Figure 11   Number of Affiliates X Would You Do Business Again

Figure 11 correlates the number of affiliates of a program to the perception of the internet users who has had their complaint answered by the club in the site ReclameAqui. The relation cause X effect does not allow such direct association. But here is the note: the clubs that knew best how to deal with complaints from their members are the ones with the best performance in terms of membership. Neglect has its price.

The loyalty of the fans and the commercial experiences lived between them and their club seem to have different dimensions. The customer may complain about the post-consumer experience and wish to cancel the purchase. However, the supporter will hardly leave his heart club for a disappointment, even more if it comes from an unsuccessful purchase. Espartel, Müller Neto and Pompiani (2009) analyzed through qualitative (exploratory) and quantitative research, and found that, "although the fan is satisfied with the site, the stores and the sponsor, are the factors 'from within of the field' (players and team performance) that trigger this sequence of relationships. In other words, the management and the structure developed by the clubs are important, but the victories and the titles won are that bring the supporters closer to the club (...). The constitution or representation of loyalty in this way is confirmed, for example, by the motivations to be a partner: the formal approach (being a partner) between the supporter and the club is mainly because of love or passion for the club and to help it grow" (p. 76).

This study shows that neglecting of returning of unhappy supporters is already starting to cause a breach of confidence in the club's advantages program. Although it is not possible to measure the correlation between the little case in the return to the dissatisfaction and bad experiences of its fans and the growth or fall of the number of affiliates - and this is one of the limitations of this article and suggestion for other researches -, it is possible to observe that the love of the shirt does not prevent that consumers feel betrayed in their confidence in the consumption, they complain publicly and they wish to cancel their commercial links with the club, as could be seen on the desires of cancellation, or else with the program of the club in the site ReclameAqui.

If it is not possible to affirm that the low performance of clubs like Flamengo and Botafogo as to the number of affiliates in their advantage programs is due to the negligence found in this study, it is possible to affirm that the clubs with the best performance among those observed here are the ones that have the most effective channels of communication with clients whose experience has been unsuccessful, and this is a managerial contribution of the study: expectations of the customers of the partner-fan programs can be frustrated in the numerous interaction alternatives, be it in the purchase of tickets, access to the site, in the delayed delivery of a product purchased or in the contact via SUPPORT to request some service. It is part of the service, as intangible, as perishable and heterogeneous. But the club that really cares about the return to the client will be able to get even closer to it, generating not only emotional fidelity (not the subject of our study) but, rather, commercial loyalty.

Being in the network, attentive to the demands and interacting with the consumer, is not only a trend, being intrinsically linked to the current social force. For Guedes and Silva (2016), "this environment leads organizations to review their communication policies and relationships with their stakeholders" (...). Living online is a reality that organizations cannot avoid "(page 63).

The fact that only one portal of post-consumer analysis is one of the limitations of the study and suggest to follow the study. Field surveys with consumers who are members of benefit programs could be produced at stadiums, at the time of purchased facilities, such as tickets to matches. And a field survey on the value perception of the club loyalty program could be done before and after the game may help to assess how much the match score interferes with the value given by the consumer to the program.

Exploring the Use of Consumer Endorser Strategy in Social Media Product Promotion Advertisement and Its Impacts on Young Consumers Behavior in Tanzania

Salimu Abushiri Jinyevu, Victoria Lucas Mkonya, Maria Lourdes Dantur
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(Email: salb90@yahoo.com, vmkonya@yahoo.com, lourdesdantur@gmail.com)

Abstract: The paper focuses on examining the use of consumer endorser as a strategy for product promotion advertisement on social media and the extent to which it affects young urban consumer behaviors in Tanzania. Using AIDA model and Characteristics of the source model, the conceptual model was designed and empirically tested using self monitored questionnaire. The results of the study shows that awareness, interest and desire have positive significance effects on both expertise endorser and trustworthiness characteristics but shows no significance with intention to buy the product. Moreover, awareness, interest, desire and intention to buy shows positive significance with endorser attractiveness characteristics. The study recommended the use of consumer endorser strategy as an effective tool for advertisement among young customers between the age of 18-25 as part of Managerial implications related to the study findings. Furthermore, future research direction has been drawn on employing a wider sample to test the effectiveness of other consumer endorser characteristics such as consumer endorser-product congruency but also on considering non convenient sample such as adults and rural consumers.
Key words: Consumer endorser; Social media; Impacts; Advertisement; Behavior

1 Introduction

Globally, the emergence of internet has influenced the transformation of the way product promotion advertisements are conducted, from traditional to modern ways. In recent years, social media usage has rapidly increased especially among young consumers who are more tied to new technology. An increasing popularity of social media and online marketing channels have become potential strategic tools to influence consumers (Truog&Simmons, 2010). It is argued that there is a reasonable number increase in the use of consumer endorser in social media advertisement due to the emergence of social media (Nhung, N.P et al, 2011). Social media affects consumer behavior and attitudes. When a product campaign ad features consumers to advertise and promote the endorsed product, the targeted audience are impacted both their attitude and behavior toward that product or a brand.

From Tanzania environment, the ICT revolution has knocked the door on how promotion is done in a new technology way especially the enhanced use of internet and the introduction of social media in early 2000's. before 2000's Celebrities were used in traditional media as endorsers but the paradigm shifted with the introduction of social media where by those who are not celebrities have also been used as endorsers. In Tanzania there is a literature gap as most previous studies focus only on celebrity endorsement and neglecting to research on the role the of non celebrity endorsers. This research seeks to fill the literature gap based on Tanzania perspective.

Moreover, the use of celebrity endorser has been criticized to cause lack of trust to customers when the same celebrity used in many different advertisements (Yashin,1998) and thus past literature suggested the use of non-celebrity endorser, however the question arise on how the consumer endorser characteristics affects consumer behavior. From the author's knowledge, currently there is no existing research in Tanzania context that provides deep insight about the impacts of consumer endorser characteristics on consumer behavior. Therefore, this research seeks at answering the research question that how the use of consumer endorser strategy in product promotion in social media affects consumer behavior?

2 Literature Review

In recent years the concept of consumer endorsers has been widely used especially with the advancement and birth of social media such as YouTube, Facebook, WhatsApp and many more. Social media has been widely used by customers as an information center for customer to get to know the product and gather as enough information as possible before they make a purchase decision (Lempert 2006).

According Friedman & Friedman (1979) have mentioned three major categories of endorsement which are celebrity endorser, consumer endorsers and expertise endorsers. In many previous researches celebrity endorsers have received much attention among many researches especially in traditional media but consumer endorsers received less attention (Natarajaan&Chawla,1997; Gaided&Rached,2010; Nhung, N.P et al,2011). In a global context very few studies have extensively dealt with consumer endorsers on social media. However, from the researcher's knowledge, there is no research found to be done in Tanzania market that intensively and specifically dealt with consumer endorsers in social media, therefore creating a research gap which this paper seeks to fill.

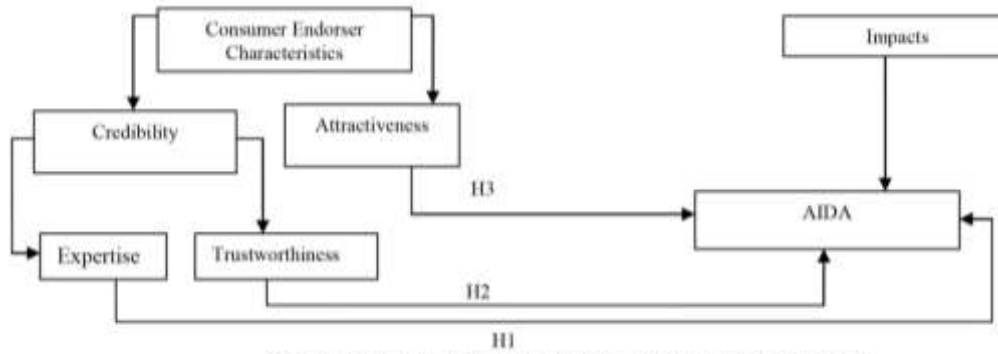
Consumer endorser can be referred to as any normal person who is non celebrity and without any prior knowledge of the product endorsed with but has just acquired that knowledge through experience of using the particular product (Friedman &Friedman, 1979).

Other studies argued that endorsers play a great role in shaping consumer behavior by creating a positive attitude on advertisement (Ohanian, 1991; Erdogan,1999, Marinov, 2007), creating and promoting brand awareness (Freberga, Graham, Mc Gaughey&Freberg,2014). Some other comparative studies have compared consumer endorser with celebrity endorser and come up with the views that celebrity endorser has more influencing power to attract consumer's attention and therefore establishing a positive feeling to consumers than non celebrity endorsers (Forouhanded et al, 2011; Liu et all, 2017, Ranjabarian et al, 2010; Erdogen, 1999). On the other hand, Belch & Belch (2009), Shimp (2000), urge that consumer endorser have influential power in enhancing and creating high level of credibility and sincerity to the product promoted.

In criticizing the use of celebrity endorsers Yeshin (Yeshin, 1998) put forward a different view point that consumers lack trustworthiness and truthfulness to celebrity endorsers when they are endorsed in multiple products or brands at the same time. Since fame does not last forever, it is likely that the indorsed brand may not perform well and loose its market performance when celebrities endorsed loses their popularity. With reference to this views, there is ambiguity in using consumer endorser (non celebrity endorser) especially on social media and therefore call for the need of an extensive research to unveil this ambiguity. This study has centered the focus to unveil the ambiguity.

Other literatures argued that the use of consumer endorser may led to enhancement and creation of higher degree of both credibility and sincerity (Belch&Belch,2009; Shimp 2000). This view is ambiguous and may rise a question as to what are the consumer attitude towards consumer endorser and what impact may it have on the advertisement with specific consideration of social media context.

3 Conceptual Frame Work and Hypothesis Development
3.1 Conceptual frame work

This study uses the AIDA mode (Awareness, Interest, Desire, Action/Intention to buy) derived from DAGMAR (Defining Advertising Goals for Measured Results) by Colley (Colley, 1984) as cited by Farouhandeh et al (Farouhandeh et al, 2011). Also the Kelman (Kelman, 1961) model on Characteristics of the source. Two models used to find the impact of the characteristics of the endorsers on the AIDA. According to the source characteristics model, Kelman (Kelman, 1961) assert that characteristics of the endorser influence consumer attitudes and behavior (action). The endorser characteristic can be categorized into two namely credibility and the attractiveness of the endorser. Credibility is the extent that a consumer put and perceive the endorser as trusted source with knowledge and enough information about the endorsed product. Thus credibility can be sub grouped into two namely Trust and expertise. Moreover, the attractiveness is related to social value, the social appearance, the likeability and familiarity of the consumer endorser to consumer. Attractiveness do affects the effectiveness of the content transmitted in social media channel and in turn affects consumer behavior. On the other hand, to study the impact of featuring consumer endorser on social media, the AIDA model is used to measure the relationship and extent to which the characteristics of the endorser affects AIDA.


Note: A=Awareness, I=Interest, D=Desire, A=Action /Intention to Buy
Figure 1   Conceptual Model

3.2 Hypothesis

From the conceptual model, the following hypothesis derived.

According to Nhung, N.P et al (Nhung, N.P et al, 2011) argued that when an endorser shows expertise characteristics it affects consumer attitude and behavior therefore the author hypothesizes that H1: Consumer endorser's expertise has a positive impact on awareness, interest, desire and intention to buy the product.

When consumers think that the endorser demonstrate a trustworthiness characteristic, this may have an impacts on all or some level of AIDA. Nhung, N.P et al, (Nhung, N.P et al, 2011) argued that trust may have impacts on effectiveness of the advertisement and consumer behavior. Therefore, the author hypothesizes that H2. Consumer endorser's trustworthiness has a positive impact on awareness, interest, desire and intention to buy the product.

The personality and attractiveness of the endorser are viewed by some previous researches to have an impact on consumer attitude and behavior (Atkin & Block, 1993 as cited by Nhung, N.P et al, (Nhung, N.P et al, 2011). The advertisement with an attractive endorser is hypothesized to be more effective than with a normal personality endorser, therefore, H3. Consumer endorser's attractiveness has a positive impact on awareness, interest, desire and intention to buy the product

4 Methodology

4.1 Data collection

This paper employs primary and secondary data. Secondary data were collected from previous studies from different journals, books, and other related literature. Primary data were collected from self monitored questionnaire. Questionnaire were distributed through online channels by sharing links to particular respondents. The research questionnaire was derived from Nhung, N.P et al, (Nhung, N.P et al, 2011) and adjusted to meet the objective of this study.

4.2 Population and sample selection

The major population of this research involves young consumers from Tanzania mainland who are social media users. A random sample of 131 respondents from Dar es salaam city which is a major business city was taken. The sample was taken from University students from different universities in Dar es salaam. The reason to select university students in Dar es salaam is because of age factor as most who are students are young generation born within the science and technology era and so they are most users of social media through various device such as mobile phones and computers. Moreover, they are urban dwellers and hence experience the technology use more than rural dwellers. Therefore, the researcher found them to be the convenient sample of the research

4.3 Reliability test

Reliability refers the internal consistence (Helms, 2006) and measured by Cronbach's Alpha test. Cronbach's Alpha coefficient ranges from 0-1 and the more the coefficient is closer to 1.0 the higher the internal coefficient. (Gliem & Gliem, 2003). According to Ndyali (Ndyali, 2014) affirms that Cronbach's Alpha must be greater than 0.60.   Cronbach's Alpha of this study is 0.683 This means that reliability results of this research are acceptable

Table 1   Reliability Statistics

Cronbach's Alpha	N of Items
.683	7

4.4 Data analysis techniques

Study data were analyzed using IBM SPSS statistics software Version 22. Different data analysis techniques were used such as Chronbach's Alpha for reliability Test. Moreover, regression analysis was also done. Lastly, Descriptive data analysis was conducted to compute frequency and percentage.

5 Findings and Discussion

5.1 Sample composition

Table 2   Demographic Results of Respondents

Characteristics	Frequency (f)	Percentage (%)
Age:		
A) 18-20	53	40.5
B) 21-25	73	55.7
C) 26- 30	3	2.3
D) 31-35	2	1.5
Total	131	100.0
Gender:		
A) Male	59	45.0
B) Female	72	55.0
Total	131	100.0
Level of education A) Undergraduate	54	41.2
B) postgraduate	2	1.5
C). Non-degree	75	57.3
Total	131	100.0
Marital status:		
A) Single	107	81.7
B) Married	24	18.3
Total	131	100.0

5.2 Regression analysis

This paper employs Multiple linear regression. Multiple regression used to examine the impacts of several predictors on a single outcome. This study, adopted multiple regression to analyze the effects of each independent variable on dependent variable. Each consumer endorser characteristics (here referred to as ETA stands for Expertise, Trustworthiness, Attractiveness) is considered as *independent variable*, while the impact/effectiveness (here referred to as AIDA stands for Awareness, Interest, Desire and Intention to buy/Action) considered as *dependent variable*.

5.2.1 The Effects of Consumer Endorser's Expertise (E) on Awareness, Interest, Desire and Intention to buy/Action (AIDA)

The model summary clarifies the correlation between independent variables (ETA) and dependent variable (AIDA), the value of R ranges from -1 to 1 and the sign shows the direction either positive or negative relationship. From table 3, the value of R shows a positive value which means there is a positive relationship between consumer endorser expertise and all AIDA factors which support H1(H1= Consumer endorser's expertise has a positive impact on awareness, interest, desire and intention to buy the product). However, desire shows higher effects that can predict 45.2% of variance in consumer endorser's expertise than the rest of the dependent variables. Moreover, R^2 elaborates the change in dependent variables (AIDA) as a result of changes in independent variable (ETA) as shown in table 3. The R^2 value for Desire is 0.198 which is greater than others. This means that Desire contribute more by 19.8% changes while other variables contribute the remaining percentage. Furthermore, The ANOVAs test asses weather the model is statistically significant better at predicting the outcome variable. Field (2009,2008) assert that for the model to be significant, the F test value should be greater than 1. From Table 3 awareness, Interest and desire have F value greater than 1 which means that they are all statistically significant, but intention to buy have a value less than 1 (F=0.219, sig 0.640 p=<0.05) which means that intention to buy is not significant and therefore should be rejected, thus the H1 support only the positive relation to all AIDA but significance is only on awareness, intention and desire but not on Intention to buy. This means consumer attention to buy is not affected by consumer endorser expertise characteristics. On the other the coefficients, shows t value results where desire shows slightly greater impact (t=5.753, sig=0.000 at p<0.05) than awareness, interest and intention to buy while intention to buy shows slightly less impacts (0.468) than the rest of the factors. The previous findings by Nhung,

N.P et al, (2011) support this finding on the basis that there is a positive relation however it shows there is only a significant correlation in awareness of the product only, while the rest of the levels shows no significant correlation.

Table 3   Model Summary, ANOVAs and Coefficients test

Dependent Variable	Model Summary	ANOVAs(p=<0.05)	Coefficients
Awareness(A)	R=0.185,R^2=0.034,AdjR ^{2}=0.027	F=4.597,Sig 0.034	StdBeta=0.185,t=2.144,Sig=0.034
Interest(I)	R=0.229,R^2=0.052,AdjR ^{2}=0.045	F=7.133,Sig 0.009	StdBeta=0.229,t=2.671,Sig=0.009
Desire(D)	R=0.452,R^2=0.204,AdjR ^{2}=0.198	F=33.099,Sig 0.000	StdBeta=0.452,t=5.753,Sig=0.000
Intention to buy(A)	R=0.041,R^2=0.002,AdjR ^{2}=-0.006	F=0.219,Sig 0.640	StdBeta=0.41,t=0.468,Sig=0.640

5.2.2 The Effects of Consumer Endorser's Trustworthiness (T) on Awareness, Interest, Desire and Intention to buy/Action (AIDA)

The model summary results in table 4 indicates that R value is positive in all AIDA variables which denoted a positive correlation between consumer endorser's trustworthiness and AIDA which support H2 (H2= Consumer endorser's trustworthiness has a positive impact on awareness, interest desire and intention to buy the product). Moreover, they are all within the range of -1 to 1 as suggested by many scholars. Since the R^2 results indicates the change AIDA due to change in Consumer's trustworthiness, the results from table 4 show that the change in consumer interest (I) will affect more changes in consumer endorser's trustworthiness by 3.4% than awareness, desire and intention to buy. However, intention to buy contributes to less changes by 0.1% than awareness, interest and desire. On another hand ANOVAs test show F value for awareness, interest and desire to be greater than 1 except intention to buy (F=0.100, Sig 0.753 at P<0.05). Since the rule of the thumb states that for any model to be statistically significant its F-test value must be equal to 1 (Field,2009), therefore the model for intention to buy on predicting consumer endorser's trustworthiness is not significant. Thus H2 accepted to show positive relation to all AIDA but significance is only found in Awareness, desire and interest but not in intention to buy. In other words, consumer intention to buy is not affected by endorser's degree of trustworthiness but other factors do. Moreover, the standard Beta coefficient for interest is 0.306 which denotes slightly more impact on the model than the rest. This results also supports the previous research by Nhung, N.P et al, (2011) and can be applied in other countries with similar environment like Tanzania.

Table 4   Results for Model Summary, ANOVAs and Coefficients

Dependent Variable	Model Summary	ANOVAs (p<0.05)	Coefficient
Awareness(A)	R=0.215,R^2=0.046,AdjR ^{2}=0.039	F=6.255,Sig 0.014	StdBeta=0.215,t=2.501,Sig=0.014
Interest (I)	R=0.306,R^2=0.094,AdjR ^{2}=0.087	F=13.362,Sig 0.000	StdBeta=0.306,t=3.655,Sig=0.000
Desire (D)	R=0.185,R^2=0.034,AdjR ^{2}=0.027	F=4.597,Sig 0.034	StdBeta=0.185,t=2.144,Sig=0.034
Intention to buy(A)	R=0.028,R^2=0.001,AdjR ^{2}=-0.007	F=0.100,Sig 0.753	StdBeta=0.028,t=0.316,Sig=0.753

5.2.3 The Effects of Consumer Endorser's attractiveness (A) on Awareness, Interest, Desire and Intention to buy/Action (AIDA)

Regression analysis was performed to find out how consumer AIDA is affected by consumer endorser attractiveness. The model summary from table 5 shows that R value is positive in all each dependent variable (AIDA). This indicates a positive relation between consumer endorser's attractiveness and AIDA which support H3 (Consumer endorser's attractiveness has a positive impact on awareness, interest, desire and intention to buy the product). Awareness shows that can predict 31.7% of the variance in consumer endorser's attractiveness than other dependent variable in the model. Field (2009) assert that the difference between R^2 and adjusted R^2 shows how good the model fits in the population, and it should be equal to or close to R^2 From the results in table 5 shows that the difference is 0.007(0.100-0.093) for awareness, 0.007(0.027-0.020) for interest, 0.006(0.105-0.099) for desire and 0.008 (0.018-0.010) for intention to buy. This closeness shows that the model fits the population. The ANOVAs analysis shows that F value is greater than 1 in all dependent variables (AIDA), this means that the model is significant as suggested by Field (2009) that for a model to regarded as significant, the F-test value should be greater than 1.0. Desire shows higher significance by F=15.204, Sig 0.000. The

coefficients indicate how crucial each consumer endorser's attractiveness in predicting consumer's AIDA. The t values for all AIDA shows that they are significant predictor of consumer endorsers' attractiveness. Both awareness and interest shows slightly higher importance (t-0.3796) in the model. The positive relation shows that the increase in consumer endorser attractiveness increases the effectiveness of product promotion advertisement in all levels of AIDA.The work by Nhung, N.P et al, (2011) also support this finding.

Table 5   Results for Model Summary, ANOVAs and Coefficients

Dependent Variable	Model Summary	ANOVAs(p=<0.05)	Coefficient
Awareness	R=3.17,R^2=0.100,AdjR^2=0.093	F=14.406,Sig 0.000	StdBeta=0.327,t=3.796,Sig=0.000
Interest	R=0.165,R^2=0.027,AdjR^2=0.020	F=5.590,Sig 0.000	StdBeta=0.327,t=3.796,Sig=0.060
Desire	R=0.325,R^2=0.105,AdjR^2=0.099	F=15.204,Sig 0.000	StdBeta=0.325,t=3.899,Sig=0.000
Intention to buy	R=0.134,R^2=0.018,AdjR^2=0.010	F=2.376,Sig 0.126	StdBeta=0.134,t=1.541,Sig=0.126

6 Managerial Implication

This study found that consumer endorser is an effective strategy for promotion advertisement in social media, it is the recommendation of this study that SMEs and marketing managers to effectively use consumer endorser strategy as it has influence in changing and influencing customer's perception and behavior towards the product.

The age of respondents of this study has a great concern to managers as shows that many are youth between the age of 18-25 which represent 96.2% of all respondents. This means that consumer endorser strategy can be more effective to young people than adults because of their high exposure with the technology world than adults. Therefore, this will help managers in decision making when making a marketing plan as to who will best be benefited with their advertisement campaign.

7 Conclusion

The objective of this study was to examine how consumer awareness, interest, desire and intention to buy are affected by consumer endorser's characteristics with special focus on consumer endorser's expertise, trustworthiness and attractiveness characteristics. The results show that consumer intention to buy a product is not affected by consumer endorser's expertise characteristics but other factors do such as awareness, interest and desire. Consumer endorser's trustworthiness does not influence consumer intention to buy but may influence awareness, desire and interest on the product. Consumer endorser's attractiveness shows significant positive relationship with all consumer awareness, interest, desire and intention to buy the product. Moreover, the higher the consumers are attracted by consumer endorser, the higher the interest of the product endorsed. Future research with a wider sample need to be administered to include other sample of respondents such as from elders and rural consumers to find out how their behaviors are affected by consumer endorser's characteristics. This study only focused on three characteristics of endorser namely attractiveness, trustworthiness and expertise but a future research need to be done to include other characteristics such as consumer endorser-product congruency characteristics to mention few.

Abstract: Understanding and fulfilling the customer's wishes is the essence of marketing, which has been evolving over the years and has reached a new stage from the concept exposed through Marketing 3.0. The article aimed to address the relevance of the relationship with customers within a new marketing perspective that has become essential for brand appreciation. Based on the methodology of literature review and through research in bibliographic references and analysis of five scientific academic studies, a study was develop to identify the practical application of the concepts of Marketing 3.0, which were found particularly in case studies. The results indicate the perception of the importance of using the new marketing as a bridge with the human being and their relationships and social objectives. Although the theme is still recent, it was perceived as an essential mechanism to add value and ensure the survival of the business, since without understanding the established relationship and the desires that permeate the client's spirit, it becomes too difficult remain in the current market.
Key words: Marketing 3.0; Relationship; Brand value

1 Introduction

The evolution of marketing, which was more valued for their concepts than the simple relationship of buying and selling, became a cause, human or social point motivator to associate to an idea, and literally buy it this were maximizing the results.

Having the Marketing as focus and Marketing 3.0 as an object of study, means that investors require gathering information to establish a business relationship without focusing only on the product or service, and yet enhance the mark.

The literature review carried out by means of survey articles with case studies on the application of marketing 3.0, presented a shot indicative of results that can be obtained with the personal values-based approach to the establishment of gains real. The analysis of real cases allows the establishment of parallel and inspire action models of recovery through the associated marketing to personal feelings.

The main reference considered was Philip Kotler, based on his several works but especially in his book Marketing 3.0 (2010), where are detailed phases of marketing that aims to reach the minds, hearts and spirits.

This article structured from the historical presentation considers the evolution of marketing until the contemporary period, always focusing Marketing 3.0, by identifying the wishes in line with the soul.

The focus in the relationship, which is fundamental to understand the desires of customers, and your relationship to the appreciation of the mark, as primary marketing goal. The presentation of practical experiences of application of Marketing 3.0, excelled for establishing how the connection between desires and values of people are turning to action and adding value.

The analysis about this phase of marketing, which has as its focus the consumer awareness and the importance of continuity of studies on the topic, already craving 4.0 Marketing of Kotler, aims to broaden the discussion about the convergence of marketing traditional to the digital age, which is already a path without back increasingly experienced by consumers.

2 Goals and Method

Since marketing began understood as a tool in addition to the synonym of sales, a view increasingly individualized graduated, the strategic focus changed from the producer/seller to the customer/consumer/opinion maker. This new vision justifies the importance of the subject of this article, problematic as follows:

How entrepreneurs are relationships with customers from the adoption of Marketing 3.0?

The objective was to analyze what are the strategies that entrepreneurs are adopting in order to meet this new phase of marketing, with cutout on the perception of actions that are integrated with human and social relations and that result in value to the products and brands.

The research conducted in the database of academic and scientific work, such as Google Scholar and Scielo, set limits on the term "Marketing 3.0" as a starting point, and established as a priority the last 10 year period (2008-2018), when the concept came to be more widespread, studied and applied.

Five scientific papers were used to report on practical examples of implementation and analysis of Marketing 3.0, in addition to bibliographical research aiming at the historical contextualization of the theme.

The bibliographic survey and qualitative research in scientific articles allow drill through, and perceptions about the characteristics relevant group of sentimental influence on marketing, as it is a way of thinking that could be followed for the construction of a reality (MINAYO, 2013).

According to Ganesh (1995, p.58), some main characteristics of a qualitative research is consideration of the environment, your descriptive character and the main focus of the approach, the result or product. In the feature article, the analysis aims to identify the path that has been trodden on this new version of marketing, that is directly related to the feeling and social belonging, so an important phenomenon to study.

3 The Evolution of Marketing

The word marketing is as meaning market, when in free translation of English market and Latin GMU's *mercatus*, but this term has gained new meanings over the years, in addition to representing sell, negotiate or advertise, as well details Kotler in his works and in the quote:

[...] marketing is social and managerial process by which individuals and groups obtain what they need and want through creating, offering, and exchange of value with other products. Many people see the marketing to seek and find clever ways to dispose of the products of an organization, namely, the marketing is only seen as advertising or selling products. However, the art of true marketing is the art of knowing what to do "(KOTLER, 2000, p. 27).

The term marketing was created in American universities in the early 1900, when integrated disciplines of the curriculum of five institutions and established the first concepts, classifications and developing a new vision in relation to business, what would become one of the great creations of the 20th century (SANTOS et al., 2009).

According to Sharma (2007), after the 1929 depression and World War II began to gain marketing body on the need to sell produce and present the products and services to the market to attract the customer, within a fitness for a new scenario commercial. In the 1930-1940, the marketing focus were the products, which according to Kotler (2010, p. 3), is the Marketing 1.0 which means, "Selling factory products to everyone who wanted to buy them." The main features of this phase were standardization, basic products and gains in scale to reduce costs of production.

From the 1950 and 1960 began to develop new concepts of marketing, with Neil Borden and the marketing mix, and in 1960 with the creation of the 4 P ´s (product, price, place and promotion) by Jerome McCarthy. According to Santos et al. (2009), at that time the expanded discussions on management and the social sciences, which led to a new marketing look, which began targeting primarily focus on information and consumer

According to Kotler (2010) is the Marketing 2.0, when the client passes to set the value of the product.

The marketing professional need to segment the market and develop a superior product to a specific target market. The golden rule according to which ' the customer is King ' works well for most companies. Consumers are better off because their needs and desires being met. (KOTLER, 2010, p. 4).

At first, it was believed that marketing was just a tool to aid the production and sales in order to generate and manage demand focusing on 4 Ps: product, price, place and Promotion. For Brazil, which had your field-based economy and little competition, the Decade of 1950 marked the beginning of marketing through widespread concepts by Escola de Administração de Empresas de São Paulo da Fundação Getúlio Vargas, and with the arrival of the first foreign organizations to use the media of the time-radios, magazines and newspapers-to publicize their products (SILVA, 2013).

The Brazilian marketing based on an American model replay until the 1970, when the expansion of the economy and the advertising agencies began to emerge as important tools in the strategy to make the industries to remember by consumers who were eager for consumption (SILVA, 2013).

From there the marketing became more valued, passing the winning departments and relevance in large enterprises, and expanding the range of expertise to Governments, civil organizations, religious bodies and political parties. Large enterprises, such as shopping malls and hypermarkets, had on

marketing the your highlight and began to discover new performance formulas to create a connection with the consumer, that's when the relationship marketing (SANTOS et al., 2009).

It is understood that the discovery of the importance of the relationship was a key point for changing the look of the consumer for the client, which took place from the late 1990, when the customer's management came to be understood as essential to maintain and increase the business. The advancement of communication, whether by advertisement, the phone and the internet, has made the relationship even more relevant, since the secret is in trying to figure out what matters to people.

The evolution of marketing and the change of vision nay be observed in the definition (s) thus submitted by the American Association of Marketing (AMA, 2013):

In 1935 = performance of activities that direct the flow of goods and services from producers to consumers.

In 1985 = the process of planning and implementation of the concept, the price, the communication and distribution of ideas, goods and services to create exchanges that satisfy individual and organizational objectives.

In 2004 = a organizational function and a set of processes for creating communication and delivering value to customers and for managing relationships with them, in a way that will benefit the Organization and its stakeholders (strategic public).

In 2013 = is the activity, set of institutions, and processes for creating, communicating, delivering, and exchanging offerings that have value for customers, clients, partners and society in General.

According to Kotler (2010, p. 4), marketers currently "trying to get to the heart and mind of the consumer", which from the Marketing 3.0 represents understand the values acting by three major forces: the era of participation, the paradox of globalization and the era of creative society, adding collaborative marketing, cultural and spiritual.

4 Spirit and Emotion

As a leading expert in the area, Kotler (2010, p. 5) points to the evolution of marketing over decades and casts the future by means of Marketing 3.0, which is focused on the combination of the emotional with the human spirit, but brings as luggage all development introduced in the last century, making this one of the most strategically important theme by combining product management, customer management and brand management.

According to Kotler (2000, p. 32), marketing is used to denote the process that includes market analysis, planning, execution and control of actions that aims to maximize the results of a company to succeed. Churchill (2005, p. 4) follows the same line to say that marketing is the process to improve the results of organizations, "[...] planning and executing the conception, pricing, promotion and distribution of ideas, goods and services to create exchanges that satisfy individual and organizational goals.

Kotler (2003, p. 167) believes that "the main functions that marketers must have in relation to customers are evaluating the opportunities, mapping the perceptions, preferences and requirements of customers", but taking into account "changes that satisfy the objectives of individuals and enterprises "(KOTLER, 2010, p. 4), which was named 3.0 Marketing.

Figure 2   Marketing 3.0 Action Goals.
Source: PAULO (2016) adapted from KOTLER (2010).

Choose the means of performing the marketing, relationships and generate satisfaction, involves communication and feedback to create the best strategy in the market that if you intend to keep or win as

the season experienced. Kotler (2010) analyzes marketing went through several stages with a large number of new concepts, but they all are always a reaction to changes in the business environment.

The current time is marked by the highest appreciation to horizontal relationships (customers) than the vertical (client-company). This trend strengthened by means of social media, but for Kotler (2010, p. 34) is a reflection of the generation of confidence (or lack thereof) in relation to advertisements of companies, as demonstrated by research and consumer market.

For organizations to create a connectivity and become relevant, Kotler (2010, p. 45) States that require "share the same dream with consumers and make a difference". One of the main examples in this sense has encouraged the change of philosophy of organizations, focusing on actions aimed at the marketing, for example corporate philanthropy, social or environmental, with internal and external measures sustainability.

Quoting Stephen Covey, Kotler (2010, p. 40) says that the goal of the new marketing is ' crack the code of the soul ', without neglecting the spirit. According to Covey, explains the four basic components of a full human being are physical body, mind capable of thinking and independent analysis, heart able to feel emotion and spirit, soul or philosophical Center. Marketing scholars point out that to place a product on the consumer's mind in a unique way is necessary to access these points. (KOTLER, 2010).

Actually marketing is evolving into a new stage, which is to find and address the minds of consumers, which has received different names as cause marketing, social or collaborative, and that has a major sustainability highlights of Marketing 3.0. However, although everyone has as focus create a connection with the consumer, terms such as Marketing to social causes (MCS), Corporate Social investment (CSI) or Corporate Social responsibility (CSR) present concepts, applications and objectives differentiated, as will be better detailed in the discussion about Marketing 3.0 in practice.

5 The Relationship and the Brand

The search for a new kind of relationship with the customer goes well beyond meeting the needs in order to strictly commercial results. It was realized that the relationship was a driving spring of business as a whole and the valorization of products and brand.

The rise of relationship marketing was a reflection of the perception that the interaction of generalized form with the intended audience resulted in more business transactions, but transformed into a philosophy of business management with the involvement of all: customers, prospective customers, suppliers, employees of all levels and middlemen; through forms of communication that create a positive business concept, which was realized over the years to become the main focus of the present (MCKENNA, 2002; GORDON, 2000).

Relationship marketing represents a major paradigm shift, because it is the evolution of competitive and confrontational mentality to a new approach marked by interdependence and cooperation (KOTLER (2003, p. 134).

It is in this direction that Ogden and Crescitelli (2007) reinforce the definition of audience or client, which is not always the final consumer in the case of relationship marketing, and list four types of public:

Inner-company officials. Feature a lot of credibility in people, because they are in direct contact with the company and production; despite not reaching the other large-scale public, if compared to other media;

Intermediary distributors, wholesalers and retailers. Retailers stand out for having greater influence over consumers;

Press, Government and community associations or called public opinion. The press has featured paper by impact and far reaching the target audience;

Consumer end user. Is primarily responsible for the value of a brand, since he is the one who defines and endorse values.

It is believed that customer satisfaction is a constant challenge for this the topic relationship marketing demand numerous and continuous studies, even because the public changes in terms of people, generations and also changes over time by your manners and actions. Kotler is an example in this regard, since it discusses the relationship marketing in extensive list of his works.

To understand the process of customer satisfaction, Kotler (2000, p. 43) points out several types of marketing: reactive, proactive and creative, explaining that the first fills a need; the second seeks to fill the needs that the client may have in the near future; and the third is the solution to production problems that customers don't even know they could have, but respond with enthusiasm to the initiative. So

creativity is valued to generate satisfaction, according to Kotler (2000, p. 53) is "the feeling of pleasure or disappointment resulting from the comparison of the expected performance for the product (or result) in relation to the expectations of the people".

Value could present a list of different definitions. In a business relationship, the term may be used as a product or service pricing, your production costs, time or existing demand, but Kotler (2000) explains that:

Value delivered to the customer is the difference between the total value for the customer, and the total cost to the customer. The total value for the customer is the set of benefits that customers expect from a particular product or service. The total cost to the customer is the set of cost that consumers expect to incur to evaluate, acquire, use and dispose of a product or service (KOTLER, 2000, p. 56).

Several authors have approached the point of view of marketing tools that generate customer loyalty or satisfaction, although all results have as Center the mark, since all individual or collective measures that reflect the perception of the client are also define the value you are adding to the company.

Marketing 3.0 has as focus just the mark, presented through the template named 3Is: brand integrity, brand identity and brand image.

Figure 3   Model 3Is
Source: Kotler (2010).

The representation by Kotler (2010) triangle-shaped features a combination of the brand, positioning and differentiation, three items synchronized in a positive way.

Kotler (2010) emphasizes that not always fixing the mind of a consumer is given so favorable, so the combination of brand and positioning that occupies only becomes complete when a differentiation that enhances the other two points. "Differentiate establishing synergy with the placement will automatically create a good brand image. Only the full triangle has credibility on Marketing 3.0" (KOTLER, 2010, p. 41).

6 Discussion: Marketing 3.0 in practice

Marketing 3.0 is a global concept that could be used in different ways, and in this article was presented a review of the literature with publications that have demonstrated practical results of implementation and evaluation of method on different fronts and goals. According to Kotler (2010, p. 22), this is an era focused on the consumer and demand "marketing collaborative approaches, cultural and spiritual", because the "marketing practices are very much influenced by the changes in behavior and attitudes of the consumer".

This view of marketing focused on social issues, such as CITES Kotler (2010), is often not well understood by consumers, as demonstrated by Mathew et al (2015). The increasing investment in social activities is understood mostly as philanthropy, but Matthews et al. (2016) highlights that every company aims to profit and there is no accounting for donating space, but occur collaborations, often without expecting some return, but as a form of institutional commitment to community development, as identified the applied research in the city of Bauru (SP) by Mathew et al (2016).

Moraes et al. (2016) reports that research has identified still some confusion about the difference between the concepts of Marketing to social causes (MCS), Corporate Social investment (CSI) and Corporate Social responsibility (CSR), but regardless of mode, any person or entity in Brazil could finance and/or develop social policies, since aligned with public policies and legislations in force.

Social investment could be implemented through social projects in various areas-environmental, educational, cultural, sporting, among others – and be performed through the company itself; with inter-sectorial partnership, for example by a project developed by another company or institution; or through the creation of an Institute that is aligned and funded by the company (Mathias et al, 2016).

So every social action may be considered an investment seeking return, be it financial, marketing or targeting the recovery of product, brand or the change of image and concept established on the company.

Moraes et al. (2016) even CITES studies and research that demonstrate the advantages identified for social investment, or the loss of opportunities for who drops the subject. American and European consumers accept paying more for socially responsible products and 70% drop the consumption of products from production processes with non-socially responsible behavior. England 86% of consumers have a more positive perception of the company that contributes to the sustainability of the planet.

In Brazil, according to the Institute for the development of Social investment research, pointed out that the binding of the company to a social cause raises the value of the institution for 96% of respondents. The Ethos Institute also identified that 51% of Brazilian consumers judge the quality of the companies for the treatment of officials and the ethical conduct of business, while 24% of consumers seek products of companies highlight the social responsibility (Mathias et al 2016)

An example of integrated marketing communication world, through social action, is the Pedigree, the company's English brand Mars that operates in the food for dogs, and that is in Brazil since 1989, quickly becoming reference for your innovation in products and marketing. From 2008, the Pedigree invested heavily in social marketing campaign "Adopt is all good", held in various countries (Santana; Ferreira, 2015).

According to figures of the Brazilian Industry Association 2013 of Pet Products (Abinpet), of the 37.1 million Pets, more than 20 million were abandoned, and 70% of them end up in shelters, and of these, 90% never find a home. Pedigree began social marketing in relation to abandoned animals in 2005 in the United States, through support to shelters to rescue abandoned dogs, the awareness of the population on the theme and the stimulus to the adoption of these dogs (Santana; Ferreira, 2015).

It is understood that by embracing this cause, the mark has met social concepts and stimulated the feeding the animals, enforcing the feed consumption through an emotional relationship with your audience. In marketing, the Pedigree switched to using phrases like "we're crazy for dog"; "It's all good Dog" and "every dog deserves a happy home", I argue that all dogs must be loved, well cared for, well fed, regardless if they are to race set or so called Mutts. That is, the brand has added social value to your marketing, as well as highlight the quality of your product for dogs "in the family", passes the subliminal message that all dogs deserve this treatment and food.

The success of the strategy, according to Santana and Ferreira (2015), fostered the contention by the mind and by the preference of consumers, so that the Dog Chow, that until 2011 worked the rational side of consumers, for example pointing out the quality of the product, went on to emotional campaigns, stating that the dog is not just a pet, but rather a part of the family.

Within the concept of Marketing, 3.0, it is understood that the strategy of the Pedigree was very well executed by using the integrated communication and aiming to add value to the brand. Besides the TV campaign "I Know", which depicted the situation of more than 20 million of abandoned dogs in Brazil, warn of the responsible Pedigree guard used the internet portals with the challenge that each one of them should find a home for an abandoned dog (SANTANA; FERREIRA, 2015); so using online tools, received a challenge to find a home for the abandoned dog. While Lord, Google's dog, featured videos on Youtube and Orkut community, Wajid had photo album on Flickr and interacted with the audience through the Yahoo answers. Already the Sissy, the dog chosen by MSN, had your own page on MSNspaces and interacted with the surfers via Messenger.

The prospective owners were attracted and directed to the website of the campaign with the goal of telling why adopt those dogs deserved. 3,192 proposals for adoption, more than 16 million of Internet users impacted and more than 1.2 million hits to site7 show that the action was a success. On Youtube of Pedigree, were posted the videos of the three dogs being delivered to their owners (Santana; Ferreira, 2015, p. 4).

Kotler (2010, p. 9) emphasizes the relevance of digital marketing to say that: "As social media are low cost and little biased, will be the future of marketing communications."

Gomes and Kury (2013) highlight that the form of communication is the factor of influencer Marketing 3.0, since information technology has penetrated the market, transformed the forms of interaction between people and how they relate to the companies.

The new era is the connectivity and mobility, especially in the last decade, when computers and cell phones increasingly accessible low-cost internet allies, open source and free wi-fi, especially through social media has changed the way people relate

Gomes and Kury (2013) mentioning the phrase of Hunt: "if any intermediary of communication changed anything, it's the internet," and analyze that there was an inversion of communications, mass media for a segmented version, which now begins by target audience, more focused and economical, from the information who is the consumer, their wishes, desires, thoughts, body and soul, its values and what's expected of a brand to consume it.

This perception has made many companies change their marketing communication strategy, adopting advertising messages aligned to social, cultural and behavioral responsibility of this new society, an attitude in keeping with the "politically correct", as shown by Silva (2016) in his analysis studying advertisements, citing two emblematic examples, which are the marketing's of Skol and Avon, who have excelled both on television as on the internet.

In 2016, Avon launched the campaign "BB Cream Color Trend and the Democracy of the skin" with the concept of empowerment of minorities, using in their fat, gay characters advertising images, black and transsexuals as protagonists, in videos that have been released both on the internet as on TV (SILVA, 2016). The objective was to deface established standards for a long time in the advertising of cosmetics: white women, skinny and beautiful.

The use of female image of stereotypical way is at the heart of discussions of the marketing and social responsibility. The beer advertisements have always been a negative icon in this sense, relating to sex and drink behavior prejudiced to heterosexual men, resulting in adverse reactions so negative that made the Ambev, largest beverage company in the Brazil and one of the largest in the world, responsible for various brands of beer, to reposition the Skol marketing (Silva, 2016).

Although complaints about sexism in advertisements for beer has remained for years, Silva (2016) analyzes the start to change marketing positioning of Skol occurred after February of 2014, when the brand launched your campaign of Carnival with the title : "I forgot the ' no ' in house '. The play won great advertising impact after being photographed by the Pri and Ferrari advertising journalist Mila Adams and published in feminist groups on Facebook. Taking into account the past brand advertising, it's easy to see why the commotion caused: the message was condoning the culture of sexual abuse to vulnerable women. After the poor reception, the campaign was taken off the air in less than a week (Silva, 2016, p. 21).

Skol has changed the focus of your advertising of the archetype of the "male-catcher" for characters who feature a young conscious personality, without prejudice against the genre or physical biotype, turning the word "respect" in your flag marketing, as "RespeitoIsON", in 2016 and the sponsorship of LGBT Parade of S ão Paulo (Silva, 2016).

It is observed that this placement has been maintained and strengthened. In 2018, the Carnival campaign hype of Skol highlighted the diversity in the party, in blocks, and other pieces in the air keep the focus differentiating what is "square" as biased points, and what is "round", symbol of the Skol, as politically correct. Several advertisements have the woman as focus, but now with a different approach, for example by encouraging respect for older women who date younger men or warning that the use of short clothes are not invitation to sexual approach.

However, for the change of the marks is necessary to change who does the marketing of the companies within the new vision of 3.0. In this sense, a good example is the Brazilian advertising agency Heads, which adopts a policy in relation to gender equality and women's empowerment principles of UN (United Nations), noting, for example, that more than half of their positions are occupied by women and that there is no wage difference between genders (Silva, 2016).

The positioning of the company, which includes studies on the presence of women in advertising, stands out in campaigns on equality, such as Valentine's Day, made for O Boticario, starring a homosexual couple. Despite controversy, this new position was positive for the company, resulting in growth and business for Heads, which won new accounts and became the second largest independent agency in Brazil (Silva, 2016).

The perception about the application of Marketing 3.0 does not only occur through the masses, with television advertisements, neither only in large organizations. Paulo (2016) demonstrated in a study carried out in a supermarket in the city of Formiga, in Minas Gerais, that 73.68% of the strategies were focused on Marketing 3.0 and 57.14%   were perceived by customers.

Through questionnaires applied to clients and managers, Paulo (2016) observed that the value of the shares applied in the supermarket of Minas Gerais and that are connected to the concept of Marketing 3.0 were:

- the suggestions of the customers;
- consumer desires;
- the staff's knowledge of the mission;
- concern for environmental issues;
- products that stimulate improvement of the quality of life;
- products with sustainable principles;
- social events to promote mission and social campaigns;
- cultural values incorporated to employees; and
- concern about the client's vision, hearing, smell, touch, and taste.

Even with this roll of actions directed to the customer, Paulo (2016) still highlights the lack of a fundamental item in Marketing 3.0, which is the broad relationship, since the only channel of communication with the customer is the site. Other shortcomings to be corrected, according to Paul's study (2016), are the limitation of the public to the middle class; the performance force focused only on its directors and supervisors, excluding the operational layer; the lack of customer awareness campaigns regarding environmental issues, and the lack of application of social and environmental practices aimed at stimulating the purchasing process (PAULO, 2016).

According to Silva (2016), SEBRAE (Brazilian Service for Support to Micro and Small Enterprises) confirms the tendency for socially engaged companies to profit more and stand out from their competitors. It is perceived that this occurs mainly because of the consumer engagement connected with the same principles and participants in social media, which reinforces the importance of knowing the soul of the consumer, as predicted by Kotler (2010) on Marketing 3.0.

"Increasingly, consumers are looking for solutions to satisfy their longing to transform the globalized world into a better world. In a confusing world, they seek companies that address their deepest needs for social, economic, and environmental justice in their mission, vision, and values. In Marketing 3.0, the goal is to offer solutions to the problems of society. Companies differentiate by their values "(KOTLER, 2010, p.19)

Gomes and Kury (2013) understand that there is a shift from the Information Age to the Age of Consciousness, which is what we experience, where the general awareness makes people cover more and also do more, take responsibility and filter what it is good and bad for you and for the world. Change is characterized not only by the reception of the message, but also by the treatment of that information with the "urgency to reconstruct thought before passing on its own message" (Gomes, Kury, 2013).

7 Conclusion

By presenting a historical account of marketing and characterizing the relevance of the relationship to identify and connect with ideals, the present article shows how Marketing 3.0 has been applied in practice and how it became relevant for companies, in terms maintenance and evolution of the business and especially for the appreciation of the brand.

It is understood that more and more organizations need to obtain knowledge of their target audience, not only through discourse or transmission of information, but demonstrating in practical actions, how it is contributing to the world, or in social or environmental causes.

The use of media, especially social media through the Internet, still makes relevant a relationship of exchange, interaction and identification of the public's desires, which is increasingly segmented into themes of interest to them. It is this identification that Kotler calls knowledge of the spirit of the consumer, and that is fundamental for companies to establish strategies of Marketing 3.0.

The topic is increasingly relevant for marketing, and more research is needed to characterize the relevance of digital marketing in this change of position, since the advance of the virtual relationship is a path without return that dominates the commercial relations; and that is precisely what Kotler approaches with the already denominated Marketing 4.0.

Influence Factors on Consumer Decisions: A Quasi-experiment with Brands of Sustainable Products

Maria Carolina Mirabella Belloque, Francisco Antonio Serralvo, Arnoldo J. de Hoyos Guevara
Pontifical Catholic University, S ão Paulo, Brazil
(E-mail: carolbelloque@gmail.com, serralvo@pucsp.br, dehoyos@pucsp.br)

Abstract: The goal set for this research is to propose a model of brand management to guide consumer choice to more sustainable options. The model assumes that consumers have varying degrees of awareness on the sustainability of products and services. At the same time, products and services may also be considered in varying degrees of sustainability. Thus the strategy of brands should be to communicate its sustainability aspects in order to reach the consumer who is at the same level. It is expected that from the momentum established by the model, in which more and more information is conveyed about the sustainability aspects of products and services, consumers start to be more aware and at least more informed. The independent variables were the brand's image and the price. The dependent variable was the participant's intention of purchase. There were 402 consumers subjected to the quasi-experiment. The results was analyzed at brand level and, in general, showed that more sustainable brands grew in participant's preference after they received information about the sustainability aspects of that type of product, but this gained preference were partially lost when participants were aware of product's prices.
Key words: Sustainability; Conscious consumption; Brands.

1 Introduction

The marketing has been studied under different aspects that are part of the concept of sustainability, which include, social marketing, marketing 3.0, green marketing and greenwashing. But in Brazil, the convergence between Marketing and Sustainability is little Studied (Moretti & Toledo, 2015).

In 2015, the UN adopted a new development agenda, which assumes the role of continuing the Millennium Development Goals. This new agenda was launched in September 2015 and entered into force on the first day of 2016. The new agenda is called Sustainable Development Goals, and consists of 17 objectives and 169 new goals. Among these objectives, the twelfth refers to responsible consumption: "ensure standards of sustainable production and consumption", being directly related to this research. It shows how relevant sustainable consume is in the contemporaneous era and that marketing and consumer behavior studies can contribute to sustainable development goals.

In this context, the overall objective is to propose a model of brand management to guide consumer choice to more sustainable options. Secondary objectives are: to analyze the importance of the brand from the perspective of sustainability and find appropriate ways to implement sustainability by organizations.

2 Literature Review

Sustainability is about the interdependence of living beings among themselves and in relation to the environment. It is the recognition of the needs and interests of other parts such as community groups, educational institutions and religious, labor and public, reinforcing the network of relationships that keeps them intact. It is also about valuing different aspects of human life as family life, intellectual growth, artistic expression and moral and spiritual development (Savitz, 2007).

The term has its origin during the 1980s, with the growing awareness that countries needed to find ways to promote economic growth without destroying the environment or to sacrifice the well-being of future generations" (Savitz, 2007, p.2) and was popularized by the Brundtland report, prepared by the world commission of the environment development (WCED, 1987).

Since then, sustainable development has been widely accepted by academics and the executives as a major theme in the research agenda and organizations (Savitz, 2007; Hahn et al, 2015; Serralvo&Belloque, 2014). It means that organizations are required to manage their business taking into account the interconnected and interdependent, economic, environmental and social issues (Hahn et al., 2015).

Sajeva et al. (Sajeva et al., 2015) used the Voltaire's view that a snowflake in an avalanche never feels responsible, the environmental problem is the fault of all the people. For these authors, while

regarding sustainability involving the social, human and environmental aspects, and economic, as well as their interactions, it is clear that environmental problems are mainly caused by societies and their inability to keep within the limits imposed by the vast natural system in which we live (Sajeva et al., 2015).

The Triple Bottom Line concept of sustainability rests in the integration of social, environmental and economic issues, making a tripod. According to this model, organizations, need to act responsibly in all three dimensions to be considered sustainable (Elkington, 1997). But, Hahn et al. (Hahn et al., 2015) wrote that organizations have failed to apply satisfactorily the concept of sustainability. They discussed about prioritizing certain aspects, namely the lack of balance between the three dimensions, generating what they call voltages. This fact is due to the incompleteness of this model; and the proposal to minimize these effects is the application of an "integrative vision of corporate sustainability" (Hahn et al., 2015).

This integrative view proposed that organizations need to pursue different aspects of sustainability simultaneously, and that managers have to consider the possible tensions between dimensions rather than dismiss them. According to the authors, through this strategy, management for sustainability will be taken beyond the Tripple Bottom Line (Hahn et al., 2015). This model takes into account the systemic aspects, organizational and individual, in addition to economic, environmental and social dimensions, and yet circumstances, in a context, space and time to analyze the possible tensions in organizational sustainability.

Hahn et al. (Hahn et al., 2015) proposed an integrative model of strategic management for sustainability. In marketing, is also concepts related to the Tripple Bottom Line pillars: economic, social, environmental. These three concepts were treated separately: commercial marketing, social marketing and green marketing. But when considering the essential function of marketing, which is to meet the needs of human beings, social and environmental aspects are implicit, since the integrity of these is essential for humanity.

2.1. Consumer behavior

Consumer behavior is the study of the processes involved when individuals or groups select, buy, use and dispose products, services, ideas or experiences to satisfy their needs and desires (Solomon, 2002; Blackwell; Miniard; Engel, 2006), and came as a distinct field of study during the 1960s (Pachauri, 2002).

The marketing concept suggests that organizations must meet consumer needs, therefore, to implement the concept of marketing, organizations must understand their customers and stay close to them to develop products and services (Peter; OLSON, 1996). Kotler and Keller (2000) aggregated to this idea the aspects of price, distribution channels and communication. The importance of consumer behavior knowledge rests on the foundation of modern marketing philosophy, which recognizes the consumer as the focus of marketing activity (Singh, Vrontis&Thrassou, 2011).

All the successful marketing program is based on a well-grounded theory and understanding of consumer needs (Runyon & Steward, 1987). Since pure economics alone cannot explain all variations in sales, several sub-perspectives within the discipline can offer rational explanations for variations in demand (Pachauri, 2002).

Each customer is unique and their behaviors vary (Grant, 2007). Simple observation provides a limited view of the complex nature of consumer choice, so researchers have increasingly sought the concepts and methods of more sophisticated research, provided by the behavioral sciences in order to understand, predict and possibly control consumer behavior more effectively. Therefore, the amount of generated knowledge must be assessed in terms of its ability to improve the efficacy of marketing practice (Pachauri, 2002).

A consumer behavior definition, proposed by the American Marketing Association - AMA in 1989, is "the dynamic interaction of affect and cognition, behavior and environmental events by which human beings conduct aspects of their lives exchanges" (AMA, 2016). This definition, according to Peter and Olson (1996) analysis, presents very interesting aspects to be analyzed. Consumer behavior is dynamic, which means it is a system moving with constant changes and alterations. Moreover, it involves interactions between affect, cognition and environmental events that promote these changes in behavior.

Rocha and Barros (2006) thought consumption by anthropology and explored the theme in the sense that consumption is a system of signification, in which the main social needs supplies is the symbolic necessity. This thought goes beyond the simple selection, use and disposal of products. For the authors, "consumption is like a code, and through him are translated much of our social relations and prepared many of our subjectivity experiences" (Rocha & Barros, 2006, p. 45).

This code reflects feelings and social aspects, forming a classification system of things and people, goods and services and groups. Since consumption allows an exercise of "classification" of society, this can be inclusive in two different ways, through the insertion of new products and services that are added and are articulated to the other, and the inclusion of identities and social relations which are defined largely from that code (Rocha & Barros, 2006).

This second way to include consumption is closely linked to conscious consumption, in the sense that this new way of consuming focusing on sustainability must be linked to an identity and supported by "compassion" towards the social relations of the individual.

2.2 Brand concept management-bcm

The model proposed by Park et al (1986) shows how many concepts related to brand management and marketing can be integrated into a single model. Koch (2014) pointed out that this model has played a key role in launching the research area of brand extension, in which the positioning of the brand is important.

Park et al (1986) explained that the selection of the brand concept can be given by the identification of functional, symbolic or experiential needs. A brand with the functional concept is defined as one that is designed to meet international consumer needs. The ones with the symbolic concept are developed to link an individual to a group, to a context or the image itself. A brand with the experiential concept was developed to fill internally generated needs for stimulation or variation.

According to the authors (Park et al., 1986), still, the terms "functional", "symbolic" and "experiential" are used to reference an image created by a brand, not a product of class. Any product can theoretically be positioned as functional, symbolic or experiential, and may still have a mixture of these concepts, as many brands have. That is, it is possible to develop an image of brand with two or more concepts.

They explained the relationship (Park et al., 1986) between the concept of a brand and its image must be managed throughout the life of the tag. For each of the three stages of management proposed by the authors, introduction, development and strengthening, there are particular positioning strategies, accompanied by appropriate marketing strategies mix, allowing consumers to understand the brand image (introduction), realize their value increasing (development), and generalize this picture to other brands of the organization (fortification).

The stage "Introduction" is defined as a set of activities to establish an image or positioning a brand in a given market during the entry period on the market. The image and positioning selected by the organization must be within the concept of the limits of the selected brand and be influenced by the presence of a niche in the market. At this stage, there may be a change in sales. When the marketing mix elements are consistent with communication, operational and complementary tasks among themselves (for example, coordinated), a synergy is more likely. The mixture coordinates successfully communication and operation tasks, the relative advantage of the brand should be apparent to the target market. Another goal of brand management concept during the entry period in the market is to develop an image that could be extended easily during subsequent phases. If this introduction does not try to foresee the next steps, synchronization efforts between steps tend to be less effective (Park et al., 1986).

During the "development" stage, the positioning strategies should focus on improving the value of the brand image so that its relative superiority to competitors can be established and sustained. Increasing the perceived value of the brand is essential as the competitive environment becomes more complex. For example, an increase in the number of competitors emulating the brand's position may decrease the ability of consumers to discriminate among brands. Moreover, the changing needs of consumers, triggered by factors such as a better knowledge of the product, or products best wishes (particularly through the use of specific situations), may require specific strategies to increase the value of the brand. It is worth mentioning that positioning strategies, implemented at the "design" stage may require the amendment of the marketing mix components (Park et al., 1986).

The authors (Park et al., 1986) pointed out the fact that the positioning strategies at that stage differ from a typical repositioning strategy. Firstly, the repositioning usually does not depend on a primary means for guiding their activities. In contrast, according to the scenario, positioning strategies in preparation, are guided by the concept of the brand. This is because the image in preparation is established, of course, the concept of the brand. Thus, the image produced is a logical extension of the initial phase and the potential inefficiencies associated with the change of an image without a scenario guiding, can be avoided.

Plans for the positioning at the stage of "preparation" should begin when the concept of the brand is initially selected by the planning for the positioning of activities. The concept selection phase, the company can create its own changes rather than react to market changes, as they occur. It is noteworthy

that the repositioning, by contrast, is usually determined from the current market conditions in the short term. Several different strategies for positioning can be used to increase the value of the image in this stage (preparation). Mainly because the brand can be made via its usefulness, or can be defined to meet a more specific need (Park et al., 1986).

Finally, keeping the exclusivity of the brand can increase their perceived value. The placement strategy that is more suitable to increase the value of a particular brand may be given by the initial concept. Although the preparation of the image may require an adjustment of the initial position. As in the introductory phase, the marketing mix elements, in preparation, will be more effective and efficient in increasing the value of the image, when these elements are consistent with the communication objectives, operational and complement each other.

In the final phase of the BCM, the stage of "fortification" aims to link a brand image developed in the image of other products produced by the company in different product classes. Various products, all with similar images, reinforce each other and serve to strengthen the image of each brand. So, all brands can benefit from this strategy. Strengthening the image of a brand by a fortification strategy does not imply that the brand development stage has been completed, it should continue throughout the life of the brand. During the fortification phase, the new product placement strategies establish the connection with the existing concept of the brand (and consequently, the image drawn brand). This connection can be achieved by a common identification joint promotion or joint distribution (Park et al., 1986).

2.3 Price

The price is "the amount of money that one must sacrifice to get something wanted" (Monroe, 1990, p.5), also acting as a product quality signal (Monroe, 1990). "The most common and obvious" to Diamantopoulos (2005, p. 245) is the importance of price to the rational principle that it is the only aspect of the marketing mix that generates revenue, while others are associated with costs. Thus, costs are incurred in order to create value while the price has the role to extract value. For Semenik and Bamossy (Semenik and Bamossy, 1995), the price is a tool that assists in one of the key roles of macroeconomic marketing function which is to facilitate the exchange process. "The price establishes a foundation to culminate in an exchange between the parties" (Semenik&Bamossy 1995, p.352).

Through the price it is established the level of reward for the production and management activities involving a particular product. However, Diamantopoulos (Diamantopoulos, 2005) emphasized that the aspect of revenue is not "in any way" (Diamantopoulos, 2005, p. 245) the only feature that makes it important. The price significantly impacts the volume of sales and therefore the participation of the brand in a given market. Diamantopoulos (Diamantopoulos, 2005) wrote that studies have shown that the price elasticity is up to 20 times higher than the elasticity of advertisement. Besides having a strong influence on demand, price's influence is manifested faster than the other aspects of the marketing mix.

Still comparing the price with the other components of the marketing mix, it is a variable that can be adjusted with a certain speed. However, Diamantopoulos (Diamantopoulos, 2005) warns that this is also a handy advantage to competitors and, on the other hand, reactions to price changes are not only faster, but more intense too, which also calls for a lot of caution in its decision-making process, since the results should promote significant impact.

While discussing price, Semenik and Bamossy (Semenik and Bamossy, 1995) followed a rationale with more emphasis on customer, rather than seller. There is other aggregate acquisition cost price, such as the time consumers takes to get a particular product; the convenience is also associated with site acquisition, opportunity and risk. For instance, consumers may think the risk of buying an unknown brand is higher than paying the higher price for name brand.

Broone and Kurtz (Broone and Kurtz, 1998), indicate that in practice the determination of cost-based pricing is the most popular method, what also occurs in Brazil according to Botelho and Urdam (Botelho and Urdam, 2005). However, Semenik and Bamossy (Semenik and Bamossy, 1995) adverted that it is a mistake to consider only the production and marketing costs in determining the price of a product. While these costs are "extremely important" (Semenik&Bamossy 1995, p.353) because it cannot determine a price that does not cover these costs, a price based only on these premises can be too high or low for the market because it does not recognize "important public" that will evaluate the price.

The authors explain that, besides consumers, there are other relevant public that affect pricing decisions. Members of the industry, as wholesalers, retailers and distributors, direct and indirect competitors, the government, which may impose restrictions to prices, and the company itself, are the highly influencing players in price decisions (Semenik&Bamossy, 1995). But for Semenik and Bamossy (Semenik and Bamossy, 1995), customers are the most important group, the actual customers and also the potential ones.

Understanding how consumers think a product, you can decide on which product features and services will allow the company to establish a price that will both be perceived as appropriate by customers and allow the company to cover its costs and obtain a reasonable return. (Semenik&Bamossy 1995, p.353)

Serpa and Avila (Serpa and Avila, 2004), while working with the relationship the reference price and the theory of perspective also approached this concept. For them, this relationship is the basis used by the consumer to judge the actual price charged for a product. The notion of justice is what determines the setting of the reference price. The reference price is the price that the buyer considers reasonable or fair.

Complementing the vision of Semenik and Bamossy (Semenik and Bamossy, 1995) and Diamantopoulos (Diamantopoulos, 2005), Broone and Kurtz (Broone and Kurtz, 1998) emphasized the legal and economic aspects in pricing theory. The authors note that in addition to the previously presented theory, there are rational rules that must be respected and that also go beyond the calculation of the cost of a particular product.

3 Model Proposal

This model is centered on the consumer. The proposal considers that in the context of sustainability, consumers have varying degrees of awareness of the products and services. Thus, the level of consumer awareness is the first key pillar of the model. It is noted that a consumer can have different degrees of consciousness for different products. However, the degree of awareness of a consumer should have no major gap between different products or services, because when the consumer has certain degree of awareness and knowledge about a topic or product, means that he has a critical thought regarding their way of consuming, and it should reflect in other issues.

The second pillar is the sustainability strategy that should be applied on the business, it is an essential aspect that must have validity, truthfulness and transparency for consumers, and it cannot carry out the practice of greenwashing (or been perceived as greenwashing by consumers). The sustainability strategy does not have to be developed in the same way proposed in the model. This is a logical suggestion of how sustainability can be developed and expanded in an organization. However, this form is more appropriate to the model as well as the organization will not meet the demand of consumers in each of the levels of consciousness indicated in the model. In this pillar, to move from one level to the other, the strategy should be cumulative. An organization that offers a sustainable product must maintain aspects of sustainability achieved in the previous level, and also sustainable level transactions in question.

The third pillar of the model is the strategy established by the brand in each consumer awareness level. This strategy, as well as sustainability, should also be accumulated. A brand that has reached the degree of integration with certain consumers should keep the information strategies and interaction to meet the consumers of other levels. The brand strategy is always based on information regarding product sustainability aspects however, the way it is presented in the third column "brand strategy" is the best way of how this information should be transmitted to the consumer, because the higher the level of consumer awareness, more demanding will be presented on their relationship with the brand.

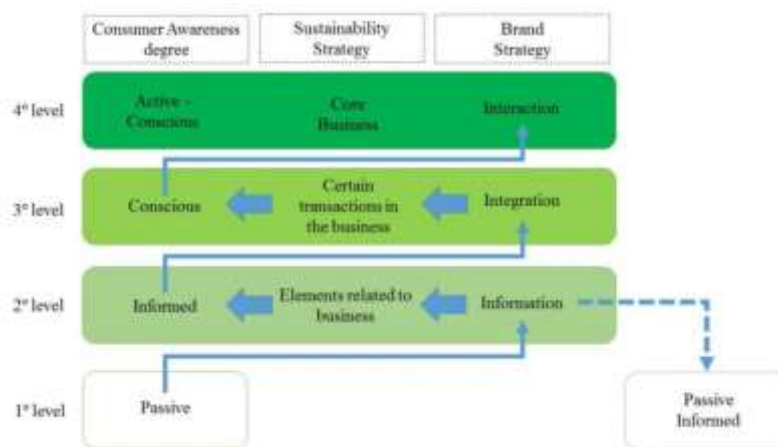
As presented previously, the model has three key pillars and four levels. Figure 1 shows the model structure.


Figure 1   Brand Management Model for Sustainability

It is important to note that consumer awareness levels are also cumulative, so the active conscious consumer is also can be considered conscious and informed, it just cannot be regarded as "passive" as a levels of consciousness.

One aspect that can influence the model is the price. The more sustainable product or service tends to be more expensive in practice. Thus, what happens is that when consumers relate to brands, the form shown in the model, may want to change your choice of consumption, but it can be limited by the difference of price paid for such a change.

It is important to explain that at in all levels, there may be a shift in consumer awareness or not. At the first level, the passive consumer can remain at the same level, but have received information, will an informed passive consumer. In other levels, the consumer only remains at the level it is, with the same degree of consciousness.

4 Method

The aim of the field research is to test the model proposed in this research. This test was done with consumers by means of a quasi-experiment. The product chosen for the quasi-experiment was the milk. In this market, there are different categories of milk, of which four were selected and assigned to the four model levels: UHT (Ultra High Temperature process), pasteurized, Organic and Soy Organic. For each category, one or two brands were used to represent them, as it is shown on the table 1. Each of the levels proposed in the model is represented by one or two brands and thus it was possible to test the selection of product category, and therefore its degree of sustainability, from the choice of the mark made by the participant.

Table 1　Corresponding brands to model levels

Level of the model	Type of Milk	Brand (s)	Price
Level 1	UHT	Parmalat	R$ 2,98
		Paulista	R$ 2,91
Level 2	Pasturized	Fazenda Bela Vista	R$ 3,91
		Xandô	R$ 4,04
Level 3	Organic	Timbaúba	R$ 6,95
Level 4	Organic Soy	Native	R$ 10,99

Following the research protocol proposed for the realization of quasi-experiment is presented.

In this research, two independent variables were isolated: the first is the image of the milk ́s brand and the second is the price. The dependent variable is the participant ́s intention to purchase among the options.

They were subjected to quasi-experiment 402 consumers of milk. The participants were selected by convenience, i.e., means that the selection has not been made by randomization, which characterizes the quasi-experimental method (Shadish et al., 2002). The test was available online and publicized through social networks and email. We asked people to forward the email and share the test ́s link on their own social networks, so it is not possible to estimate how many people received the invitation to participate.

Table 2　Stages of the quasi-experiment

Phase 1 – first exposition of brands	
O_1	Participants indicate the purchase order of preference of the brands in the form.
X_1	Information on the sustainability of milk types involved in this testing phase, are presented to the participants.
O_2	Participants indicate the purchase order of preference of the brands in the form.
X_2	The prices of the brands involved in the test are exposed to participants.
O_3	Participants indicate the purchase order of preference of the brands in the form.
Phase 2 – second exposition of brands	
O_4	Participants indicate the purchase order of preference of the brands in the form.
X_3	Information on the sustainability of milk types involved in this testing phase, are presented to the participants.
O_5	Participants indicate the purchase order of preference of the brands in the form.
X_4	The prices of the brands involved in the test are exposed to participants.
O_6	Participants indicate the purchase order of preference of the brands in the form.

Phase 3 – third exposition of brands	
O_7	Participants indicate the purchase order of preference of the brands in the form.
X_5	Information on the sustainability of milk types involved in this testing phase, are presented to the participants.
O_8	Participants indicate the purchase order of preference of the brands in the form.
X_6	The prices of the brands involved in the test are exposed to participants.
O_9	Participants indicate the purchase order of preference of the brands in the form.

The participants received clear and objective instructions regarding the procedure and informing that the information would be anonymous. Participants were subjected to nine measurements and six interleaved experimental treatments.

Initially, participants read the consent term and informed if they agreed with it. Then informed their gender, family income, age and the type of milk they consume, from the options: UHT, pasteurized and Organic. For each test phase, it was considered the number of participants, as follows: Participants who choose pasteurized milk in the question presented before the experiment: "What kind of milk do you consume?" were not considered in the first phase of the test that addressed UHT and pasteurized milk. Participants, who choose organic milk in the same issue, were not considered in the first and second phases of the test. Additionally, there was considered only in the second phase, the participants that have chosen the pasteurized milk in the second observation (O_2) and in the third phase participants who chose the milk type A in the second observation (O_2) and organic milk in the fifth observation (O_5). Therefore, the second and third stages, the "n" varies, it is the number of participants who have gone to these levels.

The following packages were presented, milk brands, which represent levels 1 and 2 of the model. Then the participant indicated on the form the order of preference for the purchase of each of the brands, the first option to the fourth option, this is the first observation (O_1). After this stage, the participants received the first experimental treatment (X_1). Appeared a screen with two images containing information about the types of milk in question. An image had negative information about the type of milk lesser degree sustainability, and other positive information about the type of higher degree of sustainability milk. In this first stage of quasi-experiment, the long-life milk is the lowest grade and the milk is the highest level. After reading the information, participants indicated again the order of preference for the purchase of each of the brands; this was the second observation or measurement (O_2). Participants then received the second experimental treatment (X_2) which was the exposure of product prices on the images of milk packaging in question. After that, participants were asked again about their purchase choice, also be noted in electronic form. This is the third observation (O_3). Here it was finished the first part of the test. Then occurred the change of brands presented to the participants. The presented brands passed to those relating to the following levels. This procedure was repeated two more times were tested for the second and third levels, and subsequently the third and fourth levels, but with only one brand representing each level.

The variables were analyzed by their measurements. The quasi-experiment under analysis has dependent samples and should be carried out test of difference between the means of dependent samples, because what is sought is to evaluate if there are changes in the behavior of individuals before and after certain interventions. For Zikmund (Zikmund, 2011), the chosen design allows to conclude that the difference between the observations (O_2-O_1, O_3, O_2 and so on) is a measure of the influence of the experimental treatment, which is performed in the first stage of the test calculation:

$$d = O_n - O_{n-1} \tag{1}$$

At where:

d: difference between the position of products in the participant's preference before and after the intervention.

On: position the product in the participant's preference after the intervention, 1 being the most preferred product.

On$_{-1}$: product position in the participant's preference, before the intervention. Is obtained, then the average difference between observations:

$$\mu d = \frac{\Sigma d}{n} \tag{2}$$

After the calculation of the differences between observations and their average, the assumptions

made were found in table 2. Interventions were made in favor of products with higher level of sustainability and therefore if the interventions X_1, X_3 and X_5 have the expected impact, the products with the lowest level (eglong life compared to Type A) must lose positions, while higher level should gain positions. In addition, since most organic products have higher prices, it was expected that the interventions X_2, X_4, X_6, and would lead to a decrease in preferably more organic products.

Lastly, the hypothesis that increased preference for products with higher level of sustainability was observed remains significant even after knowledge by participant's higher prices that these products possess (as $O_3 - O_1$). It is noted then that the assumptions were set considering the importance of the direction of change in the preferences of the participants for the products, and not only if there was a change regardless of the direction.

Table 3   Hypotheses of the quasi-experiment

	UHT	Pasteurzed	Organic	Soy Organic
$O_2 - O_1$	$H_0: \mu_d \leq 0$ $H_1: \mu_d > 0$	$H_0: \mu_d \geq 0$ $H_1: \mu_d < 0$		
$O_3 - O_2$	$H_0: \mu_d \geq 0$ $H_1: \mu_d < 0$	$H_0: \mu_d \leq 0$ $H_1: \mu_d > 0$		
$O_3 - O_1$	$H_0: \mu_d \leq 0$ $H_1: \mu_d > 0$	$H_0: \mu_d \geq 0$ $H_1: \mu_d < 0$		
$O_5 - O_4$		$H_0: \mu_d \leq 0$ $H_1: \mu_d > 0$	$H_0: \mu_d \geq 0$ $H_1: \mu_d < 0$	
$O_6 - O_5$		$H_0: \mu_d \geq 0$ $H_1: \mu_d < 0$	$H_0: \mu_d \leq 0$ $H_1: \mu_d > 0$	
$O_6 - O_4$		$H_0: \mu_d \leq 0$ $H_1: \mu_d > 0$	$H_0: \mu_d \geq 0$ $H_1: \mu_d < 0$	
$O_8 - O_7$			$H_0: \mu_d \leq 0$ $H_1: \mu_d > 0$	$H_0: \mu_d \geq 0$ $H_1: \mu_d < 0$
$O_9 - O_8$			$H_0: \mu_d \geq 0$ $H_1: \mu_d < 0$	$H_0: \mu_d \leq 0$ $H_1: \mu_d > 0$
$O_9 - O_7$			$H_0: \mu_d \leq 0$ $H_1: \mu_d > 0$	$H_0: \mu_d \geq 0$ $H_1: \mu_d < 0$

To verify these hypotheses, observations were tabulated in Microsoft Excel® software and the underlying protocol applied. This was chosen based on the guidelines proposed by Anderson, Sweeney and Williams (Anderson, Sweeney and Williams, 1999), Larson and Farber (Larson and Farber, 2004), Freedman et al. (Freedman et al., 1998), but the work that presents this protocol more closely to this case is Levin and Fox (Levin and Fox, 2004).

Data analysis consisted in checking the difference between the observations through a test of difference between means. First, it was calculated the standard deviation of the sample, then identified the number of degrees of freedom (g.1.) and performed calculation of the statistical standard Student's t. Finally, it was calculated the p-value.

5 Results

The average analysis enabled the graphic display of results, however, to say that these changes are in fact significant, statistical tests were done.

Table 4   Results

Parmalat	$O_2 (-) O_1$	$O_3 (-) O_2$	$O_3 (-) O_1$	Fazenda	$O_5 (-) O_4$	$O_6 (-) O_5$	$O_6 (-) O_4$

p-value	0,000	0,003	0,000	p-value	0,000	0,000	0,059

Table 4 shows the calculation of the Average, the Standard Deviation, the Standard Error, t test value α, for the difference between the first and second, third and second, and the third and first observation for each of the brands. The values are then analyzed.

The results, in general, shows that less sustainable brands fell on the preference of the participants after they received information about the sustainability aspects of that type of product, but regained preference when they were told on the price of these products. This is justified by the fact that the most sustainable brands are more expensive than less sustainable. It is noteworthy that despite the less sustainable brands have gained preference after the presentation of the prices, they have not returned to the same level of preference they had prior to exposure of information on the sustainability of the product types.

This general condition, has not been shown statistically to the Parmalat brand between the two observation and observation three (O_3-O_2) that is, in the first phase of the test. Although the simple average show that Parmalat brand has gained 0,030 positions. The t test and p-value showed that average cannot be considered statistically different from zero and, therefore, should reject the hypothesis of the Parmalat brand has gained the preference of participants to check their price.

Other changes that could not be confirmed statistically were the brands Fazenda Bela Vista and Timbaúba between observation four (O_4) and observation six (O_6). The simple average shows that the Bela Vista Farm brand lost 0.04 position, while the brand gained Timbaúba. But with the result of t-test and p-don't indicate that these changes in positions are relevant, so in this case, the hypothesis must also be rejected. And the difference between the ninth observation (O_9) and seventh (O_7) to Timbaúba and Native marks in the third test phase.

In all, five of the eighteen hypotheses presented on the Table 2, were statistically rejected. Hence, we conclude that the proposed model is consistent and relevant, so the purpose of this research was reached.

6 Conclusion

The goal set for this research was to propose a model of brand management to guide consumer choice to more sustainable options. And the secondary objective was to test this model through a quasi-experiment. As result of the marketing efforts to propose sustainable solutions, using theories as consumer behavior and marketing mix, appeared conscious consumers, who are those who acquire products with a low environmental impact. However, sustainable consumption also involves other actions, as seen, which are to reduce, reuse and recycle.

It is observed that among the analyzed sample, there are different reactions to put interventions, and some consumers have changed their choices and thus changed the characteristics of the sample, other participants have not changed. Importantly, the Brand Management Model for Sustainability also includes those consumers who despite receiving information on the sustainability aspects of products would not change your brand preference consuming.

The model seeks to cater to consumers with varying degrees of awareness of sustainability and thus categorizes the marks with respect to these aspects. However, it is important to highlight that does not mean that brands are better or worse. Brands are more sustainable or less. The market comprises all those consumers and all these brands, and more than the choices of consumers are more sustainable, there will always be demand for each brand in each of the model levels. Thus, an essential function that the model provides is to position the marks with respect to sustainability in this universe (market).

The central point of understanding that brands are not better or worse is the price. If a family has a low income, you cannot make more sustainable purchasing, and then mark it consumes is adequate. Moreover, reducing hunger in the world it is also a goal of sustainable development - ODS.

There is much more to do regarding the continuity and completeness of research on the topic, and the possibilities that this model offers. It would be interesting to test the model with other types of products, as well as another research approaches such as the use of interviews and a survey application.

Abstract: Based on relevant research at home and abroad, this paper chooses the special film industry to judge whether the number, direction and interest of electronic Word-of-Mouth have influence on the purchase intention by using Pearson correlation coefficient analysis method. In addition, the paper tests three hypotheses of the study by using regression analysis and points out the number, direction and interest of electronic Word-of-Mouth will affect the reception of electronic Word-of-Mouth for film consumers, thus affecting the purchase decision. Finally, the relevant countermeasures and suggestions are put forward.

Key words: Electronic word-of-mouth; Number; Direction; Interest; Film consumption

1 Introduction

With the popularity of online shopping, the internet has gradually become an important consumption channel. At the same time, product information on the internet platform, especially electronic Word-of-Mouth, plays a key role on consumers' decision, shopping behavior and product cognition. Especially for cultural consumption, due to the lower degree standardization of its products or services, various forms and limited objective properties, it is difficult for consumers to judge the actual value of cultural consumption like they perceive ordinary physical products(Sweeney J.C., Soutar, G.N., &Mazzarol, 2012;Berger, J., & Schwartz, E.M. , 2011).This has also caused various manifestations of consumers' purchasing results in the field of cultural consumption, while the film industry as the cultural consumption field is developing rapidly, and the most systematically perfect field of online shopping is better to show the influence on information type and quality for the purchase intention(Buttle F A, 1998;Smith D N, 2002; Barki H, Hartwick J, 1994)

It can be found in research at domestic and foreign that scholars mainly conduct relevant research on the effect and relationships of e-WOM on purchase intentions and decisions. It is worthwhile to affirm electronic e-WOM has a direct impact on purchase intension and decisions in areas or industries of online shopping popularity(Que keru, 2004). With the continuous enrichment of the internet, e-WOM information types are becoming more and more widespread, especially cultural consumption products like movies, and different information types show different quality of information as well as the consumers recognition degree is also different(Frenzen J K, Davis H L, 1990;Gefen D, 2000). Therefore, the analysis regarding the effects of e-WOM and purchase intention from the fundamental aspects cannot reveal the true relationship and chemical reaction between the two parties. Also, the logic paradox of "lower word-of-mouth but higher box office" is unable to be explained in film industry(Mitchell, Vincent-Wavne,1999; MARSHA A, 2015)

2 Research Hypothesis

This study proposes hypothesis including:

H1: There is a positive correlation between the number of e-WOM and the purchase intention of movie consumers.

H2: There is a positive correlation between the direction of e-WOM and the purchase intention of film consumers.

H3: There is a positive correlation between the interest of e-WOM and the purchase intention of film consumers.

3 Questionnaire Design and Preliminary Investigation

Pre-study data is obtained through on-site filling and online distribution. Through factor analysis, the validity test was conducted, the items with low correlation were removed, and the items with unreasonable expression and phrasing were revised. An official questionnaire including 12 measurement

items was formed (as shown in Table 1).

Table 1   Scale Design

Variable	Subject item
The number of e-WOM	The commentary on the film was supported by a lot of comments
	Many people commented on the film
	Many people commented on the same issue of the movie
The direction of e-WOM	The general tendency of comments on the movie is positive
	The overall suggestion for the movie is to suggest buying
	Compared to positive reviews, I believe in negative reviews
The interest of e-WOM	Interesting comments will attract my attention
	Funny comments will attract my attention
	Very interesting comments will attract my attention
The purchase intention of film consumers	I am eager to purchase this movie's tickets
	I am very likely to buy this movie's tickets
	I may (or have) recommend(ed)this movie to my friends and family

4 Research Results and Data Analysis

4.1 Reliability and validity analysis.

The internal consistency method was adopted for reliability analysis, and the questionnaire items were measured by Cronbach's α coefficient. Think of chart 2 as an example. Nunnally believed that if the Cronbach's α coefficient was greater than 0.7, the reliability would be high, but 0.5 would be the lowest acceptable reliability level. It can be seen that Cronbach's α value of all four variables were above 0.7 by Table 2, indicating that the questionnaire used for measurement had a high reliability.

Table 2   Results of Reliability Analysis

variable	The number of e-WOM	The direction of e-WOM	The interest of e-WOM	The purchase intention of film consumers
Cronbach's α	0.872	0.864	0.756	0.826

By the validity test, we found that the variance of these 4 factors accounts for 86.547% of the total variance. In another word, these 4 factors have reached an acceptable level for the interpretation of the electronic word-of-mouth. Therefore, the revised scale can be tested by investigation, which has good validity.

4.2 Correlation analysis

In this study, the Pearson correlation coefficient analysis method was used to determine whether the independent variables (the number of e-WOM, the direction of e-WOM, and the interest of e-WOM) had a significant impact on the dependent variables (purchase intention).

The results of correlation coefficient between independent variable and dependent variable are shown in Table 3.

Table 3   Correlation Analysis of Influencing Factors and Purchase Intention

Influence factor	The degree of influence on purchase intention	
	Pearson correlation coefficient	Significant level P
The number of e-WOM	0.748**	0.000
The direction of e-WOM	0.846**	0.000
The interest of e-WOM	0.624**	0.002

According to table 3, the correlation coefficient between the variables and the dependent variables had statistical significance, and the Pearson correlation coefficient was more than 0.5, indicating that the variables were positively correlated with the dependent variables. Therefore, by studying the results of correlation analysis, we can preliminarily determine the positive influence of consumers' purchase intention on the number, direction and interest of e-WOM.

4.3 Regression analysis

In order to judge whether there is causal relationship between independent variables and dependent variables, this paper further uses regression analysis. Excluding the factor of the interactions among variables, the 3 hypotheses were tested in this study.   The overall effect parameters of the regression model are shown in Table4

Table 4   Regression Coefficient of Consumer Willingness to Buy Films

	Nonstandard coefficient		Standard regression coefficientBeta	significant levelP
	B	Standard error		
Constant	2.265	0.217		0.000
The number of e-WOM	0.472	0.037	0.336	0.000
The direction of e-WOM	0.348	0.034	0.324	0.000
The interest of e-WOM	0.186	0.032	0.078	0.006

From table 4, we can see that the number, direction and interest of e-WOM are significant regression analysis on purchase intention of dependent variable. Also, the significance probability of the beta coefficients of variables is less than 0.01, indicating that 3 independent variables have significant effects on dependent variables. According to the standard regression coefficient, the regression coefficient of the number of e-WOM and the direction of e-WOM is close, and the regression coefficient of the interest of e-WOM is smaller. The order of the regression coefficient of the 3 variables is the same as the correlation coefficient.

Regression analysis shows that the number of e-WOM has a positive impact on consumers' purchase intention. Usually, the more the number of e-WOM comes into contact, the greater the probability that consumers can obtain useful information from the relevant clothing products, the more the benefit for consumers with understanding and buying the film. The direction of e-WOM indicates the direction of purchase. Usually, positive e-WOM indicates satisfaction and pleasure consumption experience. On the other hand, negative e-WOM conveys dissatisfaction and disappointing consumption experience.

The vivid and interesting e-WOM information can impress consumers deeply, and enhance consumers' acceptance of information, product cognition and memory.   Therefore, compared with other e-WOM information, the role of the interest of e-WOM is relatively indirect and concealed.

To sum up, through the correlation analysis and regression analysis, it is found that the number of e-WOE, the direction of e-WOM, and the interest of e-WOM have a significant positive correlation with the purchase intention of the film consumers. Therefore, this paper assumes that H1, H2 and H3 are established.

5 Conclusion

The amount of electronic Word-of-mouth in Internet is the most significant factor that influence the purchasing invention of film consumers. The latest research suggests that consumers will get a more comprehensive understanding about a film when there are more relevant electronic Word-of-mouth about that film, which will have a greater effect on their purchasing invention. Consumers intend to evaluate their purchasing decision by taking a page from choices of others. Depending on the particularity of film products, consumer need to know relevant information about the film by a host of electronic Word-of-mouth information. Therefore, it is rational for enterprise to apply marketing method of electronic Word-of-mouth effectively, leading consumers discuss and communicate with each other about the film products actively. Meanwhile, it is advisable for enterprise to show their advantages and features of products by means of the introduction about films and pictures of details, which will reduce the perception uncertainty of consumers and enable them to purchase appropriate film products.

There are obvious influences on purchasing decision of film consumers fromboth positive and negative electronic Word-of-Mouth. Positive electronic Word-of-Mouth influence the purchasing will of consumers in a positive way, however, the excessive praise will cause suspicion on its credibility. Accordingly, there will be more positive effect on purchasing will of consumers when positive and negative electronic Word-of-Mouth are moderately combined. The conclusion above suggests film enterprise that, it is of great necessity for them to focus eyesight on the preference of electronic Word-of-Mouth about their products in Internet, especially the negative one, and to resolve the problems which have been mentioned in the internet information timely, making efforts to eliminate the negative sentiment from consumers about products and promote the propagation and diffusion of positive

electronic Word-of-Mouth which will enhance the prestige of enterprise, instead of hiding or deleting the negative electronic Word-of-Mouth simply.

Research on Product Diffusion of Shared Bicycle Based on Bass Model

Jin Dan, Yan Dan, Yang Liu, Liu Yalan
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: jindan@whut.edu.cn, yandan@whut.edu.cn, liumuz6@qq.com, 2532064238@qq.com)

Abstract: The flourish of Mobile Internet stimulates the creation of shared bicycle which is extremely popular among Chinses. This study picked one of the shared bicycle companies-MOBIKE as a research object, dividing the registered users into four categories (Users aging 18-25,26-35,36-45, over 45), then carried out linear regression analysis according to the existing data. After that the model of MOBIKE's product diffusion was established based on Bass modal. The optimal fitting method was used to predict the future number of registered users in different age groups of the different time points. Finally, the study came to the conclusion that the total registered users would reach the market saturation in 2018.The study also compared the result of product diffusion in difference age groups, expecting to provide the companies and the government with the information for reference.
Key words: Shared bicycle; Bass model; Product diffusion; Market saturation point

1 Introduction

Owing to mobile Internet technology and GPS (Global Positioning System) positioning technology, "Internet + bicycle" model of a new generation of shared bike was born. Shared bicycle, represented by "MOBIKE", makes a great contribution to solve the "last mile" problem.

At present, the study of shared bicycle mainly focuses on its technological innovation, profit model, business efficiency and sharing economy. Articles about the diffusion of shared bicycle and its market saturation have been rarely seen. This study concentrated on the spread of shared bicycle. The common models used for product diffusion research are Compertz life cycle curve (TRAPPEYC, WUHY, 2008), Logit regression prediction model (Ma Jun, Wang Ning, Kong Deyang, 2009), Norton model (NORTON J A, 1987), Bass model (F M BASS, 1969), etc. Among all of these, Bass model and its later optimization model has been widely used in product diffusion, especially in the diffusion prediction of innovative products and innovative technology.

XieJianzhong, Yang Yu,Chen Qian, Li Fei (XieJianzhong,Yang Yu,Chen Qian and Li Fei, 2015) predicts the demand of short-period products based on the improved Bass model, having verified the scientific and effective effect of the method utilizing the example of the demand forecast of a mobile phone ; MengFudong, He Mingsheng (He Mingsheng, 2008) uses the optimized Bass model to study the diffusion of China IPV4 standard, having predicted the diffusion trend of it; Wang Rishuang, Zhang Xueli (Wang Rishuang and Zhang Xueli, 2015) and so on apply Bass model into the field of Internet finance, estimating the spread of online payment behavior; Song Zhijie, Qiao Fen, Shi Rui (Song Zhijie,Qiao Fen and Shi Rui, 2016)studies the diffusion of rumors in unexpected events based on the Bass model.

By using Bass model, the above study has achieved good results, so in this paper we studied the product diffusion of shared bicycles, utilizing the optimized Bass model which divided the users into four different age categories respectively and studies each of them, having obtained the most reliable product diffusion model of the shared bicycle from abundant alternative models.

2 Establishment of Product Diffusion Model Based on Bass Model

2.1 Construction of the product diffusion model for shared bicycle

Dating back to the birth of shared bicycle in 2014 and its first appearance in the Peking University campus in 2015, after the spread to the major cities across the country, the increasing number of registered users now has reached tens of millions. The shared bicycle causes widespread public concern, and some people   use shared bicycles for short-distance travel or visit, saying that these people are innovators, who are not affected by social pressure and the adopted; the early shared bicycles users influence other people to begin to use shared bicycles through the behavior, verbal communication, social media and other ways, such as riding a bike raising public attention, sharing experience with friends through the text messages and telephone or QQ, friends circle, microblog. This part of the affected citizens are followers. In order to build a model of product diffusion for shared bicycles, the

following assumptions are made:

    a. Market potential remains constant over time;

    b. Product diffusion is independent of other products;

    c. There is no product performance difference brought by product iteration;

    d. The geographical boundaries of the social system do not change with the diffusion process;

    e. Shared bicycles' product diffusion is only a two - stage process that is adopted and not used;

    f. Shared bicycle products is not affected by the marketing strategy;

    Based on the Bass model, the product diffusion model of the shared bicycle is directly obtained:

$$N_0(t) = m_0 \left[\frac{1 - e^{-(p_0+q_0)t}}{1 + \frac{q_0}{p_0} e^{-(p_0+q_0)t}} \right]$$

Where$N_0(t)$ is the total registered user; m_0 is the maximum market potential; p_0 is the innovation coefficient; q_0 is the imitation coefficient; t is the time.

The adoption of shared bicycle varied among different age groups, so the registered users are divided into four categories, 18-25 years old; 26-35 years old; 36-45 years old; over 45 years old, the model is optimized and the optimized Bass model is as follows:

$$N_0(t) = \sum_{i=1}^{4} N_i(t)$$

$$N_i(t) = m_i \left[\frac{1 - e^{-(p_i+q_i)t}}{1 + \frac{q_i}{p_i} e^{-(p_i+q_i)t}} \right]$$

Where$N_i(t)$(i=1,2,3,4)respectively represents the number of registered users of 18-25 years old; 26-35 years old; 36-45 years old and over 45 years old; m_i(i=1,2,3,4) represents the market potential of the above four age groups respectively;p_i(i=1,2,3,4) represents the innovation coefficients of the above four age groups respectively; q_i(i=1,2,3,4) represents the imitation coefficients of the above four age groups respectively.

3 Parameter Estimation and Model Test

3.1 Data selection

    Currently there are more than 25 companies of shared bicycle, including MOBIKE, OFO, Yonganxing, Xiao Ming cycling, etc., where MOBIKE and OFO occupy most of the market. "2017Q1 China Shared Bicycle Market Research" puts forward by iResearch. The Research shows that the market share of OFO is nearly 63% and the market share of the motorcycles is 25%. OFO put into use in colleges and universities in 2015, to the end of 2016 they began the "city sharing plan" into the city, during this two periods OFO could only be used in colleges and universities, which cannot be called real city shared bicycle. MOBIKE was put into cities at the beginning and users were required real name registration, also they used GPS positioning. So its data is more reliable and accurate. Therefore, this paper used the relevant data of MOBIKE to estimate the parameters.

    In this paper, the number of people registered in bicycles, the number of active users every week and the proportion of users in different age from May 2016 to February 2017 were comprehensively considered. The results were analyzed by the method of linear regression. According to the model, the relevant data is shown in Table 1:

Table 1　Data of Registered Users of MOBIKE from May 2016 to February 2017

Time	Total	18-25	26-35	36-45	over 45
2016.05	79.41	17.55	44.07	13.90	3.89
2016.06	86.26	19.06	47.87	15.10	4.23
2016.07	108.40	23.96	60.16	18.97	5.31
2016.08	158.09	34.94	87.74	27.67	7.75
2016.09	303.42	67.06	168.40	53.10	14.87
2016.10	406.37	89.81	225.54	71.11	19.91
2016.11	443.73	98.06	246.27	77.65	21.74
2016.12	690.94	152.70	383.47	120.91	33.86
2017.01	817.18	180.60	453.53	143.01	40.04
2017.02	908.46	200.77	504.20	158.98	44.51

Unit: ten thousand people

According to the results of the 2010 census and the average growth rate of the domestic population in recent years, the total market potential (m_0) of MOBIKE and the sub-markets potential（m_i） were calculated. The results are shown in Table 2:

Table 2   Market Potential of the Whole Market and Sub-markets of MOBIKE

Total potential	18-25	26-35	36-45	Over 45
21241648	4957932	5294456	5549750	5439510

3.2 Parameter estimation and model inspection

The nonlinear least squares method is used to estimate the model parameters. The values of the parameters run by matlab2017 are shown in Table 3. Zeng Ming, Zeng Fanxiao, Zhu Xiaoli(2013) pointed out that the empirical value of p concentrated from 0. 01 to 0.03, the empirical value of q concentrated in from 0.3 to 0.7 and rarely greater than 0.5. In this model parameter p <q, it is proved that the diffusion of MOBIKE is successful. Among them, the p value is relatively small, that is, the acceptance of innovator on MOBIKE is not predominant. It may be because the public are cautious with the product on which they need to scan the QR code; The small value of p illustratesthatpotential users are less affected by the social atmosphere.

Table 3   Parameter Estimates of the Empirical Model

parameter	estimates
m_0	2124.16
p_0	0.0138
q_0	0.2727

The model established with the above estimated parameters is compared with the actual situation, as shown in Figure 1. The model fitting coefficient R ^ 2 is 0.986, which is close to 1, indicating that the fitting effect is ideal.
Figure 1   Model Results Fitting

In figure 1 ,y-axis represents the total number of registered users, the unit is million; x-axis represents time, the unit is month. February of 2016 is recorded as 1. For example x = 3 means 2016 April.

The same method was used to estimate the parameters of the four age group - markets. The model fitting coefficient R ^ 2 is close to 1 in MATLAB2017, and the adaptability of model is good. Finally, the parameter estimation is shown in Table 4 below.

Table 4   Parameter Estimates of Sub-markets

	18-25	26-35	36-45	Over 45
p	0.0134	0.0125	0.0103	0.0033
q	0.2647	0.5842	0.2282	0.1797

4 Analysis

4.1 Comparative analysis of different age sub - markets

The following conclusions can be drawn from the estimated values of the above four age sub-markets:

(1) The innovation coefficients p of the four sub-markets are less than the imitation coefficient q, indicating that the product diffusion of shared bicycle products in different age groups is successful.

(2) In the sub-market of users over 45 years old, the innovation coefficient p is significantly smaller than that of other sub-markets, indicating that users over 45 years old are less receptive to the shared bicycle, and they are less innovative. This sub-market imitation coefficient q is also smaller than other sub-market, indicating that the spread of shared bicycle in the 45-year-old users is relatively slow.

(3) There is no significant difference in innovation coefficient p of 18-25 years old, 26-35 years old, 36-45 years old, which are within the experience value range, indicating that there are more innovators in these sub-markets. However comparing the imitation coefficient q, it is found that the q value of the 36-45 year old market isobviously greater than the other two sub-markets, indicating that the diffusion of shared bicycle products among the 36-45 year-old users is better.

4.2 Future market forecasts

(1) Total registered user volume forecast

The total registered user volume image was established according to the above estimated parameters, as shown in Figure 2:
Figure 2   Total Registered User Model Image

In Figure 2, y-axis represents the total number of registered users, the unit is million; x-axis represents the time, the unit is month. February of 2016 is recorded as 1. For example, x = 20 means October 2017.

According to the model and image the following conclusions were drawn:

a. The spread of MOBIKE is consistent with the S-curve;

b. Between May 2016 and February 2017, MOBIKE was in the bud, which is also in line with the actual situation;

c. In the next two years, MOBIKE grows quickly. By the middle of 2017, the number of registered users grew at the fastest rate, reaching 20 million in August 2018.

(2) Comparative analysis of registered users forecast in four sub-markets

The registered user volume image of four sub-markets were established respectively according to the above estimated parameters, as shown in in Figure 3,Figure 4, Figure 5, Figure 6.
Figure 3   18-25 Years Old Sub-market Model
Figure 4   26-35 Years Old Sub-market Model
Figure 5   36-45 Years Old Sub-market Model   **Figure 6   over 45 Years Old Sub-market Model**
The result of comparative analysis are shown in Table 5.

Table 5   Prediction of Sub-markets Development

	18-25	26-35	36-45	45-60
Growth period	August 2017	January 2017	December 2016	December 2018
Mature period	November 2018	July 2017	July 2017	July 2021

5 Conclusion

Based on the Bass model, a product diffusion model of shared bicycles was established in this study. By using the research data of the MOBIKE with industry representative and the least square method through MATLAB2017, the model and the actual data were fitted according to the estimated parameters. Finally, a better fitting effect was obtained, and comparing the four age sub-markets we get the following conclusions:

1. The small value of the total innovation coefficient p_0 in the model indicates that the public's acceptance of shared bicycle is not high enough. This is actually detrimental to the development of new startup products. The government should better further strengthen social innovation and publicity so as to encourage citizens to accept Innovative products.

2. The total simulation coefficient q_0 in the model is relatively small, indicating that potential users are less affected by the adopters. In the latter stage, the company can accelerate the diffusion of products by strengthening its marketing efforts.

3. In 2018, the shared is in a period of rapid growth. In mid-2017, the number of registered users had the highest growth rate and is predicted to reach the market saturation point in August 2018.

4. In the four sub-markets, the innovation coefficient p is not significantly different, while the innovation coefficient p in markets over 45 is significantly lower, indicating that the older potential users are relatively not interested in shared bicycle. This may be related to the fact that most of their participation in the internet is poor. Companies can offer other non-mobile internet bicycle services to meet their needs.

5. The imitation coefficient q in the 26-35 age markets is significantly higher than that in other sub-markets, indicating that the shared bicycle in this sub-market is rapidly spreading. In this market, young office workers have higher demand for short-distance travel, and the Internet has been integrated into their lives. These are good reasons for products diffusion effect. In contrast, the imitation coefficient q in markets over 45 is small.

The conclusions obtained in this study can provide reference data for the company and the government and the methods used have some reference significance. But there are still some deficiencies in several aspects: 1. Although the Bass model was optimized for users of different ages. However, the Bass model is still simple. Only the effect of registered users on the current users was regarded. Many factors were neglected. For example, government policies, product quality, advertising investment, users' differences except age. In later study, other researcher can introduce these variables to establish an optimized product diffusion model to get more reliable conclusions. 2.The data in this study is insufficiency. More data will be obtained for further study. To optimize model is the method for accurate data.

Research on the Influencing Factors of Brand Value of E-commerce Shopping Websites from Consumers' Perspective

Ma Ying, Li Yang, Kang Ping
School of Management, Wuhan University of Technology, Wuhan, P.R.China 430070
(E-mail: mying331@163.com, 2466779234@qq.com, kpkangping@126.com)

Abstract: The development of the Internet and the rise of e-commerce have changed people's lifestyles and shopping methods, and e-commerce shopping websites have come one after another. The fierce market competition poses challenges for the e-commerce shopping website to enhance brand value. Therefore, this paper builds a research model of brand value influencing factors based on the framework of brand value, and uses the structural equation model to study the influence of three dependent variables of brand knowledge, service value and image value on brand loyalty. As a conclusion, the three factors have significant positive impacts on brand loyalty, and the greatest impact is the service value, followed by the image value, and the least affected is the brand knowledge. This research also provides direction and basis for the increase in the brand value of e-commerce shopping websites.
Key words: Brand value; Brand loyalty; Service value; Image value; Brand knowledge

1 Introduction

With the rapid improvement of network infrastructure, more and more enterprises have begun to use the Internetand carried out trade activities through e-commerce.The development of the Internet has also brought about rapid changes in people's lifestyles. Online shopping has become the shopping mode that more and more consumer groups have chosen. The e-commerce shopping sites have also risen with great enthusiasm. Tmall Mall, Jingdong, Amazon, and Taobao have come one after another. In the fierce competition, the main problem that e-commerce shopping websites face is how to retain consumers and cultivate their brand loyalty, which involves the issue of e-commerce shopping website brand value enhancement. Therefore, the first thing is theinfluencing factor of brand value, which is the basis and direction for taking measures to enhance the brand value. Brand value has different value focus from three different perspectives: business, society and consumers.

When understanding the value of a brand from the perspective of a company, or from a financial point of view, most scholars emphasize the added value (Farquhan, 1990) or net present value (Shocker&Weitz, 1988). This is a brand premium arising from the joint action of the company, relevant stakeholders and the market (Sun Ning, 2016). The domestic scholar GuLihan (2012) simply defined the brand value as the price of purchasing a brand or resetting a brand. The definition of brand value mainly emphasized the attitude and behavior of customers to a certain brand(Raggio&Leone, 2007; Yu Junying, 2011), including the perception or understanding of the brand, the loyalty of the brand, and the added value of the product or service(Keller, 2003; KSDSingh&MA Islam, 2017). When defining brand value based on the perspective of stakeholders, scholars emphasize the excess value of all stakeholders related to the brand, including companies and consumers (Zhang Qian, 2006; Wang Xiaoling, 2010). Considering the influencing factors of brand value, Markéta&Lhotáková (Markéta and Lhotáková, 2012)believed that the value of the brand depends to a large extent on the quality of the brand. In addition, most of the literature attributed the main factors to consumers, including consumers' satisfaction with the brand (Eunha Choi, EunjuKo, 2016), consumers' perceptions of the brand's perception of the marketing program, behaviors and feelings (KSD Singh & MA Islam, 2017).

After reviewing these documents, we will find that most of the scholars' research on brand value has gathered on the analysis of traditional brand values. However, the current environment, with the development of networke-commerce platforms, is greatly different. Under this background, the traditional brand value development system can no longer meet the needs of the current corporate brand development. In conclusion, this article will focus on the brand value from the consumers'perspective, starting from the three aspects of customer transfer value, brand awareness and brand loyalty to explore the factors of the hot e-commerce shopping sites' brand value.

2 Research Design
2.1 Model construction

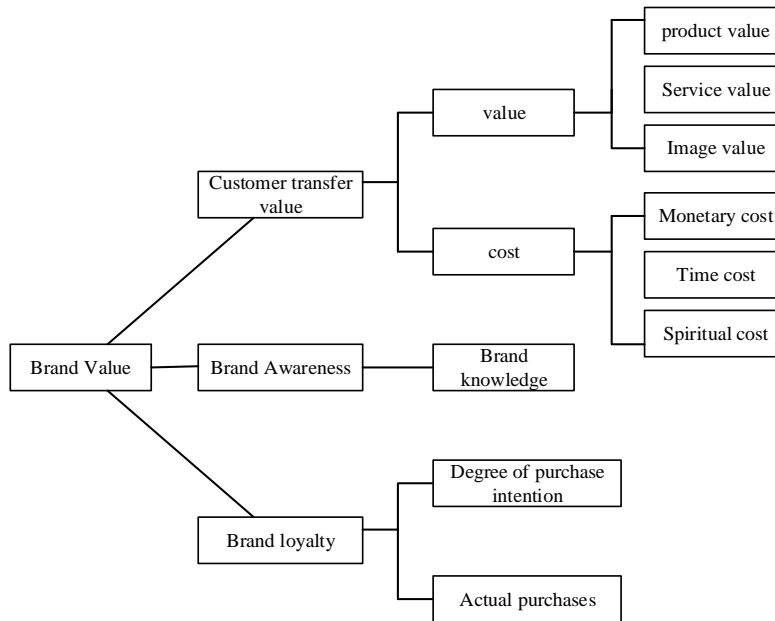
This article combines the actual situation of the e-commerce shopping site as a research object and carefully analyzes the constituent elements of the brand value (Figure 1). In the fiercely competitive market, the advantages of products and prices are no longer prominentwhich can increase consumer satisfaction.This increase in brand loyalty can be attributed mainly to the shopping experience brought to consumers by the website.Therefore, the research in this paper mainly focuses on the brand knowledge (BK), service value (SV) and image value (IV) as dependent variables. Combined with the review of the literature, this article uses brand loyalty (BL) to express brand value as the dependent variable of this study. Based on the above review, the brand value research model of this paper is constructed (Figure 2); and the measurement indexes of each variable are established by referring to the measurement schemes in existing studies.


Figure 1   Corporate Brand Value Theory Framework
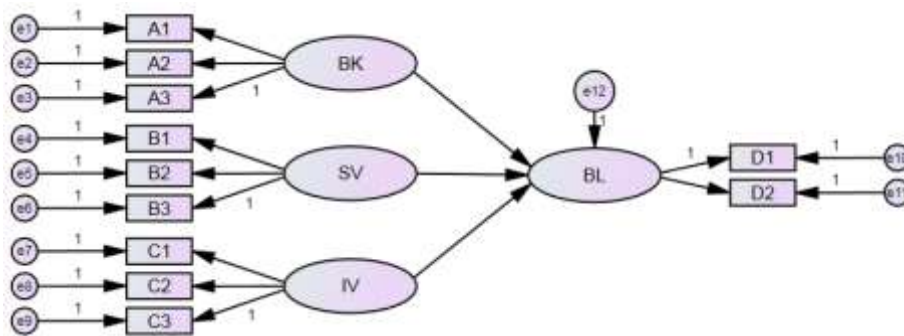

Figure 2   Brand Value Research Model Based on Consumers

2.2 Assumptions

Brand knowledge refers to the consumer's ability to identify and understand the brand of the website. If consumershad a deep understanding of a website brand, they would consider the website immediately when they need to shop online. They are very willing to spend on the website. The service value of a shopping website is mainly reflected in the website's ability to provide service to consumers. As consumers' living standards improve and their spending power increases, they increasingly focus on the quality of service during the shopping process.The image value of a shopping website is mainly reflected in the website construction of the website. New and unique web pages and convenient search pages will contribute to the image of the website, and consumers will be more likely to leave high

ratings and loyalty to the brand.Therefore, this paper proposes assumptions:

H1: Brand knowledge has a positive impact on the brand value (brand loyalty) of e-commerce shopping sites.

H2: The service value (customer service capability) has a positive influence on the brand value (brand loyalty) of the e-commerce shopping sites.

H3: The image value (website construction) has a positive influence on the brand value (brand loyalty) of the e-commerce shopping sites.

3 Data and Methodology

3.1 Data collection

This study mainly collects the data required for the study through questionnaires. The research object of this paper is the broad consumer groups distributed in various cities, mainly concentrated in large cities with relatively good degree of network development, such as Beijing, Shanghai, Guangzhou and Wuhan.Therefore, the questionnaires of this study are mainly distributed through online communicationto satisfy the diversification of the city where the surveyed people are located and the level of the survey target group.

In this study, 300 questionnaires were distributed finally and 290 questionnaires were successfully recovered. The recovery rate reached 96.7%. Among these successful questionnaires, 280 were valid and the effective rate was 93.3%.

3.2 Data analysis

(1) Descriptive statistics

A total of 280 valid questionnaires were recovered in this study, and of which 42.50% were male. The largest number of respondents in the 20-25 age group was 176 people, accounting for 62.86% of the total number. The second is the consumer groups in the 26-30 age group, accounting for 22.50%. In terms of educational level, most of the respondents are undergraduate or master's degree, accounting for 80.35% of the total. And their monthly income is mostly below 3,000 yuan. Among them, the monthly income of less than 1,000 yuan has exceeded half of the total, accounting for 51.07%. Moreover, 55.36% of these surveyed consumer groups use the Internet for a period of 6-7 years. In addition, descriptive statistical analysis shows that the data skewness statistic under each indicator satisfies the absolute value within 3, and the absolute value of the kurtosis statistic is within 10. Based on this, we can conclude that the data in this study basically obey the normal distribution.

(2) Reliability and validity test

The overall Cronbach's Alpha values for the four variables are all greater than 0.7, which is consistent with reliability test requirements. And the CITC values of 11 small indicators are all greater than 0.5, which shows that the measurement scale used now has a good reliability value. In addition, the analysis results show (Table 1) that the Bartlett sphere test χ^2 values of the 11 items in thequestionnaire were 1175 (degrees of freedom 55, sig = 0.000) and the KMO value was 0.779.

Table 1   Tests of KMO and Bartlett

Kaiser-Meyer-Olkin metric for sampling enough		.779
Bartlett's sphericity test	Approximate Chi-square	1175.491
	df	55
	Sig.	.000

(3) The fitting degree of the model

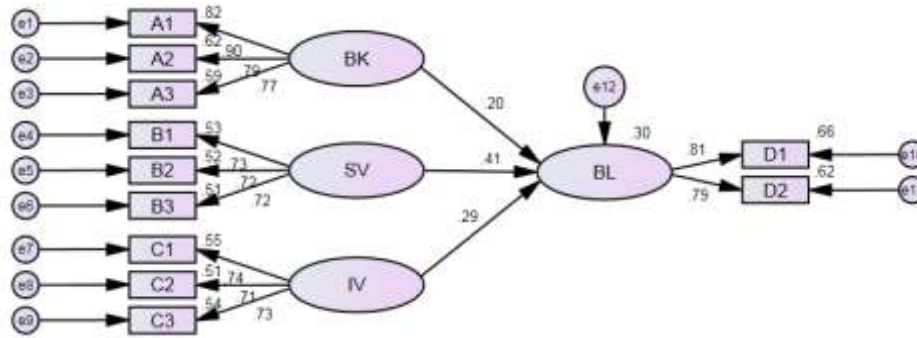
The result obtained through the AMOS 23.0 software experiment is as follows (figure 3). For the model of this study, the chi-squared value is 120.0, the degree of freedom is 41 and the ratio of chi-square to the degree of freedom is 2.926 which is less than the critical value 3, which is in accordance with the model's fitness standard. In addition, this article also uses GFI, NFI, CFI, IFI and other indexes that are not affected by the sample size to evaluate the degree of fit of the model. It turns out most of the indicators are within acceptable levels, indicating that the model fits well, but there is still room for improvement.


Figure 3   Structural Equation Initial Model Path Coefficient

Therefore, according to the correction index and suggestion provided by AMOS, this paper revised the initial model of the structural equation to reduce the chi-squared value of the model and increase the degree of fit between the model and the data. Figure4 revised from the initial model is as follows.
Figure 4   Structural Equation Correction Model and Path Coefficient

The chi-square value of the corrected model is 56.110.The degree of freedom is 38, and the ratio of chi-square to the degree of freedom is 1.477. It is in accordance with the model fitting standard, which is less than the critical value 3. Other indicators are all within the ideal range of standards. Then this model has extremely good fitting degree, and the degree of matching between the model and the data is well.

(4) Hypothesis testing

During the revision of the model, we also obtained the revised model path coefficients (Table 2). Taking brand loyalty as the dependent variable, we can know that the standardized path coefficient of brand knowledge to brand loyalty is 0.150, and its significance is 0.037, which is less than 0.05, indicating that the coefficient is significant at the 5% level of significance. That is, brand knowledge has a significant positive effect on brand loyalty, and the H1 hypothesis holds. The standardized path coefficient of service value to brand loyalty is 0.384, which is less than 0.01, and the H2 hypothesis holds. The standardized path coefficient of image value to brand loyalty is 0.251, with a significance of 0.004 and less than 0.01, indicating that the coefficient is significant at the 1% level of significance, ie, the image value has a significant positive effect on brand loyalty, and the H3 hypothesis holds. And according to the size of the standardized path coefficient, it can be known that the degree of influence of three factors on brand loyalty is service value, image value, and brand knowledge.

Table 2   Path Coefficients of Structural Equation Correction Model

path			Unnormalized path coefficient estimation	S.E.	C.R.	P	Standardized path coefficient estimation
Brand loyalty	<---	Brand knowledge	0.141	0.068	2.084	0.037	0.150
Brand loyalty	<---	Service value	0.448	0.093	4.798	***	0.384
Brand loyalty	<---	Image value	0.302	0.105	2.862	0.004	0.251

In summary, this paper validates several assumptions by using the structural equation correction model of the brand value influencing factors. The hypotheses in this study are all true.

4 Conclusion

According to the analysis of this paper, we can conclude that consumers' awareness of brand, service valueand image value have a significant positive effect on brand value of the website under consumer perspective. The greatest impact is the value of service, the second is the image value, and the least impact is brand knowledge.Based on the above research findings, this article will provide targeted recommendations for the development of e-commerce shopping sites:

(1) To strengthen employee training and enhance website service capabilities. In the fierce market competition, e-commerce shopping websites should strengthen employee standardization training and improve serive level to stand out.

(2) To improve the website construction and increase the value of the website. E-commerce shopping websites should increase investment in website construction, and build a convenient, fast, exquisite and beautiful website page to increase the image value of the website, giving consumers a good impression, and laying a good foundation for brand loyalty.

(3) To pay attention to advertising and improve website visibility. E-commerce shopping websites need to increase investment in advertising and improve their visibility through different channels. For example, "The Red Book" and "Pin Duo Duo" with higher popularity are all implanted in various programs, including TV shows and variety shows.

Abstract: Based on the assumption of bounded rationality, this paper constructs a double house price evolution game in the real estate buying and selling market. It uses the principle of replicating dynamic equations to analyze the replicator dynamics, evolutionary stable strategies and phase diagrams of real estate dealers and home buyers, discusses the replicator dynamic and stability of two-players in asymmetric real estate market buying and selling games, and obtains two evolutionary stable strategies - {high price, buy} and {low price, not buy}. Finally, the model was analyzed and corresponding suggestions were given.
Key words: Bounded rationality; Double price; Replicator dynamics; Evolutionary stable strategy (ESS); Evolutionary game

1 Introduction

The real estate industry is related to the national economy and the people's livelihood and it has always been the topic of popular debate. The game problem in the real estate market has attracted the attention of scholars in recent years. Most researches are based on the fact that all players in the real estate market have complete rationality and complete and perfect information. In a single buying and selling game in the real estate market, it is generally assumed that each player involved in the game has a higher rationality, that is, the player always takes his own best interests as the goal, and he has the judgment and decision-making ability of pursuing the maximization of his own interests in a definite and uncertain environment, can trust each other's rationality, has common knowledge of rationality(CKR).However, such high rationality assumptions can be difficult to satisfy when the game is faced with complex decision-making problems in repeated games because not all game players will trust each other's rationality, ability, trust, and trust of trust. There is any doubt or vacillation, that is, the game is "bounded rationality". Information on the process of the game, the benefits(payoffs) and the balance of the parties is also "incomplete" and "imperfect" due to factors such as region, policy, price, collusion, rent-seeking, timeliness, and channels.

Liu Jin-e(2013) analyzed the main players in the real estate market of evolutionary game theory, and pointed out that information asymmetry makes real estate developers choose monopoly pricing strategies, and buyers choose to buy at sight. Y Yang(2014)built an evolutionary game model by introducing a theory of reciprocity based on behavioral economics, believed disordered chaos was a condition of specific parameters in an evolutionary game model. Y Liu et al.(2015)used evolutionary game theory and system dynamics to study the evolutionary game of green building decisions between government and developers, the results showed that there was no evolutionary equilibrium for government static incentives. Chen Zhiyuan(20116)through the construction of evolutionary game model for commercial bank loans the real estate company's main external financing model from the bank and the cooperation of the company's dynamic game angle analysis. On the basis of the tripartite rent-seeking game model, Hong Kairong et al.(2017)conducted a dynamic evolutionary analysis of the behavioral strategies of both the local government and the central government regulatory authorities. Based on the PAB auction mechanism, Luo Guimei(2016) used robust optimization techniques and the concept of "replication dynamics" in evolutionary game theory to propose a concept of robust evolutionary game equilibrium and established a corresponding replication dynamic system. Wang Ting(2016) used evolutionary game theory and methods to model the choices of the subject-government, developer, and consumer included in the real estate market, and analyzed the results of the model.

In the real estate buying and selling market, there is not much research on the combination of double house prices and evolutionary game. The author(2012) once used Bayesian law and reverse induction to study the dynamic game of double house prices and tripartite on the basis of complete but

imperfect information. But now, we will study the buying and selling game in real estate market when dealers and home buyers have bounded rationality.

2 Model Establishment and Analysis
2.1 Basic assumption

Assuming that, in the multi-periodic real estate buying and selling market in a certain area, the same type of houses in the real estate market in the region are homogeneous, single in type, and house prices are relatively stable. Real estate developers own a certain number of new homes, and home buyers have a certain amount of ability to pay for their immediate needs or investment needs. In addition, the government's policies on the buying and selling market are consistent throughout this period.

The real estate dealers(D) and home buyers(F) are bounded rationality. They are the two players generated by the random pairing of the large group of players in the real estate market buying and selling games with very slow learning speed, that is, D and F are the two players of the repeated game generated by random participants of the participants, and the adjustment of the strategy is simulated by the "replication dynamic" mechanism of biological evolution. Because the players of bounded rationality have different levels of rationality, this means that both parties may not be able to find the optimal strategy in certain periods at the beginning, but they can learn and imitation through continuous learning and then gradually find the best strategy through trial and error, which is similar to the "evolution" phenomenon in biology. Bounded rationality also means that in general, at least some game players will not adopt an equilibrium strategy of a completely rational game. That is, the equilibrium strategy is the result of continuous adjustment and improvement rather than one-off selection, and even if it reaches equilibrium, it may deviate again.

The randomly matched game player D has two strategies-high price(k) and low price(l)the player F also has two strategies-buying(F_1) and not buying(F_2)Then, there will be four different combinations of strategies, so that the players that choose different strategies can be seen as different "types". And, this different "type" is not given, but changes with the game player's strategy, i.e. the game has a process of learning to imitate.

In the large group of participants in the game of buying and selling games, the proportion of high price(k) in game player D is x, the percentage of low price(l) is $1-x$, the percentage of players F in game F_1 is y, and the percentage of players in F_2 is $1-y$.When the players in the group are randomly paired to perform a game, each player F may encounter either a high-price type D or a low-price type D. The former has a probability of x, and the latter has a probability of $1-x$(For a large group, it is possible to ignore the influence of the game party itself on the proportion of other types of players). Similarly, the probability that each player D encounters type F_1 is y, and the probability of encountering type F_1 is$1-y$.

As set forth above, it is clear that in this evolutionary game, the proportions x and $1-x$ in the game player D are not very numerical, but instead fluctuate with time, they're the function $x(t)$ and $1-x(t)$ of time t , but for simplicity, still write as x and $1-x$.Similarly, the same is true for the ratios y and $1-y$ in player F.As the core of the game of bounded rationality analysis, the key to the dynamic change in the proportion of game player strategy type is the speed of dynamic change(the direction can be reflected by the sign of speed). The rate of dynamic change (Xie Shiyu, 2009) of this proportion depends on the speed of the game party learning to imitate, which is usually related to the size of the imitated object (It can be expressed by the ratio of the corresponding type of game players, which is related to the difficulty of observation and imitation.) and the degree of the success of the imitated object (It can be expressed by the magnitude of the payoff over the average payoff of the object-mimicking strategy, which is related to the difficulty in judging the difference and the size of the stimulus).

2.2 Model construction

On these bases, the payoff-matrix is as follows:

Figure 1   The Payoff-matrix of Asymmetric Evolutionary Game Between Two House Prices

		player-F	
		$F_1(y)$	$F_2(1-y)$
player-D	$k(x)$	a,v	c,g
	$l(1-x)$	b,w	d,h

We first consider the general situation. Since the two sides of the game are of different types, the payoffs of the two parties under different strategies are also inconsistent and asymmetric. When D is type k and F is type F_1, both parties' payoffs are respectively a, v units; When D is type l and F is type

F_1, the payoff of both parties is b, w units respectively; When D is type k and F is type F_2, the two sides' payoffs are respectively c, g units; When both sides payoff is d units to D for type l and h units to F for type F_2(As shown in Figure 1).Suppose that these payoffs are not negative and $a>b>0$, $d>c>0$, $v>g>0$, $h>w>0$. Thus, the payoff of a game player depends on its own type on the one hand, and on the type of opponents it encounters on the other hand.

According to Figure 1, it is not difficult to calculate that the expected payoffs of player D choosing k and l are:

$$E_k(D) = y \cdot a + (1-y) \cdot c , E_l(D) = y \cdot b + (1-y) \cdot d .$$

Thus the average expected payoff of player D is:

$$\pi(D) = x \cdot E_k(D) + (1-x) \cdot E_l(D) . \tag{1}$$

According to Formula 1, the replicator dynamics equation of real estate dealer D selecting k can be obtained by using the principle of replicator dynamics equation in evolutionary game theory:

$$\frac{dx}{dt} = x \cdot [E_k(D) - \pi(D)] = x(1-x)[E_k(D) - E_l(D)]$$

$$= x(1-x)[y(a-b-c+d) + (c-d)] . \tag{2}$$

In the above formula, $\dfrac{dx}{dt}$ is the rate of change of the proportion x of type k in game player D over time t. When given the specific values of a, b, c, d, $\dfrac{dx}{dt}$ is a univariate function of x, so the equation can be abbreviated as $\dfrac{dx}{dt} = \Phi(x)$.

Similarly, the expected payoffs of player F selection type F_1 and type F_2 are:

$$E_{F_1}(F) = x \cdot v + (1-x) \cdot w , E_{F_2}(F) = x \cdot g + (1-x) \cdot h .$$

Then the average expected payoff of player F is:

$$\pi(F) = y \cdot E_{F_1}(F) + (1-y) \cdot E_{F_2}(F) . \tag{3}$$

Then the F_1 replicator dynamics equation in F is:

$$\frac{dy}{dt} = y[E_{F_1}(F) - \pi(F)] = y(1-y)[E_{F_1}(F) - E_{F_1}(F)]$$

$$= y(1-y)[x(v-g-w+h) + (w-h)] . \tag{4}$$

In the above formula, $\dfrac{dy}{dt}$ is the rate of change of the proportion y of the selected type F_1 in player F over time t. When given the specific values of v, w, g, h, $\dfrac{dy}{dt}$ is a univariate function of y, so the equation can be abbreviated as $\dfrac{dy}{dt} = \Psi(y)$.

2.3 Results and model analysis

To facilitate later analysis, we introduce the concept of evolutionary stable strategy and steady state. The so called evolutionary stable strategy(ESS) is a stable state that can be converged by each game player after learning to imitate, and has a robustness against a small amount of false deviations. Take $\dfrac{dx}{dt} = \Phi(x)$ as an example, as a point of stability strategy x^*, besides itself must be equalized, it must also have the property that if there are certain players that have deviated due to accidental errors, the replicator dynamics will still return x to x^*.In mathematics, this interference causes x to appear below x^*, there must be $\Phi(x) > 0$, and when the interference appears above x^*, there must be $\Phi(x) < 0$.That is, at these stable states $\Phi(x)$'s derivative $\Phi'(x)$ must be negative, which is called "stability principle" in replicator dynamics equation. Using the phase diagram of replication dynamics, that is, the point that intersects the horizontal axis and the slope of the tangent line at the intersection is a

negative point, and replicates the dynamic ESS for the corresponding game.

Let us first analyze the replication dynamic equation at the D position.

According to formula 2,if $y = \dfrac{d-c}{a-b+d-c}$ (abbreviated as m) then $\dfrac{dx}{dt} \equiv 0$,so that all x levels are stable state. If $y \neq m$, then $x^* = 0$ and $x^* = 1$ are two stable states, among them, when $y > m$, $x^* = 1$ is ESS, and when $y < m$, $x^* = 0$ is ESS. This is because:

$$\Phi'(x) = (1-2x)[\, y(a-b+d-c) - (d-c)\,] . \tag{5}$$

Based on formula 5,when $y > m$, $\Phi'(1) < 0$,so $x^* = 1$ is ESS, and when $y < m$, $\Phi'(0) < 0$,so $x^* = 0$ is ESS. Figure 2 (a),(b),(c) below shows the dynamic trends and stability of the above three scenarios, respectively.

(a)y=m   (b)y>m   (c)y<m
Figure 2   Game group replication dynamic phase diagram at D position

Next, we will analyze the replication dynamic equation at the F position.

According to formula 4, if $x = \dfrac{h-w}{v-g+h-w}$ (abbreviated as n) then $\dfrac{dy}{dt} \equiv 0$, so that all y levels are stable state. If $x \neq n$, then $y^* = 0$ and $y^* = 1$ are two stable states, among them, when $x > n$, $y^* = 1$ is ESS, and when $x < n$, $y^* = 0$ is ESS. This is because:

$$\Psi'(y) = (1-2y)[\, x(v-g+h-w) - (h-w)\,] . \tag{6}$$

Based on formula 6,when $x > n$, $\Psi'(1) < 0$,so $y^* = 1$ is ESS, and when $x < n$, $\Psi'(0) < 0$,so $y^* = 0$ is ESS. Figure 3 (a),(b),(c) below shows the dynamic trends and stability of the above three scenarios, respectively.

(a)x=n   (b)x>n   (c)x<n
Figure 3   Game group replication dynamic phase diagram at F position

Further, we can reproduce the dynamic relationship between the above two population type ratio changes and represent it in a plane rectangular coordinate system with two scales as the coordinates, as shown in Figure 4 below:
Figure 4   The replicator dynamics and stability of two-group players in asymmetric real estate market

It can be seen from Figure 4 that $\{x = 0, y = 0\}$ and $\{x = 1, y = 1\}$ are two ESSs of this evolutionary game, and the other points are not the steady state of convergence and anti-perturbation in the replication dynamics.

When both sides of the buying and selling game fall in Region *II*, they will converge to ESS-$\{x = 1, y = 1\}$, that is, *D* chooses strategy *k*(high price) ,*F* chooses strategy F_1 (buy) ;

When both sides of the buying and selling game fall in Region *IV*, they will converge to ESS-$\{x = 0, y = 0\}$, that is, *D* chooses strategy *l*(low price) ,*F* chooses strategy F_2 (not buy) ;

When both sides of the buying and selling game fall in Region *I* or *III*, with the increase of *m* and *n* , the area of Region *IV* will increase, that is, after learning and imitating processes, most players will converge to the ESS-$\{x = 0, y = 0\}$; with the decrease of *m* and *n* , the area of Region *IV* will shrink, that is, through the process of learning and imitating, most players will converge to the ESS-$\{x = 1, y = 1\}$.

3 Conclusion and Suggestions
3.1 Conclusion and deficiency
For a player with bounded rationality under multiple cycles, the payoffs of one player depends on his own type on the one hand, and on the opponent type encountered by random match on the other hand. Therefore, the game of bounded rationality can eventually find the optimal solution of evolutionary game through replicator dynamic learning and adjustment of strategy. However, this does not rule out the appearance of sub-optimal results, that is, the game player does not eventually achieve the goal through replicator dynamic learning. Instead of high-efficiency results, there has been a reverse selection.

The development direction of the evolutionary game is not only related to the payoff matrix of both parties, but also affected by the initial state of the system, such as increasing the proportion of real estate developers making high price. The model finally formed two equilibrium points, namely {high price, buy} and {low price, not buy}. However, in reality, the game side does not hope that the game evolves in the direction of {low price, not buy}. For the sake of maximizing profit, all parties will compete in the multi-periodic dynamic learning and adjustment to{high price, buy} direction. In general, home buyers have a range of estimated values for a house. Only the "high price" within the estimated value range threshold has enough attraction and practical significance for home buyers, which is higher than this threshold, will make the buyers in a wait-and-see state.

We only analyzed the evolutionary game of players *D* and *F* under double house prices, haven't discuss the purchase motivation (just-needed, investment) of *F*, nor did we analyze the behavior of government and related stakeholders (banks, investment institutions, etc.)or the information and CKR mastery of each game player. But these will affect the game player's strategies, payoffs, the process of the game, replication dynamics and the final equilibrium. So there is further space for research.
3.2 Suggestions
Here are some suggestions:

For home buyers, in order to reduce the impact of irrational factors and asymmetric information, they should collect information in various ways through relevant channels, improve the ability to discriminate, expand the choice space, and rationally invest to reduce risks.

For real estate developers, when considering their own interests, they should also make reasonable investments and make decisions. Housing prices, so that prices can be a rational return to minimize the real estate market bubble.

For the government, how to control house prices and maintain the healthy and stable development of the housing market is its key choice, especially in the context of rapid macroeconomic growth and the crucial juncture of our country's urbanization, how to coordinate the interests of all parties house prices and suppression of bubbles are the issues that the government must face. We should strengthen supervision, improve relevant laws and regulations, and make timely adjustments and feedbacks so as to reduce bubbles and make the real estate market more stabler and healthier "live and work" together to build and realize the "Chinese Dream".

The Effect of Apology Strategy on Consumer Repurchase Intention for Online Takeaway Food Industry

Mo Guodong[1], Cheng Qi[2]
School of Management, Wuhan University of Technology, P.R.China, 430070
(E-mail: 971058359@qq.com，544390037@qq.com)

Abstract: With the development and popularization of the Internet, more consumers choose to purchase food online on the APP. In the process of ordering, delieverying and ultimate consuming bad services occured from time to time, and merchants' remedial measures were various. The influence of apology strategy on consumers' repurchasing intention after the occurrence of bad service was mainly researched based on online takeaway food industry, price sensitivity as a moderating variable was introduced and questionnaire survey and SPPS as an analysis tool were applied in this study. It was found that, in the apology strategy, illocutionary force indications , expression of responsibilities, commitment to restraint, provision of compensation, explanation , all had a positive effect on consumer repurchase intention; price sensitivity was positively correlated with the consumers repurchase intention ; price sensitivity has a positive moderating effect on the relationship between 　 illocutionary force indications, expression of responsibilities, commitment to restraint, provision of compensation, explanation and consumers' repurchase intention. while in the relationship between explanation and consumer repurchase intention, the moderating effect is not obvious.
Key words: Bad service; Apology strategy; Price sensitivity; Consumer repurchase intention

1 Introduction

For any service-oriented industry, service quality is an important factor to allure more customers in the fierce competition environment, obtain the advantages of continuing operations, and promote the increase of customer repurchase behavior. In the web3.0 era, many service industries have shifted from offline to online, and the competitive pressure has been further increased. The quality of service has also been more and more valued by online businesses. However, in reality, the occurrence of bad services is inevitable.

When the service provided by the merchant fails to meet the customer's expectations and the customer's interests are harmed, bad services are generated. After consumers have experienced bad services, they will have negative feelings or dissatisfaction. In addition to the possibility of publishing negative comments online, it is more important that consumers' willingness to repurchase may be reduced or even terminated, which is extremely unfavorable for online businesses. For example, on December 5, 2015, Xiao Han, a sophomore at Shandong Weifang University, ordered a take-out from the Internet, finding some hair in the food. Then, he threw it away. Due to the take-away only cost 10 yuan, it was not worth continuing to complain. However, he said that he would never buy take-out from that online store.

After the occurrence of bad services, remedial measures are available and expedient. That effective remedial services can effectively reduce negative impact of bad services was demonstrated in past studies. Effective remedial services can result in higher customer satisfaction compared to not having experienced bad services and "there is a moral remedy to make customers have higher satisfaction (Li C Y, Fang Y H, 2016)." Besides, and the quality of service remedy has a positive correlation with consumer behavior intention was further authenticated (Ma Penghe and Xia Jiechang, 2014). Bell & Zemke have conducted a systematic study on service remedies (Liu Fengguang, Deng Yaochen, Yan Yingru, 2016). They classified service remediation into five dimensions: apology, timely response, understanding, compensation, and remedial action. Timeliness of remediation, timing of remediation, specific strategies for remedy and effect of remedial measures on consumers' subsequent mental and behavioral issues were central part in the previous research, but no further research on the demension of apology and lack of empirical research on the fuction of particular apology strategy towards repurchase intention. In this study, the demension of apology strategy origniating from the research of Olstain and Cohen's in linguistic domain are illocutionary force indications, expression of responsibility, commitment to restraint, provision of compensation, and explanation (Yan Xuhua Wang Huaijun, 2013).

So, under the premise of minimizing operating costs, can effective apology strategy after bad service have a positive impact on consumers repurchase intention? What role does consumer price

sensitivity play in this process? This study took the online ordering APP Eleme as an example to explore above issues.

2 Literature Review

2.1Bad service

The study on the definition of bad service stems from related research on service quality. Since the 1980s, the research on service quality has gradually emerged. Many scholars have studied the quality of service and proposed the definition of service quality from different perspectives. These definitions can be broadly divided into two perspectives. One view is that service quality is the difference between customer-desired services and actually-accepted services; the other view is that service quality is a subjective perception and attitude. One view has been widely recognized— the quality of service as the difference between the customer's expectation of the service and the customer's actual perceived service after receiving the service (Yi Yamin, 2009). If the expected service level is equal to the cognitive service level, it means that the service quality is ordinary; if the cognitive service level is greater than the expected service level, it means that the service quality is high; otherwise, it means that the service quality is low. Other scholar believes that service quality is a subjective attitude response of consumers and cannot be measured quantitatively based on the characteristics of physical goods (Lee J H, 2013). Therefore, this article defines the bad service as the actual subjective experience of the customer after receiving the service is less than the customer's expectation of the service level.

2.2 Apology strategy

"Apologizing" is an act that occurs frequently in daily interactions and work.   apology is a speech act intended to support listeners who actually or potentially have been affected by being offended (Yan Xuhua Wang Huaijun, 2013) or a kind of behavior that an offender acknowledges the offense and dissatisfaction he incurred and is willing to be responsible, and expresses regret to the offended (Ancarno C, 2015). "Apology" is also one of the important dimensions of service remedy. It was divided into five dimensions: apology, timely response, understanding, compensation, and remedial (Liu Fengguang, Deng Yaochen, Yan Yingru, 2016) Later, four important dimensions of service remedies were proposed, which are recognizing service failures, apologizing, explaining reasons, and real compensation (Song Wei, Ji Kai, 2013).

The apology consists of five parts, which are the signs of illocutionary force, acknowledgment of responsibilities, or expression of accepting accusations, Justify and explain, provide remediation programs, and ensure that no such mistakes are made in the future (Agyekum K, 2015). The "illocutionary force" refers to the fact that the act of giving a meaningful discourse in a specific context is a kind of "verbal action power", that is, the language force, and the illocutionary force of a sentence depends on the means of indicating the illocutionary force used in sentences, which include the use of clear verbs, word order, emphasis, tone, and punctuation (Bentley, J, 2015). Olshtain and Cohen proposed a more specific classification framework for apology strategies, including the illocutionary force indications, the expression of responsibilities, the commitment to restraint, the provision of compensation, and the explanation. This study will also follow Olstain and Cohen's classification of apology strategies.

2.3 Consumer repurchase intention

Willingness is one of the criteria for measuring customer behavior. The willingness to repurchase has always been a research concern in the academic world. After customer experiencing products or services based on their commitment to the brand, the tendency to make a continuous purchase of the products or services is a repurchase intention (Shi Wei, 2014). Later scholars' definitions were developed on this basis. Chen, L.Y. & Lauffer believe that repurchase intention is only a subjective desire of the customer for continuous purchase, rather than a promise. Whether to continue purchasing in the future is Subjectively decided by customer (Chen, L.Y. & Lauffer, 2012，Yang K, Kim H Y, 2012). This study will follow Oliver's definition of repurchase intention.

Factors that affect repurchase intention have been frequently presented on previous research. It was discovered that customer satisfaction positively influences repurchasing intentions (Har L.C, Eze U.C, 2011; Chiu Chao-Min, Chang Chen-Chi, 2009). Sun Y, Liu L, Peng X, et al and others studied consumer repurchasing intentions from the perspective of customer perceived value and believed that the factors affecting consumer's repurchase intentions are perceived easiness of use and perceived usefulness and perceived entertaining.

2.4 The relationship between bad service, apology strategy and repurchase intention

At any time, the occurrence of bad services is unavoidable. Therefore, the corresponding remedial measures are very important to reduce or even eliminate the adverse effects of bad services. He Qichen and Xu Yanghua conducted research from the perspective of fair cognitive theory. They believe that interaction fairness (such as apology, interpretation, etc.) is more important than outcome fairness (such as material and monetary compensation) when performing service remedies. Zhou Xi believes that when the online store implements specific measures for service remedy, increasing consumers' fairness perceptions regarding service remedial attitude, service remedy methods, and service remedy compensation will greatly enhance customer satisfaction and trust. Yang Qiang studied the effects of service remedial effects and perceived control on consumers' positive word-of-mouth communication intentions. The results show that perceived control, as a personality trait, has important mediation between the effect of service remediation and positive word-of-mouth communication among consumers The research results of Yang Qiang, Wu Yibo, and Zhang Yu showed that the response speed, apology, remedial initiative, and tangible compensation all have a positive effect on consumers' positive word-of-mouth communication willingness; brand attachment has positive effect on consumers' positive word-of-mouth communication willingness; brand attachment plays a positive regulatory role in the relationship between response speed, apology and tangible compensation for positive word-of-mouth communication intention. The researches of Jian Zhaoquan and Ke Yun found that customers experiencing process errors are more likely to obtain psychological remedies, and if they encounter result errors, they are more likely to obtain substantive remedies; Substantive remedies will lead to higher customer second satisfaction and loyalty; Subsequent satisfaction positively affects customer loyalty. In summary, the quality of the merchant's remedies, the consumer's own emotions, perceived control capabilities, and consumer attachment to the brand will have an impact on subsequent behavioral intentions.

In past studies, many scholars have proposed different measurement dimensions for service remedies. Bell & Zemke divided service remediation into five dimensions: apology, timely response, understanding, compensation, and remedial follow-up. Bitner et al. recognition of the service failure, apology, explanation, and physical compensation are four important dimensions of service remediation. Although the views on the dimensions of remedial measures vary, most scholars will always include the apology dimension. However, "apology" as one of the main dimensions of service remedies has always been a lack of in-depth research

Thus, this study proposes the following hypothesis:

H1a: illocutionary force indication has a positive effect on consumer repurchase intention

H1b: expression of responsibility has a positive effect on consumer repurchase intention

H1c: commitment to restraint has a positive effect on consumer repurchase intention

H1d: provision of compensation has a positive effect on consumer repurchase intention

H1e: explanation has a positive effect on consumer repurchase intention

2.5 Price sensitivity

The study of price sensitivity originated in the field of economics. Goldsmith et al. defined price sensitivity as the degree to which the individual's perception and response to changes in the price of a product or service. Cao Li et al found that the higher the education level and income level of consumers, the less sensitive to price, and the more tolerant of price increase or price reduction (Cao Li et al, 2016). Fullerton's research suggests that customers with higher price sensitivity are more likely to make computational commitments, and customers with lower price sensitivity are more likely to make emotional commitments to suppliers. James et al. found that low-price-sensitive customers are more likely to be loyal, enjoy full-service, purchase value-added services, and spend more money than high-price-sensitive customers. Sourabh Arora and others found that "better online service quality" and "lower online price" prompted customers to purchase online later. Price-sensitive customers and those who are able to use multiple channels are more likely to go online to buy. Therefore, this study believes that price sensitivity has a direct effect on the repurchase intention, and it also has a moderating effect on the relationship between apology strategy and repurchase intention.

Thus, this study proposes the following hypothesis:

H2: Price sensitivity has a positive effect on consumer repurchase intention

H3a: Price Sensitivity has a moderating effect on illocutionary force indications and consumer repurchase intention

H3b: Price Sensitivity has a moderating effect on Expression of Responsibility and consumer repurchase intention

H3c: Price sensitivity has a moderating effect on commitment to restraint and consumer repurchase intention

H3d: Price sensitivity has a moderating effect on provision of compensation and consumer repurchase intention

H3e: Price Sensitivity has a moderating effect on explanation and consumer repurchase intention

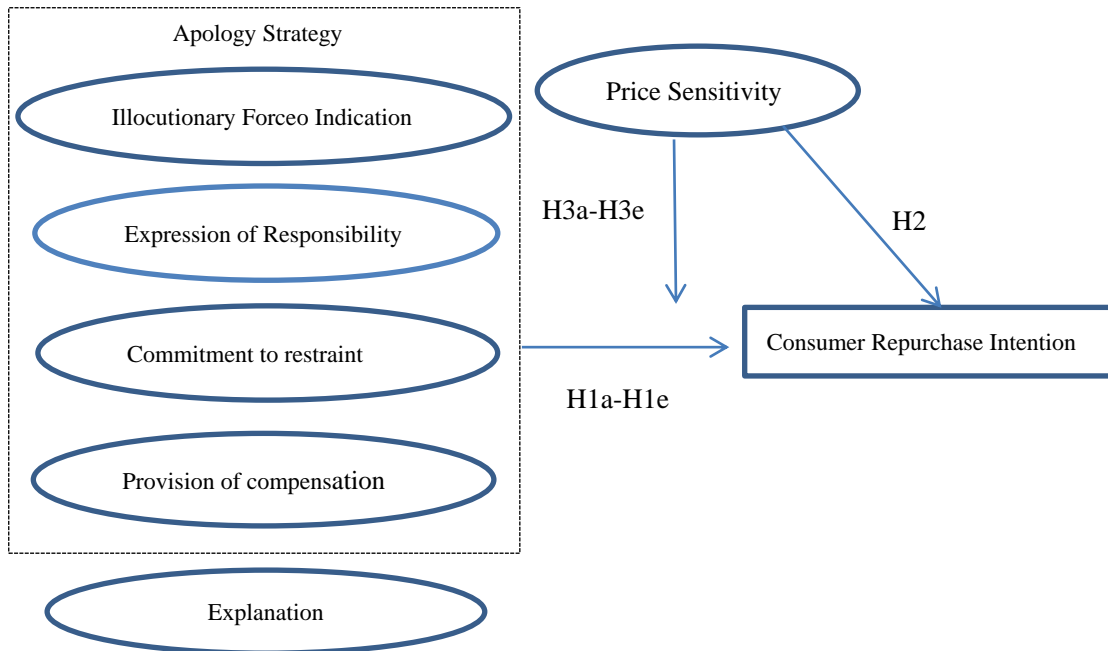
The theoretical model of this paper is shown in the Figure 1 below


Figure 1　Theoretical Model

3 Methodology

3.1 Sample

Nowadays, the online catering and offline distribution services represented by Eleme and Meituan are popular in the web3.0 era, and the probability of bad service is high. Therefore, this study will focus on Eleme. the online catering service APP, as a research context and collect data through questionnaire surveys. The target of the survey was mainly the people in Wuhan who had ordered online experience on Eleme APP.

3.2 Variable design

In this study model, the mature scale was used for variable measurement, and was modified according to the actual situation. In the questionnaire, the apology strategy was measured by the five dimensions of "Illocutionary Force Indication",, "Expression of Responsibility", "Commitment to restraint", "Provisions of compensation", and "Explanation" according to study of Liu Fengguang et al and Zhou Yi . The price sensitivity scale refers to the research of Cao Li et al.. The measurement of repurchasing intention was performed using the scale used by Blodgett, Granbois & Wanger. All measuring question options are measured by Likert 5-grade scale.

3.3 Samples and data collection

Due to the limitation of some objective conditions, a total of 53 e-questionnaires were sent out in this study and 53 questionnaires were returned. After removing 8 invalid questionnaires, 45 questionnaires were analyzed by SPSS 18.0. The effective recovery rate was 84. 9%. The demographic information of the total sample is as follows: 57.78% of females, 42.22% of males, 73.33% of 18-25 years old, 15.56% of 26 to 30 years old, 4.44% of 31 to 40 years old, 6.67% of 41 years old and above; 13.33% of specialists and specialists below. Undergraduate 35.56%, Master and above 51.11%.

3.4 Exploratory factor analysis and confirmatory factor analysis

This study uses SPSS 18. 0 conducting an exploratory factor analysis on the apology strategy, price sensitivity, and consumer repurchase intention. The statistical results showed that the KMO value was 0. 883, 0. 765,0. 808, indicating that the questionnaire is suitable for exploratory factor analysis. In

addition, Cronbach's α coefficient was used to test the reliability of each scale, and the coefficient values were all greater than 0. 7, indicating that the scale has a good level of confidence. The confirmatory factor analysis of the sample was performed using AMOS software. When the χ^2/df was between 1 and 3, the fitting degree was better, and the smaller the better, the χ^2/df values of all variables in this study were consistent, and the RMSEA value was less than 0. 08, each variable NFI, CFI, IFI, GFI and other indexes are all greater than 0.9. Therefore, the fitting effect of each model in this study is good. In addition, the measurement methods adopted in this paper are all selected from the more mature scales in the existing literature, and the related personnel were consulted before the formal investigation to ensure the content validity of the questionnaire.

3.5 Hypothesis testing and analysis

3.5.1 Effect of apology strategy on repurchase intention

As shown in Table 1, gender, age, education, and occupation were controlled in Model 1 to avoid the influence of these factors on the regression results. Model 2 mainly examines the causality of the Illocutionary Force Indication, the expression of responsibilities, the commitment to restraint, the provision of remedy, the explanation, and the consumers repurchase intention. After controlling for variables such as the expression of responsibilities, commitment to restraint, provision of remedy, and explanation, the   Illocutionary Force Indication has a significant positive effect on consumer repurchase intentions, which is expressed as β = 0. 071, p < 0. 001, Then H1a is verified. Similarly, H1b~ H1e is verified. In Model 3, this study examines the relationship between price sensitivity and consumer repurchase intention. From the table, price sensitivity has a significant positive effect on consumer repurchase intention.，which is expressed as β = 0.578, p < 0. 01. Thus H2 is verified.

3.5.2 Verification of the moderating effect of price sensitivity

In order to avoid the problem of multiple collinearity between interaction terms and independent variables and control variables, this study firstly decentralizes each of the regulated variables and independent variables before analysis, and de-centers the variables and multiplies them to obtain the value of the interaction term. Since there are multiple interaction items in this study, multiple collinearity problems between interaction items may still occur in the specific analysis process. In order to solve this problem, we gradually put the interaction items into the main model, and then test the regulation effects separately. The results are shown in Table 1. In the main effect model 2, the price-sensitivity variable was put into the model 4, and the explanatory power of the model was significantly improved, showing ΔR^2 = 0. 068,p < 0. 001. Model 5 was added to the interactive item "Price sensitivity × Illocutionary Force Indication" to model 5, and the explanatory power of the model was also significantly improved, showing ΔR^2 = 0. 049, p < 0. 001, and price sensitivity can positively modulate the relationship between the means of indicating the power beyond the verbal and the repurchasing intention of consumers, expressed as β = 0. 034, p < 0. 01. Thus H3a is verified. In the same way, H3b - H3d are verified. In addition, Model 9 was added to the interactive model of "price sensitivity × explanation " in model 4, although the explanatory power of the model was improved, but the effect of price sensitivity on interpreting and explaining consumer repurchase intention was not significant. Then H3e failed the test.

4 Conclusion

This study is based on 45 samples of on-line ordering experiences. The study explored the relationship between apology strategies, price sensitivity and consumer repurchase intentions in the context of bad services and discussed the moderating effects of price sensitivity. The main conclusions reached in the study are the following two aspects:

(1) After the occurrence of bad service, the merchant's apology strategy (illocutionary force Indication, expression of responsibility, commitment to restraint, provisions of compensation, and explanations have a positive influence on consumers repurchase intentions, and   there is a positive correlation between price sensitivity and consumer repurchase intentions.

(2) The effect of apology strategy on consumers' repurchasing intention will be regulated by price sensitivity. the study found that price sensitivity has a obvious regulatory effect on the means of indicating extra-legal power, expressing responsibility, expressing commitment, providing restraint, and compensating consumers' repurchase aspirations. However, this moderating effect on the relationship between explanation and consumer repurchase intention is explained is not obvious. This may due to, when bad service occurs, the more explanations, the more the consumer feels that the merchant just wants to shirk responsibility instead of really solving the problem, so that consumers can't be satisfied with the apology for this bad service. then costumer has less intention to repurchase. Therefore, whether the price sensitivity is high or low, it is difficult to have a positive impact on this process.

Influence of Brand Ritual Sense on Purchase Intention: The Mediating Effect of Consumer Involvement

Ye Can, Liu Mingfei, Liu Yixuan, Liu Xuan
1 School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: yecan@whut.edu.cn, Liumingfei5223@163.com, jasonlewes@whut.edu.cn, 760028239@whut.edu.cn)

Abstract: With the increasing enrichment and popularity of Internet entertainment, many online video platforms have transformed from a single video playback platform into an online community of rich online and offline activities. The online community of social, video playback, entertainment and information has organized many ritual activities online and offline, and developed many functions to increase customer stickiness, greatly increasing its added value. Based on brand ritual and Brand participationtheory, this article puts forward the assumption of the relationship between brand ritual sense, consumer involvement and purchase intention through literature learning, electing 287 users of IQIYI Bubble Community as a sample, using questionnaire survey to collect primary data. Using the SEM to conduct empirical tests, it was found that the sense of brand ritual has a positive effect on consumer involvement and purchase intention, and consumer involvement as a mediator has a positive effect on purchase intention.
Key words: Brand ritual; Involvement degree; Purchase intention; SEM; Online community

1 Introduction

In recent years, with the rapid development of the entertainment industry, the fan-focused economy dominated by celebrities has become a focus of capital chase and the focus of market attention. The online video community, which is closely related to celebrities, is not satisfied with the function of only playing video and broadcasting, wants to become the entrance of entertaining society, form a new platform for social film and television, mainly for film and television, stars and fans.For example, IQIYI Bubble Community, with the precipitation of video content and star resources, has created distinctive features and interactive modes such as "stars have come" and "vote", and has carried out "fan public interest" and "film release conference" offline activities. Through ritualized activities, the user's cognition of the self is strengthened, and the desire to participate in the activity is further generated. In the process, self-recognition is updated and a sense of belonging is shared among the groups that participate in the activity. The above factors enhance the user's involvement in the bubble community from the three dimensions of cognition, behavior, and emotion, and in turn affect the purchase of bubble community related products.

Therefore, this article will study the relationship between brand ritual sense, consumer involvement and purchase intention.

2 Literature Review and Theoretical Hypothesis

2.1 Brand ritual sense (F_1)

Brand ceremonies are ceremonial interactions between consumers and a brand. Brand ceremonies bring special emotional experiences to consumers through this ritualized interactive behavior, and enhance the emotional connection between consumers and brands (XueHaibo, 2015;Raj, 2012;Prexl and Kenning, 2010).Based on the concept of brand ceremonies, brand ritual sense refers to the emotional connection between a consumer and a brand in the process of ceremonial interaction with the brand. The significance of brand rituals includes four dimensions: self-concept, self-display, self-participation, and self-renewal.Self-concept refers to the consumer's understanding of self-identity through ritual process; self-display means that the consumer displays and expresses himself through the ritual process; self-participation means that the consumer perceives a sense of participation through the ritual process; update means that consumers improve and change themselves through the ritual process (Ran Yaxuan and Wei Haiying, 2017;Wei Haiying and Zhang Lei, 2010; Wei Haiying and Luo Ziwei, 2014).Studies have shown that brand rituals can not only bring consumers a sense of comfort, efficacy and order brand experience, but also affect the consumer's perceptions and emotions, the long-term purchase behavior of consumers and brand value judgment (Vohs K, 2013; Vohs K and Wang Y, 2012).For users of online video communities, the special brand experiences brought about by brand ritual activities in the

community can deepen their involvement in the online community and may also motivate them to purchase the products or services related to the brand.

This article measures the sense of brand ritual from the four dimensions of self-cognition(X11), self-display(X12), self-participation(X13), and self-renewal(X14), and proposes the first two assumptions. H1: Consumers' sense of brand ritual has a significant positive impact on their involvement. H2: Consumers' sense of brand ritual has a significant positive effect on their purchase intention.

2.2 Consumer involvement (F_2)

The degree of involvement is expressed as the individual's intention and interest in a goal or activity. If consumers think they understand that a product is more helpful to their goals, the more likely consumers are to actively learn about the product. When consumers show a high degree of involvement, it means that they will have a high level of concern and a high level of perception and will be presented as a result of a series of active information collection, processing, and decision-making (Lin Dan, 2017).Involvement can measure the psychological state of consumers and have a positive effect on consumers' purchase intention. For online video community users, the object of consumer involvement may be a product or brand, an advertisement or a platform community, or a structure associated with a consumer's goal. Either an antecedent element concerning individuals, objects or emotions may trigger it.The brand ritual sensation, as a kind of emotion triggered by a specific brand ritual, is very likely to prompt consumers to engage and promote their purchase intention.

This paper divides consumer involvement into cognitive involvement(X_{21}), emotional involvement(X_{22}), and behavioral involvement(X_{23}), and examines the mediating role of consumer involvement in the influence of brand ritual on purchase intention. Based on this, the third and fourth hypotheses of this paper are proposed. H3: Consumer involvement has a significant positive effect on their purchase intention. H4: Consumer involvement has a mediating effect on the influence of brand ritual sense on purchase intention.

2.3 Purchase intention (F_3)

Consumers' willingness to buy refers to the possibility that consumers try to buy a particular product. Under the influence of external factors, consumers' attitudes toward a particular product constitute the consumer's willingness to buy. This attitude is the product that consumers make. The subjective inclination of the choice (Liu Cuiping, 2013).Through the influence of various external factors, consumers will have a higher or lower willingness to purchase certain products, and higher purchase intentions may prompt consumers to purchase. On the basis of the definition of purchase intention, online video community users' willingness to purchase indicates that users are willing to make purchases on the platform.From the perspective of consumers, the perceived value and perceived cost of video sites, the personality characteristics of users, and word-of-mouth information received can all influence consumers' willingness to purchase products related to video sites.

After checking the reliability of the scale, the validity test of the scale is carried out. This article measures consumers' willingness to buy from consumers' strong desire to pay for on-demand online video(X_{31}), recharge members(X_{32}), purchase peripheral products(X_{33}), and pay for votes(X_{34}).
Figure 1   Research Hypothesis

3 Data Analysis and Hypothesis Testing

3.1 Model selection and data collection

This paper uses the Likert five scale questionnaire to obtain the required data. In this survey, 287 questionnaires were distributed. This study intends to select the SEM to examine the relationship between brand ritual sense, consumer involvement and purchase intention.The SEM establishes a causal model to observe causal relationships between variables. SEM is divided into measurement model and structural model in two parts: 1. measurement equation describes the relationship between latent variables and observed variables, observation variables are through the scale or questionnaire and other measurement tools to obtain the intuitive data. 2. Structural equations describe the relationship between

latent variables. Exogenous latent variables refer to latent variables as causal factors, and endogenous latent variables are latent variables that can act as outcomes.

The measurement equation is expressed as:

$$Y = \Lambda yn + \varepsilon \tag{1}$$

Among them, X is the observed variable of ξ, Y is the observed variable of η, ξ and η are exogenous latent variables and endogenous latent variables. Λ x and Λ y A are the relationships between latent variables and observed variables, respectively, Which is factor load matrix, δ and ε are the errors of the X and Y variables, respectively.

The structural equation is expressed as:

$$\eta = B\eta + \Gamma\xi + \varepsilon \tag{2}$$

Among them, η indicates endogenous latent variables, ξ indicates endogenous latent variables, B is the relationship between endogenous latent variables.

3.2 Reliability and validity analysis

In this paper, statistical software SPSS23.0 is used to analyze the reliability of the brand ritual, consumer involvement and purchase intention. Cronbach's α reliability coefficient is used to check the internal consistency and stability of the scale, which is between 0-1. The larger the α value, the higher the data reliability. The reliability test results are shown in Table 1.

Table 1 Reliability Test Results

	Corrected item and total relevance	Squared multiple correlation	Clone Bach after deleting items Alpha
X_{11}	.582	.478	.937
X_{12}	.749	.725	.930
X_{13}	.774	.731	.929
X_{14}	.744	.724	.930
X_{21}	.794	.759	.928
X_{22}	.832	.811	.926
X_{23}	.799	.779	.928
X_{31}	.576	.536	.937
X_{32}	.656	.678	.934
X_{33}	.798	.759	.928
X_{34}	.776	.742	.929

The Cronbach's α value of the measured variable satisfies a critical condition greater than 0.7, and is all above 0.9. The revised correlation coefficient between the post-item and the total is above 0.5, and there is a high degree of credibility between the research variables. Therefore, there is no need to eliminate the indicators.

Validity test. This paper uses SPSS23.0 to process the observed variables, and obtain the load value of each factor and KMO sample measure and Bartlett sphericity to test the validity of the data. The KMO value is 0.916, which is above 0.9. The Bartlett's spherical test Sig. is 0.000<.005. The questionnaire has good validity and is very suitable for factor analysis.

3.3 Hypothetical test

Figure 2 Structural Equation Model Path Diagram

Table 2   Model Fit Test Results

Index classification	Index name	Model fitting value	Critical value	Fit evaluation
	X^2/DF	3.627	<5	Good
Absolute fit indicator	RMSEA	0.076	<0.08	Acceptable
	GFI	0.919	>0.9	Acceptable
	AGFI	0.897	>0.9	Acceptable
	NFI	0.947	>0.9	ideal
Value-added adaptation indicator	RFI	0.929	>0.9	ideal
	IFI	0.961	>0.9	ideal
	CFI	0.961	>0.9	ideal
	PGFI	0.571	>0.5	Acceptable
Simplified fitting index	PNFI	0.706	>0.5	Acceptable
	PCFI	0.716	>0.5	Acceptable

287 sampledatas were substituted into the covariance structure model to fit. According to the hypothetical structural equation path diagram, the effective samples were calculated using Amos24.0, and the path coefficients among the variables of the structural model were obtained. To ensure the adaptability of the structural equation model, check the fitted index of the model in the output. The chi-squared-degree-of-freedom ratio is 2.411. In the well-adapted range of 1-5, it indicates that the model has a good fitting effect. The RMSEA value is 0.062, indicating that the model fits well and the model can be accepted. The goodness-of-fit index, the revised goodness-of-fitness index, the norm-fitting index, the incremental fit index, and the simple fit index are within a reasonable range , indicating that the model is well-fitted.

Table 3   Hypothesis Test

Latent variable	path	Observation variable	Influence direction	Path coefficient	S.E. value	T value	P value	test result
X_{11}	←	Self-awareness	+	0.70	0.062	14.082	***	Pass
X_{12}	←	Self-display	+	0.88	0.047	20.938	***	Pass
X_{13}	←	Self-involvement	+	0.89	0.047	21.073	***	Pass
X_{14}	←	Self-renewal	+	0.88	0.038	18.732	***	Pass
X_{21}	←	Cognitive involvement	+	0.94	0.049	20.963	***	Pass
X_{22}	←	Emotional involvement	+	0.91	0.035	26.834	***	Pass
X_{23}	←	Behavioral involvement	+	0.90	0.036	25.627	***	Pass
X_{31}	←	Recharge members	+	0.64	0.059	12.446	***	Pass
X_{32}	←	Pay-on-demand	+	0.77	0.053	16.636	***	Pass
X_{33}	←	Peripheral products	+	0.91	0.041	22.555	***	Pass
X_{34}	←	Paid voting	+	0.90	0.047	24.438	***	Pass

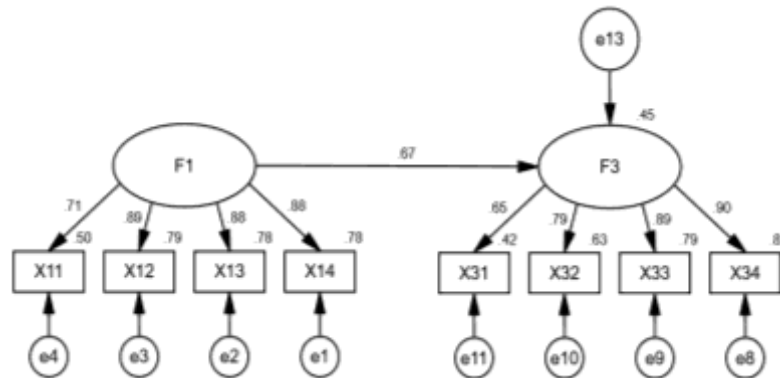
In order to test the mediating effect of consumer involvement in the influence of brand ritual sense on purchase intention, this article removes the "consumer involvement" latent variable and its observed variables from the structural equation model, through the sense of brand ritual to purchase. The change in the path coefficient of the willingness to influence is used to test whether the hypothesis is passed or not. The results show that after removing the "consumer involvement" as a mediator variable, the path coefficient that reflects the influence of brand ritual sense on the purchase intention changes from 0.11 to 0.67, which is a very significant improvement. Therefore, this paper accepts hypothesis 4.


Figure 3   Mediation Test

4 Conclusion

Based on the empirical analysis results, this paper draws the following conclusions: First, the sense of brand ritual has a significant positive impact on consumer involvement, and ritualized activities in online video communities will increase consumer involvement in the community. Second, the sense of brand ritual of consumers has a significant positive impact on their purchase intentions. The rituals of online video communities enable consumers to purchase desires for a range of products or additional services. Third, consumer involvement has a significant positive impact on purchase intentions, and consumers' high involvement levels make them have a stronger desire to purchase online video community products. Fourth, the degree of consumer involvement has an intermediary effect in the influence of brand ritual sense on purchase intentions. The sense of brand sponsorship of online video communities increases their willingness to purchase peripheral products or additional services by enhancing consumer involvement.Therefore, it is recommended that relevant online video platforms carry out distinctive brand activities, develop ritualized platform functions, enhance consumers' emotional attachment to the community, increase consumer involvement, and ultimately increase consumers' willingness to purchase and increase platform profits.

Here are some deficiencies in this article. First of all, the theoretical hypothesis proposed in this paper is based on interviews and literature analysis only. It has certain limitations. In the future research, the online community users can obtain and analyze the first-hand text data of online community users, and enhance the reliability and validity of the theoretical construction. Second, this article only studied one case of the bubble community. Future research can conduct multiple case studies on different types of online communities. Thirdly, this article only empirically tests the relationship among brand ritual sense, consumer involvement and purchase intention.In the future, it should be based on this to study the online community's implementation path to increase consumers' willingness to purchase, thus providing guidance for corporate practice.

Research on the Brand Personality of TOYOTA

Cao Dan

Print Department, Hubei Institute of Fine Arts, Wuhan, P.R.China, 430205

(E-mail: 1021131762@qq.com)

Abstract: Brand personality is a collection of human characteristics, which are associated with the brand. It has four main functions: the integration of brand elements, the definition of brand sign, the composition of brand differences and the analogy of brand associated. The brand personality system is formed by matching positive and negative side of the fixed personality characteristic adjectives, making up five temperaments and then establishing the relation system. Through this system, TOYOTA brand has investigated and contrasted between the users and the similar brands, got the focus that brand personality needed to strengthen in the future of user experience and market competition.

Key words: Brand personality; Personality characteristics; Attributes and interests; TOYOTA brand

1 Introduction

When it comes to the brand, there are the study of brand image, brand culture, brand communication and so on, but the brand personality as the general definition of the brand has always guided each brand elements. However domestic and overseas research on brand personality has focused on the dimension and scale of brand personality. The five dimensions and scale of brand personality, which was made by Aaker in 1997, is a relatively systematic measurement scale for brand personality. In 2003, with Chinese traditional culture, Huang Shengbin and Lu Taihong have summed up the five brand personality dimensions and scale system of "benevolence, wisdom, bravery, pleasure and elegance" on the basis the study of Aaker, which is significant in the localization attempt to research on brand personality dimension. But the establishment of brand personality evaluation system and how to use it to evaluate, all these need further research.

Based on this background and the excellent achievement, this paper has proposed the brand personality evaluation system based on ten groups of personality characteristic adjectives and their antonyms. The system has been used to compare between the users and similar brands for the purpose of strengthening brand personality points.

2 The Overview of Brand Personality

2.1 The meaning of brand personality

In 1997, Aaker had summed up brand personality into five dimensions: sincerity, exciting, competence, Sophistication and ruggedness, and developed a systematic measurement scale (Aaker Jennifer L, 1997）, which has effectively explained the difference between brand personalities. At home, Huang Shengbin and Lu Taihong have made the localization study of brand personality dimensions, which are "benevolence, wisdom, bravery, pleasure and elegance". "Benevolence" is used to describe people's noble quality. "Wisdom" is a description of people's wisdom quality. "Bravery" is a strong image characteristic. "Pleasure" is the meaning of optimism and self-confidence. "Elegance" is used to describe the refined behavior (Huang Shengbin, Lu Taihong, 2003).

In psychology, the personality is defined that a person, to some extent, has maintained a definite self-action and experience, which resulted in the unified model of psychology and physiology (Guo Weipan, 1972). And the view of brand personality is formed by applying the knowledge of personality to the brand research. In a manner of speaking, brand personality is a collection of human characteristics, which are associated with the brand. Just as everyone has his own personality, so is the brand.

2.2 The function of brand personality

2.2.1 Brand personality can integrate each element of the brand

Brand personality has the function of summing up various elements of the brand. It is that converting the brand into "obvious" thing through human character metaphor (Caprarag V, barbaraneil, 2001). At the beginning of the first contact with brand, consumers get the overall understanding of brand through the integration of a unified brand personality. As to enterprises, recognizing brand image from the perspective of brand personality can understand the content and cultural essence of the brand in whole.

2.2.2 Brand personality can fully define the brand sign

With the premise of different brand personality, even if the enterprise has conveyed the same

information to consumers, it will result in different views. For example, the beverage advertising will promote the message with high vitamin C and can eliminate fatigue to the audience. But if the brand is defined as "full of youthful spirit and energy", the brand will be mistaken for nourishing nutrition. In other words, it's possible to be considered as a better taste of fruit juice when "sensitive and delicate" brand personality instead. Therefore, the brand personality is the core of the brand.

2.2.3 Brand personality has formed the difference of the brand

Consumers tend to distinguish the same kind of competitive brands from brand personality. Grasping the advantages and shortage of own brand by analyzing the brand personality of similar competitive brand is favorable to determine brand positioning in market competition. Such as snow beer "Globe Trekker", it's often selected by consumers because of the deep impression on the synonymous with courageous, tenacious, brave brand personality.

2.2.4 Brand personality can analogize things that related to brand

Brand personality can make it easier for people to infer the relationship between business consumers, and other stakeholders (Zhang Junni, Jiang Minghua and Pang Jun, 2005). Enterprises need to establish their own personality, clear consumers' mind on brand personality at the same time. If the gap of relative relationship is appearing, there will be a corporate phenomenon between the two personalities. For example, the unconventional enterprise has produced an egoistic image among consumers however. This situation can be settled by strengthening the components of brand personality, or clarifying the consumer's impression on this brand.

3 The Construction of Brand Personality System

The complex and changeable human character make it difficult to describe, this is also true in the research on personality psychology. The construction of brand personality system can be able to carry out modular management for specific brand personality, take the advantages and weaknesses of brand personality, improve and optimize the vulnerable, and gradually upgrade the brand personality characteristics (Shi Leishan, Ding Jiayong, 2005).

3.1 Identifying the characteristics of the brand personality

As the first step, establishing the characteristics of the brand personality can clearly grasp brand. The adjective used to describe personality characteristic can be selected in the limited vocabulary. In order to draw the conclusion, we have selected ten personality characteristic adjectives to describe the object. They are consistent, independent, optimistic, flexible, capable, energetic, advanced, caring, exquisite and honest.

3.2 Pairing the antonyms of ten personality characteristic adjectives

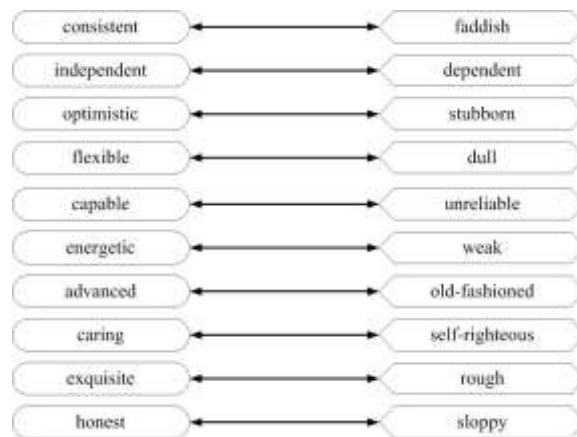
In order to better identify the complexity of the brand personality system, we must associate the antonyms of ten personality characteristic adjectives and then combine the two relative adjectives with a group (Figure 1).


Figure 1   Ten Groups of Personality Adjectives and Their Antonyms Formed by Associating Two Adjectives into Each Group According to the Opposite Meaning

3.3 Matching the positive and negative side of ten groups

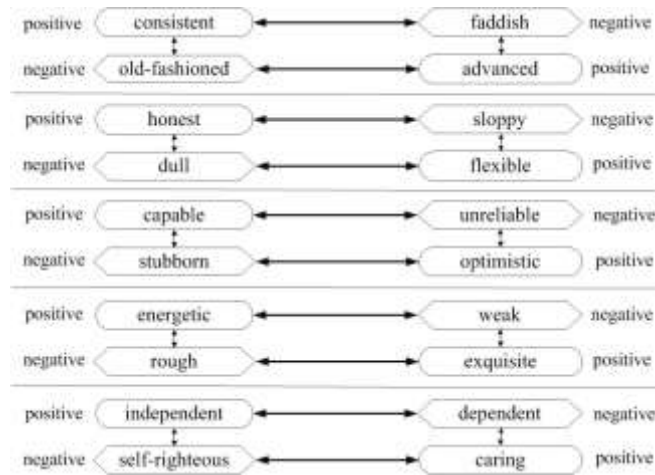
Based on ten groups of personality adjectives and their antonyms above, we choose one adjective from them to describe the positive and negative side of each group and to match (Figure 2).


Figure 2　The Positive and Negative Side Defined by Choosing One Adjective from These Groups to Describe the Positive and Negative Aspect of Each Adjective

3.4 Inferring the relationship between each groups and forming brand personality system

Temperament is the innate characteristics, which forms the deep relationship between the personalities. Such as the group of consistent and faddish, old-fashioned and advanced, the formation in fact is a kind of stable relationship, so we define this group as stable temperament. Therefore, other groups can also be defined as loyal temperament, exploring temperament, active temperament and dominant temperament (Figure 3).
Figure 3　The Brand Personality System Formed by Associating Ten Groups of Related Adjectives into Five Temperaments

4 The Brand Personality of TOYOTA

As the starting point, we choose TOYOTA brand and investigate the consumers' minds of its brand image. The TOYOTA Corporation owns the whole product line-up from the general car to the commercial vehicle. Its activities extended from actively participating in environmental protection, traffic safety protection to holding F1 and other racing activities. Both the company itself and consumers have got a lot of knowledge about TOYOTA (Ambler T.D, 1997). But the knowledge system of TOYOTA is so huge that it's hard to explain in just a few words. Therefore, it is very important for TOYOTA Corporation to clear their brand personality.

4.1 The survey group of TOYOTA brand personality

So the TOYOTA Corporation has done a survey in the United States, which is mainly aimed at the

major consumers of the United States to make a questionnaire survey based on brand personality and brand image. By analyzing and comparing the differences between TOYOTA and non TOYOTA group, we will sum up the brand personality of TOYOTA and make the further development strategy.

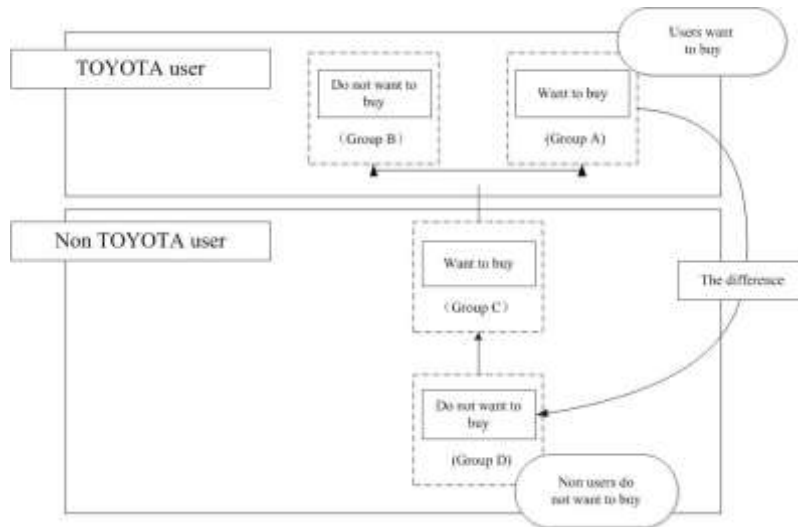
We have set two standards in order to distinguish between TOYOTA and non TOYOTA group. One is "Do you have a TOYOTA car" and the other is "Do you want to buy a TOYOTA car in next purchase". According to the results, there are the four different groups (Figure 4). Group A: it's a TOYOTA user now and will consider buying a new TOYOTA car in the next purchase; Group B: it's a TOYOTA user now but no longer continue to buy TOYOTA; Group C: it's not a currently TOYOTA user but will buy a new TOYOTA car; Group D: it's not a currently TOYOTA user and doesn't consider to the use of a new TOYOTA car.


Figure 4   The Four Groups in Survey Divided from Their Consumption Experience for the Purpose of Finding Out the Big Differences Between These Groups and Comparing

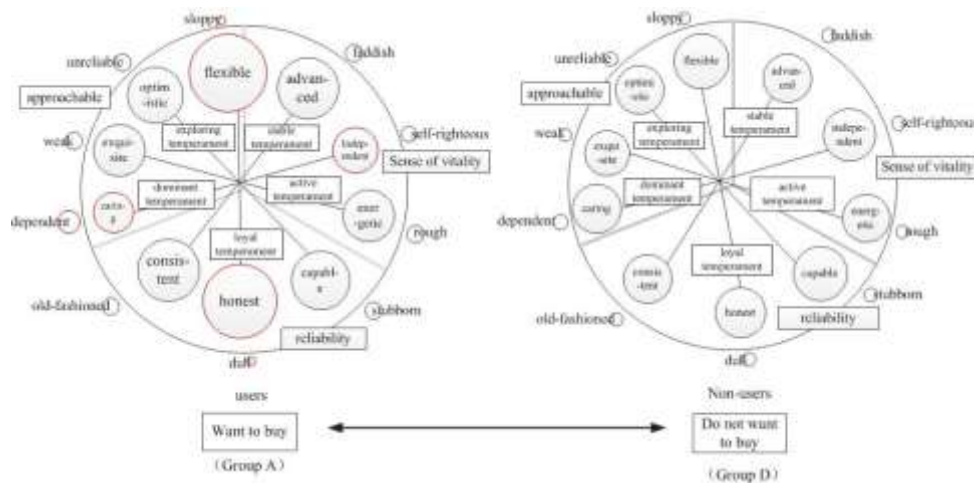
Due to differences in consumption experience, Group A has given the high evaluation of the brand and Group D has got the worst. Therefore, we choose the biggest difference between Group A and Group D to compare(Figure 5). As Figure 5, the size of the circle indicates the strength of the brand impression and the adjectives used are the ten personality characteristics adjectives above (Chen Jiangjun, 2005).


Figure 5   The Comparison Between Group A and Group D Shows That TOYOTA Has Got Different Impressions between Groups with Different Consumption Experience.
(Note: The Size of the Circle Indicates the Strength of the Brand Impression and The Red is the Emphasis Section)

The results show that: Group A has got the impressive "honest" circle, which reflects the company's biggest strong point is high quality. And we should see the big "flexible" circle at the same end of coaxial line, which indicates that the company has obtained an ideal impression on loyal temperament. And the "dull" and "sloppy" circle, the negative side of the same pair, are relatively small. As to dominant temperament, the circle of "caring" and "independent" is slightly weaker than the others, but the negative "dependent" circle is particularly large. The big "flexible" and "honest" evaluation is mainly attributed to the function and quality of the TOYOTA (Xia Xianglong, Yin Liuying, 2005). It's possible that TOYOTA hasn't shown its advantage when compared with other brands because of the relatively weak circle of "independent" and the large "dependent" ring. But each circle in Group D is very small. It's possible that the overall brand impression is relatively weak for its slight consumption of this brand in Group D.

4.2 The comparison between TOYOTA and other car brands

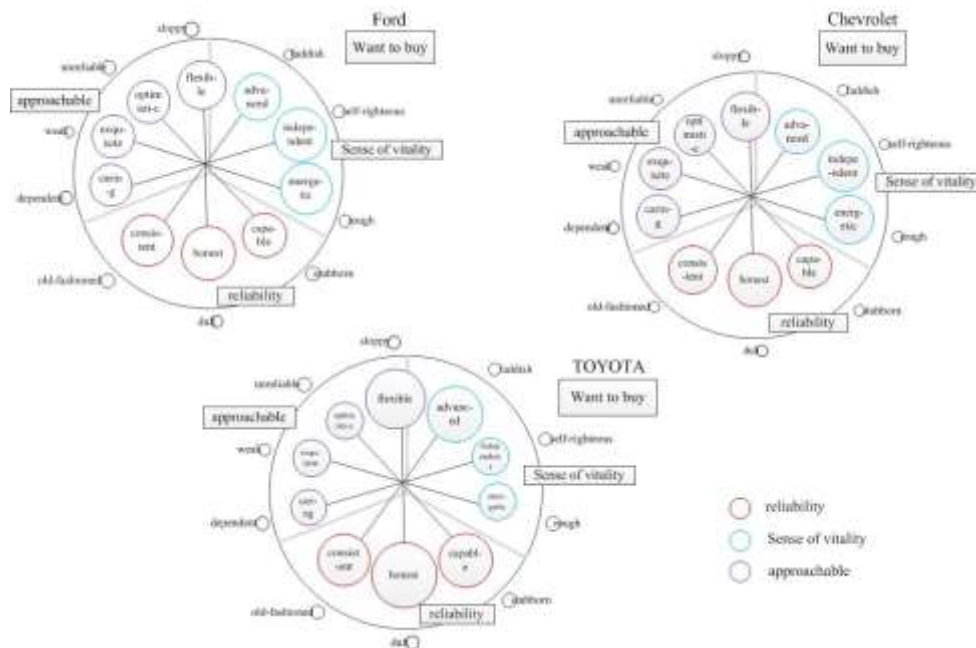
Next, we will compare the TOYOTA with similar competitors, selecting Ford and Chevrolet as comparison object which have occupied the first and second market share in United States (Figure 6).


Figure 6   The Comparison Between Ford, Chevrolet and TOYOTA Shows That There Are Different Sections of "reliability", "sense of vitality" and "approachable" among Three Brands

(Note: The Size of the Circle Indicates the Strength of the Brand Impression and the Red is the "reliability" Section, the Blue is "the sense of vitality" Section, the Purple is the "approachable" Section)

As Figure 6, there are higher evaluations of "honest" impression in three brands, and the "honest" ring of TOYOTA is the largest. In addition, TOYOTA also has a strong feature of "capable", so we can get a comprehensive reflection that the TOYOTA owns the powerful reliability. Secondly, the Ford and Chevrolet get the bigger "energetic" and "independent" points, however the "advanced" point of TOYOTA is relatively high, which results in the imbalanced sense of vitality. When it turns to approachable section, TOYOTA's "flexible" personality characteristic is superior, but the remaining three rounds on this section aren't so obvious that don't give the overall growth in approachable part.

With the strongest "reliability" of TOYOTA and the prominent "approachable" impression of Ford and Chevrolet, we can drawn that Ford and Chevrolet as the United States manufacturers is affected by the consumption quantity of indigenous residents, which can also explain the reliable but unapproachable performance of TOYOTA. In other words, foreign companies must improve the "approachable" impression in order to increase their market share in the United States.

4.3 The comparison of Group A and Group D between interests, attributes and brand personality

Based on Group A and Group D above, we add several interests including the functional interest, emotional interest, self-expression interest and attributes to investigate two groups (Jin Liyin, 2006). As the result below (Figure 7): Group A has a deep understanding of the relationship between the emotional

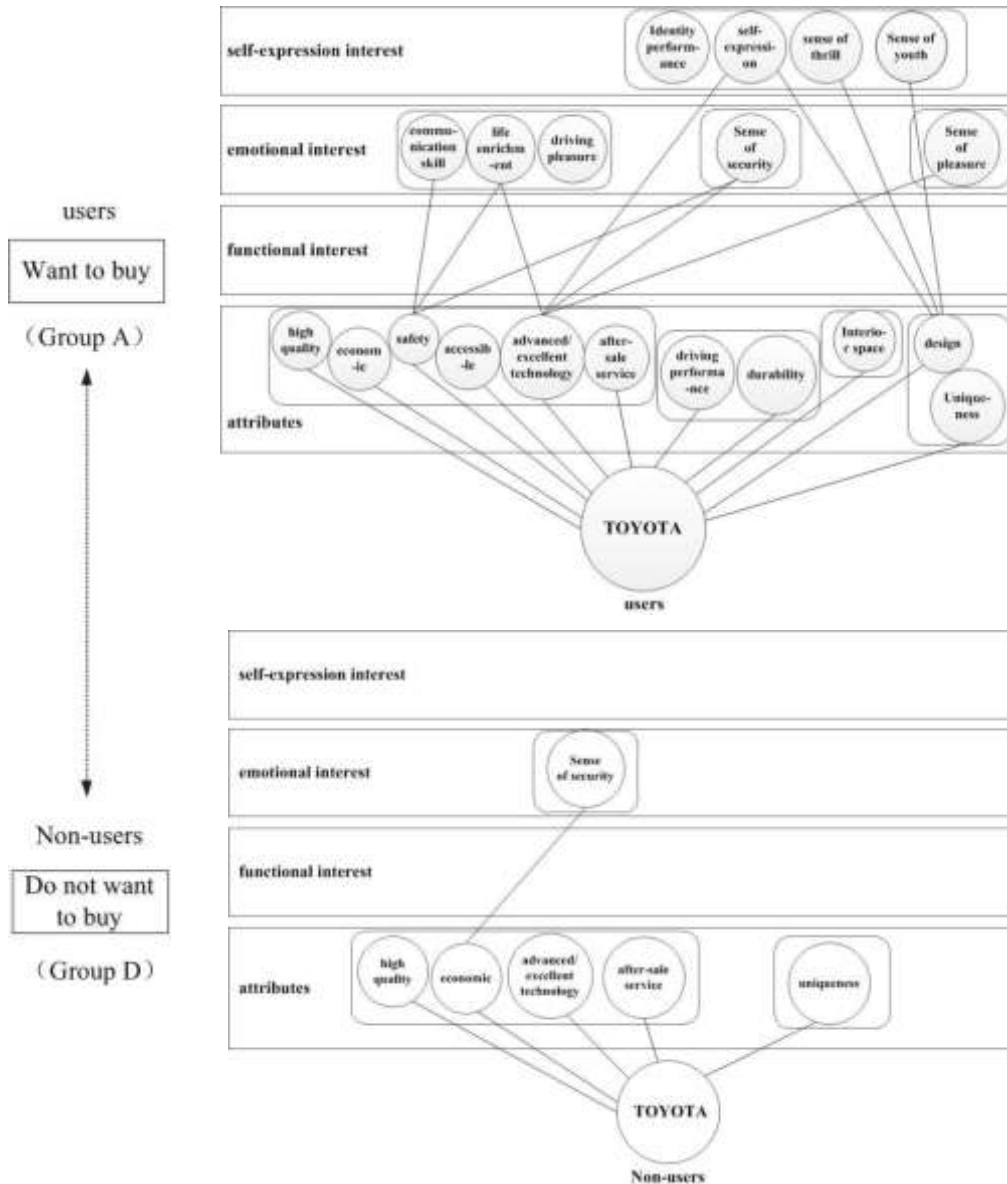
interest and the attributes. Taking advanced / excellent technology as the starting point, supplying with safety and design attribute, connecting with the sense of security and pleasure in emotional interest and creating the sense of youth or thrill in self-expression interest, we can infer that the advanced technology, safety and design of TOYOTA has being fully recognized by users and affected emotional level in further. Although Group D have obtained a certain knowledge of high quality, economic, advanced / excellent technology, but these have just affected on the sense of security in emotional level, so the association system is relatively weak.


Figure 7   The Comparison of Group A and Group D Shows That TOYOTA Has Got Difference Interests, Attributes and Brand Personalities in Each Group Due to the Distinguishing Consumption Experience.
(Note: The Attributes and Interests Generated by Different Groups are Connected by Line)

The contrast between Group A and Group D can be drawn: Group D only has connected economic attribute with the sense of security, which refers to spend little money and saving. However Group A has connected advanced / excellent technology with the sense of security, which can be supposed that the brand make people safe and comfortable through advanced technology. So the same sense of security means two different meaning. One has experienced the latest TOYOTA car and obtained advanced brand impression, the other hasn't experienced the new car and got brand impression in view of economic

considerations.

5 Conclusion

After several survey results above, we can conclude that for TOYOTA brand's personality. Group A has got the "honest" "flexible" and "dependent" impression, and Group D's impression is generally weak. If there is too much "honest" feature in Group A, it is easy to turn negatively to "dull" impression and "flexible" feature will also be changed to "sloppy" one. Therefore, the two sides of loyal temperament must be kept in positive balance, avoid turning to the negative side. In addition, it is necessary to emphasize the "independent" personality characteristics. In comparison with Ford and Chevrolet, there is a strong reliability in TOYOTA but the remaining two personalities in sense of vitality except for the "advanced" are not obvious, so the "energetic" and "independent" points must be pressed. In the long run, TOYOTA as a foreign company should promote the development of "approachable" personality in U.S. market. For the views of attributes and various interests, the differences of Group A and Group D in the sense of security manifest that TOYOTA should connect advanced / excellent technology with design for the promotion of "advanced" personality and the general sense of vitality in further. And the price of TOYOTA cars should also be given an control for that users won't experience new cars for the high price.

However, there are some limitations in this research, such as the difference between users in diverse regions and the survey results of Group B and Group C, which may affect the overall evaluation of TOYOTA's brand personality. That needs further research to supplement and improve.

Research on Brand Ritual Dimension Based on Structural Equation Model

Wang Suying, Chen Yun
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: SusieW1997@163.com, chenyun135@126.com)

Abstract: This research designed an investigation questionnaire of the brand ritual dimensions through in-depth interviews and related literature. SPSS was used for exploratory factor analysis. Six influencing factors were obtained: scene, emotional experience, empathy, brand characteristics，memory enhancement and interaction, then using the structural equation model for confirmatory factor analysis of the extracted factors. Research has enriched the theoretical system of brand ritual and has practical reference significance of the brand management and promotion of enterprises.
Key words: Brand ritual; Factor analysis; Dimension; Structural equation model

1 Introduction

In the increasingly severe market competition, cultivating a brand ritual suitable for consumers is an effective way to build relationships between consumers and brand emotions. The so-called brand ritual is a kind of ritualized interaction between consumers and a certain brand (XueHaibo, 2015). Brand ritual can help companies and consumers create value together; create identity for community members, build common beliefs, increase consumer's sense of belonging to the brand community and brand culture; help to enhance consumer and brand emotions Relevance and brand loyalty (XueHaibo, 2015; Wang Yufen, 2017). Prexl& Kenning (2010) found through research that participation, brand trust, intrinsic rewards and external rewards have a significant positive effect on brand ritual intensity. The strength of brand ritual has significant positive effects on the four stages of the loyalty concept of Oliver (1997, 1999): cognitive loyalty, emotional loyalty, intentional loyalty, and behavioral loyalty. Ran Yaxuan and Wei Haiying (2017) explored the mechanism of brand ritual and its influencing factors through grounded theory. The research results showed that the brand basic meaning formed a brand ritual through the interaction process to the brand ritual meaning flow.

In light of the concept of this study and the theoretical gaps between existing literature, this paper explores the possible dimensions of brand ritual with exploratory research methods in order to compensate for the theoretical gaps and provide theory and practice for companies to design brand ritual, formulate brand strategies, and build brand image.

2 Theoretical Background and Research Design
2.1 Theoretical background
2.1.1 Ritual

In general, ritual consists of a series of symbolic symbols, actions, processes, etc. The expression and propagation of its meaning is mainly represented by symbols (Gu Hong, 2017). Collins (2009) proposes that rituals are aggregates of various symbolic symbols, the essence of which is to reveal the meaning of value and thus exert its meaning at the core of the product. Rook (1985) proposed that the ritual experience has four elements: ritual symbols, ritual scripts, ritual role and ritual audience.

2.1.2 Brand ritual

XueHaibo (2015) proposed that brand ritual is ceremonial interactions between consumers and a certain brand. Based on the concept of ritual, Ran Yaxuan and Wei Haiying (2017) proposed that brand ritual refers to a series of formal, repetitive patterns, values, and meanings surrounding brand activities. Brand ritual is characterized by stylized actions, routine behaviors, symbolic exhibitions, intentional unity and increasing influence (XueHaibo, 2015).The brand consumption ritual refers to a ritual constructed by the brand design and used in the process of consumer consumption. It is an interactive ritual activity between the consumer and the brand (Zheng Ling et al., 2017).

Therefore, this article believes that brand ritual refers to a series of non-functional behaviors related to brand activities that have repeatable patterns and symbolic meanings.

2.2 Research design

The study first conducted heuristic in-depth interviews with 12 consumers that had experience in brand ritual activities. Then, interview results and literature research are combined to form a brand

ceremony dimension pre-survey scale. In March 2018, 100 college students were selected for a preliminary survey. After analyzing the 73 valid data obtained from the preliminary survey and deleting the measurement items that did not meet the requirements of the pre-survey, the analysis results show that the pre-survey scale of the brand ritual dimension is a reliable and valid research tool. In April 2018, 300 questionnaires were distributed to consumers through offline paper questionnaires and online questionnaires. A total of 279 valid questionnaires were collected, and the effective questionnaire recovery rate was 95.9%.

3 Data Analysis

In the valid questionnaires, males and females accounted for 35.5% and 64.5%, respectively; those aged between 19 and 22 accounted for the highest proportion, 55.9%; respondents with monthly incomes ranging from 2001 yuan to 5,000 yuan accounted for the highest proportion, at 35.5%.

3.1 Reliability and validity analysis

3.1.1 Reliability Analysis

Reliability refers to the reliability of the data, that is, whether repeated measurements under similar conditions give consistent and stable measurement. In this paper, internal consistency coefficient Cronbach α value is used for reliability test. This paper used SPSS22.0 for the reliability test of the scale. The results showed that the alpha coefficient of the scale was 0.921, indicating that the questionnaire was highly reliable and the measurement results were reliable.

3.1.2 Validity Analysis

Validity refers to the accuracy of the measurement. At the beginning of the study, in-depth interviews were conducted with 12 interviewees. Through Nvivo11's coding and qualitative analysis of the interview content, the existing literature was combined into a brand ritual dimension scale. Therefore, it is considered that the scale has good content validity.

3.2 Factor analysis

3.2.1 Exploratory factor analysis

IBM SPSS Statistics 22.0 is used for factor analysis of the scale. IBM SPSS Statistics is a statistical analysis software that provides tools that enable users to quickly view data, formulate assumptions for other tests, perform processes that clarify relationships between variables, create clusters, discover trends, and make predictions. The results show that the KMO statistic reaches 0.937, the Bartlett's sphere test approximates the chi-square value of 10767.069, the degree of freedom is 435, and P=0.000, which is significant at the 0.05 level. The data are suitable for factor analysis.

In this paper, the principal component analysis method is used to extract factors, and the maximum variance method is used to rotate the factors. The brand ritual dimension scale is used to extract factors, and the eigenvalue >1 is the principle of the extraction factor. Using Kaiser's normalized orthogonal rotation of maximum variance, a total of 6 factors were extracted, and 79.67% of variance were interpreted cumulatively. The extracted factor loads were all above 0.5, indicating that the scale had a good structural validity (see Table 2). After the orthogonal rotation, R1 "requires brand ritual in many aspects of life", R18 "brand ritual occur at specific times, places, or events" and R19 "does not arbitrarily participate in a brand ritual or not" in each The load on the factor is not significant, so R1, R18, and R19 are eliminated and the subsequent indicators are reordered.

As showed in Table 2, R1~R3 describe the importance of the brand ritual scenes and atmosphere to the consumers, so the F1 is named scene. F2 contains six indicators of higher factor loads with R4~R9. These six indicators collectively describe the brand ritual to create a good emotional experience of consumers, and therefore define it as an emotional experience. R10~R13 indicate that brand ritual must meet certain psychological needs of consumers and therefore define F3 as empathy. R14 ~ R17 show the brand's characteristics and the importance of culture in the brand ritual, so the F4 named the brand characteristics. R18 ~ R19 show that brand ritual needs to create a deep impression for consumers, strengthen memory, so the name of F5 memory strengthening. R20 ~ R27 indicate that brand ritual requires the interaction between consumers and brands and the interaction between consumers and others. Therefore, F6 is named interactive.

Table 2　Brand Ritual Dimension Factor Analysis Results

Extraction factor	Measurement Statement	Factor loading
F1 scene	R1:Need to create a scene.	0.908
	R2: Need to create an atmosphere or feeling.	0.911
	R3: Some parts need to be carefully designed.	0.863

Continural Table 2

Extraction factor	Measurement Statement	Factor loading
	R4: To make consumers have a good experience.	0.731
	R5: Can create emotional experience for consumers.	0.784
F2 emotional experience	R6: Can make people have a good mood.	0.798
	R7: Can trigger participants' emotional expression.	0.797
	R8: Meets consumer characteristics.	0.790
	R9: Fits consumer's emotions.	0.757
	R10: Can enhance the mindset of consumers and make people more active.	0.870
	R11: Meets the psychological needs of consumers.	0.778
F3 Empathy	R12: Pinpoints some kind of consumer desire.	0.873
	R13: Can do the next thing better.	0.602
	R14: Should highlight the brand's characteristics.	0.840
F4 brand features	R15: Can convey brand culture and spirit.	0.833
	R16: The products involved should reflect the brand values and brand spirit.	0.838
	R17: The products involved should be able to highlight the differences in the brand.	0.829
F5 memory enhancement	R18: To impress people.	0.847
	R19: Strengthen the memory in the minds of consumers.	0.858
	R20: There may be "constrained psychology".	0.829
	R21: High operability.	0.756
	R22: It is widely circulated, many people will do this.	0.876
F6 interactivity	R23: Sometimes people need someone to teach.	0.831
	R24: Brand ceremony should be fun.	0.858
	R25: Through this kind of activity, people can express some of their own opinions.	0.858
	R26: Sometimes you need someone else to interact with yourself.	0.860
	R27: Sometimes people have to "play a role" in this activity.	0.866

3.2.2 Confirmatory factor analysis

In this paper, AMOS 21.0 software is used to verify the samples and the maximum likelihood method is used to verify the model's fitness. The result is as follows:

Table 4   Model Goodness of Fit Indicators

	χ^2/df	RMSEA	GFI	AGFI	NFI	CFI	IFI
Initial model	2.718	0.079	0.818	0.777	0.924	0.950	0.950
Revised model	1.765	0.052	0.881	0.851	0.953	0.979	.979

Table 5   Confirmatory Factor Analysis

factor	Items	Estimate	t-value	CR	AVE
	R1	0.983			
F1	R2	0.988	62.495	0.973	0.923
	R3	0.91	33.5		
	R4	0.797			
	R5	0.894	17.881		
	R6	0.894	19.895		
F2	R7	0.927	18.564	0.955	0.781
	R8	0.828	16.028		
	R9	0.952	19.399		
	R10	0.683			
	R11	0.927	13.848		
F3	R12	0.93	13.871	0.862	0.621
	R13	0.541	8.53		

Continural Table 5

factor	Items	Estimate	t-value	CR	AVE
F4	R14	0.858		0.947	0.817
	R15	0.919	21.795		
	R16	0.898	20.83		
	R17	0.939	22.806		
F5	R18	0.931		0.9227	0.857
	R19	0.92	18.348		
	R20	0.946			
	R21	0.813	18.264		
F6	R23	0.958	36.491	0.985	0.902
	R24	0.967	38.562		
	R25	0.979	41.333		
	R26	0.988	44.274		
	R27	0.985	43.25		

As can be seen from the table, the normalized factor loadings for all measurement indicators are all 0.5, Ave values are all greater than 0.5, and CR values are all greater than 0.8, indicating that the convergent validity is good. The initial model's indicators, χ^2/df value is 2.718, less than 3, RMSEA(0.052) is less than 0.08, GFI value is 0.818, AGFI value is 0.777, NFI value is 0.924, CFI value is 0.950, and IFI value is 0.950, the model needs to be revised. Modify the model according to the model modification index, and increase the relative path of e5 and e6, the relative path of e7 and e9, the relative path of e20 and e21, and the relative path of e4 and e6. The fitting indicators have been improved and the model has reached a good fitting degree.
Figure 1   Revised Confirmatory Factor Analysis Chart

4 Conclusion

Based on the research of existing brand ritual, this paper proposes the research concept of brand ritual dimensions, and uses in-depth interviews to obtain research items for measurement. Then six factors are obtained through exploratory factor analysis, and structural equation model is used for verification. Factor analysis. This study concludes that there are six dimensions of brand ritual: scene, emotional experience, empathy, brand characteristics, memory enhancement and interaction. Theoretically, this study proposes the dimension of brand ritual and enriches the theory of brand ritual. In practice, this study also serves as a reference to companies to carry out brand ritual.

There are still some deficiencies in this study. First of all, the survey sample of this study is mainly from Wuhan City. The use of more effective measurement tools to collect consumer information and reduce sample bias needs to be strengthened. Second, this study focuses on the dimensions of brand ritual. It is still necessary to further study how companies can take effective measures to strengthen the impact on brand ritual on customers and increase customer loyalty.

An Investigation on the Factors Influencing Organic Food Purchase Intention in Wuhan

Geffroy Anne-Laure, Ju Lie, Wang Aimin
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 2481694393@qq.com, wangam@vip.163.com)

Abstract: This paper aims to investigate the factors influencing the purchase intention of organic food in the mid-sized city of Wuhan (China). After reviewing relevant literature, the research method was developed based on five hypotheses and a handed survey online have been conducted with a total of 162 valid responses. The finding of this study revealed that purchase intention in Wuhan is influenced by similar factors as larger cities. Indeed, despite a lack of knowledge and trust, very few experiences with organic food products, high prices and lack of distribution channels, it does not stop consumers to intend purchasing organic food products.
Key words: Organic food; Purchase intention; Mid-sized city; Convenience

1 Introduction

With a population over 1.3 billion people, China is the fourth largest country in the world by land size. Its continuous growth in economy and society leads to an emerging middle and high income class, more and more concerned to live a healthy lifestyle (Li, 2006). But for decades, China has been facing the problem of a seriously contaminated environment, especially in the food industry. Associated with an increasing disposable income, the recurrent food scandals allow the organic industry to grow and expand in China, creating potential consumers emerging from mid and big-sized cities (Yin et al, 2010). This paper intends to review the factors influencing the purchase of organic food and to analyze them to the mid-sized city of Wuhan. With more than 10 million inhabitants, Wuhan is considered to have an excellent growth prospect city despite a slow adoption of trends, and lower income factor than bigger cities.

Moreover, previous studies on organic food consumption mainly focus on consumer behavior, purchase intention and demand for organic food in Europe and western countries. Since related studies in China have been only led in big and major cities, it is essential to study the factors influencing Chinese consumer's purchase intention towards organic food in developing cities where the approach about culture and knowledge of organic products is less developed in order to reach a better understanding on a larger scale of population.

2 Literature Review

2.1 Organic food consumer

International publications on organic consumers mainly research on a consumer profile or try to understand the attitudes towards purchase intention in the field (Harper et al, 2002; Padel et al, 2005). Literature can also be found about the main drivers of organic consumption through different approaches such as demographic variables, attitudes, motivations, personal factors, willingness to pay and beliefs. Most of studies describe organic food buyers in China to be a middle to high income consumer, educated females, from 28 to 50, married, pregnant or with infants; or to be senior population, or with health issues (Magnusson et al, 2001; Giannini et al. 2014; Thompson et al. 1998（Li et al, 2015). Official reports and market overviews add other profiles having different consumption behavior and preferences: white collar families, overseas returnees, government officials, young people, foreigners living in China, and corporations.

2.2 Factors influencing consumer purchase intention towards organic food

With the expansion of organic food in China, demographics barriers and cultural differences influence the intention to buy, even though similar factors and attitudes can be found in different countries. Indeed, most of studies led in different countries show the same concerns for health motivation issues, food quality and the environment (Pearson et al, 2007).

2.2.1 Health and environmental awareness

A large amount of literature covers the relationship between health and organic food. Most of findings defines health as the main factor for consumers to buy organic food because of its positive association (Zanoli and Naspetti, 2002; Kyriakopoulos and Van Dijks, 1997); but other researches

suggest otherwise. Michaelidou et al. (Michaelidou et al., 2008) and Tarkianen and Sundqvist (Tarkianen and Sundqvist, 2005) demonstrate that food safety and ethical concerns are the most important factors when purchasing organic food. Regarding environmental awareness, Chen (Chen, 2007) states that consumers involved in an environmental behavior are more likely to have strong intention to purchase organic food products.

2.2.2 Economic development

For some authors, the factor 'price' negatively affect organic food purchase and its frequency (Hughner, 2005; Shepherd et al., 2005) because of its high value on everyday products (Briz and Ward, 2009) ; when others explain that consumers who already have purchased organic food at least once do not consider price as an essential factor (Zanoli and Naspetti, 2002). Moreover, Krystallis and Chryssohoidis (Krystallis and Chryssohoidis, 2005) state that willingness to pay is driven by food quality, food safety and trust in certifications; more than price. However, studies show that 'availabity' (or convenience) has a negative impact on organic food purchase, as product varieties and places to shop are often limited (Zanoli and Naspetti, 2002; Dettmann and Dimitri, 2010).

2.2.3 Demographics

Regarding demographic variable, most of studies show the correlation between consumers with middle to high income and higher educational background; and organic food purchase (Tsakiridou et al.,2008; Thompson,1998; Magnusson et al. 2001, Li and Xin, 2015).

2.2.4 Standards and regulations

Padel (Padel, 2005) found the absence of trust in organic labelling and certification to be the most significant barrier to purchase. According to the author, governments should enforce and intervene in the food supply chain through laws and regulations. Magnusson et al., 2003 defend the organic label as a sign of higher quality for consumers.

2.2.5 Transparency of production process

Food safety is considered as primordial when purchasing organic food, and composition and methods of production are important factors (Michaelidou et al.,2001). The trust in quality standards and integrity influence organic food intention (Lockie et al.,2004; Thompson, 1998); while a brand reputation and positive corporate image promoting common values towards the environment and health concerns can influence a consumer purchase intention in accordance (Onyango et al.,2007).

Based on extant literature, the following hypotheses have been developed, affecting (positively, neutrally or negatively) the organic food purchase intention in Wuhan.

Table 1   Hypotheses

Hypotheses	Factors	Influence
1	Health and environmental awareness	Positive - **Main driver**
2	Transparency of production process	None
3	Standards and regulations	None
4	Economics development	Negative
5	Demographics	Positive

3 Methodology

A survey has been designed using 25 items relevant to the consumer's purchase intention towards organic food, and then conducted in the city of Wuhan. These questionnaire statements have already been conducted in previous researches from different countries, and are based on relevant literature. Moreover, they are divided into four variables containing on average 4 items, and demographic variables: Health and Environmental Awareness, Transparency of Production Process, Standard and Regulations, and Economics Development. A five points Likert scale going from [1] I strongly disagree to [5] I strongly agree, where [3] indicates neutrality has been used (Bryman and Bell, 2007). Regarding quality criteria, each concept has been tested with Cronbach's alpha test, reveling positive results with a minimum value of 0,602 and maximum value of 0,838; 0,60 considered as an accepted level of internal reliability (Bryman and Bell, 2007). Regarding data analysis methods, this study used frequencies, descriptive analysis, Chi-square test, and Phi&Cramer's V values.

During 60 days, 200 questionnaires have been administrated online through social communication tools (wechat, qq) with snowball sampling, and then reached randomly through convenience sampling with QR codes and links to the survey. The questions were first written in English and then translated in Chinese by a native expert, before conducting a successful pilot testing. Finally, over 162 respondents,

162 valid questionnaires were collected.

4 Hypotheses Results and Discussion

H1: Health and environmental awareness are the main driver and positively affect organic food purchase intention in Wuhan

Five items have been included in Health and Environmental awareness concept, but item 2 (Health is important to my lifestyle) has been removed based on the Skewness and Kurtosis criteria. The author will remind the reader that the Likert scale is going from [1] I strongly disagree to [5] I strongly agree.

H1 is rejected. The results for this concept show that 69,8% of respondents are concerned about food safety and believe that organic food is better for their health (53,1%). The respondents show a little knowledge when 32,7% strongly believe in organic food produced without chemicals. Even though 27,8% remain neutral, this score can be explained by the skepticism people can have towards organic food products and its production process. Only 0,6% of respondents declared to not pay attention to the environment when 61,7% do pay attention to the environment. Regarding the last item, 56,2% of respondents believe that organic food support the environment protection when only 4,9% disagree. The statistics results get along with previous theories suggesting that health awareness has the least strong influence on driving consumers to purchase organic food and that food safety and ethical concerns are the main drivers (Tarkianen and Sundqvist, 2005; Michaelidou et al., 2008). H1 is rejected.

H2: Transparency of production process have a neutral influence on organic food purchase intention in Wuhan

H2 is partially supported. 25,3% of respondents have already experienced organic food in the past, with 14,2% never did. This result can be explained by the fact that organic food can be experienced in different ways such as reading in magazines, or watching an ad. As an experience is personal to one, the author does believe that the respondents choosing the neutral item (24,7%) have by deduction, never experienced organic food before as they are not able to make a clear statement. Regarding the role of public administration and ecological organizations on organic food advertisement, 26,5% of respondents strongly disagree and 24,1% have a neutral opinion which can reflect an absence of interest/knowledge in this area. 60,5% strongly agree to have information access to the food they buy, supporting the theory that composition of products is an important factor in the purchase intention (Tarkianen and Sundqvist, 2005; Michaelidou et al, 2001; Lockie et al, 2002). The interest of respondents to know the reputation of the brand (56,2%) also supports another theory stating that brand reputation has a positive influence by reflecting the quality of a product. To conclude, neither a previous organic experience nor an organic food advertisement positively or negatively affects the purchase intention. But information access and brand reputation do have a positive influence on purchase intention.

H3: Standards and regulations have a neutral influence on organic food purchase intention in Wuhan

H3 is partially supported. 30,9% of respondents are neutral about the food standards and regulations awareness when buying food, and only 13,6% strongly agree to be aware. This result shows that the majority of respondents are not aware of any food standards and thus, are blind to food dangers when shopping. Respectively 29,6% (neutral,) 19,8% (agree) and 16% (strongly agree) do not possess the knowledge to identify labels and names of organic food products. Therefore it can be concluded that this factor appears to be a personal knowledge most of respondents in Wuhan do not have. Regarding the trust in organic food standards and regulations, respondents are most likely to trust them, even though 21,6% of respondents do not have an opinion about it. This results falls in line with Aryal et al (2009) findings claiming that Chinese consumers experience a lack of trust when certifying organic food products. As a result, respondents do not seem to be aware about the authenticity or organic food products, and its standards and regulations. Therefore it does not influence their purchase intention.

H4: Economic development factors negatively affect organic food purchase intention in Wuhan

H4 is partially supported. The majority of respondents tend to agree that organic food is more expensive (51,9% - strongly agree; 23,5% - agree) and therefore support the literature review stating that price negatively affect organic food purchase and its frequency (Sheperd et al, 2005). Indeed, the frequency results indicates that 17,9% never buy organic food 26,5% - sometimes, and 28,4% - usually. This result can be explained by the fact that some organic food products are less expensive than others, or represent a necessity which can lead to a usual purchase (ex: health concerns). Moreover, price is not the only factor to consider during purchase process. Indeed convenience factor respectively shows 21,6%

and 24,7% of respondents strongly disagree and disagree about easily finding and buying food in Wuhan. This finding supports Li and Xin (2015) research claiming that consumers who have the least access to organic food tend to go to organic farms and organic food specialty stores more often. Finally, respondents show positive results about willingness to pay (agree 32,1%, strongly agree 19,8%), even though they think that price is expensive.

H5: Demographic factors positively affect organic food purchase intention in Wuhan

H5 is rejected. Demographics analysis showed that 61,1% of respondents were female, and 38,3% were male. This result might be biased as an equal number of men of women would have been more representative of the population. Age of correspondents ranged between 26-35 years old (53.1%), followed by 25,2% (18-25), 18,2% (36-45) and 2,5% (46-55): with 54,3% being undergraduate and 30,9% postgraduate. The highest range of income was found between 3,000-6,000 yuan/month (23,5%), followed by 6001-9000 yuan/month (21%), with 26,5% of respondents working as Company staff/clerical, and 21,1% as 'other'. Regarding the family situation, 51,2% chose the item 'not married' and 'no children' (57,4%). These demographic results found in Wuhan seems to match to the organic food consumer profile already analyzed by previous studies as: 'a middle to high income consumer, educated females, from 28 to 50'. The absence marital and children situation can be explained as most of respondents were undergraduate and postgraduate students, therefore may not be engaged in serious relationships yet and are committed to their careers. In addition, results from educational background support previous researches stating that high level of education is important when purchasing organic food products (Zhu et al. 2013).

5 Conclusion

The findings of this paper have revealed that purchase intention in Wuhan is influenced by similar factors found in large cities' studies (e.g Beijing, Guangzhou etc.). However, it can be noticed that some aspects diverge. This study reflects that higher educated and higher income profiles are more concerned about their health as well as environmental issues. Therefore, they intend to buy organic food products, despite not having the knowledge to identify it. An important point to notice is that people show an interest in the information process about a product, as well as the brand reputation. If this issue could be solved, their trust in organic food certification would be restored, leading to purchase and not only intention to buy. Regarding purchase habits, more expensive prices do not stop the respondents when considering buying organic food products, even though there is a serious problem of product availability to solve. These findings support a previous research led in Wuhan stating that the reason why people do not buy organic food is because of a poor knowledge, channels to buy are few, and consumer willingness to pay is low (Wang, 2014).

5.1 Managerial limitations

Many marketers of organic food can benefit from this research study, especially as the organic food market is yet to be fully developed and covered in China. The author encourages marketers to educate their target audience, and better promote organic food products. This study provides enough data and information to assist strategic management with decision-making process.

5.2 Limitations and future research

Future research should be conducted narrowing the range of demographic factors, and researching deeper into each factor to better understand the choices of respondents. Because the final sample was quite small, it would be interesting to reach a larger sample in order to be more representative of Wuhan population.

The Practice of Marketing in Law Offices: Professionals Opinion

Siméia de Azevedo Santos, Alexandre Luzzi Las Casas
Pontifical Catholic University of São Paulo, São Paulo, Brazil.
(E-mail: sazevedotreinamentos@gmail.com, alascasas@pucsp.br)

Abstract: Brazil is one of the countries that, in proportion to its population, has one of the largest numbers of lawyers, losing only to the United States and India. In this scenario of demand for the profession, and given a large number of corporate law firms in Brazil, and especially in the south-east of the country, this research aims to explore the practice of marketing in lawyer's office based on concepts of service marketing. To reach the objective of the study, the first part of the research aims to clarify the functioning and some particularity of law firms, as well as the disclosure and marketing restrictions that the sector has. The research presented is made up of two studies: a market study conducted in 2015 on legal marketing of corporate-oriented offices, and the other by a survey conducted with professionals from the same market research field, law firms focused on corporate service, updating part of the issues raised and confronting possible changes in the perception of this public. The main analyzes point to the importance of all tools or a set of tools working together, but in the research done with professionals in 2018 reveals a perception that staying present in the events is a more effective way to do marketing in this sector, reinforcing the concept of relationship in service marketing.
Key words: Legal marketing; Digital legal marketing; Professional services marketing.

1 Introduction

In proportion to its population, Brazil is a country with a high number of lawyers, losing only to the United States and India. According to data collected by the Brazilian Lawyers Organization - Ordem dos Advogados do Brasil (OAB), the institution that regulates the activity nationally, in 2008 there was one lawyer for every 322 Brazilians (JusBrasil, 2008)[1].

Among the main elements to explain this number of professionals trained in law is the fact that the profession of lawyer is one of the most traditional in the history of professions, considered one of the three highest paid professions in business (Positive World, 2016), and has power in governmental roles, potentialized by Brazilian bureaucratic procedures.

In this context of demand for the profession, it is also observed the big number of law schools in the country in relation to all other countries in the world: in Brazil there are about 1240 law schools, practically the same number as all the faculties of the rest of the world (GGN, 2015)[2].

In this scenario of demand for the profession, and given the large number of corporate law firms active in Brazil, and especially in the southeast of the country, this research aims to explore the practice of marketing in lawyers office, based on marketing concepts services, with special focus on relationship marketing (Las Casas, 2012) and also digital marketing.

To reach the objective of this study, the first part of the research aims to clarify through theoretical research the functioning and some particularity of law firms, as well as the disclosure and marketing restrictions that the sector possesses. The second part brings results of two types of research, one with secondary data (Intelijur, 2015)[3] and one made by the researchers of this paper in a survey form.

The first study is a market study carried out in 2015 on legal marketing of corporate-oriented offices (Intelijur, 2015), and the other by a survey carried out with professionals from the same universe of market research, or law firms ,focused on corporate care, updating part of the issues raised and confronting possible changes in the perception of this public.For the purpose of this article, only the questions that really fit the objectives of this study were selected.

Research questions focused on the importance of the application of marketing tools and how these tools apply to market customer as well as talent recruitment, and the perception of how new topics like big

data and internet of things can affect legal marketing.Few articles address marketing in law firms. None of them seeks to identify the perception of professionals as to the achievement of better results. This article will fill this gap. This study results will bring new insights concerning marketing for the academy and professionals.

2 Theoretical Framework
2.1 Law firms
Law firms in Brazil are constituted by a specific body, the OAB, or "Ordem dos Advogados do Brasil", and Law No. 8,906 of July 4, 1994, which constitutes and regulates this branch of activity. The Statute of the Lawyer and the Brazilian Bar Association provides in chapter IV, article 15, that lawyers may meet in civil society to provide legal services.

However, when the norm refers to society whose purpose is to practice law, it means that the activity is performed through its partners and other lawyers linked to it, and Paragraph 3 of this same article requires that the proxies be granted individually to lawyers with an indication of the company of which they are a part, since the names of the offices must always represent the first and last names or only the surname of at least one of the partners, as referred to in Article 16.

Another peculiarity of law firms is the fact that they can not function by presenting commercial characteristics, or adopting a fancy name or performing different legal activities.
According to the jurist Gonçalves Neto (2006), "society exists to support the joint activity of lawyers, manage their accounts and facilitate their work." In this same line of thought, Selem (2012) in dialogue with other authors puts the differentiation of the lawyers' societies for the purpose of regulating and disciplining reciprocal relations between lawyers, fundamental to the administrative and financial life of the group, disciplining the office's file and the distribution of remuneration.

The Brazilian Statute of the Lawyer (Law 8.906, July 4th, 1994) predisposes to the unit of professional qualification, that is, all partners must be lawyers, the society should only have the purpose of practicing law, have its registration in the Order and do not present market characteristics.

These characteristics have made law firms models apart in the history of management since any publicity or even a recruitment and selection program must be carefully developed so as not to hurt any of the regulations.

Despite the restrictions, this peculiar characteristic has evolved and gained prominent proportions, considering international experiences, most of the American references, and experiences of the administrative evolution of large and medium law firms, as reported by Esequiel (2016), especially when the subject is the perenniality and growth of law firms.
2.2 Contextualization of legal administration
Administration in law firms is still addressed in a specific way, mainly due to the fact that a law firm has not been compared during a long time with a company, positioning itself from the interpretation of Law No. 8.906 (1994), which provides for the Statute of the Advocacy and the Brazilian Bar Association, OAB.

Additonally, there are some limitations on the following topics:

• **Strategic Planning and Marketing:** Aimed to positioning the company to its target market (Las Casas, 2015) and defining the potential to growth. According to Selem (2012), strategic planning for legal administration is very focused on the internal methodology of work. Strategic planning also covers issues related to marketing communication, although specifically legal, that defines and explores possible channels of communication to convey news and articles, and consequently the image - taking into account the restrictions of the Code of Ethics of the Order (Law 8.906 of 1994) - in addition to other related issues.

• **Financial Management:** Within an office, financial management is responsible for setting budgets for resource use and procurement of supplies, verifying what is feasible or feasible to advance to a client at recourse costs, measuring and compiling the economic and financial results of the period, in addition to analyzing the possible points of saving and which are the most profitable. According to Hipólito (2011), cash flow and the available budget are also assessed in the verification of cost advances for clients, and timesheet or record of time spent with process activities or legal opinions of a certain client for collection of values and pricing of the work developed, using this information to generate indicators of profitability and financial performance.

• **Information Management**: With the emerging technologies facilities, business has gained speed in the interconnection of available data and information (Taurion, 2014), The offices that have a portfolio of medium to large processes need a registration and information management system to help optimize

customer response time and the lawyer's performance. The interconnection between systems serves precisely to achieve integration of information and speed in obtaining answers, either in the sharing of customized spreadsheets or properly developed systems for process registration and judicial follow-ups, such as the popular systems in the sector: Thomson Reuters, Totvs, and Tedesco.

• **Human Resources Management:** in the law firms, the human resources management policy is divided into three specific groups: lawyers, trainees, and administrative staff. According to Esequiel (2011) and Castro (2012) for lawyers, it is necessary to periodically maintain and review the policy of division of labor, the possibility of ascension predefined by the career plan, as well as factors that influence motivation and engagement and the improvement of the professional, and there is room for the use of intern marketing tools (Brum, 2010). For trainees in law it is necessary to maintain a scholarship-internship policy, as well as promotion policies, recognition for good work and time spent at home, and for administrative staff also the development of a career plan, salary policy based on the evolution professional, continuous stimulation to the learning and the improvement. These strategies are linked to the retention of talents, and to the better development of the people in the accomplishment of their attributions.

Due to the fact that the structure of the law firms are very peculiar and peculiar, many differences have been generated in office management, but in recent history a large number of large and medium-sized banks have applied management concepts by administrators with specific knowledge and training in the area, called administrators or legal managers, acting along with the direction of the members (Goes, 2011).

2.3 Legal marketing

To support legal marketing, which is marketing in a professional service sector, we will explore the theory of service marketing. Service is understood as an act, an action or a performance, according to Rathmell (apud Las Casas, 2012).

This act can be presented in several ways. In the case of the law firm, the service provided is the act of the law firm assisting or defending the client company in a judicial proceeding, or an acquisition involving more details, or in the closing of sales and service contracts between the client company and a third, or countless other activities, based on the legal knowledge that the lawyer can offer to assist his client.

One of the possible tools for use by the legal public is relationship marketing, which is the process of identifying, establishing and improving customer relationships so that the objectives of all parties involved are met. Relationship marketing refers to business relationships between economic partners, service providers, and customers, and is a process where trust is essential (Las Casas, 2012).

Legal business is based on relationship marketing: the law firm use to expose its brand in trade promotions, give references of work done and its results , disseminate relevant content in lectures or events, presence in the digital environment through the dissemination of news, respecting the Restriction Resolutions of the OAB Statute (1994), exploring the niches according to banking or lawyer specialization, as well as using networks of associations and content marketing through lectures and social networks.

• **Niche Market**: In advocacy, the niche of action can justify even more its "added value".An article in the Conjur portal (Melo, 2017)[1] explored the power niche issue applied to law firms: that is, a specialized niche within the law not yet explored with prominence or proficiency. This has been the case, for example, with offices that emphasize their proficiency in assisting the corporate establishment of startups, or of offices that collaborate with the elaboration of new security or financial products, that is, the office and lawyers become specialists in the area of business of the client and apply the right to this, showing more explicitly their niche of action.

• **Global Advocacy Networks:** The networked society (Castells, 2010) has exponentiated access to information and interconnected consumer markets and service providers, and this was no different with law firms. Although they go through rigid regulatory aspects for association with foreign entities, accessibility networks have narrowed these barriers. Among the main characteristics for the formation of alliances between Brazilian laws firms with offices in other countries are:

1) A company aiming at the overall improvement of matters related to national and international laws, regulations and procedures, for clients in Brazil and abroad.

2) Society tends to have better acceptance among younger professionals.

3) It has rigid norms to be accepted by the OAB, according to project of 2012:

---

[1] Melo, J. O. (2017). Power Niche É A Mais Nova Ideia De Marketing Aplicável A Advogados. Disponível Em: <http://Www.Conjur.Com.Br/2017-Abr-02/Power-Niche-Ideia-Marketing-Advogados>. Acesso em: 1 Jun 2018.

I - the foreign office can not influence the decisions of the office of which it is associated in Brazil.

II - it is vetoed the submission of societies of lawyers in the country, before societies of other nations.

III - the foreign lawyers / offices, can only act as consultants in Brazil with previous authorization of the OAB.

IV - any type of association that implies loss or diminution of the institutional identity or the autonomy of the administrative, financial, professional or strategic planning management by Brazilian law firms is Prohibited.

V - a foreigner who violates the rules will have the authorization to act as a consultant in Brazil revoked. The cases will be analyzed by the sections where the defendant can defend himself and, according to the result, to appeal to the Federal Council. Lawyers and Brazilian companies that contradict the norms will be subject to the disciplinary process in the OAB, besides administrative, civil and even penal sanctions, according to the provision. (OAB, 2012).

According to the opinion of the lawyer Miguel Reale Junior, the administration of the office does not have to be done by a lawyer, which has opened a field for administration as well, legal administration.

In Brazil the foreign lawyer needs authorization from the OAB, which will grant" leave to act" as a foreign legal adviser. The authorization must be requested in the section of the Order where the professional wants to work. A residence visa in Brazil is required, proof of enrollment as a lawyer in your country of origin, proof of good reputation, certified by an organ of the country of origin and corroborated by three Brazilian lawyers. In the case of offices, the corporate name may be the same as that used abroad, provided that preceded by the expression "Consultants in Foreign Law", and the authorization must be renewed every three years. Table 1 shows the International Corporate Advocacy Associations. Its possible to realize the importance to global market for Law firms due to the high number and offices and several countries Associations operate**.

2.4 Market research on legal marketing

One of the marketing channels used by law firms is directories and associations, including to gather some market information, such as action markets, new laws, and even legal marketing, as was the case of the study published by the portal Intelijur in 2015 on the theme (Intelijur, 2015).

Among the information published in the study, carried out with professionals of business law firm, we highlight as follows:
Figure 1   Marketing Budget in Relation to Annual Billing
Source: Intelijur, 2015.

This research was carried out with 38 professionals from corporate law firms, all affiliated to the institution called legal management, designated by the acronym GEJUR.

Based on the survey data in graph 1, 55% of the interviewed reported that the firm invests up to 2% of annual marketing revenue, 35% investing from 0 to 1% and 20% investing from 1% to 2%. About 25% of the respondents did not respond, or declared not to know this data.

Table2   Main Marketing Tools Used by Law Firms

Tool	% cited
LinkedIn	65%
Site	62%
Gifts	51%
Conference talks	51%
Internal marketing	49%
Associations	49%
Events	45%
Facebook	43%
Sponsored events	38%
Pro-bono activities	30%

Continual Table 2

Tool	% cited
Blogs	24%

Blogs	24%
Market research	16%
Directories	13%
Twitter	13%

Source: Intelijur, 2015.

According to the results presented in Table 2, LinkedIn's professional network was the most cited marketing tool, followed by an institutional website. However, what the respondents considered most effective was the keynote speeches at events.

2.5 Legal marketing case study

Fifty professionals answered the questionnaire, which was sent via link by email and LinkedIn message during the month of juny.

To identify industry insiders' perceptions of what tools might represent good opportunities for legal marketing, a questionnaire was directed to the same public profile of market research conducted in 2015, corporate law practice professionals.

To identify the profile and the experience of the professional, the question about the career of the respondent made it possible to cluster the perceptions of lawyers with more than five years of career, young professionals such as trainees and legal assistants, and backoffice professionals in offices.
Table 4   Profile of Professionals
Source: Survey, 2018.

The questions ranked on a Likert scale the importance for the visibility of a law firm attributed to each listed marketing tool, with scale 1 being not relevant and 5 being very relevant. The following tools were added to: LinkedIn, Facebook, Instagram, Twitter, News Blog, Institutional Site, Event Participation, Event Sponsorship, Event Speech, Relationship in associations and chambers, Texts or articles published in the media, Pro-bono activities and Participation in directories.

It was also questioned on the same scale of Likert being 1 disagree and 5 agreeing quite well to ask how much the respondent believed that these tools collaborated with the marketing for the capture of clients as much as for the attraction of talents or human resources, and how much the interviewee believed new technologies such as big data and internet of things, can impact the legal marketing.

The last question was opened and not mandatory if the interviewee wanted to list some other item that could assist in the disclosure of the name of the office that was not previously listed.

3 Results

Normalizing the likert scale to percentage using Microsoft Excel software, the following results were found:

Table 5　Results– Tools

Tool	General perception of effectiveness
LinkedIn	82.8%
Facebook	62.0%
Instagram	54.4%
Twiter	45.2%
Blog	68.8%
Site	87.6%
Participation in Events	91.6%

Table 6　Results – Question about IoT, Big Data and HR

Question	General perception
Do you believe that these tools help you attract customers (marketing) as much as attract talento (Human Resources)?	83.6%
Do you believe that new technologies like Big Data and Internet of Things (IoT) can impact the Legal Marketing?	82.0%

Source: Survey, 2018.

4 Conclusion

This study aimed to evaluate the practice of marketing in law offices. Initially, the restrictions for the practice were evaluated according to the Brazilian legislation, the opinions of the professionals of the sector were evaluated in two researches. One of them, a sectoral survey pointed, among other data, the main forms of commercialization. The complementary research of the type survey was made in the São Paulo market to identify the practice of marketing including digital marketing

The studies point to congruences, especially regarding the use of social networks, the use of websites and blogs and the prominence that the events cause in the sector.
Facebook and LinkedIn had a greater prominence only after the market research date of 2015, and scored with average strength in applied research.

In general, lecturing at events has proven to be more effective in respondents' opinion than sponsoring events.

The main analyzes point to the importance of all tools or a set of tools working together, but in the research done with professionals in 2018 reveals a perception that staying present in the events is a more effective way to do marketing in this sector, reinforcing the concept of relationship in service marketing.

Others responses: lectures in colleges, strategic location of the office, acting in relevant cases, talent attraction policy, joint action with social media resources.

Possible future studies: to understand whether the legal departments or the businessmen who contract the legal services have a similar perception of the scale of the marketing tools that the offices use. Crossing information may be possible to identify more assertively in which marketing tool can be invested with more intensity, of course, although it is important to consider several possibilities together, not only for the customer conversion but also for brand appreciation.

Strategies for E-C Translation of Western Brand Names: A CIS Perspective

Li Lu

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: allylee3@foxmail.com)

Abstract: English-Chinese (E-C) Translation is essential when a Western enterprise firstly sets foot on China. Currently, there are many globally eminent enterprises that have achieved remarkable success, to some extent, ascribing to their translation strategy informed with Corporate Identity System (CIS). This paper firstly touches upon the background of E-C brand name translation. Then, the origin and main segments of CIS as well as brand name translation have been discussed. In the main body of this paper, with careful elaboration on Corporate Identity System and some eminent translation examples, success can be found from translations informed CIS and positive impact on corporations according to their interactions. Also, the author wishes to show the huge effects between the E-C brand name translation and the development of enterprises with the help of CIS.

Key words: Corporate Identity System (CIS); Brand name; Brand name translation; Translation strategy

1 Introduction

More and more Western brands can be found in China. Except for their quality, the very first factor that attracts the attention of consumers is the translated brand name. To compete with local brands in China, Western brands would adopt diverse translation strategies and methods to complete their translation in tune with the Corporate Identity System (CIS) of their firms, which makes their trademarks more recognizable, novel and fascinating.

Corporate Identity System is composed of three main parts, mind identity system (MIS), visual identity system (VIS) and behavior identity system (BIS). They help companies to render brand names in accordance with their exclusive form which presents unique characteristics and captures the public. Also, the English to Chinese translation and CIS can be advanced by each other which, to some extent, this phenomenon can serve as a driving force propelling the improvement of the enterprise itself.

The CIS perspective is rarely adopted by scholars and researchers, and people who realize the connection between them provided a little discovery. Actually, according to the author's discovery, the advancement that CIS offers to translation is enormous which can be conducive to each party of them. All in all, the development of CIS will exert significant influences on the English-Chinese (E-C) translation.

2 Corporate Identity System (CIS)

After China joined the WTO, competitions have raged between Chinese corporations and foreign companies. Gradually, Western businessmen adopted a management strategy, Corporate Identity System (CIS), to help a company to translate its brand accurately with the its culture and concept, in order to establish its own visual identification, gain popularity and increase sales volume. It emerged in 1940s in America, during which time, IBM adopted this strategy to design and manage its own business which proved successful afterwards. The year 1967 was the time when Japan enjoyed the sudden rise in economy and that was also the time when Japanese introduced the CIS. And it was then found in Hong Kong and Taiwan shortly. Gradually, mainland China learned the mindset of CIS since the reform and opening-up started.

CIS, namely, mind identity (MI), visual identity (VI) and behavior identity (BI), sees an enterprise from a static view but fully expresses the standardized mind, vision and behavior which make a brand highly recognizable, extremely valuable and extraordinarily distinctive.

Corporate mind represents the values and concepts upheld by staff in the long-time and the corporate management philosophy and strategies formed in this process. Visual identity means the advertisements, trademarks, brand names, and the environment of the corporation itself and its corporate culture. Corporate behavior identity is directed by the conduct of a corporation, including how staff reacts on various occasions and its commercial activities.

3 E-C Brand Name Translation

In terms of marketing, brand mirrors the core value, guarantee and intangible asset of a corporation which renders its product recognizable. Besides conveying the meaning of a brand, brand name translation should be simple and easy to pronounce and remember. People attach great importance in giving name to a new-born baby, for an auspicious name may bring good luck to it. So does the outstanding brand name to a company.

Full expression of product, avoiding of taboos and mystery are three major principles governing brand name translation. Also, in E-C brand name translation, it should be noted that novel names can leave strong impressions on customers while intense cultural belonging of Chinese characteristics can be found in a truly brilliant E-C name.

Just like some cosmetics manufactures and footwear companies, special features should be paid more attention to correspondingly. Besides, brands should follow traditional culture. Like the French fragrance trademark OPIUM, it is inappropriate to translate it into "鸦片"(yapian, the Chinese name for opium), for this Chinese version may be detested or even boycotted in China. In addition, translators may adopt transliteration to render brands in a mysterious and exotic way, in order to attract public attention.

During the process of rendering, it is sound for companies to blend the concept, image and conduct of themselves in their brand name translation.

4 Case Studies: Translation of Famous Western Brands Informed by CIS

In the light of the CIS system, firms can combine its idea, image and even the outlook within the little E-C trademark which contains pregnant meanings. Also, it is an adoptable method for companies to seek further development in years to come. As companies develop, the CIS system, perceived as the guideline of planning of the translation of Western brands, can also be pushed forward as well.

4.1 Lancôme and its translation strategy

France is the biggest cosmetics manufacturing paradise all over the globe. And Lancôme, established in 1935, is one of the most eminent cosmetics manufacturers, covering perfume, skin care product and cosmetics. It is translated into "Lancôme" (lankou, orchid and cardamom, which are two types of herbs) in Chinese, with two characters exhibiting different well-known herbaceous plants respectively, which indicates that all the materials Lancôme adopt are extracted from plants. And it is not hard to find that every single product of Lancôme has a print of rose embedded on the package.

The mind identity (MI) of Lancôme is fully shown by the rose and the translated name, "Lancôme". "lan" (lan, orchid in Chinese) and "kou" (kou, cardamom in Chinese) are two popular Chinese herbal medicines which would attract Chinese customers for the long-lasting traditional Chinese medicine history and consumer fervor towards naturally-produced goods. And the first character "lan" could represent a beautiful girl with elegance in the Chinese tradition, so when Chinese clients firstly see this character, they may strongly perceive the uniqueness of it.

Concerning about the whole package, Lancôme has three colors for different functions and one typeface for all, but the decorations of no matter sunblock or foundation or lipstick are all designed in a simple style but comprehensively expressing the characteristics of feminine except for the products for men only. And this is all about the analysis of visual identity (VI).

When it comes to the behavior identity (BI) of "Lancôme", Lancôme would show its trademark at the end of the 15-second or 30-second advertising film for about 3 to 5 seconds. Along with the brand, a gentle and deep voice articulating "lankou" in the advertisement has also left impression on the masses of China.

4.2 Nike and Its translation strategy

A piece of news swept the Internet several years ago about how crazy Chinese middle school students are about Nike sneakers. Nike was translated into "耐克" (naike, endurance and conquering, the Chinese meaning for each Chinese character) in Chinese market. It can be learned from the two characters that "nai" (nai, endurance) and "ke" (ke, conquering or overcoming) both have the meaning of overcoming, surmounting and conquering. Furthermore, as a sportswear enterprise, the product of it should be suitable, comfortable and durable. And in the Chinese tradition, people appreciate the characteristics of durability and quality, especially in the manufacturing industry. So this translated brand is comprehensively welcomed by Chinese people, which fully expresses the MI of this internationally popular brand.

In terms of VI, people may think of its classic logo and unique advertisement, its simple typeface and concise promotional slogan upholding its high fashion in high quality. Moreover, black and white

are selective colors to attract no matter female or male as long as you love sports.

Few Chinese people may know that Nike is the name of the Goddess of Victory and the logo tick is the embodiment of her wings. As a matter of fact, Nike frequently puts emphasis of victory on its product. Behavior identity system is fully shown in front of customers in a comprehensive way combined with the idea and visual effect of the brand, the large sales and tremendous popularity, which render Nike one of the most noted and prosperous sports manufacturers in the world at large.

4.3 Jaguar and its translation strategy

Jaguar, a well-known automobile brand, enjoys the longest carriage maker history in Britain. As a brand of racing car and limousine trademark, it is famous for its instantaneous acceleration and aerodynamic body. This motor brand is translated into "jiebao" (jiebao, fast jaguar in Chinese) in mainland China, although some people may call it "meizhouhu" (meizhouhu, American tiger) or "jijia" (jijia, transliteration of jaguar in Cantonese) in Cantonese. "jiebao" may be the best translated version for its similarity of pronunciation with the original name and it can express more profound meanings for itself.

No matter you take a look at the logo of Jaguar or see "jiebao" in Chinese characters, the first thing comes to your mind may be a fleeting jaguar on a grassland. So, the customers, no matter from the West or China could embrace the same perception of it. Firstly, "jiebao" is the literal translation of jaguar in Chinese. Then, the character "jie" (jie, fast or rapid) denotes swiftness seen as a must of a luxurious automotive, with "bao" (bao, leopard in Chinese), one of the fastest-running animals in the globe. From this Chinese version, the core performance of its car can be easily summarized and at the same time, conveying the MI in all directions.

In VIS, Jaguar adopted an image of a galloping jaguar as its logo, fully presenting its brand name and unfolding the extraordinary speed it will bring to customers. On the whole, "jiebao" interprets its idea, visual sense and genuine performance thoroughly by analyzing "jie" in distinct dimensions.

5 Implications for the Translation of Western Brand Names

5.1 Gaining popularity

Popular companies own celebrated brands which reflect the CIS of the firm. In other words, a brand can be seen as the epitome of the CIS of its own. Technically, a successful Western E-C name shoulders the responsibility of expressing unique concept, presenting appropriate image and providing equal service.

Like the world-renowned record company, Rock, is translated into "gun shi" (gun shi, rolling rock). With "gun" (gun, rolling or rock music) representing rock music—"yao gun yue" (yao gun yue, rock music in Chinese) in Chinese, and "shi" (shi, rock) the literal translation of a rock, Rock has been quite famous in China since many years ago.

5.2 Projecting better image

Along with the expansion of the popularity, a brand will become a unique image kept in the mind of customers. To put it in another way, when customers want to buy one type of product, there may be multiple choices in this field. In their mind, the preferential brand image should possess high quality, exquisite package and thoughtful services.

Take Rock as an example, it is now regarded as one of the most prestigious record companies in the whole world and the most classic Western music brand in China.

5.3 Establishing status

Successful brands can capture the attention of Chinese consumers. In recent years, exported products are flocking into Chinese market. It is quite normal that almost everyone, impoverished and affluent alike, owns something from the outside world. At any place in the world, products with Chinese translated names can be found. This could also be considered as a way to explore market, a method to build up the brand status in China and conquer their market.

Rock entered Chinese market with "gunshi" instead of other fancy names grasping people attention. From that time on, rock has fully entered Chinese people's life.

6 Conclusion

Due to the economic boom in China, a large number of Western enterprises are turning their eyes to Chinese market. In order to publicize their products, foreign entrepreneurs would try their best to express the concept of their companies. However, difficulties could be easily found during the English to Chinese translating process because of the obviously diverse cultures, traditions, mindsets, etc. Apart

from this, successfully demonstrating the corporate idea is also a hard task.

Corporate Identity System (CIS), composed of mind identity, visual identity and behavior identity, is a system measuring and presenting the idea, image and performance of a firm. If the rendering process is blended with CIS, the E-C translated brand names could show the core idea of its company besides the product itself, while CIS could also be advanced in line with the prospect contained in this newly translated name.

According to study, there are researchers working on the connections between the CIS and E-C translation. Nonetheless, few of them have found the mutual effects between each other. As a matter of fact, the CIS could serve as a guideline for E-C brand name translation in order to create a more fascinating trademark for its enterprise to attract more consumers, and then, to establish a brighter vision for the company.

The analysis of these aspects in this paper may give readers a little enlightenment encompassing emphasis being put on the promotion of the CIS and translation in order to gain a better E-C translation under the CIS perspective.

A Study on the Influence of Brand Personality and Brand Communication on Brand Loyalty

Cheng Kangni
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 1329846938 @qq.com)

Abstract: In today's complex and ever-changing environment, the competition between enterprises has also gradually changed from the original quality war and the price war slowly to the brand war. Therefore, how companies create unique and attractive brand personality to obtain more loyal consumers has become an important research topic. At the same time, this study considers that when the brand personality of a brand influences the loyal attitude of consumers, the interaction process between consumers and brands which is brand communication plays an especially important role. This research selects the smartphone brand as the research object. And the empirical research finds that brand personality and brand communication play a positive role in promoting brand loyalty and brand identity plays a mediating role in the process of brand personality and brand communication affecting brand loyalty. This study has enriched the literature on brand theory and provided useful inspiration for companies to build strong brands.
Key words: Brand personality; Brand communication; Brand identity; Brand loyalty

1 Introduction

The maturity of product technology has made the homogenization of market products more and more serious and the competition between enterprises has become more intense than ever.Since Ogilvy (1950) put forward the concept of brand, domestic and foreign companies have begun to pay attention to the importance of brand building. By shaping the brand personality to meet the emotional needs of customers, attractive brand personality will make customers deeply love the brand and become a brand loyal customer. Today, consumers are more eager for the emotional functions provided by the brand and use their products to express their emotions and display their own personalities. Therefore, the unique and distinctive brand personality can obtain the consumer's favor and recognition.However, brand communication provides a channel for consumers to understand brand personality and maintains a long-term relationship between brands and consumers (Parvatiyar, 1995). In interaction with consumers, consumers will form a good relationship with the brand and form a brand identity. Then they will become loyal consumers of the brand.

This study believes that brand personality and brand communication have a significant direct impact on brand loyalty. At the same time, they also indirectly influence brand loyalty through brand identity. Although there have been studies on brand personality, brand communication and brand loyalty in the literature, they have been analyzed from a single variable to analyze its impact mechanism. For this reason, this study uses brand personality and brand communication as independent variables and brand identity as an intermediary variable to explore the direct and indirect effects of brand personality and brand communication on brand loyalty.

2 Literature Review

2.1 Brand personality

The term "brand personality" comes from the personality of the person in psychology. Later, some scholars introduced personality into brand science and gradually formed the concept of brand personality. Therefore, the personality of a brand and the personality of a person are common in certain aspects (Epstein, 1977). In the process of interaction between consumers and brands, customers will understand the personality of the brand and then will judge whether brand personality is in line with their own personality. Consumers also desire to express their own personality through brand personality (Plummer, 1985). For the study of brand personality measurement, the most classic and most widely used is Aaker's five dimensions: sincerity, excitement, competence, fineness and crudeness according to Goldberg's "Big Five" model. This study is based on the brand personality scale developed by Aaker and focuses on the characteristics of the research object which is the smart phone brand.

2.2 Brand communication

Brand communication is a bridge between consumers and brands and it is also an important form

for consumers to understand brand personality. The concept of brand communication can be summarized as the brand's philosophy and personality are conveyed to consumers through the channels of promotion and other channels based on the core of the brand's philosophy and culture. The researches on brand communication is not much. The domestic research on brand communication is rare. Cheng Binbin (2016) studied brand communication strategies under the new economic situation and proposed social marketing strategies that focus on consumer emotional appeal. Huang Minxue (2017) and other scholars proposed that brand communication in the social media will promote consumer brand community recognition.

2.3 Brand identity

Compared with brand communication, researches on brand identity at home and abroad are very rich. Sven & Sue (2008) believes that brand identity is the degree of integration of the personality conveyed by the brand and the self-perceived personality of the consumer. Consumers may perceive the identity of the brand more when they recognize that the brand personality is consistent with themselves.

Reviewing the researches on brand identity in recent years, we found that many studies analyzed the influence of brand identity on consumer's attitude and purchase intention. Scholar Zhang Jinxin (2017) studied the impact of online negative reviews on online purchase intentions and analyzed the regulatory role of brand identity. Li Huamin and Li Rong (2013) studied how customer's experience influenced brand loyalty and empirically analyzed the mediating role of brand identity.

2.4 Brand loyalty

The concept of brand loyalty was first put forward by Brown. He described the brand loyalty as the repetitions of buying behavior. He thought that when consumers repeatedly purchased the same brand product more than four times, he could be regarded as the loyal consumers of the company. Day (1996) first outlined brand loyalty in terms of attitudes and behaviors and believed that brand loyalty is not only reflected in consumers' repeated purchase behaviors of products, but also reflected in whether consumers have a unique favorite attitude toward brands.Brand loyalty has always been a research hotspot in marketing. Based on social exchange theory, Wang Jun (2016) finds that brand reliability has a significant positive effect on brand loyalty, in which consumer's brand trust plays an intermediary role between brand reliability and consumer brand loyalty and consumer's emotional attachment plays a regulatory role between brand reliability and brand trust.

3 Experimental Model and Assumptions
Figure 1   The Experimental Model

Based on the literature review and the experimental model, the following hypotheses are proposed:

Hypothesis 1: Brand personality has a significant positive effect on brand loyalty.

Hypothesis 2: Brand communication has a significant positive effect on brand loyalty.

Hypothesis 3: Brand identity has a significant positive effect on brand loyalty.

Hypothesis 4: Brand identity plays an intermediary role in the process of brand personality and brand communication affect brand loyalty.

4 Survey and Data Analysis

4.1 Measurement method

The research object selected in this study is the smartphone brand which is understood and used by most consumers today. This study also investigates college students as target groups and use electronic

questionnaires to collect data. A total of 127 questionnaires were recovered, 3 invalid questionnaires were filled out and 124 were valid questionnaires.

This article uses the brand personality scale developed by Aaker for the measurement of brand personality. Chinese scholar Xiao Chuanliang (2007) divided the brand communication effect into two dimensions: psychological effect and purchasing effect to measure brand communication. The internal consistency reliability coefficient of this scale is Cronbach's $\alpha=0.79$. This study is based on Sven Kuenzel's Brand Identity Measurement Scale to measure brand identity. The internal consistency reliability coefficient of this scale is Cronbach's $\alpha=0.93$. At last, this study divides brand loyalty into attitude loyalty and behavioral loyalty based on Kelley (2003). The internal consistency reliability coefficient of this scale is Cronbach's $\alpha=0.81$.

4.2 Empirical analysis

4.2.1 Correlation analysis

From Table 1, we can see that there is a positive correlation between brand personality and brand communication with brand loyalty. Also, there is a positive correlation between brand identity with brand loyalty. Therefore, Hypothesis 1, Hypothesis 2 and Hypothesis 3 are initially verified.

Table 1   Correlation coefficient matrix

Variable	Mean	S.D.	1	2	3	4	5	6	7
1 Sincerity	21.76	28.17	1						
2 Excitement	2.62	0.91	0.067	1					
3 Fineness	34.51	39.43	0.045	0.097	1				
4 Competence	18.33	19.26	0.337	0.259	0.076	1			
5 Brand Communication	50.86	10.49	0.130	0.068	0.039	0.082	1		
6 Brand Identity	49.98	18.77	0.320***	0.410***	0.495***	0.332***	0.355***	1	
7 Brand Loyalty	30.18	11.06	0.369***	0.348***	0.391***	0.407***	0.313***	0.484***	1

Note: *** means $p<0.01$, ** means $p<0.05$, * means $p<0.1$, the same as below.

4.2.2 Regression analysis

For the hypothesis test, this study uses statistical analysis software SPSS20.0 to conduct multiple regression analysis to verify the causal relationship between variables.

Model 1 of Table 2 examines the effect of control variables on brand identity. Model 2 shows that after controlling the age and income of consumers, there is a significant correlation between brand personality and brand communication with brand identity. There is a significant correlation between brand identity and brand loyalty. Therefore, Hypothesis 1 and Hypothesis 2 and Hypothesis 3 have been repeatedly verified.

Table 2   The Mediating Role of Brand Identity

Variable	Brand Loyalty		
	Model 1	Model 2	Model 3
Control variable			
Age	0.029	-0.021	-0.032
Income	0.047	0.049	0.082
Sincerity		0.334***	0.227***
Competence		0.362***	0.206***
Variable	**Brand Loyalty**		
	Model 1	Model 2	Model 3
Excitement		0.317***	0.269***
Brand Communication		0.449***	0.377***
Brand Identity			0.218***
R^2	0.003	0.113	0.145
Adjusted R^2	-0.019	0.083	-0.116
ΔF	0.153	11.677***	3.107***

In Table 2, we use Model 1, Model 2 and Model 3 to test the mediating role of brand identity in brand personality and brand communication and brand loyalty. Model 2 shows that after controlling the age and income of consumers, there is a significant correlation between dimensions of brand personality and brand communication and brand loyalty (p<0.01). Hypothesis 1 and Hypothesis 2 have also been repeatedly verified.Model 3 is a full model. After the variable of brand identity is added, the correlation between brand personality and brand loyalty is reduced. It can be seen that brand identity plays a partial intermediary role between brand personality and brand communication and brand loyalty. Therefore, hypothesis 4 of this paper is verified.

In order to verify the synergy of brand personality and brand communication on brand identity,this study performs regression analysis on each variable.

Table 3   The Synergistic Effect of Brand Personality and Brand Communication

Model	Independent variable	R^2	Adjusted R^2	F value	Standardization coefficient	t	Sig.
1	brand personality	.517	.515	21.58	.613	17.133	.000
2	brand communication	.484	.482	28.90	.516	13.022	.000
3	brand identity	.685	.684	53.76	.827	26.038	.000
4	brand personality	.581	.578	16.77	.441	7.496	.000
	brand communication				.367	6.073	.000

Dependent variable: brand loyalty

From Table3,Compared with Model 1 and Model 2, We can see that the R^2 is improved and the standard estimation error is reduced in model 4when the independent variables are brand personality and brand communication. That is to say, the model 4 provides favorable fit statistics and the degree of integration becomes better. So, the synergistic effect of brand personality and brand communication is verified.

5 Conclusion

This study takes the smart phone brand as the research object, carries on analysis to the sample data and discusses the relationship between brand personality and brand communication, brand identity and brand loyalty. The main conclusions are as follows:(1) Brand personality and brand communication have a positive effect on brand identity. (2) Brand identity can promote brand loyalty. (3) Brand identity plays an intermediary role between brand personality, brand communication and brand loyalty. This study combines brand personality with brand communication as a system, analysis their direct influence on brand loyalty and how to further enrich the brand theory system through the indirect influence of brand identity on brand loyalty. At the same time, this study also made a slight contribution to the theoretical development of brand communication and provides some valuable inspiration for corporate marketing practices.

An Empirical Study on the Influencing Factors of Relationship Commitment in Marketing Channel

Wu Xiaojuan

Wuhan Huaxia University of Technology, Hubei Wuhan, P.R.China, 430223

(E-mail: 402928043@qq.com)

Abstract: The relationship between suppliers and dealers in their marketing channels has become the marketing research focus because it directly affects competitive advantage of an enterprise. This paper reviews the relevant literature and builds an influential model of relationship commitment in marketing channel, and combines with empirical study to test the analysis. Empirical findings show that Major antecedents of affective commitment are trust and shared values; both service quality and relationship termination costs are positively associated with income commitment; relationship termination costs positively impact on switching cost commitment.

Key words: Relationship commitment; Income commitment; Switching cost commitment; Affective commitment

1 Introduction

How to improve the quality of channel relationship is an urgent problem that needs to be solved in marketing theory and practice. By constructing and testing a theoretical model of the antecedents of relationship commitment in marketing channel, the present study is intended to extend existing research on the antecedents and consequences of relationship commitment and to provide practical guidance for current enterprises.

The study of the theory of relationship commitment is mainly the description of the behavior level and mental level.American scholar Becker (Becker, 1960) suggested that "commitments come into being when a person, by making a side bet, links extraneous interests with a consistent line of activity" from the aspect of behavior. Moorman, Zaltman, and Deshpande (Moorman,Zaltman and Deshpande, 1992) proposed that "Commitment to the relationship is defined as an enduring desire to maintain a valued relationship". We adopt the mainstream view, defined customer relationship commitment as an enduring desire to maintain a valued relationship.

In recent years, researchers have mostly regarded customer relationship commitment as multi-dimensional. Meyer and Allen(Meyer and Allen, 1991)argued that three major dimensions of relationship commitment: affective commitment, continuance commitment, normative commitment. Wang Zehua (Wang Zehua, 2002) suggested three major dimensions of customer relationship commitment: income commitment, switching cost commitment, affective commitment. This study, there are three major dimensions: income commitment, switching cost commitment, affective commitment. Now economy commitment and affective commitment used do not embody the qualitative difference between the benefit and switching cost factors. In this paper economy commitment is classified more particularly by the income commitment and switching cost commitment. Demonstration by Wang Zehua (Wang Zehua, 2002) indicates it to highlight the characters of channel member more accurately.

In this study, we will focus on the influencing factors of relationship commitment in marketing channel: trust, shared values, service quality, and relationship termination costs through the research and summary of relevant documents, combined with the previous visit to Wuhan electronic products dealers.

Trust is so important to relational exchange that it is the cornerstone of the strategic partnership. We conceptualize trust as existing when one party has confidence in an exchange partner's reliability and integrity. Moorman, Zaltman, and Deshpande (Zaltman, and Deshpande, 1992) ,Morgan & Hunt (Morgan and Hunt, 1994) found that trust by marketing research users in their research providers significantly affected user commitment to the research relationship. Wang Zehua (Wang Zehua, 2002) found thata negative relationship between trust and income commitment, and a positive relationship between trust and affective commitment.

Shared values, Morgan and Hunt (Morgan and Hunt, 1994) found that the only concept that we posit as being a direct precursor of both relationship commitment and trust, is the extent to which partners have beliefs in common about what behaviors, goals, and policies are important or unimportant, appropriate or inappropriate, and right or wrong. Dwyer, Schurr, and Oh (Dwyer,Schurr and Oh, 1987), Morgan and Hunt (Morgan,Hunt, 1994) theorized that shared values contribute to the development of commitment and trust.

Service quality is often conceptualized as "a comparison between customer expectations and performance". Parasuraman et al. (Parasuraman et al, 1988) propose that there are five key determinants of service quality: reliability, responsiveness, assurance, empathy and tangibles. Ko de Ruyter &Wetzels (Ko de Ruyter and Wetzels, 1999) found that Service quality positively impact on affective commitment and calculative commitment.

Relationship termination costs. Morgan and Hunt (Morgan and Hunt, 1994) proposed that termination costs are, therefore, all expected losses from termination and result from the perceived lack of comparable potential alternative partners, relationship dissolution expenses, and or substantial switching costs. These expected termination costs lead to an ongoing relationship being viewed as important, thus generating commitment to the relationship. Morgan and Hunt (Morgan and Hunt, 1994) test that relationship termination costs are positively associated with relationship commitment using data from automobile tire retailers.

2 Research Model and Hypotheses

In this article, we review commitment theory and research and propose an influential model of relationship commitment in marketing channel, it is presented in Figure 1. In the model of commitment to be described in this article, there are three major dimensions: income commitment, switching cost commitment, affective commitment.

Stated in formal fashion, our study tests 12 hypotheses:

H1: There is a positive relationship between shared values and income commitment.

H2: There is a positive relationship between shared values and switching cost commitment.

H12: There is a positive relationship between relationship termination costs and affective commitment.
Figure 1　An Influential Model of Relationship Commitment In Marketing Channel

3 Research Design

In this paper, data were collected using questionnaires sent to dealers in the electronics industry. There are two parts in the questionnaire. The first part, respondents need to confirm suppliers who they usually visit and answer some questions about relationship commitment in marketing channel. The second part is about their information. All measures employ 7-point scales. Then we use SPSS Statistics 19.0 for data processing. In order to explore the attitude and behavior of the dealers to the suppliers, we investigate the dealers of the electronics industry in Wuhan. We visited 150 dealers of Wuhan, Hubei province from China with random sampling method. Returned questionnaires totaled 128, and there were 7 invalid questionnaires, so we got 121 questionnaires at last.

Sample characteristics. Our sampling method succeeded in providing respondents who varied greatly on firm characteristics. There are 29% channel managers and 54.5% Salesman among our respondents. They have more contacts with suppliers, and they are able to understand the influencing factors of relationship commitment in marketing channel. 97.52% dealers have had more than three years of contacts with their main suppliers. 82.65 % dealers have had more than three suppliers. It shows that there are many suppliers in the electronics industry and the market competition is fierce. It is a good research object for the study of the influencing factors of relationship commitment in marketing channel.

4 The Results of the Study and Analysis

4.1 Reliability and validity test

Each variable's Cronbach 's alpha is more than 0.7, and it shows that the scale is reliable on the reliability, as shown in Table 1. KMO value of various factors is 0.868. It is greater than 0.6, the scale has good structure validity.

Table 1   Reliability Statistics

variable	N of Items	Cronbach's Alpha
income commitment	3	0.808
switching cost commitment	3	0.852
affective commitment	3	0.832
relationship termination costs	2	0.710
trust	9	0.834
shared values	5	0.885
service quality	10	0.864
Total reliability	35	0.944

4.2 Correlation analysis

The correlation coefficient between relationship termination costs and income commitment is 0.486, the correlation coefficient between trust and income commitment is 0.384, the correlation coefficient between shared values and income commitment is 0.414, the correlation coefficient between service quality and income commitment is 0.434. They have a significantly positive influence on income commitment. It is presented in Table 2.

Table 2   Correlation Matrix of Relationship Termination costs, Trust, Shared Values, Service Quality and Income Commitment

	variable	income commitment	relationship termination costs	trust	shared values	service quality
income commitment	Pearson Correlation	1	.486**	.384**	.414**	.434**
	Sig. （2-tailed）		.000	.000	.000	.000
	N	121	121	121	121	121

**. Correlation is significant at the 0.01 level (2-tailed).

The correlation coefficient between relationship termination costs and switching cost commitment is 0.663, the correlation coefficient between trust and switching cost commitment is 0.569, the correlation coefficient between shared values and switching cost commitment is 0.549, the correlation coefficient between service quality and switching cost commitment is 0.399. They have a significantly positive influence on switching cost commitment. It is presented in Table 3.

Table 3　Correlation Matrix of Relationship Termination costs, Trust, Shared Values, Service Quality and Switching Cost Commitment

variable		switching cost commitment	relationship termination costs	trust	shared values	service quality
switching cost commitment	Pearson Correlation	1	.663**	.569**	.549**	.399**
	Sig. （2-tailed）		.000	.000	.000	.000
	N	121	121	121	121	121

**. Correlation is significant at the 0.01 level (2-tailed).

The correlation coefficient between relationship termination costs and affective commitment is 0.512, the correlation coefficient between trust and affective commitment is 0.592, the correlation coefficient between shared values and affective commitment is 0.582, the correlation coefficient between service quality and affective commitment is 0.479. They have a significantly positive influence on affective commitment. It is presented in Table 4.

Table 4　Correlation Matrix of Relationship Termination costs, Trust, Shared Values, Service Quality and Affective Commitment

variable		affective commitment	relationship termination costs	trust	shared values	service quality
affective commitment	Pearson Correlation	1	.512**	.592**	.582**	.479**
	Sig. （2-tailed）		.000	.000	.000	.000
	N	121	121	121	121	121

**. Correlation is significant at the 0.01 level (2-tailed).

4.3　Regression analysis

In this study, we use multiple linear regression analysis to analyze the prediction effect of relationship termination costs, trust, shared values, service quality to relationship commitment.

The regression coefficient of service quality to income commitment is 0.517, and the regression coefficient of relationship termination costs to income commitment is 0.343. The regression coefficient significance level is less than 0.05, so it will be noted from Table 5 that service quality and relationship termination costs displayed a significant, positive linkage with income commitment .Therefore H4 and H10 are supported. The regression coefficient significance level of trust and shared values are more than 0.05, so they are ruled out, H1 and H7 are refused.

Table 5　The Regression Coefficients of Shared Values , Service Quality, Trust, Relationship Termination costs to Income Commitment

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error			
1　(constant)	.915	.745		1.228	.222
shared values	.094	.123	.086	.765	.446
service quality	.517	.174	.298	2.979	.004
trust	-.110	.156	-.085	-.709	.479
relationship termination costs	.343	.095	.374	3.610	.000

a. Dependent Variable: income commitment

The regression coefficient of relationship termination costs to switching cost commitment is 0.474. The regression coefficient significance level is less than 0.05, so it will be noted from Table 6 that relationship termination costs displayed a significant, positive linkage with switching cost commitment.Therefore H11 is supported. The regression coefficient significance level of trust, service quality and shared values are more than 0.05, so they are ruled out, H2, H5 and H8 are refused.

Table 6　The Regression Coefficients of Shared Values , Service Quality, Trust, Relationship Termination costs to Switching Cost Commitment

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error			
1	(constant)	-.175	.719		-.244	.808
	shared values	.165	.118	.134	1.391	.167
	service quality	.098	.167	.050	.584	.560
	trust	.241	.150	.166	1.605	.111
	relationship termination costs	.474	.092	.461	5.178	.000

a. Dependent Variable: switching cost commitment

The regression coefficient of shared values to affective commitment is 0.262, and the regression coefficient of trust to affective commitment is 0.303. The regression coefficient significance level is less than 0.05, so it will be noted from Table 7 that shared values and trust displayed a significant, positive linkage with affective commitment.Therefore H3 and H9 are supported. The regression coefficient significance level of service quality and relationship termination costs are more than 0.05, so they are ruled out, H6 and H12 are refused.

Table 7　The Regression Coefficients of Shared Values , Service Quality, Trust, Relationship Termination costs to Affective Commitment

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error			
1	(constant)	.680	.641		1.061	.291
	shared values	.262	.106	.252	2.481	.015
	service quality	.219	.149	.133	1.468	.145
	trust	.303	.134	.247	2.264	.025
	relationship termination costs	.137	.082	.158	1.683	.095

a. Dependent Variable: affective commitment

5 Conclusion

Empirical findings show that Major antecedents of affective commitment are trust and shared values; Both service quality and relationship termination costs are positively associated with income commitment; relationship termination costs positively impact on switching cost commitment.

In summary, several lessons emerge from the findings of this research that might be usefully applied to marketing channels.

The need for relationship marketing stems from the changing dynamics of the global marketplace and the changing requirements for competitive success. To be an effective competitor in today's global marketplace requires one to be an effective cooperator in some network of organizations.

We posit that relationship commitment develop when suppliers attend to relationships by (1) maintaining high standards of corporate values and allying oneself with exchange partners having similar values; (2) improving the quality of their services by providing smoother and more profitable products that are superior to the offerings of alternative partners; (3) communicating valuable information, including expectations, market intelligence, and evaluations of the partner's performance to improve mutual trust and satisfaction.

The study also has certain limitations. First, this study has the limitation of the industries. Research should be made for different industries to study. Another limitation is that this study only considered the impact of four antecedent variables. Other antecedents, such as relationship benefits, communication in the relationship might prove insightful. Our theory and the model need further explication, replication, extension, application, and critical evaluation. We offer them to the marketing discipline and marketing practice for all these purposes.

Abstract: This paper mainly studies the effect of bad lifestyles on the consumption willingness and consumption behavior of vegetables of Chinese urban residents. It studies factors which impact vegetable consumption behavior of urban residents in China by utilizing consumer behaviors theories and empirical research method. Currently, there is little research on the effect of lifestyles on consumption behavior and foreign scholars only studied the impact of smoking, drinking, physical exercise and other habits on vegetable consumption. Therefore, the paper utilizes the new approach to study the effect of the lifestyle on vegetable consumption behavior of urban residents. After implementing data analysis, the article draws the conclusion that the lifestyle exerts great effect on urban residents' vegetable consumption behavior. People who smoke, drink alcohol and engage in less physical exercise will have low vegetable consumption than people who have more healthier lifestyle.
Key words: Vegetable consumption willingness; Vegetable consumption behavior; Living habits; Regression analysis; Common method variance

1 Introduction

Lifestyle refers to the way of life for individuals to better satisfy their own needs, it gradually formed in different kinds of activities. People may have different lifestyles; some are good, some are bad. In the study, the author defines lifestyles referring to smoking, drinking and physical exercise.

According to the relevant news reports and investigation reports, currently, the number of smokers in China ranks first globally. In 2017, there were 281 million of smokers in China which accounted for about 1/3 of the smoking population in the world. While the ratio of drinking between male and female were as high as 84.1% and 29.3%. 65% of drinkers have unhealthy drinking habits and the most serious problem they are facing is excessive drinking. On the other hand, according to the related report, people who participate in physical exercise on the regular basis accounts for only 28.2% of the total Chinese population.

These bad lifestyles will increase the incidence and mortality of chronic diseases, such as cardiovascular. While taking more vegetables can effectively reduce the incidence of chronic diseases such as cardiovascular, stroke, hypertension, diabetes and certain types of cancer (Bazzano, 2002; Appel, 2003）[3-4]. Therefore, people who do not like doing physical exercise and who are smokers or drinkers should take more vegetables in order to keep health. Are people with unhealthy lifestyles willing to take more vegetables? How lifestyles affect urban residents' consumption behavior of vegetables? These series of questions are neglected by scholars. In order to obtain answers of questions, the paper focuses on the impact of lifestyles on urban residents' consumption behavior of vegetables.

2 Theoretical Review and Research Hypothesis

Nowadays, only a few researchers pay attention to the effect of lifestyles on consumption behavior. Meanwhile, most of these researchers are foreign scholars who only study the impact of smoking, drinking and physical exercise on vegetable consumption. Obviously, the influence mechanism of vegetable consumption behavior did not discuss before.

Agudo (Agudo, 2002) pointed out that people who smoke usually consume less vegetables and more meat by investigating the eating habits of community residents in the south-east area of New England. Am J ClinNutr (Am J ClinNutr, 2008) asserted that people who don't smoke often consume more vegetables than the others by conducting surveys on health education and lifestyle. Appel JJ (Appel JJ, 2010) analyzed the Canadian community health survey data from 2000 to 2001 and found that Canadians who often engaged in physical exercise and never smoking and drinking, usually consume more fruits and vegetables than the others.

According to analyses listed above, it seems that people who smoke, drink and take less physical exercise are going to consume fewer vegetables.Based on the existing researches, some scholars have

pointed out that lifestyle will affect people's consumption behavior of vegetables. However, these researches only studied some individual factors such as smoking, drinking and physical exercise, without taking lifestyles as a variable.

According to the above analysis, this paper makes the following assumptions:

Hypothesis 1: Lifestyle plays a significant role on the vegetable consumption behavior of urban residents.

Hypothesis 2: Lifestyle plays a significant role on the willingness of vegetable consumption of urban residents.

Hypothesis 3: The willingness of consuming vegetables plays a significant role on consumer behavior of urban residents.

Hypothesis 4: Vegetable consumption willingness plays an intermediary role between lifestyles and vegetable consumption behavior of urban residents.

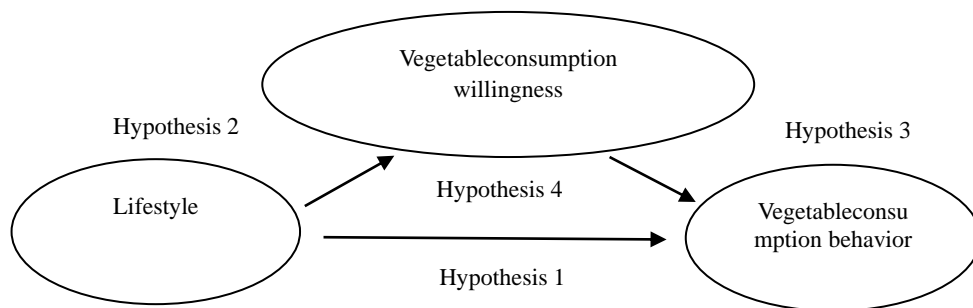
The article presents a mechanism for the impact of lifestyles on the willingness of Chinese urban residents to explain how the living habits affect the consumption behavior of Chinese urban residents and the specific path (as shown in Figure 1).


Figure 1   Research Model

The theoretical model is a comprehensive model and includes four subsystems, in order to better explain the four subsystems model, firstly symbols are defined as follows:

LS- Lifestyle

VC- Vegetable Consumption

VCW- Vegetable Consumption Willingness

Based on this, the four subsystems model was constructed.

Model 1：$VC = \alpha_1 + \beta_1 LS$

Model 2：$VCW = \alpha_2 + \beta_2 LS$

Model 3：$VC = \alpha_3 + \beta_3 VC$

Model 4：$VC = \alpha_4 + \beta_4 LS + \gamma_1 VCW$

3 Data Analysis

The variables involved in the study mainly include lifestyles, vegetable consumption willingness and vegetable consumption behavior.

3.1 Reliability test

Table 1 is the Cronbach's alpha values for the survey. According to the data listed in Table 1, lifestyle variables were measured by three indicators, Cronbach's α was 0.964. The vegetable consumption willingness variables were measured by three indicators, Cronbach's α was 0.908. The consumption behavior variables were measured by two indicators, Cronbach's α value was 0.832, and the overall reliability of the questionnaire was 0.863, which indicates that the questionnaire used in this study has good reliability.

Table 1   Relliability Test Value

Construct	Observations	Cronbach's α
vegetable consumption willingness（CI）	CI1	0.908
	CI2	
	CI3	

Continural Table 1

Construct	Observations	Cronbach's α
vegetable consumption behavior(CB)	CB1	0.832
	CB2	
Lifestyle(LS)	LS1	
	LS2	0.964
	LS3	

3.2 Validity test

The main component factor analysis method is mainly used in the validity test. The criterionfor determining the validity by using the factor analysis method is that the factor load of each variable should exceed 0.5, preferably more than 0.7, and the average variance extraction value of each variable is better than 0.5.

Table 2-5 are the KMO and Bartlett spherical test values, factor load values and mean variance extraction values for each variable. In this study, factor analysis was performed according to the criteria of factor eigenvalues greater than 1 in principal component analysis. Among them, the total variance of a factor in the study of the lifestyle of the question is 93.439%, and the three items are sufficient to be 0.725. Bartlett's spherical test approximate card square values is 1808.506 (df is 3，p is 0.000). The total variance of a factor in the study of the vegetable consumption willingness of the question is 84.446%, and the three items are sufficient to be 0.743. Bartlett's spherical test approximate card square values is 949.158（df is 3，pis 0.000), suitable for factor analysis.

The total variance of a factor in the study of the vegetable consumption behavior of the question is 85.614%, and the two items are sufficient to be 0.605. Although the best standard is below 0.7, Bartlett's spherical test approximate card square values is 328.133（df is 1，pis 0.000), suitable for factor analysis, significantly good, so it is also suitable for factor analysis. Table 5 is the consumption willingness of the three test items, consumer behavior of the two questions, life habits of the three items together to do the factor analysis of the dimensions of the factor loading and the Average variance extracted (AVE). It can be seen from Table 5 that the factor load of all measurement dimensions is more than 0.7, that is, the measured items can well measure the basic situation of the variables. On the other hand, the average variance extraction of the three variables respectively was 0.823, 0.824 and 0.921, respectively, and the effective standard (AVE> 0.5) was reached. Through the above analysis, it can be shown that the measurement of the questionnaire used in this study is better.

Table 6 shows the co-variance between variables and variables in the survey sample and the average variance extraction number AVE of the corresponding variables. From the values listed in the table, we can see that the co-variance of the variable with any other variable is less than the average variance extraction(AVE). Therefore, the questionnaires used in this study have a better discriminant validity.

Table 2   Aggreate Validity Test Value

Construct	Observations	Factor load	Average variance extraction（AVE）
Vegetable consumption willingness（CI）	CI1	0.917	
	CI2	0.928	0.823
	CI3	0.875	
Vegetable consumption behavior（CB）	CB1	0.942	0.824
	CB2	0.872	
Lifestyle（LS）	LS1	0.959	
	LS2	0.941	0.921
	LS3	0.978	

Table 3   Distinguish The Validity Test Value

	CI	CB	LS
Vegetable consumption willingness（CI）	0.823		
Vegetable consumption behavior（CB）	0.297	0.824	
Lifestyle（LS）	0.195	0.190	0.921

Note: The bold numbers in the table are AVE values for each construct

3.3 Hypothetical test

Before using SPSS 21.0 to analyze the data, the study conducted Anova analysis to examine the significance of the overall regression model. The significance of regression models in thestudy reached a level of 0.000 which is indicating that the respective variables had a significant effect on the dependent variable. And the VIF values of each variable are below 10, indicating that there is no multicollinearity between variables.

Table 4 is the specific regression results regarding control of variables, living habits, vegetable consumption and vegetable consumption behavior. Model 1 is a regression model of the control variables on consumption behavior. Model 2 is the main effect regression model of adding independent variables to study the main effect relationship between Chinese urban residents' lifestyle and vegetable consumption behavior. The results show that there is a positive correlation between lifestyle and consumption behavior of Chinese urban residents (β= 0.186, p <0.001). Lifestyles have significantly affected the consumption behavior of Chinese urban residents. The empirical results show that hypothesis 1 has been validated.

Model 3 is a regression model of control variables for Chinese urban residents' willingness to consume vegetables. Model 4 is the relationship between living habits and the willingness of Chinese urban residents to consume vegetables. The results show that there is a positive correlation between lifestyle and Chinese urban residents' consumption appetite (β = 0.193, p <0.001). That is, lifestyle affect the willingness of Chinese urban residents to consume vegetables, People with healthy lifestyles are going to have stronger willingness to consume vegetables. The empirical results show that hypothesis 2 has been validated. Model 5 is the relationship between the willingness and the behavior of Chinese urban residents to consume vegetables. The results show that there is a positive correlation between Chinese urban residents' consumption appetite and consumer behavior (β = 0.193, p <0.001). That is, the consumer willingness affects the consumer behavior of Chinese urban residents to consume vegetables. Chinese urban residents who have stronger willingness to consume vegetables are more likely to consume vegetables. The empirical results show that hypothesis 3 has been validated.

In this paper, hypothesis 4 suggests that vegetable consumption will play a mediating role between lifestyle and Chinese urban residents' vegetable consumption behavior. To validate the mediating role of the variables in the theoretical model, most scholars utilize the validation method proposed by Baron and Kenny in 1986. This paper also applies the method to verify the mediating role of consumer willingness.

Baron and Kenny argued that there was some requirement should be met to validate the mediating role of variables. Firstly, changes in the variable can be significantly explained by the independent variables. Secondly, changes in mediating variables can be significantly interpreted by independent variables. Thirdly, changes in the variables can be significantly explained by the intermediary variables. Fourthly, when the mediating variable and the independent variable are added to the regression model, the explanatory effect of the independent variable on the dependent variable disappears or decreases. If the effect disappeared, it means the variables are complete intermediaries. If the effect reduced, it means the variables are partial intermediaries. It can be seen from Table 13 that the first three conditions have been met. In order to meet the fourth condition, the paper did regression analysis with urban residents' lifestyle, vegetable consumption willingness and vegetable consumption behavior. According to the analysis of Table 13, the effect of the variable lifestyle on the consumption behavior of Chinese urban residents has been weakened after adding the willingness to consume vegetables into the regression model. Therefore, the conclusion can be drawn that the consumption willingness of vegetables plays as a partial intermediary between lifestyle and consumption behavior of Chinese urban residents. In the other words, lifestyles will not only influence vegetable consumption willingness of Chinese urban residents, but also affect Chinese urban residents' vegetable consumption behavior. The empirical results show that hypothesis 4 has been validated.

Table 4　Regression Results

Variable		Consuming behavior		Consumer willingness		Consumer willingness	
		Model 1	Model 2	Model 3	Model 4	Model 5	Model 6
Control variable	Constant term	0.004	-0.008	0.277	0.281	-0.077	-0.068

Notes：**、*** represents P<0.05、P<0.001

4 Conclusion

This paper mainly studies the effect of bad lifestyles on the consumption willingness and consumption behavior of vegetables of Chinese urban residents. The findings are unique and provide some guiding significance in the area. There are also some limitations in the study. Firstly, the paper utilized smoking, drinking and physical exercise to measure the living habits, it only took a testing item to measure those 3 habits respectively. Although the measurement is creative and it passed the reliability and validity test. The results still need further validation. Secondly, the study analyzes regions and occupations as control variables in the regression model. It did not analyze consumers' attitude, subjective norms and perceived behavior control which are classic theories of planned behavior.

Research on the Regulation Elements of Technical Service Quality, Functional Service Quality and Satisfaction from the Perspective of Relationship Norms and Service Types

Ye Tao[1,2]
1 School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
2 Wuhan Sports University, Wuhan, P.R.China, 430070
(E-mail: 12416010@qq.com)

Abstract: The effects of customer employee relationship norms (interactive elements) and service types (elements of service) on the relationship between service quality and satisfaction are discussed in this paper. The study shows that symbiotic relationship norms will strengthen the relationship between functional service quality and satisfaction, but weaken the relationship between technical service quality and satisfaction; exchange relationship norms will strengthen the relationship between technical service quality and satisfaction, but weaken the association between functional service quality and satisfaction; trust service will strengthen the relationship between functional service quality and satisfaction, but weaken the relationship between technical service quality and satisfaction; search service will strengthen the relationship between technical service quality and satisfaction, but it will weaken the relationship between functional service quality and satisfaction.
Key words: Technical service quality; Functional service quality; Satisfaction; Relationship norms; Service type

1 Introduction

The service delivery process consists of four kinds of participation elements, namely, employees, customers, service itself and interaction process.

Research on the quality of service. The quality of service is the gap between customer service expectations and actual feelings (Gronroos, 1984). In many literatures, the quality of service is divided into two dimensions, namely, functional service quality and technical service quality (Gronroos, 1983; Sharma and Patterson, 1999). The quality of technical service, the quality of functional service, and the image of the enterprise will affect the quality of service perceived by consumers (Brogowicz, 2009). The quality of functional services refers to the nature of the interaction between the service providers and the customer and the process of the transmission of the core services; the quality of the technical service refers to the output and quality of the service (Sharma and Patterson, 1999).

Research on relationship norms. The relationship specification refers to the potential relationship rules formed by the consumer in the process of communication, interaction and communication with the enterprise (brand). This rule affects the consumer's expectation to the behavior of the enterprise, and the response and attitude of the consumer to the enterprise (Doney and Cannon; Stern, 1997). The relationship specification includes two types (Clark and Mills, 1993; Aggarwal, 2004), that is, the exchange relationship specification and the communal relationship norm. In addition, when consumers start different specifications, they present different psychological and behavioral patterns (Aggarwal and Law, 2005; Aggarwal and Zhang, 2006) in dealing with the relationship with the enterprise.

Research on service types. Previous literature and scholars, based on the complexity of product, the accessibility of consumer product information, and the difficulty of evaluating the product attribute information by consumers, divide the service into three types, namely, search, experience and credence serveices (search, experience, and credence serveices, Nelson, 1970; Darbi and Karni, 1973; Iacobucci, 1992; Brush and Artz, 1999; Zeithmal and Bitner, 2000). In the past, many scholars have analyzed and studied it as a predominant factor (Girard and Dion, 2009; Hsieh and Hiang, 2004)

Research on customer satisfaction. Customer satisfaction refers to the consumer expectations based on historical experience and information, and the evaluation and judgment of the expectation consistency after the consumer expectations are compared with the actual perceived experience (Oliver and Linda, 1981). Some scholars believe that satisfaction is a service evaluation and perception that is formed by consumers comparing consumer costs (time, physical and monetary input) and income (psychological, social and physical income) (Churchill and Surprenant, 1982). In summary, satisfaction is the overall evaluation and judgment of consumers after the use of products or services (Fornell, 1992).

In the existing domestic and foreign literature, the research on the attributes of employees or

customers is more abundant, but there is less attention to service elements and interactive elements; there is more literature to explore the quality of service to the main effect of satisfaction. A small amount of literature begins with the dimension of service quality, and the influence of technical service quality and functional service quality on satisfaction is explored, but the research on regulatory elements and boundary conditions is scarce.

The purpose of this study is to explore the impact and regulation of customer employee relationship norms (interactive elements) and service types (elements of service) on the relationship between service quality and satisfaction on the basis of existing research.

Based on the perspective of customer employee relationship and interaction, the relationships between relationship norms and technical service quality, functional service quality and satisfaction are explored. Based on the perspective of service nature, the adjustment function and effect of service types on the relationship between technical service quality, functional service quality and satisfaction are analyzed.

2 Data and Methodology
2.1 Method one-regulatory effects of relationship norms
Experimental objectives are following: Firstly, to explore the main effect of technical service quality and functional service quality on satisfaction; Secondly, to explore the moderating effect of relationship norms between on technical service quality and satisfaction; Thirdly, to analyze the moderating effect of relationship norms between on functional service quality and satisfaction.
2.1.1 Experimental subjects
The subject is a college student. A total of 130 questionnaires were issued, and 112 valid questionnaires were removed from those that were invalid, incomplete or unqualified.
2.1.2 Experimental program
Situational guidance; Measure the "technical service quality" and "functional service quality" perceived by consumers in the service process; The subjects were manipulated by relationship norms; Collect the respondents' satisfaction with the company's brand; Conduct the inspection of the operation and collect the demographic characteristics of the sample.
2.1.3 Hypothesis test
On the basis of variance analysis, the hypothesis H1 is verified, the variable is "satisfaction", the independent variable is "technical service quality (high and low group)", "functional service quality (high and low group)" and relationship norms (symbiotic norm and exchange norm), and the independent variables are classified variables.

Weverify hypothesis H1a and hypothesis H1b by constructing technical service quality (high and low) * relationship norms (symbiotic, exchange) matrix and functional service quality (high and low) * relationship norms (symbiotic, exchange) matrix.

(1) The main effect analysis of technical service quality and functional service quality. The analysis of the single variable main effect shows that the quality of technical service is positively affecting the level of consumer satisfaction ($F_{(1112)} = 32.420$, $p < 0.01$), and the quality of functional services is improving the satisfaction of consumers ($F_{(1112)} = 40.231$, $p < 0.01$).

(2) Interaction of quality of technical services * relationship norms. The interaction results show that there is interaction between technical service quality (high and low) and relationship norms ($F_{(1112)} = 38.794$, $p < 0.001$).

When the symbiotic relationship is initiated, the groups with higher quality of technical services and lower groups shows no significant difference on the level of satisfaction ($F_{(1112)} = 2.911$, $P = 0.12$). When the exchange relationship is started, the groups with higher quality of technical services and lower groups are significantly different at the level of satisfaction ($F_{(1112)} = 88.442$, $p < 0.001$).

(3) Interaction of functional quality of service* relationship norms. We divide the functional service quality into high group and low group through the median. Interaction analysis shows that there is a significant interaction between functional service quality (high and low) and relationship norms ($F_{(1112)} = 42.224$, $p < 0.001$). There is no significant difference in the level of satisfaction between the high and low functional service groups ($F_{(1112)} = 1.116$, $P = 0.34$).

When the standard of consumer symbiotic relationship is started, consumption is more important for emotional, interaction and communication elements, which leads to high and low groups of functional service quality, and there are significant differences in the level of satisfaction ($F_{(1112)} = 67.231$, $p < 0.001$).

To sum up, first, the symbiotic relationship norm will strengthen the relationship between functional service quality and satisfaction, but it will weaken the relationship between the quality of technical service and satisfaction (H1a).

Second, the norm of exchange relationship will strengthen the relationship between the quality of technology service and satisfaction, but it will weaken the relationship between service quality and satisfaction. Therefore, it is assumed that H1a and hypothesis H1b are verified.

2.2 Method two--the adjustment effect of service types

The purpose of experiment two includes three aspects.

First, verifying the effect of functional service quality and technical service quality on satisfaction again.

Second, exploring and analyzing the moderating effect of search service on service quality between different dimensions and satisfaction.

Thirdly, analyzing the moderating effect of trust service on service quality and satisfaction

2.2.1 Experimental subjects

The subjects of this study are MBA students from a university.A total of 140 questionnaires were distributed in the study, and 121 valid questionnaires were finally obtained after the wrong answers, invalid answers and poor-quality answers were eliminated.

2.2.2 Experimental procedures

Interpretation of service types;Filling out one of the most impressive search and trust services in the last three months in groups;Measuring the "technical service quality" and "functional service quality" experienced by the subjects in the whole service process;Collecting participants' satisfaction with the company (or employees);The test of manipulation; Collecting the demographic characteristics of samples.

2.2.3 Hypothesis test

Using variance analysis to verify and assume H2,the dependent variable is "satisfaction",and the independent variable istechnical service quality(high and low group)、functional service quality(high and low group)and service type(search service and trust service),the independent variable are all categorical variable.By establish technical service quality(high、low)*service type(search、trust)matrix、functional service quality(high、low)*type of service(search、trust)matrix to verify and assume H2a,   H2b should be assumed too.

Firstly,the main effect analysis of technique service quality and functional service quality.The analysis of variance indicates that technique service quality（$F(1,121)=35.211$，$p<0.01$）and functional service quality can all promote the satisfaction of consumers positively.

Secondly,the reciprocal action of technique service quality*service type.The reciprocal actionIndicates, technique service quality(high、low)and service type(search、trust)have a significant interaction effect（$F(1,121)=44.774$，$p<0.001$.Which leads to the background of trust service, the technique service of high quality group and low group, on the level of satisfaction doesn't have significant difference（$F(1,121)=1.232$，$P=0.18$）.But as background of search service, this two groups have significant difference（$F(1,121)=58.172$，$p<0.001$）.

Thirdly, the reciprocal action of technique service*service type. The reciprocal action indicates, functional service quality(high、low)and service type(search, experience)have a significant interaction effect（$F(1,121)=38.771$，$p<0.001$）.By the background of search service, the satisfaction level between high group and low group doesn't have significant difference（$F(1,121)=0.998$，$P=0.53$.But on the background of trust service, the functional service between high and low group, have a significant difference in satisfaction level（$1,121)=63.224$，$p<0.001$）.

In conclusion, first, trust service will intensify the relationship between functional service quality andsatisfactory,but it can weak the relationship between technique service quality and satisfactory (H2a).

Second, search service can intensify the relationship between technique service quality and satisfactory,but it can weak the relationship between functional service quality and satisfactory. Therefore, it is assumed that H1a and hypothesis H1b are verified.

3 Results

Based on the data of experiments and questionnaires, the hypotheses test and exploration are conducted by means of variance analysis and structural equation modeling (path analysis). The first one

is to explore the moderating variables of the quality of functional service and the quality of technical service affecting the satisfaction. We start from two perspectives: relational norms and service types. Study two aims to analyze the mediating and intrinsic transmission mechanisms of the quality of functional service and the quality of technical service. From the perspective of trust, we analyze the boundary adjustment variables that affect the satisfaction of different dimensions of trust. Specifically, the research contents of the paper are as follows:

3.1 Service quality is not a single dimension; the data shows that the quality of service processes and the quality of service results will positively significantly increase consumer satisfaction levels.

3.2 The regulatory effect of relationship norms. Relationship norm regulates technical service Quality, functional service quality and satisfaction. The customer and employees showed intimacy and altruistic orientation and were sensitive to functional service quality. When the exchange Relational Norms was initiated, the customer and employees were presented with economic relations, transaction relationships, and merchant relations. Pay more attention to the exchange of interest and reciprocity norms. In this context, consumers are more sensitive to the quality of technical services, which leads to the exchange relationship specification will strengthen the relationship between technical service quality and satisfaction.

3.3 Regulatory effects of service types. Different types of services mean that consumers have significant differences in product knowledge, experience, and access to information, which leads to differences in consumer sensitivity.In the context of search service type, consumers have the ability to evaluate products and services, and are more sensitive to the quality of technical services. Under the background of trust services, consumers rely more on service processes, employee communication, and interaction to judge the quality of services, and on functional services. The quality is more sensitive.

3.4 The mediating mechanism of service quality affecting satisfaction based on trust theory. The study finds that the path and mechanism of the quality of functional service and the quality of technical service influencing the satisfaction are asymmetric. Specifically, technology service quality promotes customer satisfaction through competence trust. The quality of functional service focuses on the communication, interaction and communication between employees and customers in the service process, mainly by improving the consumer's good faith and honest trust, thus affecting the level of consumers.

3.5 Trust dimensions, relational norms and satisfaction studies. It is found that when the symbiotic relationship is started, consumers pay more attention to the interaction elements in the service process. Consumers regard employees as intimate partners, more altruistic and morefriendly, and are more sensitive to employee interaction, communication and conversation. In this context, the norms of symbiotic relationship will strengthen the relationship between goodwill trust, integrity, trust and satisfaction.

3.6 Trust dimension, service type and satisfaction degree. The study finds that when consumers recall search service, consumers have the ability to evaluate and judge services, and they value the achievement of service and results. In this context, search service will enhance the relationship between competence trust and satisfaction. However, when the consumers recall the trust type service, the consumer lacks relevant experience and knowledge of the product due to the more complex services, the consumers are more dependent on the process elements of the service to form the judgment of the quality of service, so it is more sensitive to the good intentions and professional norms of the employees. Therefore, trust service will enhance the relationship between goodwill trust, integrity, trust and satisfaction.

4 Conclusion

Based on the results, some suggestions can be given as follows. First, managers should ensure service results and performance, while need to pay attention to the interaction, communication and communication status between customers and employees, so as to improve satisfaction and loyalty of customer.Second, according to different customer types, employee relations management practitioners can focus on strengthening different service elements. Exchange relationship specifications. The enterprise shall guarantee the results, performance and expectation of the service of the service; symbiotic relationship norms, employees should interact and communicate with customers proactively.Third, according to different type of service, the key point of enterprises needs to adjust the service. For trust services, enterprises should improve the level of satisfaction of customer through service processes. For search service, enterprises should ensure the quality of service performance and

results, to win satisfaction and loyalty of customers.

The research has some insufficiency. First, adjust the diversity of variables. The research mainly investigate the adjustment variables from the perspectives of interaction elements and service itself, There are other potential variables that can be analyzed and studied in depth, such as communication quality, customer involvement, and customer self-explaining tendencies.Second, the study only explores binary interactions. The future may consider exploring three-way interactions and exploring more valuable discoveries and results. For example, the interaction between the quality of services dimension* relational norms* and nature of service.

Abstract: Public bicycle franchise is a special intangible asset. Its evaluation must be undertaken with the transfer of public bicycle franchise and the introduction of social capital. In this thesis, the evaluation model of public bicycle franchise based on income approach was built. And some profound research was made to its basic model and two stage models. Moreover, the methods to determine three important parameters including the discount rate, the amount of revenue, and the franchising period were analyzed. It can provide a reference for the deal and assessment of future similar public bicycle franchise.
Key words: Public bicycle; Franchise; Income approach; Evaluation model

1 Introduction

The rapid development of urbanization has caused traffic congestion and environmental pollution. The development of urban public transport is an effective way to alleviate urban traffic. As a powerful extension of urban public transport, public bicycles have been developed in recent years. Different modes of public bicycle operation have been formed in various cities in China, such as the Beijing mode of pure private sector, the Wuhan mode of government subsidized contract, the Suzhou mode, and the Hangzhou mode of government purchasing services (Wang Huanming, Li Peng, 2015). From the view of the operation of each city, the pure private Beijing mode is a failure. In 2012, the government began to dominate the operation of the public bicycle system, and provided relevant support to the enterprises, and implemented a partial market mode. At present, it is in the process of development (Yang Yuanjun, 2014). The Wuhan modesubsidized by the government has also failed mainly because private enterprises used government resources for the development of public bicycles to undertake other businesses. In 2014, Wuhan public bicycles were formally accepted by the Wuhan Ring Investment Group, approved by the Municipal Party Committee and the Municipal Government. The Group invested and formed the state-owned enterprise of WuhanDriving Service Co., Ltd., which is solely responsible for the resumption of public bicycle projects in Wuhan. The contract Suzhou mode and the government purchase service Hangzhou mode have run more successfully. But from the Hangzhou mode, it still needs a large amount of local government financial subsidies every year, so it has also increased the government financial pressure. In the Third Plenary Session of the 18th CPC Central Committee, it was proposed that the cooperation between government and social capital should be actively promoted, and the PPP model was introduced to alleviate the government financial pressure. This also pointed out the direction for the development of public bicycles in China. The franchise of public bicycles to social capital granted by the government can achieve a win-win situation between government and social capital. At present, some cities in China, such as Fuyang and Zhanjiang, are also actively introducing PPP model to invite public bicycle franchises. As a special intangible asset, public bicycle franchise is necessary to evaluate its value. At the same time, it should be combined with the actual situation of the development of public bicycles in our country, and use the correct evaluation method to evaluate the value of the franchise rights of public bicycles.

2 Related Analysis on Franchise Rights of Public Bicycles

2.1 The concept of franchise rights of public bicycles

The word "franchising" comes from the English language. It means that franchise is the franchisor's own trademark, trade name, product, product patent, technical secret, formula, management model and other intangible assets which are granted to the franchisee in the form of franchise contracts, in accordance with the franchisor's unified business model to engage in business activities, and to charge the cost of the business form.The essence of franchise is the right of concession, which can be divided into two categories according to the difference of the Licensor: commercial franchise and government

franchise (Yu Bingwen, Wang Meiting, 2013). The franchising in this paper mainly refers to the government franchise in public utilities. The introduction of the franchise system can effectively reduce the financial burden of the government so that the government can put more capital and energy into the construction of urban infrastructure and effectively improve the operation and management level of public utilities (Xu Zongwei, 2001). It can also innovate the financing channels of public utilities and alleviate the supply imbalance of municipal public utilities (Chen Hongbo, 2003). Besides, it can effectively reduce the operation cost of municipal public utilities and promote the growth of investment (Yang Shiwen, 2003), which can guarantee the independent operation of the project and improve the operating efficiency (Li Ming, JinYucheng, 2007).

This article is aimed to the study of the franchise rights of public bicyclesystem granted by government agencies; that is, in the business of bicycle sharing system, the government authorizes investors to establish franchised operating companies and own the management privileges of the construction and operation of public bicyclesystem for a certain period of time. It mainly includes the chartered right to charge bicycles, the franchise of franchised advertising and the franchise of service facilities. During the concession period, the company can collect investment from bicycles and comprehensive development and operation to recover investment and obtain profits. After the expiration of the franchise, the government will clarify the rights and obligations between the government and the concessionary investor through contractual agreements or other means.

2.2 The value essence of franchise rights of public bicycles

The franchise of public bicycles is an intangible asset. At present, there is no unified definition of intangibleassets. The definition of an intangible asset by the International Evaluation Criterionis that it is a non monetary asset which can prove its own value through economic property. It does not have the physical form, but it can bring rights and economic benefits to the owner. . The definition of intangible assets in China's Evaluation Criteria is that intangible assets are: to be controlled by a specific subject; not to have the physical form; to play a long-term role in production and operation and to bring economic benefits. Therefore, the value of public bicycle franchise is mainly reflected in its economic benefits (Jiang Nan, 2015)

As an asset without material entities, the income of intangible assets is usually expressed through the income of the related assets, which is shown as the income of products, services or enterprises which it has adhered to, that is, the excess returns to the specific subject. Therefore, the benefits gained from the franchise of public bicycles are more manifested in the excess profits they can bring to the franchisees of public bicycles. This excess return is the essence of the value of public bicycle franchise.

3 The Evaluation Model of Public Bicycle Franchise Based on Income Approach

3.1 The setting of the evaluation model

The evaluation model of public bicycle franchise can be shown in the formula as follows:

$$P = \sum_{t=o}^{T} \frac{NCF_t}{(1+r)^t} \tag{1}$$

Among them:

P-- evaluation value of franchise for public bicycles

r -- discount rate

T -- the franchise period

NCF_t-- net cash flow in T

The model can be used to predict the annual earnings of the future franchise period for T years accurately, and the cycle of bicycle franchise in China is long, and the forecast changes of net income in the future may be larger. Therefore, the accuracy of the forecast results is difficult to guarantee. In order to get more accurate results, it can be evaluated in a piecewise way.

3.2The evaluation model of initial annual discount plus later annual discount in earnings

Assuming that the earnings of the first 5-10 years can be predicted and the annual return of public bicycles will remain approximately the same, the model [9] can be used in the early annual discount and the later annual income discount evaluation model. The formula can be expressed as:

$$P = \frac{NCF_1}{1+r} + \frac{NCF_2}{(1+r)^2} + ... + \frac{NCF_m}{(1+r)^m} + \frac{NCF}{r}\left[1 - \frac{1}{(1+r)^{T-m}}\right]\frac{1}{(1+r)^m} \tag{2}$$

Among them:

NCF_1--future income in T

NCF_2--the income of late annuity

m-- the accurate forecast of the 5-10 years period

3.3 The evaluation model of the early annual discount and the later equal increase income.

Assuming that the earnings of the first 5 to 10 years can be predicted, the annual earnings of public bicycles increase in proportion. In this case, we can use the way of the early discount and the later equal increase rate. The formula can be expressed as follows:

$$P = \frac{NCF_1}{1+r} + \frac{NCF_2}{(1+r)^2} + ... + \frac{NCF_m}{(1+r)^m} + \frac{NCF_{m+1}}{r-s}\left[1 - \left(\frac{1+s}{1+r}\right)^{T-m}\right]\frac{1}{(1+r)^m} \tag{3}$$

Among them:

s-- the ratio of the late earnings to the increasing ratio ($r{\neq}s$)

In the actual assessment process, the corresponding model should be determined according to the actual situation of each city, and the value of the franchise of public bicycles should be evaluated.

4 The Parameter Extraction of the Evaluation Model

4.1 Discount rate

The discount rate is a key factor in determining the value of the franchise rights of public bicycles. The methods used to determine the discount rate are the constituent element method and the capital asset pricing model. The constituent element method means that the discount rate is equal to the sum of the risk free rate, the risk reward rate and the rate of inflation, in which the rate of non risk return generally refers to the yield of the treasury bond, and the rate of inflation is to evaluate the purchasing power of the currency in real time. The risk reward rate is the compensation for the investment risk of the investors, and the rate of risk reward is due to the rate of risk reward. Since there is a quite high sense of subjectivity in determining the risk reward rate, it is difficult to reflect the true discount rate. Therefore, the discount rate of public bicycle franchise value should be evaluated by capital asset pricing model (Yuan Zhongwen, Nu Jun, 2014).

$$R = R_f + (R_m - R_f) \times \beta \tag{4}$$

Among them:

R_f -- risk free reward rate

R_m-- the historical average of the expected rate of return on the market

β-- risk adjusted coefficient

The risk-free rate is generally referred to as the yield of short-term treasury bonds. Therefore, it is possible to refer to the 5- year coupon interest rate of treasury bonds on the basis of benchmark days in the assessment. The historical average of the expected rate of return of the market is generally associated with the stock price index. At the time of evaluation, the average return of the annual closing price of the Shanghai index and the Shenzhen index since the founding of the index can be respectively calculated, and take the geometric average rate of return of both the Shanghai stock index and the Shenzhen index as the historical average of the expected return rate of the market. The risk adjusted coefficient can refer to the beta value of a comparable listed company in the same industry, and the regression line method can be used. That is to say, the regression coefficient of the stock return and stock market return is the beta coefficient. Because the calculation of beta coefficient is more complex, it can be learned through Wind data query.

4.2 The amount of income

The amount of revenue is expressed by the annual net profit after the public bicycle franchise in the future. The net cash flow per year is equivalent to the annual cash inflow from the public bicycle franchise, reducing the operating cost of the last year. The franchise of public bicycles includes franchise fees for bicycles, the franchise rights of franchise advertisements and the franchise rights of comprehensive service facilities. As each city carries out the transfer of the franchise of public bicycles, the scope of the transfer is not the same. Some only transfer the bicycle rental franchise, so the annual cash income only includes the annual rental fee for bicycles. At the same time, some transfer the bicycle rental franchise, the franchise of advertisement and the franchise of comprehensive service facilities, so the annual cash income mainly includes the annual rental fee for bicycles and the advertising revenueobtained. Only the transfer of bicycle chartered right is discussed here. The annual rental fee of a

bicycle is the product of the charge standard and the annual rent amount. The fee standard is determined according to the local economic development and policy. The annual rent amount can be calculated by the weighted average of the most optimistic income expected value, the most likely return expected value, and the most pessimistic income expected value.The annual operating costs include daily maintenance costs, overhaul costs and management costs during the operating period. The daily maintenance costs mainly refer to the various funds consumed for the daily maintenance of public bicycles, and their maintenance costs have a linear relationship with the factors such as the amount of bicycle rents and precipitation. The cost of overhaul is mainly used for periodic and preventive comprehensive repairs, making the bicycle maintain the original function state. The influence of these factors is more complex and can be predicted according to the experience method. The management costs mainly include the wages and benefits of managers and the costs of relevant management institutions, which can be predicted according to the annual management costs of other urban public bicycles. There is a certain proportion between the annual operating cost and the annual cash income in the earnings forecast, so we can determine a certain proportion according to the experience data of other cities, and make a reasonable forecast for the net income per year.

4.3 The time limit of return

The time limit of return, the time limit obtained from the franchise of public bicycles, refers to the time period of the entry into force of the franchise to the end of the franchise, and it can be referred to as the franchise period for short. The determination of concession period is more complicated. The government hopes to recover the franchise right earlier. The franchising company hopes that the franchising period will be longer and more revenue will be obtained. Generally speaking, the franchise period should not be shorter than the investment recovery period of public bicycles, nor should it be longer than the economic life of public bicycles. There are two kinds of algorithms for franchise period: the investment recovery period plus the reasonable profit period method, and the suitable investment yield method (Zen Hang, 2012). The investment recovery period plus reasonable profit period means that the franchise period of the project is equal to the sum of both the investment recovery period and the reasonable profit period, in which the investment recovery period refers to the static investment recovery period, and the reasonable profit period is determined by the government and the social capital. The method of suitable investment rate of return refers toselect a suitable rate of return on investment as the discount rate to discount the net cash flow of public bicycles franchised in different years. The appropriate rate of return on investment should be higher than the benchmark discount rate of the project. The higher part is the profit of the public bicycle business. The formula can be expressed as follows:

$$\sum_{t=0}^{T} NCF_t (1+i)^{-t} = 0 \qquad (5)$$

Among them, i means a suitable rate of return on investment.

5 Conclusion

Asquasi-public goods to alleviate urban traffic pressure and mitigate environmental pollution, public bicycles can not rely solely on the power of the market. Under the situation of promoting the PPP model, the government should cooperate with the social capital to promote the construction of urban public bicycles. Since the franchise of public bicycles may serve as a bridge to link between the government and social capital, the income law is the best method to evaluate its value under the current situation of the development of public bicycles in China.

In the process of evaluating public bicycle franchise by the income approach, it is quite subjective to determine the discount rate and the amount of income. We should analyze the various risks of the discount rate, and predict the annual cash income and the operation cost in the amount of income. Moreover, we should carefully determine the three basic parameters of discount rate, the amount of income and the period of franchise in order to get a reasonable and accurate evaluation. In general, with the continuous improvement of the trade market and the transaction database of the franchise rights of public bicycles in China, it is also feasible to use the market law to evaluate its value in the future.

The Solution for Traditional Publishing Media under the Background of the Rise of New Media

Wang Langtao
Wuhan University of Technology Press, Wuhan, P.R.China, 430070
(E-mail: wanglt77@whut.edu.cn)

Abstract: The new media experience a fast development with the rapid expansion of Internet and Digital Technology. There is a great impact on the traditional publishing media. Is this a life and death struggle? However, the new media era is a new product with a strong vitality; while traditional publishing media also have their own advantages. Therefore, it's an inevitable development that the new media absorb the advantages of traditional publishing media. This paper analyzes the development path of new media and the advantages and disadvantages of traditional media compared with new media in recent years, it is proposed that, with the application of new media technology and development in the production of content, there will definitely a new development opportunity for the traditional publishing media.
Key words: New media; Challenge; Opportunity; Traditional publishing

1 Introduction

In recent years, with the advantages compared with traditional media, the rise of new media bring a great impact on people's real life. The new media occupy the media market and penetrate into all aspects of people's life in a very short time. This creates dilemma for the traditional publishing media and great pressure for many traditional media practitioners. Some people think that traditional publishing media come to the end and would be replaced by new media. However, some people think that traditional publishing media also have their own market and would not be replaced. Different researchers have different opinions on the transformation of traditional media. From the three aspects of rapid changes of technology upgrading, cultural change and public demand that has given rise to the change of media environment, Wang Hongyu (Wang Hongyu, 2015), Zhou Xiangyan (Zhou Xiangyan, 2009) and Liu Mengda(Liu Mengda, 2016) have proposed that, traditional media should break through constantly in order to survive. Wang Liming (Wang Liming, 2016) and Chen Dong (Chen Dong, 2016) have proposed from three aspects that the transformation of traditional media is very urgent and necessary. First, the media should develop towards diversification since the audience gradually changes to diversification. Second, based on the extremely fierce competition in the market, traditional media and new media can't develop at the same pace, each side should show its unique advantages. Third, with the rapid development of the Internet and information dissemination and updating, traditional media have been greatly impacted with continuously decreased influence. Therefore, it is necessary to adapt to the development of the times and keep pace with users. However, Bai Qifeng (Bai Qifeng, 2013) made a more accurate description of the current situation of traditional media. From the media environment to the necessity and urgency of reform, all the explanations have told us the breakup of the monopoly and challenges meet by traditional media. First, the challenge of information content because of the restrictions on the amount of information. Second, the challenge of communication mode. As one-way media, no feedback channels are available between the audience and newspaper. There is a lack of extensive communication between media and users. Fourth, the challenge of information expression. The information dissemination of text and audio is flattening by the traditional media, while more comprehensive and three-dimensional dissemination of information can be made by the new media. From the development at home and abroad, it is believed that the real development path is the integration of traditional publishing media with the advantages of new media.

2 The Rise of New Media
2.1 The concept of new media

In essence, new media is a constantly changing concept. With the development of technology and times as well as the continuous enrichment of knowledge, integration and transformation will be made with the new media through the absorption of new contents. As a kind of media form and communication carrier, new media is essentially a way of information transmission that can eliminate the limitation of time and space with strong interactivity.

New forms of media include e-books, mobile newspapers, web publications, mobile websites, television, digital TV, webcasts, blogs and podcasts. To be more specific, based on the information science and take the mass communication theory as the basis, new media is a highly integrated comprehensive interdisciplinary with the integration of culture and art, the application of information transmission technology to the areas such as literature and art, entertainment, business and management.

2.2 The development trend of new media

With its strong vitality and the extraordinal acceptability of the public, the appearance of new media bring challenges to the traditional publishing media. The market of the traditional publishing media are occupied by the overwhelming new media. Being developing at a surprising speed and as a new way of modern communication, new media approach to the increased users in just few years which it takes newspapers, books, magazines, radio and television for decades and hundred years to achieve it.

2.3 The influence of new media on traditional publishing media

The new media is a platform for free thinkers. Because of its nature such as sharing and deep communication, it becomes more and more popular. Among these audiences, especially the young generation, they are addicted to the mobile phone, microblog and internet forum. Media users redistribute their limited time, shifting their attentions and interests to the new media. In this way, the development of traditional publishing media has been influenced to a certain extent by the appearance of new media.

At present, the world has entered the era of mobile Internet, which is an irreversible industrial revolution. In the traditional printing and publishing period, we had developed a set of editorial and publishing strategies, which can be carried out for 10 years. Nowadays however, when we come into a new thing, maybe it was out of date already. The one-year plan could be an adventure since it is most likely out of date after it has published just several months later. iPad is only three years old, but the changes that it bring to the world is obvious.

Through the communication with traditional publishing media practitioner, it can be summarized into two opinions towards new media, one is that the traditional business can be continued instead of change and reform; the other is that it holds pessimistic attitude and they think magazine come to the end. In fact, one should be both optimistic as well as crisis awareness. Since it can't be avoided, so it is better to welcome it. For many marketable publications, including *Readers Magazine*, they face both challenges and opportunities. Traditional publishing media should adapt to this situation. The most important is that, the traditional publishing media practitioners need to correct their thoughts at any time with continuous study, and get ready to change with adjustment.

3 Advantages and Disadvantages between New Media and Traditional Publishing Media

New media has the characteristic of timeliness, which is unmatched by traditional publishing media. In recent years especially, with the appearance of new media such as Weibo, the events that happened just now all over the world will be uploaded to the Internet in a few seconds and spread to the whole world. This couldn't be imagined by the traditional media before. Take the education on socialist concept of honor and disgrace proposed by the President Hu Jintao for example, one publishing plan of a book about this topic has made, but the author has found that, there are so many similar things with various forms on the Internet which are more diversified than traditional books with visual impact.

In order to make the products that meet the market requirements, traditional media still lags behind compared with the new media. It should focus on the content and give priority to the content in order to provide better products. That is to say how the traditional publishing media can make full use of its advantages and improve its disadvantages. According to the author, the advantages and disadvantages of traditional media compared with new media are shown in the Table One as follows:

Table 1   Advantages and Disadvantages of Traditional Publishing Media Compared with New Media

Advantages	Disadvantages
1. Originality and selection of information.	1. Slow content updating.
2. Depth and credibility of the content.	2. Simple content presentation method.
3. Professional editorial staff with good ability.	3. Weak interactivity.
4. Stable audience.	

4 Challenges and Opportunities Faced by Traditional Publishing Media
4.1 Challenges faced by traditional publishing media
The development of new media is not rapid and powerful in the social environment currently, but there are various signs that challenges and difficulties are faced by the traditional publishing media. Some people even think that traditional publishing media will eventually be replaced by the new media, some people even predict that one has to go to the museum if want to see the paper medium in the future. Would book and magazine still exist? It is the issue concerned by the traditional publishing media. However, the traditional publishing media has a profound historical heritage. Many people are in particular pursuit of the feeling of paper and ink fragrance. The authority and influence within traditional media cannot be replaced by the new media at the present stage. Moreover, the replacement of traditional media by new media is usually a gradual process instead of a comprehensive process.

From another perspective, faced by the impact and influence of the new media, traditional publishing media should keep pace with the times and make full of its advantages to maintain its strong competitiveness through unique development method in order to establishing a coexistence and win-win situation with the new media. Faced by the appearance of new media, traditional publishing media have been able to treat the developmental characteristics of new media and itself in a correct way after panic at the initial stage. It can learn the advantages from the new media. Traditional publishing media should swallow their pride and abandon the mode of dissemination with superior feeling, thus it can become popular among the audience. Change the audience from being passive to active as to the information dissemination, make the mode of dissemination with humanity and interactively.

4.2 Opportunities faced by traditional publishing media
It can be said that, besides the challenges to traditional publishing from the mobile Internet, it also brings corresponding opportunity. First, a large number collection of data enables publisher to have a clear understanding of their users and readers. Thus, better service can be provided for their users based on the foundation.

In the traditional period, one periodical with 4 billion circulation is a huge success because of the limitation of distribution channel and publishing stock. However, it is not surprising that there are so many applications with millions of active users in the period of mobile Internet. The cost of acquisition and physical distance is eliminated by the Internet and better content can be found and experienced than before. For the content producers, if the content is good with well operation, its Internet users can certainly reach to 10 times as that of paper media circulation. Advertising and value-added services can be continually provided to these users. This is the development trend of the media in the future.

Take the periodical *Readers* for example, the overloaded information could be an opportunity. Because it is seldom for the ordinary people to have ability or energy to get the right information from the mass information. What they need is a recommendation like a sieve or filter. The editor with human nature is better and more accurate than the calculation of computer to provide the information to the users. In the period with insufficient information, *Readers* had achieved success by providing effective information to the users. In the period of the long tail, abstract journal is more like an effective filter which it can constantly provide reading service to the users. It can choose information, save time and energy for the users. This is the opportunity for the *Readers*.The premise is that these two kinds of publishing methods are different, which involves the awareness of product and service as well as new editorial thought.

5 Strategies for the Traditional Publishing Media during Transformation
5.1 Strengthen internet thinking
According to the opinions proposed by Mr. Zhou Hongshen, the founder of Qihoo 360 Technology Co. Ltd, Internet thinking contains four key factors: user first, experience first, free business model and disruptive innovation. The essence of Internet thinking can be summarized as: user-centered, perfect user's experience, think what the user thinks, and start from the emotional appeals of the user in order to provide individualization service for the user.

The integration of traditional publishing media and new media is to find the social value of traditional publishing media under the framework of the Internet, transform traditional publishing media through Internet thinking instead of treat the Internet as the extension and supplement of traditional publishing media. The Internet Plus mode is to enable traditional media to build a powerful

communication ability on the platform with the help of advanced communication technology and method from the new media based on the exploitation of its own content and brand communication ability.

5.2 Adhere to the content

The unique advantages of traditional publishing media can't be possessed by the new media. More specifically, the content and editing standards of traditional publishing media can't be reached by the new media. Traditional publishing media can achieve success in content through authoritative analysis and penetrating comments. The traditional print media should attach importance to its own capability, make its content more competitive, meet the needs of reader as the starting point, provide the reader with the information they need, treating the reader as god, thus the interaction communication can be realized.

Traditional publishing media can enhance and make full use their advantages, and provide the core content to their audience through rapid and convenient way. The audience can get valuable information. These are the advantages of traditional publishing media that are not possessed by the new media. This can be regarded as the traditional publishing media to be popular with the audience. Where is the living space and future of traditional publishing media? It is proposed that besides the strengthen of the advantage in content, it should also develop the speciality in its authority.

5.3 Active transformation by the traditional publishing media talent through the use of advantages

Now most of the traditional print media has its own website, traditional publishing media must learn new technology with integrated development. It should be actively integrated into the new media such as network, e-paper, mobile news, especially small fresh e-books, and further participate in the cultural management in all aspects such as network media, mobile media (mobile phone newspaper), cultural publication, electronic schoolbag, etc.

The profound literary accomplishment as well as editing and publishing experience of the traditional publishing media editor are the advantages in the transformation. Their accurate reading comprehension ability and fast editing ability enable them to adapt to the characteristics of high speed and efficiency of the new media. The talents of traditional publishing media can make use of their own advantages in editing and publishing fields, integrate the Internet thinking, learn new technologies, and improve their abilities accordingly. It is entirely possible for them to adapt to the requirements of new positions rapidly and gain new career development opportunities.

6 Conclusion

It is very dangerous to ignore the development of new technology and new media. It is also unwise to lose confidence in development because of the challenges from the new media. It is wise to attach importance to the new media, absorb new technologies, and choose the right development road.

In the fierce market competition, the traditional publishing media must take the initiative, seize the opportunity and make full use of the advantages of brand and resource, enhance the competitiveness in the fields of new technologies and communication in order to realize the development goal that the integration, promotion, coexistence and win-win can be found between the old and new media. In order to meet the development of society and needs of people, the development of the media has been increasingly integrated. Traditional media will inevitably find the most suitable way in each transformation.

Market Bottlenecks and Future Development Analysis of the APP for Children's Co-education both at Home and at School

Luo Xiaoqi

School of Arts and Laws, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 1476765373@qq.com)

Abstract: This paper uses a comparative summary and FieldWork, presented a query on the market development of the APP for children's co-education both at home and at school. It is believed that the existing products cannot fundamentally solve the problems which parents concerned. The product homogeneity is highly competitive and the ultimate victims are users. After analyzing several well-developed APPs for children's co-education both at home and at school, it is found that their fundamental problem lies in focusing on the wrong parts. They focus on the parents rather than the children. Finally, it is concluded that we must focus on children, increase children's participation, and constantly strengthening their professional education.The product is really conducive to the healthy growth of children, which is possible to build a unified infant market platform for the qualitative leap to China's immature toddler market.

Key Words: Co-education both at home and at school; Application; Children's market; Education industry

1 Introduction

The school-family connection of American pre-school education is mainly based on parent organization, and the parent organization and school in the United States are equal. Of course, there are APP, such as Remind and Buzzmob, which provide school-family contact functions, but their functions are all very simple. It can facilitate the convenient transmission of information, and the purpose is to reduce the cost of paper. School-family connections in Britain are mainly letters .Sometimes are e-mail or paper letters. Chinese parents are mostly busy with their careers, and they have less time to accompany their children. The feature-rich home produced app arises at the historic moment, but the development time is not long, and there are many problems. At present, there are some articles in China pointing out the problems existing in the app.Serious homogenization is one of the most criticized.

The reference is mainly to explore the application of homelands co-breeding APP under the background of "internet+" and the positive interaction between line and line.

The second literature: From the Internet to the "Internet +", the progress of information technology has greatly changed people's lives. Under the influence of the great era, the combination of "Internet +" and early childhood education has promoted the upsurge of home interaction APP. Starting from the practical problem of home interaction, this paper discusses the application of home interaction APP in the field of preschool education, and puts forward some suggestions and ideas.

The sixth literature: This paper presents a thematic review of app-enabled learning in the context of recent developments in mobile technology and m-learning. Three key themes are presented that reflect the issues that teachers, school leaders and systems have grappled with in recent years.

The seventh literature: The children's market is very challenging but has great potential. In the very dynamic and ever-changing face of the children's market, identifying and being able to optimize the factors that can preserve product dominance is the key to product longevity. This paper attempts to identify factors which are identified as the antecedents of brand loyalty in the children's market. We propose a model which tries to encapsulate the antecedents of a brand relationship and its influence toward brand loyalty. We did a semi structure interview in Indonesia, Portugal, and Brazil to validate our model. We also did a survey within these three countries to test our hypotheses. The findings of the preliminary study, semi-structured interviews, and past research suggest that brand personality, brand trust, and brand salience are important antecedents to create a brand relationship in the children's market.

The ninth literature: Driven by the "Internet +", a large number of APP software based on home ownership has emerged. In view of the characteristics of APP in the current home, this paper focuses on analyzing its advantages and disadvantages in its application, and puts forward some rectification strategies.

The tenth literature: The key of home co-education lies in the communication between parents and kindergartens. Traditional communication methods can not meet the needs of development. In today's "Internet +" era, new Internet information technology has begun to be applied in home communication. Through combing all kinds of online and offline communication modes, this paper draws a conclusion that the benign interaction between online and offline is the inevitable trend of the development of home co-education communication mode.

2 The Market Situation of the APP for Children's Co-education both at home and at school

The preschool education industry has developed rapidly in the past two years,and the capitalists smell the benefits,and a large amount of capital has begun to flow into the kindergarten market.
Figure 1   Number of Children in Kindergarten (unit: a children)
Figure 2   Prediction of the Market Scale of Preschool Education in China (unit:a hundred million RMB)

This huge market has not been well excavated, and has not yet formed a brand and monopoly. So now is a good opportunity for development. Whoever can seize it first is the winner.

This part will start from three aspects of the market of the APPs for education, the APPs for co-education both at home and at school, the APPs for children's co-education both at home and at school to help us understand the current market situation of this kind of products.

2.1 The market of the APPs for education

China's first comprehensive and systematic education APP evaluation report was released in the 7th China education gala of sina. By November 2014, the total number of education APPs in China has exceeded 70,000, accounting for about 10% of the APP market share in China, ranking second only to game APPs in apple APP store.

In China, where material conditions are gradually getting richer, cultural education has been put on the agenda. Parents of the younger generation pay more and more attention to children's education, and education expenditures have been increasing year by year. In addition, the "Internet + education" policy enables people engaged in the Internet and education industries to see opportunities and join the

research and development of education APPs.

Due to the low market access threshold of education APP in China, the product similarity is serious and the quality is difficult to be guaranteed. Sina education conducted a comprehensive evaluation of the top 200 education APPs in domestic APP stores. Education APPs with a full score of 100 and above 80 are excellent products worthy of recommendation. But the results showed that less than 10 percent of APPs scored 80 or more.

2.2 The market situation of the APPs for co-education both at home and at school

The education of a child is mainly at home and school. Parents are eager to obtain information about their child from the teacher, and the teacher also hopes that the parents can understand their child and help the teacher better educate the child. Therefore, the communication between the parent and the teacher become a must.

With the advent of the Internet and mobile terminals, communication between parents and teachers has gradually shifted from offline to online. Our mobile phones receive a huge amount of information every day, and people are already upset with the huge amount of information. However, they are still greeted by a lot of invalid information in the communication group of home and school. The home-school communication groups on QQ and WeChat not only waste time for parents to read invalid information, but also sometimes miss important information released by teachers, causing great influence.

So the APPs for co-education both at home and at school came into being. There are mainly the following categories: national type, regional type, K12 universal type, targeted type. There are many varieties and fierce competition.

2.3 The market situation of the APPs for children's co-education both at home and at school

According to the online education career yearbook provided by the cnki.net, by 2016, the number of children in our country reached 47.25 million and the number of kindergartens reached 239,812. This is still a blue ocean child market. Everyone wants to occupy a place.

According to the assessment data, preschool education users currently spend about 94 yuan on average, and the average amount they may spend in the future is as high as 178 yuan, ranking the top among educational APPs. At present, the market has done a better job with the smart tree children's growth industry cloud platform, shell chat, palm home, in the next chapter we will introduce these products in detail.

According to the product trail and online user's evaluation, there is no obvious difference between these APP products except the design of the page, and the homogeneity problem is quite serious. "In fact, many of the functions of those APPs have not been fully developed and have already been introduced to the market. In the process of promotion, some users might give up those APPs. Therefore, some functions cannot be completed, and the final functions are almost identical to QQ and WeChat."

Due to the imperfection of design and the lack of information about the demands of users, many users registered when those APPs were firstly introduced, but soon their enthusiasm began to decline, and the usage rate could not be maintained. And because of the fierce competition among those products, the market for each product is very fragmented, and it is difficult for customers in these infant markets to have a common platform.

2.4 Foreign markets

Living Tree was established in 2012. The main product is the Tiered Social Network, a home-school interaction APP, through which teachers, schools, and district administrator can send texts, pictures, and other types of messages within the product. It is mainly prepared for parents and children to acquire the notification of schools and classes. It was announced on November 30, 2016, that the product was acquired by Dean Drako, the founder and former CEO of network security firm Barracuda Networks with several million dollars. The home-school co-education in foreign countries is different from that in China. They focus on social network. Therefore, Living Tree, an APP focused on providing social network platform, meets the needs of teachers and students, and the number of users is increasing.

3 Popular Products Analysis

Common function: Notification/ Children Dynamics Sharing/ Private Chat Between Teachers and Parents/ Children Recipes/ Parents Circle Communication/ Bedtime Story

3.1 Smart tree preschool cloud platform (page base color: green)

Users: 32 provinces, 120,000 kindergartens, 30 million users

The Smart Tree Preschool Cloud Platform was developed by Beijing Huanyu Wanwei Technology

Co., Ltd., with kindergarten principals, teachers, and parents as the main service targets, and focused on building an integrated service platform for home education.

In February 2018, the Smart Tree was financed by 700 million RMB.

Features:

Cloud office system (storage of children's and parents' files, storage of weekly plans and attendance and leave for each class, reduction of teacher workload, and implementation of integrated kindergarten information management.)

Weekly event recommendation (Wisdom Tree organizes various national events weekly, as well as rich prizes)

Quality childcare knowledge (baby see, baby listen, childcare tips and other quality parenting content to help your baby grow better)

3.2 Shell chat (page base color: yellow)

Users: 31 provinces, 50,000 kindergartens, 10 million users

Shell chat returned to the nature of education, and continued to build a one-stop home education products and personalized parenting program. It was committed to liaising parents and kindergarten to promote home synchronization, and to truly realize the children's personalized training.

Shell chat is the only brand of Viagra shares (the first share of A-share preschool education), Tsinghua Enlightenment and NetEase.

Features:

Professionalism (combined with authoritative organizations to create and combine data on the use and behavior of millions of children, to record and analyze growth status, and to generate exclusive childcare programs. Hundreds of pre-school education experts have settled in Shell Chat, and more than 30 well-known educational institutions and publications have been established to meet the childcare needs of users with multiple contents.)

Director's exclusive functions (information monitoring and teacher work statistics) The "Little Yellow Chicken Guardian Program" (a public welfare project to prevent the loss of children in kindergartens was initiated by Shell Chat, NetEase, Gaode, and the Children's Safety Foundation. The use of mobile Internet technology prevents children from being lost.)

3.3 Palm home (page base color: blue)

Users: 50,000 kindergartens, 10 million users

For the kindergarten industry, we have created a cloud-based platform for home-school communication, park management, and presentation sharing based on mobile Internet technology.

Features:

Video surveillance (application of remote video technology provides core patented technical support for campus security and transparency management.)

Sign-in management (advanced sign-in equipment is connected to the palm-home network, and parents authorize pick-up and drop-off of children by handing them home.

Kindergarten, through fingerprints, photographs and parents, checks passenger information in a timely manner to ensure the safety of children.

4 The Environment Pest Analysis

4.1 Policy environment

In the "13th Five-Year Plan" for the development of national education in 2016, it is proposed to make full use of big data, cloud computing and other information technologies to promote the development of "Internet Plus Education". This is the first time that "Internet Plus Education" has been written into national education. "In the planning, the conference pointed out that during the "13th Five-Year Plan" period, we must continue to place education in a strategic position of giving priority to development and advance education modernization.

4.2 Economic climate

China's GDP reached over 82.7 trillion yuan in 2017, which is the first time to exceeded 80 trillion yuan, and the Engel coefficient fell from 30.1% in 2016 to 29.3% in 2017. With the progressive improvements in people's livelihood, cultural requirements have also gradually increased. In addition, there are increasingly investment in education because the younger generation of parents tend to create and provide better quality education for their children. Huge demand embraces a huge market. The education industry, billed as a growing industry, is more and more prosperous year by year. For instance, "Internet Plus Education" pushed education in the spotlight once again in 2016, which became highly

favor among numerous entrepreneurs. "The data shows that the number of start-up companies in the educational technology circle is growing at an average annual growth rate of around 50% in recent years, of which the number of online education projects currently surpasses 3,000."

4.3 Social environment

In December 2017, China Institute of Educational Finance Research-Household Survey(CIEFR-HS) at Peking University officially released the initial survey data for domestic household education spending in China. The survey data in the next semester of 2016 and the last semester of 2017 estimated that the total expense of family education on the pre-primary and basic education in China was approximately 1.9 billion yuan, accounting for 2.48% of the 2016 GDP. That means that individuals gradually realize the significance of early childhood education because the early education of a child shapes his whole life. Therefore, parents are willing to invest more money and energy to provide their children with the best education during this period, and kindergarten and early childhood programs are preferred by parents.

4.4 Technical factors

Cloud computing, internet of things, big data technology and related industries rise rapidly and diversified newly services flourish within the context of "Internet Plus". Due to little technology for home-school co-producing products, this product needs more detailed page design, more understanding of the infant market and preschool education as well as professional knowledge of pre-school education, which is expected to bring young children better growth environment, so that they can embrace the trust of parents and build brand loyalty.

5 Problems and Difficulties

5.1 Homogenization and competition

There are 76 APPs focused on home-school interaction are neatly arranged online. However, there is no real difference among them, whose the main function includes the private chat between parents and teachers, school notice, dynamic sharing, parenting knowledge. Other common additional functions consist of bedtime stories, nursery rhymes learning, punch check-ins, and course studies, which are not only insubstantially different from similar products, but also similar to APPs that focus on additional functions as what is mentioned above. Indeed, one-stop services are more convenient, but parents and children will not tend to use them if they are not professional and attractive compared with APPs doing these products exclusively. That is to say numerous functions are not necessarily more appealing.

Home-school interaction is so attractive for APPs entrepreneurs and some businessmen, and those merchants looking for another ways to start with existing social platforms that are already popular. For example, following the launch of "Ali Teachers and Students" by Alibaba last year, Tencent has recently added this function to the QQ group, and many people turn their attention to Tencent's other social software- WeChat. In fact, there are companies that are helping schools to develop related services based on WeChat official accounts and establish their own online home-school communication channels. For example, Nanjing Maunguan Technology Co., Ltd. ("Mongguan Stock"), which has recently raised about 10 million RMB on the New Third Board, currently mainly popularizes its "Micro Campus Alliance" home-school platform based on WeChat.

In this way, homogenization brings serious disorderly competition, which damages the interests of users. Some APP users are still being used while they are disabled. The APP still retains a large number of pictures of children, registered phone numbers and other important information. However, there is no person in charge is responsible for the loss of such information.

5.2 Lack of profession

Although the current home-school co-education APP boasts education, there is no way to prove its real effect in education. Indeed, it can be felt that parents' monitoring of children has been strengthened, but people begin to wonder if it will be harmful to the free growth of children. The free development of the parents; the communication between the parents and the teacher just brings more convenience the teacher and the parents, but it needs to think whether it is conducive to children's education. So, that the focus of this product is a child or a parent deserves to pondering.

Social APP is currently a benchmark product in the era of mobile internet, such as WeChat, which is well-known to all of us, and a strangers' social APP that is listed in the United States. Meanwhile, APPs of home-school communication are also standard educational products of K12 education on the Internet. Owing to the functional overlap of these two kinds of APPs as well as the higher cost for parents to acknowledge those new studying products, WeChat has greatly weaken the competitiveness of

those APPs which are only capable of social communication. Thus for those APPs of home-school communication, to strengthen their unique educational function is the only way out.

Social interaction is universal from the perspective of tool attributes. However, as social interaction becomes different, the demand for products will vary accordingly. Because of the special nature of education, parents, students, and teachers participate in the tripartite party, and the communication between the two groups is quite different. Therefore, a product that better understands education is naturally more popular.

5.3 High usage rate for users is hard to maintain

Since users are mainly parents who are a very busy group, their time spent on an APP is very limited. If this product is not necessary, they will directly give up. Few parents are free to chat with their teachers every day; dynamics do not have to be brushed every day; what can be notified is to communicate with the teacher directly when they pick up the children, instead of chatting online. From this point of view, this just-needed requirement doesn't seem to be so necessary. Therefore, although parents registered an account under the management of the kindergarten, the actual usage rate cannot be guaranteed. Thus the construction of this platform is meaningless. Without active user, who can see and promote advertising? With only a beautiful outlook, how this platform will work is worth thinking about.

6 Future Trends and Development

6.1 Market diversification of preschool education industry

The kindergarten industry has not yet formed a monopoly and the market is very decentralized. At present, the number of kindergartens in our country is close to 240,000, but only 6,000 of the top 20 preschool education corporations in China add up, accounting for not to 6% of the market share. Therefore, if it is to seek kindergarten cooperation, in addition to a few big heads, the rest require a door to door run. Especially in some small cities, people's acceptance of new things is limited. It is difficult to take the initiative to try. Only the APP actively seeks cooperation. The workload is very large. Therefore, the establishment of a unified infant platform still has a long way to go.

6.2 Strengthen proficiency

Many existing products are just for users' convenience. But they only see the superficial needs, yet forget the most essential needs of parents: the expectation for their children's better growth instead of the pursue of convenience. The development of the preschool education industry in China is relatively late, and the preschool education is still immature. If there is an APP with a strong educational specialty, it will quickly be recognized by the teacher parents and the relevant experts. After all, there is no product in the market that can make it.

6.3 Increase children participation

It's better to figure out children's preference rather than their parents', and attract parents with their children's preference. Nowadays, the services provided by the products are mainly parents-focused, such as exchanges experience parenting, children's dynamic sharing, in which children's participation is very low. This kind of product is completely irrelevant to children, though it should be. If an APP can tap the child's interests, and let parents and children participate in the activities of the APP together, it will not only play a role in educating children, but also increase the time for parents and children to get along with each other. In this way, the user's activity will naturally come up.

7 Conclusion

The development of child-care platforms still needs time, and co-apprenticeship for child care is a good point to start, but its development still needs a long way to go. With the decentralization of kindergartens and the unification of preschool education platforms, it is difficult for children's brands to build. Children's home-school co-APPs should be child-centered, accurately capture the pain points of parents, enhance the professionalism of product education, win the trust of parents and teachers, and ultimately be able to build a unified child care platform, which can bring a qualitative leap to the child care market.

Abstract: This essay began with the definition, development and classification of corporate social responsibility strategy, then Coca-Cola company was taken as a research object to evaluate the effectiveness of its CSR strategy through its response to different criticisms. Through such analysis on three key issues, it could be concluded that Coca-Cola water stewardship as an effective strategy helped the company to solve serious water criticism. However, in terms of the criticism of sugar use and packaging, the corresponding CSR strategies taken by the company failed to solve the problem effectively due to the lack of attention and incorrect focus.
Key words: CSR; Effectiveness; Three key issues; Strategy

1 Introduction

Over the years, because of the coming of the era of globalization, business competition is becoming more and more fierce, and the core competitiveness of enterprises has gradually transformed from the indicator of "hardware" such as machinery, equipment, and plant into a "software metrics" such as brand, company values, social responsibility, etc (Ambastha and Momaya, 2004). Therefore, many multinational companies are gradually realising the importance of corporate social responsibility (CSR).This essay will firstly analyse the meaning of CSR in a critical way. Then taking Coca-Cola as an example, the significance and effectiveness of CSR strategy will be evaluated through analysing the company's responses to three key issues which have been particularly criticised, and finally corresponding recommendations for improvement will be given.

Coca-Cola as a leading company in the industry has devoted itself into CSR to ensure the sustainable development of itself and the whole society as well, and the company uses the term of 'sustainability' in the the report for describing the CSR plan in the official website. The goal of the company is to establish a positive example for how to carry out more sustainable businesses worldwide through the joint efforts of Coca-Cola Company and nearly 250 bottled partners in more than 200 countries (Sustainability Report, 2016). However, in Coca-Cola's Sustainability Report (2016), there is no clear definition of CSR or introduction about 'What does CSR mean to the company?', also the company has not stated that how long they have worked on reporting sustainability.

2 Concepts and Research Status of CSR

Corporate Social Responsibility (CSR) represents a change in the direction of business operation from the interests for shareholders to the interests for the whole society. However, after decades of the research for CSR, there is still no universally accepted definition for it. CSR has been defined differently by different writers or entrepreneurs based on their personal perspective. Generally, CSR is regarded as a duty that enterprises should integrate social, environmental and economic issues into their operations, decisions, strategies, and culture, so as to create better practices within the company, and make the society become better (Blowfield and Murray, 2014). CSR is also known as some other terms, such as corporate accountability, corporate ethics, business sustainability, and so on. With CSR becoming increasingly related to business strategic practices, there is a trend to call it "responsible competitiveness" or "corporate sustainability".

Although there is no consensus as to how to define or implement CSR, main CSR theories and related approaches could be categorised to four groups - Instrumental Theories, Political Theories, Integrative Theories and Ethical Theories (Garriga and Melé, 2004). Firstly, Instrumental Theories regard the corporation as an instrument or a tool used to maximise profits, which has been seem as a sole responsibility for the corporate (Friedman, 1970). Some Instrumentalists claim that CSR is bad for business because it would increase costs and take profits away from shareholders, while the other branch of instrumentalist regards CSR as a way to find more profits. The second group is called Political Theories which emphasise the connection or relationship between the corporate and the society (Garriga and Melé, 2004). Corporate would think they should use business power to take responsibilities in the political environment, for example some companies would like to do something which is considered as

governments' duties, such as providing health services. In addition, Integrative theories insist that corporate should pursue long-term profits and success by integrating social demands into the business, which could help companies develop steadily (Garriga and Melé, 2004). In these theories, stakeholder management as one of the most important ways could help companies fulfill social demands. Ethical theories as the last group make the profits irrelevant to CSR, and ethical obligation is seen as the top consideration in the process of business operating.the main aim of these theories is to make the whole society become better with the company's development (Garriga and Melé, 2004). In this way, the relationship between business and society could be Strengthened.

Carroll as the representative of Integrative Theories put forward 'The Pyramid of CSR' as a useful and widely used tool to evaluate the performance of CSR. Carroll (1991) argues that four positions constitute the total CSR, they are economic, legal, ethical, and philanthropic. For the majority of enterprises, the latest situation is that all four aspects in CSR need their attention, and they should take effective measures corresponding to such four different parts to ensure validity of CSR.

In the real life, more and more companies put CSR in the crucial position of business operation because of its overall advantages. The most mentionable point is that the corporation could increase the reputation from implementing CSR strategy, which serves a dual purpose (Brammer et al, 2007)- Firstly, customers would want to buy more products or services because of the clear and positive image of the company. Secondly, other enterprises would be more willing to invest or cooperate with the corporation. Then in this way, companies could attract more customers, improve relations with other companies, and promote profits in long term.

However, the existence of CSR has been controversial for decades. For example, Friedman is a representative for opposite arguments of CSR, he believes that the sole responsibility of the company should be increasing profits for itself and shareholders, rather than being charged with "social responsibility" for the public or whole society, while the private capacity of shareholders could be seem as social responsibility (Friedman, 1970). Also there are some other arguments against CSR. Firstly, focusing most on CSR would affect the success of companies businesses in the marketplace, because CSR would waste lots of time and money. In addition, another idea is that it is the responsibility of the government to deal with social issues, not business (Aguinis and Glavas, 2012).

3 Introduction of Coca-Cola

Coca-Cola as a leading company in the industry has devoted itself into CSR to ensure the sustainable development of itself and the whole society as well, and the company uses the term of 'sustainability' in the the report for describing the CSR plan in the official website. The goal of the company is to establish a positive example for how to carry out more sustainable businesses worldwide through the joint efforts of Coca-Cola Company and nearly 250 bottled partners in more than 200 countries (Sustainability Report, 2016). However, in Coca-Cola's Sustainability Report (2016), there is no clear definition of CSR or introduction about 'What does CSR mean to the company?', also the company has not stated that how long they have worked on reporting sustainability.

The latest sustainability report of Coca-Cola will be taken in to see the company's efforts for sustainability. In the Sustainability Report 2016 of Coca-Cola, it presents seven different aspects in its sustainable plan, includes agricultural, climate, giving back, human rights, packaging, water and women. They could be categorised into three types, environment, human rights and donation.

In terms of environmental perspective, the company showed that they did much for the goal about more sustainable source for priority ingredients by 2020. Their goal on climate protection is to reduce Coca-Cola's carbon emissions by 25% by 2020, and the plan was half done in 2016 (Sustainability Report, 2016, p9). In addition, the company has been committed to avoiding waste in the life cycle of packaging. The Sustainability Report 2016 shows that 60% of Coca-Cola's bottled and canned beverages launched in the market were repackaged or recycled (p12). Then, the company has focused water stewardship efforts on the areas where they can have the greatest impact to protect water sources.

As for the part of human rights, Coca-Cola said that respect for human rights is a core component of their business and the basis for their ability to run a successful global enterprise (Sustainability Report, 2016, p11). The company uses the human rights policy and supplier guidelines as the basis for managing global business. On the other hand, 5by20 is a program designed by Coca-Colain 2010, which aims to enable more women with the economic empowerment.

When it comes to donation, the Coca-Cola claims that they have always had a strong tradition of giving back to the society. The Coca-Cola Foundation, launched in 1984, is a global philanthropic arm.

The Coca-C[1]ola Foundation awarded more than $900 million since 1984, and in 2016, the company donated 1.2 percent of the company's operating income, $106 million, into local communities (Sustainability Report, 2016, p10).

4 Main Implementations of CSR by Coca-cola

As a corporation with a history of more than 100 years and worldwide business, for a long time, Coca-cola has been striving to take root in community and achieve harmonious development among corporation, community and ecological environment. To be more specific, Coca-cola is making efforts to protect water resources, save energy, tackle climate changes, protect environment and health, promote prosperity and development of the community where it is located, innovate operation, take care of its employees, lead cooperation and mutual benefits of supply chain. The concept of corporate social responsibility has integrated into the daily operation and management of Coca-cola and influenced society and other stakeholders.

4.1 Water use

Coca-Cola has been criticised on their water use for long time, particularly their practices in India. In 1999, Coca-Cola had set up a bottling plant in Kala Dera, Rajasthan, which was consistent with the government's plan. The plan aimed to transform a backward rural area which completely dependent agriculture into a modern industrial center. As the company stated, setting up the plant also as an effort showed company's CSR vision and mission of benefiting the society.

However, after investing heavily in Kala Dera plant, the company faced resistance from the community, including some activists in 2004. Farmers began to launch a "water protest" on Coca-Cola, because after the Coca Cola Co was commissioned, they were faced with a serious drop in the water level (Chaklader and Gautam, 2013). According to the research done by Ananthakrishnan Aiyer (2007), such phenomenon made irrigating lands and sustaining crops become more and more difficult, which put local families at risk of losing livelihoods at that time. As a result, the verbal clashes and protests became increasingly serious in Kala Dera, even surrounding villages began to crusade against Coca-Cola for their unethical behaviour of overusing water source. Finally, Coca-Cola had to close down that plant in 2004 after the village council refused to renew the operating licence for the company in Kala Dera (Chilkoti, 2014).

After that, the company changed its CSR strategy in India, from solely supporting economy to protecting environment.From the research done by Chaklader and Gautam (2013) it can be seen that Coca-Cola India patiently heard feedback and opinions from all stakeholders and tried to communicate and cooperate with them rather than denying or shrinking responsibility. Coca-Cola India took several targeted actions for implementing the new strategy of sustainability to deal with challenges of water scarcity in Kala Dera. For example, it started a project to promote drip irrigation in Rajasthan. Coca-Cola helped the government of Rajasthan increase the subsidy offered to farmers for drip irrigation from 50 percent to almost 90 percent (Hills and Welford, 2005). Furthermore other a series of initiatives as a part of Coca-Cola India's water stewardship promote working with local communities.Also Coca-Cola has expanded the support of healthy watersheds and sustainable community programs to balance the water used in the process of producing beverages. Finally, the company has successfully decreased its water usage ratio by more than 25 percent from 2004 to 2009 (Coca-Cola, 2018).

According to CSR Pyramid (Carroll, 1991), such new strategy in India fulfilled the ethical responsibilities, doing right things to protect water and meeting the villagers' expectation for livelihood. All these initiatives helped Coca-Cola turn the negative situation where they had to close down the plant in Kala Dera (Chaklader and Gautam, 2013). According to the interview research conducted by Hills and Welford (2005), it shows that Coca-Cola India has enjoyed local favour as it successfully coped with the water issues in Kala Dera by its new CSR strategy, and those actions had boosted up the confidence level of the villagers towards the ethics of company and changed the perception about the company. Therefore, although the efforts on such issue spend the company about five years, at the end the company transformed the negative resistance into positive popularity through its CSR activities. Besides, as Coca-Cola announced, they have learned a great deal from such challenges happened in India, which has positively influenced the way they approach responsible water stewardship today, in

India and even globally (Coca-Cola, 2016). For example, after that Coca-Cola established a global water stewardship strategy to initially protect water source around the world and avoid similar infamous issue.[1]

4.2 Sugar-added

About ten years ago, there were many questions about the side effects of sugar in Coca Cola. According to a report of Sunday Times, Coca-Cola contains a sugar substitute known as aspartame, which affects the brains of drinkers (Gard, 2015). In recent years, soda consumption is down amid anti-obesity campaigns and an overall trend toward health and wellness (Bernstein et al, 2012), and especially Coca-Cola as a biggest soda company has been criticized. Although the company earlier countered that aspartame was a safe and appropriate additive with low calorie content and its safety has been recognized by the U.S. food and drug administration, it is still being rejected by many healthy people. So enterprises have to adopt a series of corporate social responsibility strategies to reduce the side effects of sugar.

In order to cope with the health crisis caused by sugar, Coca-Cola claims that they are committed to providing people with a variety of product choices which uses clear product nutrition labeling and actively advocates healthy lifestyle (Sustainability Report, 2016). According to the investigation of Gertner and Rifkin (2018), the company has made a lot of effort for promote the nutrition of the product, including adopt a positive calorie label on the package, develop low-calorie and zero-calorie products, change the recipe of the product to reduce sugar addition, and more transparently open sponsorship money, as well as do not advertise children under the age of 12. For example, recently, Coca-Cola introduced Coca-Cola Zero Sugar, a new product taste and look more like the original Coca-Cola, but without sugar (Hepburn, 2016).

However, the latest research done by Cox (2009) shows that Company is still criticized for its sugary traditional products. It is worth mentioning that in Coca-Cola's Sustainability Report 2016, the company did not put the reducing sugar as one of the seven main aspects, so it could be seen that the company still does not regard reducing sugar content as the main target of sustainability. Thus, Coca-Cola's CSR strategy has not done much to reduce sugar, which makes the company remains mired in disputes over the health risks of sugary drinks. At the same time, CSPI has launched a lawsuit alleging that Coca-Cola misled consumers about the health risks by funding research that downplays the dangers of sugary beverages and spending billions of dollars on deceptive advertising that have enormous appeal to consumers (Spinet.org, 2017). Therefore, the CSR strategy has been widely questioned, whether Coca-Cola thinks it is better to reinvent itself as a new healthy brand than to spend money on new recipes of sugar-free coke.

4.3 Packaging

The third key issue for the beverage industry as a whole has been around packaging. Serious problems about climate change and landfill waste make product packaging become one of the factors for consumer choice. Though the influence of product formula has been the focus of consumer attention for a long time, it is increasingly argued that the waste produced by daily consumption will also have adverse effects on the environment, so recently the environmental consequences of packaging and the amount of household waste become a focus (Bone and Corey, 2000). Especially for food and beverage industry, Plastic packaging waste is the main reason of environmental impact. A shocking 5.35 trillion pieces of plastic fragments were floating in oceans, which would greatly affect marine animals, also fish would bring plastic waste into the food chain causing poisoning of more species, even including human beings (Tencati et al, 2016). Therefore, now a new element has come to the front of the packaging - environmental packaging.

In such background, for fulfilling customers' expectation and making contribution to the environment Coca-Cola has been working to find ways to avoid their packaging turning into waste and to optimise packaging efficiency. Also in response to this issue, Coca-Cola set long-term vision in the sustainability report to contribute meaningfully to the "circular economy", in which materials are used

and reused to provide ongoing value (Underwood, 2003). In 2016, the company claimed in its Sustainability Report that they would focus on recycling as a core to ensure its environmental packaging. Coca-Cola has aimed to achieve the goal of recycling a bottle for every new Coke bottle, sold also the company set investing in recycling facilities around the world as one of its targets. (Sustainability Report, 2016).

However, although the company actively responded to claims on environmental packaging, some criticisms against Coca-Cola in the aspect of packaging has still appeared. For example, according to analysis by Greenpeace, last year Coca-Cola increased the production of plastic bottles by more than a billion, and fewer than half of them were collected for recycling and only 7% of those collected finally were turned into new bottles (BBC News, 2018). Instead, the research done by Greenpeace (2018) shows that most plastic bottles produced end up in landfill or in the ocean, which could lead to the negative consequences mentioned above. As a result, Coca-Cola was slammed for focusing on recycling, instead of making moves to decrease its use of single-serve plastic bottles (BBC News, 2018). Therefore, Coca-Cola still has a long way to go to show it is taking the plastics epidemic seriously.

5 The Assessment of The Role of CSR in Coca-cola

5.1 Properly execute social responsibility and improve economic benefits

When executing social responsibility, an enterprise will pay for the cost. As a result, it will be harmful to economic benefits in the short run. Nevertheless, after perfectly fulfilling environmental protection, human rights protection, social welfare, etc., it will find out that it will obtain larger benefits because in the process of executing social responsibility, this enterprise also reveals its sense of responsibility to society. In other words, products produced by an enterprise with a sense of responsibility will be accepted by more consumers, which can not only increase its competitive advantage in market share, but also bring benefits to this enterprise. It is one of the important reasons why Coca-cola can steadily occupy overseas market.

5.2 Strive to share interests with stakeholders

To implement social responsibility, Coca-cola needs to share interests with stakeholders at first. It shall surrender part of the profits to other stakeholders, share interests with other parties in cooperation and promote communication and corporate operating efficiency.

5.3 Pay attention to the implementation of environmental-protection responsibility

When implementing social responsibility, a food enterprise should put a special emphasis on environmental protection. Coca-cola has done a lot of work and made remarkable achievements on environmental protection. Food safety and development of food enterprises can't do without the protection from ecological environment. Therefore, food industry of China should consciously be responsible for improving food quality, realizing high-quality development and actively implementing environmental protection. In addition, it should establish a production and operation system synchronous to environmental protection, constantly increase investment in environmental protection funds, take the initiative in developing and producing green food so as to make contributions to environmental protection.

5.4 Abide by requirements raised by local governments for corporate social responsibility

The international standards of social responsibility are constantly improving and the awareness that enterprises must adhere to standards is also enhancing. As governments of various countries are accelerating the steps of social responsibility standardization, transnational corporations must also internalize external standards into their own standards. At the same time when comprehensively implementing social responsibility, Coca-cola has won trust from markets and governments of various countries by adapting to local conditions. For example, Coca-cola has adjusted modes of social responsibility implementing in accordance with laws and regulations of social responsibility formulated by governments of various countries. As a result, governments will adopt more liberal policies, give support, reduce limitation, provide tax preference, etc. to some extent for Coca-cola. Favorable operating environment helps [1]to advance corporate production and operation, reduce obstacles, promote sustainable development and improve value. On the contrary, if Coca-cola conducts illegal acts such as fraud, production from inferior raw materials, etc., even though Coca-cola's profits may be boosted due

---

[1] Chilkoti, A. (2014). Water shortage shuts Coca-Cola plant in India. [Online], Available at: https://www.ft.com /content /16d888d4-f790-11e3-b2cf-00144feabdc0.[Accessed 26 Feb. 2018].

Coca-Cola.(2018). Our Business | Coca-Cola. [Online], Available at: http://www.coca-cola.co.uk/about-us/our-business [Accessed 9 Mar. 2018].

to decrease in operating cost in the short run, it will face massive fines and other punishments imposed by national governments. In short, even though Coca-cola may bear some costs in order to be responsible for governments, in the meanwhile, it also provides a stable and good external environment, promotes sustainable development and increases value for itself in the long run.

6 Conclusion

In response to the problem of Coca-Cola's CSR strategy, there are two main recommendations which could help the company improve the effectiveness of the strategy to solve criticisms. Firstly, Coca-Cola should put 'reducing sugar' as a main part of sustainability, because the health awareness of people would not decrease, focusing more on reducing sugar would retrieve consumers who are looking for other health drinks. On the other hand, Coca-Cola should try to decrease the use of single-serve plastic bottles rather than just focus on recylcling. In this way, relevant environmental pollution will be effectively mitigated, which would help the company defeat the criticism about they are not taking the plastics epidemic seriously.

Abstract: The actual utility of the product represents the customer perceived value, and the ideal point represents the customer satisfaction value. Thus, the utility theory can reasonably explain the relationship between the customer's perceived value and the customer expected value and customer satisfaction. When the consumer is regarded as a whole, the purchase decision only depends on the two factors of price/quantity and the zero-sum game relationship with the producer. Applying the theory of consumer surplus, we can conclude that the greater perceived value of the customer, the greater the residual value of the consumer; no-difference curve theory can explain customer perceived value from the customer and the manufacturer perspective, but only provides a static combination of two influencing factors.
Key words: Customer perceived value; Utility; Consumer surplus; Indifference curve

1 Introduction

Value refers to the utility of the item, i.e. the value of the item, and the exchange value of the item that is exchanged with the consumer (Adam Smith, 1972). Value is the abstract human labor condensed in commodities, which can be measured by the socially necessary labor time in commodities (Marx & Engels, 1976). From a competitive perspective, value is the price which is a buyer is willing to pay for a product (Michael Porter, 2005) and is a consumer's assessment of the ability of the product to meet various needs (Philip Kotler, 2013). Many scholars at home and abroad believe that value is the perceived value, and perceived value is the subjective cognition and judgment of the perceived subject's value to the perceived object.

Customer perceived value is a trade-off between customer perceived performance and purchase cost (Michael Porter, 2005), derived from the benefits of the product and the cost of getting the product (Monroe & Krishnan, 2005; Wood &Scheer, 2006), equivalent to market-aware quality after corporate product price adjustment (Gale, 2003), is a customer-perceived evaluation of product or service attributes and their consumption experience (Woodruff, 2005), which is what customers perceive. The overall evaluation of the utility of a product or service after the profit it receives is based on the cost of obtaining the product or service (Zeithaml, 2008), which is functional, social, emotional, cognitive, and contextual. The combination (Sheth, 2001), according to different connotations and dimensions, can be divided into product value, service value, personnel value and image value (Philip Kotler, 2013), product value, use value, possession value and total value (Bruns, 2013), preceived acquisition value, transaction value, use value and redemption value (Parasuraman & Grewal, 2016), emotional value, social value, quality value Price value (Sweeney&Sautar, 2011), the value of utilitarianism, hedonism value (Chandon, 2000), or by the value of the real, the desire value (Woodruff & Flint, 2012). Foreign scholarsprovided a comprehensive model explaining the relationships among experience quality, hotel image, perceived value, and customer loyalty in the setting of boutique hotel（Ananda Sabil Husseinet al,2018），conceptualized perceived value,brand image and Islamic attributes to studies the relationship that exists in the industry(Nashrul Hakimi,et al.2018)，and acquired the influence of green perceived value and green perceived risk perceptions on the green products purchase intention(Titis Shinta Dhewi,et al..2018)

Foreign scholars' research on customer perceived value has formed a trade-off evaluation theory represented by Zeithaml and Woodruff and a multi-factor theory represented by Sheth. On the basis of absorbing and weighing the evaluation theory and multi-factor theory, domestic scholars have given formula definition: customer perceived value = F (functional value, emotional value, and social value) = F (customer perceived profit, customer perceived profit and loss) (Fan Xiucheng, 2013), or customer

perceived value = customer perceived utility ÷ customer perceived cost (i.e. the ratio of value experience and usage gains and losses) (Dong Dahai, 2015).

There are many definitions of customer perceived value at home and abroad, but in essence, the following consensus has been reached: customer perceived value is a kind of value provided by the enterprise to the customer; the value is perceived by the customer rather than the real value; the perceived value is ultimately determined by the customer rather than the enterprise, but the enterprisehas a significant impact on it; the perceived value is the trade-off between the perceived profit and the perceived cost. Through literature search, it is found that there are only 6 doctoral thesis on perceptual value and value perception research in the 18 years from 2001 to 2018, and less than 20 master's thesis. This fully shows that domestic research on customer perceived value has just begun, and is still in the stage of introduction, absorption, digestion and exploration.

Although customer perceived value is originated in psychology and applied to marketing, its theoretical explanation can be found in economics.

2 Utility Theory Explanation

As the name implies, the utility is effectiveness and function, and is a kind of psychological feeling and subjective experience of human beings. For the customer, the utility is the benefit or satisfaction obtained when consuming a product or service. The utility of the product is not only the physical property of the product itself that satisfies people's needs and desires (such as bread can fill the hunger, clothes can keep out the cold)), also depends on the consumer's own subjective feelings (i.e. customer perceived profit). Conceptually, customer perceived value includes not only perceived profit but utility, but also perceived profit and loss. If the "loss (ie cost)" and "expenditure (i.e. pay)" are included in the meaning of "utility", then the meaning of customer perceived value and utility is equal and equivalent. The utility theory can be used to explain how limited rational customers spend limited disposable income on a variety of goods or services that meet their needs.

When using utility theory to explain how customers choose products, the size of the consumer's utility is used as a criterion. The utility theory has three basic assumptions: (1) The various options available are interrelated. There is an alternative or complementary relationship between them; (2) consumers' preferences for optional goods are consistent and indifferent. That is, if the consumer has a preference for commodity A rather than B, then he cannot have the same preference for commodity B than A or for commodities A and B; (3) the consumer's preference for alternative commodities is transitive. That is, if the consumer's preference for commodity A is better than B and the preference for commodity B is better than C, then his preference for commodity A must be better than C. The ordinal utility theory assumes that the utility of different commodities can be compared and ranked, so that consumers can sort the preference of alternative commodities. The cardinal utility theory also assumes that the utility of a commodity can be calculated by a unit, summed up, and then the degree of satisfaction obtained by consuming a commodity can also be measured by the base utility unit. Although some economists believe that the theory of cardinal utility is not valid, because the nature of different commodities is different, there is no comparability, and its utility cannot be measured by the same unit, but the thought of ranking on ordinal utility of consumers according to the degree of preference of different commodities is acceptable. In fact, the three basic hypotheses and ordinal utility theories about utility are the theoretical basis of customer perceived value. The rational consumer purchasing decision is based on the perceived value of the customer; the empirical study on customer perceived value and quantitative analysis is based on the theory of cardinal utility theory, is the quantitative calculation and quantitative ranking of customer perceived value.

An important result of the study on utility theory is that the measurement of utility can be independent of the proportional or interval table tool in the theory of cardinal utility, making it feasible to conduct comparative research between customers: various options can be used with the help of multidimensional utility meters. The commodity is a point on the multidimensional scale and is assigned a value separately while maintaining the original preference ranking. The point on the scale that represents the customer's favorite item is called the "ideal point". The product represented by the ideal point may be one of the alternative items, or it may not be any of the alternative items, but is a kind of fictitious imaginary "ideal" commodity.

The concept of ideal point provides an analytical basis for using the utility meter to describe the consumer's consumption preferences, and is also a tool for explaining customer perceived value. The ideal point of a customer on the utility meter indicates the expected value of the customer's desire to

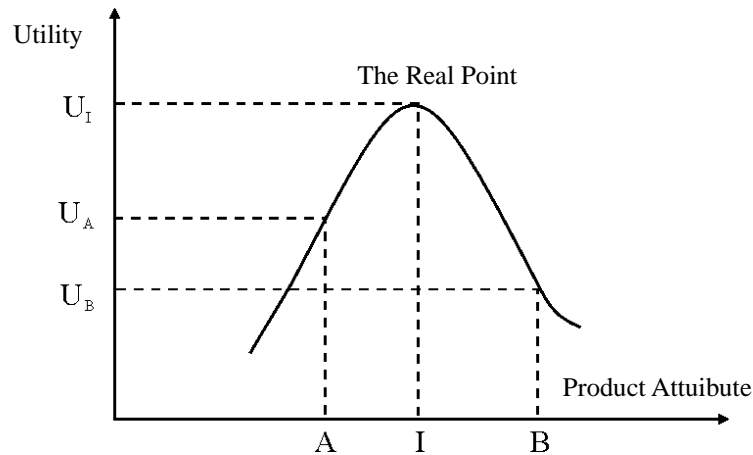
purchase the goods or services, is also the customer's desired value. The actual utility perceived by the customer after purchasing the goods or services is the perceived value of the customer. If the expected value of the goods or services purchased by the customer can be expected, that is, the customer expects the value to reach the desired utility level (i.e, the desired point reaches the ideal point); if the actual utility of the goods or services is lower than the utility level, i.e. customer perceived value is lower than the customer's expected value, the customer will be dissatisfied; if the expected value (ideal point) of the goods or services purchased by the customer is much lower than the expected ideal utility level (the ideal point), the utility of actual purchase or consumption of the goods/service is between the ideal point and the desired point, that is, the customer perceived value is greater than the customer's expected value, and the customer will be satisfied.


Figure 1   Utility Theory Explanation of Customer Perceived Value

The ideal point concept in utility theory can well explain the above relationship between customer perceived value, customer expectation value and customer satisfaction, but it also has the following limitations: (1) The consumption preference and customer perceived value reflected by the utility meter are based only on the product attributes itself, but do not take into account the customer's own background, personality and other customer's behavior; (2) use the ideal point to reflect the customer's expected value and the customer's perceived value, and use the gap between the two to represent the customer. The degree of preference for products is too simple and abstract, there needs further improvement and improvement.

3 Consumer Surplus Theory Explanation

Economic theory tells us that as consumed goods is more, the total utility received is accordingly increased, but the utility of each unit of commodity consumption is less than the utility of the previous unit of commodity consumption. that is, the marginal utility is diminishing. Then, rational consumers should arrange consumption expenditures in such a way that they obtain the maximum total utility from the purchased goods. At this time, the ratio of the marginal utility of each commodity to the price of its commodity is equal. In theory, every consumer is willing to pay the same price for the same commodity. However, the consumer will ultimately determine the price he is willing to pay based on his own perception of the value of the utility of the product, such that there is a difference between the price he is willing to pay and the price actually paid, which is the consumer surplus. Consumer surplus refers to the difference between the price that a consumer is willing to pay to purchase a good or service and the actual price paid. This indicator measures the extent to which consumers' needs are met after they purchase goods on the market. It exists because the actual price paid is determined by marginal utility rather than by total utility: the price that consumers pay for each unit of goods and the price of the last unit of purchased merchandise is equal, that is, the price is balanced. According to the law of diminishing marginal utility, the utility of previous units of goods is greater than the utility of the last unit of goods. Therefore, consumers have a certain amount of consumer surplus for each unit of goods previously purchased.

The price that the consumer is willing to pay is based on the value and utility perceived by the customer. Then, the consumer surplus is the difference between the perceived value of the consumer and

the actual price paid. Therefore, customer perceived value is also marginally decreasing. There is no doubt that the perceived value of the customer buying the first item is definitely not the same as the perceived value of the last item purchased. This will be described below with reference to Figure 2.
Figure 2   Customer perception value Consumer Surplus Theory Explanation

As can be seen from the figure, the greater the customer perceived value, the more the consumer surplus (because the actual payment price is certain). However, using consumer surplus theory to explain customer perceived value, we must explain the following three points: (1) It is very difficult to measure the consumer surplus of a single consumer, but collect each consumer as a whole, and then measure the overall consumption. The remainder is feasible. This point is useful for quantitative analysis of customer perceived value, but given the individual differentiation characteristics of customer perceived value and the different attributes of each product, quantitative analysis and empirical research in the general sense are not applicable; (2) consumer surplus theory does not cover all the factors in the process of consumer purchase and consumption, only including the two factors of commodity price and purchase quantity. In fact, the quality of goods, advertising, packaging, sales services and consumer's own interests, habits, preferences, background and other factors have a large impact on customer perceived value; (3) the increase in consumer surplus is the cost of producers' surplus reduction, that is, the negative correlation between the consumer surplus and the producer surplus is a trade-off, and the consumer and the producer are in a zero-sum game relationship. As can be seen from Figure 2, assuming that the supply curve moves from S1 to S2, the market equilibrium price will fall from P1 to P2, and the consumer surplus will increase from RP1E1 to RP2E2, and the increased shadow area of the consumer surplus is equal to the shadow area of the producer surplus. The zero-sum game relationship presented does not apply to customer perceived value and corporate perceived value, because the customer-to-business relationship is not one necessarily zero-sum game relationship, and there is no negative correlation between customer perceived value and corporate perceived value, may be a positive correlation. Because companies create and improve customer perceived value does not necessarily reduce their interests, it is likely to increase profits.

4 Indifference Curve Theory Explanation

The indifference curve refers only to the trajectory description of the various combinations of the two commodities that enable the consumer to achieve the same level of satisfaction. Each point on the indifference curve represents the total utility provided by the combination of different purchase quantities of two commodities, so it is also called the equivalent line, which is mainly used to analyze the consumer's choice of two commodities.

The indifference curve has three basic assumptions: (1) The consumer preference is complete, that is, the consumer can discharge the preferences of the different combinations of the two commodities in a certain order; (2)The consumer preferences are deductible, i.e. If consumer preference A is better than B and preference B is better than C, then he must prefer A to C (this is the same as hypothesis 3 of utility theory); (3)All goods are good, that is, consumers think all goods have no negative utility and are worth having, and the more the better.

In theory, it can be assumed that a person has an infinite number of indifference curves for two kinds of commodities, that is, an infinite number of invariant curves can be drawn on the same graph, and each indifference curve represents a certain total utility level and different product combinations. The indifference curve has the following characteristics: (1) The farther the indifference curve is from

the origin of the coordinate, the higher the total utility level is represented; (2) Any two indifference curves are impossible to intersect, or parallel, and the distance each other can be a variable; (3) The slope of the indifference curve is negative, that is, the marginal replacement rate of the two commodities is negative; (4) The marginal substitution rate decreases, that is, each indifference curve is convex Bending to the origin and inward.

As mentioned earlier, customer perceived value is the trade-off between customer perceived profit and customer perceived spending (profit and loss). Using the indifference curve theory to explain customer perceived value, the customer perceived profit score can be divided into two parts: the product perceived profit (Vp) and other perceived profit (Vs), and the customer perceived expenditure is divided into currency perceived expenditure (Cp) and non-currency perceived expenditure (Ct).In this way, an indifference curve can be used to reflect the combination of all product perceived profit (Vp) and other perceived gains (Vs) that bring the same level of satisfaction to the consumer (Figure 3), and another indifference curve to reflect the combination of all monetary perceived expenditures (Cp) and non-monetary perceived expenditures (Ct) in the equal consumer pay. (Figure 4).
Figure 3   Perceived benefit indifference curve   Figure 4   Perceptual Expenditure Indifference curve
Figure 3 depicts three indifference curves for the perceived value of a customer's merchandise. It can be seen from the figure that the perceptual value on the same curve is the same; any perceptual value combination on curve V1 is higher than any perceptual value combination on curve V2; any perceptual value combination on curve V2 is also higher than any of the perceived value combinations on curve V3.

Figure4shows three indifference curves for monetury perceived expenditures and non-monetary perceived expenditures when a customer purchases an item. The three curves show that the customer perceived expenditure at point E is greater than the customer perceived expenditure at point F, the customer perceived expenditure at point G is less than the customer perceived expenditure at point F; and for point H and point E, the customer perceived expenditure is the same indifference curve.

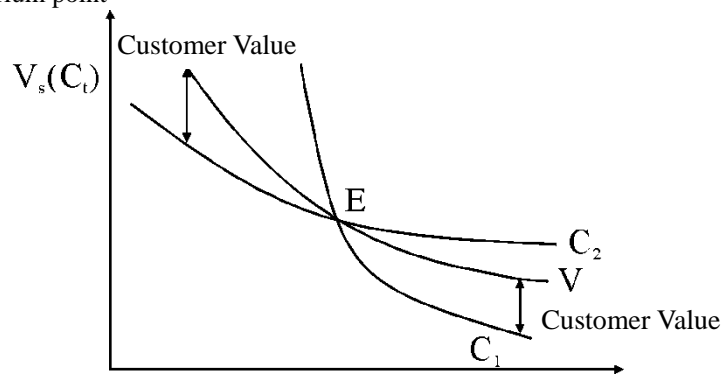
Referring to Figure 3,Figure 4, and Figure 5 can be drawn to reflect the relationship between customer perceived profit and customer perceived expenditure. In Figure 5, the curve V is the customer perceived profit curve, the curves C1 and C2 are the customer perceived expenditure curves, and the intersection point E represents the customer perceived profit. Equal to customer perceived spending, is the perceived equilibrium point


Figure 5   Relationship between Customer Perceived Profit and Customer Perceived Expenditure

As can be seen from Figure 5, when the customer perceived expenditure curve is C1, on the right side of point E, the customer's product perceived profit is relatively high, and other perceived profits are relatively low, at which time the customer perceived profit is greater than the customer perceived expenditure. Therefore, the perceived value of the customer is relatively high. At this time, the customer is more likely to generate the purchase behavior. On the left side of the E point, the customer's product perceived profit is relatively low, and other perceived profits are relatively high. At this time, the customer perceived profit is less than the customer perceived expenditure. Therefore, the perceived value of the customer is negative, and it is unlikely that the customer will make a purchase. When the customer perceived expenditure curve is C2, the opposite is true. On the left side of point E, the customer's product perceived profit is relatively high, other perceived profits are relatively low, and customer perceived profit is greater than customer perceived spending. Therefore, the perceived value of the customer is relatively high. At this time, the customer is more likely to generate the purchase behavior. On the right side of the E point, the customer's product perceived profit is relatively low, the other perceived profit is relatively high, and the customer perceived profit is lower than the customer perceived expenditure. Therefore, the perceived value of the customer is negative, and the possibility that the customer generates the purchase behavior is small at this time.

It is worth mentioning that, assuming that the customer perceived benefit curve and the customer perceived expenditure curve completely coincide, the customer perceived value is always zero. This is a very special situation which is almost impossible in reality.

The above is the description and interpretation of customer perceived value using the indifference curve theory from the customer's perspective. Next, the ability line based on the enterprise perspective is introduced into the indifference curve. Vendor capability refers to the ability of a manufacturer to create value and provide value for customers. A capability line such as a manufacturer refers to different combinations of factors that provide the maximum customer perceived value in the case of a manufacturer's ability. Then, under the condition that the ability of the enterprise to create value for customers and provide value, how can the customer's perceived value elements be combined to make the customer's perceived value the most? As shown in Fig. 6, the capability line AB of the manufacturer is tangent to the indifference curve V2, and the combination of the two perceptual value elements represented by the tangent point E provides the customer with the maximum perceived value under the established conditions of the manufacturer's ability, and the customers provided by other combinations. The perceived value level must be lower than the perceived value of the customer represented by point E. AB intersects with the indifference curve V3 at point C. According to the law of no difference curve, the higher the total utility level from the origin, the higher the customer's perceived value level is lower than the E point, and the utility is greater than the indifference curve of V2. V1 is located outside the V2, away from the origin, and it is impossible to intersect with the capability line AB such as the manufacturer. Therefore, among all the combinations of value elements, the customer point value represented by point E is the largest, which is the equilibrium point.

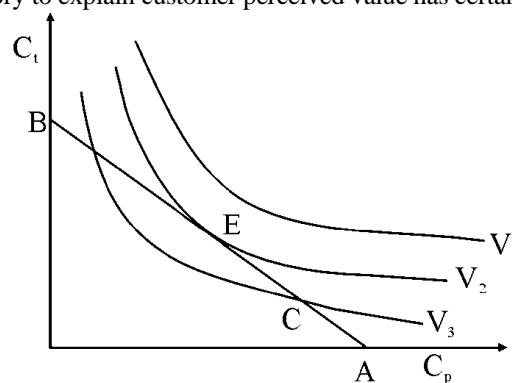
The indifference curve can be used to analyze and explain the customer's preference for different perceived profit factors and different perceived expenditure factors. Using the capability line such as the manufacturer, it is also possible to propose a value combination proposal for providing the maximum customer perceived value. However, due to the dynamic and individualized value of customer perceived value, the assumptions of the indifference curve are not necessarily true in reality, and the influencing factors of customer perceived value are far more than two, while the indifference curve only provides a combination of two factors. These all lead to a significant reduction in the explanatory power of the indifference curve. Most importantly, the application of indifference curve analysis and interpretation of customer perceived value must first analyze the factors that influence customer perceived value. Therefore, the use of indifference curve theory to explain customer perceived value has certain limitations.


Figure 6   Interpretation of the Indifference Curve of Customer Perceived Value

4 Conclusion

Through the above analysis, the following conclusions can be drawn:

(1) Replace "customer perceived value" with "product actual utility" and "customer satisfaction value" with "ideal point". In this way, utility theory can reasonably explain the relationship between customer perceived value, customer expectation value and customer satisfaction. ;

(2) Under the assumption that the consumer is regarded as a whole, the purchase decision only considers the price/quantity factor, the customer and the producer is a zero-sum game relationship, the application of the consumer surplus theory can be known: the greater the perceived value of the customer, the greater value of the residual consumption;

(3) The indifference curve can analyze and explain the customer's preference for different perceived profit factors and different perceived expenditure factors, and can also propose to the enterprise the value combination proposal to provide the maximum customer perceived value, but only provide two influencing factors satatic combination.

Abstract: Brand competition has become an effective means of competition among enterprises in the environment of modern market competition. Based on defining the connotation of brand competitiveness and the key indicators of automobile brand competitiveness, this paper takes Japanese, American, German and Chinese automobile brands as the research object, analyzes the development status of China's automobile market and the market performance of American, German and Chinese automobile brands. From the perspectives of brand marketing ability, brand value and consumer perception of brand, this paper makes a comparative analysis on the competitiveness of four countries' automobile brands in Chinese market, which aims to offer a reference for automobile brands in different countries to identify their advantages and disadvantages, and finally strengthen their competitiveness.
Key words: Chinese market; Japanese; American; German and chinese; Automobile brands; Competitiveness

1 Introduction

Brand competition has become an effective means of competition among enterprises in the environment of modern market competition. From the development experience of major automobile manufacturing countries in the world, to obtain brand-centered competence is the only way for a big automobile country to become powerful. It is also the key to meet demands of the global automotive market and enhance the international competitiveness of enterprises. With the development of economic globalization and the acceleration of China's opening to the world, lots of automobile brands from all over the world have been flooding into China. After more than a decade of rapid growth, however, China's automobile market is going through a period of slow growth. The competition among automobile brands of various countries is very fierce. In Chinese automobile market, what about the market performance of each automobile brand? What are the advantages and disadvantages of different automobile brands in the fierce competition, and how to improve their competitiveness? Those are very important issues of concern for automakers all over the world.

2 Automobile Brand Competitiveness Definition and Its Elements

2.1 The connotation and elements of brand competitiveness

As for the concept of brand competitiveness, scholars at home and abroad have achieved fruitful research from different perspectives. Some scholars thought that brand competitiveness was the ability of enterprises to build strong brands and support the sustainable development of brands in a certain market environment. The main factors that constitute the brand competitiveness were brand awareness, loyalty, consumer perception, brand association, brand relations, etc. (Aaker, 2004; Keller,1998). The brand value came from its value to customers, that is, the so-called brand equity based on customers, the brand represented the seller's consistent commitment of product features, benefits and services delivered to the buyer (Philip Kotler, 2002). Best brand was the guarantee of quality, and the essence of the brand was the intangible contract between enterprises and consumers, the competitiveness of a brand depended on its market share of comparative advantage and certain premium capacity. The brand competitiveness was reflected by the aspects of quality, image, personality and service. (Zhang Shixian, 1996). The brand competitiveness was the ability to occupy the market, gain dynamic competitive advantage and obtain long-term profits by its particularity or advantages which could not be easily imitated by competitors (Wang Yonggui et, al., 2002). Some scholars studied the brand competitiveness from the view of customer-based brand value, they thought that brands generating competitive brand equity will gain market share, relative to the competition (Hume Winzar, Chris Baumann, Wujin Chu, 2018); Brand competitiveness is a brand's possession of competitive advantage. Competition is a market condition, whereas competitiveness is about the ability to create competitive advantage (Baumann et al., 2017).

To sum up, although different scholars have not reached an agreement on the definition and elements of brand competitiveness, they generally believe that: (1) Brand competitiveness is a kind of comparative ability, which is the ability of a brand to participate in market competition and to gain market share, dynamic competitive advantages and long-term profits; (2) Brand competitiveness is a kind of comprehensive ability, which is the result of multiple factors and can be measured by some explicit indicators; (3) Brand competitiveness is an ability of sustainable development. Its essence lies in the commitment of the brand to customers and the value brought by consumers. It maintains a long-term and stable interaction relationship with customers. Based on above, this paper put forward that brand competitiveness is a unique ability formed by an enterprise through the effective allocation and use of resources, which is different from or going beyond other competitors. It is a comparative ability of brand marketing, brand value and overall image which comes from consumers' cognition, feeling, attitude and experience of brand products and service.

2.2 The key indicators of automobile brand competitiveness

Automobile brand competitiveness is the ability of comparative advantage, it can be reflected by the brand market ability, brand value and consumers' comprehensive evaluation of automobile brand product attributes and brand value image. So the competitive advantage of automobile brand can be measured and compared from three aspects: brand market ability, brand value and consumer perception. Among them, brand market ability is the external and explicit market performance of brand competitiveness, it directly reflects the ability of the brand to expand market, occupy market and gain profits. It can be evaluated by market share, sales volume and profit. Brand value is the specific embodiment of brand competitiveness, reflecting various resources investment and the development potential of the brand so as to maintain and improve the market position and gain competitive advantage. Brand value is also the main indicator of marketing performance, and it is the result of the comprehensive effect of various marketing techniques and marketing methods (Yu Mingyang, Yang Fangping, 2009). Consumer perception mainly reflects the value perception of the brand and the interaction between business and consumer, it can be evaluated by the value of consumer perception of some important properties of automobile products, such as safety, quality, value (cost-effective), performance, design, style, technology innovation and environmental protection, etc., and brand image, such as brand awareness, brand familiarity, brand reputation, brand satisfaction and brand loyalty.

3 The Market Performance of Japanese, American, Germany and Chinese Automobile Brands

3.1 The growth of automobile sales in Chinese market

In the year of 2017, the annual production and sales volume of China's automobile market reached 29,015,400 and 288,789 vehicles respectively. It had ranked the first in global automobile sales for nine executive years. In terms of sales volume for passenger cars, annual sales in China increased from 4.97 million in 2008 to 23.1 million in 2017, with an average growth rate of 36.5% (as Figure 1). In general, China's automobile market has developed rapidly in the past decade, and the market competition is very fierce. The passenger car market begins to differentiate, and the consumption of luxury cars has been increasing rapidly.
Figure 1   The Sales Volume of Passenger Cars in China's Auto Market from 2008 to 2017
Note: the number of cross passenger vehicles is not included here.

3.2 The proportion of Chinese and foreign automobile brands sold in Chinese market

With the opening of China's automobile market, foreign automobile brands have poured into Chinese market. The sales volume of Chinese automobile brands are significantly lower than those of foreign brands during the period of 2013-2017, and it was less than half as many as foreign brands during the period of 2013-2015. But in general, the rise of sales volume of Chinese automobile brands is increasing year by year. From the year of 2013 to 2017, the proportion of Chinese and foreign automobile brand sales is shown as Table 1.

Table 1　The Proportion of Chinese and Foreign Automobile Brand Sales from 2013 to 2017

Year Proportion of automobile brand sales	2013	2014	2015	2016	2017
Chinese automobile brand	25.1%	24.6%	29%	33.8%	36.4%
Foreign automobile brand	74.9%	75.4%	71%	66.2%	63.6%

Note: the number of cross passenger vehicles is not included.

3.3 A comparison of the "sales leads" of Japanese, American, Germany and Chinese automobile brands in Chinese market

"Sales leads" is the number of items that can reflect consumers' intention to buy a car, which is counted by the telephone system of "Automobile Home" and other channels. Sales clue is a measure index closely related to the last step when users order and purchase, which has significant value for forecasting the market development trend. During the period of 2014 to 2017, compared with German, Japanese and American, Chinese automobile brands have an absolute advantage in the proportion of sales leads, which is generally on the rise. The sales leads of German automobile brands occupy the second place, Japanese and American automobile brands are in the third and fourth place. The automobile brand sales leads in Chinese market are as shown in figure 2. The data show that Chinese automobile brands have a higher degree of enthusiasm for car purchase, and the growth trend is year by year. Compared with the purchase enthusiasm of American, Japanese and German, Chinese automobile brands have stronger market advantages than others.
Figure 2　The Proportion of Four Countries' Automobile Brand Sales Leads from 2014 to 2017

4 A comparative Analysis on the Competitiveness of Automobile Brands in China's Market

4.1 A comparison of the market ability of automobile brands among four countries

(1)A comparison of the sales volume of automobile brands in different country

Brand sales volume is an important indicator to reflect the profitability and market performance of enterprise brands. According to the performance of the passenger car market, the growth rate of China's passenger car brand sales was reached as high as 50.2% during the period of 2013-2017, the volume is rising from 7.222 million vehicles in 2013 to 10,8467 million vehicles in 2017. The sales volume of China's passenger car brand kept on the first, and then followed by Germany, Japanese and American automobile brands. The passenger car sales in four countries continued to rise year by year, which is

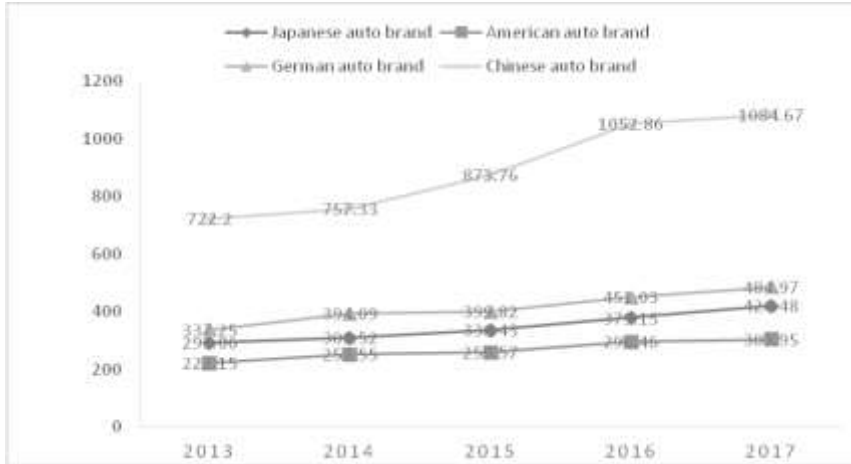
shown in figure 3. It can be seen from the figure in the Chinese market, compared with Germany, American and Japanese automobile brands, the overall sales of Chinese automobile brands had maintained a steady growth, and the sales volume had an absolute advantage. However, that doesn't mean it's more profitable. Because the price of China's automobile brand is lower than the price of Germany, Japan and American, and the purchase power of most Chinese consumers are relatively limited, lots of Chinese are more inclined to choose Chinese automobile brands.


Figure 3   The Sales Volume of Passenger Car for Four Countries from 2013 to 2017 (units: 10 thousand vehicles)

（2）A comparison of market share of automobile brands of four countries

To a large extent, brand market share reflects the competitive position and brand competitiveness of enterprises, which is an important index that enterprises pay close attention to. During the year of 2013 to 2017, the market share of Chinese, German, Japanese and American brands remained unchanged, they ranked first, second, third and fourth respectively. Chinese automobile brands had the largest market share and kept the fastest growth in the world. The market share of passenger cars in China and other countries in the last five years was shown as figure 4.
Figure 4   The Market Share of Passenger Car for Four Countries in Chinese Market from 2013 to 2017

4.2 Comparisons of the value of different automobile brands among four countries

According to the automotive brand ranking data in 2016 released by Consumer Reports, which is the leading automotive market research agency in America, there were 10, 9 and 6 auto brands of Japanese, American and Germany respectively ranked in the top 30 most valuable brands in automotive brand ranking list. Audi, a German car brand, came first, followed by Subaru, a Japanese car brand, and Lexus. However, Chinese car brands did not appear on the list. In addition, according to the global automotive brand value ranking for 2017-2018 released by Rand Finance in the UK, the top ten automobile brands are occupied by German, Japanese and American companies .In 2018, the number of TOP10 automobile companies of German, Japanese, American and Chinese is 5,3,2, and 0 respectively;

and the number of TOP50 is 7, 11,10 and 5 respectively; and the number of TOP100 is 7,14,17 and 22 respectively. It can be seen that Chinese automobile brands have some market advantages in China, however, the overall brand value is low. However, we are pleased to find that the number of Chinese companies entering the top 100 increased from 18 to 22 in 2018, which shows that the brand competitiveness of Chinese automobile enterprises is strengthening gradually.

4.3 A comparison of Chinese consumers' perception of four countries' automobile brands

(1)Data collection. Taking Chinese consumers as the respondents, this paper conducts an expert interview on brand image of different automobile brands from the perspective of consumers' perception. The important attributes of consumers' perception of automobile brand products and important indicators to measure automobile brand image were determined, and questionnaire design, questionnaire pre-survey and formal investigation had been done. The questionnaire was distributed to consumers in the form of E-mail and website, the official website of questionnaire star was used for the investigation. After one month survey, we collected a total of 396 valid questionnaires.

(2)Sample characteristics. In this survey, 210 males and 186 females accounted for 53.03% and 46.97% of the total sample respectively. The sex ratio of the survey is reasonably distributed. From the view of age distribution, the sample size for age under 22 years is 45, accounting for 11.36% of the total sample; the sample size for age of 23-35 is 248, accounting for 62.63% of the total sample; the sample size for age of 36-50 is 87, accounting for 21.97% of the total sample, and the sample size for age over 50 is 16, accounting for 4.04% of the total sample. From the view of education, there are 20 people in high school and below, accounting for 5.05%; there are 55 people in university or college, accounting for 13.89%; there are 237 people are undergraduate degree, accounting for 59.85%; and 84 people have graduate degree, which account for 21.21%. In a word, the sample proportion distribution is reasonable.

(3)Statistics and analysis.

①A comparison of value perception of automobile brands of four countries. For automobile products, safety, quality, value, performance, design style, technological innovation and environmental protection are not only important brand's attributes, but also important indicators of consumer perception. According to the evaluation of various brand attributes (we assumed the total score is 5) and statistical analysis of questionnaire, Chinese consumers' evaluation of various attributes of Japanese, American, German and Chinese automobile brands are shown in table 2.

Table 2   Chinese Consumers' Evaluation of Various Attributes of Automobile Brands

	Safety	Quality	Price	Performance	Design style	Technological innovation	Environmental protection	Mean value
Japanese	3.39	3.62	3.59	3.74	3.62	3.71	3.66	3.61
American	3.89	3.78	3.4	3.75	3.66	3.75	3.51	3.68
German	4.27	4.16	3.48	4.1	3.88	4.03	3.74	3.95
Chinese	3.5	3.31	3.9	3.37	3.36	3.21	3.29	3.42

In general, in terms of safety, quality, performance, design style, technological innovation and environmental protection, German automobile brands ranked the first, Chinese automobile brands lead the first in value (cost-effective), but lag behind in other attributes. Japanese and American automobile brands have their own advantages in various attributes, but they all lag behind German automobile brands. For Japanese brands, the main disadvantage is safety, while in other aspects, they are similar to American. Chinese consumers have a high value perception of German automobile brands, and then followed by American and Japanese brands, while the perception of Chinese brands is relatively at a disadvantage situation.

②A comparison of automobile brands image among four countries. Brand image can be generally measured by indicators like brand awareness, familiarity, reputation, satisfaction and loyalty. According to the survey, it is shown that the Japanese brand awareness is 9.9%, American auto brand awareness is 6.6%, German auto brand awareness is 77.89%, Chinese auto brand awareness is 5.61%. It can be seen that German automobile brands have the leading place in the Chinese market, and then followed by Japanese, American and Chinese.

In terms of brand familiarity and reputation, 5 automobile brands were selected from each country. And there are 20 brands of four countries totally, which were randomly placed in the questionnaire item. The respondents were required to choose the automobile brands that they are familiar with and prefer to, and the number of their choices is no more than four. According to the statistics, the cumulative numbers

of Japanese, American, German and Chinese brands that consumers were familiar with in all samples are 297, 251, 739 and 188 respectively. The average familiarity of automobile brands in each country takes up 15%, 12.7%, 37.3% and 9.5%; the cumulative numbers of Japanese, American, German and Chinese brands that consumers prefer to in all samples are 224,210,722 and 92 respectively. The average reputation of automobile brands in each country are 11.3%，10.6%，36.5% and 4.7%. Obviously, the German automobile brand won the best brand familiarity and best reputation remarks, however, the Chinese automobile brands had the lowest ones. Japanese and American brands ranked second and third respectively.

In terms of brand satisfaction and loyalty, this paper uses NPS (Net Promoter Score) to reflect consumers' loyalty to automobile brands and purchase intention. According to the calculation formula of NPS=(number of recommenders/total sample size) * 100%-(number of derogators/total sample size) * 100%, the NPS of automobile brands for four countries can be calculated. Among them, those with evaluation scores of 9 and 10 belong to the recommender, those with 7 to 8 belong to the passive, and those with 0 to 6 belong to the derogatory. According to the calculation, the NPS of Japanese, American and Chinese automobile brands are all negative, while the NPS of German automobile brand is 17.68%. The result shows that in Chinese automobile market, consumers have the highest loyalty and purchase intention to German automobile brands, but they have low brand loyalty to Japanese, American and Chinese cars. To some extent, it reflects the advantages of German automobile brands, and it will maintain a good developing trend and sustainable profitability at present and in the future. On the other hand, it also shows that Chinese consumers are picky, and it will be still difficult for Japanese, American and German car brands to maintain consumers' high satisfaction and loyalty.

5 Conclusion

In recent years, China's automobile market grows very fast, and the international automotive brands have entered the Chinese market. Although this gives Chinese consumers more choices, it also undoubtedly intensifies market competition. Based on the research above, we can find out：Firstly, from the perspective of brand marketing ability, Chinese automobile brands have more competitive advantages, and their sales volume and market share are much higher than those of Japanese, American and German automobile brands. The survey indicates that with the growing strength of Chinese automobile brands, Chinese consumers are more in favor of domestic automobile brands these years. Secondly, from the perspective of brand value, China's automobile brand value lags far behind those of Japanese and Germany brands; the foundation of enterprise brand competitiveness, resources investment and brand development potential ability need to be strengthened and improved. Finally, from the perspective of consumers' perception of automobile brand value, although Chinese automobile brands have advantages in value, they lag behind German, Japanese and American brands in safety, quality, performance, design style, technological innovation and environmental protection. In terms of automobile brand image, the overall evaluation of Chinese automobile brands is not high, which still lags behind American, Japanese and German brands.

Factors Contributing to Transformation Process in Kenya's Manufacturing Sector

Ombongi Priscilla Nyanchama, Wei Long
School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: priscillanyanchama@yahoo.com, longwei@whut.edu.cn)

Abstract: Kenya's manufacturing sector provides a clear footing in industrialization advancement. However, the sector is faced with challenges in its efforts to build a competitive manufacturing base as well as cultivating business and industrial environs. Therefore, the paper intends to ascertain factors contributing to manufacturing sector transformation process and its position in Kenya's economic growth. We analyze annual data for the period 1975-2017. The findings of this study using time series regression analysis confirms that new investments by manufacturing sector to credit issuance by financial institutions and commercial banks ratio, labor involvement to output to manufacturing output ratio, value addition output to manufacturing output ratio positively contributes to transformation of Kenya's manufacturing sector and Economic Growth. The study also reveals that lack of political good will during election period does affect manufacturing sector operations. The study recommends manufacturing sector to embrace innovation concept and technological advancements for betterment of operational efficiency and effectiveness.
Key words: Manufacturing sector; Transformation; Kenya; Economic growth

1 Introduction

Manufacturing Sector is very essential in industrial revolution and growth for any given economy. Transformation has not been easy for manufacturing firms in developing countries (Marival Segarra-Oña et al., 2016; Navas Antonio, 2014; Beckmann B. et al., 2016) due to lack of capability to innovate and adopt technological advancements. The world economy at large has been influenced by competition at both national and international level whereby each firm tends to fight for a better position (Jacob Chege et al., 2016; Reischauer G., 2018).

The growth and structure of manufacturing sector has not provided even level playing field for its investors due to unrealistic policies (Odhiambo Walter, 1991; Rioba Martin E. 2013; Yash Mehta, A. John Rajan, 2017). However, facts provided by Kenya National Bureau of Statistics (KNBS) have showed how the manufacturing sectorial activities contribute to Kenya's Gross Domestic Product. In 2017, there was a tremendous deceleration on industrial contribution to GDP; hence service-oriented sectors seemed to contribute more to Kenya's overall economic growth. For the manufacturing sector to be revived and become main contributor of economy, strategies towards long-term sustainability are vital.

According to Kenya National Bureau of Statistics report Kenya has witnessed varied performance in the manufacturing sector which is largely associated to lack of total commitment and proper resources allocation towards industrial development (Rioba Martin E., 2014; Aaron Atteridge, Nina Weitz, 2017). Navas Antonio argued that market competition for manufactured products do dictate transformations in manufacturing firms that depend on innovation (Schumpeter, 1934; Helena Forsman, 2011; Heredia Pérez et al., 2018). Mendi P., Mudida R. highlighted how past informalities affect innovation in Kenya's firms which still proves a major challenge for firms transforming from informal to formal classification. Mendi P., Mudida R. research failed to put more weight on fund availability as an enabler of innovation implementation in firms while (Rioba Martin E., 2013; Jacob Chege, 2016) found out how unfriendly Kenya's reform policies towards manufacturing sector transformation were.

It is therefore evident that past studies have given emphasis on innovation concept and policy implementation in manufacturing firms excluding attention towards manufacturing sector new investments, manufacturing productivity, value addition, mode of financing and labour productivity regardless of political situation. With inclusion of innovation and technological advancements, the study aims at ascertaining the factors leading to major transformations in Kenya's manufacturing sector since independence before and after multi-party democratic system of governance.

2 Manufacturing Sector Developments

Agricultural activities are considered to be main contributors of GDP for Least Developing

Countries (LDCs). In Kenya, agricultural sector is the number one contributor of country's GDP (KNBS, 2018) but is currently faced with challenges, such as, global warming leading to adverse climate change, natural calamities and bio-diversity loss.

To exit low-income status, manufacturing sector development is considered to be a likely alternative (Olamide Oguntonye, Steve Evans, 2017).

Innovation concept cannot be ignored, if sectorial development in LDCs is to be achieved (J. J. Wakeford et al., 2017; Ueasangkomsate P., Jankkot A., 2017; Beckmann B. et al., 2016; Mendi P., Mudida R., 2017). Through innovated systems, competition at firm, sector, national, and international levels is boosted. It is through innovation that manufacturing firms are able to do away with traditional methods or processes of production by embracing science, technology and creativity (Helena Forsman, 2011; Heredia Pérez et al., 2018).

Proper resource allocation is also of significance in manufacturing development through optimal input allocation (Zhang Xun et al., 2017; W-C. Lee, S-S. Wang, 2017) hence, increased output, reduced waste reduction and increased efficiency in production (Konstantinos Salonitis, Christos Tsinopoulos, 2016). Infrastructural development especially capital investments, technological advancements, state-of-the-art equipment, skilled labour and R&D need to be given priority through allocation of necessary funding towards their successful implementation (Ueasangkomsate P., Jankkot A., 2017; Yash Mehta, A. John Rajan, 2017).

Political goodwill is another aspect that cannot be ignored. Corruption in LDCs is one major challenge towards realization of industrialization through manufacturing development (Mijiyawa A. G., 2017). LDCs' governments and democratic processes should provide favourable manufacturing environment by supporting right policies and discouraging slow and tedious bureaucracies (Navas Antonio, 2014).

Last but not least, financial structures are crucial in manufacturing development. Financial institutions and commercial banks play key role in ensuring credit is allocated to most industrious manufacturing firms. Also, it is ideal to financially support Small and Medium Enterprises (SMEs) in the manufacturing sectors (Hoxha Indrit, 2013) that are characterized by weak R&D and incapacity to innovate (Helena Forsman, 2011). Findings have proved how degree of competition in banking sector does have an impact on external financing towards manufacturing sector whereby, industrialized countries are largely dominated by monopolistic banking competition. (Munacinga Simatele, 2015).

Therefore, agenda by Kenya government to revitalize of the manufacturing sector is ambitious priority towards industrial development, job creation for youth as well as boosting of local and overseas market accessibility for its products (KNBS, 2018). It is evident from the literature review above that with proper resource allocation, labour productivity, implementation of innovation towards value addition, availability of external financing and presence of political good do play part in various transformations in manufacturing sector.

3 Econometric Modeling

The research model is based on Ordinary Least Square Principle (OLSP) in efforts to determine effects of manufacturing transformation on economic growth using Eviews10. Secondary data for dependent, independent and control variables was from KNBS for the years between 1975 and 2017. The model specification is based on the function below;

$$EG=F(IF, LQ, VQ, P) \tag{1}$$

The estimation time series linear equation; econometric model is then written as follows;

$$EG=\beta_0+\beta_1 IF+\beta_2 LQ+\beta_3 VQ+\beta_4 P+\varepsilon \tag{2}$$

Where, Measure for economic growth (EG) is the dependent variable represented by real GDP growth rate while independent variables are; new investments by manufacturing sector to credit issuance by financial institutions and commercial banks ratio (IF), labour involvement to output to manufacturing output ratio (LQ), value addition output to manufacturing output ratio (VQ) and political good will (P) is a dummy variable used to capture election and campaign period during the study period. ε is the error term. β_0, β_1, β_2, β_3 and β_4 are OLS estimators.

In dealing with data deviations due to changes in respect to time, logarithms are introduced to equation 2.

$$LogEG=\beta_0+\beta_1 logIF+\beta_2 logLQ+\beta_3 logVQ+\beta_4 P+\varepsilon \tag{3}$$

The OLS estimators are expected to give desired properties; Best Linear Unbiased Estimators (BLUE), consistent, normal distribution of residuals among other time series properties for the variables.

4 Statistical Results

The empirical analysis commenced by conducting unit root tests through Augmented Dickey-Fuller (ADF) test that confirmed that all variables except EG and P were stationary after first differencing. By comparing Test Statistic Value (TSV) and Test Critical Value (TCV) for each variable as shown in Table 1 at 5% significance level, inferences for Unit Root Test are also indicated.

Table 1   Stationary Test through ADF

Variables	Test for Unit Root	Include in Test Equation	ADF(TSV)	ADF(TCV)	Inference
LogEG	Level	Intercept	-4.7869	-2.9331	Stationary
LogEG	ΔLevel	Intercept	-8.7767	-2.9350	Stationary
LogIF	Level	Intercept	-2.1524	-2.3201	Non-Stationary
LogIF	ΔLevel	Intercept	-9.1895	-0.5498	Stationary
LogLQ	Level	Intercept	-0.105	-1.4387	Non-Stationary
LogLQ	ΔLevel	Intercept	-6.3834	-3.5407	Stationary
LogVQ	Level	Intercept	-0.9448	-0.9492	Non-Stationary
LogVQ	ΔLevel	Intercept	-6.8178	-0.2871	Stationary
P	Level	Intercept	-5.9819	2.9389	Stationary
P	ΔLevel	Intercept	-9.9352	2.9411	Stationary

Source: Computed by Author Using Eviews10 Software

Table 2   Johansen Co-Integration Tests

Hypothesized No. of CE(s)	Eigenvalue	Trace Test		Maximum Eigenvalue	
		Trace Statistic	0.05 Critical Value	Max-Eigen Statistic	0.05 Critical Value
None	0.777924	113.0488*	69.81889*	61.69424*	33.87687*
At Most 1	0.439511	51.35436*	47.85613*	23.73681	27.58434
At Most 2	0.336632	27.61775	29.79707	16.82742	21.13162
At Most 3	0.226709	10.79034	15.49471	10.54111	14.26461
At Most 4	0.006060	0.249223	3.841466	0.249223	3.841466

Source: Computed by Author Using Eviews10 Software
* Denotes rejection of the hypothesis at the 0.05 level

Further, the study also rejects the null hypothesis of no co-integration at 5% significance level. Table 2 shows Johansen Co-integration tests for both Trace and Maximum Eigenvalue. From Table 2 Trace test indicates two co-integrating equations while maximum Eigenvalue indicates one co-integrating equation at the 5% level of significance. However, the study fails to reject the null hypothesis for at Most 2, 3, 4 for Trace value and at Most 1, 2,3 and 4 for Maximum Eigenvalue since respective statistics values are less than critical values at 5% significance level. The results therefore confirms existence of long run relationship among EG, IF, LQ, VQ and P with co-integrating relationship as shown in Table 3.

Table 3 Result of the Long Run Economic Growth Model (Standard Error in Parenthesis)

LogEG	LogIF	LogLQ	LogVQ	P
1.00000	-0.12958	0.131533	0.214848	-11.9001
	(0.63912)	(0.44997)	(1.1663)	(1.1267)

Source: Eviews10 Output

Through regression analysis, Table 4 provides values for estimation equation in the short run with EG as the Dependent Variable. The results indicate that all independent variables except Political goodwill have positive impact on countries economic growth. Unit increase in value addition output to manufacturing output ratio increases economic growth by 0.61. Unit increase in labour productivity increases EG by 0.29 while unit allocation of financial credit to new manufacturing investments contributing 0.1 increase in EG. Meanwhile, lack of political goodwill especially during election and campaign period have negative impact on EG.

Table 4   Short Run Estimate Model

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	0.016107	0.056471	0.285212	0.0077
LogIF	0.097172	0.399759	0.359289	0.0011
LogLQ	0.285607	0.298577	7.889552	0.0001
LogVQ	0.612050	0.213054	6.034190	0.0000
P	-0.002351	0.132970	4.602904	0.0002
R-squared	0.675512	Mean dependent var		0.008781
Adjusted R-squared	0.660422	S.D. dependent var		1.933834
S.E. of regression	2.403313	Durbin-Watson stat		2.188528
F-statistic	58.02126			
Prob(F-statistic)	0.000000			

Source: Eviews10 Output

The R-Squared results in Table 4 also indicates that the variables in question contributes 67.55% to economic growth while 32.45 takes care of other variables not factored in this study.

5 Conclusion

In conclusion, based on research findings above, Kenya's manufacturing sector plays a big role in growth of the country's economy though it's has not reached its peak. It's obvious, with ongoing industrial uprising in Kenya and other developing countries whose economies largely depend on agriculture, more transformations are yet to be witnessed. With innovation and technological advancements, manufacturing outputs will be through efficient and effective operations and quality aspect will not be compromised.

Political environment seems to have impact on manufacturing firms' operations. Therefore, political goodwill need to be embraced especially during electioneering period. From the study, it's is evident that during general election periods, manufacturing outputs, new annual investments as well as credit issuance by financial institutions are sluggish hence a negative impact on manufacturing activities contributing to GDP and Kenya's overall economic growth.

Kenya's manufacturing sector is the leading in East and Central Africa, as a result, other countries in Sub-Saharan Africa have developed a greater interest towards Kenya. With the recent signing of African Free Trade Area Agreement and manufacturing revitalization pillar under "Big Four" agenda, the government and the private sector under Kenya Association of Manufactures alliance need to collaboratively work as team by formulating policies, channeling more resources in support of R&D, investment in state-of-the-art equipment and technological advancements in efforts to ensure the manufacturing sector continues to transform in an accelerating manner.

Further, the research recommends that the management of local manufacturing firms embrace the innovation culture in their internal structures in efforts to promote local sector competition as well as meeting global competition standards. In terms of labour productivity, the manufacturing sector need to be in the forefront in ensuring its maximum outputs are met at minimum costs without interfering with its socio-economic role.

An Empirical Study on the Financial Affordability of Public: Private Partnership Projects in Underdeveloped Areas of China: Taking the Xinjiang Uygur Autonomous Region of China as an Example

Guo Yiru, Hu Yan
School of Management, Wuhan University of Technology, Wuhan, P.R.China 430070
(E-mail: 415299616@qq.com, 898913420@qq.com)

Abstract: At present, China's research on the demonstration of financial affordability is limited to calculate a specific project. This paper takes the Xinjiang Uygur Autonomous Regionof China as an example to make an empirical study on the financial affordability of Public-Private Partnership projects in underdeveloped areas in China. Firstly, the main factors affecting the financial affordability of the Xinjiang Uyghur Autonomous Region of China were identified by using the grey correlation analysis method. It was concluded that the regional fixed asset investment was closely related to the local government's financial affordability.Secondly, through the comparing analysis of the fixed asset investment and PPP project financial investment of Xinjiang, some suggestions are raised for the economically underdeveloped areas in China.
Key words: PPP project; Financial affordability; Grey correlation analysis; Financial advice

1 Introduction

The Public-Private partnership mode has high hopes in solving the contradiction between the limited government finance and people's unlimited demand for public services. Under the tide of Public-Private Partnership, more and more infrastructure and public projects have been transformed into PPP modes in recent years. It is conservatively estimated that during the Thirteenth Five-Year Plan period, the annual investment in PPP projects will reach 1 trillion yuan. PPP mode management involves all aspects of financial work, including direct liabilities such as government payments, financial subsidies and related supporting arrangements,guarantees and other contingent liabilities, financial commitment such as implicit responsibility.ADB (ADB, 2014) pointed out that many practical experiences have shown that low-quality PPP projects will increase government financial burden. Due to the long period of PPP projects, the government has a relatively large risk of uncontrollable debts in long-term expenditure responsibilities. In addition, the serious abuse of the PPP mode in recent years has made local financial collapses very common.Gao Jianchu and Ma Jinying pointed out that financial affordability is the financial burden taken by the government to the whole economic and social development.Thedemonstration of financial affordability is a key step in the adoption of the PPP mode, and an important guarantee for the government to fulfill its contractual obligations. Wang Xi and Xia Qiang believe that it is conducive to standardize the management of fiscal expenditures for PPP projects, to promote project implementation in an orderly manner, and to effectively prevent and control fiscal risks. Zhang Naxin(Zhang Naxin, 2017)believes that the affordability demonstration is an important guarantee for the government to fulfill its contractual obligations, which is conducive to prevent and control fiscal risks, and to achievethe sustainable development of PPP.Since the Ministry of Finance of China promulgated the "Guidance Guidelines on the Financial Sustainability of Government and Social Capital Cooperation Projects", the arguments for the financial sustainability of PPP projects of China have been analyzed only for specific projects and have less reference to the local government of China fiscal performance capabilities. This article has taken the Xinjiang Uygur Autonomous Region of China as an example. From the perspective of the factors that have affected the financial sustainability of local government PPP projects, the grey correlation analysis model has been used to select the main influencing factors. With detailed analysis, policy recommendations for the development of the Xinjiang Uygur Autonomous Region of China have been proposed.

1.1 Related concepts of public-private partnership mode

1.1.1 Public-Private Partnership mode

The Public-Private Partnership mode is defined by the Ministry of Finance to mean thatthe government has a long-term cooperative relationship with social capital through franchising, purchase services, equity cooperation, etc. in order to enhance the supply capacity of public goods and services, and improve supply efficiency.

1.1.2 PPP project development stage

The Ministry of Finance defines that the PPP projects will go through the following five stages of development: project identification, project preparation, project procurement, project implementation, and project handover.

1.2 Financial affordability related concepts

1.2.1 Fiscal affordability argument

The Ministry of Finance defines that the fiscal affordability argument is to identify and measure the fiscal expenditure responsibilities of the government and the Public-Private Partnership project, and scientifically assess the impact of project implementation on current and future fiscal expenditures for the PPP project finance, and provide the basis for financial management of PPP projects.

1.2.2 The standard of financial affordability

The Ministry of Financebelieves that all PPP projects need to set expenditure responsibilities from the budget.　The proportion of general public budget expenditures should not exceed 10% in every year in China. Cao Shan (Cao Shan, 2017) thought that the purpose of setting this figure is to control the total scale of PPP projects and ensure the ability of local governments to afford the cost.

2 Factors Affecting Local Government Financial Afford Ability under PPP Mode

2.1 Setting up a grey correlation analysis model

This paper uses the grey relational analysis method from the perspective of empirical analysis to analyze the factors affecting the financial affordability of local government under the PPP mode.The relationship between the total investment of the PPP project, the level of economic development, the urbanization rate, the degree of fiscal decentralization, the scale of local fiscal revenue and the scale of the population, and the financial affordability of local governments are discussed.

Liu Sifeng (Liu Sifeng, 2004) made the basic steps of grey relational analysis which are as follows:The first step is to determine the analysis sequence.On the basis of qualitative analysis of research questions, a dependent variable factor and multiple independent variables are identified.The dependent variable data constitute the reference sequenceX_0' and each variable data constitutes a comparison sequence $X_i'(i = 1,2, \cdots, n)$,$n + 1$ data sequences into the following matrix:

$$\left(X_0', X_1', \cdots, X_n'\right) = \begin{bmatrix} x_0'(1)x_1'(1) & \cdots & x_n'(1) \\ x_0'(2)x_1'(2) & \cdots & x_n'(2) \\ \vdots & \vdots & \vdots \\ x_0'(N)x_1'(N) & \cdots & x_n'(N) \end{bmatrix}_{N\times(n+1)} \tag{1}$$

Among them,$X_i' = (x_i'(1), x_i'(2), \cdots, x_i'(N))^T$,i = 1,2, $\cdots$ n, N is the length of the variable sequence.

In the second step, the sequence of variables is dimensionless.In general, the original variable sequence has different dimensions or orders of magnitude. In order to ensure the reliability of the analysis result, the variable sequence needs to be dimensionless.After being dimensionless, the sequence of the various factors forms the following matrix:

$$(X_0, X_1, \cdots, X_n) = \begin{bmatrix} x_0(1)x_1(1) & \cdots & x_n(1) \\ x_0(2)x_1(2) & \cdots & x_n(2) \\ \vdots & \vdots & \vdots \\ x_0(N)x_1(N) & \cdots x_n(N) \end{bmatrix}_{N\times(n+1)} \tag{2}$$

The specific method is that for the minimum index,the minimum value in the sequence is 1,all other values are divided by the minimum value. For the maximum value indicator,the maximum value in the sequence is 1,all other values are divided by the maximum value：

$$x_i(k) = \begin{cases} \frac{x_i(k)}{max\, x_i(k)} \\ \frac{x_i(k)}{min\, x_i(k)} \end{cases} \tag{3}$$

$$i = 0,1, \cdots, n; k = 1,2 \cdots, N$$

The third step, the absolute difference.Calculate (2.2) the absolute difference between the reference sequence and the rest of the comparison sequences,the following absolute difference matrix is formed:

$$\begin{bmatrix} \Delta_{01}(1)\Delta_{02}(1) & \cdots & \Delta_{0n}(1) \\ \Delta_{01}(2)\Delta_{02}(2) & \cdots & \Delta_{0n}(2) \\ \vdots & \vdots & \vdots \\ \Delta_{01}(N)\Delta_{02}(N) & \cdots & \Delta_{0n}(N) \end{bmatrix}_{N\times n} \tag{4}$$

Amongthem, $\Delta_{0i}(k) = |x_0(k) - x_i(k)|$, $i = 0,1,\cdots,n$; $k = 1,2,\cdots,N$; In absolute difference matrix, the maximum number and the minimum number are the maximum difference and the minimum difference:

$$\begin{cases} \max_{1\leq i\leq n\ 1\leq k\leq N}\{\Delta_{0i}(k)\} \triangleq \Delta(\max) \\ \min_{1\leq i\leq n\ 1\leq k\leq N}\{\Delta_{0i}(k)\} \triangleq \Delta(min) \end{cases} \tag{5}$$

The fourth step is to calculate the correlation coefficient.Transforming the data in the absolute difference matrix as follows:

$$\xi_{0i}(k) = \frac{\Delta(min)+\rho\Delta(max)}{\Delta_{0i}(k)+\rho\Delta(max)} \tag{6}$$

The following correlation coefficient matrix is obtained:

$$\begin{bmatrix} \xi_{01}(1)\xi_{02}(1) & \cdots & \xi_{0n}(1) \\ \xi_{01}(2)\xi_{02}(2) & \cdots & \xi_{0n}(2) \\ \vdots & \vdots & \vdots \\ \xi_{01}(N)\xi_{02}(N) & \cdots & \xi_{0n}(N) \end{bmatrix}_{N\times n} \tag{7}$$

The fifth step is to calculate the degree of association.The degree of correlation between the comparison sequence and the reference sequence is reflected by N correlation coefficients. The correlation between X_i and X_0 can be obtained by finding their average number:

$$r_{0i} = \frac{1}{N}\sum_{k=1}^{N}\xi_{0i}(k) \tag{8}$$

The sixth step is to sort according to the degree of relevance.The correlation degree between the comparison sequence and the reference sequence is arranged from largeness to smallness.The greater the degree of association, the more consistent the changes in the comparison sequence and the reference sequence

2.2 Choosing relevant variables

It is generally believed that the budget expenditure of local public finance is the core index of PPP project's financial affordability.Therefore, this paper combines the actual situation of the financial sustainability of PPP projects in China and selects the annual general public budget expenditure of Xinjiang Uygur Autonomous Region of China as the reference index X_0, selects the PPP project local fiscal investment, regional economic development level, urbanization rate, fiscal decentralization, local fiscal revenue, population size, fixed assets investment and other factors as comparative indicators. Based on this, the impact of the comparison index on the reference index was analyzed.

Table 1   Main Factors and Factor Codes

Factor name	Factor code
Local public budget expenditure	X_0
Per capita GDP	X_1
Urban population quantity	X_2
General public budget income	X_3
Population size	X_4
Fixed assets investment in the region	X_5
Financial income from higher level subsidies	X_6
Local bond issue income	X_7

3 Case Study

The blue book in the "Report on the Development of China's Provincial Economy Comprehensive Competitiveness (2014-2015)" published by the Chinese Academy of Social Sciences (2016) revealed that Xinjiang Uygur Autonomous Region of China ranked 26th in the Chinese provincial economy competitiveness ranking,ranking in the lower reaches of the country.In 2016the per capita GDP of China

was 53980 yuan and the Xinjiang Uygur Autonomous Region of China was 40427 yuan.Based on this, it can be seen from the comparison that the situation of Xinjiang Uygur Autonomous Region can well represent China's underdeveloped areas.In the following, we will use the grey correlation analysis method and select 2012-2016 data to empirically analyze the financial sustainability of PPP projects in the Xinjiang Uygur Autonomous Region.Specific steps are as follows:

The first step, select the added value of the general public budget for each year as the reference series and select the other 7 indicators as the comparison series. Please refer to Table 2 for details.

In the second step, the original data listed above is dimensionless processed using Equation (2.3). The processed data is shown in Table 3.

The third step is to use Mat lab software to get the grey correlation analysis ranking of comparison factors and reference factors, as shown in Table 4.

Table 2   Raw Data on the Main Factors Affecting Fiscal Affordability

Factor code / year	2012	2013	2014	2015	2016

Table 3   Main Factors Affecting Financial Affordability: Dimensionless Data

Factor code / year	2012	2013	2014	2015	2016
X_0	1.000	1.155	1.303	1.465	1.542
X_1	0.831	0.924	1.000	0.985	0.995
X_2	0.847	0.868	0.913	0.961	1.000
X_3	0.683	0.848	0.964	1.000	0.976
X_4	0.931	0.944	0.958	0.984	1.000
X_5	0.583	0.759	0.908	1.000	0.931
X_6	0.014	0.000	0.808	0.941	1.000
X_7	0.000	0.000	1.000	5.273	7.409

Table 4   PPP Financial Affordability Gray Correlation Analysis

Ranking	Comparative factor	General public budget expenditure correlation
1	Regional fixed asset investment	0.908
2	General public budget income	0.888
3	Urban population	0.877
4	Population size	0.822
5	Financial income from higher level subsidies	0.751
6	Local issuance of bond income	0.585
7	Per capita GDP	0.497

4 Result Analysis

Using the grey correlation analysis method, the correlation degree between the various comparative factors in the financial affordability of the Public-Private Partnership projects and the local public budget expenditure can be obtained.The ranking table can be found that the highest correlation factor of the financial capacity in PPP projects is fixed asset investment. The second is the general public budget revenue and the number of urban population.The increase of urban population will increase the demand for public goods and have a greater impact on financial affordability.Population size and superior

financial subsidies are more strongly correlated with financial affordability.The correlation between local bond income and per capita GDP and financial affordability is poor.

Observing the above results, we can see that the financial sustainability of the Xinjiang Uygur Autonomous Region of China has a strong correlation with regional fixed asset investment.By reading the Xinjiang Statistical Yearbook (2017), the annual investment in fixed assets for the years 2012-2017 and its share in local GDP, the investment in PPP projects and their proportion of the investment in fixed assets are now drawn together in the Figure 1 for readers' comparison.
Figure 1   Comparison Chart

Observing the above figure, we can see that theXinjiang Uygur Autonomous Region of China continued to increase investment in fixed assets from 2012 till now.Fixed asset investment in each year accounts for a large proportion of the local GDP.Especially after entering 2014, the amount of fixed assets investment even exceeds the gross national product of the region,Xinjiang has entered the stage of relying on investment to drive economic development.The reasons behind the high investment in fixed assets are as follows:First, the Xinjiang Autonomous Region of China is located in the inland area with inconvenient transportation and backward infrastructure.If we want to change the backward situation in Xinjiang and promote the development of Xinjiang's economy, we must vigorously promote investment in fixed assets, improve infrastructure, overcome infrastructure shortcomingsand attract more companies to Xinjiang of China.Second, the proposed "Belt and Road" of Chinese's national strategy in 2015 provided Xinjiang with new opportunities for development.As an important hub of the economic belt of the Silk Road and an open window to the west, Xinjiang of China has energetically carried out investment activities under the support of national policy to inject new vitality into the economy of Xinjiang.The investment of PPP projects in Xinjiang Autonomous Region of China from 4.929 billion in 2015 to 26.410 billion in 2016 and 770.615 billion in 2017are inseparable from the increase in fixed assets investment.

Table 5   Quantity of PPP Projects and Investment in Government and Social Capital in Each Year

	2015	2016	2017
Government investment in PPP Projects	24.3	656.3	1161.58
Social capital investment in PPP Projects	24.99	1983.85	5097.35
Number of PPP projects	17	431	589

As can be seen from Table 5the PPP project has injected capital vitality into Xinjiang's annual investment in fixed assets.Especially in the past three years, the relatively high investment in fixed assets and the support of national policies have created a good environment for the development of PPP projects, attracting a large amount of private investment to participate in infrastructure construction.It has increased the proportion of investment in PPP projects year by year, greatly alleviating the financial pressure of local governments.Note that increasing investment in fixed assets reached more than 1 trillion, even was put forward in 2017 in the Xinjiang Autonomous Region of China of fixed assets investment target of 1 trillion and 500 billion.However, from the above shown charts, we can see that the financial income composition of Xinjiang is relatively large from higher level financial support and local government bond income.In particular, financial support revenue from superiors accounted for over 70% of the budget revenue in the past three years.From the perspective of the development of PPP projects in recent years, the vast majority may be concentrated in infrastructure such as transportation, municipal engineering, and water conservancy constructionand so on. Projects with more than 30 years' investment duration are not in the minority.As we all know, as long as the PPP project is within the project cooperation period, the government will put a certain amount of financial expenditure into it every year until the end of the project.Assuming that Xinjiang's fiscal revenue is still mainly dependent on higher government subsidies and government bond income in the future and it continues to make high fixed assets investment targets while the PPP project is still pouring into Xinjiang,the financial affordability of the Xinjiang Autonomous Region of China is worrying.It is likely that a larger portion of

the PPP project will be at risk of being unfinished.Therefore, we must consider the affordability of financial supply to avoid hidden risks caused by the introduction of PPP mode.It is expected that the implementation of the PPP model will not only increase the efficiency of the public goods, but also ease the pressure on local government financial expendituresin order to promote the role of public goods supply.

5 Conclusion

5.1 Optimizing the structure of local fiscal revenue and introducing PPP projects rationally

Under the current circumstances, the PPP projects form a mutually beneficial relationship with the investment direction of the Xinjiang Autonomous Region of China in developing infrastructure.The introduction of the PPP projects can alleviate the pressure of local financial expenditures. However, it should also consider its own fiscal revenue structure.In order to ensure sustained and stable economic development in Xinjiang areas, the PPP projects should land smoothly.On the one hand, the competitiveness and economic attraction of Xinjiang areas must be enhanced through local policy support, the transformation of the economic development mode and the search for new economic growth points.On the other hand, the quantity of PPP projects should be controlled reasonably and the admission standards should be improved. The aim is to promote the development of the PPP projectsfrom quantity to quality.

5.2 Make a reasonable investment target of fixed assets

When local governments set targets for investment in fixed assets,on the one hand, we should decide whether we need to increase investment in building according to our own economic development.On the other hand, we should also consider the financial input of subsequent PPP projects.High investment in fixed assets is not only provided by social capital in PPP project, but also provided by local government financial expenditure. According to the current situation of the PPP projects in the Xinjiang Autonomous Region of China, 40% of the fixed assets investment is provided by the government finance.If the Xinjiang Autonomous Region of China continues to formulate a high fixed asset investment, it will squeeze out the financial investment in the PPP projects in the later period, leading to a risk of tailwind.

Abstract: The current management model can no longer meet the requirements of sustainable improvement if only vehicle manufacturer is taken as the core enterprise in the supply chain. Based on the location of auto parts enterprise in the supply chain, the concept of medium auto parts enterprise is proposed. The problem of product processing quality management for medium auto parts enterprise is analyzed. Based on supply chain lifecycle, this paper attempts to analyze the vehicle manufacturer as the core enterprise which is just suited to carry out the supply chain quality management in the incubation period of the supply chain. In the construction period and the operation period of the supply chain, taking the medium auto parts enterprise as the core enterprise is more suited for supply chain quality management.
Key words: Product processing quality; Medium auto parts enterprise; Supply chain lifecycle; Requirement analysis; Supply chain

1 Introduction

At present, competition from vehicle manufacturers emphasis on product development time of supply chain and competition for quality reliable control of products (Carvalho et al. 2010). The role of vehicle manufacturers has transformed into the system integrator of Assemble-to-Order due to they are highly dependent on tier one suppliers, forming the auto product supply chain network system with the participation of vehicle manufacturers, complete system suppliers, component suppliers, raw material suppliers, and interchangeable parts suppliers. As a result, the vehicle manufacturers have increased the requirements for the technical capabilities of auto parts suppliers for the outsourced management of parts.

In current research, the quality management of the supply chain is only carried out by the auto manufacturer as the core company. It is easy to ignore the quality problems in the product installation process and increase the quality risk of the supply chain. Especially in the case of asymmetric information, manufacturers and suppliers determine their individual quality levels to maximize their own profits in quality contracts (Hu, 2010). These bring more quality risks to supply chain management. So about 30% of the external quality of the automotive industry is caused by suppliers and 15% is related to the manufacturer's assembly (Liker et al., 2004). And Helper and Kuan (Helper and Kuan, 2016) points out only 37% of automotive suppliers are in the catalog of vehicle manufacturer NAICS 3363. It makes the quality management of the supply chain difficult to predict due to the lack of correct quality control information.

There are also some other problems arising from the current quality management model of the auto parts supply chain. According to the China Automotive Complaint Analysis Report for 2016~2017, complaints about auto product quality are still hot spots for consumer complaints. In the 169 brands and 691 cars, the total complaints of the self-owned brands and joint-brand cars were as high as 99%, and only about 30% of car manufacturers responded and accepted 100% of the complaints, reducing the customer complaints relief index and influence of brand purchase index. The decrease in the index directly affects the efficiency of car brands. The complaints about the quality of automotive products could not be dealt with and resolved in time. These problems hinder the current supply chains model lack of reasonable supply chain lifecycle requirement plan. Researchers have identified the problems. Chandak et al. (Chandak et al., 2014) pointed out that due to the complexity of the supply chain, small and medium enterprises should further consider the management of the product life cycle. However, the evaluation and verification of the quality level depend on the vehicle manufacturer, since there is no complete product processing quality information network in auto parts supply chain. The current study mainly focuses on the analysis of suppliers' relationship and quality level (Chen et al. 2017), the risk of

supply chain quality (Klingebiel et al., 2015; Thun and Hoenig, 2011), the model of supply chain quality management (Akbaripour et al., 2015), which is based on the core enterprises of vehicle manufacturers. But there is not been thoroughly analyzed and studied from the perspective of product processing quality management in auto parts suppliers.

To improve the quality of product processing quality supply chain management centered on vehicle manufacturers, this paper considers the coordination of the medium auto parts enterprise and analyzes the existing practical engineering problems in the product quality supply chain management of auto parts by describing the relationship between medium auto parts enterprise and the upstream and downstream enterprises. And it attempts to analyze the application stage and product quality management characteristics of medium auto parts enterprise and proposes the strategies to solve the problems.

2 Problem of Product Processing Quality Management in Auto Parts Supply Chain

In this section, the concept of medium auto parts enterprise is proposed to give its place of prominence in auto parts supply chain. Taking medium auto parts enterprise as point cut, this paper analyzes the existing practical engineering problems in the product quality supply chain management of auto parts by describing the relationship between medium auto parts enterprise and the upstream and downstream enterprises. The analysis also lays a foundation for further analysis of quality management requirements of the medium auto parts enterprises.

2.1 Concept of medium auto parts enterprises in the supply chain

At present, domestic and foreign scholars have not yet formed a unified definition of the supply chain, but the description of the supply chain includes the following aspects. (1) The object of the supply chain is the upstream and downstream enterprises which are related to the internal relations in the fields of processing, transportation, and service. (2) The goal of supply chain is to achieve information sharing between upstream and downstream business, such as customer demand information, transportation logistics information, maintenance service information, and product quality information. (3) The purpose of the supply chain is to meet cost reduction requirements by sharing information while ensuring the quality of the product, including production planning costs, logistics transportation costs, manufacturing costs, and other additional costs.

This paper only emphasizes the product processing quality of auto parts supply chain, so the object of the product processing quality of auto parts supply chain consists of the vehicle manufacturer and its suppliers which are responsible for product processing and manufacturing. The suppliers are all auto parts enterprises. And only the first tier suppliers are directly related to the vehicle manufacturers. The second tier suppliers are directly related to their own upstream enterprises which are also first tier suppliers of vehicle manufacturers.

It is clear that there is a type of auto parts enterprises which are the subject of product processing quality control and management and play a dominant role for vehicle manufacturers. They are responsible for the final processing quality of the product and the communication between assembly factories (such as vehicle manufacturers, engineer company, chassis company etc.) and their secondary suppliers. To highlight the importance of these auto parts enterprises in the supply chain, we define these auto parts enterprises as medium auto parts enterprises.

2.2 Characteristics of product processing quality management in auto parts supply chain

Medium auto parts enterprise is a first tier supplier directly associated with assembling factory. As the first tier supplier of assembly factory, the upstream of medium auto parts enterprise is the assembling factory and has its own downstream supplier.

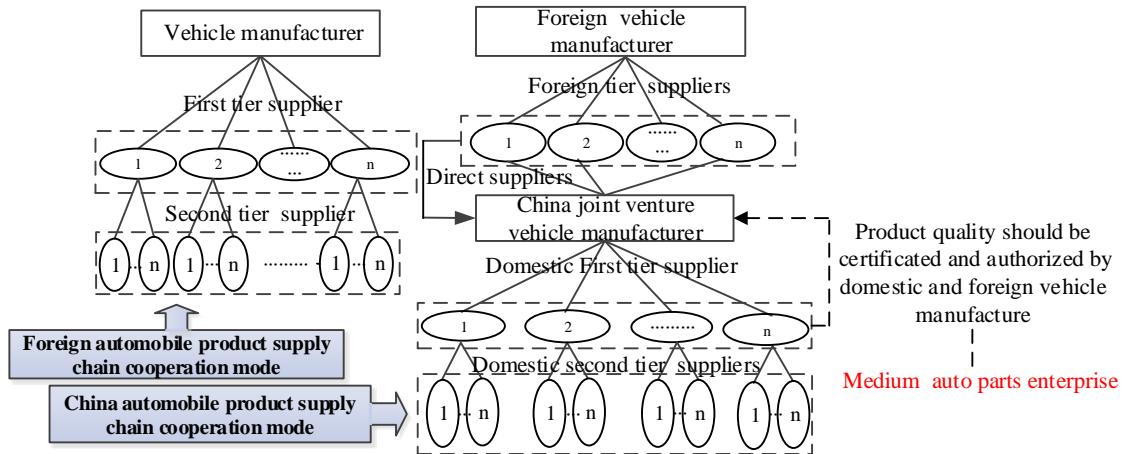
The main function of medium auto parts enterprise is to synthesize and match supply chain product processing quality. Figure 1 shows the cooperation mode between foreign vehicle manufacturers, domestic joint venture vehicle manufacturers, and medium auto parts enterprises.


Figure 1   Cooperation Mode between Vehicle Manufacturers and Medium Auto Parts Enterprises
Source: Supply chain management and operation mode of an auto parts enterprise in China

From Figure 1, it can be seen that foreign first tier suppliers can directly supply the vehicle manufacturers due to their participation in the development stage, but for Chinese joint vehicle manufacturers, medium auto parts enterprises are not involved in the product development stage, and the product quality level depends on foreign vehicle manufacturers. It should take the Chinese domestic vehicle manufacturers as core business, jointly developing the localization of new products. At the same time, due to the imperfection of supply chain quality management, the following problems still exist:

(1) As the core enterprise of Assemble-to-Order (ATO) supply chain, assembly factory (such as vehicle manufacturer, engineer company, chassis company etc.) directly assemble auto parts provided by Tie 1 suppliers, ignoring the quality risks caused by their own installation and assembly, making medium auto part enterprises take on the main responsibility of product quality risk in supply chain.

(2) In the 21st century, the competition of auto brands emphasizes on product quality and cost in the supply chain. However, they have not formed a unified management model for product quality standards and indicators between vehicle manufacturers, medium auto part enterprises, and second-tier suppliers.

(3) Each node enterprise in the supply chain with the biggest motive for profit maximization maximizes to choose the product quality level, has not taken into account the influence of its own product quality level of its upstream enterprise on product quality control. As a result, the supply chain cost control measures are not perfect, bringing more technical challenges to medium auto parts enterprise.

3 Strategies for Auto Parts Supply Chain Management

In this section, through the comparison and analysis of the product quality transmission of taking vehicle manufacturing or medium auto parts enterprise as a core enterprise, it is analyzed that the current management model cannot be met only by taking vehicle manufacturers as the core enterprise. Based on supply chain lifestyle, the quality management characteristics and control points of each stage of supply chain lifecycle are clearly given.

3.1 Transfer process analysis of product processing quality

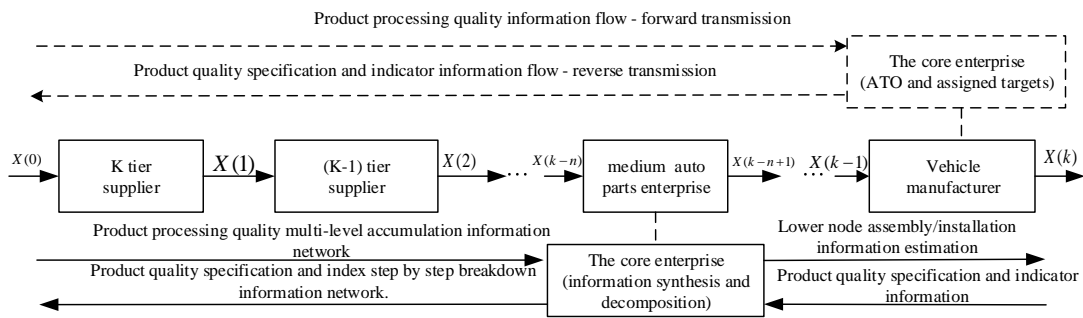
Yan (2013) analyzes the typical transmission process of product information and quality flow with the vehicle manufacturer as the core enterprise. However, this analysis method ignores the status of product quality control in the medium auto parts enterprises. Figure 2 illustrates the difference of product quality transmission model in the supply chain with vehicle manufacturers as the core enterprise and with the medium auto parts enterprises as the core enterprise.


Figure 2   Product Processing Quality Transmission Model in Supply Chain

As shown in Figure 2, the existing research is based on taking the vehicle manufacturer as the core enterprise. The forward transmission of product processing information is transmitted from the product quality information (X (0)) of the K tier suppliers to the upstream nodes until vehicle manufacturers. The reverse transmission of product quality specification and index information is from vehicle manufacturers to downstream nodes step by step. However, if medium auto parts enterprise is taken as the core enterprise, in the forward transmission, medium auto parts enterprises are not only synthesizing quality information from downstream enterprises but also considering assembly information of the vehicle manufacturer. In the reverse transmission, medium auto parts enterprises should cooperate with vehicle manufacturer decompose product quality specifications and indicators, monitor the downstream enterprises requirement dynamics of the quality specifications and indicators. So this paper proposes taking medium auto parts enterprise as the core enterprise to improve the design scheme of product processing, to effectively provide technical support to the vehicle manufacturer, and to reduce product processing and manufacturing costs.

3.2 Strategies of product processing quality management in supply chain life cycle

On the basis of supply chain lifecycle proposed by Chang (2012), with the auto parts product quality management as the starting point, the application stage of taking medium auto parts enterprise as a core enterprise is analyzed.

(1) In the incubation period, the task for vehicle manufacturers is to seek better quality suppliers. For suppliers, it is a technical support to provide the product quickly and effectively, and obtains the quality certification from vehicle manufacturers. Product quality management is carried out by vehicle manufacturers during the supply chain incubation period. The second tier suppliers cooperate with medium auto parts enterprises to provide product quality guarantee scheme to the vehicle manufacturer. Meanwhile, vehicle manufacturers complete the evaluation and certification of medium auto parts enterprises product quality level, and build the supply chain product quality management system. Therefore, at this stage, vehicle manufacturers are the core enterprises to meet the requirement of supply chain product quality management.

(2) During construction period, a stable cooperative relationship has been established between vehicle manufacturers, medium auto parts enterprises and second-tier suppliers. Medium auto parts enterprise and second-tier suppliers have received quality certification from vehicle manufacturers. The key task in this stage is to provide feedback and improvement on quality problems that happen during the trial production stage. Vehicle manufacturers inspect the products provided by medium auto parts enterprise, and provide feedback of inspection information to medium auto parts enterprise. Medium auto parts enterprises propose a product quality improvement plan and release it to a second-tier supplier based on the feedback information. According to the improvement information given by medium auto parts enterprises, the second tier suppliers adjust product quality control scheme, and then send product final information to medium auto parts enterprises. At this stage, product quality management is carried out around the medium auto parts enterprise. Therefore, medium auto parts enterprise is the core enterprise to meet the requirement of supply chain product quality management.

(3) During the operation period, products have entered the mass production stage. It is also a stage in which vehicle manufacturers require medium auto parts enterprises to provide products with stable quality levels. The medium auto parts enterprises must not only consider the influence of their own equipment, environment, and process fluctuation on product quality stability, but also consider the impact of accumulative quality errors caused by natural or artificial factors from second-tier suppliers,

and also consider the assembly influence mode and accuracy of vehicle manufacturer. Product quality control and management are carried out around the medium enterprise in auto parts industry. Therefore, a medium auto parts enterprise should be the core enterprises to meet the requirement of supply chain product quality management.

3.3 Strategies of product quality management for medium auto parts enterprise facing ISO/TS 16949:2016

ISO/TS16949:2016 is the basis for the implementation of supply chain product quality management, emphasizes its universality and suits for various types and services. It is also one of foundation in this paper that proposes medium auto parts enterprise as the core enterprise to carry out product quality management in the supply chain. In view of new demands of ISO/TS16949:2016, the strategies of product quality management for medium auto parts enterprise should be further improved from the following aspects:

(1) Taking the medium auto parts enterprise as core enterprise, the product quality assurance system should be established to improve the planning and analysis of product quality.

(2) Taking the medium auto parts enterprise as core enterprise, the product quality transmission and prediction model should be built to improve product process quality control.

(3) Taking medium auto parts enterprise as core enterprise, the product quality tracking, and risk prediction system should be created to track potential risk prediction and emergency response plans of product quality, and to improve the competitiveness of supply chain products based on quality and time.

4 Conclusion

This paper introduces the concept of medium-size auto parts enterprise and indicates that the chief status of auto parts enterprise has been ignored in current auto parts supply chain management model. Based on supply chain lifestyle, it points out that supply chain members should undertake different work task at each supply chain lifecycle stage. During the construction and operation periods of the supply chain, it is urgently to take medium auto parts enterprise as the core enterprise to implement the auto parts supply chain management.

Abstract: "The Belt and Road" Initiative is a top-level design in China, since the date of the proposal, the number of overseas projects in China has increased on a large scale. With the increasingly important role of supplier relationship management in the supply chain procurement strategy, research on supplier management and procurement management in overseas construction supply chain is emerging. On the basis of the study of related literature, starting from the view of construction supply chain management, thepaper constructed a theoretical hypothesis model and studied the relationship between supplier relationship quality and supply chain procurement performance, and made assumptions on the mediating effect of supply risk in this relationship. The purpose of this study is to provide a theoretical basis for optimizing supplier relationship and improving procurement performance in overseas construction supply chain of China's construction enterprises.
Key words: Constructon supply chain; Procurement performance; Supplier relationship quality; Supply risk

1 Introduction

In September and October 2013, "The Belt and Road" Initiative, namely the construction of "new Silk Road Economic Belt" and the concept of "twenty-first Century Maritime Silk Road" have been put forward. In recent years, along with the "The Belt and Road" concept gradually implemented, the number of China's overseas projects is booming. In the first half of 2016, the project that China's construction enterprises signed has reached 3080, the total amount of the contracts are worth $51 billion 450 million, representing an increase of 37% over the same period last year, it accounted for 51.6% of the total number of new overseas projects contracted by China in the first half of 2016. Faced with such a booming overseas construction market, research on overseas construction projects has also become a hot spot.

Because of the characteristics of overseas projects, the risks faced by them are more unique and more prominent than those in China. Overseas engineering projects alwayshave higher investment and are much more complicated than those at home, the process standards, design requirements and quality standards mostly follow the standards of British, American and European, the time limit is tight and the cost of project delay is high (Yu Xuni, 2013). In addition, overseas engineering projects usually have a longer period of general construction, a larger number of interest units involved and huger amount of investment than inboard (Li Hui, 2015). And from the two aspects of project implementation and project implementation process, the risk identification of overseas projects is carried out, including objective natural disaster risk, social security risk, economic risk, legal environment risk and many other aspects. On this basis, the engineering supply chain in the construction of overseas projects is often faced with more complex external environment than in China, and also because the constructon supply chain itself has many types of resources, management work covers the whole process of construction, and the relationship between the members of the supply chain is constantly in the dynamic evolution process, the relationship between supplier relationship quality and procurement performance in overseas construction supply chain is very complex. In order to help our construction enterprises to reduce the cost and improve the profit, it is very necessary to carry out this research.

Based on the literature of the related fields, this paper built a hypothesis model based on the questionnaire survey data of the construction field scholars and practitioners, and discusses the many factors that affect the relationship between the supplier relationship quality and the procurement performance. Through the hypothesis and verification of the structural relationship between these factors, the mediator variable is found, and the effective ways to improve the performance of supply chain procurement in overseas construction projects are presented.The resultsof this study can also provide reference and guidance for the work and decision-making of relevant enterprises.

2 Literature Review and Research Background

2.1 Supplier relationship quality

The quality of relationship was first born in the field of marketing, and better relationship quality is more conducive to increasing consumer loyalty. With the development of supply chain management theory and the maturity of engineering supply chain theory, the relationship quality is gradually introduced into construction supply chain management. In order to further study the quality of supplier relationship, many scholars have begun to divide supplier relationship quality into multiple dimensions, and studied them respectively.

Based on the empirical study of 561 international project contracting enterprises, it can be concluded that the relationship between partners was the most important relationship capital of the enterprise. The relational capital includes three dimensions: trust, reciprocity and information sharing, The different dimensions together affect the performance of the firm (Sarkar, 2001). In relation to supplier relationship quality, Foreign scholars took the lead in the study of relationship quality, through the investigation and analysis of the relationship between the salesman and the customer, they firstly established the relationship quality model, and divided the relationship quality into two dimensions of trust and satisfaction (Crosby et al. 1990). And the later scholars conducted three dimensional division of trust, satisfaction and commitment in the study (Smith, 1998). SomeChinese scholars studied the quality of supplier relationship in the International Sourcing market. They believes that the main influencing factors of supplier relationship quality under international environment are information exchange, mutual trust and communication barriers (Zhang Yue, 2008). Based on the perspective of relationship marketing and quality management, the author has established the dimensional division of trust, communication, commitment and cooperation of the supplier relationship quality under the international market. Later domestic scholars had established a multidimensional impact model of supply chain relationship quality and government procurement performance, by the questionnaire survey, it is found that supplier relationship quality has a significant positive impact on government procurement performance (Wang Hong, 2012). In the study, the author divides supplier relationship quality into three dimensions: trust, satisfaction and commitment. Based on the characteristics of the researches, this paper selects trust, communication and cooperation in three dimensions for further research.

2.2 Supply risk

After studied the information risk of supply chain risk in depth, combined with information management theory and risk management theory, a strategy to effectively encourage and restrain enterprise behavior through the establishment of profit distribution and risk sharing mechanism is proposed (Yang Hongfen et al. 2002), it can also promote the information sharing among enterprises, reduce the risk of supply chain and the probability of bullwhip effect, improve the competitiveness of the supply chain and to eliminate the information risk. This also shows the significant impact of supplier relationship quality on supply risk. When it comes inboard, Chinese scholars combined with relevant research results, selected multiple indicators to measure the risk management of logistics service supply chain. According to the risk evaluation index system, the relevant evaluation of logistics service supply chain is carried out, and strategies for coping with related risks are pointed out (Guo Zhaohai 2013). It is found that positive information communication with suppliers will bring positive help to risk control. According to the evaluation of the risk factors in several construction supply chains (Wenzhen, 2011), the author set up a fuzzy comprehensive evaluation index system of two levels to measure the risk of construction supply chain. In this system, the author believes that the risk of suppliers plays a very important role in this system, and supplier relationship quality has a significant positive impact on supply risk. Based on the above researches, the following hypotheses are proposed.

H1a: trust has a significant negative impact on the risk of construction supply chain.
H1b: communication has a significant negative impact on the risk of construction supply chain.
H1c: cooperation has a significant negative impact on the risk of construction supply chain.

2.3 Procurement performance

In the actual operation of engineering supply chain, internal and external uncertainties will influence the supply chain risk. The domestic and foreign literature on risk identification and management of the supply chain has pointed out that the identification work in the risk study is weak and should be strengthened in the future work (Zhou Yanju, 2006), the author made a quantitative research on risk identification, evaluation and risk management feedback mechanism to enhance corporate performance. In the field of empirical research, after analyzed the risk management strategy of

Engineering Supply Chain under EPC (EPC) mode (Zhiqiang, 2009), the risk assessment index system of engineering supply chain is also proposed. In the first level risk index of this system, the author divides the risk factors according to the different responsibilities of the different stages of the construction supply chain, and improves the performance of the enterprise through the management of the risk. Withthe data collected through field visits, interviews and workshop seminars, the identification and classification method of the uncertainty source of Engineering Supply Chain under ETO (order Engineering) mode is studied (Jonathan et al. 2013), the author also puts forward corresponding control strategies to eliminate uncertainty in engineering supply chain, reduce risks and improve performance.Based on the above researches, the following hypotheses are proposed.

H2: supply risk has a significant negative impact on procurement financial performance of construction supply chain.

Because the quality of the supplier relationship embodies the tightness of the cooperation between the supply and demand parties in the engineering supply chain, the quality of this relationship will inevitably affect the performance of the two parties, including the ocurement performance. Based on the theory of relationship capital, the establishment of a relationship network between construction enterprises and suppliers can bring about performance improvement for enterprises, and supplier relationship is an important resource for enterprises. The difference of performance between enterprises is due to the special heterogeneous resources owned by enterprises. The foreign scholars first proposed the importance of purchasing performance to the realization of an enterprise strategic goal, and found the impact of closer supplier relationship to a high level procurement performance (Stanley, 1994). In view of the resource based theory, the relation capital theory and the transaction cost economics, a structural equation model is established (Mahesh et al. 2011), which takes the supplier relationship as the dependent variable, the enterprise performance as the independent variable, and obtains the significant positive effect between the supplier relationship quality and the enterprise performance. On the basis of empirical research of government procurement, the quality of supplier relationship has a significant positive effect on the performance of government procurement (Wang Hong, 2012). Based on the above researches, this paper proposes the following hypotheses.

H3a: trust has a significant positive impact on the procurement financial performance of construction supply chain procurement.

H3b: communication has a significant positive impact on the procurement finance performance of the construction supply chain.

H3c: cooperation has a significant positive impact on the procurement financial performance of construction supply chain procurement.

2.4 Proposed conceptual model

At present, the research on the relationship between supplier relationship quality and procurement performance under the background of overseas engineering supply chain is not comprehensive enough. For this reason, there is no mature conceptual model for the study of overseas construction projects. Through combing the literature, on the one hand, we divide the supplier relationship quality from three dimensions: trust, communication and cooperation. On the other hand, using supply risk in engineering supply chain as an important mediator，and studied how the supplier relationship quality affects procurement performance in the supply chain under overseas background. This paper attempts to propose a multi factor conceptual model for the impact of supplier relationship quality on supply chain procurement performance in overseas projects，as shown in Figure 1
Figure 1   Conceptual Model

3 Research Design

According to the previous literature research and model construction, this paper carried out the design of the questionnaire. The first part of the questionnaire is about the basic information of the subjects. The main part of the questionnaire adopts the Likert scale, from 1 to 5, respective from "very disagree" to "complete consent". The survey was conducted for the middle and primary managers of an enterprises with overseas construction projects. From the beginning of November 2017 to the end of December 2017, 110 formal questionnaires were issued, 97 questionnaires were collected, 6 questionnaires were deducted, and a total of 91 questionnaires were collected. The recovery rate of the questionnaire was 88.18%, and the effective percentage was 93.81%.

In order to verify the accuracy and reliability of the scale, the reliability and validity of the scale must be tested in order to ensure the correctness of the results. In this paper, SPSS 18 software is used to test the KMO scale of the questionnaire, and the Cronbach's Alpha coefficient of the scale is analyzed. The reliability and validity of dimensions of supplier relationship quality, supply chain procurement performance and supply risk data are shown in Table 1.

Table 1   Reliability and Validity Analysis Table

Variable	index	KMO	Cronbach's Alpha
Trust	A1、A2、A3		0.860
Communication	B1、B2、B3	0.851	0.825
Cooperation	C1、C2、C3		0.807
Supply Risk	D1、D2、D3	0.733	0.769
Procurement finance performance	E1、E2、E3	0.699	0.886

Generally speaking, when the value of Cronbach's Alpha is at 0.7-0.8, the reliability is acceptable. When the value of this system reaches 0.8-0.9, the reliability is very good. For the KMO test, the general KMO statistics in 0.8-0.9 show that it is very suitable for analysis. At the time of 0.7-0.8, it is suitable for analysis. At 0.-0.7, it is not suitable for analysis. In contrast, the Cronbach's Alpha coefficients and KMO values in Table 1 are in line with the requirements.

4 Results and Analysis

Through the analysis of the reliability and validity of the model and data, the results show that the structural equation model constructed in this paper is ideal in terms of reliability and validity, which is suitable for further structural equation analysis. We continue to use AMOS21.0 software to analyze the fit indices and path of the model, so as to test the hypothesis. The result of the path analysis of the model is shown in Table 2.

Table 2   Path Coefficient and Correlation

Path	Path coefficient	Estimate	C.R.	P	Result
Trust - supply risk	.17	.16	3.40	***	adopted
Communication - supply risk	.37	.20	5.02	***	adopted
Cooperation - supply risk	.36	.24	4.77	***	adopted
Supply risk - procurement financial performance	.28	.19	3.82	***	adopted
Trust - procurement financial performance	.19	.18	2.71	.01	adopted
Communication - procurement financial performance	.23	.14	3.38	***	adopted
Cooperation - procurement financial performance	.19	.17	4.25	***	adopted

According to the model path coefficient and the significant data shown in Table 2, it shows that 9 causality in the model are all proved, and the hypotheses in the study are adopted.

SPSS18.0's PROCESS plug-in is used in this paper to use Bootstrap method to test the intermediary effect of supply risk. The 95% confidence interval of indirect effects of trust, communication and cooperation on purchasing financial performance is [0.0314, 0.3727], [0.0525, 0.3814], [0.0091, 0.4262], respectively, none of the 0 indicates that the mediating effect of supply risk is significant.

5 Conclusion

Based on the above research, we draw the following conclusions:

First, it is of great significance to maintain and improve the three dimensions of trust, communication and cooperation in the relationship quality. It is vital to maintain the smooth development of the procurement performance of the enterprise supply chain. This also illustrates the importance of developing strategic partnership and the implementation of strategic sourcing in the overseas construction projects.

Secondly, because of the characteristics of overseas construction projects, the risks faced by them are more unique than those of China. The risks in two aspects of supply and demand will have extremely serious impact on the work of both the supplier and the supplier. It is of great significance for overseas construction and construction enterprises to improve risk warning capability and improve risk emergency management mechanism.

Finally, as a multi-party and complex system, the construction supply chain requires cooperation among all members, mutual trust and reciprocity, active sharing of communication information, and placing the overall interests of the construction supply chain in the first place. Only if there is mutual benefit, can the relevant members of the supply chain be able to maximize their own interests.

In this paper, the quality dimension of supplier relationship in construction supply chain is divided, and the influence of construction supply chain risk on the relationship between supplier relationship quality and procurement performance is studied. But because the relationship quality in the supply chain is a concept involving both suppliers and demand-side, Therefore, in the future research on the impact of supplier relationship quality on procurement performance, we can analyze the performance of suppliers, Considering the supplier's performance factors in the procurement performance, we introduce the variable of demand risk to conduct a deeper study. In this way, we can ensure that the research is more comprehensive and at the same time, we can more specifically study the internal relationship and impact of supplier performance and procurement performance.

An Empirical Analysis on the Convergence of Manufacturing and Information Industry and Its Affecting Factors

Wang Fang, Pan Maomao, Gao Yuexian
School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: wf87586519@163.com, 822576700@qq.com, g1768664189@163.com)

Abstract: Industrial convergence is a new trend of contemporary economic development, a booster for upgrading industrial structure and changing the mode of development. Promoting industrial convergence has a profound impact on the economic development of our country. Based on the data of manufacturing industry segmentation and information industry convergence, this paper establishes multiple linear regression model and ridge regression model, and empirically analyzes the impact of various factors on industrial convergence. The results shows that technological innovation and consumption structure upgrading play a more important role in industrial convergence, and government regulation has a relatively weaker impact on convergence, while the training of composite talents has lagged behind the impact of it. In view of the empirical conclusions in technological innovation, talent training and other aspects, this paper puts forward some suggestions on how to deepen the convergence of manufacturing and information industry in China.
Key words: Industrial convergence; Influencing factors; Multiple linear regression; Ridge regression

1 Introduction

Industrial convergence refers to the phenomenon that the traditional boundary between different industries tends to blur or even disappear, and then a competition synergy between horizontal industries appears, thus forming a phenomenon of greater compound economic effect. The traditional extensive economic growth mode could no longer meet the requirements of economic development. Fostering industrial convergence has become China's new economic growth point, which contributes to transforming the economic development pattern and optimizing the industrial structure. The pursuit of profit maximization by enterprises has prompted the diffusion and absorption of emerging technologies, which has allowed cross permeation of technologies from different industries, resulting in a common technology platform and technology convergence. Economic deregulation of government has lowered entry barrier, makes it possible for enterprises to operate across industries, and provided a good environment for industrial convergence. Modern high-quality composite talents, large multinational cross-industry companies and upgrading of consumer notions are all important driving forces for industrial convergence. These factors have promoted the spread and application of the same technology in different industries, resulting in crossing and overlap between different industries and collaboration between companies in different fields has created greater composite economic effects. Therefore, the deep study of scientific and technological innovation, government regulation and other factors on the specific impact of industrial convergence has an important role in enhancing China's industrial competitiveness, optimizing the allocation of market resources, and forming a new economic growth point.

Most scholars believe that technology and government regulation are the main factors that affect the industrial convergence. For example: Zhi Caoyi (Zhi Caoyi,2001) thinks that technological innovation and government deregulation leads to the formation of competitive and cooperative relationship between enterprises in different industries, and thus industrial convergence occurs. Ma Jian (Ma Jian, 2002) holds that technological innovation is the internal cause of industrial convergence, and the relaxation of economic regulation is the external reason of industrial convergence. Chen Xiaotao (Chen Xiaotao, 2007) discusses the influence of technology diffusion and absorption on the formation of industrial convergence from three aspects: the distance of technology diffusion, the speed of technology diffusion and technology absorption. Zhang Haiyan and Wang Zhongyun believe that technological progress has promoted the formation and convergence development on the creative industries of national culture tourism in China.Dan Yuanyuan and Luo Wei argue that technological innovation and convergence are the main reasons for promoting industrial convergence, while the relaxation of government regulation provides a loose macro-environment for industrial convergence. Other factors that affect industrial convergence include the development of multinational corporations and the cultivation of compound talents, in which Li Wuwei (Li Wuwei, 2002) thinks that industrial

convergence is the embodiment of the inherent law of industrial development. And the factors to promote industrial convergence include industrial innovation, relevance between industries, transnational corporations, and so on. Chen Liuqin (Chen Liuqin, 2007), Xiao Yefei(Xiao Yefei, 2014), Liu Xiangping (Liu Xiangping, 2014) have studied the motive force of China's industrial convergence from the aspects of technological innovation, competition and cooperation relationship of enterprises, pursuit of scope economy, the development of multinational corporations, deregulation and so forth.Chen Caijuan (Chen Caijuan, 2008) clarifies the motive force of industrial integration from enterprises and talents. She thinks that enterprises are the main body of industrial convergence and compound people are the key to industrial convergence. The cultivation of compound talents and the merger and reorganization of enterprises can form a new integrated enterprise. Wu Haijin (Wu Haijin, 2009), Qi Liangqun and Xiu Guangli all think that government policies, the main role of enterprises, technological innovation, and the cultivation of composite talents will affect industrial convergence. And the latter holds that the high correlation, technological innovation and the need to upgrade the industrial structure between industries germinate convergence together. Some scholars have added micro-level--the factors of enterprise management and product. For example: Yoffie (Yoffie, 1997) thinks that management innovation is another significant factor affecting the convergence of the information industry. Zhou Zhenhua (Zhou Zhenhua, 2003) takes telecommunications, radio television and publishing as the research object, add the organizational structure and management innovation of enterprises in influencing factors besides the development and deregulation of information technology. Han Xiaoming (Han Xiaoming, 2006) has divided into different models to study the fundamental causes of industrial convergence. It is considered that the enterprise's pursuit of output efficiency and growth sustainability, the pursuit of economic benefits and the appropriate scale are respectively the fundamental reasons for the convergence of the output mode evolution and the internalization of industrial division of labor. Guo Dongyang (Guo Dongyang, 2014) analyzes the influence of product industry channel, product effectiveness, professional knowledge, specialized assets and industry concentration degree on the convergence of manufacturing and logistics industry.

To sum up, domestic scholars believe that the main factors affecting industrial convergence are: technological innovation, government regulation, enterprise management model innovation, the development of transnational corporations and compound talents and so on. First of all, the study of domestic scholars on the factors affecting industrial convergence is very comprehensive, which analyze the many motive power of industrial convergence but mainly focused on qualitative analysis. And without specific data as the support, it is impossible to quantitatively describe the contribution degree of each factor to industrial convergence. However, with the emergence of the important role of industrial convergence in economic development, it is particularly necessary to provide decision basis and policy effect for decision makers more accurately. Secondly, there are few articles that put the factors of consumption structure upgrading, technological innovation, government deregulation and so forth together to study the influencing factors of industrial convergence. Though technology, government, enterprises and other factors play an important role in the development of industrial convergence, the promotion of consumption structure upgrading on the driving force of industrial convergence still cannot be ignored. The change of consumption structure will directly cause the change of producer's expectation to the market and the adjustment of the company's production decision, thus promoting the intersection between the business to form the emerging integrated industry. For example, the desire of consumers for convenient shopping has prompted the emergence of online shopping platforms, that is, the convergence of traditional sales industry and the Internet has led to a new industry. Finally, the factors affecting industrial convergence can be divided into two levels: macro aspect mainly including technology, talent, government, multinational corporation, consumption structure, etc.; micro aspect including organization, management and products of enterprises, etc.

2 Analysis of the Influencing Factors on the Convergence of Chinese Manufacturing Industry and Information Industry

There are numerous factors that affect the industrial convergence, and the areas with different degree of development will have different level of talent, science and technology, openness, consumption view, etc., the differences of which will lead to the uneven degree of industrial convergence in different regions of our country. The technology, labor factors and development environment of different industries will also lead to uneven degree of industrial convergence. This paper will qualitatively analyze the factors that lead to the difference of industrial convergence between

regions and industries in China through the two aspects of region and industry. The convergence degree is measured by input-output method, that is, the proportion of information technology output to total output is used to represent the convergence degree between information industry and manufacturing industry. Its mathematical formula can be expressed as follows:

The convergence degree of Information Industry and Manufacturing Industry i

$$= \frac{Input\ of\ information\ technology\ in\ production\ process\ about\ industry\ i}{Total\ output\ of\ industry\ I} \times 100\%$$

Table 1   Ranking on the Convergence Degree of China's Manufacturing Subdivision and Information Industry(Unit：%)

Ranking	2007	2010	Ranking	2007	2010
1	Instrument and cultural office machinery manufacturing industry (26.4638)	Instrument and cultural office machinery manufacturing industry (24.0502)	8	Chemical industry (0.8250)	Chemical industry (1.0069)
2	Electrical machinery and equipment manufacturing industry (6.7681)	Electrical machinery and equipment manufacturing industry (6.7979)	9	Metal products industry (0.7127)	Metal products industry (0.8779)
3	General specialized equipment manufacturing industry (3.1057)	General specialized equipment manufacturing industry (3.0656)	10	Petroleum processing, coking and nuclear fuel processing industry (0.5897)	Non-metallic mineral products industry (0.6446)
4	Transportation equipment manufacturing industry (1.7668)	Transportation equipment manufacturing industry (1.9747)	11	Wood processing and furniture manufacturing (0.5641)	Wood processing and furniture manufacturing (0.6441)

6	Metal smelting and Calendaring Industry (1.1712)	Metal smelting and Calendaring Industry (1.1692)	13	Textile industry (0.5045)	Petroleum processing, coking and nuclear fuel processing industry (0.4865)
7	Textile, clothing, shoes, hats, leather, down, down and its products industry (0.9155)	Textile, clothing, shoes, hats, leather, down, down and its products industry (1.0261)	14	Food manufacturing and tobacco processing industry (0.4955)	Textile industry (0.4850)

Source: Calculated by the author (based on China input-output tables for 2007 and 2010)

After using the input-output method to estimate the convergence degree of Chinese manufacturing subdivision industry and information industry and ranking, the results come out as table 1. It can be seen from Table 1 that the ranking of the industrial convergence degree in 2007 and 2010 is basically parallel with no significant change, and the range ability of the financial convergence degree of each industry in the two years is relatively tiny. In 2007, the convergence degree less than 1.0 per cent was the food, tobacco processing, textile, non-metallic mineral, etc. 8 industries, and in 2010 it fell to only textiles, petroleum processing and coking, nuclear fuel processing, food manufacturing, tobacco products, etc. 6 industries. In 2007, there are three industries: metal smelting and calendaring processing industry, papermaking, printing, culture and education sports goods manufacturing, transportation equipment

manufacturing, etc. 3 industries reached the convergence degree ranging from 1.0% to 2.0, and it increased to 5 industries in 2010. The chemical industry and textile, clothing, shoes, hats, leather, down and their products industries have been added. The convergence degree more than 2.0% was instrumentation and cultural office machinery manufacturing, electrical machinery and equipment manufacturing and general Specialized equipment manufacturing industry three industries. The industry of the best convergence result was electrical machinery and equipment manufacturing industry, it was 5.086; and the industry of the worst convergence result was food manufacturing and tobacco processing industry with 0.674%.

The internal motive force of the development of industrial convergence is industrial relevance and the goal of the enterprise profits maximization. For example, the manufacturing industry of instruments and cultural office machinery has the characteristics of high technology, high output, low energy consumption, low material consumption and low pollution, which meet the requirements of changing the mode of economic development in the country at present. And as the basic means of information measurement and control, with the progress of science and technology and the acceleration of informatization this industry has a high degree of correlation with other industries, bearing big driving effect and considerable potential for development. Based on the above characteristics, local governments have actively supported the development of the manufacturing industry of instrumentation and cultural office machinery, thus attracting highly-qualified composite talents and multinational companies to enter the industry. These factors will further promote the convergence of the industry and the information industry in terms of technology absorption and diffusion, business intersection and penetration. And for example, although the textile industry is an important component of China's traditional industry, its benefits are now declining and its contribution to the whole economic output value is relatively small. And it is also facing the existing circumstances that the enterprise information level is not high, the technical equipment is backward, the high-quality human resources is insufficient, the cost of factors of production is upward, the environment pollution is serious and so on. This determines that although the barriers to entry in the industry are very low, they are unable to attract international companies with advanced technology and management experience, as well as talent, which in turn leads to a low convergence degree between the textile and information industries.

To sum up, through the comparison of the convergence degree between the manufacturing subdivision industry and the information industry, it is found that the technical characteristics of the industry itself will cause great differences in attracting talents and introducing foreign capital of the industry, thus resulting in the otherness of the convergence degree between the industries. Combined with the research of domestic and foreign scholars and the qualitative analysis of the actual data, this paper establishes the model by selecting the data from 1995 to 2011 to quantitatively analyze the affecting degree of technological innovation, government regulation, the development of multinational companies, the cultivation of compound talents, the changes of consumption structure and other factors on industrial convergence.

3 Model Establishment and Empirical Conclusions

3.1 Model hypothesis and index selection

Through the theoretical analysis on the influencing factors of industrial convergence in the previous chapter, it can be seen that five factors, technological innovation, government regulation, the scale of multinational corporations, the number of compound talents and the upgrading of consumption structure, will have a certain degree of impact on industrial convergence. Based on the above analysis, this paper makes the assumptions given in Table 2:

Table 2 Model Hypothesis

Variables	Measure index	Hypothesis
Technological innovation	$= \dfrac{Technological\ innovation\ R\&D\ Expenditure}{Revenue\ of\ major\ activities} * 100\%$	It is the internal driving force of industrial convergence, and it has positive relationship with it.
Government deregulation	$= \dfrac{\dfrac{Proportion\ of\ large\ and\ medium\ enterprises - sized\ enterpris}{Number\ of\ large\ and\ medium - sized\ enterprises}}{Total\ number\ of\ enterprises} * 100\%$	It provides an external environment for industrial convergence and has a positive relationship with it.

Continual Table 2

Variables	Measure index	Hypothesis
Development of multinational corporations	*Multinational corporation scale* $= \dfrac{Foreign\ capital}{Total\ paid - in\ capital}$	It is an important thrust of industrial convergence and has a positive relationship with it.
Cultivation of compound talents.	*Number of composite talents* $=$ *total number of ordinary undergraduate graduates in subdisciplines* $-$ *total number of ordinary undergraduate graduates*	It is an important force to promote industrial convergence, and it has a positive relationship with it.
Consumption structure upgrading	*Technological innovation* $= \dfrac{Per\ capita\ non-material\ consumption\ expenditure\ of\ urban\ residents}{Per\ capita\ total\ consumption\ expenditure\ of\ urban\ residents}$	It is another thrust of industrial convergence, and it has a positive relationship with it

3.2 Data processing

This paper takes the manufacturing industry as an example to study the factors that affect the convergence between manufacturing industry and information industry. The data are derived from the China Statistical Yearbook and the China Statistical Yearbook of Science and Technology. The proportion of sales revenue of new manufacturing products to the main business income and the proportion of R & D expenditure to main business income these two sets of data are derived from the China Statistical Yearbook of Science and Technology, and the other data are all from the China Statistical Yearbook. The convergence degree is calculated by the input-output method according to the international input-output table[1]. There is a big difference between the sample of compound talents and other samples, so it is more persuasive to take logarithm of this set of data to reduce the gap between samples. Because our country only began to implement the double degree system in 2004, the data of compound talents are all zero in 1995-2003. In view of this, this paper introduces a virtual variable D to distinguish the two periods. That is,

$$D = \begin{cases} 0 \ldots \ldots \text{Before the implementation of the double degree policy} \\ 1 \ldots \ldots \text{After the implementation of the double degree policy} \end{cases}$$

Table 3   Results of Unit Root Test

Variables	Data	Test results	Variables	Data	Test results
y	Original data	Acceptance of original hypothesis	x_3	Original data	Acceptance of original hypothesis
	First order difference	Rejection of original hypothesis		First order difference	Rejection of original hypothesis
x_1	Original data	Acceptance of original hypothesis	x_4	Original data	Acceptance of original hypothesis
	First order difference	Rejection of original hypothesis		First order difference	Rejection of original hypothesis
x_2	Original data	Acceptance of original hypothesis	x_5	Original data	Acceptance of original hypothesis
	First order difference	Rejection of original hypothesis		First order difference	Rejection of original hypothesis

To avoid pseudo regression, the unit root test is performed on the original data and the first order difference data of all variables before regression analysis. The test results are shown in Table 3 that accepting the original assumption means there is a unit root in the group data, and rejecting the original hypothesis indicates the data is stable. You can see from Table 3 that all variables are first-order stationary, and then do cointegration tests on variables y, x_1, x_2, x_3, x_4, and x_5. That is to say, the unit root test is done for the residual series obtained by linear regression. The test results show that there

---

[1] Since《China input-output table》was published only in 1997, 2002 and 2007, 《China input-output extension table》was published only in 2000, 2005 and 2010, the years of date are few. The data are derived from the International Input-Output Association website.

is no unit root in the residual series, thus there is a long-term cointegration relationship between variables and we can make multiple linear regression.

3.3 Model establishment

3.3.1 The establishment of multivariate linear regression model.

Model 1 takes the proportion of new product sales income to the main business income as a dependent variable, the proportion of the R & D expenditure of manufacturing industry to the main business income, the proportion of large and medium-sized manufacturing enterprises to all enterprises, the scale of multinational corporations, the number of compound talents and the proportion of non-material consumption to total consumption as independent variables to make linear regression model. The regression results analyzed by eviews6.0 are shown in formula (1). It can be seen from formula (1) that technological innovation, the development of multinational corporations and the upgrading of consumption structure are positively correlated with the industry convergence, which is consistent with the model assumptions in the previous section. However, the government regulation and the cultivation of compound talents are negatively related to industrial convergence, which is not in accordance with the hypothesis in the previous section. The fitting degree is very high that the R^2 value of model 1 is 0.985 and the modified R^2 value is 0.971. The F statistics value of model 1 is 73.680, which is significant at the confidence level of 99.9%, that is, the whole variable has a better explanation for the model. The T statistics value of the variables x_2 and x_4 are -1.318 and -1.247 respectively, which means they are significant at the confidence level of 85%. And the T test value of the variable x_3 is 0.883 denoting the coefficient of the variable is significantly crossed that the variables is not obvious to the industry convergence. The model fitting result is contrary to the reality, and R^2 statistics value of the model is very large but the T test value of each variable is very small. Thus, we can tell it that the model has multiple collinearity.

$$y = 0.276 + 1.031x_1 - 0.007x_2 + 0.006x_3 - 0.006x_4 + 0.033x_5 \tag{1}$$

3.3.2 The establishment of ridge regression model.

Further collinearity diagnosis of the model shows that the VIF values of the variables x_1 and x_5 are 4.907 and 4.597 respectively, the eigenvalue is close to 0 while the dimension is 5 and 6, and the conditional index value is far bigger than 10, which indicates that the model has a serious multiple collinearity. In this paper, the method of ridge regression is used to eliminate the influence of multiple collinearity on the model. Specially used for the analysis of collinear data, ridge regression is an improved least square estimation method. When there is multiple collinearity between independent variables, the variance of regression coefficient estimation is very large, the estimated value is very unstable, and the estimation model is quite different from the actual model. By introducing ridge parameter k and adding a positive constant matrix kI to XX, the estimated value of coefficient is more stable than the model obtained by multivariate linear regression according to $\hat{\beta}(k) = (XX + kI)^{-1}XY$.
Figure 1   Ridge Trace

First, we use Spss19.0 to standardize all the independent variables and get the new variables $zx_1, zx_2, zx_3, zx_4, zx_5, zx_6$. Then take 0.01 as step size to make the ridge trace map of all variables between 0.0 and 0.5. The result is shown in Fig.1 that the ridge trace tends to be stable and R^2 is 0.914

when k value is 0. 45. Finally, given k is 0.45, the ridge regression equation of the standardized variable is shown as formula (2). The R^2 of model 2 is 0.914 and that of modified model is 0.876, which is lower than that of the original model but the effect of this model has reached a good level. The F test value of model 2 is 23.528, which is significant at 99.9% confidence level.

$$y = 2.317 + 0.104zx_1 + 0.024zx_2 + 0.032zx_3 + 0.021zx_4 + 0.12zx_5 \qquad (2)$$

Through the comparison of model 1 and model 2, it can be seen that the coefficient of unreasonable variables becomes reasonable through ridge regression, that is, the relationship with industrial convergence of the variables of government regulation and the cultivation of integrated talents is changed from negative effect to positive effect. According to table 4, the T test value of the model has also changed greatly. The coefficient of the other variables is significant at the confidence level of 90% except the cultivation of compound talents is significant at the confidence level of 85%. Technological innovation and consumption structure upgrading play a greater role in deepening industrial convergence, while the other variables have a weaker effect on industrial convergence. The government's loosening the economic regulation of various industries to provide a good environment for the industrial convergence is the indispensable external condition which the industrial convergence can take place. The government is not involved in the internal dynamic mechanism of industrial convergence, which may lead to the smaller coefficient of variable x_2. As early as 1995, our country put forward the strategy of rejuvenating the country through science and education, but the cultivation of compound talents started late that there is a shortage of compound talents now. Besides, exerting the effect of the investment of compound talents on industrial convergence needs a long time and this effect is lagging behind, so the influence of compound talents on industrial convergence is relatively weak. Although the development of multinational corporations in China has been very rapid since China's entry into WTO, the introduction, digestion and absorption of foreign advanced technology has always been a difficult problem for our government and enterprises. Therefore, the role on the development of multinational corporations in China has not been fully demonstrated, as a result of which the role of this variable in promoting industrial convergence is not fully played out.

Table 4   T Test Value and P Statistics Value of Model Variables

Model	Technological innovation		Government deregulation		The development of multinational corporations		The cultivation of compound talents		Consumption structure upgrading	
	t	p	t	p	t	p	t	p	t	p
Model1	4.503	0.001	-1.247	0.106	0.883	0.189	-1.318	0.095	5.658	0.000
Model2	5.973	0.000	1.281	0.100	1.711	0.044	1.149	0.148	6.805	0.000

4 Conclusion

Through qualitative and empirical analysis of industrial convergence in different provinces and manufacturing industry segments, we can see that technological innovation, government regulation, talent cultivation and other factors exactly affect the development of industrial convergence. Some conclusions obtained in this paper are as follows.

(1) The integration between technology-intensive industry and information industry is the highest, followed by labor-intensive and capital-intensive industries.In the measurement of theconvergence degree of manufacturing and information industries, instruments and cultural office machinery, electrical machinery and equipment manufacturing industries and etc. ranked in the top basically belong to technology-intensive industries, which have a higher correlation with other industries. It is easier for such industries to apply information technology to the production process and thus to integrate with the information industry. And the food industry and tobacco processing industry and etc. ranked at the bottom basically belong to labor-intensive or capital-intensive industries. Compared with the R & D investment of information technology, they pay more attention to the use of labor resources and capital. These industries are less related to other industries, so they do not have a good convergence with the information industry.

(2) The influence of technological Innovation and consumption structure upgrading on Industrial Convergence is significant.In the multivariate linear regression model, technological innovation and consumption structure upgrading are positively correlated with industrial convergence. And in the Ridge regression model, the effect of technological innovation and consumption structure upgrading on promoting industrial convergence is significant.The innovation and development of information technology is the basis of the convergencebetween information industry and other industries. The

empirical analysis shows that compared with other factors, technological innovation has a greater impact on industrial convergence. Similarly, along with the increase of people's income and the improvement of the living standard, the consumption structure and the consumption idea have also had the obvious change, this has directly caused the change of the product and the service, thus has promoted the emergence of many new products and the emerging industry. It also promoted the development of industrial convergence.

(3)The deregulation of the government, the development of multinational corporations and the training of compound talents have no obvious effect on the industrial convergence.In the multivariate linear regression model, the government deregulation and the training of composite talents are negatively related to industrial convergence. Although the development of multinational corporations is positively related to industrial convergence, its impact is very weak. In the Ridge regression model, the government deregulation, the development of multinational corporations and the training of composite talents all have positive effects on industrial convergence, but the degree of action is not obvious. To a large extent, government regulation has caused barriers to entry between different industries, and the government has not really participated in the internal mechanism of industrial convergence. The development of multinational corporations is an important driving force of industrial convergence, but the role of this variable in deepening industrial convergence has not been fully demonstrated. In addition, there is still a great space for the development of compound personnel in our country.

On the basis of the above three basic conclusions, this paper will put forward the following suggestions on how to promote technological advancing, further expand the scope of government deregulation, strengthen talent cultivation, optimize the development of multinational companies in China and accelerate the upgrading of consumption structure thus deepening the industrial convergence degree.

(1) It is an effective means to deepen the convergence degree of information industry and manufacturing industry in our country by vigorously developing the information technology industry of new generation and enhancing scientific and technological innovation ability of enterprises, universities and scientific research institutions. Specifically, we can enhance the innovation ability of information technology in our country through the following aspects: first, to establish information service centers in different regions to further promote the construction of digital cities in China, to deepen "the convergence of three networks" thus promoting the full coverage of information networks in various regions such as communications and the Internet networks; second, to actively promote enterprise informatization, to promote the application of information technology in various industries thus achieving the penetration of information technology in all production links of enterprises, to vigorously support the informatization of small and medium-sized enterprises thus laying a foundation for the convergence between information industry and other industries in China; third, to further enhance the comprehensive strength of enterprises in science and technology, to establish and improve a system of technological innovation that takes the enterprise as the main body, market as the guidance and combined with production, teaching and research.; fourth, to guide the technological cooperation between upstream and downstream enterprises, evaluate national and provincial innovative enterprises and give corresponding encouragement to different levels of enterprises in order to stimulate the vitality of enterprise innovation.

(2) Speeding up the transformation of government functions to create a looser policy and institutional environment for industrial convergence is indispensable. First of all, it is necessary to play the fundamental role of the market in the resources allocation and relax the economic regulations on various industries. For example, we can enhance the competitiveness of enterprises in the domestic and foreign markets by canceling or partially abolishing the price, investment, service and other restrictions of the regulated industries. Second, to deepen the reform of state-owned enterprises, to promote the agglomeration of state-owned capital into high-tech industries, strategic emerging industries and other fields thus improving the core competitiveness of large state-owned enterprises is important. Thirdly, we should strongly support the development of small and medium-sized enterprises, lower entry barriers and improve the relevant policies or regulations and security system of small and medium-sized enterprises to create favorable conditions for the fair competition of enterprises. Finally, we need to strengthen the construction of characteristic industrial parks and high-tech zones on all regions and guide the gathering of traditional industries and high-tech industries so that the convergence between the two can be realized.

(3) It is initial to fully explore the role of transnational corporations in the economic development of our country. On the one hand, the government should guide enterprises to merge and restructure

across regions and industries, improve the level and quality of utilizing foreign capital, improve the domestic investment environment, and increase the intensity of attracting investment from high-tech industries and strategic emerging industries, broaden the channels for the utilization of foreign capital, optimize the utilization of foreign capital structure, and innovate ways of utilizing foreign capital. On the other hand, domestic enterprises should rely on all kinds of key projects in our country, vigorously introduce foreign core technology, key equipment and advanced management experience, and give priority to developing foreign investment projects with high scientific and technological content and high added value.

(4) We need to highlight the cultivation of compound talents needed in modernization construction and set up interdisciplinary professional mechanisms in universities and scientific research institutions to provide talents guarantee for deepening industrial convergence and speeding up the industrial structure upgrading. Besides, we can improve the quality of higher education, focus on the cultivation of innovative scientific and technological personnel, comprehensive technical personnel. We will step up the introduction of talents, strive to internationalize major cities, speed up the construction on community, school, medical services of urban internationalization and so on, achieve bilingual services in both Chinese and English on government websites, increase the foreign language service content of government windows and public service units to provide comfortable living and working environment for foreign excellent managers and technicians. We will strengthen cooperation between Chinese enterprises, universities and scientific research institutions and international economic and technological institutions, encourage them to cooperate with advanced foreign enterprises, colleges and institutions, and support enterprises' talents, science and technology personnel to go abroad for training and participate in international economic and technological exchanges. We should encourage enterprises to improve our talent market, accelerate the construction of a talent market information platform, and provide more comprehensive information for enterprises and talents.

(5) In response to the current diversified and personalized needs of consumers, on the one hand, enterprises should keep up with the changes in market demand and make rapid adjustments. Enterprises in various industries need to adopt advanced information technology to detect market trends so as to take the lead in time and profit. On the other hand, people's curiosity about new things and the pursuit of a convenient life have forced enterprises to produce kinds of products that can meet the various needs of consumers. This will promote the interaction and penetration of enterprises in different industries, even mergers and acquisitions, thus promoting industrial convergence. Therefore, guiding people to change the consumption notion to promote the consumption structure upgrading can deepen industrial convergence.

Abstract: In this paper, DEA (Data Envelopment Analysis) method is used to calculate the total factor productivity index of Hubei manufacturing industry in 2006-2015 Malmquist, and the vertical and horizontal comparison is made. The results show that the manufacturing industry in Hubei province exports the main reason is that the enterprise scale, insufficient investment; secondly because of lack of innovation, lack of technical innovation; at the same time the enterprise internal management has certain improvement but its amplitude is smaller. On this basis, the paper puts forward some policy suggestions.
Key words: Manufacturing; Export efficiency; DEA; Malmquist index

1 Introduction

What really concerns the long-term economic growth of a country is not the "quantity" of exports, but the "quality" of exports.Hausmann, Hwang&Rodrik, 2007China's manufacturing exports have leapt to the top of the world, but its export products are mainly concentrated at the end of the global value chain. On May 19, 2015, under the backdrop of the Chinese economy entering a new normal, the State Council issued Made in China 2025 and proposed the development goal of entering into a manufacturing powerhouse of the world by 2025. China's 13th Five-Year Plan also clearly states that it is necessary to further promote international production capacity and equipment manufacturing cooperation and accelerate the optimization and upgrading of foreign trade. It can be seen that how to become a "powerful country" from the "big country" in the manufacturing industry and improve the efficiency and quality of manufacturing product exports has become an urgent and important issue.

Hubei, which is located in central China, has encountered the same problem: the manufacturing industry is large but not strong. The export delivery value of Hubei's manufacturing industry increased from 44.01 billion yuan in 2006 to 167.85billion yuan in 2015, with an average annual growth rate of 16.11%. From a structural point of view, the industries with a high proportion of export delivery values include agricultural and non-staple food processing industry, textile industry, textile and clothing, apparel and chemical raw materials, and chemical manufacturing industries. In 2015, the export delivery value of the above four sub-sectors was 57.049 billion yuan, accounting for 33.81% of the total. This phenomenon indicates that the main export of Hubei manufacturing industries is mainly high-pollution and labor-intensive industries.

We selected 26 subdivided industries in Hubei Province as a sample to study the export efficiency of the manufacturing industryand uses the DEA method to compare the export efficiency of the subdivided industries in Hubei manufacturing industry horizontally and vertically, and to formulate relevant policies for the promotion of manufacturing exports in Hubei Province. Policy to provide reference.

2 Model

The Malmquist Total Factor Productivity Index was first proposed by Caves, Christensen, and DeWitt in 1982. In 1994, Fare et al. gave a non-parametric linear programming algorithm to make the Malmquist Total Factor Productivity Index method widely used. Timothy J. Coelli (Timothy J. Coelli, 1998), University of Queensland, Australia, introduced the method more systematically. The index is constructed from the input-output vectors observed during the period s and the period t, and is measured by the radial distance related to the reference technology. Because the distance can be either output-oriented or input-oriented, the Malmquist TFP varies depending on the orientation of the use. The paper uses the output-oriented Malmquist Total Factor Productivity Index. The Malmquist Total Factor Productivity Index for the period s is given by:

$$m_0^s \ (q_s, q_t, x_s, x_t) \ = \frac{d_0^s(q_t, x_t)}{d_0^s(q_s, x_s)}$$

Similarly, we define the output-oriented Malmquist Total Factor Productivity Index for period t as:

$$m_0^t （q_s, q_t, x_s, x_t） = \frac{d_0^t(q_t, x_t)}{d_0^t(q_s, x_s)}$$

Among them，(q_t, x_t) and (q_s, x_s) represent the input and output vectors of s and t periods respectively. In addition, d_0^s and d_0^t represent the distance functions referenced by the technique T^s of the s period and the technique T^t of the t period, respectively.

Since the Malmquist Total Factor Productivity Index can be defined using the technology of the period s and the technology of the period t, the Malmquist Total Factor Productivity Index is defined as the geometric mean based on the two indices of the period s and the period t. Therefore, the Malmquist Total Factor Productivity Index is given by:

$$m_0 （q_s, q_t, x_s, x_t） = \sqrt{m_0^t （q_s, q_t, x_s, x_t） * m_0^s （q_s, q_t, x_s, x_t）}$$

Where there are technical inefficiencies, the output-oriented equine MQV may be rewritten as:

$$m_0 （q_s, q_t, x_s, x_t） = \frac{d_0^t(q_t, x_t)}{d_0^s(q_s, x_s)} \sqrt{\frac{d_0^s(q_t, x_t)}{d_0^t(q_t, x_t)} * \frac{d_0^s(q_s, x_s)}{d_0^t(q_s, x_s)}}$$

The ratio outside the root number measures the change in technical efficiency between the time s and the time t measured in output-oriented terms, and the geometric mean of the two ratios within the root number represents the technique between the two periods. Variety. If the assumption of constant returns to scale is relaxed, the above technical efficiency can be further decomposed into pure technical efficiency and scale efficiency. We can get the following formula:

$$\text{Tfpch} = \text{Techch} \times \text{Pech} \times \text{Sech} = \text{Techch} \times \text{Effch}$$

In the formula, Tfpch represents the Malmquist total factor productivity index; Techch represents technological progress; Pech represents pure technological efficiency changes; Sech represents scale efficiency changes; Effch represents changes in technical efficiency.

3 Data Sources and Instructions

The study period of this paper is from 2006 to 2015, and the data are derived from Hubei Statistical Yearbook. Since the Hubei Statistical Yearbook adopted the National Economic Sector Classification (GB/T 4754-2011) standard since 2012, there are some changes in the industry's subdivision industry classification standards. In order to ensure the consistency of statistical caliber and the consistency of data, our paper selects 26 manufacturing sub-sectors as research objects. Among them, the rubber and plastic products industry's data before 2011 is the sum of the rubber products industry and the plastic products industry, and the transportation equipment manufacturing industry is the sum of the automobile manufacturing industry and the railway, shipbuilding, aerospace and other transportation equipment manufacturing industries after 2011. Since the oil processing, coking and nuclear fuel processing industries, and the export value of the tobacco products industry all appeared zero, they were excluded.

Because we use the DEA method to measure the export efficiency of the Hubei manufacturing sub-sector. We select the export delivery value of each sub-industry in Hubei Province as the output variable and the total assets of each sub-sector, total industrial output value, and the average number of all employees as the input variable.

4 Empirical Analysis
4.1 Total factor growth rate and its decomposition of manufacturing export in Hubei

DEA analysis was performed using DEAP 2.1 software. The results are shown in Table 1 and Table 2. They respectively show the Malmquist index and its breakdown of the two sectors of the manufacturing industry in Hubei and time series.

Table 1   2006-2015 The Malmquist Index and its Decomposition

Industry Number	TEC	TC	PTEC	SEC	Malmquist Index
1	1.030	0.987	1.029	1.001	1.017
2	1.010	0.985	1.013	0.996	0.995

21	1.035	0.991	1.044	0.991	1.026
22	0.992	1.019	1.002	0.990	1.011
23	1.073	0.989	1.065	1.007	1.062
24	1.000	0.990	1.000	1.000	0.990
25	1.034	0.991	1.066	0.969	1.024
26	1.032	1.003	1.059	0.974	1.035

Table 1 gives the overall situation of total factor productivity of exports of 26 manufacturing sub-sectors in Hubei Province from 2006 to 2015. Among them, there are 11 sub-industry TFP growth rate is positive, accounting for 42.31%; 15 sub-industry TFP growth rate is negative, accounting for 57.70%. The average annual growth rate of the wine, beverage and refined tea manufacturing industry was 9.1%, followed by the electrical machinery and equipment manufacturing industry, with an average annual growth rate of 6.2%. The average annual decline rate of the furniture manufacturing industry was -20.8%.

Looking at the index of pure technological efficiency changes, the overall pure technical efficiency of the various sub-industries in manufacturing industry in China is 1.019, showing a good trend. Of the 26 subdivided industries, 21 sub-industries are greater than or equal to 1, and only 5 sub-industries are less than 1. The top three rankings in the growth rate of pure technology efficiency were Manufacture of Chemical Fibres, Printing and Reproduction of Recording Media and Manufacture of Measuring Instruments and Machinery, with growth rates of 11.8%, 6.8%, and 6.6% respectively.

From the scale efficiency change index, there are 18 industries with a scale efficiency change index of less than 1,indicating that the scale efficiency of various sub-industry exports in Hubei manufacturing industry is not high, and there is room for further improvement.

From the point of view of technological progress, the average index of technological progress is 1, and the progress and decline of Hubei's manufacturing sub-sectors offset each other. The technological progress of the Manufacture of Liquor, Beverages and Refined Tea is most obvious. Followed by 1.9% for c Manufacture of Automobiles and Manufacture of Raw Chemical Materials and Chemical Products.

Table 2   2006-2010 Export Efficiency Malmquist Index and Its Decomposition

Period	TEC	TC	PTEC	SEC	TFP
2006-2007	1.105	0.883	1.095	1.009	0.975
2007-2008	1.088	0.797	1.012	1.075	0.867
2008-2009	0.938	0.907	0.860	1.090	0.850
2009-2010	0.326	3.208	0.800	0.407	1.045

Period	TEC	TC	PTEC	SEC	TFP
2010-2011	2.299	0.468	1.770	1.299	1.077
2011-2012	0.707	1.245	0.912	0.775	0.881
2012-2013	1.500	0.759	1.064	1.410	1.139
2013-2014	1.174	0.780	1.144	1.026	0.916
2014-2015	0.785	1.419	0.792	0.991	1.113
Average	0.979	1.000	1.019	0.960	0.979

As can be seen from the above table, the average annual growth rate of manufacturing exports from Hubei Province during 2006-2015 was -2.1%. Although there has been an increase in 2009-2010, 2010-2011, 2012-2013, and 2014-2015, there have been 13.3% and 15% declines in 2007-2008 and 2008-2009, respectively, and the decline is larger, offsetting the increase. It can be seen that the global financial crisis in 2008 had a very large negative impact on the export of Hubei's manufacturing industry. Both the technical efficiency and the scale efficiency have shown a decrease in the lower range, which has dropped by 2.1% and 4.0% respectively. Although the efficiency of pure technology has grown, it has not been significant, with an annual average of only 1.9%.

4.2 Cross-sectional data analysis of hubei's manufacturing export efficiency in 2015

15	0.026	0.107	0.243	irs
16	0.045	0.066	0.678	irs
17	0.128	0.170	0.756	irs
18	0.084	0.229	0.367	irs
19	0.112	0.155	0.719	irs
20	0.118	0.157	0.749	irs
21	0.100	0.147	0.680	irs
22	0.088	0.097	0.903	irs
23	0.245	0.266	0.924	irs
24	1.000	1.000	1.000	-
25	0.136	0.424	0.321	irs
26	0.171	0.560	0.305	irs
Average	0.237	0.389	0.585	

In 2015, there were a total of two industries at the forefront of production: Manufacture of Leather, Fur, Feather and Related Products and Footwear and Manufacture of Computers, Communication and Other Electronic Equipment. Their overall efficiency, technical efficiency, and scale efficiency are all optimal, indicating that the export efficiency of these two industries is effective for DEA.

The export efficiency of manufacturing enterprises in Hubei is low in scale. Looking at the scale of returns in 2015, 23 of the 26 manufacturing industries are in an increasing phase, accounting for 80.76%; three industries are in a decreasing phase, accounting for 11.54%; and two industries are in the constant

stage of scale compensation, accounting for 7.69%. It shows that the manufacturing enterprises in Hubei Province have increased their investment, and the expansion of production scale will increase the export efficiency of these enterprises. The pure technical efficiency of the Manufacture of Textile, Wearing Apparel and Accessories and Manufacture of Chemical Fibres are all 1. The pure technical efficiency of these two industries is optimal, but their scale efficiency is not high. The Manufacture of Textile, Wearing Apparel and Accessories is in the stage of diminishing returns to scale, and Manufacture of Chemical Fibres is in the stage of increasing returns to scale. This shows that from the perspective of export efficiency, the former should reduce investment and scale down; the latter should increase input and expand production scale.

In 2015, the average comprehensive technical efficiency, pure technical efficiency, and scale efficiency of various industries in Hubei Province were 0.237, 0.389, and 0.585, respectively. The inefficiency of comprehensive technical efficiency is mainly due to the lack of efficiency of pure technology.

5 Conclusion

From the above studies, we can see that in order to increase export efficiency, Hubei's manufacturing industry should start with increasing scale efficiency and technological progress. Although Hubei is a major province of education but not a major province of innovation, innovation has not yet become industrial competitiveness and increased scientific research investment. And actively promote the industrialization of scientific research results and form an international competitiveness to promote the export of manufacturing products.

From the view of returns to scale, most of the subdivided manufacturing industries in Hubei Province are in the phase of increasing returns to scale, which shows that there is still considerable room for improvement in the scale of manufacturing exports from Hubei Province. That is, Hubei Province should increase investment in manufacturing. Further expand the production scale of manufacturing enterprises, promote the export of manufacturing industries and increase the export efficiency of manufacturing industries.

The International Financial Reporting Standards Adoption and Value Relevance: A Case of Sri Lanka

Weerathunga P.R., Chen Xiaofang
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: weerathungaroshan@gmail.com, cxf2010611@163.com)

Abstract: In line with the global convergence of International Financial Reporting Standards (IFRS/SLFRS), all companies listed in Colombo Stock Exchange (CSE) were required to adopt IFRS/SLFRS in preparation of their financial statements with effect from 01st January 2012. Prior to the adoption of IFRS, these firms reported under Sri Lanka Accounting Standards (SLAS). This study examines two sets of financial statements prepared under the above two reporting regime to identify the improvement in value relevance of financial information. The sample of the study consists of 157 firms listed in CSE during the period of 2007 to 2015. In order to test whether IFRS/SLFRS accounting numbers correlate more strongly with stock prices than SLAS accounting numbers, several measures of value relevance are compared between the pre-IFRS adoption period and the post-IFRS adoption period. This study utilized two value relevance metrics. First, value relevance measure is based on the association (adjusted R^2) from a regression of Stock prices on earnings and book value of equity derived from Ohlson (Ohlson, 1995). Second value relevance metric of this study is based on the explanatory power (adjusted R^2) from regressions of net income on annual stock return separately for good news and bad news firms. The findings of the study revealed that the adjusted R^2 for the firms under SLAS significantly higher than that of under IFRS/SLFRS indicating that the earnings and book value of equity are more value relevant under SLAS compared to IFRS/SLFRS. These results are inconsistent with the prediction and with most of the prior studies. This implies that the adoption of IFRS/SLFRS did not improve the value relevance of financial information instead the value of financial information was deterred for Sri Lankan firms.
Key words: Value relevance; IFRS; SLAS; Sri Lanka

1 Introduction

In Sri Lanka, International Financial Reporting Standards (IFRS) were initially introduced in 2011. However, fully convergence of IFRS took place in 2012 due to the fact that IFRS is highly technical and companies and other bodies needed a considerable period of time to understand these Standards. Only a few companies prepared their financial statements using IFRS in 2011. From 01st of January 2012, all the companies listed in the Colombo Stock Exchange were mandated to prepare their financial statements in accordance with IFRS. Even though this implementation of IFRS was termed as the convergence of IFRS, there was fully adoption of IFRS merely labeling them as SLFRS. Prior to the adoption of IFRS, Sri Lankan firms reported under Sri Lanka Accounting Standards (SLAS) which were virtually same as International Accounting Standards (IAS). There are several purposes of adopting IFRS as a mandatory requirement for financial reporting. According to The Institute of Chartered Accountant (CA Sri Lanka), which is the authorized body for issuing accounting standards in Sri Lanka, the primary objectives of Adoption of IFRS are; (i) to produce high quality, transparent and comparable information in financial statements and financial reporting to help users of information to make economic decision (ii) to promote the use of rigorous application of those standards (iii) to bring about convergence of Sri Lanka Accounting Standards and IFRS to produce high-quality solution. Mandatory adoption of IFRS was expected to bring certain benefits to the country. First, investors are benefited from making available accounting information which is more reliable, relevant, timely and most importantly comparable across different jurisdictions. It will enable them to make rather rational and more valid decisions. Second, from the professionals' standpoint, having considerable knowledge of globally accepted accounting standards empower them to provide their service in various part of the world. Third, complying with IFRS will lead to a higher level of consistency in reporting structure and the requirements; better access to international capital, improve the confidence of international investors.

IFRS are globally accepted high quality a single set of accounting standards issued by International Accounting Standards Board, IASB, in London. The primary objective of IFRS is to reduce information asymmetries between countries (Barth et al., 2008) and different users of the financial statements, primarily investors (Haller et al., 2009). Many studies investigating consequences of IFRS adoption

have revealed that the primary objective of IFRS has been met. The findings of those studies indicate that the accounting quality under IFRS is higher than that of under Local Accounting Standards. (Barth et al., 2008; Capkun et al., 2008). When the quality of financial statements is increased, it reduces the information asymmetries for different users (Tarca, 2004; Ashbaugh et al., 2001) and which in turn affects the efficient allocation of investment among different companies. However, whether or not the mandatory IFRS adoption leads to a higher accounting quality is still controversial. Therefore, Studies which examine the consequences of IFRS adoption are very important, because it provides an opportunity to understand how the IFRS is being applied and whether the required disclosures are useful to investors for equity decision.

The study aims to compare the value relevance of accounting information under two reporting regime. The study period of this paper spans from 2007 to 2015.   During the period of 2007 to 2011, the financial statements of Sri Lankan firms were prepared in accordance with SLAS, and during the period 2012 to 2015 Sri Lankan firm produced IFRS compliance financial statements. This enables the comparison of value relevance of financial information between pre and posts-IFRS adoption. Such comparison is important because it reveals whether or not financial information under IFRS is more value relevant than that of under local accounting standards. Eccher and Healy (2000) argue that IFRS are more suitable and can produce high-quality accounting information when it applies to countries with highly developed capital markets such as the US and UK. It is reasonable to question, even if IFRS are high-quality enforceable accounting standards, whether these accounting standards are optimal for developing and less developed countries where institutional setting and enforcement mechanism are far different from developed countries. Thus, this study provides useful insights to the ongoing debate of whether or not IFRS accounting numbers are more value relevant.

2 Prior Studies and Hypothesis Development

Conceptual Framework for preparation and presentation of financial statements introduced by IASB prescribes four qualitative characteristics that should be embedded in financial information. Among them, one of the most important qualities is relevant. Relevant financial information enables the users to make decision differently. Financial information is relevant, if and only if, it contains a predictive value or confirmatory value. If users can use financial information in predicting future outcomes, information is said to have predictive value. As well as, financial information has confirmatory value if it provides feedback about previous evaluations. Therefore, if financial information is relevant, investors will use this information when making investment decisions. This will result in a closer association between accounting numbers such as earnings and market measures such as Stock prices and returns (Amir, Harris Venuti, 1993; Francis and Schipper, 1999; Ali and Hwang, 2000; Hung, 2000).

There have been several studies, which focus on the value relevance of accounting amounts after the mandatory adoption of IFRS. These include Goodwin, Ahmed and Heaney and Ahmed and Goodwin from Australia; Gjerde, Knivsfla, and Saettem from Norway; Horton and Serafeim and Christensen, Lee, and Walker from the UK. There have also been studies focuses on multiple countries IFRS adoption and value relevance. For example, Capkun, Cazavan-Jeny, Jeanjean and Weiss for 7EU countries; and Wang for 14 EU countries find that no incremental value relevance under IFRS adoption. A study conducted by Christensen, Lee, and Walker and Horton and Serafeim find that UK firms exhibit incremental price relevance under IFRS. Another study conducted by Capkunet al. reveal IFRS financial statement convey more value relevant information relative to local UK GAAP. Wang observe the return and net income reconciliation under IFRS and find that is once again consistent with incremental value relevance for IFRS. All of the studies focus on mandatory IFRS adoption use incremental value relevance approach. The reason is that incremental value relevance approach test whether IFRS information has incremental explanatory power for the Stock price. However, most of the previous empirical studies suggest that IFRS amounts highly value relevant. Thus, the following hypothesis is formulated.

H1: The Value Relevance of post-IFRS accounting information is higher than the value relevance of pre-IFRS accounting information

3 Empirical Method
3.1 Sample and data

The population of this study is all the companies listed on CSE. As on the 01st of March 2018, there are 299 companies listed on CSE representing 20 business sectors. However, the final sample of

the study consists of 157 companies. Following is the sampling procedures of the study. First, all the companies listed under the Banking, Finance, and Insurance industry sector were excluded, since the regulatory and enforcement mechanisms for these companies are far different from that of for other companies. Thus, accounting quality of these companies may be higher than other companies even prior to the mandatory adoption of IFRS (SLFRS). Second, the companies with non-March financial year ending were excluded from the sample. Third, companies quoted on or after 31st March 2015 were excluded due to the sample period of the study spans from financial year 2007/2008 to 2014/2015. Finally, several companies were excluded from the final sample due to insufficient of data available over the sample period. Data for the study were manually collected from the annual report of the firms.

3.2 Value relevance metrics

This study includes two measures of value relevance. First, value relevance measure is based on the association (adjusted R2) from a regression of Stock prices on earnings and book value of equity derived from Ohlson (Ohlson, 1995). Firms with superior accounting quality are expected to exhibit a higher association between Stock prices and earnings because higher quality earnings should better reflect a firm's underlying economics (Ali and Hwang, 2000). Stock price (P), is first regressed on industry indicator variable in order to control for mean differences in Stock price across industries. The residuals from this regression (MVPS*) are then regressed on the book value of equity per Stock (BVPS) and net income per Stock (NIPS). Stock price (MVPS) used in this study is the price of Stocks three months after financial year-end. The reason for this is that financial statements (annual reports) of firms are made available to the public mostly after three months' time. Thus, the first value relevance measure is based on the adjusted R^2 from equation (1).

$$MVPS^*_{it} = \alpha0 + \alpha1 BVEPS_{it} + \alpha2 NIPS_{it} + \varepsilon_{it} \qquad (1)$$

A higher adjusted R^2 indicates that there is a closer association between earnings and Stock prices, therefore greater use of financial information to users. Thus, a higher adjusted R^2 is indicative of a close association between Stock price and accounting numbers.

Second value relevance metric of this study is based on the explanatory power (adjusted R^2) from regressions of net income on the annual stock return. Following Barth et al. (2007) earning and return relationship is calculated separately for the firms with positive and negative returns. This is because the firms are divided into two categorize as good new firms and bad new firms. Then, taking earning as dependent variable two reverse regressions were estimated for good news and bad news firms separately. Same as the equation (01), earning, measured as net income per Stock divided by Stock price at the beginning of the year (NIPS/P), is first regressed on industry indicator variable to control for mean difference across industries. The residual from this regression is named as [NIPS/P] * and which is then regress on annual stock return (RETURN). Following Lang, Raedy, and Wilson (2006) and Barth, Landsman, and Lang (2008), annual stock return (RETURN) is measured as the natural logarithm of the ratio of stock price three months after fiscal year end to stock price nine months before fiscal year-end, adjusted for dividends.

$$[NIPS/P] ^*_{it} = \alpha0 + \alpha1 RETURN_{it} + \varepsilon_{it} \qquad (2)$$

As with previous equation (01), this regression was estimated separately for pre-adoption and post-adoption periods. A higher adjusted R^2 indicates that there is a closer association between earnings and return, therefore greater usefulness of financial information to users. Thus, a higher adjusted R^2 is indicative of higher value relevance.

4 Data Analysis and Results

4.1 Descriptive statistic

This section presents descriptive statistics for the sample firms to provide insight into firm characteristics. Descriptive statistics for test variables are presented in Table 1. Specifically, Table 1 presents the descriptive statistics for each of these variables pooled over the sample period. In order to reduce the effects of extreme observations variables have been winsorized at the 2.5 and 97.5 percentiles.

Table 1   Descriptive statistics for test variables

	Mean	Median	Maximum	Minimum	Std. Dev.	Obser.
			Test Variables			
RETURN	0.050	0.085	1.859	-2.029	0.905	1256
NIPS/P	0.117	0.061	0.706	-0.085	0.182	1256
MVPS	199.628	70.500	1,300.000	4.900	332.981	1256

Continual Table 1

	Mean	Median	Maximum	Minimum	Std. Dev.	Obser.
			Test Variables			
BVPS	143.082	53.578	777.975	2.242	210.785	1256
NIPS	12.975	4.112	79.375	-3.375	20.821	1256

The average Stock price (MVPS) for firms over the sample period is Rs.199.62. The median Stock price is quite lower at Rs.70.50 reflecting skewness in price. Fundamentally, based on theories of market efficiency, the annual means for MVPS should follow the pattern for NIPS. However, reported mean values for MVPS and NIPS do not show such a close pattern indicating the inefficiency of the market. The descriptive statistics for the annual Stock returns (RETURN) show the overall mean (median) value of 0.050 (0.085). This variable is measured as the natural logarithm of the ratio of stock price three months after fiscal year end to stock price nine months before fiscal year-end, adjusted for dividends.

4.2 Results of the value relevance metrics

This study employed two value relevance models to compare the association between accounting information and Stock prices under pre-IFRS and post IFRS period. The first model is based on the relationship between Stock price and accounting information (BVPS & NIPS). The second model measures the relationship between annual stock return (RETURN) and accounting information (NIPS/P*) and is estimated separately for both good news firms and bad news firms. Regression results of the first model reveal that there is a significant positive association between MVPS* and BVPS&NIPS (results are not reported here). Similarly, annual positive stock return (Good News) is positively correlated with net income per share scaled by stock price.

Table 2   Summary of the results for value relevance metrics.

Value relevance	Prediction	Pre IFRS R^2	Post IFRS R^2	H_1
MVPS* and BVPS & NIPS		41.84%	34.78%	Not supported
NIPS/P* and RETURN Good News Bad News	Pre IFRS <post-IFRS	5.16% 2.48%	1.87% 1.56%	Not supported

Adjusted R square (R^2) for each value relevance metrics for each period are tabulated in Table 2. As shown in the Table 2, nearly 42 percent of the variation of stock price is explained by the variation of book value per share and net income per share in the pre IFRS period whereas only 34.78 percent of the variation of stock price is attributable to the variation of selected accounting information variables indicating that the deterioration of value relevance of accounting information following IFRS adoption. The findings of the first regression are inconsistent with the prediction and therefore hypothesis one is rejected. The results of the second value relevance metrics are also inconsistent with the prediction. This study predicted that there would be a higher association between annual stock return and net income per share scaled by share price in the post-IFRS adoption period. According to the Table 2, the adjusted R^2 value for the pre IFRS adoption period for the good news firms is 5.16 percent and that of for bad news firms is 2.48 percent. Showing a decline in value relevance of accounting information, the adjusted R^2 value for the post-IFRS adoption for good news (bad news) firms is 1.87 %(1.56%). But as expected, results indicate that higher adjusted R^2 value (5.16%, 1.87%) for good news firms during both pre and post-IFRS adoption. However, the regression results as a whole do not support the hypothesis developed in this study thereby hypothesis one is rejected.

5 Conclusion

This study compared the value relevance of accounting information between pre-IFRS and post IFRS adoption period.   Collecting data from a sample of 157 firms listed in CSE over the period of 2007 to 2015, this study employed two value relevance models in line with Ohlson (Ohlson, 1995). In the first model, book value per share and net income per share regressed against stock price to uncover the association between accounting information and share price. In the second model, the annual stock return was regressed against net income per share scaled share price.

This study found that the value relevance of accounting information is relatively low in the post-IFRS adoption period. These results were inconsistent with the prediction of the present study and most of the prior studies which have concluded that the value relevance of IFRS accounting numbers is

higher than that of under local accounting standards. Even though, the present study reveals that a decline in value relevance of accounting information following IFRS adoption in Sri Lanka, such decline cannot be directly attributable to the IFRS adoption. Further, the results of the study neither condemn nor discourage the use of IFRS in preparation of financial statements. This is because there is no substantial evidence to claim such decline in value relevance of accounting information following IFRS adoption since the value relevance models used in the study may not sound enough to capture the value relevance in a weak institutional setting. Moreover, such a deterioration of value relevance of accounting information may be attributable to the recent market manipulation in the CSE such as insider trading and "pump and dump" tactics that artificially jostle share prices towards the benefit of a handful of individuals.

Abstract: It is particularly important to study and promote the standardization of prosthetic fitting process in the face of a large group of physically handicapped people and ever-growing demand for prosthetic fitting. Through field research with interviews and observations, this study examines the current situation of prosthetic fitting process and makes analysis on the standardization of the process in Hubei Province. Findings indicate thatprosthetic fitting process in Hubei province is relatively complete, with advantages of comprehensive services and systematic evaluation. However, there are still some limitations, such as a lack of prosthetic fitting use evaluation institutions, no early strength training for handicapped, and shortage of professional talents. We further propose countermeasures including enhancing the level of professional evaluation, improving prosthetic training equipment, and training professional talents, etc., expecting to accelerate the standardization of prosthetic fitting process.
Key words: Prosthetic fitting; Standardization; Case study; Hubei province

1 Introduction

In recent decades, with the joint action technology and economic factors which contribute to the high rates of safety misadventure and traffic accident, the number of the physically handicapped population is increasing. The growing number of physically handicapped persons drives growth in demand for prosthetics.In the meantime, forphysically handicapped people from different physical conditions, economic levels and living environment, their demand for prosthetics varies. The key to application of assistive devices and technologies is adaptation, as there is no best assistive device, just most suitable one, and adaptability is benefit for utilization of residual functions and improvement of the situation. In April 2011, China Disabled Persons' Federation (CDPF) conducted a nationwide real-name survey on the need for rehabilitation of people with disabilities, and it found that 91.9% of the people with disabilities demanded for assistive devices. From November 1, 2012 to October 31, 2013, the rate of disabled persons receiving prosthetic fitting services in the urban and rural area of China is 20.7% and 16.3% respectively. There are significant disparities between the actual configuration and needs of assistive devices for the disabled persons in China (Zhong et al, 2014). Prosthetic fitting is an important means for amputee rehabilitation and returning to society.For amputees and people with amelia, prostheses are artificial limbs and devices that directly compensate for limb disability, which can enhancetheir compensatory functions, reduce or offset physical disorders, and thus promote their participation in social life.

Prosthetic fitting promotes development of the work on persons with disabilities, and takes an important role in the supply and demand relations in the market. A variety of practices have been carried out on prosthetic fitting in China. As far as the ways and effects practices are carried out, mostly take hardware development as the starting point to drive the development of prosthetic fitting, focusing on technology research and development and technical operations. Actually prosthetic fitting is not only a technical problem, but it also involves needs investigation, adaptation services and effective evaluation, etc., which are a complete process. Construction of a standardized and specialized prosthetic fitting process is conducive to meet the varied and individualized needs of physically handicapped people, to ensure the quality of prosthetics, and to improve the service level and service efficiency of prosthetic service organizations. In this way, the independent living capacity of physically handicapped people can be restored, and their early return to family and society can be achieved. Through a systematic and in-depth exploration in the prosthetic fitting process in Hubei province, this studyaims to analyze the present situation and existing problems of prosthetic fitting process, and put forward corresponding feasible countermeasures, expecting to promote the standardization of prosthetic fitting process.

2 Literature Review

Previous studies in China mostly discuss the status quo of prosthetic fitting, analyze the problems existing in prosthetic fitting and put forward countermeasures, and carry out the research on the application of science and technology according to the specific amputation situation when carrying on the case analysis.Wu et al. (Wu et al., 2008) studied the patients with thigh amputation in Sichuan province, and concluded that the procedure of prosthetic assembly includes systematic rehabilitation intervention, prosthetic assembly, and intensive training for prosthetic assembly and its use methods after amputation. Han et al. (Han et al., 2017) considered that prosthetic assembly includes four procedures: rehabilitation and training prior to prosthetic installation, temporary prosthesis assembly, form prosthetic and functional reinforcement training and walking adaptation training in various complex environments. Liu et al. (Liu et al., 2017), in another case study in Guangdong province, stated that prosthetic fitting could be treated first, then designed, manufactured and installed. In the study of prosthetic fitting process in Hubei Province, Zhao et al. (Zhao et al., 2002) focused on the use training of patients, which was divided into three parts: standing training, balance training, walking training and the application of walking aids. Subsequently, Zhao et al. (Zhao et al., 2004) in the process of intelligent hip prosthesis assembly, it is proposed that the procedure of prosthetic assembly should include: preparation before assembly, assembly and training of temporary prosthesis, configuration of prosthesis, fabrication and assembly of prosthetic receiving cavity. Five parts of prosthetic debugging and walking training. Yang et al. (Yang et al., 2005) studied and analyzed 17 patients with spinal cord injury. It was concluded that the prosthetic assembly process was divided into three parts: different orthosis and training of the lower extremities. Overseas researchers present a more detailed picture of the issue, focusing on the users' perspectives on the prosthetic fitting. Webster et al. (Webster et al., 2012) described the rate of successful prosthetic fitting over a 12 month periods; described prosthetic use after amputation; and explored factors associated with greater prosthetic fitting, function, and satisfaction. Findings indicated most individuals achieved successful prosthetic fitting by one year following a first major non-traumatic lower-limb amputation, and utilization and function of prosthetic fitting depends on both medical variables and psychosocial factors. Leow et al. (Leow et al., 2013) described short finger stumps fitting process and evaluated 10 patients'fitting. Lineham et al. (Lineham et al., 2014) describes the revision process of the prosthetic fitting, and to improve prosthesis fit and comfort through a case report.

To sum up, comprehensive research on prosthetic fitting process rarely exist in China. The existing researches on prosthetic fitting process are mainly focused on the economically developed areas, mainly using case study method to elaborate andanalyze the prosthetic fitting process in cases. Cases highlight the stage of training before prosthetic fitting and prosthetic use training methods, regardless of any other stages. Convergence shows in the prosthetic fitting process elaborated in existing researches, and standardized and professional prosthetic fitting process is not brought up. Also, demand and training items and duration of individual client are stressed, making the prosthetic fitting process not universally applicable; in addition, different procedures of the process are briefly described, and some parts are missing. The research in Hubei Province is insufficient. The number of disabled persons in Hubei province is 3.794 million, of which 1.057 million are limb disabled, about 1000 of them are amputees each year, and 70,000 of them can stand and walk after installing prostheses and orthotics. Hubei Province is one of the three provincial experimental zones for social security and public service for the disabled in China. There are a huge amount of physically handicapped persons and heavy demand for prosthetic fitting in Hubei Province, which is typical and representative. It is of practical significance to analyze the status quo of prosthetic fitting process in Hubei Province.

3 Data and Methodology

Qualitative research methods are adopted in this study, and the central part of China, Hubei province, is taken as the case. By field research method, the research team visited the Orthotics and Prosthetics Center of Hubei Disabled Persons' Federation, which is one specialized rehabilitation organization set under Hubei Disabled Persons' Federation, specializing in prosthetics and orthotics manufacture and fitting. We got first-hand data through interviews and observations. There are eight technical persons, five of which holding professional qualification certificates; they design prosthetics, fit them and provide services for patients with different physical conditions. During the research, the staff of the center elaborated on the general situation of prosthetic fitting in Hubei province and the fitting process, guided the research team members in visiting the housing conditions the center provided for patients, equipment for manufacturing prosthetics, prosthetics molds and training facilities, and introduced the usage methods of all facilities one by one, so as to deepen the research team members'

understanding on prosthetic fitting process, and provide detailed and authentic data for the study in this paper.

4 Research Findings

The prosthetic fitting process in Hubei province includes: prosthetic fitting plan put forward, needs investigation, expectations assessment, stump measurement, mold manufacture, prosthetic manufacture and fitting, use training, effects evaluation.

4.1 Prosthetic fitting plan

Every year Assistive Devices Resource Center for Persons with Disabilities of Hubei Province under Hubei Disabled Persons' Federation puts forward the prosthetic needs quota plan for physically handicapped persons in accordance with the plan of CDPF. Currently, except for persons amputated for traffic accidents and those who have compensation amount, for factors like limit of human resources and plan quota, every year only 20-30 people can get prosthetic fitting.

4.2 Need investigation

Based on the situation of physical disabilities and fundamental prosthetic fitting standard for those with the need, Disabled Persons' Federation of the city and county conduct preliminary investigations in the city and county, and civil affairs commissioners report the number of eligible persons to Orthotics and Prosthetics Center of Hubei Disabled Persons' Federation. If family economic conditions are not so good, physically handicapped persons with Disabled Identification Card may submit an application to local competent departments, and get fund support from the project. Other patients with need for prosthetic fitting may fit prosthetic after they submit application to Disabled Persons' Federation and prove qualified after investigation.

4.3 Expectations assessment

A t initial stage, Hubei Orthotics and Prosthetics Center will conduct preliminary investigation on patients' basic information, such as their occupation, amputation parts, and amputation reasons, whether there is record for them fitting prosthetic, family economic conditions, fund resource for first fitting, and whether they have other disabilities. Then they learn about some other aspects, such as their living conditions before prosthetic fitting, daily activities (bathing, walking outside, simple housework, doing manual labor, bicycling, etc.), main entertainment activities, whether the neighborhood committee carry out collective recreational activities or not, so as to manufacture prosthetics that are suitable for their living environment.

4.4 Stump measurement

After the number of persons for prosthetic fitting is confirmed, based on different situations, one of the following two programs is chosen to conduct measurement on the stump part of patients: if the number is proper, local government staff organize patients to go to the center for treatment; if the number is too large, the center dispatches medical staff to local places for stump measurement before prosthetic fitting.

4.5 Mold manufacture

Technical staff make molds at Disabled Persons' Federation of the county or city according to the fitting measurement chart, and take the molds back to the base.

4.6 Prosthetic manufacture and fitting

a. Technical staff first conduct prosthetic modelling on the basis of measurement statistics, one day for one case approximately; b. When the prosthetic gets dry by airing, use machine to polish it smooth on surface; c. Install parts; d. Fit prosthetic for patients, check the suitability and try sample; e. Adjust the prosthetic for patients whenever needed; f. On completion of adjustment, coat the prosthetic with foam of similar color as skin, and prosthetic manufacture is completed. The complete prosthetic manufacture process takes about one week.

There are two types of prostheses at the Orthotics and Prosthetics Center of Hubei Disabled Persons' Federation: stainless steel and titanium-tin. Stainless steel prosthetic is heavier; while titanium-tin one is lighter, and can be subject to appropriate modifications during exercises, which save effort and is more comfortable, but more expensive. The comfort level of prosthetic is relevant to materials, and certain differences exist between the materials of normal prosthetic and more expensive ones.

4.7 Use training

The center provides professional training equipment for patients in fundamental training such as walking, ascending and descending, going upstairs and downstairs. During training period, patients can

live at the center for three to five days based on their individual adaptation conditions. The center provides free accommodation for patients and patients' family members.

4.8 Effects evaluation

After physically handicapped persons leave the base, the center arranges follow-up visits to them within one to three months, and makes proper adjustment and modification on the assistive devices. Now for limit of human resources, follow-up visits are mainly telephone follow-up, only few done by revisit. The content for follow-up includes: a. Situation of the prosthesis: whether part of the skin is red and swollen; whether the weight-bearing area is proper or not; whether the prosthetic alignment is proper or not; whether the false foot is fractured or not; whether the socket is proper and without damage or not, etc.; b. Prosthetic use conditions: daily walk distance; weight-bearing capacity; whether the patient can drive or not, etc.; c. Current state of life: whether the patient is capable of working, his/her self-care status, etc.

The service lifetime prosthesis for one case is about two years. In case the patients are in need of prosthetic refitting, they may apply to the local Disabled Persons' Federation.

5 Conclusion

Standardization and professionalization of prosthetic fitting process play a vital role in development of prosthetic fitting and rehabilitation of physically handicapped persons. It requires specified process and steps for prosthetic fitting: prosthetic fitting plan put forward, needs investigation, expectations assessment, stump measurement, mold manufacture, prosthetic manufacture and fitting, use training and effects evaluation.

The work of prosthetic fitting in Hubei province has made some achievements. First, it provides convenient services. Orthotics and Prosthetics Center of Hubei Disabled Persons' Federation has set up a number of stations, which execute similar process, and among them there is close communication—patients can go to the nearest one for prosthetic fitting. Sometimes, the center arranges staff to go to villages and towns or local government makes unified arrangement for patients to go to the center for treatment, which is very convenient for users. Second, it has a comprehensive evaluation. The center has prepared "Prosthetic Disposal List of Orthotics and Prosthetics Center of Hubei Disabled Persons' Federation" and "Prosthetic Fitting Follow-Up Visits Record" to make full-scale record and evaluation on patients, which improves the standardization level of prosthetic fitting process as well while meeting patients' need for prosthetic fitting and manufacturing suitable ones for them. However, there are some limitations of the prosthetic fitting process in Hubei province. First, there are absence of professional evaluation institutions. In the prosthetic fitting process, the center takes full charge of expectations assessment and effects evaluation, and no professional third party evaluation institutions are set up, which affects the assessment results and reduces accuracy and satisfaction of prosthetic fitting. Second, it lacks the early strength training for handicapped. While for follow-up work, the center has not made training plan for restoring muscle strength of stump up to now, and special equipment for muscle strength training is in lack. After being amputated, patients' stump muscle strength atrophy, and this hinders prosthetic fitting. Third, there is a shortage of professional talents. In prosthetic fitting process, nearly all steps are completed by technical staff of the center, which is difficult for them to provide fine services.

We would like to propose suggestions from the following three aspects. First, set up third-party evaluation institutions to promote evaluation professionalization. We can organize organizations for persons with disabilities and the representatives, think tank/research institutions to conduct third-party evaluation; support development of third-party medical service evaluation, health management service evaluation and consultation services. Second, perform special muscle strength training, introduce and innovate muscle strength training methods. Before prosthetic fitting, muscle strength training needs to be done to restore muscle strength: improve range of motion of stump upper joint, enhance stump skin elasticity, improve sense of balance of the body, and strengthen muscle strength of ipsilesional upper and lower extremity and the body. Third, establish a professional talents training mechanism for rehabilitation of physically handicapped persons, and improve a long-term safeguard mechanism which is beneficial for growth and ability displaying of professional prosthetic talents; expand talents training scale, pay special attention to nurturing grassroots rehabilitation professional technical personnel and backbone of the subject, and steadily improve professional skills.

Design and Implementation of University Financial Information System Based on Business Process Reengineering

Wang Rui

Financial Department, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: amanda_wangrui@foxmail.com)

Abstract: This paper mainly explores the theory and practice of business process reengineering and using this methodology in financial information systems of Chinese universities. It established an event-driven process reengineering to integrate accounting processes of financial information system. And the implementation of event-driven system can improve comprehensive budget controlling, financial supervision and provide more valuable information for decision-making. Itis concluded that event-driven and process reengineering optimized the value of financial information system and provides asolution to support the process of continuous improvement.

Key words: BPR; Financial management; Information system; Event-driven

1 Introduction

The first proponents of the Business Process Reengineering (abbreviated as BPR) theory started in 1993; the concept of business process reengineering was defined for the first time in history. Business process is a set of defined activities which have multiple input, after a series of transformation they output multiple results which is kind of appreciation for users. When we organize all the actual process of input and output of the object types and logical classification, business process can be divided into original business process, financial accounting process and decision-making process. The theory of business process reengineering was initially based on the requirement to increase market competitive power. The rapid development of information technology and the wave of globalization involve more and more companies and makes traditional "bureaucracy management" based on the division of labor theory is gradually difficult to adapt to organizational development.

MIT conducted a study called "management" to explore how to use the booming computer information technology to provide new ideas for the development of the enterprise management, and puts forward the concept of reengineering. A redesign of business processes is to enterprises within and across organizational boundaries between workflow and procedure diagnosis and innovation. The continuous change of the enterprise environment and the experience of strategic management have led industrialists and theorists to constantly seek new solutions and promote the development of enterprise management theory.

Domestic scholar states that the methodology of process management is based on that first of all process improvement are sustainable. Process management is obviously more practical, especially compared with the rapid development of BPR. In practice, the thought of process management has begun to play a huge role in enterprises; thefinancial accounting in colleges and universities need to become more service-oriented, open and intensive. The financial management mode changes from the accounting growth model to science-based performance appraisal model and also from the reimbursement model to the management decision model. The implementation of financial information system architecture based on business process reengineering is playing an important role in the architecture of financial management hierarchy in colleges and universities.

2 Financial Information System Design Based on Process Reengineering

2.1 Data-flow in traditional financial accounting process

Basic functions of accounting, in the accounting theory, are defined by accounting statement for accounting practice and financial supervision. The functional theory of accounting and financial management also changes with the general environment of accounting, and goes through the "accounting tool theory", "management tool theory", "technical theory" and "information system theory". According to the "information system" hypothesis, the essence of accounting defined as an information system, must satisfy the basic functions of general information system, namely the input, storage and processing, and output function, it is just in line with the accounting business process composition mode. In the traditional accounting business process of colleges and universities, the processing steps of data are shown in table 1 below:

Table 1   data-flow of accounting process

Processing sequence	Data-flow procedure	Data-processing workflow by procedure
1	Input - data collection.	The data acquisition process mainly collects data from the service object and prepares the processing flow.
2	Data processing and storage.	Processing and storage process is to reflect the economic activities related to the data of the original documents for processing: review the original vouchers, prepare and audit accounting vouchers, then the classification, calculation, transmission, and save the results in all kinds of accounting books.
3	Output - generates accounting reports.	Accounting report information is based on the books, the preparation of internal reports and statements provided to the management department, external units and all the information users.

A traditional accounting process of accounting work will complete by the steps shown above, but after a series of function and business process, the accounting supervision and control functions are just static. We know that the traditional forms of accounting include balance sheet, profit statement, cash flow statement, etc. The report of the university also includes the report of the financial statement of the competent department and the financial statement of the ministry of finance. These should be the accounting information for management services, but they cannot directly affect the management process and the original business process. The form of accounting information cannot meet the information needs of the decision-makers. Highly aggregated data is difficult to directly reflect the true operation details of the university. The extraction and analysis of report data has become the responsibility of financial management personnel. The style and type of books and reports restrict managers' direct access to information.

The accounting process cannot give a real-time feedback and control. The occurrence of capital flow must be accompanied by logistics, while the traditional accounting information system generates reports for logistics information in operation, which is reflected in the later stage. While other non-financial reporting forms, there is no opportunity to embed operation processes for information that is important for business oversight and control. A set of outdated information, from a control point of view, is worthless. While there is no effective real-time feedback, the decision makers are unable to control the information received, and the value of the entire information system is greatly reduced.

2.2 Process reengineering of financial information system

Different departments in universities operate in various processes, but the commonality is involved in logistics, cash flow and information flow processing. It is very important to adapt all kinds of financial business activities under new situation, new demands in business activities with various departments or units of relevance, collusion. This makes it possible to implement BPR in financial information system. In order to form a new financial business process chain, the simplest and clear method in find an intuitive way for customer service is to build a process-centric of financial information system within the basic premise of colleges and universities. From the business process reengineering view, accounting, management, planning and design are three respective aspects. Around the financial system, through developing process management across departments set up the whole business realization of process centered information system architecture of new financial business process. The steps of the entire process reengineering of financial information system are shown in figure 1:
Figure 1   BPR Diagram of Financial Information System

The original business and financial accounting processes have their own orbit, process reengineering will not mess from beginning to end of the orbit, and on the contrary, path will become more complex and orderly. This is due to the use of event-driven approach to process integration. As an

in the computer field object-oriented programming jargon, event-driven refers to when a particular event or an event group requires its corresponding code begins to work, immediately start executing program instructions.

From the perspective of events, the basic structure of event-driven system is composed of event record collection mechanism, event sending and receiving mechanism, and event processing mechanism. The event record collection mechanism is specifically responsible for recording and collecting necessary events or event groups. Event sending and receiving mechanisms are located in the event producer and event responder, responsible for event communication. The event processing mechanism deals with specific events at the back end of the event receiver and returns the corresponding processing results. The following part will show how to use event-driven mechanism to improve business process and realize the concrete process design and implementation of financial business integration.

3 Analysis and Implementation of College Financial Information System Based on Process Reengineering

3.1 Event-driven and data-flow redesign in financial information system

When we use event-driven in accounting and financial management, it refers to the original business processes need to be confirmed by the financial information system, reflect the economic issues or control, supervision and can be directly under the support of information technology, trigger the financial information system to perform the corresponding operation. This means that the financial information system of business process execution process and system logic can be triggered at the same time, and the process won't have to go through artificial secondary process intervention, in the form of documents exported from the system (paper documents, database export documents, etc.), after a long time delay can enter into the financial information system again. The three main event types and contents in the financial processing process of colleges and universities are listed in table 2:

Table 2　Types of Events And Data-flow in Financial System

The event type	The operation process and data-flow	Traditional process	Information system integration pattern
Operation Events	Operation events are the procedure that provides service to a customer during a business process. For example, submit an expense report, submit equipment purchase order, etc.	Artificial processing	Manually process and submit the trigger events to the information system.
Recording events	The occurrence of operational event starts the financial accounting process. The operation behavior that is confirmed will be recorded as accounting matters and stores as data by the form of accounting voucher.	Information system record	The information system records and triggers the approval process and submits the pending approval items to the decision-making level.
Decision-making events	The feedback and approval of financial accounting record of system report information that provided by mostly the decision-making level, generally refers to the managers in the planning, control and evaluation in the process of financial management activities. For example, the approval of equipment requisition, the approval of capital budget, etc.	Manual processing and feedback	Complete the decision within the system and feedback directly to the business processing layer, and complete the business feedback actions within the information system.

In the traditional accounting processing procedure, system and technical checks and balances, accounting personnel is not original business activity of all data, but only comply with the accounting events defined data collection. The result of this is that the same economic business related data is kept in the hands of the accounting and non-accounting personnel for different attributes and purposes. This accounting system neglects a large amount of management information, which leads to the estrangement between financial and non-financial information.

3.2 Implementation of financial information system based on BPR

Financial information system based on event-driven with a set of business processes will integrate all systems including financial data and non-financial data to create a logical data collection, and would not only provide financial accounting confirmation process but also provide all the required information,

and does not produce data storage, such as data inconsistency problem again. But as the event-driven model needs to support event of information demand in response to different motives, there must be two kinds of information is stored for procedure call, namely the method database and model database. Among them, the purpose of the method database is to store various information extraction rules, such as various information validation principles, multiple attribute measurement standards, accounting standards, etc. Model database provides user motivation to satisfy all kinds of data and management model, such as data analysis model, the financial reporting model, data storage model, the prediction model, and other user customizable model, etc. Table 3 lists the main data field table setup examples in the financial system, and table 4 shows an example of the system information triggered by the decision event in the information system:

Table 3   Main Data Field Information Table

Field code	Field name	Field type	Field length	Example
kmbh	Accounting Number	text	10	5001020103
bmbh	Department Number	text	3	301
jje	Debit Amount	number	10	8,900.00
xmye	Balance of project	number	10	300,000.00

Table 4   Project Control (Decision Event) in the Information System

Return string	Implication
1	The fund balance of the project is overspent, and no verification is allowed.
2	The fund balance of the project is not overspent, but the single item limit is overspent, and the verification is not allowed.
3	The item number is incorrect, and the item does not exist in the data dictionary.
0	The fund balance of the project and the amount are not overspent, the verification is allowed.

With the strengthening of the national financial supervision mechanism, the financial management strength and the demand for improvement should fully reflect the leverage effect of financial management in the allocation of university resources. By event-driven as the main line, combining with the university core operation processes and ensure BPR classification, identify the different business, different categories of process management principles and focus, to complete the specific financial business process architecture. The financial management of colleges and universities must be strengthened with students, faculty, assets, and funds for the total resource framework, based on the optimal allocation of resources, play a role of prediction, analysis, and construct the performance evaluation as the goal.

Therefore, financial management information system must increase or strengthen financial supervision, information collection, data analysis, decision-making functions in a quick, powerful integrated information technology platform. And in the same process and business standards, data and communication standards as the basis to build both support daily business processing and to serve the university as a whole management and decision-making system. Eventually at the same time, the university organization management institutions, policies, procedures and measures for the university financial information fusion system, guarantee the legal economic activity compliance as well as the safety of the funds, assets and true, risk prevention and control for economic activities in colleges and universities. College financial information system integrated by process reengineering will serve all levels and departments of colleges and universities, provide a powerful business processing, information query, financial analysis and decision support capability.

4 Conclusion

Using process reengineeringto implement event-driven centered college financial information system would unify the design process in the information system settings module, and put main data together such as name, location, node, and the serial number. Different business process will be set automatically according to the corresponding process, such as approval or submit back step by step approach, driven by trigger event and data in order to implement different link or processing. Function of business collaboration and process through make full use of information technology, and other department or unit outside the campus information system interconnection and interflow, will be treated as financial operation extends to other department or unit, is advantageous for the financial management

activities and decision making level together, to ensure that processes all fronts. It is conducive to strengthening the capital flow, information flow and logistics flow between the financial department and other units or departments.

The internal control framework in the financial information system implementation based on business process reengineering architecture and process driven strengthened the process control management. The process control rules, methods and procedures are all put in system with implement process event tracking, operating records and monitoring functions. At the same time, the internal control of the process is completed from two aspects: management level and process implementation. Intensive flat management concept utilizes information technology and modern information logistics technology to realize automation of business process, reduce or control human intervention. In the framework of the financial information system of university, the management level and the intermediate link are reduced, and the concept of intensive flat management is realized effectively by BPR. Compared with that prior setting values for the entire regulation, financial early warning function through will perform operations or execution results such as data information system automatically send warning or control.

The diversification of funds, the operation of multi-campus and the expansion of the total amount of matters have brought great challenges to the financial management of colleges and universities. At the same time, the comprehensive information of the society has provided a powerful impetus for the development and progress of financial information system in colleges and universities. Therefore, the financial management of colleges and universities needs comprehensive and integrated solutions to support continuous improvement and optimization of business processes. The BPR methodology in financial information systems implementation established an event-driven business process reengineering to integrate operation and accounting process as the center of the financial information system architecture, and the implementation of it can improve interactivity, real-time characteristics for comprehensive budget controlling.

Research on the Business Model of Non-car Operating Carrier Based on Business Model Canvas

Zhang Jianming, Wu Xia
Wuhan Huaxia Institute of Technology, Wuhan, P.R.China, 430223
(E-mail: huozhetree@163.com, sunnywu529@163.com)

Abstract: Non-car operating carrier is a new business form in the logistics industry. Using the general tools of the business model canvas, this paper presents nine components of the non-car operating carrier business model, including customer segmentation, value proposition, access channel, customer relations, source of income, core resources and key business, key cooperation and cost structure. These nine elements describe the basic principles of the value creation, transmission and acquisition of the non-car operating carrier.
Key words: Non-car operating carrier; Business model; Business model canvas; Constituent elements

1 Introduction

According to the Opinions on Promoting Online and Offline Interaction to Speed Pp the Transformation and Upgrading of the Innovation and Development of Commercial and Trade Circulation issued by the General Office of the State Council in September 2015, the trials of non-car operating carrier will be implemented to explore the transformation and upgrading of the innovation and development of commercial and trade circulation. In September 2016, the General Office of the Ministry of Transport further promulgated the opinions on accelerating the innovation and development of non-car operating logistics. This document lays the political foundation for the non-car operating carrier enterprises, and clarifies the content of the trials, including the specification of the operation behavior of the non-car operating carrier, promotion of the credit construction of non-car operating carrier, implementation of the incentive policies relevant to non-car operating carrier, encouragement on non-car operating carrier to innovate the operation management mode, and exploration and innovation of management system for non-car operating carriers.

The term "non-car operating carrier" evolves from the vocabulary of "track broker" widely used in USA, and is an extension of non-vessel operation carrier on land. The non-car operating carrier signs the contract of carriage of goods with the shipper, bears the responsibility and obligation of the carrier, and completes the transportation.

Non-car operating carrier, as a new form of business in the logistics industry, is still in the initial stages of development. The industry management department lacks management experience in this new model, although it has managed the carriage of vehicles for a long time. Domestic scholars, studying the business model of non-car operating carrier, mainly draw on the experience of foreign typical enterprises. Jin Zhongxu et al. (Jin Zhongxu et al., 2017) analyzed the status quo and existing problems of the development of domestic non-car operating carrier operating carrier logistics by referring to the logistics model of typical foreign car carriers. Based on new technologies such as cloud computing, the Internet of Things, big data, etc, he has proposed a non-car operating carrier logistics model based on "Internet+", established a one-stop transportation service platform, implemented refined specialized transportation, and expanded value-added services. Wu Xia (Wu Xia, 2017) analyzed the development model of typical non-car operating carrier companies at home and abroad, and put forward the development path of main customers' freight multiplication services based on the "Driver Po" Internet logistics information platform. Taking Wuyi Yun Tong, which is a pilot company for non-car operating carrier, for example.

As a major public pilot platform enterprise for non-car operating carrier, its business model has a certain degree of particularity and certain representation. Wu Yong et al. (Wu Yong et al., 2013) considered that the type of platform is a typical logistics public information platform for enterprises to choose the business model foundation, and only those business models that are compatible with the type of platform can guarantee the sustainable development of the platform. He proposed that SMEs should be the mainstay, adopt a flexible price matching mechanism, establish a joint operation model of government associations, improve privacy protection and credit mechanisms, and provided differentiated services and the use of cloud computing for process integration are the survival path for typical logistics public information platform companies. Chen Huoquan et al. (Chen Huoquan et al.,

2010) believed that the business model of logistics information platform is generally divided into four types: government-owned, government-controlled operations, social capital-holding operations, and social capital operations. The business model of logistics information platform in developed countries and regions adopts government-owned or controlled government investment and financing. In terms of management and operation, it focuses on social operation, and on the profit model, it adopts a non-profit public welfare model.

The logistics industry has reached broad consensus on the reason of the construction of non-car operating carrier, but less discussion has been done on how to build a non-car operating carrier enterprise and what kinds of non-car operating carrier enterprises should be built. However, this is a very urgent task to the development of the industry.

2 The Business Model Canvas Style

Alexander Osterwalder and Yves Pigneur put forwards the business model canvases or business model patterns theory. The business model canvas, as shown in Figure 1, is a general tool for describing, visualizing, evaluating, and innovating business models. Business models are the fundamental principles that describe how companies create value, deliver value and gain value.

Key Partnerships:	Key Business Area:	Value Proposition:	Customer Relationship	Customer Segmentation:
	Key Resources:		Channel Access:	
Cost Structure:			Revenue Sources:	

Figure 1   Schematic Diagram of Distribution of Business Model Canvas components
Source: Alexander Osterwalder, Yves Pigneur. New Generation of Business Model. Machinery Industry Press, 2011.

Similar to the painter's canvas, the business model presets nine spaces that can be filled by business models in the present or the future. The nine components of the business model canvas include customer segmentation (CS), value proposition (VP), channel access (CH), customer relationship (CR), revenue sources (RS), key resource (KR), key business area (KA), key partnership (KP) and cost structure (CS). Customer segmentation refers to the different people or organizations that enterprises want to contact and serve; value proposition refers to a series of products and services that create value for specific target customers; channel access refers to the path that enterprises communicate and contact target customers to deliver value proposition; customer relationship is the type of relationship established by enterprises to keep good relationships with specific target customers; revenue sources is the cash income that enterprises get from a specific target customer. This income is generated from the value proposition that successfully provides to the customer; core resources are the most important assets that are necessary to ensure the efficient operation of a business model; key business area is the most important activity that is necessary to ensure the effective operation of the business model; key partnership is relationship with the suppliers necessary to ensure the effective operation of the business model since some businesses need to be outsourced or obtained from the outside; cost structure refers to the cost structure caused by the above elements of the business model.

In order to present a general tool for describing, visualizing, evaluating, and innovating the business model of non-car operating carrier, some constituent elements of business model of non-car operating carrier were recognized and then the business model canvas of non-car operating carrier was constructed based on the theory of business model canvas. Similar to the views of Alexander Osterwalder and Yves Pigneur, the nine elements of business model of non-car operating carrier were revealed in this paper, including customer segmentation, value proposition, access channel, customer relations, source of income, core resources and key business, key cooperation and cost structure. These nine elements describe how to create and realize the business value for non-car operating carrier.

3 Analysis of Constituent Elements of Business Model of Non-Car Operating Carrier

The nine constituent elements of the business model canvas describe and define the principle of how enterprise creates value, transfers value and obtains value, showing the logic of revenue creation of enterprises. Using the structural model of the business model canvas, the nine elements of the non-car operating carrier's commercial model can be described in detail, as shown in Figure 2.

Key Partnerships: The relationship with the actual carrier can be either the strategic alliance relationship between non-competitors or the supplier relationship.	key Business Area: Provide the shipper with solutions, transport business information, set up transport organizations, etc.	Value Proposition: to provide customers with fast, safe, low-cost transport service	Customer Relationship: personal assistant, special personal assistant	Customer Segmentation: shipper (manufacturing enterprises, business enterprises, third-party logistics enterprises and other enterprise owners)
	Key Resources: Transportation business information matching platform, vehicle source, tourist source, human resource relationship resources, etc.		Channel Access: highway, railway, shipping, air transport mode, multimodal transport, and auxiliary channel	
Cost Structure: The actual carrier's freight human platform development and maintenance fees, etc.			Revenue Sources: Income from value-added services provided by the shipper for the shipper and the actual carrier	

Figure 2 Distribution Diagram of Nine Constituent Elements of Business Model of No-car Freight forwarder

3.1 Customer segmentation

Customers are the most important components of any business model. In the non-car operating carrier business model, the customer segmentation element is used to describe the different groups and organizations that the non-car operating carrier enterprises want to contact and serve. The customer segmentation in the commercial mode of the non-car operating carrier is the shipper. Different shippers have different service requirements and diversified business forms, and thus there is a fragmented market and a diversified market. Different shippers need and provide different products and services to meet their needs and need to be contacted through different distribution channels. Different types of relationships are needed. There are different profitability and willingness to pay for different aspects of products and services. According to the organizational form, the shipper can be divided into manufacturing enterprise, commercial enterprise, third-party logistics enterprise, other enterprise cargo owner, and individual customer of social families. According to the business form, we can divide it into a single transportation demand customer and multimodal transport type demand customer. According to the service time points, the shipper can be divided into short-term customer and long-term customers.

3.2 Value proposition

In the non-car operating carrier business model, the value proposition element is a series of products and services that create value for specific customers. Specifically, the value proposition of non-car operating carrier is to provide fast, safe and low-cost transport services for shippers. Value

proposition creates value by catering to the unique combination of the needs of subdivided groups. The value proposition of a non-car operating carrier can be quantitative (such as cost, price, service speed) or qualitative (such as security, convenient, functional, value-added customer experience). The value proposition element is the value created by the different customer groups of the non-car operating carrier for its shipper. It solves the shippers' transportation service problem or satisfies their demand. Non-car operating carrier has three kinds of value; these are efficiency improvement, operation standardization and service innovation. First of all, as a typical representative of the light asset model, the non-car operating carrier enterprise has the innate function of reducing cost and increasing efficiency in large-scale operation and low-cost operation. Non-car operating carrier enterprises have their unique advantages in technology, management and core resources, and these unique advantages are the important guarantee for their standardized operation. As a service-oriented enterprise, service innovation is its core competitiveness. Service innovation is an important way to create value for non-car operating carriers.

3.3 Channel access

In the non-car operating carrier business model, channel elements describe how to communicate, contact their segmented customers and pass the value proposition. Channel access is the customer contact point, which plays an important role in the customer experience. The channel paths can be divided into own channel and partner channel. In the commercial mode of the non-car operating carrier, the channel mainly refers to the partner channel. The partner refers to the cooperative relationship between the non-car operating carrier and the actual carrier. The channel path in the commercial mode of the non-car operating carrier includes four modes of unimodal transportation, i.e., highway, railway, shipping and aviation; it also includes multimodal transport modes and auxiliary transport modes, such as warehousing, distribution, packaging, circulation processing, handling, loading and unloading, and information processing.

3.4 Customer relationship

In the non-car operating carrier business model, the customer relationship element is the type of relationship that describes the relationship between the enterprise and the specific customer segmentation group. In the customer segmentation group, the establishment of customer relationship type directly affects the overall customer experience. The enterprise customer segmentation group of the non-car operating carrier mainly includes all kinds of enterprise, such as manufacturing enterprise, business enterprise, third party logistics enterprise. It also includes individual customers of social families. Therefore, the type of customer relationship of the non-car operating carrier generally includes two categories: personal assistant and dedicated personal assistant. The personal assistant works by the interaction between people. During the service, the customer can communicate with the customer representatives and ask for help. A dedicated personal assistant includes a dedicated customer representative arranged for a single client. It is the deepest and most intimate type of relationship, and it usually takes a long time to build. The goal of customer relationship is customer acquisition, customer retention and business revenue promotion.

3.5 Revenue sources

In the non-car operating carrier business model, the revenue sources are the important factors that depict the cash income of enterprises from each customer group. If the customer segmentation is the heart of the business model, the revenue source is the artery. Sources of revenue include transaction revenues derived from one-time payments and recurring revenue from customers who continue to pay for value proposition and after-sales service. The main revenue sources for non-car operating carriers are the use of fees, which are derived from charging through specific services. Specifically, the weight of goods transported, the distance from the place of delivery and the length of the delivery time specifically are included into the shipper's consignment expenses. The revenue from the value-added services is provided by the shipper and the actual carrier.

3.6 Key resources

In the non-car operating carrier business model, the key resource element is the most important factor that is necessary to describe the effective function of a business model. Each business model requires key resources that enable enterprise organizations to create and deliver value propositions and reach out to the market, build relationships with customer segments and earn revenue. Key resources can be owned, leased or acquired from key partners. The key resources of non-car operating carrier enterprise include transportation business information matching platform, vehicle source, passenger source, human resources, relationship resources and so on. The transportation business information matching platform of the non-car operating carrier enterprise is generally owned by the enterprise itself,

and the vehicle source is the actual carrier that establishes the partnership. The key resources required by different business models are also different.

3.7 Key business area

In the non-car operating carrier business model, key business is the most important element that companies must do to ensure that their business models are viable. Any business model requires a variety of key business area activities, which are the most important actions that must be implemented. Similar to core resources, key businesses are the basis for creating and providing value propositions, reaching out to markets, maintaining customer relationships and earning revenue. Key business area can be divided into manufacturing products, problem solving, platform or network and other categories. The key business area of non-car operating carrier includes problem solving, platform or network. Specifically, the problem solving is to provide solutions to the business needs of the shipper. The non-car operating carrier receives the business needs of the shipper in the first, and thus provides the solution to the problem. This process increasingly relies on the platform or network business activities. Even the key business area of the non-car operating carrier business model is increasingly related to platform management, service provision and platform promotion. Platform or network includes transportation business information matching, transportation organization, service tracking, settlement, service evaluation, business promotion and so on.

3.8 Key partnerships

In the non-car operating carrier business model, the key element of cooperation is the network of suppliers and partners to enable the effective operation of the business model. Partnership is the cornerstone of the business model. The key partner of the non-car operating carrier is the actual carrier. The relationship between the non-car operating carrier and the actual carrier can be a strategic alliance between non-competitors, or a buyer-supplier relationship that ensures a reliable business. These two basic forms are used to optimize the allocation of resources and business, reduce costs and form a partnership of optimized partnerships and economies of scale. The key partnership of the non-car operating carrier business model is often outsourced to share infrastructure, social resources, information resources, and operating risks. Specifically, the actual carriers get business from the non-car operating carriers, and the non-car operating carriers obtain the specific logistics resources from the actual carriers.

3.9 Cost structure

In the non-car operating carrier business model, the cost structure element describes all the costs incurred by operating a business model, such as creating value, providing value, maintaining customer relationships, and generating revenue. From the perspective of cost structure, business models can be divided into cost-driven business models, value-driven business models, and business models between the two. The cost-driven business model focuses on minimizing the costs. The aim of this approach is to create and maintain the most economical cost structures by adopting low-priced value propositions, maximizing automation and extensive outsourcing. Value-added value proposition and highly personalized service are usually characterized by value-driven business models. On the basis of revenue source, key resources, key business, and important cooperation, the cost structure of a non-car operating carrier mainly includes the carrier's cost of the actual carrier, manpower, platform development and maintenance fees. The cost structure of non-car operating carrier can be divided into fixed cost and variable cost. Fixed costs are mainly concentrated in key resources and important cooperation, and variable costs are mainly concentrated in key business and revenue sources.

4 Conclusion

As a B2B industry, the logistics industry has its own operation rules. The high dependence on the Internet of the non-car operating carrier enterprise is the key to the development of this industry. There have been several prototypes of the commercial mode of non-car operating carrier in China. Since the current business environment, enterprise development stage and enterprise strength of various enterprises are different, the development of business models also vary across enterprises. On the basis of the nine elements of the commercial mode of the non-car operating carrier, the improvement ways of each component discussed in our analysis are worthwhile for further investigations.

Abstract: Aquaculture in Malaysia has become a global seafood industry for food security. Malaysia aquaculture industry ranked 15 out of the leading world producers in 2014 with an estimated 521,000 tonnes of total aquaculture production which is aligned to the 11th Malaysia Plan under the National Agrofood Policy (NAP), 2011-2020. As leading world producers, it is important to learn the foundation of the industry and current challenges encountered by the sector. This paper address six major issues and challenges of the aquaculture sector in Malaysia specifically issues of fish stock depletion, climate changes, current diseases affected farmed aquaculture, the impact of media towards aquaculture industry, non-compliance feeding practised towards halal aquaculture and poor interaction between stakeholders. The methodology of this study involves searching of the divergent trusted database and related information using most popular search engine that covers 55 selected and reviewed journals including major resources database from fisheries authorities: Department of Fisheries Malaysia, Food and Agriculture Organization of the United Nation and WorldFish Centre. A combination of these research findings, newest technology application will be suggested as accurate and timely information on managing aquaculture systems.
Key words: Aquaculture; Industries; Challenges; Malaysia

1 Introduction

Malaysia has become one of the biggest seafood players in the world as it ranked in top 25 world producer in 2014 with an estimated 521,000 tonnes of total aquaculture production (FAO, 2016). Globally, the fisheries sector contributed to 1.1% share of world output in 2013 with 0.4% is contributed from the aquaculture sector (Chan et al., 2017). Apart from that, the agriculture sector contributed 10.7% to the total national gross domestic product (GDP) and the aquaculture sector contributes 8.9% to the total agricultural GDP, created an estimated 1,753,900 million jobs for Malaysians (DOSM, 2016). It shows that the sector not only has offer food security to the country but the aquaculture production has been known as the potential contributor to alleviating hunger and poverty for the world (Allison, 2011).

In Malaysia, the sector has recently encountered several issues and challenges in aquaculture industry (Troell et al., 2014) despite being projected to continuously grow in the near future (DOF, 2016). Hence, the objective of this paper is to highlight all relevant papers and crowd-sourced inputs in the fields particularly selected issues and challenges of the environmental issues, national issues and technology challenges in managing aquaculture system. Therefore, to understand of these related issues, the paper starts with the research methodology of findings the current issues and challenges of Malaysian aquaculture. Then, in Section 2, the overview of aquaculture status in Malaysia is explained in details. Section 3, the issues and challenges of the industry is presented specifically. Section 4 recommends policy enhancement and technology application as tools to improve the issues and challenges; and finally, the conclusions, limitations and implications of the study are explored.

2 Global Issues and Challenges of Aquaculture

The research nature in findings issues and challenges in aquaculture sector are enormous and is not easy to be confined to one paper, thus, the pertinent materials are scattered across diverse journals, conferences papers, the online database including government agencies database. Department of Fisheries Malaysia, Food and Agriculture Organization of The United Nation (FAO) and WorldFish database are the most common database to search for general issues and challenges in Malaysian aquaculture, followed by other classification of local and international agencies (Table 1).

NUMBER OF LITERATURE
Figure 1   The Relevant Resources to Search the Current Issues and Challenges in the Aquaculture Industry in Malaysia

Publications with the most the recent year 2017 until the past two decades, 1997 were identified. A first quick content screening identified journals and articles either to included or excluded from the analysis. The paper also includes open access and peer-reviewed papers. Since the paper highlights current issues and challenges, most cited references based on the most recent years since 2013 to 2017 while most cited journals in the year 2010 and previous years are used as supporting references to the latest research (Table 1). To optimise the accuracy of the research findings on selected issues, interview with fisheries officers have been conducted in May 2017 to confirm and support the findings particularly resource based on online newspapers. The references were collected in different resources in order to find the relevant subjects and the data, journals and articles were checked by second and third researchers.

Table 1   Articles and Journals that Most Cited in Different Years Based on Identified Major Data Bases

Major databases	Most cited references (in year)							
	< 2010	2011	2012	2013	2014	2015	2016	2017

3 The Aquaculture Status of Malaysia

In 2015, the statistics shows that Malaysia has produced 1,998,440 tonnes (total valued RM 13180.5 million), with marine capture fisheries and inland fisheries, estimated at 1,489,974.75 tonnes (valued at RM 9393.7 million) and aquaculture production, including seaweeds, ornamental and aquatic plants, recorded at 508,465.25 tonnes (valued at RM3786.8 million) (DOF, 2016) (see Fig. 2).
Figure 2   National Fishery Sector Production Value, (2006-2015) (DOF, 2016a)

The fisheries sector in Malaysia contributes 10.7% to the total agricultural gross domestic product (GDP) and, created an estimated 1,753,900 million jobs for Malaysians in agriculture and fisheries sectors (DOSM, 2016) as listed in Table 2. The demand for the fisheries products is increasing annually due to the growing numbers of per capita fish consumption arose from 45 kg in 1998 (Pawiro, 2001) to 58.1kg in 2011 more than any other ASEAN countries (Chan et al., 2017). Due to the rising demand of fisheries product, it is noted that aquaculture governance has made remarkable progress under 11th Malaysia Plan aligning with the National Agrofood Policy (NAP), 2011-2020 that the fisheries sector will continue to be the objectives of agro-food sub sector development as it plays important role in the food security (EPU, 2016).

Table 2   Status of Malaysian aquaculture in 2015

Types	Total	Source
Marine capture and inland fisheries	Production(tonnes): 1,489,974.75 Value (RM): 9393.7 million	(DOF, 2016)
Aquaculture production (including seaweeds, ornamental and aquatic plants)	Production (tonnes): 508,465.25 Value (RM): 3786.8 million	(DOF, 2016)
Fisheries sector contributes to GDP	10.7%	(DOSM, 2016)
Jobs opportunity in agriculture and aquaculture sectors	1,753,900 million	(DOSM, 2016)
Per capita fish consumption	58.11 kg	(Chan et al., 2017)

In contrast, based on the demographic view, the recent statistics shows that most of the employees originate from other countries, Indonesia, Thailand, Bangladesh, and others with 3151 Indonesian labours, followed by others namely Bangladesh and Thailand of 1971 workers, 552 workers, and 144 workers respectively (DOF, 2016). These workers are working in different aquaculture systems around the country.

4 Issues and Challenges in Malaysian Aquaculture Industry

Since Malaysian aquaculture has ranked in top 15 world aquaculture producers, the growth of an industry around the globe should be perceived. The fact is most of the recent surveys agreed that the exponential growth period of the industry worldwide is ended and although the sector will yet continue to grow, the growth projected rate is predicted to decelerate around the world (Béné et al., 2015). Thus,

the world facts aligned with the country data in 2015 shows the declining number of culturists for Malaysian marine farmers at 5.38% and freshwater farmers at   6.62% compared to previous year (DOF, 2016), shows in Table 3.

Table 3   Issues in Aquaculture

No	Issues	Context of review
1	*Fish stock depletion*	Since 2004, of the 600 marine fish stocks worldwide monitored by FAO, 3% are underexploited, 20% are moderately exploited, 52% are fully exploited, 17% are overexploited, 7% are depleted and 1% are recovering from depletion while the research on the global list of fish stocks has ranked Malaysia as ranging from moderately and ranging from fully exploited to over exploited (FAO, 2004). The excessive fishing activities and fleet overcapacity of these stock have contributed to the millions of Malaysian Ringgits cessation of resource rent (Tai, 2014) or in the other words, the rising price of fish has increased by an average of 6.2% yearly since 2005, due to the increasing costs of fishing operations (Aruna, 2014)[1]. Since the capture fisheries production decreasing while cost of fishing operations raising, the price of wild fish may increase that further impetus the rapid growth of aquaculture (Ottinger et al., 2016)
2	*Climate Changes Issues*	Estimation of the loss valued RM 25 million including Perlis, Kedah, P. Pinang, Perak, Johor, Pahang, Terengganu, and Kelantan. The major impacted state is Pahang region with 390 culturists has estimated the loss of RM 7.5 million (Hassan, 2016). As consequences, the effects of climate change on freshwater systems will presumably be increased water temperatures, decreased dissolved oxygen levels, and the increased pollutants toxicity (Ficke et al.,2007) .
3	*Diseases affected farmed species*	The disease could easily affect aquaculture farmed species. The disease outbreak specifically Tilapia Lake Virus (TiLV) has recently affected Tilapia species with significant mortalities up to 90% in farmed tilapia (Eyngor et al., 2014) and is considered to be a potential threat to global tilapia farming particularly countries namely Southeast Asia, Egypt, Israel and South America (Fitzsimmons & LwinTun, 2017). The TiLV or a new Orthomyxovirus, a summer mortalities disease has been found in Israel in 2014 that has affected Tilapia during June to October (known as summer month) when water temperatures rise to over 25 ℃ (Fathi et al., 2017). The detection of TilV in clinical samples are successfully done, however, the potential causes of the disease outbreak until now has not been found (Dong et al., 2017)
4	*Media influences towards aquaculture industry*	The consequence, aquaculture sector not only prone to disease, the media has playing extensive roles in shifting the aquaculture economics. The research found by Fitzsimmons and LwinTun (2017) shows that demand in the US and Europe has been falling since 2014 with the imports decreased yearly even though the price is lower and quality of fish improved specifically in improvised packaging, more value added products and better traceability. They identified that the websites hosted from the United States have clearly given provocative statements about the nutritional facts of Tilapia fish. In the statement referring to the research by Weaver et al., (2008), defined specifically on fatty acid characteristics of Tilapia has the inflammatory effect to consumers that further being cited by more than 100 papers including websites.
5	*Non-compliance towards Halal aquaculture*	Apart from that, the trend issue in food industry worldwide has moved towards demanding halal food for the Muslim population. Thus, Malaysia planned to be a halal hub industry for the Muslim preference by taking precaution on the matter of offering healthy, safe and halal food by providing certifying standards of halal food guidelines: MS1500:2009 (DSM, 2014) to serve[2] the Muslim community in the country. However, Malaysian aquaculture products are still contaminated with the forbidden resource: Muslim scholars named it as non-halal contents resource. For example, gelatin resources are not declared by several countries (Tukiran et al., 2016). Several cases evidence have also found that freshwater fishes were fed with non-halal resource (a resource from pig carcasses and waste)(Norhana et al., 2012) and it is considered as haram (forbidden or proscribed by Islamic law) to consume (Pauzi& Man, 2015).
6	*Poor interaction between stakeholders*	The development of aquaculture industry was supported by upstream and downstream activities (Hempel, 2010). Both activities represent a complete aquaculture supply chain that involved major players in the industry particularly brood-stock suppliers, hatchery farmers, culturist, collectors and related processing companies (Galappaththi et al., 2016). However, the main scarcity in the value chain is the poor interaction between aquaculture players and the fisheries authorities (Department of Fisheries Malaysia). This is due to lack of meaningful communication and the absent of updated information that accessible to aquaculture sector (Shaffril et al., 2009) .

Research suggests that the probable reason for the slower growth also are caused by failure on producing a sufficient variation of genetically improved species (Biscarini et al., 2015) , lack of species-specific feeds (Yue & Wang, 2017), fresh water supply shortage (Béné et al., 2015), culture sites availability for optimal yield (Troell et al., 2014), however, only selected issues will be discussed in this paper that is particularly on fish stock depletion that triggered the rising of feed costs (Béné et al., 2015; FAO, 2012), environmental issues occurred in the country (e.g. flood occurrence and El-Nino phenomena), diseases that affected cultured species (Yue & Wang, 2017), media influences on spreading misinformation (Fitzsimmons & LwinTun, 2017) and other national issues related to unethical feeding practiced towards halal perspective (Saidin et al., 2017), and demographic distribution. As aquaculture industry is a part of SMEs, the industry also surrounded by challenges specifically uncertainty in the external environment and pressures from globalization and market liberalization (Zulhasni, 2015). Those issues and challenges are major concerns to Malaysia as the industry encountered new global competitors and new technology development worldwide.

5 Conclusion

This study provides six major issues and challenges that represent the scenario in the Malaysian aquaculture industry. Among those issues are fish stock depletion, climate change issues, disease affected farmed species, media influences towards aquaculture sector, non-compliance towards Halal aquaculture including poor interaction between stakeholders. Therefore, the paper addressed the issues and challenges that need to be encountered by all aquaculture players. The issues and challenges experienced by the sectors should be tackling through collaboration among stakeholders perhaps using advanced and newest technology that probably give impact to the regional and global economics of aquaculture industry. Moreover, the solutions should be meet the needs of business owners, which contribute to the improvement or innovation initiative to the organization itself.

Proposed Roadmap of UTM 21st Century Education System Using TRIZ System Evolution Forecasting Methodology

Zulhasni Abdul Rahim, Nurhakim Yusof, Mohd. Hatta Mohammed Ariff
Malaysia - Japan International Institute of Technology, Universiti Teknologi Malaysia, Kuala Lumpur, Malaysia.
(Email: zulhasni@utm.my, norhakim@utm.my, mohdhatta.kl@utm.my)

Abstract: In regards to Education 4.0, UTM has introduced a New Academia Learning Innovation (NALI) model. NALI is designed to be in line with the National Higher Education Strategic Plan that covers the 10 Shifts components. Under Education 4.0 will require human resources with adequate data and digital literacy. Students across disciplines will, therefore, need to gain digital literacy during their studies. For this, the concept of blended learning is emphasized in NALI model. Blended learning is a combination of active and systematic strategy with the use of digital teaching materials in class. This encourages better and more meaningful learning experience for students. In this digital era, globalised online learning, one of the critical components, is essential for supporting student-centred learning. Even though students are able to explore and gain quick information from the web search, however, to craft the digital learning framework for higher education is challenging. In this paper shows the evolution trends of education system road map by using new concept of TRIZ to forecast the direction of future education system.
Key words: 21st century education; Roadmap; Innovation; TRIZ

1 Introduction

For the past few decades, Malaysian higher education system has not only made significant gain in student enrolments, but the achievement has grown wider in global recognition such as research publications, patents, and institutional quality, as well as become a top destination for international students (Wan et al., 2017). For continuously stay abreast with the global trends, Malaysian education system needs to keep evolving over time for providing talent and high-quality graduates. Preparing Malaysian, especially youth generation, that capable to strive in complex and ever-changing future will require strong fundamental transformation of how the higher education currently operate (Grapragasem et al., 2014).

Currently, the impact of industrial revolution 4.0 (IR 4.0) has given a new impetus to educational transformation (Baygin et al., 2016). Thus, new educational programmes will have to be developed to meet changing demands especially across disciplines. The IR 4.0 demands has led to a new paradigm of higher education, known as Education 4.0 that train students to produce innovations. Malaysian thinkers agree the Education 4.0 will be shaped with education that able to produce highly creative graduates with the ability to think critically regardless of their disciplines (Schuster et al., 2016). In the era of IR 4.0 jobs that require creativity are likely to stay. For this, Malaysia Education Blueprint (2015-2025) has identified 10 Shifts that would be needed to take the Malaysian higher education system towards becoming global educational expert and the development of 21stcentury citizenship (Ministry of Education of Malaysia, 2013).

2 Transformation of 21st Century Education System

Growing up with this level of technology means growing up with a completely unprecedented amount of information at your fingertips. There are kids who have never been more than a few seconds away from the answers to their questions, with everything just a quick search away. They are able to teach themselves about any topic they are interested in without even leaving their bedroom. The current cohort of students come from Digital native generation. These two generations have grown up with advanced technology as a given in their homes and classrooms. They are digital natives, as comfortable using apps and code as their grandparents were flipping pages (Šorgo et al., 2017).

Digital native generation are also the most internationally connected in history. They encounter people online from all over the world and can easily make friends on the other side of the planet before they have even left their home state. Schools and parents are also increasingly offering children and young people the opportunity to travel, creating a truly borderless experience of learning. The students in our schools today are intelligent, independent and extremely capable. They are skilled with

technology and comfortable with global and intercultural communication. We can expect that future generations are going to have even more experience in these areas (Cleveland et al., 2016).

A 21st century education is about giving students the skills they need to succeed in this new world and helping them grow the confidence to practice those skills. With so much information readily available to them, 21st century skills focus more on making sense of that information, sharing and using it in smart ways. While digital integration is also fundamental to a thorough 21st century education, it is not enough to simply add technology to existing teaching methods (Echenique et al., 2015). Technology must be used strategically to benefit students. Students are increasingly advanced users of technology even as they enter school for the first time, so this can often mean being open to the possibilities presented rather than attempting to teach and prescribe the use of certain programs. Many a classroom 'technology class' has baffled children by attempting to teach them about programs, websites and hardware that are no longer relevant or that they understand far better than the teacher does (Henderson et al., 2017).

3 The Challenges in 21st Century Education Transformation Roadmap

The 21st century education contained various challenges and also opportunity for education provider such as UTM in excel together with the trends. The form and shape of UTM's 21st century education will eventually change through innovation, but the functionality is always intact as UTM's education system. However, there are lacks implementation and execution of strategy regarding with the transformational of form and function for UTM 21st century education system (Aris et al., 2016). By having those strategy, it will able to have a strong roadmap on the direction of transformation and effectively execute the process of transformation at a higher degree. In the context of UTM's initiatives and transformation strategy towards 21st century education system, this paper will focus on; exploring the predictive trends of transformational shape and form towards 21st century education system and develop a transformational roadmap on the trends of UTM's evolution towards 21st century education system using TRIZ forecasting methodology.

4 The TRIZ Concept of Evolution Trends of Education System towards 21st Century Education

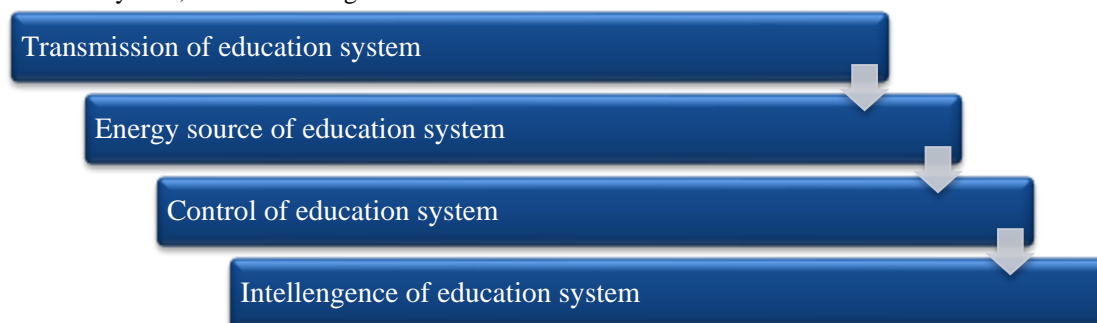
TRIZ is the Russian acronym for "Teoriya Resheniya Izobretatelskikh Zadatch" (теория решения изобретательских задач) meaning the 'Theory of Inventive Problem Solving' Developed in 1946 by soviet inventor Genrich Altshuller and his colleagues. The key objective of TRIZ methodology is to have problem solving processes that rooted from the development of patented invention that is faster and better in term of solving technical or engineering problems. From previous research, the development of invention involved fundamental concept of technological system evolution that consist of repeated trends (Zulhasni et al., 2015 & Rahim et al., 2015). By understanding how technology system evolves, we can foresee the directions of system change and take the opportunities in business competition. There are 9 trends of engineering system evolution in TRIZ methodology (Zulhasni et al. 2015). However, this paper only uses two significant trends that able to support the transformational of education system forwards. The first selected trends are trends of increasing towards supersystem that pushing system towards utilizing the function of external system to carry out the core function of education system, as shows in Figure 1.


Figure 1   Trend of Increasing of Functionality towards Supersystem of Education System

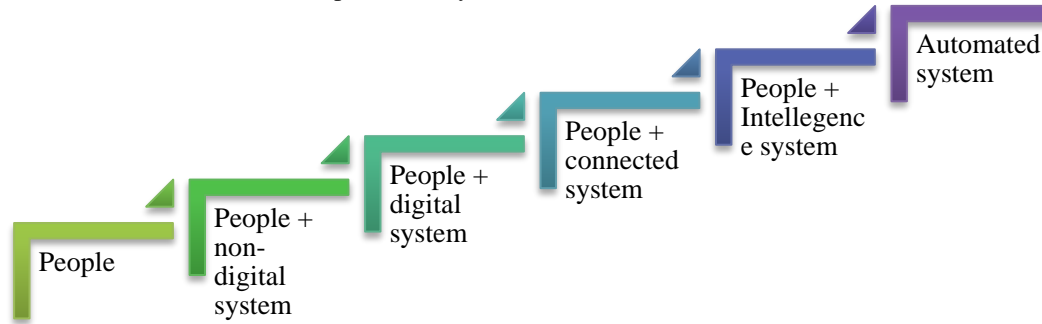
The second trends are the trends of decreasing human involvement that focus to changing the education system towards less dependency of human in carry out the operation of education system, as shows in Figure 2. The trends started with people interaction of education system and adding supporting system in teaching and learning process. Then, digital elements become important elements in the education system and move towards improving level of connectivity and intelligence in education operation. The final concept of this trends will be the autonomous elements that have been integrated or embedded within the education operational system.


Figure 2　Trends of Digitalization in Reducing Human Involvement of Education System

5 The Transformational Matrix of UTM's 21st Century Education System Evolution

Figure 3 shows the transformational matrix of UTM's evolution towards 21st century education system by combining two selected TRIZ trends that have been mentioned in the previous section. It consists of S-curve maturity model and combined it with two TRIZ the trends of system evolution. The proposed matrix is integrated with another TRIZ tool called S-curve trend.
Figure 3　The Transformational Matrix of UTM's 21st Century Education System Evolution

The S-curve consist of system maturity as the education evolves towards 21st century system. There are 4 phases in the S-curve;

(1) Infant phase that represent the new adopter of early transformational changes in conventional education system,

(2) Growth phase that represents the increase of degree of transformational in education system that involved digitalization and outsourcing the specific functions to external education system

(3) Mature phase that represent radical transformation changes of education system towards

connectivity and add more value on the level of control system.

(4) Final phase is decline phase. It represents the optimize education system that highly automate and use high level of intelligent functionality in the operation of education system. From this phase, the optimization leads to saturation of system change and new innovation leaps are critically needed for the education system. Without innovation, the education will be not competitive and phase out eventually in future.

This matrix able to provide UTM a roadmap to prepare and implement phase by phase in transforming current education system to 21st century concept. The realization of these roadmap requires multiple levels of design and development effort and skill. Creating a success transformational education system is also a complex   task and it need to be accepted by its users who are primarily the 21st century higher education students (Veeber et al., 2015). It must be effective in engaging and enriching students learning.

6 Conclusion

The transformational changes are critical to UTM in evolving the education system towards 21st century teaching and learning. The transition must be guided with clear direction and supported with implementation concept of education system transformational changes. The element of digitalization of systems within the education program are one of the critical factors to move forward. However, the form and shape are changes according to technology trends and progress. TRIZ methodology have been introduce in this paper based from the ability to forecast technology evolution with several tools and techniques such as trends of engineering system evolution and S-curve. Based from system functionality, the education system will transfer out to external system that is abundance such as online system that available in the internet. The changes towards automation of education system also pushed the education system evolved and transform to a higher level of functionality.

The TRIZ tools are integrated together and formed the proposed transformational matrix for UTM to evolve its education system towards 21st century goals. The proposed matrix provides UTM to identify their position in terms of education evolution phase and strategize their way forward to the next phase of evolution.

Towards Developing a Decision-making Tool for Technology and Knowledge Priorities

Josu Takala, Sara Tilabi
School of Technology and Innovation, University of Vaasa, P.O. Box 700, 65101 Vaasa, Finland
(E-mail: josu.takala@uva.fi, sara.tilabi@uva.fi)

Abstract: The main focus of this paper is to propose a method for prioritizing knowledge and technology factor of firms towards sustainable competitive advantage. The data has been gathered and analyzed from two high tech start-ups in which technology and knowledge play major role in company's success. The analytical hierarchy model (AHP) is used to determine competitive priorities of the firms. Then knowledge and technology part of sense and respond questionnaire is used to calculate the variability coefficient i.e. the uncertainty caused by technology and knowledge factor. The proposed model is tested in terms of two start-ups. Based on the initial calculation of uncertainties, some improvement plan is proposed, and the method is applied again to see if the uncertainty of knowledge and technology decreases. In both cases, the proposed model helped to have a clear and precise improvement plan and led in reduction of uncertainty.
Key words: Sense and respond method; Sustainable competitive advantage (Sca); Knowledge and technology (Kt); Uncertainties; Analytical hierarchy process (AHP)

1 Introduction

The world is changing rapidly so is the business environment. This turbulent environment in business world affects the dynamic nature of competitive advantage among firm and makes the competition more intensified. According to Si, Takala and Liu (2010) "The future competitiveness of manufacturing operations under dynamic and complex business situations relies on forward-thinking strategies". One of the key drivers of competition is technology change. Any technological modification which could pioneer a firm in an industry is considered valuable. Although the technology factor plays an important role in obtaining profit for a company, it is not important for its own sake. It is important if can help companies to reduce cost or make differentiation or speed up delivery (porter,1986).

Technology changes and development could create new opportunities and as well as threats to companies (Takala&Zuchetti, 2016). It also important because it can affect industry structure and create new rules of competition. Understanding the effects of technological changes on the structure of an industry has even more importance in the era of digitalization and industry 4.0 (Oettmeier& Hofmann, 2017). It is perceived that competing in "high technology" industry is considered as key to gain profit (Porter, 1986). But it also demands lots of company resource, since it forced company to adapt to the technical requirements of the market continually (Takala&Zuchetti, 2016). So, it is very much important to look at technological capability of firms with resource based view approach and make decision about technology investment regarding companies limited resources.

This paper tries to evaluate technology and knowledge factor and connects it to companies' business strategy. Additionally, it aims to show how technology and knowledge decision reflect uncertainties. Managing uncertainties in business strategy is very important since it is replacing traditional risk management (Takala and Uusitalo). Therefore, this article is a step towards modelling knowledge and technology priorities considering business strategy.

2 Theory Background
2.1 Business strategy

Quinn 1980 defines strategy "the pattern or plan that integrates an organization's major goals, policies and action sequences into a cohesive whole". Nowadays firms need to apply strategies that can grantee their sustainable competitive advantages over others rather than only gaining short term benefit. The notion "sustainable competitive advantages" (SCA) was defined by porter in 1985. He proposed a positioning theory based on generic strategy. His positioning theory classified business strategy in three main categories: overall cost leader ship, differentiation and segmentation. In cost leadership category, companies seek to deliver product and services at lowest price by different means like optimizing process and standardize their products and services. In differentiation category companies seeks to deliver superior products and services by offering high quality and/or customized products and finally in

segmentation group, companies focus on fulfilling unique needs of selected segment of customer based on geography or income level (Porter 1980). This categorization was not comprehensive enough because it did not consider firm's resources and internal capabilities. Based on Wernerfelt (Wernerfelt, 1984), in finding optimal market for a firm, its products and its resources should be taken to account at the same time because resource and product are two sides of a coin for firms. Later on, Barney includes the role of resources in company business strategy as they can bring competitive advantages to firm. Because firms' resources are rare, have no direct substitutes, and help companies to achieve opportunities or avoid threats. Regarding companies' resources, competitive strategy is defined as creating value chain that cannot be implemented or duplicated by others easily (Barney, 1991).

Another classification of business strategy could be based on Miles and snow topology. In this model four business strategy groups are defined: prospector, analyzer, defender and reactor. prospector is those firm which try to lead their industry, their main focus is to deliver high quality products. Analyzer tries to focus on quality and cost simultaneously and remain steady in their market. Defenders try to minimize cost and focus on a mature product or market operation, they concentrate on process improvement and prefer not to take risks. And finally, reactor happens in absence of any clear strategy (Daft, 2009)

2.2 Sense and Respond model (S&R)

This model was introduced by Ranta and Takala in 2007 and assists frim in estimation about what would happen in future. This method is replaced traditional way of planning production and is more based on anticipation customers' need on real time. This method helps firms to collect data regarding their experience and expectation and provides a way for firm about how they see themselves compare others in terms of different attributes. Additionally, it helps firms to see the development of a certain attribute in a specific time frame (Strauss and Neuhauss 1997; Bradley and Nolan 1998; Ranta and Takala 2007).

The sample of questionnaire is presented in the following table:

Table 1   Format of the Questionnaire

Performance attribute	Scale: 1=low, 10=high		Compared with competitors			Direction of development		
	Expectation (1-1)	Experience (1-10)	worse	same	better	worse	same	better
Performance 1								
Performance 2								

In this study, the following attribute has been used for performance measurement in sense and respond questionnaire:

Table 2   Sample of Performance Measurement Which Has Been Applied in This Study

	ATTRIBUTES	
	Knowledge & Technology Management	
1	Training and development of the company's personnel	← Flexibility
2	Innovativeness and performance of research and development	← Cost
3	Communication between different departments and hierarchy levels	← Time
4	Adaptation to knowledge and technology	← Flexibility
5	Knowledge and technology diffusion	← Cost
6	Design and planning of the processes and products	← Time
	Processes & Work flows	
7	Short and prompt lead-times in order-fulfillment process	← Flexibility
8	Reduction of unprofitable time in processes	← Cost
9	On-time deliveries to customer	← Quality
10	Control and optimization of all types of inventories	← Quality
11	Adaptiveness of changes in demands and in order backlog	← Flexibility
	Organizational systems	
12	Leadership and management systems of the company	← Cost

	ATTRIBUTES	
13	Quality control of products, processes and operations	← Quality
14	Well defined responsibilities and tasks for each operation	← Flexibility
15	Utilizing different types of organizing systems	← Flexibility
16	Code of conduct and security of data and information	← Cost
	Information systems	
17	Information systems support the business processes	← Time
18	Visibility of information in information systems	← Time
19	Availability of information in information systems	← Time
20	Quality & reliability of information in information systems	← Quality
21	Usability and functionality of information systems	← Quality

2.3 RAL model

To integrate sense and respond method to Miles and snow typology, RAL model is used. RAL is abbreviated from responsiveness, agility and leanness. According to Takala (2012), a firm can be optimized in terms of responsiveness, agility and leanness by prioritizing quality, cost, time and flexibility.

Figure 1   RAL Model

2.4 Technology and knowledge rankings

Knowledge and technology requirement is added to sense and respond questionnaire to gather information about companies' knowledge and technology priorities. Since the company's resources is limited, so it is very important to find the technology focus which is align with company business strategy and can grantee firms competitive advantage and profitability. Based on Marone (Marone, 1989), technology can provide opportunities and bring competitiveness to firms. Additionally, technology strategy plays an important role in the success of technology-based startups and improves their competitive advantage (Campos et.al, 2009). Therefore, companies should integrate it to their business strategy.

To gain sustainable competitive advantage and create core competences, knowledge and intellectual capital also plays significant role. According to Libut (Libut, 2001), achieving sustainable competitive advantages is mainly based on knowledge meaning that in order to create value chain, knowing how to do thing is as important as having access to special resources. To create value chain, knowledge should be shared effectively within firm while be protected from liking outside. So, to gain competitive advantage knowledge, skills and intellectual property should be easily shared inside the firm but difficult to be copied by competitors. This kind of knowledge which is "difficult to express, formalize or share", called tactic knowledge. Tactic knowledge is very much related to firms' experience, organization structure and routines (Libut, 2001). The role of technology in organization and getting competitive advantage is even more important in terms of "technology entrepreneurship" and high tech business and so many studies has been conducted to investigate it in terms of resource based view, dynamic capabilities and core competence (Bailetti, 2012).

To evaluate knowledge and technology impact on firm business strategy, respondents have to estimate each attribute of sense and respond questionnaire in terms of basic, core and spearhead technology. In other word respondents should detect the share of these three technologies in term of each

attribute while the sum of all shares is 100%. Here, basic technology means the kind of technology which is used commonly and can be purchased or outsourced. Core technology refers to the technology that is bringing competitive advantage to company currently and spearhead technology refers to future technologies.   These three different technologies differ each other in terms of required resource and knowledge. This difference influences a lot in firm's strategy implementation and in particular to the success of high tech-based business (Takala et al, 2013).

Table 3   Technology and Knowledge Share for Different Attributes

	Basic	Core	spearhead
Performance 1			
Performance 2			
Performance 3			
Performance 4			

3 Method

In this study, analytical hierarchy process (AHP) model and knowledge and technology part of sense and respond questionnaire is used. AHP method is used to weight the component of RAL method: quality, cost, time and flexibility. Analytic Hierarchy Process (AHP) method is based on pairwise comparison between criteria and was introduced by Saaty in 1980. This method is "a multi-attribute decision instrument that allows considering quantitative and qualitative measures and making tradeoffs". In order to calculate the partial uncertainty regarding to each type of technology, this paper suggests variability coefficient. The formula is as follow:

$$\text{Coef. Var}_{\text{Basic}} = \frac{\text{Standard Deviation}_{\text{Basic}}}{\text{Average}_{\text{Basic}}} \quad (1)$$

$$\text{Coef. Var}_{\text{Core}} = \frac{\text{Standard Deviation}_{\text{Core}}}{\text{Average}_{\text{Core}}} \quad (2)$$

$$\text{Coef. Var}_{\text{Spear Head}} = \frac{\text{Standard Deviation}_{\text{Spear Head}}}{\text{Average}_{\text{Spear Head}}} \quad (3)$$

The above formula shows the level of deviation among participants' response in terms of each technology type regarding different component of RAL model. After calculating the coefficient of variance (CV) for different type of technology, the next step is to calculate risk level in partial and in total. The following formula is used to calculate the partial and total risk of technology:

$$c_1: \text{Quality}, c_2: \text{Time}, c_3: \text{Cost}, c_4: \text{Flexibility}$$

$$\underset{c_1,c_2,c_3,c_4}{TotalTK\ risk}\ (RMS) = \sqrt{\sum_{c_1,c_2,c_3,c_4}\left[\left(\sum_{b_1,c_1,sh} Coef.Var_i\right)^2\right]^2}$$

$$Partial \begin{cases} \underset{c_1,c_2,c_3,c_4}{TK\ risk\ Basic}\ (RMS) = \sqrt{\sum_{c_1,c_2,c_3,c_4}\left[\sum_b\left(\frac{std_i}{mean_i}\right)^2\right]^2} \\[2ex] \underset{c_1,c_2,c_3,c_4}{TK\ risk\ Core}\ (RMS) = \sqrt{\sum_{c_1,c_2,c_3,c_4}\left[\sum_{core}\left(\frac{std_i}{mean_i}\right)^2\right]^2} \\[2ex] \underset{c_1,c_2,c_3,c_4}{TK\ risk\ Sh}\ (RMS) = \sqrt{\sum_{c_1,c_2,c_3,c_4}\left[\sum_{sh}\left(\frac{std_i}{mean_i}\right)^2\right]^2} \end{cases} \quad (4)$$

When all the risk is calculated, next step is to calculate sustainable competitive advantage (SCA) index, using the following formula:

$$TotalRisk(Geom) = [(1 - SCA)TKrisk]^{\frac{1}{2}} \quad (5)$$
$$TotalSCArisklevel = 1 - TotalRisk(Geom) \quad (6)$$

4 Case Studies and Data Collection

The data and cases which are presented in this study are gathered during the student work shop in Warsaw University of life science in Poland. The data which are presented here, are based on high tech startup companies and the decision in which technology focus is crucial in their success. Additionally, they have limited resources as startups and resource allocation plays critical role in setting their strategy. Considering all above, cases are presented here are fit to examine the proposed method here.

During case studies, different group has started the data collection step by defending main attributes in project (regarding project goal and its mission). Then the next step is to estimate these main

criteria in terms of different technology share (basic, core, speared). When the data is gathered, final stage is to calculate the variability of coefficient and risk level and to examine how improvement plan might affect the risk of technology deployment.

5 Results

5.1 Case 1: establishing a new transportation company based online scooter

The mission of this start up is to offer high quality and environmental friendly transportation services for customer and having fun simultaneously. The business model of this start up is as follow: customer can rent a scooter on the station via app and they can leave it whenever they want. Since the process of renting works with net and online application, therefor it is very easy and accessible. Customers are charged based on minutes while the starting three minutes is considered free of charge especially for preparation. No driving license is needed for driving scooter and only ID card is enough. There is promotion for long term contact and you can have a friend (or company) with you using the scooter each time. This starts up has the following partners: manufactures of scooters, leasing company, local government, advertising company and eco-friendly organizations. Customer target group are: people who follows environmental friendly life style, passengers in rush, people who likes using technology in everyday life. The core idea behind this start up is to offer rental high-quality scooter for a short period of time. This business needs some spearhead technology (advance technology) such as: stations with sun panels and tablets with navigation system. The current competitive priorities for company are: safety and flexibility, availability and cost. And in future it slightly changes to: safety and cost, 2. availability and flexibility. Manufacturing business strategy index for past and for future is presented in the following table:

Table 4   Manufacture Business Strategy for Scooter Starts Up, in Past and in Future

	Cost	Quality	Delivery	flexibilty	Inconsistency
Past	0.074	0.513	0.138	0.275	0.004
Future	0.275	0.513	0.138	0.074	0.004

The source of uncertainty in term of technology is presented in the next figure. As the pictures demonstrates, spearhead technology reflects the highest level of uncertainties in technology and knowledge decision making process.
Figure 2   The Source of Uncertainty in Technology Type, Current Situation

Considering the available resources and company main goal and to decrease the level of uncertainty the following improving plan has been suggested: 1. to locate ten rental stations in the city center containing five scooters at each, 2. Customers could return the scooter at the station free of charge otherwise there is extra charge in case of leaving scooter somewhere else in the city. 3. Constantly observe the availability and the location of demand and relocate station to more popular areas if needed. After implementation the improvement plan, the source of uncertainty would look as follow:
Figure 3   The Source of Uncertainty in Technology Type, after Improvement Plan

Comparing figure 2 and 3 shows that total uncertainty decreases by 25% after improvement plan. While spearhead technology holds the biggest share of risk and uncertainties in past and after improvement plan. Following the formula 1-6 the partial and total risk of technology would be as follow:

Table 5   The Summary of Risk Level

	Technology and Knowledge risk			Total risk (Geom)	Total SCA risk level
	Basic	Core	Spearhead		
Past	0.66	0.74	0.88	1.33	0.36
Future (after improvment plan)	0.45	0.35	0.78	0.97	0.31

The following bar charts show the source of risk and uncertainties in technology deployment has changed after implementation of improvement plan.
Figure 4   Comparison of Risk Share in Terms of Each Technology, Current (before) and Improved (after)

Having searched the source of uncertainty among sense and respond attribute, the following criteria are detected as critical before suggestion of improvement plan:
   (1) Training and development of company's personnel
   (2) Short and prompt lead time in order-fulfilment process
   (3) Reduction of unprofitable time in process
   (4) On-time delivery to customer
   (5) Control and optimization of all type of inventories
   After improvement plan, the critical attribute would be:
   (1) Code of conduct and security of data and information
   (2) Information system supports the business process
   (3) Visibility of information in information system
   (4) Quality and reliability of information in information system

5.2 Case 2: establishing an entertainment start up based on portable scape room idea

The core idea behind this start up is that the group of people enter to a space room (in here truck trailer) and in order to find the exit way, they need to solve a mystery. This scape room is portable and is able to reach to customer place. This entertainment vehicle is suitable for all the ceremony like wedding, birthdays, parties and all sort of events which people needs to be entrained. The spearhead technology in

this start up is "holographic design" while truck could be considered basic technology and advertisement channel is core technology.   The business strategy priorities for this company are: (1) quality. (2)delivery, (3) flexibility and 4. cost.   They are presented in the following table:

Table 6　Company Competitive Priorities in Past (before improvement plan)

	Cost	Quality	Delivery	flexibility	Inconsistency
Past	0.057	0.499	0.284	0.160	0.004

Technology and knowledge requirement of this company is filled by seven respondents mainly from marketing, design and logistic department and the results is presented in the following:

Table 7　Knowledge and Technology Share- before Improvement Plan

No	Quality			Flexibility			Cost			Delivery		
	Basic	Core	Spearhead	Basic	Core	Spearhead	Basic	Core	Spearhead	Basic	Core	Spearhead
1	80	20	0	30	50	20	60	30	10	80	20	0
2	20	40	40	15	63	22	30	50	20	10	70	20
3	20	50	30	10	70	20	10	60	30	25	35	40
4	10	45	45	0	50	50	10	45	45	20	40	40
5	30	60	10	0	70	30	30	40	30	20	60	20
6	30	60	10	0	70	30	30	40	30	20	60	20
7	80	20	0	30	50	20	60	30	10	80	20	0

Uncertainties related to technology deployment before implementing improvement plan is demonstrated in the following bar chart:
Figure 5　The Source of Uncertainty in Technology Part, Before Improvement Plan

As the bar chat shows, basic and spearhead technology causes the biggest share ofuncertainty in this start up. Some improvement plan has been suggested as follow to decrease the level of uncertainty like: deploy mobile phone app, to increase the truck numbers and projects at least one yearly, corporate with fuel company, offering bonus to customer in case of recommending the company to someone else, and implement customer satisfaction survey constantly. After the improvement plan, knowledge and technology requirement for each type of technology would be as follow:

Table 8　Knowledge and Technology Share-after Improvement Plan

No	Quality			Flexibility			Cost			Delivery		
	Basic	Core	Spearhead	Basic	Core	Spearhead	Basic	Core	Spearhead	Basic	Core	Spearhead
1	30	60	10	30	50	20	20	60	20	80	20	0
2	30	50	20	15	63	22	30	50	20	70	15	15
3	20	50	30	10	70	20	10	60	30	75	15	10
4	20	50	30	10	50	40	10	45	45	60	20	20
5	30	60	10	10	60	30	30	40	30	65	25	10
6	30	60	10	10	60	30	20	50	30	60	15	25
7	40	50	10	20	50	30	30	60	10	80	20	0

And the uncertainty related to each type of technology is presented in the next figure:
Figure 6   The Source of Uncertainty in Technology Part, Before Improvement Plan

Comparing figure 5 and 6 shows after implementing improvement plan, the main source of uncertainty is spearhead technology.

Uncertainty related to technology and knowledge is presented in the following table:

Table 9   The Summary of Risk Level

	Technology and Knowledge risk			Total risk (Geom)	Total SCA risk level
	Basic	Core	Spearhead		
Past	1.69	0.68	1.4	2.31	0.48
Future (after improvment plan)	0.71	0.30	1.11	1.35	0.37

Having searched the source of uncertainty among sense and respond attribute, the following criteria are detected as critical before suggestion improvement plan:

1.Adoption to knowledge and technology

2.Design and planning the process and product

And after improvement plan, critical attribute would be:

1.On time delivery to customer

2.Quality control of product, process and operation

3.Utilizing different type of organizing system

4.Code of conduct and security of data and information

5.Quality and reliability of information in information system

6 Discussions and Conclusion

This study tries to present a new decision making to evaluate the technology priorities considering business strategy. This tool supports decision makers to decide about technology focus regarding companies' business strategy and its internal resource.

The presented SCA model-based knowledge and technology here provides decision maker better tool towards gaining sustainable competitive advantages by making right decision regarding different technology level. The technology decision could be increasing investment or out sourcing for example.

Moreover, the model provides the possibility of:

Observing the right type of operation strategy (cost, quality and time) which could result in company better performance

Investigating which company unit follow company business strategy and which not

Take better strategic action by knowing the criteria which are unbalanced in terms of resource allocation

Companies which are presented here are high tech start-ups. And in both, spearhead technology plays significant role in creating uncertainties. Using this new development tool, these start-ups were able to reduce the risk related to technology deployment for spearhead technology and in total. The proposed model also is connected to sense and respond method which enable companies to detect the focus attribute to maximize their profit regarding company competitive advantage which could be differentiation or cost reduction for example.

Although the effect of technology and knowledge on SCA observed by the proposed model here is not significant, it cannot be neglected. The main role of this paper is to investigate the effect of different

technology types on SCA level considering the uncertainties in different technology level.

The analysis and proposed tools are performed on high-tech startups in which technology and specially advanced technology plays significant role. The proposed model in this paper is a suitable tool for decision makers in showing firms' strengths and weaknesses and also in detecting the focus area towards gaining sustainable competitive advantage.

Feature Selection on Arabic Document Classification: Comparative Study

Yousif A. Alhaj[1], Mohammed A. A. Al-qaness[2]
1 School of Computer Science and Technology , Wuhan University of Technology, Wuhan, P.R.China, 430070
2 School of Computer Science, Wuhan University, Wuhan, P.R.China，430070
(E-mail: yalhag@gmail.com, alqaness@whu.edu.cn)

Abstract: Feature selection is standard techniques that used to improve the accuracy and efficiencyof the document classificationsystem.The high dimensionality of the feature space is a major problem in documentclassification. Feature selection technique is the process of reducing the vast number of the space features in document classification. The aim of this study to explorethe impact of featureselection techniques namely-Chi-square (CHI), and Information Gain (IG) on the accuracy of Arabic document classification. The experiment conducted using Support Vector Machine (SVM) classification technique.K-fold cross-validation examined to evaluate classifier, and f1-micro used to test the classifier. The Term Frequency-Inverse Document Frequency (TF-IDF) used to extract features. Experiments Analysis reveals that the feature selection techniques have a significant impact on the classification accuracy. Findings of this study show that the Chi-square feature selection techniqueoutperformed the information Gain feature selection technique. The SVM classifier achieved 95.42% micro-F1 value when feature size equals 4000 and by using Chi-square feature selection technique.
Key words: Arabic text classification; Feature selection techniques; Text preprocessing

1 Introduction

The Document classification is becoming more critical with increasing the massive amount of electronic documents. The massive number of features is a significant challenge in document classification which reduces the performance of document classification and time-consuming. Feature selection technique is used to reduce the feature space by selecting the essential features. Classifying documents manually is becoming time-consuming and much more difficult than before because of the massive amount of information accumulation on a daily basis in different information resources. Automatic Text Classification (ATC) is a machine learning technique which aims at assigning a text document automatically to a thematic category from a predefined set of classes. ATC has a vital role in many information retrieval applications such as sentiment analysis(Dahou et al., 2016), website classification (Ahmadi et al., 2011), email filtering (Sakurai and Suyama, 2005),spam filtering (Al-Kabi et al., 2012)and automatic indexing(Percannella et al., 2005).

The document in text classification system must pass through a set of stages(Ayedh et al., 2016).The first stage is document preprocessing which Include tokenization, normalization, stop word removal and stemming. The second stage is feature extraction and feature selectionthat extract features and select the criticalfeature. The final stageis document classification wherein the training and testing data are divided from a collection of documents. In this stage, the classification algorithm build model from training data and evaluated by test data.

In Document classification, the researchers deal with the problem of the high dimensionality of feature space thatreduces the accuracy and efficiency of the document classification system .Feature selection used to solve the problem of the high dimensionality of feature space by selecting the criticalfeatures.Moreover, in thisresearch, weinvestigated theimpact of feature selection techniques namely- Chi-square, Information Gain on the accuracyof accuracy of Arabic document classification.

The remainderpart of this paper is organized as follows; Section 2 discusses Literature Review. Section 3 presents the research methodology. Experiment work and result described in Section 4, and finally conclusion is presented in Section 5.

2 Literature Review

The vast majority of the research on documentclassification has been investigated in Latin-based languages and other languages, however Arabic document classification still in the fancy stage.

The influence of stop word elimination on Arabic document classification evaluated byAl-Shargabi et al.(Al-Shargabi et al., 2011).They testedseveralclassification algorithms, and concluded that the SVM

with sequential minimal optimization achieved the highest accuracy and lowest error rate. The impact of preprocessing om Arabic document classification investigated by Ayedh et al (Ayedh et al., 2016a)Examined the impacts of normalization,stop word removal and stemming on the accuracy of Arabic document classification.Three machine learning classification algorithms used to build the classification model. Chi-square feature selection selected the essential features. They concluded that the superiority of the SVM classifier over the other classifier algorithms when thenormalization and stemming combined.

The influence of stemming technique on Arabic document classificationevaluatedby Duwairiet al. (Duwairi et al., 2009). They concluded that the light stemming approach enhances the accuracy and outperformthe other approaches.

Ayedh et al(Ayedh et al., 2016b) Investigated three feature weighting approaches that depend on inverse document frequency (IDF) namely , Term frequency (TFiDF), the position of the first appearance of a word (FAiDF), and the compactness of the word (CPiDF) on the classification accuracy.Several feature selection techniques are used to select the critical features namely Chi-square (CHI), Information gain (IG), GalavottiSebastiani-Simi Coefficient (GSS),and Goh and Low (NGL) coefficients.Support vector machine (SVM) learningused to build the model of classification. Their results showed that the notability of the GSS over the other feature selection techniques when TFiDF, CPiDF,andFAiDF feature weighting method are combined.

Zaki et al. introduced a hybrid system for Arabic document classification(Zaki et al., 2014) grounded on the semantic vicinity of terms and the use of a radial basis modeling.Stop word elimination, normalization, and stemming techniques were investigated as preprocessing tasks.They implemented the hybridization of N-gram + TF-IDF statistical measures to calculate the similarity between words. Theyfound the use of radial basis functions developed the performance of the system.

Al-Tahrawi and Al-Khatib estimated the Polynomial Networks(PN)inArabic document classification and compared the performance with severalalghorithms such as Support Vector Machine, Naïve Bayes, and J48 on Alj-News dataset(Al-Tahrawi and Al-Khatib, 2015). Their results showed that the PN was very competitivebut not the best for all the categories in the dataset. Theyrecommended some points for future work to improve the performance of PN.

Elhassan and Ahmedstudied the effect of stemming techniques including Khoja and Light stemmers on Arabic document classification(Elhassan and Ahmed, 2016). Various machine learning algorithms investigated to build the model of classification system namely Sequential Minimal Optimization (SMO), Naïve Bayesian (NB), J48 and K-nearest neighbors (KNN). Their result showed that the Sequential Minimal Optimization (SMO) classifier outperform others classifiers and the light stemmer outperforms the Khoja stemmer.

Mesleh evaluated several feature selection techniques on Arabic document classification based on support vector machine(Mesleh, 2008). The preprocessing tasks normalization, stop word removal and stemming were examined in their experiments. Their experiments resultsshowed that the Ng-Goh-Low (NGL) coefficient, the Galavotti-Sebastiani-Simi (GSS) coefficient and chi-square significantly outperformed the other techniques.

3 Research Methodology

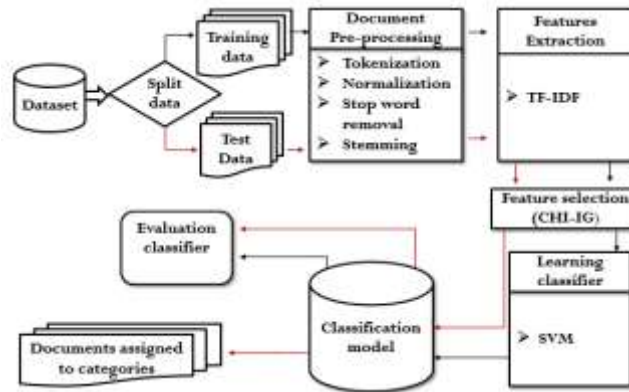
An Arabic Document Classification framework usually consists of three main stages, pre-processing stage, feature extraction（representation）, feature selection stage, and finally, the document classification stage. Pre-processing stage contains the process that transforms the text into a suitable format. Feature extraction stage is the process that extract the feature from text and transforms it into the numericalvector, feature selection is the process of selecting the important features. Document classification includes classification model evaluation and classification model construction. The description of these phases are presented in the following figure1.


Figure 1   Arabic Document Classification Framework

3.1 Document pre-processing

Document pre-processing is the process that transforms the original textual words into standard structure documents classification. Also known as the first step in document classification (categorization) system. Pre-processing technique used to reduce the ambiguity of words and enhance the performance of classification.Document pre-processing include various techniques such as tokenization, normalization, and stop word removal,and stemming.Tokenization is the process that dividing the texts into tokens .Normalization is the method that convert character into stander format ,remove Arabic diacritics, numbers, Latincharacters, and non-Arabic characters. We used the same techniques of normalization(Larkey et al., 2002).Stop word is insignificant word in your dataset, sothe stop word removal a list[1]of Arabic stop word prepared to be eliminated from all the documents. Stemming technique define as the process that reduce the wood to their root or stem ,we usedTashaphynestemmer (https://pypi.python.org/pypi/Tashaphyne/) as their performance(Oraby et al., 2013).

3.2 Feature extraction and selection

The second stage of document classification process called feature extraction and feature selection .Feature extraction is the process that extract features from text and convert it into numerical vector to be suitable for machine learning algorithms. Several different methods have been used to extract features. One of the most common methods is TF-IDF(Ayedh et al., 2016a).Feature selection aims to select the most applicable words that differentiate (one topic or class from other classes) between classes in the dataset.Various feature selection techniques have been investigated for document classification. In our paper, we suggested Chi-square (CHI), and Information Gain (IG) feature selection techniques.

3.2.1 Chi-Square

Chi-square testing (χ^2), which is defined as a well-known discrete data hypothesis testing method from statistics; this technique evaluates the correlation between two variables and determines whether these variables are independent or correlated(Thabtah et al., 2009). χ^2 Value for each term t in a category c can be defined by using equations (1) and (2)(Sebastiani, 2002).

$$\chi^2(t_k, c_i) = \frac{|Tr| \cdot [p(t_k, c_i) * p(\overline{t_k}, \overline{c_i}) - p(t_k, \overline{c_i}) * p(\overline{t_k}, c_i)]^2}{p(t_k) * p(\overline{t_k}) * p(c_i) * p(\overline{c_i})} \tag{1}$$

And is estimated using

$$\chi^2(t, c) = \frac{N*(AD-CB)^2}{(A+C)*(B+D)*(A+B)*(C+D)} \tag{2}$$

Where:

A = The frequency of t and c occurrences,

B = The frequency of t occurrences without c,

C = The frequency of c without t,

D = The frequency of non-occurrence of both c and tand N is the quantity of document.

3.2.2 Information Gain

Information gain is commonly used as a term goodness criterion in machine learning. Information gain measures the amount of information obtained for category prediction by knowing the presence or absence of a term in a document(Zifeng et al., 2007),(Xu et al., 2005).The IG idea is to determine features that reveal the most information about the categories. The IG of feature t is defined as:

---

[1] https://github.com/yalhag1/Arabic-stop-word-list

$$IG(t,c_i) = \sum_{i=1}^{i=m} p(t,c).log\frac{p(t,c_i)}{p(t).p(c_i)} + \sum_{i=1}^{i=m} p(t^-,c_i).log\frac{p(t^-,c_i)}{p(t^-,c_i)} \quad\quad (3)$$

And is estimated using:

$$IG(t) = \sum_{i=1}^{i=m} A.log\frac{A}{(A+C)(A+B)} + \sum_{i=1}^{i=m} B.log\frac{B}{(B+D)(A+B)} \quad\quad (4)$$

3.1 Document classification

The final stage of the document classification process is called document classification wherein the training and testing data are divided from a collection of documents .In this stage, we examined a popular statistical classification and machine learning technique for document classification namely support vector machine (SVM)(AbuZeina and Al-Anzi, 2017) to build the model of document classification. We have developed our application using Python Programming to implement the experiments .The parameters setting of SVM used in python programming such as SVC(kernel='linear', C=1) .

4 Experiment and Results

4.1 Arabic Data collection

To evaluate the impact of feature selection on Arabic document classification, we have used an in-house dataset that collected from numerous published papers for Arabic document classification and gathered from Arabic news websites.The collected dataset contains 1000 documents divided into 6 categories of economy, medicine, politic, religion, science, andSport. In this Arabic dataset, each document must be assigned to one of the conformingclass directories. The statistics of the dataset are shown in Table 1. The largest category contains around 351 documents, whereas the smallest category contains nearly 54 documents.

Table 1   The Statistic of Document in the Corpus

class name	Number of documents
Economy	92
Medicine	42
Politics	274
Religion	54
Science	351
Sport	187
Total	**1000**

4.2 Accuracy analysis

In this paper, all documents in the dataset were prepared by converting them to UTF 8 encoding. Feature selection methods namely Chi-square and information gain were carried out by constructing feature sets that consist 1000, 2000, 3000, 4000, and 5000 features.SVM techniques performed to observe the accuracy of document classification system. K-fold 10 cross-validation examined to evaluate classifier.Several mathematic rules such as recall (R), precision (P), and F-measure (F) are investigated to evaluate the performance of classification model to classify documents into the correct category which are defined as follows:

$$Precision = \frac{True\ postive}{True\ postive + False\ postive} \quad\quad (5)$$

$$Recall = \frac{True\ postive}{True\ postive + False\ negative} \quad\quad (6)$$

$$Micro - F1 = \frac{2*\ Precision \times Recall}{Precision\ +\ Recall} \quad\quad (7)$$

4.3 Result and discussion

Resulting F1-micro obtained from the dataset based on the impact of feature selection techniques namely Chi-square and information gain are illustrated on Table 2.

Table 2   F1 Measure Scores for Feature Selection Techniques

Classification algorithm	Feature size	CHI	IG
	1000	0.9370	0.9271
	2000	0.9452	0.9401
SVM	3000	0.9521	0.9482
	4000	**0.9542**	0.9521
	5000	0.9522	0.9522

According to the proposed method of feature selection methods namely-Chi-square and information gain has different impact based on SVM classifier algorithm. The evaluation was investigated after preprocessing tasks namely –normalization, stop word removal and stemming technique .TF-IDF extract features to be appropriate for machine learning classification. The results show that the feature selection methods have different impact based on type of feature selection methods and features size. The Chi-square feature selection method overcome the Information Gain feature selection method with all the feature size except when the features size equal 5000 they have the slimier impact . The best result found with Chi-square feature selection method when feature size equal 4000.

5 Conclusion

In this study, we investigated the impact of featuresselection techniques namely- Chi-square (CHI) and information gain (IG)on accuracy of Arabic document classification. Support vector machinelearning algorithmhave been investigated to solve the problem of text categorization. TF-IDF used to extract features. Findings of the study show that the Chi-square (CHI) feature selection technique outperform the information gain feature selection technique. Based on features selection techniques and the number of feature sizethe performance and accuracy in Arabic documents classification have different impact. We believe this results will be helpful for examiners in document classification system to choose the property method of feature selection technique and the number of features. Future research would focus on study how to choose the optimal feature selection method and important featuresfor Arabic document classification based on optimization algorithm such as genetic algorithm.

Abstract: Human values and affective traits were found to predict attitudes toward the use of different types of knowledge-based theory through creative climate. In this study (N =329), we aimed to gain a more comprehensive understanding of those predictors toward use in a structural equation model (SEM), provided a better overview of a possible structural path that drives to such antecedents for Small and Medium Enterprises (SMEs) in Bangladesh. Precisely, we predicted and found that the relations between the variables and impact of different variables were modeled and tested by applying SEM. Based on the questionnaires survey on SMEs in Bangladesh, this empirical study indicates that all the predictor variables significantly influence the endogenous variables except knowledge management (KM) and employee resilience (ER), and creative climate (CC) and organizational resilience (OR). The study provides several theoretical and practical implications for further research.
Key words: Creative climate; Knowledge management; Employee resilience; Organizational resilience

1 Introduction

In today's competitive environment, organizations enlarge globally and face a lot of contests to meet their objectives. To survive and contend successfully in the dynamic atmosphere, organizations require proactive work climate for performing at high standards to yield for long-run sustainability of the organization (Majeed, 2011). To keep in line with it, CC is the essential element to the long-term success and subsistence of organizations. Ultimately, most managers realize that a productive workforce and climate will provide a global, sustainable and competitive advantage for a learning organization. On the same lines, KM has attracted individual responsibility of employees' (Li et al., 2013). Recently, researchers have paid interests in this arena because of its acute role displayed in the competitive business world as well as OR (Linnenluecke, 2017). Empirical studies imitated that the antecedents predicting creative climate are KM, ER, and OR which practically mentioned in several studies. Besides, resilience in organizations and among employees is relevant in any context which introduces challenges and transcends a post-disaster context (Näswall et al., 2015). This little adaptation capability is undoubtedly a matter for the development of organizations in the modern edge. However, the ability of a knowledgeable resource in any organization to learn faster than those in other organizations establishes the only sustainable competitive advantage at the disposal of a learning organization (Geus, 1988). It is the link between learning organization and the success in changing the environment. To address this issue, According to Denyer (2017), OR is required for businesses to respond to the interruptions as well as positively adapt in the face of challenging conditions, leveraging prospects and delivering sustainable performance improvement. By addressing these rationales, this study intends to figure out how CC, KM, and EM directly influence OR rather than CC and KM affect OR through ER.

2 Theoretical Background and Hypotheses Substantiation

2.1 Impact of creative climate on the relationship between employee and organizational resilience

Organizations need to shape a climate that stimulates creative climate. CC is the organizational appearances as perceived by its members (Ekvall, 1996). It also encourages people to generate new ideas and helps the organization to grow and increase its efficiency and at the same time it enables members to generate and implement creative ideas more effectively (Ekvall et al., 1983). Accordingly, OR is the ability of the organization to cope with modification through continuous replenishment of business operations to prevent deterioration and disuse (Scott, 2007). In today's rapidly-changing environment, ER is a critical resource for organizations. In this progress, ER plays a great role in this context (Näswall et al., 2013), as the definition of ER builds on the definition of OR, defined as "a function of an organization's overall situation awareness, management of keystone vulnerabilities, and

adaptive capacity in a complex, dynamic, and interconnected environment". Therefore, the hypotheses of these relationships are:

H2. Creative climate significantly predicts employee resilience

H4. Creative climate has a positive impact on organizational resilience

2.2 Influence of knowledge management association with employee and organizational resilience

KM is one of the most important sources for the organization to achieve the sustainable competitive advantage and adaptation. Prior studies posited on developing resilience by focusing on individuals' knowledge and adaptability (Sutcliffe and Vogus, 2003), and self-enhancement skills and attachment style (Bonanno et al., 2002). In this connection, resilience in leaders has been shown to affect subordinates' and the organization's performance (Youssef, 2004). With the view in mind, KM as a strategy to manage organizational knowledge assets helps in management decision making, and enhances keenness and increase capacity for creative climate and innovation (Nowack et al., 2009). The process of KM, i.e., knowledge acquisition, distribution, interpretation and organizational retention, paves the way for enhanced organizational enactment (Lee and Choi, 2003) by solving the business hitches and exploring the potential growth opportunities. Nonaka (2007) mentioned that KM involves the acquisition, creation, and use of information for change that can culminate in innovation and, ultimately, organizational resilience (Hamel and Valikangas, 2003). To support this, Grant and Kinman (2012) also painted the inescapability of resilience for employees working in ardently challenging and different occupation. In this regard, to bridge this gap, we hypothesize:

H1. Knowledge management has a positive effect on employee resilience

H3. Knowledge management positive impacts organizational resilience

H5. Employee resilience influences organizational resilience significantly

2.3 Relationship between creative climate and knowledge management

Basically, climate for creativity investigates how the prevailing workplace environment supports creativity of SMEs in Bangladesh. To achieve this, researchers and practitioners need to understand the influence and relationship of CC on knowledge management. A part of this, Service and Boockholdt (1998) concluded that CC is related to and has a major impact on psychological processes particularly in knowledge-base organization. Consequently, these components exert a direct influence on the performance and outcomes of individuals, working groups and the organization. Study conducted among managers of information technology in Malaysia revealed that organizational CC had a positive and significant impact on KM (Samad, 2010). Furthermore, it is often investigated that creative organizational learning is increased from knowledge process capabilities that create, transfer, and use knowledge (Malhotra, 2004), and the result of increased organizational creativity is improved organizational performance . Based on the preceding discussion, we propose the following hypothesis:

H6. Creative climate significantly predicts knowledge management

To emulate a clear demonstration of the present investigation, we developed a conceptual framework (Figure 1) based on insights gained from the prior studies.
Figure 1   Conceptual Research Framework

3 Research Design and Methodology

3.1 Respondents' demographic features

Detailed demographic characteristic of the respondents has been reported below the table (1):

Table 1   Participants' Demographic Profile (N=329)

Variables	Categories	Frequency	%	Variables	Categories	Frequency	%
Gender	Male	252	77.0	**Education**	Master	105	32.0
	Female	77	23.0		Others	224	68.0
Age	Below 35 Years	186	57.0	**Tenure**	Below 10 Years	208	63.0
	Above 35 Years	143	43.0		Above 10 Years	121	37.0
Size	Small	176	53.0				
	Medium	153	47.0				

3.2 Survey instruments

A total of 480 questionnaires were delivered through the offline and online survey, but 343 responses were received. In the screening test, 13 responses were dropped out to address the issues of common method bias, missing data, outliers, and data normality. Survey instruments of creative climate (Kim and Yoon, 2015), knowledge management (Noruzy, Dalfard, Azhdari, Nazari-Shirkouhi, and Rezazadeh, 2013), employee resilience (Näswall et al., 2015) and Organizational resilience is adopted from Mafabi et al. (Mafabi et al., 2012) that consists of organizational competitiveness, organizational adaptiveness, and organizational value, were used in this research. Notably, a 5-point Likert scale has been used for the sake of uniformity in measuring the variables. The scales ranged from strongly agree (1) to strongly disagree (5). Microsoft Excel 2016, AMOS version-20, and IBM SPSS version-21 analytical tools were used to operate the data.

4 Measurement Models Evaluation
4.1 Model specification with construct validity, reliability, and goodness-of-fit statistics

Measurement model evaluation considers several issues to test the measures' authenticity. Fit indices, construct validity, and reliability were examined. With 38 manifest variables, the confirmatory factor analysis (CFA) did not yield a good output. Due to issues involved in the regression weights and items' loading, one item from CC, five items from ER, one item from KM, and five items from OR were deleted. Estimates on the CFA demonstrate a good fit (χ^2/df =1.345, GFI = 0.912, RMR= 0.023, CFI = 0.969, TLI = 0.964, IFI=0.969, RMSEA = 0.032) (Hair Jr et al., 2014a). Convergent validity has been measured with average variance extracted (AVE) and composite reliability (CR). The table 2 reveals that all the criteria are above the threshold limit: minimum AVE=0.502 (0.50) and composite reliability=0.754 (>0.700). We also observed that the square root of the AVE of a construct is higher than its correlation with any other constructs. Thus, the convergent and discriminant validity results reports no concern on validity issues (Hair Jr et al., 2014b).

Table 2   Measurement Model'S Correlation Matrix, CR, AVE, and Descriptive Statistics

	1	2	3	4	5	6	7	8	9	10	11

SD	-	-	-	-	-	.549	.585	.551	.549	.570	.600

ED. Education, FS. Firms' size, CC. Creative climate, OV. Organizational value, ER. Employee resilience, OC. Organizational competitiveness, OA. Organizational adaptiveness, KM. Knowledge management, SD. Standard deviation. Scores in bold in the diagonal matrix represents the square root of the AVE of the construct. **. P < 0.01 level (two-tailed). *. P < 0.05 level (two-tailed).

4.2 Global structural model validation and fit analysis

Following the measurement model analysis, we have further evaluated the structured model to ensure the global fitness of it. The estimates on the fit indices,   (χ^2/df =1.378, GFI = 0.907, AGFI = 0.864, CFI = 0.965, TLI = 0.961, NFI=0.911, RMSEA = 0.034),   are found above the threshold limit (Hair Jr et al., 2014a). Hence, the globally accepted fit indices warrant the further analysis to test the preconceived hypotheses. In order to further strengthen the model's predictive relevance, we examined the coefficient of determination (R^2). The result shows that the structural model explains 13.9% (R^2_{KM}), 5.3% (R^2_{ER}), and 45.4% (R^2_{OR}) change in KM, ER, and OR. The magnitude of R^2 ranges from weak to substantial but not insignificant according to the rule of thumb set by Cohen (Cohen, 1988).

5 Results and Discussion

As depicted in table 3 represents the findings in the structural model coefficients' weight. In H1, we hypothesize that knowledge management is not significantly linked with the employees' resilience. The estimated result (β= -0.018, p<0.05) not supported. This result is found inconsistent with the findings of (Stephenson, 2010). The H2 reported that the creative climate reserves a significant influence on employees' resilience. In line with the hypothesis, the calculated results strengthen the proposition (β=0.237, p<0.01). Prior research results also supported the studied findings (Ekvall et al., 1983). The H3 proposes that knowledge management significantly predicts organizational resilience. The observed results unearthed that employees' engagement has a significant influence, β =0.507; p<0.05, on employees' resilience. The current findings are also found similar to the rest of the global findings (Mafabi et al., 2012). Again, H4 showed that creative climate is significant with organizational resilience. This estimated result is not supported (β= 0.244, p>0.05). The H5 and H6 reported that employee resilience and creative climate are also predicting the organizational resilience and knowledge management accordingly. On the same lines, the calculated results (β=0.159, p<0.01 for H4 and (β=0.337, p<0.01 for H5) strengthen the propositions.

Table 3   Path Analysis in a Structured Model

Hypothesis	Path Relations			β	SER	T-Stat.	p. value	Decision
H1	EmR	<---	KnM	-0.018	0.085	0.234	0.815	Not Supported
H2	EmR	<---	CrC	0.237	0.076	3.161	0.002	Supported
H3	OrR	<---	KnM	0.507	1.78	1.993	0.047	Supported
H4	OrR	<---	CrC	0.244	1.012	1.54	0.125	Not Supported
H5	OrR	<---	EmR	0.159	0.141	1.993	0.047	Supported
H6	KnM	<---	CrC	0.373	0.066	5.153	0.000	Supported

6 Conclusion

This study aims at finding the predictor variables of CC and KM in Bangladesh at different organizational units. The result shows that CC, ER, and KM significantly affect OR at different levels. Besides, CC, KM, and ER are also found to be significant predictors of OR. This result has some theoretical, academic and practical significance. Unlike many other studies, this study shows that KM is not significantly affecting ER and CC has an insignificant effect on OR which is a new direction for further research. Studies on CC, KM, and ER are relatively new; however, this study shows that they affect OR significantly. Therefore, professionals and practitioners require committing more resources on the adequate focus on KM and ER. Academics and researchers can do more research on KM practices, ER systems, and OR for further development. One of the limitations of this study is the sample size which is limited to generalize the universe. Also, moderation effect of demographic factors and mediating effects of above-considered variables mentioned in the structured model are apparently absent. Future studies suggested chalking out the mediating effect and moderating effect of third variables on the relationships between employee and organizational resilience.

Abstract: Under the implementation of the "Internet plus initiative", Chinese businesses have realized that "knowledge" is an inexhaustible motivation for economy growth. However, most companies only recognize the advantages, but seldom translate the knowledge into real business profits effectively. In addition to the reason of poor technology, it is more troublesome not to have a sound and complete knowledge management system at the top level. This article will provide a new "pyramid model" of knowledge management based on the purpose of realizing profits. The model starts from three dimensions of Knowledge Formation, Knowledge Application and Knowledge Maintenance, explaining a tight connection between knowledge management and business profits.
Key words: Knowledge management; Business profits; Knowledge formation; Knowledge application; Knowledge maintenance

1 Introduction

In 1983, Professor Paul Romer of University of California came up with "New growth theory", which marked the start of Knowledge Economy. Nowadays, knowledge has turned into essential productive factors and valuable capital. Economy of China has shifted from high-speed growth to high quality development. Therefore, it is imperative to promote the knowledge management.

In western researches, the definition of knowledge management changed from the original "information management technology" to an important bypass occupying a large proportion of business management. P. Quitas considered knowledge management as a continuous process of handling knowledge in order to enhance the performance of the organization. Three major factions appear, including the "technical school" emphasizing technology, the "behavior school" emphasizing people, and the "comprehensive school" which emphasizes technology, people, and knowledge.

Chinesebusinesses have started late and have little experience in knowledge management. Although there are still some theories like IDE-SECI Model and Knowledge Management Values, the system is relatively fragile. Sun Yongbo's propose of the "Jungle Phenomenon" directly points out some existing problems. Young scholars are accustomed to study from their own majors. The grafting behavior makes knowledge management mixed with other structure theories, like HR management and strategic management theories. It fails to highlight the value of knowledge management itself.

According to studies at home and abroad, systematic research on knowledge management is becoming increasingly important. How to realize the role of knowledge management in the production and management of enterprises is a task that each enterprise manager needs to consider. Knowledge management is no longer a static measure, but a dynamic management and operation process.

2 Knowledge Management and Business Benefits

Knowledge management refers to building a comprehensive system, in which the information, technology, or ideas are continuously fed back to the production through processes like acquisition, creation, integration, application, updating, or maintenance, finally realizing the purpose of business' value-added.

Companies with rich knowledge prove to be more competitive in market. Scholars have made investigations to SMEs, high-tech enterprises, private enterprises and manufacturing companies:

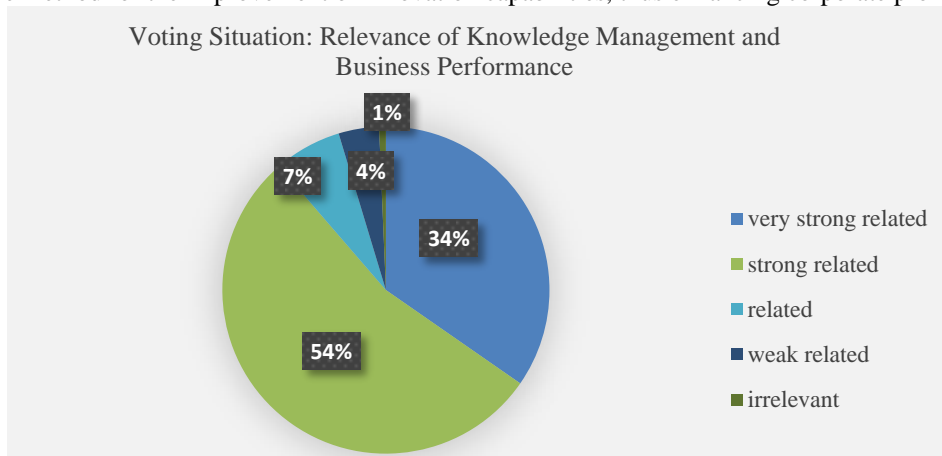
1) According to data from the Ministry of Industry and Information Technology in 2012, China's technological SMEs created 65% of invention patents, accounting for 75% of corporate innovation, and covered more than 80% of new product research and development.

2) Through the analysis of relevance, in high-tech companies, the interaction between each step of knowledge management and the performance of technological innovation proves that they complement each other.

<center>Table 1   The Analysis of Relevance</center>

	Knowledge acquisition	Knowledge conversion	Knowledge application	Knowledge protection	Performance
Knowledge acquisition	1				
Knowledge conversion	650**	1			
Knowledge application	529**	534**	1		
Knowledge protection	488**	550**	377**	1	
Performance	702**	734**	654**	684**	1

Note: ** refers to $P < 0.01$

3) Through questionnaires, in manufacturing enterprises, knowledge management is a powerful and effective method for the improvement of innovation capabilities, thus enhancing corporate profits.


<center>Figure 1   Voting Situation</center>

Sufficient studies indicate that the company's knowledge management will directly affect the economic efficiency. However, there is still a long way to go before we make knowledge productive.

The contemporary knowledge management is not yet mature, and most enterprises in China are in desperate need of transformation. Vague management concepts and little scientific guidance or top-level design will cause lack of knowledge, waste of knowledge, and leakage of knowledge. This paper proposes a systematic "Pyramid Model" of knowledge management based on realizing corporate benefits, and then elaborates the three-dimensional management mode of "Knowledge Formation--Knowledge Application--Knowledge Maintenance".

3 Construction of Pyramid Model
3.1 Dimensions of the model

Dimensions of Knowledge Management are key theoretical foundation supporting the theoretical system of knowledge management.To study the contribution of knowledge management to business efficiency, we must first comprehensively explore its internal dimensions.Thomas H. Davenport believed that the truly significant two aspects of knowledge management are the creation of knowledge and the use of knowledge.Anderson proposed a knowledge management import method, which divided knowledge management into six phases. There are also processes such as knowledge acquisition, knowledge transfer, knowledge storage, and knowledge creation that are known to the general public.

Existing theories elaborate on specific steps of knowledge management. However, in the period of deepening revolution, enterprises should pay attention to the entire system of knowledge management and form a top-level system that can guide enterprises' production and improve their performance. Knowledge management has turned into a dynamic management and operation process.

Therefore, based on previous research, this paper divides various management contents into different levels and dimensions, exploring the relationship between each step and the realization of the

economic benefits of enterprises, finally putting forward three core dimensions of the knowledge management system: Knowledge Formation, Knowledge Application, and Knowledge Maintenance.

3.2 Pyramid model under three dimensions

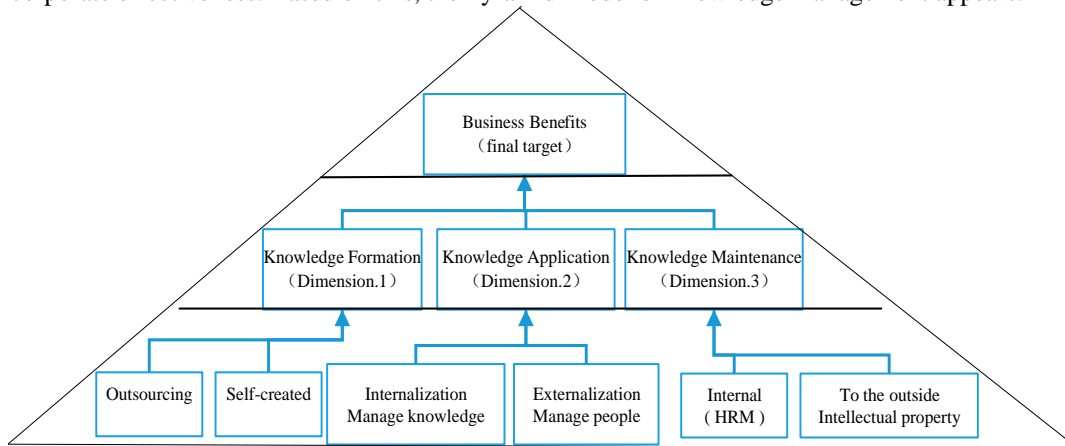
Three dimensions of knowledge management based on business efficiency are Knowledge Formation, Knowledge Application, and Knowledge Maintenance. The first dimension forms the foundation of the knowledge barn, the second dimension permeates knowledge into production, and the third dimension is both defensive and offensive. Together, these three dimensions form the three pillars of corporate effectiveness. Based on this, the Pyramid Model of knowledge management appears.


Figure 2   Pyramid Model

From top to bottom, the first level is the ultimate goal of the enterprise, the second level is the support of three dimensions, and the third level is the content anatomy of the three dimensions, forming the basis. This three-level "pyramid" is the core structure of enterprise knowledge management, and it is a brand-new analysis based on the traditional classification of "dominant and recessive". It takes a dialectical view of each behavior, and is both offensive and defensive.

Following sections will specifically analyze the principles of three dimensionsand how the "pyramid model" can relate knowledge management to business efficiency.

4 Model Analysis

4.1 Dimension 1: knowledge formation

Forming a company's unique knowledge is different from the knowledge innovation. Innovation means original knowledge and involves copyright; knowledge formation covers a wider range of methods. Ways to form knowledge can be divided into positive strategies and conservative strategies. The latter focuses on cultivating and protecting the internal knowledge of enterprises. The former emphasizes the "acceptable" attitude to the external environment.

The survival of a company in the social environment will inevitably rely on the information exchange.Therefore, businesses' knowledge mostly come from external material. The senior managers are keen on perceiving advanced knowledge. With excellent PR capabilities, they introduce the knowledge into their own companies. When the society is open and full of vitality, knowledge will flow faster. A passionate, free and open society can accelerate this metabolism.

However, picking up others' wisdom can only ensure the company's basic benefits. If they want to stand out, they must form their own competitive creativity. The origin of knowledge innovation may be inconspicuous. A tiny idea of employees is also likely to cut down costs. The "hidden knowledge" mentioned in most documents is the starting point of knowledge innovation. Therefore, whether managers have good insights or whether they can perceive the growth point within the company has an impact on the efficiency of a company.

From the above, two major foundations supporting the first dimension are "outsourcing" and "self-created". They correspond to learning and innovating behaviors.

4.2 Dimension 2: knowledge application

When enterprises acquire sufficient knowledge, they must apply these results to production, turning knowledge into real motivation.Knowledge Application is the bridge between knowledge and business benefits.

Polishing new knowledge to realize application is vital for business benefits. As mentioned above, many companies understand the advantages, but fail to translate them into actual business benefits. In China, companies are facing this transition crisis.Besides the scarcity of technology, companies should also pay attention to the full use of existing knowledge to avoid the problem of "knowledge waste".

In 1958, Michael Polanyi proposed explicit and tacit knowledge theory from the field of philosophy, providing managers with a new idea. Explicit knowledge is often depicted in written words, diagrams, and mathematical formulas. Unwritten words, similar to tacit, are tacit knowledge.

Something new appears if we put this theory into knowledge application. Knowledge provided by the external environment is explicit, while knowledge generated inside is implicit. This paper proposes a two-way transformation of internal and external knowledge to achieve full use of knowledge.

Japanese knowledge management expert Ikujiro Nonaka once proposed the SECI model of a four-dimensional transformation of explicit and tacit knowledge, mainly based on the management of knowledge itself.

Table 2   SECI Model

	tacit knowledge	Explicit knowledge
tacit knowledge	Socialization	Externalization
Explicit knowledge	Internalization	Combination

This paper proposes a two-way transformation of internal and external knowledge, adding a second element to traditional management human, which emphasizes the staff in managing knowledge.

4.2.1 Internalization: knowledge management

Nowadays, knowledge updates fast and it takes time to cultivate knowledge within the company. Most companies will target at advanced technologies emerging from the outside environment. Internalizing knowledge is compiling "outsourcing" knowledge into a corporate database.

In internalization, coding technology is particularly important. Enterprises can obtain first-hand information through government policies, market trends, customer opinions, etc., and then code them with information management systems or database systems.Through methods like pattern recognition, optimization algorithms and artificial intelligence, thousands of information are classified and stored in memory units, in forms of items.

There are many ways to encode knowledge, possibly in texts: knowledge about facts (Know-what) and knowledge of natural laws (Know-why), such as Google search engine. The ability of Know-how and Know-who is not easy to encode in text, but can be encoded in audio or video, such as "online teaching". Enterprises will eventually develop classification directories and rights control. Some management systems such as QA and EPR are internationally recognized and relatively mature.

Obviously, the coding process of internalization focuses on handling knowledge itself.

4.2.2 Externalization: staff management

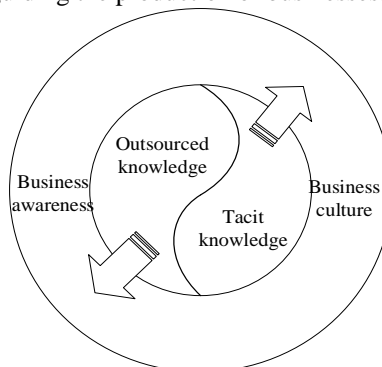
The concept of internal knowledge is more than tacit knowledge. Generally, tacit knowledge emphasizes irrationality, culture and arbitrariness. It focuses the natural operational process formed between staff. There have never been clear rules in the text and non-standard tacit knowledge just exists. Internal knowledge is not onlyimplicit knowledge, but also those outsourced and not recognized by the staff. The re-externalization here is not exporting, but actually a behavior of permeating new knowledge into each department, forming corporate consciousness and corporate culture. Then, internal knowledge can enter regulatory documents, guiding the production of businesses.


Figure 3   Externalization

To turn outsourced knowledge as part of business consciousness or to promote tacit knowledge as part of corporate culture, we must first give ideological and technical guidance to the staff. In other words, it is the issue about managing people. If knowledge is not accepted, it cannot help the production and management, let alone the economic efficiency. For outsourced knowledge, companies consider employee training and guidance to master emerging technologies. For tacit knowledge, companies should commend the creators, promote academic salons, and hold learning seminars.

In order to encourage more employees to identify with internal knowledge, companies need to improve reward and punishment systems for self-learning, exchange, and discussion. At the same time, cross-functional and departmental communication channels can be established between departments at all levels to prevent the problem of low productivity due to knowledge obstruction or poor exchange.

4.3 Dimension 3: knowledge maintenance

When an enterprise can well conduct a two-way conversion of internal and external knowledge, achieving the purpose of improving corporate performance, the next step should be the struggle for the long-term and stable growth of the interests. As the international environment changes rapidly and market information keeps entering and exiting, companies should guarantee the ownership of knowledge. That is, maintenance of knowledge.

The legal monopoly of knowledge is an intangible property right. According to Michael Porter's competitive advantage theory, the reason why a country is prosperous is that it has a competitive advantage in the international market.

However, there is difference between knowledge maintenance and intellectual property maintenance. Maintaining knowledge not only means the oath of sovereignty to the external environment, but also correct measures within the company. The internal policy mainly reflects in the continuous upgrading of knowledge and the handling of knowledge transfer. From Kodak and Motorola, it is clear that knowledge must follow the trends, adapt to market demands, make corresponding adjustments, and add new elements to stimulate consumers' desire to shop.

The upgrading of knowledge goes with the human resources strategy. People are the most important capital and the carrier of knowledge in an enterprise. HR strategy proves to have significant correlation with corporate performance. With a medium of knowledge management, will this positive effect decrease? Some documents use second-order confirmatory factor analysis, the structural equation model and the statistical software AMOS16.0 to establish a hypothetical model of mediator variables. It shows that HR strategy does not directly affect corporate performance, but through intermediate variables. Knowledge management is just the bridge to connect enterprise human resource management practices and corporate performance.

Table 3　Mediation Role of Knowledge Management Orientation

	Business benefits	Knowledge management	Benefits(Under management)
HR strategy	0.29***	0.52***	0.18***
Knowledge management			0.218*

Note: *** refers to $P < 0.001$

After joining the knowledge management, the regression coefficient between HRs and firm performance became 0.18, and the correlation with corporate performance decreased.

At the same time, the regression coefficient of knowledge management orientation is 0.218, which is statistically related to corporate performance as a general correlation ($0.01 < p < 0.05$).

This shows that after adding knowledge management, the impact of HRs on corporate performance has become significantly lower, and knowledge management has influence on corporate performance. Therefore, knowledge management orientation plays an intermediary role in HRs and corporate performance.

4.4 Evaluation on pyramid model

From the first dimension, two major ways of forming knowledge are outsourcing and self-building. These are important elements, which promote enterprises' knowledge barn. From the second dimension, knowledge application is the key of knowledge management since it determines whether the enterprise can transform the knowledge into interests safe and sound, whether it can permeate knowledge into every process of production and whether it can make full use of knowledge rather than waste it. The two-way transformation is actually a process of precipitation to sublimation. Knowledge was first coded to form a system, and then employees are trained and motivated, thus the potential knowledge can be

developed into corporate consensus. Knowledge maintenance, like logistics, always guard's property rights, guaranteeing the competitive position of the market. It makes knowledge keep in pace, injecting fresh blood into the enterprises through staff management.

The knowledge management "Pyramid Model" put forward in this paper integrates domestic and foreign research results in recent years. After detailed analysis, the paper provides a systematic program for knowledge management, rational and evidential. Three major dimensions are main axis: Knowledge formation, Knowledge operation and Knowledge maintenance.

Nonetheless, the paper still has some shortcomings in modelling. There are few concrete business cases, and the data is still not enough. Furthermore, if supported by some mathematical tools, the paper will be more persuasive. I hope in further studies, the theoretical system can be continuously improved, forming a more systematic and comprehensive knowledge management architecture.

5 Conclusion

Based on the realization of corporate benefits. The paper focuses on researching and exploring the operating principles and methods of the "Pyramid Model" in knowledge management. It deeply analyzes knowledge management from three dimensions as "Knowledge Formation-Knowledge Operation-Knowledge maintenance". The model aims at penetrating knowledge management into each step of production and developing a reference plan for companies to earn more profits.

In 2018, multinational academics reach the consensus that we should promote organized and ecological knowledge management. The Pyramid Model get inspiration from the consensus and tries to be innovative. Some improvements can be realized in the future:

1) Enrich the theoretical basis of major dimensions of "Knowledge Formation-Knowledge Operation-Knowledge maintenance" to form a more solid foundation for knowledge management.

2) Gather more information of all kinds of enterprises, make more complete statistical analysis, collect and summarize information with a certain mathematical model.

3) Find out more about the relationship between the three dimensions and business benefits, provide comprehensive reform programs of knowledge management, and focus on the cultural differences between the East and West.

At home and abroad, it has been widely recognized that knowledge turns into the third capital of the world economy. The 21st century will be an era of knowledge blowout.Enterprises need to face challenges directly and form top-level knowledge management topologies of their own characteristics, making knowledge penetrate into all steps of production. Using knowledge to realize the profits of enterprises is the exact feature of the "Information Age".

A Research on Value Evaluation of Garbage Incineration Power Generation Project Based on B-S Model

Ye Jinling, Ye Houyuan
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 523159386@qq.com, yehy@whut.edu.cn)

Abstract: With the development of the economy and the accelerated process of urbanization, the amount of waste, such as domestic waste and industrial waste, is increasing rapidly, and the municipal solid waste is becoming a huge problem that hinders the development of the city. However, in the academia, there is no systematic evaluation method for the garbage incineration power generation project. So if we just simply apply the traditional evaluation method to the project, we would ignore the strategic value and ecological value of the project investment. Therefore, it is an urgent problem to find a new method of project valuation. In this paper, the B-S model of the option pricing model is selected, and on this basis, the market and policy factors that affect the model results are proposed. It is considered that the waste incineration power has the value of evaluation and the possibility of evaluating the results.
Key words: Garbage incineration power generation project; Real option; B-S model; Project evaluation

1 Introduction

Since nineteenth Century, industrial development has caused rapid population concentration in the world and the rapid development of urbanization. Because of this, garbage disposal has been becoming a worldwide problem. In China, the average daily garbage output per person is about 1 kilograms, and is increasing rapidly at the rate of 8%~10% per year, while the rate of innocuous treatment for domestic waste is only 51.7%. Garbage siege has become a huge obstacle to the development of contemporary cities.

So, with the development of the economy, the progress of technology and the spread of the concept of environmental protection, people began to seek a more sustainable way of garbage disposal. In this environment, garbage incineration power generation came into being. It is of great significance to explore a set of methods suitable for the evaluation of the investment value of the garbage incineration power generation project, because of the great market prospect, the large independent expansion space and the high esteem between the government and the people.

Foreign scholars have made some achievements in the study of this issue. For example, in 1987, Trigeorgis and Mason believed that the real value of the project could be evaluated with the value of the basic NPV plus real options[1]; the results of Hantzis and Tanguturi thought that real options theory could be used in some project investment decisions[2]; Schuhmacher considered the risk management of waste incineration projects, The Monte Carlo method can be used to understand what effect the incineration of garbage can have on the human body; in its study, Hertzman believes that enterprises should open garbage incineration technology and improve public acceptance of garbage incineration projects; Corjan B has established a dynamic and computable general equilibrium model to analyze the cost benefit analysis of the carbon emission allowance price adjustment in the EU carbon emission trading system[3]

In recent two years, scholars in China have begun to pay attention to this issue. Kang Zhentong uses the cost - benefit method to analyze the problems that need to be paid attention to in the calculation of the cost, cost and income in the economic evaluation of the BOT project of domestic garbage incineration. Zhu Feng used traditional cost-benefit analysis and sensitivity analysis to conduct an economic evaluation and analysis of a garbage incineration power generation project. Song Jinbo and some one else used the system dynamics model to evaluate the revenue of the BOT project of garbage incineration power generation, constructed the system dynamics model of the revenue of the BOT project of the waste incineration power generation, and simulated the situation with the actual case[4].

2 Analysis of the Characteristics

We generally think that the garbage incineration project is a kind of environmentally friendly, renewable energy generation project, and has been encouraged by the government and the strong support of public opinion[5]. Therefore, the following characteristics can be summed up through the

analysis.

(1) The irreversibility of investment. The development and construction of garbage incineration power generation projects requires specialized equipment such as incinerators, and the amount of investment is huge. Once capital is invested, it will be difficult to recover. And the equipment's specificity is very high. If the decision is to withdraw from the midway, the equipment can not be transferred to other usage. Therefore, once the initial investment is invested, it will become sunk cost and has strong irreversibility.

(2) the uncertainty of the return on investment. First of all, due to the large investment in the construction period of the garbage incineration generation and the imperfect income system of domestic waste, the return on investment of government subsidies is not definite. On the other hand, the electricity price income is also influenced by the state policy, the substitutes of complementary products, and the development of technology, and the return on investment is relatively strong. So, it may have some risks.

(3) the future growth space. In recent years, the shortage of energy resources, the problem of garbage besieging is the focus of attention at home and abroad. Garbage incineration power generation project has great strategic value for enterprises. With the intensification of global climate problems, China must shoulder the responsibility for reducing emission in the future, and the government's policy support for waste incineration will be further strengthened.

To sum up, the garbage incineration power generation project has the irreversibility of investment, the uncertainty of income and the growth of investment, which makes the future cash flow of the project face great uncertainty. The traditional discounted cash flow method (DCF) does not consider such uncertainty and is not applicable to the investment price evaluation of such projects. The real option evaluation method is to use the thinking of financial options to solve the problems existing in the real investment. In the project decision, the option analysis technology is adopted to conceptualize, quantify or model the problem of investment flexibility that the traditional DCF can't deal with[6].

3 The Construction of the Model
3.1 Applicability analysis of model
In the general research, there are three kinds of options pricing methods: B-S pricing model, two fork tree model and Monte Carlo simulation. The most widely used is the B-S model, which has several application preconditions. The price changes of the subject matter are in accordance with the random Brown movement, the subject matter is in a free trading market, the price changes into a continuous state, the price change rate can be measured and kept constant[7]. Next, the rationality of the B-S model applied to garbage incineration power generation project is analyzed first.

Without the influence of external policy or other contingency, the price of the garbage incineration power generation project usually changes in a continuous way, and does not take a large jump, which is in line with the random Brown movement. In addition, it is difficult to meet the requirements of the complete market in the B-S model, and China's carbon market is not perfect. However, this year, the continuous transaction, especially the CCER project of waste incineration, has been developing continuously, and the reasonable market transaction price is gradually forming, so it is now possible to assume the premise of satisfying the B-S model. Therefore, we can think that the B-S model can be used to calculate the theoretical price of options, but our assessors can also improve the adjustment according to the current market conditions.

3.2 Model construction
The classic B-S model is generally:
$$C = S*N(d_1) - L*e^{-rT}N(d_2) \tag{1}$$
$$And, d_1 = \frac{ln\frac{S}{L} + (r + 0.5*\sigma^2)*T}{\sigma*\sqrt{T}},$$
$$d_2 = d_1 - \sigma*\sqrt{T} \tag{2}$$

C—the initial reasonable price of the project,
L—option delivery price
S—the present price of the waste incineration project
T—validity period
R—continuous compound interest rate free interest rate
σ—the volatility of future revenue from waste incineration
This formula can be used as the pricing basis of our project value assessment, that is, the formula

for calculating the real option value of garbage incineration power generation. On this basis, because of the consideration of the enterprises, there are other factors that affect the value of the project, such as the changes in environmental related policies, the development of the related industries, the progress of environmental protection technology and so on. If the above formula is used to evaluate, it will bring value to be overestimated or underestimated. From this point of view, this paper will amend the above models in combination with environmental protection policy and technology development, in order to improve the accuracy of project value assessment.

The return value S of the expected cash flow of a project obeys the stochastic Brown motion law due to the influence of market uncertainties.

$$d_S = \mu * Sd_t + \sigma * Sdz \tag{3}$$

Among them, μ is the expected growth rate of S return, and σ is the volatility of future earnings growth.

In addition, considering the influence of technological progress and policy factors, the future expected earnings will change under the influence of these factors. It is foreseeable that the progress of garbage disposal technology will reduce the expected growth rate of future revenue .And its possible to change from μ to $(\mu-a)$. In addition, changes in the relevant policies will lead to a larger fluctuation of future earnings growth and a change from $(\mu-a)$ to $(\mu-a+b)$, so the expected return S will change to:

$$d_S = (\mu-a+b) * Sd_t + \sigma * Sdz \tag{4}$$

According to Ito lemma, the revised B-S pricing model is:

$$C = S * e^{(b-a)T} * N(d_1) - L * e^{-rT} N(d_2) \tag{5}$$

$$\text{And,} d_1 = \frac{ln\frac{S}{L} + (r+b-a+0.5*\sigma^2)*T}{\sigma*\sqrt{T}},$$

$$d_2 = d_1 - \sigma * \sqrt{T} \tag{6}$$

3.3 The determination of wave rate σ

Commonly, the methods used to determine the wave rate are the approximation method of historical return volatility and the iterative method. However, because the garbage incineration power generation project is still in the emerging stage, and the historical data are limited, and the future development is also faced with many uncertainties, so it is difficult to predict the volatility of future income accurately with the limited historical data. The iterative method is used to measure and calculate the variable speed iteration.

The so-called variable speed iterative method is that each iteration is not an increasing number of Q elements, but the expert determines how many elements each time according to their own decision. Each increment may be certain, perhaps not necessarily, the result of this iteration is more in line with the actual situation, and can also better express the expert opinion.

$$m(u_i) \triangleq \frac{\sum_{j=1}^{n} \sum_{s=1}^{tj} C_{U_S^{(j)}}(u_i)}{\sum_{j=1}^{n} t_j} \tag{7}$$

In order to be more precise, each expert should memorizing m times without memory. After the iteration process is terminated, we also calculate the coverage frequency of u_i, $i=1,2,... k$;

Among them, t_j is the termination step of the iteration process of the j evaluator, and the result is that the arithmetic mean of the m result is obtained.

$$w_A(u_i) = m(u_i)/\sum_{i=1}^{k} m(u_i), \tag{8}$$

and then, the σ obtained.

4 Conclusion

With the development of economy and the increasing number of garbage, the garbage incineration power generation project has become a hot issue in the society. Since the traditional net cash flow method is unable to meet the needs of the project asset evaluation, we combine the other methods of intangible assets assessment, such as real option method, to explore a new way ,using for this kind of value assessment. However, this paper only discusses the factors that affect the results from the market impact and policy impact, but does not pay attention to the social and environmental impacts of such projects, which is still not perfect and needs further research and discussion.

for their kind cooperation. Finally, thanks to ICIM for giving me this opportunity.

Research on Countermeasures for Efficient Flow of Science and Technology Resources to Small and Micro Technological Enterprises: A Case of Hubei Province

Wu Xia[1], Cheng Yanxia[2]
1 Wuhan Huaxia University of Technology, Wuhan, P.R.China, 430223
2 Wuhan University of Technology Wuhan, P.R.China, 430070
(E-mail: sunnywu529@163.com, chengyanxia221@126.com)

Abstract: Science and technology resources are critical for fast development of small and micro technological enterprises. In this paper, the possession of science and technology resources by small and micro technological enterprises of Hubei Province is investigated to analyze main problems with the flow of science and technology funds, talents and outcomes to small and micro technological enterprises, in order to find out causes of these problems. At last, pertinent counter measures and suggestions favourable for efficient flow of science and technology resources to small and micro technological enterprises are brought forth.
Key words: Science and technology resources; Small and micro technological E\enterprises; Efficient flow; Transformation of scientific and technological outcomes

1 Introduction

Small and micro scientific and technological enterprises are crucial supporting forces for rapid development of strategic emerging industries in Hubei Province. Science and technology resources are critical for fast development of these enterprises. In particular, quantity and quality of science and technology funds, talents and outcomes are directly associated with development pace and competitive advantages of these small and micro enterprises. Micro and small technological enterprises' improvement of their creativity is directly impacted by efficiency and effectiveness of transfer, cooperation, sharing and transformation during the flow of science and technology funds, talents and outcomes.

Domestic and foreign scholars mostly focus on studying implications, compositions and allocation of science and technology resources. Adam Smith（1766）considered that effective resource allocation can boost the productivity of society.Zhou Jizhong (1999) put forward that science and technology resources, which couldn't be imitated or copied within certain period, could create considerable economic benefits for enterprises, directly or indirectly promote scientific and technological progress, and facilitate sustainable economic development.Kim, Lanus, Dahl man and Carl-J(1992) considered that science and technology resources belonged to a complete dynamic system that was made up of three resource factors, namely human resources, funds, material resources and information in sciences and technologies; they elaborated demand and supply of science and technology resources as well as their connections from the perspective of market mechanisms based on market theories. Fan Decheng and Du Mingyue (2017), who established an index system of resource allocation and evaluation for technological innovations of industries, empirically analyzed the efficiency of resource allocation for technological innovation of high-end equipment manufacturing and corresponding factors. Wang Fan (2018) analyzed features, laws and methods of allocation of science and technology resources in markets. In studies about small and micro technological enterprises, domestic and foreign scholars have mostly focused on exploring status quo and financing of small and micro technological enterprises. For instance, Jian Ya Gu（2014）considered that the financing difficulties of small and medium-sized technology enterprises are the main factors restricting their development.Cai Xiaolin (2016) explored development status of these enterprises and related factors. Han Junhua et al (2017) analyzed problems with inclusive finance in small and micro technological enterprises and corresponding strategies. Above all, domestic and foreign scholars have seldom studied the flow of science and technology resources to small and micro technological enterprises. This paper focuses on investigating countermeasures for facilitating efficient flow of science and technology funds, talents and outcomes to small and micro scientific and technological enterprises in combination with compositions of science and technology resources, so it is of relatively great theoretical and realistic significance.

2 Basic Situation of Existing Science and Technology Resources in Small and

Micro Technological Enterprises of Hubei Province

In Hubei Province, small and micro technological enterprises are mostly in strategic emerging industries and relevant high-techindustries, including biology, medicine, optoelectronic information, new materials, optical-mechanical-electrical integration, resources, environment, new energies, energy efficiency and high-tech services. In Hubei Province, small and micro technological enterprises are mostly in Wuhan (including Wuhan Pioneer Park for small and micro technological enterprises, Pioneer Park for University Students, Wuhan Optics Valley Software Park and Guanggu Bio City), Huangshi, Xiangyang and Yichang, as shown in Table 1. Hence, the respondents and samples investigated in this study are also mostlyin following areas.Questionnaire surveys and interviews were performed. 300 questionnaires were issued and 265 valid questionnaires were recovered at a recovery rate of 88% or so.

Table 1   Industrial and Regional Distribution of Small and Micro Technological Enterprises in Hubei Province

Industries	Regional Distribution
New-generation Information Technologies	National key optoelectronic information industry bases of Wuhan East Lake High-Tech Development Zone; electronic industrial bases of Yichang, Jingzhou and Suizhou
High-end Equipment Manufacturing	Industry bases for smart equipment in Wuhan and Xiangyang, industry bases for ocean-engineering equipment in Jingzhou; aerospace industry bases in Jingmen, Xiangyang, and Huangpi, Wuhan.
New Materials	Wuhan East Lake High-Tech Development Zone; bases of energy storage materials in Yichang and Suizhou; bases of new metallurgical materials in Huangshi and Qingshan, Wuhan; bases of new chemical engineering materials in Yichang, and Yangluo, Wuhan
Biological Medicine	Wuhan National Biological Industry Base; Yichang Biological Industry Park Bio-pharmaceutical industry bases in Tianmen, Yidu, Wuxue and Qichun; bio-pharmaceutical bases in Xiangyang, Jingzhou and Jingmen
Energy-efficient and Environment-friendly	Wuhan East Lake Industry Base for Energy-efficient and Environment-friendly Equipment; large circular economy demonstration areas in Qingshan, Yangluo and Ezhou; industry bases for resource recycling in Yichang, Jingmen and Gucheng
New Energies	Industry bases for nuclear power equipment in Yangluo and Jiangxia, Wuhan; Wuhan East Lake High-Tech Development Zone; PV industry bases in Yichang and Suizhou; Solar Demonstration Base on Huangjin Mountain of Huangshi; Ezhou Solar-thermal Industry Base

2.1 Science and technology funds

As per a survey, small and micro technological enterprises of optical-mechanical-electrical integrated industries have invested as high as RMB6,000,000 in research and development at maximum. In bio-pharmaceutical industries, these small and micro enterprises' investments in research and developmenthave been equivalent to 65.9% of the total sales revenues at most. After their incorporation, thesmall and micro technological enterprises will make more and more investments in research and development. The sources of scientific research funds include government support, private investments, sales revenues, self-financing, financing, declared provincial/municipal projects, free foundations, bank loans, Angel Investment and risk investments. 45.8% scientific research funds of small and micro technological enterprises come from government support, while self-financing occupies 37.5% of these funds.

Table 2   Information about Research & Development Funds of Small and Micro Technological Enterprises in Different Industries

Different Industries	Total Amount of Investments in Research and Development (RMB)	Ratio between the Amount of Investments in Research & Development and Total Sales Revenues (%)	Ratiobetween Government Funds and Total Investments in Research & Development (%)	Ratio of Technical Products to Total Outputs (%)
ElectronicsandInformation (Software Research & DevelopmentandCommunication Networks and so on)	4,336,200.00	56.637	15	69.5
Biology and Medicine	4,289,100.00	65.9	29.5	40.18
New Materials	522,900.00	40.71	32.85	91.42
Optical-mechanical-electrical Integration	6,000,000.00	6	5.8	80
Earth, Space and Ocean Engineering	250,000.00	20	0	100
Others	500,000.00	5	0	70

2.2 Science and technology talents

A survey suggests that 53.8% small and micro technological enterprises have their own research & development institutions and scientific research teams. Each scientific research team is approximately made up of 11.97 members on average, including 1.52 members with Ph.D. Degree, 4.09 members with Master's Degree, 5.2 members with Bachelor's Degree, 0.17 experts enjoying government allowances, 0.52 members with senior titles and 1.03 members with intermediary titles. These three years, 4.15 and 1.55 science and technology talents have annually flown into and out of the small and micro technological enterprises on average. Each talent has been trained for 3.67 times and received continuing education for 1.27 times. The monthly salaries of these talents are RMB24,545.45 per capita, while companies lack 2 science and technology talents a year.

2.3 Outcomes and information about sciences and technologies

Small and micro scientific and technological enterprises have seldom made profitsin sciences and technologies. On average, each small and micro scientific and technological enterprise has cumulatively owned 2.85 patentson average, 3.64 patents at most in the biomedicine industry, and particularly 9 utility patents in photoelectric integration since they were established. In Hubei Province, scientific research institutions, universities and internet are important channels for small and micro technological enterprises to acquire information about sciences and technologies in the early period of their founding and during their development. Those mature enterprises obtain information from leading science and technology conferences, as they have become scientifically and technologically advanced with certain capacity for scientific research. However, deficient circulation of sciences/technologies and lack of trading platforms hinder efficient flow of science and technology outcomes to small and micro technological enterprises.

3 Major Problems with Efficient Flow of Science and Technology Resources to Small and Micro Technological Enterprises

3.1 Poor awareness of preferential supporting policies, small benefits and limited sources of science and technology funds

There is a great shortage of funds for small and micro technological enterprisein the growth stage. According to a survey, 69.8% enterprises have poor awareness of and benefit a little from preferential supporting policies of science and technology funds. In Hubei Province, the funds of small and micro technological enterprises are mainly from self-financing, venture capital funds and innovation funds in the early start-up stage. The proportion of funds from self-financing and banks has increased to 69.6% and 26.1% respectively during the growth of these enterprises, but venture capital funds only occupy less than 1%. University students' entrepreneurship is essential for small and micro technological enterprises in Hubei Province.In the growth stage of these enterprises, 90% funds are obtained from self-financing, whereas less than 10% funds are raised from banks and venture capital funds. In the process of their growth, 78.3% small and micro technological enterprises are short of funds. Thus, it is clear that small and micro technological enterprises don't have many platforms and channels for obtaining funds. It is more difficult for these enterprises to get science and technology funds.

3.2 Inadequate reserves of science and technology talents, great lack of backbone research & development talents, incomplete scientific research teams and brain drain in small and micro technological enterprises

The science and technology reserves are rather scarce in small and micro technological enterprises. A survey suggests that 63.1% small and micro technological enterprises heavily lack science and technology reserves, suffering from a heavy lack of backbone research & development talents. Scientific research teams of 85% small and micro technological enterprises have inadequatecapacity for scientific research, technological integration and titles. These teams are so unstable that they aresubject to great loss of members. In particular, small and micro technological enterprises even become talent training bases for large scientific and technological enterprises. Especially in the early start-up stage ofover 70% small and micro technological enterprises, more than 80% members of scientific research teams are elementary research personnel. With weak capacity for research & development, scientific research teams achieve very few outcomes in scientific research with independent intellectual property rights. In addition, the science and technology outcomes introduced into these enterprises can be hardly industrialized with high efficiency.

3.3 Great lack of self-owned science & technology outcomes, weak roles of science & technology intermediaries and great difficulties in introducing the outcomes

Firstly, small and micro technological enterprises have achieved very few outcomes in sciences and technologies. According to a survey, each small and micro scientific and technological enterprise has only cumulatively possessed 2.85 patents on average. Secondly, it is extremely hard for these enterprises to introduce science and technology outcomes. Only 40% universities and scientific research institutions are willing to transfer science and technology outcomes to small and micro technological enterprises. Relatively few market-oriented approaches are available for the flow of science and technology outcomes to small and micro technological enterprises. 65.2% outcomes flow through platforms of industries, universities and research institutions. About 5.6% outcomes flow by investing in technologies and starting up scientific & technological enterprises. However, other market-oriented approaches for transforming science and technology outcomes only account for 8.7%. Thirdly, science and technology intermediaries play weak roles. Hubei Province is a leading province in sciences and technologies, where there are 16 national demonstration organizations for technology transfer, 16 provincial similar organizations, and several workshop-style technology intermediaries. Hence, the general scale of science and technology intermediaries is small in this province. Owing to weak strengthsof these enterprises, the conversion rate of patented outcomes is low.

4 Countermeasures for Efficient Flow of Science and Technology Resources to Small and Micro Technological Enterprises

4.1 Improving policy guidance, communication and implementation; establishing long-acting sustainable mechanisms for guiding the flow of science and technology funds

First of all, efforts shall be made to develop diverse channels for communicating supporting policies about science and technology funds for small and micro technological enterprises. It is necessary to expand channels for policy communications, diverse the ways for communicating policies and transform one-way communications into two-way coordinated communications. Governments ought to allocate "policy guidelines for small and micro enterprises", create efficient convenient media or carriers for communicating information regarding policy support, develop models for coordinated policy communications with enterprises, select typical enterprises and promote policies in different industrial parks. Secondly, growth funds shall be constructed for small and micro technological enterprises, in order to reinforce extended supporting roles of venture capital funds from governments, make social capitals more attractive and fully accommodate these enterprises' needs for science and technology funds. The appeals of social funds such as finance, venture capitals and funds may be enhanced based on growth funds. Furthermore, platforms may be built for sustainable flow of science and technology funds via concerted efforts of governments, banks and venture capitals. Thirdly, "post-subsidization" policies shall be formulated for small and micro technological enterprises.For enterprises that make outstanding contributions to government-level science and technology programs (including science & technology programs of Hubei Province and special science & technology programs) as project participants and have project achievements industrialized in part, fiscal funds may be allocated to them based on their project achievements upon the completion of projects. At the end of projects, hierarchical rewards may be set and granted for those enterprises which are involved in strategic emerging industries or pillar industries of Hubei Province, achieve technological outcomes with prominent contributions to industry development, or possess domestic or foreign advanced technologies and industrialize them. Fourthly, guide financial institution to establish life cycle and credit evaluation systems for small and micro technological enterprises. Increase non-financial indexes for credit evaluation and establish credit evaluation systems for small and micro technological enterprises with "one guarantee, three items, one certificate and three qualifications" in their start-up stage. "One guarantee" refers to credit guarantee, namely offering guarantee with guarantee contracts or by undertaking national and provincial science and technology programs. "Three items" comprise of "moral standing, products and collaterals". "One certificate" is "rental certificate for corporate officers or property ownership certificate for the offices". "Three qualifications" include "qualifications for production/operations, professional and technical qualifications", which signify the capacity of small and micro technological enterprises in technologies, research and development. Construct internet-style credit recording and evaluation systems for small and micro growing scientific and technological enterprises that aim at both individuals and enterprises. Integrate entrepreneurs' personal credit with credit of enterprises and treat their credit in different banks as basis for subsequently evaluating their credit for loaning from banks.

4.2 Establishing enterprise and market-oriented talent reserve systems for small and micro technological enterprises under the guide of governments

At first, build "two major platforms" for talent development in small and micro technological enterprises for the purpose of increasing market attractiveness. Build a range of supporting, functionally complete and unique industrial development platforms with respective extraordinary characteristics for small and micro technological enterprises by orienting towards small and micro technological enterprises, within parks for small/micro enterprises and aiming at small and micro technological enterprises, so as to make physical environment of these enterprises' talent markets more attractive. Launch policies about housing subsidies for science/technology talents at different levels and improve platforms suitable for living or settling down. Secondly, construct vigorous incentive mechanisms for science and technology talents of small and micro technological enterprises. Execute shareholding plans for core science and technology plans of enterprises and integrate leading science/technology talents with development prospects of enterprises, in order that enterprises and talents share risks and revenues. Allocate revenues from science and technology outcomes and grant more rewards for science/technology innovations. Build different development channels for different types of science and technology talents. Thirdly, expand platforms and channels for small and micro technological enterprises to introduce talents; promote intensive coordination between policy environment and regional construction of talent bases. Build and enrich information bases for leading science and technology talents of small and micro technological enterprises; draft and implement funding plans for talents of these enterprises. Bring the roles of talent pools into play in universities and scientific research institutions through joint efforts of governments, universities and enterprises. Establish small and micro technological enterprises to cooperatively initiate projects by taking advantage of enterprises, universities, research institutions and professional reforms. Encourage experts and professors of universities and scientific research institutions to pay attention to small and micro technological enterprises. Fourthly, introduce models for governments, universities, scientific research institutions, small and micro technological enterprises to jointly build incubation bases or virtual operating organizations for these enterprises. Universities or scientific research institutions provide offices, incentive start-up funds, entrepreneurship advisors and research & development teams (made up of mentors and postgraduates); small and micro scientific   and technological enterprises provide platforms for   practising and make science/technology outcomes market-oriented; governments offer more policy support and guidance; enterprises set up core research & development departments inside universities or scientific research institutions, so that these enterprises may introduce requisite talents efficiently and improve existing scientific research personnel's strengths in research & development.

4.3 Bringing roles of market intermediaries and governments in promoting efficient flow of science and technology outcomes to small and micro technological enterprises

Firstly, build technical alliances for small and micro technological enterprises. These enterprises shall collaborate and complement each other in resources for technological innovations, share resources, centralize their creative resources and technologies, take advantage of their clusters and jointly declare projects of special funds within the industry for increasing the success rate of obtaining special funds. Governments are expected to encourage universities and scientific research institutions to build technical alliances for small and micro technological enterprises, make concerted efforts to explore common key technologies for these enterprises, buildcomplete channels for cooperation, facilitate overall technological breakthroughs of these enterprises, enhance creativity of the enterprises, promote the flow of science/technology outcomes to these enterprises and stimulate transformation of these outcomes. Secondly, build cloud-based information platforms for seamless transfer of science and technology outcomes and bring the dominant roles of commercialized markets into full play. Give the roles of competitive market mechanisms into play. Regulate intermediary markets based on the law about the "survival of the fittest" and support development of private science/technology intermediaries. Governments shall support intermediaries which are entrusted to transform major science and technology outcomes of this province by offering them subsidies for the transformation and purchasing services from them, so as to improve quality of intermediaries in Hubei Province. Improve platforms for exchanging information about science and technology outcomes; build national cloud-based big data platforms for information about sciences and technologies (including patents and technologies) under the lead of industry associations; gradually build information service platforms for efficient flow of science and technology outcomes to small and micro scientific and technological enterprises, integrating services of information retrieval, application, evaluation, examination/approval, trading, investment, financing and evaluation, in order to share information, bring roles of market into play in resource allocation, and promote efficient cooperation between suppliers and demanders of these outcomes through markets.

5 Conclusion

It cost more than a year to issue and collect the survey questionnaires. Although 300 questionnaires were allocated, only 88% valid questionnaires were recovered. Besides, this survey only focused on small and micro technological enterprises of Hubei Province, whereas questionnaires were not issued in other provinces, so empirical research with a larger sample size may be conducted in the future. In this paper, policy suggestions concerning efficient flow of science and technology resources to small and micro scientific and technological enterprises are put forward based on the survey conditions. In the future, attempts may be made to deeply and empirically explore the influence mechanisms of science and technology resources as well as the growth of these enterprises.

An Empirical Study on the Resource Allocation Efficiency of Private Universities Based on DEA: A Case Study of 21 Private Universities in Hubei Province

Yin Xinrui, Xu Hongyi
School of Education, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 344286091@qq.com, steven_64@163.com)

Abstract: Principal component analysis is used to screen indicators for the allocation efficiency of compulsory education resources. The DEA analysis method combined with the screening indicators is used to evaluate the input output efficiency of the allocation of educational resources in private universities. This paper makes an empirical analysis of the allocation of educational resources in 21 private universities in Hubei province. The overall efficiency of the input and output of educational resources allocation in private colleges and universities in Hubei is relatively high, but there are some differences because of the different organizers. The causes of non DEA are overinvestment, insufficient investment and backward management. The allocation of educational resources in private colleges and universities should be controlled to increase the efficiency of the scale, promote the balanced and sustainable development of private education, establish the advanced education concept of private colleges and universities, and create a unique college culture.
Key words: DEA; Private university; Resource allocation efficiency; Hubei

1 Introduction

The scarcity of resources makes the efficiency of resource allocation as a measure of the rational degree of resource allocation from the economic field to the field of education, and mainly studies the problem of the investment and output of resources. The research on the efficiency of educational resources allocation in China begins only in the late twentieth Century. Since the reform and opening up, private education has been growing and expanded, effectively increasing the supply of education services, making positive contributions to promoting the modernization of education and promoting the economic and social development, and has become an important part of the socialist educational cause. On 2017 01, 18, the State Council issued several opinions on encouraging social forces to set up education to promote the healthy development of private education.(Wei Quanling,2000)The opinion stressed that encouraging social forces to set up education and promoting the healthy development of private education is an important task that concerns both current and long-term interests. This paper combines the principal component analysis with the DEA method to explore the index selection of the allocation efficiency of education resources. In addition, through the empirical analysis of the investment and output efficiency of the 21 private colleges and universities in Hubei Province, this paper concretely understands the efficiency of the allocation of private education resources and the main problems facing them.(Wei Quanling,1998)

2 Methods, Indexes and Selection of Samples

2.1 Overview and advantages of DEA method

At present, there are many kinds of evaluation methods, such as analytic hierarchy process (AHP), fuzzy comprehensive evaluation method, grey relational grade evaluation method, etc., because the above methods have the limitations of subjectivity in determining the weight of indexes, and the constraints on the correlation among the indexes are not easy to be tested, and the results can not be adjusted. (Wei Quanling, 2012)Therefore, the paper chooses DEA method to comprehensively evaluate the efficiency of education resource allocation.

As a statistical analysis method, the DEA method has an absolute advantage in dealing with multiple target decision problems with multiple transmission and multiple outputs. It is mainly to determine the relative effective production frontiers by means of mathematical programming and statistical data by keeping the transmission or output of the decision unit unchanged. Each decision unit is projected to the DEA. The relative effectiveness of the decision making unit deviating from the DEA frontier is evaluated on the frontier of production. In determining the relative effectiveness of decision making units, each decision unit is optimized, so the relative efficiency is the maximum, and the selection of weight is also optimal, which avoids the subjectivity of the traditional method in the weight

selection. At the same time, the DEA method, aiming at non effective units, will use "projection principle" not only to give the direction of the adjustment of the index, but also to give the accurate quantity of the adjustment of the index, and it has the idea of optimization.(Yu-Chuan Chen, Yung-Ho Chiu,Chin-Wei Huang,ChienHeng Tu,2012)

Using an input-based C2R model with non-Archimedean infinity (1), the overall efficiency can be evaluated. Using the input-based BC2 model with non-Archimedean infinitesimal (2), its technical efficiency can be evaluated. Finally, using the overall efficiency/technical efficiency, that is $s^* = \dfrac{\theta^*}{\sigma^*}$, to achieve economies of scale. As the model shows:

$$
(D_\varepsilon)\left\{
\begin{aligned}
& Min\left[\theta - \varepsilon\left(\hat{e}^T s^- + e^T s^+\right)\right] \\
& \sum_{j=1}^{n} \lambda_j x_j + s^- = \theta_{x0} \\
& \sum_{j=1}^{n} \lambda_j x_j - s^- = y_0 \\
& \lambda_j \geq 0, \quad j = 1, \cdots, n, \\
& s^- \geq 0, s^+ \geq 0.
\end{aligned}
\right\} \tag{1}
$$

$$
(D_\varepsilon)\left\{
\begin{aligned}
& Min\left[\theta - \varepsilon\left(\hat{e}^T s^- + e^T s^+\right)\right] \\
& \sum_{j=1}^{n} \lambda_j x_j + s^- = \sigma_{x0} \\
& \sum_{j=1}^{n} \lambda_j x_j - s^- = y_0 \\
& \sum_{j=1}^{n} \lambda_j x_j = 1 \quad \lambda_j \geq 0, \quad j = 1, \cdots, n, \\
& s^- \geq 0, s^+ \geq 0.
\end{aligned}
\right\} \tag{2}
$$

According to the C2R model and the BC2 model, the result data in the Efficiency Summary and Summary of Output/Input Slacks are entered in the table: DMU is the name of the 21 private universities in turn; θ* is the overall efficiency value, and σ* is the technical efficiency. Use $s^* = \dfrac{\theta^*}{\sigma^*}$ derived S* scale benefit value。 According to the results of the DEA method founders Charnes and Cooper et al., "The necessary and sufficient condition for the decision-making unit DMU to have constant returns to scale is to have a scale return value of 1".

Because of the use of DEA method for efficiency evaluation, we need to test the output variables by correlation, avoid too much correlation and improve the accuracy of evaluation, so the paper first uses the principal component analysis method and the SPSS software to screen the index before the DEA evaluation.

2.2 Selection of indexes and selection of samples

Considering the availability of data, according to the statistical data of the official network of private colleges and universities, 7 variables are selected preliminarily: the area of the school, the area of the building, the number of the colleges, the number of professional, the total number of books in the library, the total number of full-time teachers, the number of teachers with Senior title, and the X1 - X7, respectively. The output of the variable includes two aspects. On the one hand, the number of students is trained by the school. The number of students is taken as a measure of the "number" of the school output. On the other hand, the quantity of the "quality" of the students is trained by the school. Here, the students' first employment rate is taken as a measure of the "quality" of the school output, which is expressed in Y1 - Y2, respectively.(Fan JiXuan,2013)According to the analysis, the contribution rate and extraction rate of each component of the index are obtained. (Table 1)

Table 1   Principal Component Analysis

componet	Initial eigenvalue			Extraction sums of squared loadings			
	total	%of variance	cumulative%	total	%of variance	cumulative%	extraction
1	4.943	70.615	70.615	4.943	70.615	70.615	.601
2	.728	10.395	81.010	.728	10.395	81.010	.736
3	.466	6.660	87.670	.466	6.660	87.670	.401
4	.292	4.170	91.840	.292	4.170	91.840	.756
5	.279	3.991	95.831	.279	3.991	95.831	.815
6	.224	3.197	99.028	.224	3.197	99.028	.895
7	.068	.972	100.000	.068	.972	100.000	.740

3 DEA Analysis Results

3.1 Overall results

Using DEA-SOLVER Pros software, we input data from 21 private colleges and universities, and get results through CCR and BCC model analysis. (Table 2)

Table 2   DEAAnalysis Results (Partial Results)

DUM	Crste	Relative effectiveness	Vrste	Technical effectiveness	Scale	Scale effectiveness
DUM1	0.827	Invalid DEA	0.829	invalid	0.998	drs
DUM2	1.000	DEA is valid	1.000	valid	1.000	-

DUM5	1.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000
DUM6	1.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000
DUM7	1.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000

According to the abovetable, The amount ofresources that can be reduced by investing resources in the educational resources of private universities in Hubei Province in 2017 is: the average area of each school is reduced by 37.376 mu, the average building area can be reduced by 11 thousand and 700 square meters, and the average professional number is reduced by 4.The volume of paper collections in the library decreased by 26 thousand and 290 copies, the number of full-time teachers decreased by 10, and the number of teachers in sub high schools and above decreased by 4.(Wang Qi,2015)

4 Conclusions
4.1 Control scale and improve efficiency
From the previous analysis, we can see that promoting the balanced and sustainable development of education, the efficiency of the investment and output of 21 private colleges and universities in 21 private colleges and universities is 0.991, and the overall efficiency of the allocation of resources is high, but there is still a certain gap between the different hosts. The reasons for the invalidity of resource allocation in private colleges and universities in Hubei are summarized as follows: first, the irrational or unfair allocation of resources is unreasonable. Most schools have the situation of overinvestment in resources, which is mainly manifested in the blind expansion of campus area in schools to obtain land value-added income. A small number of schools have insufficient investment in resources, which has affected the scale and efficiency of resources input.(Bougnol M-L,Dula J H,2006)Second, the management level and system construction of the resource allocation is not complete, for example, the situation still exists because of the irrational management and utilization of the input resources, which leads to the idle resources or the low rate of resource output. Private colleges and universities have a single source of funds and lack of development potential. Most private universities in China are self -financing schools and adopt the path of "relying on tuition to run schools" and "snowball". The development of the school is subject to the accumulation of tuition, which causes some schools to not coordinate the relationship between the two and the expansion of the investment.(Jeannette Taylor,2001)The input of teaching funds is insufficient and it is difficult to guarantee the quality of teaching. Schools should pay full attention to the scientificity, rationality and effectiveness of the allocation of resources. For schools of too large scale, schools should concentrate their resources on teaching, improve the quality of teaching, improve management level and system construction, improve the efficiency of resource investment and output, and strengthen the schools with insufficient investment and high technical efficiency. On the other hand, it is necessary to increase the investment in resources, on the other hand, to supervise the improvement of the system construction and management level, and to enhance its comprehensive competitive power. (Abbott M, Doucouliagos H, 2004)
4.2 Setting up the advanced education concept of private universities and creating a unique and charming university culture.
Although the private university is only a private profit organization, it is still a member of the social family, so it should not only pursue the economic profit, have the sense of the times, have the time responsibility, and establish the people oriented teaching management idea to take on the social responsibility and use the same storage. Different attitudes encourage the interweaving of different views, optimize the teaching management based on the concept of people-oriented and democratic decision-making, take the historical mission from the perspective of serving the society, and cultivate more outstanding talents for the Chinese dream.Culture is a treasure, a spirit, and a valuable asset. For colleges and universities, culture is the soul and blood of colleges and universities. It is a lighthouse for all teachers and students, guiding all teachers and students not afraid of difficulties and active

struggle.(Abbas Valadkhani,AndrewWorthington,2006) China's private universities started late, and many schools have not yet formed their own university culture. To create a unique campus culture is the only way to realize the connotative development of private universities. Combining its own advantages to create a unique charm of the university culture, to educate people by culture and make the university culture a spiritual home for all teachers and students, it is bound to insert a strong wing for the connotation development of private colleges and universities.

Abstract: The promotion of efficiency in running a university in interprovincial universities is an important aspect of supply-side structural reform. The scientific evaluation of the efficiency in running a university in interprovincial universities is the premise of gap analysis in higher education and further seeking ways to reform. This paper employs factor analysis to evaluate the input and output data of talent training in universities of China's 31 provinces (including autonomous regions) in 2013-2015. Meanwhile, the performance factors of the undergraduates and college students through unified entrance exam, performance factors of postgraduates, as well as the scores and rankings of comprehensive performance are obtained. Contrast and characteristic analysis are made based on rankings in combination with such strategies as "One Belt and One Road" and "Made in China 2025", the ways to promote performance of interprovincial universities are proposed for the purpose of further optimizing area arrangement and supply-side structure.
Key words: Interprovincial universities; The evaluation of efficiency in running a university; Factor analysis; Empirical study

1 Introduction

A series of measures have been taken to promote the efficiency of education since the National Medium-and Long-Term Plan for Education Reform and Development (2010-2020) was introduced, higher education has been greatly developed as a result. In 2015, the gross enrollment rate of China's higher education has reached for 40%, signaling the coming of the post-popularization period. However, with the advancement of popularization, there exist many problems of the imbalance between supply side and demand side in current higher education. For example, the imbalance between different regions and the structure of academic discipline, the loss of hierarchical structure and the separation of formal structure. The supply of higher education is closely related to the core elements such as labor (staff and students), land (basic resources), capital (school funds and intangible reputation) within the higher education system. The supply-side structural reform in higher education aims to pursue quality in universities and comprehensively reforms the core elements of higher education. The developmental focus will shift from the scale and quantity to structure, quality, efficiency and innovation（Jin Baohua, Liu Xiaojie，2016）. Under the guidance of national quality improvement and the performance orientation of fund allocation policies, the relevant data from higher education input and output in 31 provinces and cities in China from 2013 to 2015 were selected and the factor analysis was used to objectively evaluate the efficiency in running a university in interprovincial regions and to analyze the differences so as to provide practical guidance for structural reforms in the supply side of regional higher education and ensure the healthy and balanced development of higher education.

2 Evaluative Indexes and Methods

2.1 Factors of affecting the efficiency in running a university and the construction of evaluative index system

From the perspective of economics, the efficiency (or performance) in running a university can be simply understood as "the comparison between input and output in universities", that is, the proportion of input to the university's work output in a certain length of time. As talent cultivation is the core task of universities, the efficiency of talent cultivation is mainly studied in this paper. According to the scientific, comprehensive, and operable principles of index system construction, the actual data with theoretical models are combined, that is, starting from the factors that affect the efficiency of talent cultivation, taking into a full consideration on the reality of talent cultivation in universities. Based on the existing research results and the accuracy and availability of relevant statistic data, the evaluative

index system is constructed by adopting the summary mode in this paper.

According to the key elements of supply side in higher education such as labor, basic resources, school funds and so on, the factors affecting the efficiency of talent training in universities are shown as follows: (1) Educators (the input of teachers), including full-time teachers, administrative staff, assistant and workers; (2)Educatees (students), including the scale, source and employment of students, etc. (3) Financial investment, which currently remains the main channel for educational funding in education; (4) Material input, which refers to school buildings, equipment, books, etc.

To summarize the above analysis, the evaluation of efficiency in running a university consists of three dimensions i.e. scale, input, and output. The scale is the basic index of higher education institutions and students in a certain area, reflecting the capacity of higher education in the region. The investment in human, financial, and material resources is the basic guarantee for the talent training quality while the output is the result and effect of personnel training. Therefore, in accordance with the relevance to personnel training, the availability and importance of data, this paper selects the following main indexes: the number of higher education institutions, the number of students enrolled as general undergraduates and graduates, the investment of teachers, the expenditure on public finances, material inputs such as books, classrooms, fixed assets and so on, the number of undergraduates and college students awarded diplomas, the number of undergraduate and college students awarded degree certification, etc. The specific scale indexes include: X_1 the number of higher education institutions, X_2 the graduate students enrollment, X_3 the undergraduate and college students enrollment, X_4 the number of graduate students, X_5 the number of the undergraduate and college students; input indexes include: X_6 the number of full-time teachers, X_7 the number of administrative staff, X_8 the number of support staff, X_9 the number of workers, X_{10} expenses of public finances education, X_{11} sports venues, X_{12} books, X_{13} the number of computers, X_{14} classrooms, X_{15} fixed assets; output indexes include: X_{16} the number of graduates awarded diplomas, X_{17} the number of graduates awarded degrees certification , X_{18} the number of undergraduate and college student awarded diplomas, X_{19} the number of undergraduates and college students awarded degree certification.

2.2 The method of evaluation
2.2.1 The Selection of Method

Based on 19 variables that can be observed in relation to talent cultivation, the efficiency in running a university in 31 provinces were measured and the correlation between them was analyzed, so that the key factors affecting the differences could be found. The evaluative index system is complex and the workload is rather heavy. The method of factor analysis is one of the multivariate statistical analysis, which explores the internal structure of the correlation coefficient matrix of variables and finds a few random variables that can control all variables to describe the correlation among multiple variables, thereby the observation system is simplified and quantitative evaluation of each sample is ultimately implemented (Xu Qian,2012). It matches the characteristics of the evaluation of efficiency in running a university in interprovincial universities, which in turn greatly reduces the difficulty of evaluation work and improving work efficiency (Costello, A. B., Osborne, J. W., 2009). Therefore, the method of factor analysis is adopted in this paper.

2.2.2 The adaptive test of method

According to 19 evaluative indexes constructed, the basic data of the education statistics in universities in 31 provinces and cities in China published by the Ministry of Education website from 2013 to 2015 were selected to evaluate (Ministry of education of the People's Republic of China,2014, 2015, 2016). Due to the large number of indexes, the original data used here were omitted. At the same time, the data of the 19 sample indexes were all positive, the standardized processing of which was unnecessary. With SPSS software (Zhang Wentong,2002), KMO test statistics and Bartlett's spherical test methods were used to perform factor analysis adaptive test on the samples. The calculative results were as follows: KMO for 2013,2014,2015 was respectively 0.839, 0.858, and 0.844, so KMO has passed the test. At the same time, the companion probability was 0.000, less than the significance level of 0.05, indicating that Bartlett's spherical has passed the test, too. So, factor analysis was applicable to the selected sample data.

3 The Process of Evaluation
3.1 The determination and extraction of common factors
3.1.1 The Determination of Common Factors

The common factors are extracted with principal component analyzed via SPSS software. Taking

2013 as an example, after the decomposition of the total variance, it can be clearly seen that the eigenvalue of two factors is greater than 1after rotating, whose cumulative contribution rate is 96.234%. The specific calculative results are shown in Table 1.

Table 1   The Eigenvalue and the Contribution Rate of Cumulative Variance（2013）

compo nents	the initial eigenvalue			extract square and load			rotation of squares and loads		
	total	variance %	accumul ation %	total	varian ce%	accumula tion%	total	variance %	accumul ation%
1	15.238	80.199	80.199	15.238	80.199	80.199	10.790	56.788	56.788
2	3.047	16.035	96.234	3.047	16.035	96.234	7.495	39.446	96.234

3.1.2 The Analysis of Commonness.

From the calculative results of regeneration commonality in 2013, it can be seen that the commonality of all other variables was above 90% except for x_9 and x_{10}, whose common degrees were respectively 0.848 and 0.846, indicating that these sample variables could be explained by these two common factors, named them as F_1 and F_2.

3.1.3 The Loading Matrix of Factors and the Naming of Common Factors

From the calculation of the un-rotated loading matrix of factors, the factor load is relatively average, especially the common factor F_1 is between 0.740 and 0.982, and the relationship with each factor is not intuitive. In order to observe the sample more clearly, the variance maximizing orthogonal rotation method is used here to rotate the factor to obtain the rotated factor load matrix, which is shown in table 2.

Table 2   The Loading Matrix of Rotated Factors

X	Common Factor F_1	Common Factor F_2
x_{18}	0.972	0.208
x_3	0.970	0.192
x_5	0.967	0.226
x_{11}	0.958	0.240
x_1	0.915	0.338
x_{19}	0.911	0.387
x_{14}	0.910	0.273
x_6	0.900	0.430
x_{10}	0.880	0.267
x_{12}	0.879	0.466
x_{13}	0.726	0.658
x_7	0.670	0.725
x_{15}	0.649	0.727
x_8	0.606	0.783
x_9	0.522	0.759
x_{16}	0.214	0.975
x_{17}	0.214	0.975
x_4	0.190	0.979
x_2	0.187	0.979

From the loading matrix of rotated factors shown in Table 2, it can be known that 11 indexes including x_{18}, x_3, x_5, x_{11}, x_1, x_{19}, x_{14}, x_6, x_{10}, x_{12}, and x_{13} have a high load on the common factor F_1. The 11 indexes mainly reflect the status of input and output directly related to general undergraduates and college students and personnel training. Therefore, F_1 is named as the performance factors of the undergraduates and college students through unified entrance exam; The following 8 indexes, x_7, x_{15}, x_8, x_9, x_{16}, x_{17}, x_4, x_2, etc. have a high load on the common factor F_2. As the above 8 indexes mainly reflect graduate students and the input-output status indirectly relevant to the training of talents, F_2 is consequently named as a graduate performance factor.

3.2 The calculation of factor scores and comprehensive efficiency in running a university

3.2.1 The Calculation of Factor Scores

The factor score coefficient matrix A can be obtained by rotating the factor load matrix, as shown in Table 3. The formula for each factor score F is: F=AX, where A is the factor score coefficient and X is the original data.

Table 3   The coefficient matrix A of factor score in 2013

X	Common Factor F_1	Common Factor F_2
x_1	0.105	-0.037
x_2	-0.094	0.204
x_3	0.132	-0.078
x_4	-0.093	0.204
x_5	0.128	-0.070
x_6	0.091	-0.014
x_7	0.017	0.084
x_8	-0.001	0.106
x_9	-0.012	0.110
x_{10}	0.108	-0.049
x_{11}	0.124	-0.065
x_{12}	0.083	-0.003
x_{13}	0.034	0.061
x_{14}	0.112	-0.052
x_{15}	0.013	0.087
x_{16}	-0.089	0.200
x_{17}	-0.089	0.200
x_{18}	0.131	-0.075
x_{19}	0.098	-0.025

3.2.2 The calculation of comprehensive efficiency in running a university

The calculative formula for talent cultivation efficiency of colleges and universities in 31 provinces and municipalities in 2013 can be expressed as follows: Comprehensive schooling efficiency = $(56.788\% * F_1 + 39.446\% * F_2)/96.234\%$, specific scores of which are shown in table 4.

Table 4   The Scores of the Factors and Comprehensive Efficiency of 31 Provinces   in 2013

In the same way, the efficiency in running a university in 31 provinces and cities in 2014 and 2015

was evaluated, and the scores of various factors and comprehensive efficiency of 31 provinces and cities in 2014 and 2015 were also obtained.

4 The Results of Evaluation

In general, the higher the score, the better the school is run. A score of zero or a negative value does not mean that the efficiency in running a university is negative. It merely means the zero point of the average schooling efficiency. The corresponding rankings were obtained according to the scores of various factors and comprehensive efficiency of universities in 31 provinces during 2013-2015.

4.1 The evaluative results and presentation of changing trends

4.1.1 The Ranking of the Performance Factors of the Undergraduates and College Students through Unified Entrance Exam

The rankings of the performance factor F_1 of ordinary undergraduates and college students through unified entrance exam during the 2013-2015 in the 31 provincial colleges and universities were shown in Table 5.

Table 5   The Ranking of the Performance Factor F_1 of Ordinary Undergraduate and College Students through Unified Entrance exam

ranking	1-10	11-20	21-31
2013	Shandong Henan Jiangsu Guangdong Hebei Sichuan Hubei Hunan Anhui Zhejiang	Jiangxi Liaoning Shaanxi Fujian Shanxi Heilongjiang Guangxi Yunnan Chongqing Jilin	Guizhou Inner Mongolia Tianjin Xinjiang Gansu Shanghai Hainan Ningxia Beijing Qinghai Tibet
2014	Shandong Henan Guangdong Jiangsu Hebei Sichuan Hubei Henan Anhui Zhejiang	Jiangxi Liaoning Shaanxi Fujian Heilongjiang Shanxi Guangxi Chongqing Yunnan Jilin	Guizhou Inner Mongolia Tianjin Gansu Xinjiang Shanghai Hainan Beijing Ningxia Qinghai Tibet
2015	Shandong Henan Guangdong Jiangsu Sichuan Hubei Hebei Hunan Anhui Zhejiang	Jiangxi Liaoning Shaanxi Fujian Heilongjiang Shanxi Guangxi Chongqing Yunnan Guizhou	Jilin Inner Mongolia Tianjin Gansu Xinjiang Shanghai Hainan Beijing Ningxia Qinghai Tibet

From Table 5, we can see that the ranking of the performance factor F1 of general undergraduate and college students through unified entrance exam in 3 years: (1)For 3 consecutive years there are16 remaining unchanged, which are ranked as follows: Shandong 1, Henan 2, Hunan 8, Anhui 9, Zhejiang 10， Jiangxi 11, Liaoning 12, Shaanxi 13, Fujian 14, Guangxi 17, Inner Mongolia 22, Tianjin 23, Shanghai 26, Hainan 27, Qinghai 30, Tibet 31. (2) There are 8 rising trends, namely Beijing, Heilongjiang, Hubei, Guangdong, Chongqing, Sichuan, Guizhou and Gansu. In 2015, it increased by 1 compared with 2013. (3) There are 7 declining trends: Hebei, Shanxi, Jilin, Jiangsu, Yunnan, Ningxia and Xinjiang. Compared with 2013, the number of others fell by one with the exception of Hebei, which dropped by two.

4.1.2 The Ranking of Graduate Performance Factors

The ranking of graduate performance factors in interprovincial universities in 2013-2015 were shown in Table 6.

Table 6   The Ranking of Graduate Performance Factor F_2

ranking	1-10	11-20	21-31
2013	Beijing Shanghai Jiangsu Hubei Shaanxi Liaoning Sichuan Heilongjiang Jilin Guangdong	Tianjin Zhejiang Shandong Hunan Chongqing Fujian Hebei Gansu Yunnan Anhui	Shanxi Xinjiang Guangxi Inner Mongolia Jiangxi Qinghai Guizhou Hainan Ningxia Tibet Henan
2014	Beijing Shanghai Jiangsu Hubei Shaanxi Liaoning Heilongjiang Sichuan Guangdong Jilin	Tianjin Zhejiang Hunan Shandong Chongqing Fujian Hebei Gansu Yunnan Anhui	Shanxi Xinjiang Guangxi Inner Mongolia Jiangxi Hainan Ningxia Guizhou Qinghai Henan Xizang

Table 6 shows the ranking of graduate performance factor F_2 for three consecutive years: (1) There

are 11 without change, which are ranked as follows: Beijing 1, Shanghai 2, Jiangsu 3, Hubei 4, Shaanxi 5, Liaoning 6, Chongqing 15, Fujian 16, Hebei 17, Shanxi 21, Jiangxi 25. (2) There are 9 ascending trends: Inner Mongolia, Zhejiang, Anhui, Henan, Hunan, Guangdong, Guangxi, Hainan and Ningxia. In 2015 and 2013, Anhui, Guangdong, Hainan and Ningxia rose by 2 and Inner Mongolia, Zhejiang, Henan, Hunan, and Guangxi increased by one. (3) There are 11 downtrends: Tianjin, Jilin, Heilongjiang, Shandong, Sichuan, Guizhou, Yunnan, Tibet, Gansu, Qinghai and Xinjiang. Among them, Sichuan fell by one in 2014 compared to 2013, and it remained the same in 2015 to 2013; in both 2013 and 2015, Qinghai dropped by three, Xinjiang decreased by two, and the other 8 were all down by one.

4.1.3 The Ranking of Comprehensive Efficiency

The ranking of comprehensive efficiency in interprovincial universities in 2013-2015 was shown in table 7.

From Table 7, we can see that the rankings of the comprehensive benefits for 3 consecutive years are: (1) There are 21 without change, and they are ranked as below: Jiangsu 1, Shandong 2, Guangdong 3, Beijing 4, Sichuan 7, Tianjin 23, Hebei 10, Jilin 18, Zhejiang 12, Anhui 13, Jiangxi 16, Fujian 17, Hunan 11, Guangxi 21, Yunnan 22, Hainan 28, Gansu 26, Xinjiang 27, Ningxia 29, Qinghai 30, Tibet 31. (2) There are 4 increasing trends, namely Henan, Chongqing, Guizhou, and Shaanxi. The rank in 2015 all increased by 1 compared with 2013; Heilongjiang increased by 1 in 2014 and returned to the rank of 2013 in 2015. (3) There are 4 downtrends, namely Shanxi, Inner Mongolia, Liaoning, and Hubei, in 2015 all falling by 1 in comparison with 2013, except for Shanghai, falling by 1 in 2014 and returning to the same rank of 2013 in 2015.

Table 7   The ranking of comprehensive efficiency

ranking	1-10	11-20	- 31
2013	Jiangsu Shandong Guangdong Beijing Hubei Henan Sichuan Liaoning Shaanxi Hebei	Hunan Zhejiang Anhui Shanghai Heilongjiang Jiangxi Fujian Jilin Shanxi Chongqing	Guangxi Yunnan Tianjin 、 Inner Mongolia Guizhou Gansu Xinjiang Hainan Ningxia Qinghai Tibet
2014	Jiangsu Shandong Guangdong Beijing Hubei Henan Sichuan Shanxi Liaoning Hebei	Hunan Zhejiang Anhui Heilongjiang Shanghai Jiangxi Fujian Jilin Chongqing Shanxi	Guangxi Yunnan Tianjin Guizhou Inner Mongolia Gansu Xinjiang Hainan Ningxia Qinghai Tibet
2015	Jiangsu Shandong Guangdong Beijing Henan Hubei Sichuan Shaanxi Liaoning Hebei	Hunan Zhejiang Anhui Shanghai Heilongjiang Jiangxi Fujian Jilin Chongqing Shanxi	Guangxi Yunnan Tianjin Guizhou Inner Mongolia Gansu Xinjiang Hainan Ningxia Qinghai Tibet

4.2 The correlative analysis of the rankings among the comprehensive efficiency, general undergraduates and college students through unified entrance exam f_1 and graduate performance factors F_2

Here, the overall performance of top 10 for three consecutive years and the last 8 are analyzed.

4.2.1 The Comprehensive Performance of Top 10

(1) The following 4 provinces, Jiangsu, Guangdong, Hubei, and Sichuan, whose ranking of performance factors of the undergraduates and college students through unified entrance exam and graduate performance factors are all among the top 10, indicating that they all have comprehensive advantages. (2) Shandong, Henan, and Hebei Provinces ranked among the top 10 in terms of performance factors for general undergraduates and college students, indicating that they are evidently advantageous in the training of general undergraduates and college students. (3) The top 10 performance factors of graduate students in Beijing, Liaoning and Shaanxi provinces indicate that they are obviously superior in graduate students' training.

4.2.2 The provinces in which comprehensive efficiency ranked for three consecutive years

The comprehensive efficiency ranked the last 8 for 3 consecutive years are Guizhou, Inner Mongolia, Gansu, Xinjiang, Hainan, Ningxia, Qinghai, and Tibet. The performance factors of graduate students in Gansu are ranked 18 or 19. In another 7, both the performance factors of undergraduates and college students through unified entrance exam and graduate performance factors are ranked after 20.

5 Conclusion

As mentioned above, it follows that: (1) At present, there are obvious differences as far as the efficiency in running universities in interprovincial regions is concerned. The top 10 provinces and cities

for three consecutive years are those with relatively strong educational strength, while the last 8 provinces and cities are basically the western and remote areas with underdeveloped education. (2) The provincial differences in the efficiency in running a university is difficult to change within three to five years. Ranks have remained mostly unchanged for three consecutive years. While those whose ranks have changed are quite few within small ranges, in most cases increased or decreased by one. (3) The level of comprehensive efficiency is closely related to the rankings of the performance factors of the undergraduates and college students through unified entrance exam and graduate performance factors. In provinces with high comprehensive efficiency, at least one of the two rankings are at the forefront, on the contrary, the two low-ranking factors are definitely lead to lower overall efficiency.

In summary, differences in the efficiency in running a university in interprovincial universities mainly include two factors: the marked regional disparities in the overall strength between the developed provinces and the western, remote areas and the obvious discrepancies in different levels of undergraduates and graduate students in various provinces. Therefore, the following suggestions to improve the efficiency in running a university are presented: one is to optimize the regional structure, promoting balanced and coordinated development of higher education by the opportunity of the "One Belt and One Road" initiative(FengZhijun,2015); the other is to establish a dynamic adjustment mechanism for the type structure, level, discipline of universities that can adapt to the state strategy need of "Made in China 2025" (Hu Bo, Feng Hui, Han Weili, Xu Lei, 2017); what's more, to optimize the supply structure of the interprovincial higher education in order to provide talents for regional economic development (Jin Niu, Chen Chao,2016).

Impact of Charismatic Leadership of Expatriate Manager on Construction Project Performance

Ashok K. Shah[1], Yu Jintian[1], Subhash k Shah[2]
1 School of Management, Wuhan University of technology Wuhan, P.R.China 430070
2 Department of Civil Engineering, Religare Constructions Pvt. Ltd. Kathmandu, Nepal
(E-mail: ashokshah3538@outlook.com, yjt8188@126.com, esubasshah@gmail.com)

Abstract: This study aimed at empirically elucidating the impact of charismatic leadership (CL) of expatriate manager on project performance in construction industry in Nepal. Primary data was obtained from international construction project & project in relation to expatriate manager by means of sending questionnaires to 200 employees in Nepal. It was found that there is perfect positive correlation between charismatic leadership and project performance. The results further indicates that the construction industry in Nepal is sensitive to member's need (SMN) and personal risk (PR), hence SMN and PR are more predictive of project performance (PP). In conclusion, expatriate leaders in construction project can boost the probability of project performance by executing CL behavior, and paying particular attention to the Environment, member's need, Strategic vision and articulation, personal Risk and unconventional Behavior.
Key words: Charismatic leadership; Expatriate manager; Project performance; Construction industry

1 Introduction

Project management is observed as the process of making decision, defining strategic plan and executing specific task by applying available human and financial resources. The Performance of Construction project depends on factors such as project nature, location of the project, procurement process, participants relations, competitiveness, quality of project manager and the ability of key project leaders (Baker et al., 2008). Undisputedly, the key Project Leaders are architects, engineers, surveyors and project managers who supervise the execution of the project(Blackbum, 2002).

Expatriate managers are managers who come from different culture, society or country. They have to learn about different culture with bi-lateral environment in a variety of different settings. Good adjusted expatriate managers are comfortable to work and communicate with people with different cultural orientation and this has benefits for project performance in construction industry (Lee et al., 2017). Construction industry is one of the most emerging and important sectors that contributes positively to economic growth in every country, hence, the focus on leadership and project performance of this industry.

Among the Leadership styles, Charismatic leadership uses follower enthusiastic measure to keep moral up with business (Gebert et al., 2016). Charismatic leaders are extraordinary powerful in psychology (Grabo& Van Vugt, 2016), Dispensation (Tumer,2015), idealized influence regarding attribution and behavior, inspirational motivation & vision for Task performance (Banks et al.,2017). Expatriate manager need charismatic leadership for relating project performance. In sort, previous research on charismatic leadership has taken related organizational hierarchy rather than expatriate, also observed more relating with transformational and transnational leadership in construction project (Tabassi et al.,2016).

There are many researches about relationship between leadership style and job satisfaction, safety leader, procurement supply chain. This research focuses on charismatic leadership of expatriate manager and project performance. What is the impact of charismatic leadership of expatriate manager on project performance in construction project and influence of leadership style are main questions in this research.

2 Literature Review and Research Framework

Relevant literature on leadership, charismatic leadership, expatriate manager and project performance have defines in different way. Leadership defined as the individual who establishing a clear vision, sharing vision with team so that they follow willingly, provide information, knowledge, coordinating & solve the conflict within team and with external relate issue (Ortega, 2017). Charismatic leadership always is in controversy even there are some literatures as value based, symbolic, emotions-laden leader signaling. Some of have supported as "go back to the drawing board" (Sy et al., 2018). Charismatic leadership considered personality traits, future investigation, predictor of supervise related

task performance or organizational level performance (Banks et al., 2017). Project performance frameworks maintain by project manager. Project performance have different dimensions to understand, these are Time, cost, Quality, Safety, Client Satisfaction, green environment and human resources (Demirkesen&Ozorhon, 2017).

Most of the researchers have focused on project performance and their attributes to impact. For example, (Eriksson & Westerberg, 2011) study highlighted the procurement process is highly contributed to the construction project performance. Similarly (Xia et al., 2018) research revealed that there is safety performance impact to the project performance and (Wu et al., 2017) study implied that leadership improvement and its impact to workplace safety and its performance.

Wang et al. (Wang et al., 2005) have investigated the impact of charismatic leadership style on team cohesiveness and overall performance. This study indicates that there is strong link between charismatic leadership and project team performance with cohesiveness but they have excluded the different project performance dimension. Their study has not paid attention at all about expatriate manager to the construction project performance. Cross border business consist different employee from different culture & there are more limitation of study for expatiate employee and their contribution to the project.

Fig.1 explain the research framework, as discussed in literature, Charismatic leadership of expatriate manager directly impact to project performance.

Independent Variable   Dependent Variable

- Sensitivity to the Environment (SE)
- Sensitivity to Member's Needs (SMN)
- Strategic Vision & Articulation (SVA)
- Personal Risk (PR)
- Unconventional Behavior (UB)

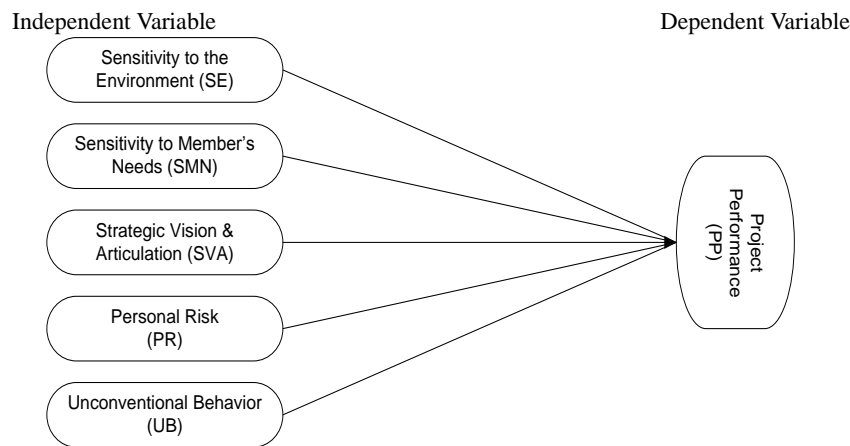
→ Project Performance (PP)


Figure 1   Conceptual Model

There are five dimension of charismatic leadership: Sensitivity to the environment (SE), Sensitivity to members' needs (SMN), Strategic vision and articulation (SVA), Personal risk (PR) and Unconventional behavior (UB) (Rowold et al., 2007) The Sensitivity to the Environment (SE) ensures that the leaders assess the environment for growth opportunities.   The Sensitivity to member's Need (SMN) refers the leader carefully evaluates their need. The Leaders formulate vision for organization which force to followers by inspiring way is defines as Strategic vision and articulations (SVA). For personal risk (PR) self confidence and action taken for achieve vision. Unconventional behavior (UB) refers to the leaders which build trust and commitment to followers and also leaders be as role model for followers. This conceptual model describes all the independent variable varies to the project performance.

3 Research Methodology
3.1 Participants
In this research, participants were Construction Company in Nepal. Total of N=200 employees, 156 responded (78%). These employees are working under team. There is hierarchically system so that middle level project manager (3%) reports to top level senior manager (6%), project team member (42%) & Functional manager (34%) reports to project manager. Procurement manager (Others-15%) reports to project manager and senior manager.   61% employees are 20-30 Years old were 90% are male.
3.2 Research Instrument
To collect data, two instrument used in this research. The variables in Multifactor Leadership questionnaire (MLQ) are the Independent variable and dependent variable which measure the project

performance (Rowold&Heinitz, 2007). 20 statement of MLQ were use for charismatic leadership dimensions. 4 items for Sensitivity to the Environment (SE), 4 items for Sensitivity to Member's Need (SMN), 4 items for strategic vision and articulations (SVA), 4 items for Personal Risk(PR) and   4 items for Unconventional Behavior (UB).

A 5 point Likert scale is used to understand leadership behavior of charismatic leaders and estimate based on 1:2:3:4:5 (Vonglao et al., 2017) The rating scale of leadership items are 1= Not at all, 2= Once in awhile, 3= sometimes, 4= fairly often, 5= frequently.

3.3 Data Analysis

The Statistical package for social science (SPSS) and Excel were used to carry out to achieve the objective of research. The questionnaire coded and kept into the software. The reliable test and multiple regressions used to find the relations between variables.

4 Results and Analysis

4.1 Cronbach alpha test

Cronbach's Alpha measures the internal consistency between items in scale. Most of the items that range between reliability coefficient of 0.6 -0.8 will be retained and used in scale.   Table 1 provides the summary of reliability test.

Table 1   Summary of Cronbach's Alpha (a) Reliability Test for Each Variable

Sr. #	Leadership Style	Cronbach's Alpha
A	Sensitivity to the environment (STE)	0.842
B	Sensitivity to members' needs (SMN)	0.710
C	Strategic vision and articulation (SVA)	0.716
D	Personal risk (PR)	0.715
E	Unconventional behavior (UB)	0.741
P	Project Performance (PP)	0.831

4.2 Factor analysis

Factor analysis used for data reduction to identify a small number of factors that most of the variance observed in a much larger number of manifest variable. The output of factor analysis is a number which represents the measure and factor loading of any variables. In this study any value which is less than 0.3 is suppressed and variable can be exclude. Table 2 represents the summary of the factor for independent variable. In the matrix since all the variables are greater than 0.3 so all items are included in this research. These results clearly show all variables are useful for this research.

Table 2   Summary of Factor and Factor Loading for Each Independent Variable

Sensitivity to the environment (STE)	STE1	STE2	STE3	STE4
Factor Loading	0.731	0.674	0.522	0.787
Sensitivity to members' needs (SMN)	SMN1	SMN2	SMN3	SMN4
Factor Loading	.878	.957	.730	.728
Strategic vision and articulation (SVA)	SVA1	SVA2	SVA3	SVA4
Factor Loading	0.862	0.981	0.733	0.715
Personal risk (PR)	PR1	PR2	PR3	PR4
Factor Loading	0.878	0.944	0.749	0.745
Unconventional behavior (UB)	UB1	UB2	UB3	UB4
Factor Loading	0.897	0.968	0.764	0.778

4.3 Regression analysis

Regression analysis helps to find the relationship among the variables. Basically, regression analysis is used to find how typical values of dependent variables change when any one of the independent variables varied. In this research, stepwise regression is applied among dependent variable, which is project performance, and 5 independent variables which are charismatic leadership dimensions.

Table3   Model Summary for Dependent Variable (Project Performance)

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.962[a]	.925	.923	.99875

a. Predictors: (Constant), UB, SVA, STE, SMN, PR

Table 4   ANOVA for Dependent Variable (Project Performance)

Model		Sum of Squares	df	Mean Square	F	Sig.
	Regression	1851.370	5	370.274	371.205	.000[b]
1	Residual	149.624	150	.997		
	Total	2000.994	155			

a. Dependent Variable: PP
b. Predictors: (Constant), UB, SVA, STE, SMN, PR

The results of Regression model Summary and ANOVA show in the table 3 and table 4. In this analysis show the R=.962 it means there is perfect positive relations between charismatic leadership of expatriate manager and project performance in Nepalese Construction industry. R2=.925 value show 92.5% change in dependent variable just due to independent variable. The standard error of the estimate is too much smaller which confirm regression line is more accurate prediction. F test value is far greater than 1 so its verify regression model is better than mean model and significance (p=.000<.05) means there is significant relationship between project performance and all the independent variable.

Table 5   Regression Analysis and Coefficient for Project Performance

CL Dimension	Project Performance				
STE	1.388				
SMN		1.684			
SVA			1.58		
PR				1.676	
UB					1.639
Constant	10.436	6.002	7.506	6.216	6.818
Observation	156	156	156	156	156
R-Squire	0.882	0.91	0.82	0.923	0.908
St. Error	0.041	0.043	0.06	0.039	0.042
Sig. Value	0.000	0.000	0.000	0.000	0.000

In table 5 all the dimensions of charismatic leadership used in the regression model individually to determine the impact of each project performance. The significant impact (p=.000<.05) on regression model show in all each variable. There is almost same impact to the dependent variable which shows the B value although Sensitivity to members Need (SMN) is the highest predictor with 1.684(B=1.684) and R2=.882 to the project performance by expatriate manager. This is followed by personal Risk (PR), Unconventional Behavior (UB), Strategic Vision and Articulations (SVA) and Sensitivity to the Environment (STE) respectively.

5 Conclusion

This research discovered that all dimension impact to project performance and among them sensitivity to members need and personal risk are more impacted. SMN is about the leader carefully evaluating their followers and PR talks about self confident and believe in potential outcome of vision. These discovered agree with the results of Wang et al. (Wang et al., 2005) on factor to project performance.

The main aim of this research is to scrutinize the impact of leadership style specially five dimension of charismatic leadership which named Sensitivity to the environment, sensitivity to member's need, strategic vision and articulations, personal risk and unconventional behavior on project performance. In this research most of projects target to the international project or either the project which have expatriate leaders.

The impact of charismatic leadership of expatriate managers on project performance in Nepalese construction industry and the dimension of the charismatic leadership influence on project performance are major queries used to achieve the research objectives. For CL of expatriate manager on project performance, empirical analysis show that 96.2% of construction project performance depends on charismatic leadership style (R=.962 and p=.000<.05) and for dimension of CL on project performance, the finding exposed that project performance by expatriate leaders more depends by sensitivity to members need and personal risk. These dimensions are strongly support to the project performance. The research has come out with the idea that project performance in construction industry in Nepal should use sensitivity to the members need and personal risk by expatriate managers.

Analysis on the Application of Project Time Managementin Construction Development Project

Zheng Feng

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 5102265@qq.com)

Abstract: Time is money, and efficiency is life. Whether a project can meet the predetermined time requirement is a key element of project management and performance measurement, and the purpose of the schedule is to save time and save time. So progress control is the primary content of project control and the soul of the project. In a sense, time management determines the success of management. How to manage the project in the construction project management is worthy of our thinking and research.This paper takes the construction and development of a residential building project in Wuhan as an example,conduct in-depth analysis.Finally, some solutions to the problems in project time management are put forward.

Key words: Project management; Project time management; Optimization and control; Construction development project.

1 Introduction

For project management, the biggest constraint is time, time management is an important part of project management, while quality management, cost management, scope management and project management are the four constraints in the implementation process of the project, therefore, effective time control is an important guarantee for the project to be completed on schedule. It is the central task of the project manager to ensure that the construction progress is on time. The quality of the project and the cost objective are both the opportunity and the cost, so whether the project can be completed at the scheduled time is also an important factor in the assessment of a successful project manager (Bai Sijun, 2014). Using Gantt chart and the key path analysis method andestablishing a good project time management systemcan greatly improve the management level of the entire project, and also greatly improve the success rate of the project at the same time.The actual project time management work is based on a research carried out before the project, which can help the project manager to scientifically and rationally analyze the project time management situation, and with the scientific project time management method and the implementation of effective project time management, the project manager can achieve the effective control and optimization of project schedule management.It has a very important significance for the construction unit to better adapt to the new situation development needs, to improve market competitiveness, and to avoid the occurrence of delays, and it also has a reference function for other projects.

2 The Concept and Process of Project Time Management

2.1 The concept of project time management

Project Time Management, also known as project schedule management or project duration management, is to ensure that the project can be completed on time to complete a series of management process. In project management, achieving time and cost control is the key to success, and time management is an important step in ensuring that the entire project is successfully implemented within the expected timeframe(Xu Chengji, 2013). A schedule should be developedto strengthen the project time managementand coordination project construction progress, so that it will not deviate from the track of the project,and the project can be completed according to expected durability.

2.2 The main process of project time management

In the project time management theory, the management process is summarized as five aspects: the definition of project activities, activity sequencing, activity time estimation, time schedule and schedule control.

Activity definition. A project activity is defined as a project time management that identifies and defines the activities that are necessary for a project. It is an important part of project time management, including specific activities such as identification, definition, decomposition and documentation of project activities. Its main basis is the project work breakdown structure (WBS), project scope statement, project activity attributes, and it also needs to refer to various historical information and data. In the

implementation of the project, all the activities are listedin a list of activities, and each member is clearly aware of the need to deal with the work. The list of activities should take the form of a document. As the project activity is broken down and refined, the work breakdown structure may need to be modified, which also affects the rest of the project(Wang Liwen et al, 2013). Once the activity definition is complete, the content of the project's work breakdown structure is updated.

Activity sorting. The sequencing of the project activities is to determine the interrelations and dependencies of the activities in the list of project activities, and accordingly make a reasonable arrangement of project time management in the order of the activities of the project. The main basis is the list of project scope, list of project activities and their attributes and milestone list. In the definition of the relationship between the activities of the project the general usedmethodsare node activity method, arrow chart method, conditional diagram, network template and other project management methods, and finally the network mapis completed. One of the more commonly used methods is the node activity method, also known as the priority diagram or single-code network map method.

Estimation of activity durationrefers to what resources (people, equipment or materials) to use when implementing the project activity, the amount of resource used, and the time spent using the resource. This work should be done by the project team who is familiar with the characteristics of the project activity. Therefore, in the estimation of the duration, the activities of the list, a reasonable resource need, the ability of personnel factors and environmental factors on the project duration should be taken into full consideration(Cao Weijun, 2016). The impact of risk factors on the duration should be fully taken into account in the estimation of the duration of each activity. Duration estimates can be made in the following ways: expert review form, simulation estimates, retention time.

Schedule a schedule. Project time management has two core elements, one is the development of the project schedule, the other is the project schedule control, and all the others are providing information and basis for the two cores. The progress of the schedule should be considered in the light of the project network map, estimated activity duration, resource requirements, resource sharing, project implementation calendar, schedule limit, earliest and latest time, risk management plan, and activity characteristics.

Progress Control. The process of progress control is to monitor the progress of the project implementation, andcompare it with the progress of the benchmark plan, if there is a deviation,measures should be takento correct it. Progress control is the primary content of project control, and the soul of the project is mainly to monitor the progress of the implementation of the situation, timely detect and correctthe bias and error. In the control the factors that affect the progress of the project changes, changes in the progress of the project on other parts of the impact of changes in the schedule should be takeninto consideration when taking the actual measures.

3 Application of Project Time Management in Construction Development Project
3.1 Brief introduction of residential building development project of chaoling village in hongshan district, wuhan

The project is located in Zhilingling Village, Zuoling Town, Hongshan District. The total project includes the new 1 # -6 # residential building with a total construction area of 37,901 square meters. The structure is mixed structure, ground 4/5/6 layers. This article only takes Building 1 as an example to discuss. The project started on December 5, 2016, requiring that it should be completed and delivered on March 20, 2018, with time constraints and more uncertainties. The building of the Building 1 project is divided into basic engineering, the main project and ancillary facilities of the three major projects.The project's basic project is divided into construction survey, earth excavation, cutting equipment construction, and bearing platform beam reinforced concrete. The main project is divided into earth backfill, the main project and the main project acceptance and other sub-projects, ancillary facilities into decorative construction, external construction, water supply and drainage, electrical construction and acceptance and so on.

3.2 Construction decomposition structure of construction development project

Work Breakdown Structure (WBS) is the basic basis for the definition of activities, through the use of activities decomposition technology, the work is further broken down into smaller, more control of specific activities, it is the basis for the development of time plans. In the definition of project activities, it is necessary to take full account of the level of detail of the project work breakdown structure and the impact of different levels of details on the definition of project activities(Zhan Xia, 2016). In the work of a project decomposition, what exactly is the more appropriate level of detail? If the decomposition is too

rough, it may be difficult to reflect the entire content of the project; if thedecomposition is too detailed, itwill increase the amount of work to develop plans. This depends largely on the trade-off between the degree of input of the planned work and the purpose to be achieved. Therefore, the details and levels of the project work breakdown structure on which the project activities are defined depend mainly on the following factors:

(1) The level of work responsibilities of project teams or individuals in the project organization and their level of competency, as well as the level of project management and project budget control requirements and the level of management of specific project teams(Xia Ruifeng, Ning Xuanxi, YuMing, 2015). In general, the smaller the division of responsibilities of the project organization and the higher the level of management and budget control, the work breakdown structure of the project needs to be more detailed and hierarchical.

(2) The role of the projector. Different project participants have different requirements for structural decomposition. If the owner requests the overall decomposition of the project task book, the whole process of the project will be included in the scope of decomposition, but often relatively rough, generally only to grasp the top of the several levels; and the contractor must break down the work specified in the contract or the work contracted by their own (engineering), because the contractor's task is to complete the contract work (engineering).Since the contractor has to implement this work by himself,the decomposition has to be smaller, and sometimes the project task (contract) the contractor should complete is only a sub-project, a task, or even a work packagein the owner of the total project decomposition.

(3) The size and complexity of the project.The decomposition level and the unit of large and complex project should naturally be more; otherwise, the decomposition level and unit of small and simple project should be less. However, this does not have a strict boundary, and different areas or industries have different understanding of the size of the project, so it depends on the specific circumstances and requirements of the project.

(4) The degree of risk.For riskierprojects and project units (Such as subprojects, tasks, etc.), such as projects with the use of new technologies, new processes, or the implementation of special circumstances, it should be broken down more detailed, so that the details of the plan can be a thorough analysis of the risk; and for less risky, conventional, technically mature projects, you can break down relatively rough.

According to the above requirements, the work decomposition of the building development project of Building 1, Chaoling Village, Huliang Village, Hongshan District, Wuhan, is formulated, as shown in Table1.

Table 1　Decomposition Structure of Building Development Project of Building 1, Residential Building, Express Village, Hongshan District, Wuhan

Activity Description	Activity Description
1 Construction preparation	8 Pouring pile
2 Pile foundation	8.1 Construction lofting
2.1 Square pile construction	8.2 Protection tube production
2.2 Construction lofting	8.3 Drilling
2.3 Piling up	8.4 Steel works
3 Beam	8.5 Concrete infusion
3.1 Template construction	8.6 Pile head chisel except
3.2 Steel works	9 Site pouring concrete surface layer
3.3 Concrete engineering	9.1 Template works
4 Longitudinal beam	9.2 Steel works
4.1 Template works	9.3 Concrete engineering
4.2 Steel works	10 Exterior construction
4.3 Concrete engineering	10.1 Support the shelves erection
4.4 Installation of stringer	10.2 Template works
5 Concrete slabs	10.3 Steel works
5.1 Template works	10.4 Concrete engineering
5.2 Steel works	11 Clipping
5.3 Concrete engineering	11.1 Template works

Continual Table 1

Activity Description	Activity Description
5.4 Installation of concrete slabs	11.2 Steel works
6 Concrete surface layer	11.3 Concrete engineering
6.1 Template works	12 Power supply system
6.2 Steel works	12.1 Cable bracket
6.3 Concrete engineering	12.2 Cable laying
7 Exterior construction	12.3 Distribution box
7.1 Template works	13 Water supply and drainage system
7.2 Steel works	13.1 Water supply pipeline laying
7.3 Concrete engineering	14 Acceptance of qualified

3.3 Activity sequencing and time planning for construction development projects

For theconstruction activities of Building 1, Residential Building, Cheong Leng Village, Hongshan District, Wuhan, the activities necessary to complete the project are given in the form of a working breakdown table, and these activities must be carried out in a certain order in actual executionprogress. One of the important reasons is that some of the activities must be carried out after the completion of certain activities, so the next work is to sort the activities of the work.

Activity sorting is to identify the activities of each of the activities in Table1, and the order of the activities is arranged and determined accordingly. It can be seen that the sorting of activities must first identify the dependencies between the activities, which depends on the existence of the unmodifiablelogical relationship between the activities themselves, and some are determined according to the need(Xu Yuan, 2016). In general, to determine the relationship between the activities sequencing and activities, the logical relationship between different work should be analyzed first, and then determine the artificial relationship between activities on the basis of the logical relationship.Among them, the main contents of the activities sequencing are:

3.3.1 Thedetermination of the objective existed logic relationship

This is the basis for the sort of activity. The determination of the objective existed logic relationshipis mainly based on the project process, technology, spatial relations and other factors, so it isclearer, and relatively easy to determine.

3.3.2 The determination of a variable logical relationship

Due to the arbitrariness of such activities, the results will directly affect the overall level of the schedule. The determination of such activities is more difficult and needs to be determined through the process of analysis, research, comparison and optimization. Variable logical relationships are critical to the successful implementation of the project.

3.3.3 Determination of external control relationship

There is usually a certain impact between the project work and the project work, so in the process of project planning, some of the constraints and impact of the external work on the project work should be taken into account, so as to grasp the development of the project.

3.3.4 Restrictions and assumptions in the implementation process

In order to develop a practical schedule, consideration should be given to possible restrictions on project implementation, and take into account the assumptions on which project planning is dependent(LuoXun, Zhang Shuling, Chen Xin, 2015). The logical relationship between the activities of the building development project of the residential building in the project is not clear, but these factors do not affect the order of the activities of the project. The logical relationship between the main activities of the construction project is shown in Table2.

Table 2　Logical relationship between building development project activities of Building 1, Shiling Village, Huliang Village, Hongshan District, Wuhan

Activity number	Activity Description	Immediately work
1	Construction preparation	None
2	Square pile order (prefabricated)	1
3	Piling up	2
4	Measured at present	3
5	Prefabricated longitudinal beam	1
6	Install the stringer	5
7	Panel prefabricated	1

Continual Table 2

Activity number	Activity Description	Immediately work
8	Installation panel	7
9	Cast-in-place	8
10	Exterior construction	1
11	Distribution System	10
12	Water supply and drainage system	11
13	Clipping	9、12
14	Completion acceptance	13

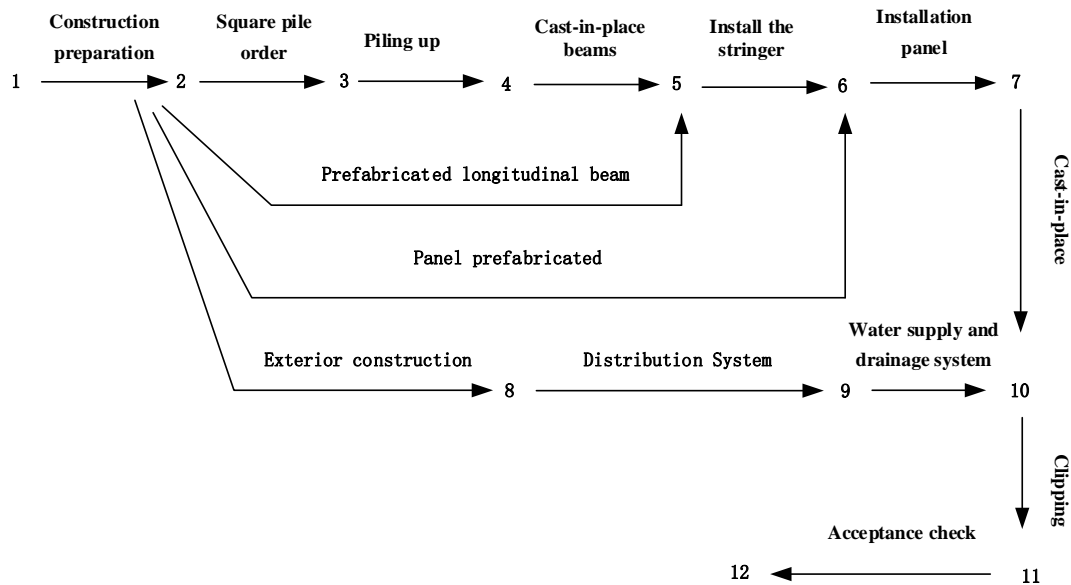
Based on the logical relationship between the above activities, the time plan network of the building development project of Building 1, Building, Chaoling Village, Hongshan District, Wuhan, is shown in Figure 1 and Table 3.


Figure 1   Time Plan of Building Development Project of Block 1, Residential Building, Express Village, Hongshan District, Wuhan

Table 3   Time Plan for Building Development Project of Block 1, Residential Building, Express Village, Hongshan District, Wuhan

Activity number	Activity Description	Expected completion time (days)
1	Construction preparation	12
2	Square pile order (prefabricated)	90
3	Piling up	54
4	Measured at present	90
5	Prefabricated longitudinal beam	105
6	Install the stringer	30
7	Panel prefabricated	90
8	Installation panel	45
9	Cast-in-place	48
10	Exterior construction	135
11	Distribution System	75
12	Water supply and drainage system	30
13	Clipping	9
14	Completion acceptance	3

3.4 Building development project time control

3.4.1 Organization guarantee in construction preparation stage

First of all is to establish and improve the project organization system.

(1) To establish project management agencies suit the project characteristics as soon as possible, so that personnel at all levels can get into the roleas soon as possible to ensure that the decomposition of the construction tasks to be implementedas soon as possible.

(2) To organize constructionaccording to the project law, and give full play to theadvantages ofoptimal allocation of resources and dynamic management.

(3) The main management and technical personnel of the project department are composed of people with rich experience in construction. Project manager, project chief engineer and chief economistform the decision-making layer of the project, and the relevant personnelmaintain stability in the entire construction process from the tender stage to the end(QiaoYuanxing, 2016).

(4) Intensive management is carried out in the construction operation layer to give full play to the technical advantages of each unit and sub-unit.

(5) According to the nature and characteristics of the project, the construction operation layer is the main construction team of the project manager, which has been engaged in the comprehensive municipal engineering, road engineering and basic construction tasks, and given full play to the construction advantages to ensure that the implementation of the construction tasks in a compact and orderly manner.

The second is to carry out and complete the construction work ahead of schedule.

(1) Speed up the deployment of resources to ensure that personnel, machinery, equipment and the necessary materialsare in place in a timely manner.

(2) To complete the temporary facilities in the fastest speed, so as to provide a good conditionfor carrying out of the project.

(3) To Make up the implementation plan of each sub-department and sub-project as soon as possible,and timely submit the plan to the owners and supervision for approval, so that the project can meet the construction condition as soon as possible.

(4) Combined with the actual project, make the specific measures and methods of project management and quality assurance to achieve standardized management and lay the foundation for the smooth implementation of the project.

3.4.2 Organization guarantee during construction process

First is to realizeinformation management, make timely adjustment of the duration plan and resource allocation, and useproject management software to prepare the overall construction schedule. On this basis, make "month and week" construction schedule and the construction schedule of each sub-department and sub-project, in the plan implementation process, timely collect construction information and process and analyze the data with software, timely adjust theschedule and resource allocationaccording to the results to ensure the duration.

Secondly, strengthen the business system responsibilities and strict implementthe job responsibility system. To strengthen the responsibility of the business system, strict implement the post responsibility system, allocate the construction task to each individual toensure that all job responsibilities cover all aspects of project construction, no gaps, no overlap, so as to ensure the realization of the target duration through the quality of human work.

Finally, is to strict implement the site conference system

(1) Daily work meeting of each team will be held to sum up the completion of the plan on that day and arrange the next day's work plan, the work meeting should be hosted by the technical director, and the team captain should be present. According to the situation in the scene, temporary coordinated meeting should be held to strengthen the scene command and dispatch work, so that the project can maintain a normal and orderly construction.

(2) Take the initiative to strengthen therelationship with theowners and supervisors and other relevant departments, hold regularmeeting with the participation of the owners, supervision, design and construction units every week, the meeting will summarize the progress of the project on that week and make next week's work plan, discuss the problems demanding prompt solution and develop appropriate measures to ensure the smooth implementation of the next step.

(3) Timely organizesub-items and sub-project to conduct acceptanceinspection. To organize the acceptance inspection of the completed sub-items and sub-projects, especially the hidden projects in time, to ensure that the next step can start in time.

(4) To develop and strengthen the finished product protection measures.To develop and strengthen the finished product protection measures to ensure that no project delay is caused in the construction

process because of the rework or repair of the damaged finished or semi-finished products cause by human factors.

3.4.3 Construction plan guarantee

First is to prepare the project schedule.

(1) To make the overall construction schedule control plan according to the general principles of construction, and to divide the construction section to form an effective parallel construction and orderly flow of operations in accordance with the project, engineering, construction conditions and the proposed construction technology, the personnel, machinery and equipment to be put into construction, etc.

(2) In the construction schedule control plan, the division plan and the sub-project construction plan must be decomposed, and the logic relationship of each project and each process should be analyzed according to the decomposition plan, the key line construction period should be determined, the resources should be rationally configured and scientifically used, and thus by ensuring the realization of key line duration, to ultimately ensure the realization of the total duration.

Second is the preparation of material purchase plan.

(1) One-time preparation plan: After receiving the construction drawings, immediately organize the technical and relevant personnel to carry out the drawings review, and timely contact with the design unit to clarify the problem of the drawings, make timely preparation of a one-time preparation plan and submit it to material sector, so that the material department can master what are the materials the project required and the time they need to be on the site, only in that way, they can ensure that all kinds of materials can becontacted, ordered and reserved in advance to avoid the time waste of waiting for thematerials in the construction process.

(2) Plans and Pursuit Plans. Based on the monthly construction schedule, it is advisable to provide materials plan to the materials department on a regular basis. At the same time, according to the adjustment of the project plan of that month, a backup plan on the required materials should be made, so that material procurement can be targeted to ensure that the monthly plan to be achieved on schedule.

(3) Prepare the funds use plan. According to the overall construction schedule, the quarterly and monthly funds expense is required to be estimated, and the using plan should be prepared to ensure that the project advance payment and the settlement money of the project can be a reasonably used, to ensure that the overall progress be finished on schedule.

3.4.4 Construction technology assurance

Technically, according to the progress plan requirements, the technical staff should make construction program, technical exchange, and preparation plan as soon as possible, and actively adopt new technique and new technology to improve labor productivity. As for engineering, the work that can be done with machinery should not be constructed by hand and reasonable arrange the process of convergence and insertion, to reduce the intermittent time between processes, realize orderly and reasonable flow construction, control the construction pace, adjust the labor time to prevent the pause in the process to shorten the duration, and to achieve schedule goal.

(1) Earnestly check the maps, make in-depth investigation of the situation on the spot, and make feasible technical disclosure according to the actual situation. As for the focused and difficulties of the project, develop a reasonable construction program, finish the preparatory work in advance, and make effective technical assurance measures.

(2) To determine a reasonable construction process, organize the cross-construction of the process, make full use of the face parallel construction, speed up the construction speed and shorten the effective duration.

(3) Combined with the project schedule, prepare detailed material use plan to ensure that the material supply can meet the construction needs.

(4) Resolutely implement the "three seized" systemin the construction progress, to ensure that the quality of a qualified acceptance, to avoid rework.

4 Conclusion

In short, project management, especially project time management, is critical to the smooth implementation of a project. To ensure the long-term success of the enterprise, and put the essence of project time management and the mode of solving the problem by thinking deeply into the awareness of all employees, a comprehensive project time management system is needed (Zhou Peng, 2016). The promotion of the concept of time management needs the support of high and middle leaders to ensure that sufficient resources can be provided to implement the improvement project to ensure that the project

objectives is in line with the enterprise's development strategy, to ensure the significance and importance of implementation of the project, andto ensure the success of the project.

Analysis and Implementation of Supermarket Management System

Wei Hengqing
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 247316223@qq.com)

Abstract: Supermarkets serve a wide range of consumers, satisfy the diversification of individual and family consumption requirements in small quantities. Traditional management methods are inefficient, in the meantime, data cannot be statistically analyzed in a timely manner. Therefore, it is important to associate computers to establish an efficient supermarket business management system.The system helps managers to manage procurement, sales, inventory, coordinate different links as well as improve the utilization of funds. User management, merchandise management, and sales management are essential functions of the supermarket management system.After a thorough analysis of the system requirements, this system is designed with C++ and database technology to achieve the basic functions required for supermarket management, while contains testing and maintaining functions.
Key words: Supermarket; Management; System; C++; Database

1 Introduction

1.1 Background and significance of the research

The knowledge of marketing has been fully applied in the supermarket management system. Successful managers do well in using marketing strategies to direct business operations in a market economy. At the same time, the progress of science and technology has led to the increase of social products, the expansion of the consumption demand, the enhancement of the status of the middleman and the improvement of the awareness of the consumers' rights, which have promoted the progress of marketing. From application to transformation to modernization, marketing is constantly innovating, enriching and enriching.

Supermarkets connect production and consumption, so they play an increasingly significant role in our daily life. With the rapid development of the economy, the types of commodities sold by supermarkets have been continuously enriched, the scale of operations has been constantly expanding, and their operation and management have also become more complicated due to complex and ever-changing market changes. The early forms of labor are gradually being taken place by new technologies (Long Zhenhua, 2015).The management system is the result of these enhancements. It combines the basic hardware and various software of the computer(Zhou Lijuan,2016).It uses the models that can analyze and make decisions to provide information,with which the basic functions of the enterprise such as decision-making, planning and control have been effectively implemented. In addition, it improves the company's management capabilities(Wang Wei, 2015).

1.2 Domestic and foreign research status

The rapid development of PCs has gradually modernized the management system of foreign supermarkets. Under the fierce competition and baptism of foreign supermarkets, small and medium-sized supermarkets have gradually grown and developed, and they have also formed a set of exclusive system operations, which led to a series of formations and high-end information technology during this period, such as Electronic Ordering System (EOS), Electronic Funds Transfer System (EF), Electronic Data Interchange (EDD), Barcode Identification System and Point of Sale Management (POS).

Information management has been widely used in various industries in the United States and European countries (N Avouris,A Dimitracopoulou,V Komis,2003).The development of the industry is very rapid, and the pace of informatization is getting faster and faster (RichardJ. Burkhard, TimothyR. Hill, Shailaja Venkatsubramanyan, 2011). Today's technology has the capacity to develop corresponding software for different needs and make these independent modules easily related to each other(Gerald Post, Albert Kagan, 2001). Because of these important modules, which are independent and can serve the whole system, cover various aspects of the operation of supermarkets, they provide practical, systematic and integrated services for daily management and normal operation of supermarkets,also they effectively help to achieve effective management tools and supply a convenient platform(G Al-Hudhud,2015).

Although the development of supermarkets in China lags behind the developed countries.As the rapid economic development, continuous innovation in science and technology, various means of

payment become more and more convenient, and the combination of artificial and intelligent management models is particularly important recently. Different supermarkets concentrate to design a management system that meets its own conditions now.

2 Systems Analysis

System analysis is the leading link in system design. System analysis starts from requirements and feasibility. After analysis, it will summarize what specific functions and the system will eventually achieve system design.

2.1 System requirement analysis

In the development process of the management information system, the core link is to analyze the requirements of the designed system. This requires some preparatory activities. After a detailed, comprehensive and complete system investigation, the analysis was started, and then the basic logic design of the system was completed on this basis.On the basis of the previous work, the strategic objectives and the established requirements after the analysis are first identified in the system, and the problems that may exist in the system will be studied thoroughly and thoroughly, and the necessity of these objectives and requirements should be clearly defined.The main content of the system investigation is the system management business and the internal data flow of the system. The ultimate goal of the analysis is to propose a logical design scheme for the system.

2.2 Analysis of the basic function of the system

After a detailed understanding of the current system organization structure and work tasks, the overall planning of the supermarket management system is combined.Finally, the system should satisfy the entire department store business information flow, and computer management and meet the requirements of social development. The system is divided into four modules, which need the functions that the system can achieve. The specific requirements should include six aspects as follows:

(1) Setting up the landing interface (which can be registered). Different users have different permissions and can manage users.(2) Purchase of goods and daily settlement can be done.(3)Managers can view sales and basic information about goods.(4)When you manage goods, you can check the quantity and price. In addition, it can also add and delete operations and check the date of purchase.(5)The inventory can be checked, so the manager can make the next stage plan accordingly.(6)For purchasing operations, you can check the supplier and purchase date.

3 Technical Foundation of System Development

The Visual Studio is developed by Microsoft Corp covers a variety of development tools. Among them, the UML tools and related code control tools are applied to the whole software life cycle.

SQL Serve:The SQL Server database management system is relational, with good scalability, and a high degree of integration with related programming or other software (Li Xinlan, Gu Hongen,2011).

4 Detailed Design of the System

4.1 Overall design of the system

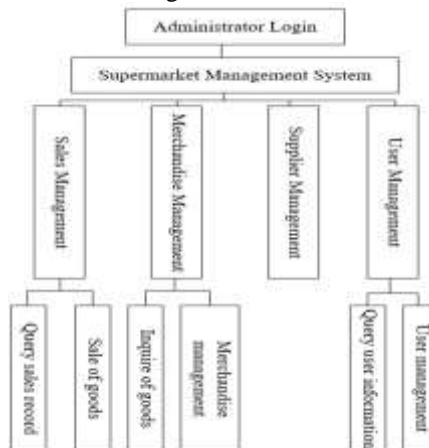
The overall structure diagram is shown in Figure 1.


Figure 1   Overall Structure Block Diagram of The System

4.2 Database design

According to the data analysis obtained by system analysis, the conceptual design of database is carried out. Based on the top-down analysis of DB demand in department store system, this paper gradually describes the conceptual structure from the bottom up with the E-R model(Li Tao,Yang Zhouli,2015). E-R is entity link, which effectively describes the links between real world databases, but more importantly, it transforms E-R into relational framework(Shi Yufang, Luo Rong, 2015).

According to the needs of department store management system, this paper has set up information records about supermarket business, sales, commodities, suppliers and orders.Take Commodity information record table for example.

Table 1   Commodity Information Record Table

Field Name	Data Type	Primary/Foreign key	Allow to be empty	Remarks
Name	VARCHAR	Primary	NO	
Price	Float		NO	
Discount	VARCHAR		NO	
Num	Int		NO	

4.3 Each module design

After the design of the overall structure of the system and the interface of the system, it is the detailed program design for the different small modules after the system is divided.

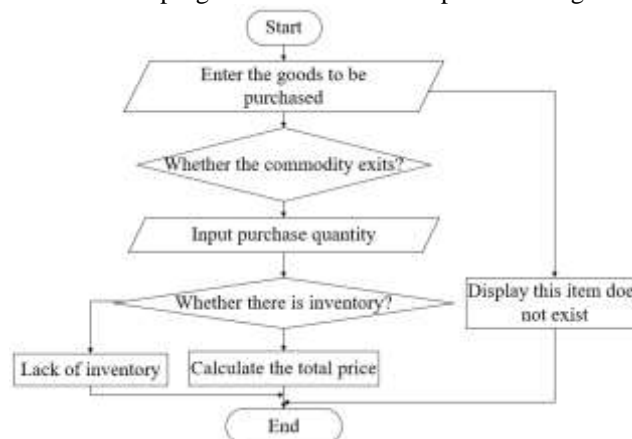
The sale of goods is mainly used for users to purchase existing commodities. The sale of goods is the key to the whole procedure. It involves calling between different data tables and accumulating total sales volume by function. The basic program flow chart of the purchase of goods is as shown in Figure2.


Figure 2   Product Sales Flow Diagram

4.4 Key program design

After the logical and physical model is clarified, the system design is to use MFC and combine the previously designed database to achieve each specific function.

How to use ADO objects for programming is described in detail below.

(1)The first is to introduce ADO library files.

(2)Initialize the ADO environment.

(3)Interface Introduction.

There are some interfaces in ADO: _ConnectionPtr, _CommandPtr, and _RecordsetPtr.

In order to conveniently return the recordset or null pointer directly, the _ConnectionPtr interface is used.There are some methods in the recordset of the _CommandPtr interface to execute the returned stored procedures and SQL statements. _RecordsetPtr provides some control functions for the recordset.

(4) Use ADO to access the database.

The ConnectionPtr interface is used to connect. First, it creates a working instance of the ConnectionPtr interface and then points to and opens an ODBC data source or OLE DB data provider.

5 Conclusion

Through the comprehensive analysis of the current market and technology, it is of great significance to design a universally applicable supermarket management system. Before designing, it is

necessary to have a basic understanding of the principles of management in order to have the correct logic, especially to have a comprehensive understanding of the basic operations of the supermarket.

Programming is the key to this design of the system. The supermarket must not only have a friendly user interface, but also have a strong database. The C++ is used in program design. The related technologies of MFC have a deep understanding of its message mechanism, which helps to design a system interface that is easy to manage. At the same time, the connection between the database and the application program is the key to the system design because the system It is the effective processing of unused data.

Analysis and Optimization of Service Cashier System Based on Queuing Theory

Fan Tao
Graduate School, Wuhan University of Technology, Wuhan, P.R.China, 430070
（E-mail: 38315354@qq.com）

Abstract: How to decide the numbers of opening cashier desks based on the numbers of consumers and the capacities of cashiers is a big problem needed to be solved in retailing industries. Taking the queuing system of a supermarket service industry as the research object, the theory of queuing theory has been used to study the queuing phenomenon, $M/M/1/\infty/\infty$ model for different periods of time to meet different waiting time optimization have also been adopted, then the optimization model of the cashier queuing system has been established, the problem of cost and opportunity has been solved preferably.
Key words: Service cashier; Queuing theory; Queuing model; Analysis and optimization

1 Introduction

Queuing phenomenon is that the members which need to be severed are more than the service agency can hold in line. This phenomenon can often be seen in supermarket, shopping mall, hospital, cinema, canteen and so on. One of them, supermarket is not only a typical serve retailing industry, but also a place where shopping is gathered. Queuing phenomenon sometimes results from lots of consumers and absence of opening cashier desks. And a small amount of consumers in some time make ample cashier desks become idle. So how to decide the numbers of opening cashier desks based on the numbers of consumers and the capacities of cashiers is a big problem needed to be solved in retailing industries. Therefore, studying this problem by using queuing theory takes on some practical significance.

2 Queuing Model

Queuing theory which is an important branch of Operations Research is a scientific way of mainly researching the crowding phenomenon resulted from random factors. Queuing theory can be applied into these areas of the nature of public serve arising crowding phenomenon. The queuing process model is shown in Figure1:
Figure 1   Queuing Process Model

According to the amount of ashier desks and arriving distribution of consumers, common queuing can be classified into single-serve and muti-serve Poisson arriving, negative index service time, random service time and fixed service time models[Liu Liwen,2006].

In classical queuing system, using 3 or 5 English alphabet partitioned by "/" to define some queuing system. For example, in $A/B/C/D/E$, A is the type of input distribution, B is the distribution type of service time, C is the number of service desks, D is the system capacity, and E is the amount of customers. $M/M/1/\infty/\infty$ is a queuing system whose input process is Poisson flow, time is negative index distribution, C service desks are in parallel service, the system capacity and the numbers of customers is innumerable.

There are six performance index to describe queuing system (1) load level of system ρ ; (2) idle probability of system P_0 ; (3) the length of line: L_s is average value; (4) the length of queue: L_g is average value; (5) sojourn time: the time of a consumer staying in line, its average value marked as W_s ; (6) waiting time: its average value marked as W_g .

3 Analysis of Cash Register System

　　Queuing system of service industry including supermarket and shopping mall is extremely different from queuing phenomenon of production process, because its face to customer directly. Its quality have very close relationship with the satisfaction of customers and has decisive impact on economic benefits of supermarket and shopping mall.

　　The problem of queuing for server is how to control the cost of operating including the number of service desks and staffs. The more service desks are the bigger operating cost is. However, the less service desks are, the longer time consumers wait. There is an extremely close relationship between satisfaction of customers and their shopping degree. Above all make up opportunity cost.

　　Therefore, supermarket and shopping mall should try their best to shorten the consumers' waiting time and the length of queuing, improve satisfaction of consumers. Only this, supermarket and shopping mall can attract more consumers.

4 Example of Queuing System

　　This research takes a supermarket as an example and analyses its queuing system of cashier desks except on festivals.

4.1 Distribution of cashier desks

　　This supermarket has 40 cashier desks: number 1-5, number 7-20, number 6 and number 21-40, which are shown in figure 2. Number 6 is the path of mobile payment. Others paths have same function which can be paid in cash, bank card and shopping card.
Figure 2　Cashier Layout

4.2 Data Processing

　　There are two scheduling for arraigning the work of cashier: morning shift (7:30-14:30) and afternoon shift (14:30-21:30). According to the three segments of morning, afternoon and evening, the data can be handled by three time segments(9:00—11:00，14:00—16:00，18:00—20:00).

4.2.1 Arrival situation of consumers

　　Due to random coming of customers, so a continuous statistic is made for consumers arriving at one random cashier at each of 3 periods when counting the arrival time of consumers in the cashier desk in one hour. One of them, the data of consumers' arrival time in one continuous hour in 9:00-11:00 shown in Table 1:

Table 1　Customer Arrival Data Sheet

Customer code	Arrival time	Arrival interval	Customer code	Arrival time	Arrival interval
1	00:00:00	76	28	00:30:02	71
2	00:01:16	71	29	00:31:13	74
3	00:02:27	77	30	00:32:27	70
4	00:03:44	72	31	00:33:27	62
5	00:04:57	77	32	00:34:39	66
6	00:06:14	67	33	00:35:45	73
7	00:07:21	74	34	00:36:58	75

Customer code	Arrival time	Arrival interval	Customer code	Arrival time	Arrival interval
8	00:08:35	73	35	00:38:13	68
9	00:09:48	64	36	00:39:21	69
10	00:10:52	66	37	00:40:30	70
11	00:11:58	68	38	00:41:40	66
12	00:13:06	74	39	00:42:46	60
13	00:14:20	77	40	00:43:46	75
14	00:15:37	76	41	00:45:01	66
15	00:16:53	70	42	00:46:07	71
16	00:18:03	56	43	00:47:18	77
17	00:18:59	79	44	00:48:35	72
18	00:20:18	44	45	00:49:47	73
19	00:21:02	45	46	00:51:00	70
20	00:21:47	73	47	00:52:10	69
21	00:23:00	48	48	00:53:19	72
22	00:23:48	43	49	00:54:31	79
23	00:24:31	55	50	00:55:50	72
24	00:25:26	67	51	00:57:02	76
25	00:26:33	69	52	00:58:56	70
26	00:27:42	66	53	01:00:06	73
27	00:28:48	74			

By this way, consumers, arrival rate in three time segments of one cashier desk can be counted, which is shown in Table 2:

Table 2   Customer Arrival Rate Sheet

Time periods	Average arrival rate λ（Person / hour）	Checkout counter
9:00—11:00	52.912	14
14:00—16:00	58.797	14
18:00—20:00	55.984	14

4.2.2 Service time of consumers

Due to the full experience of cashiers, the difference of their service speed can be neglected when counting their service time. The length of service time depends on consumers because different consumers have different taste on the number of products, mode of payment and package[Cai Wenjing,2013]. Therefore, 24 groups, 24 groups and 30 groups data of consumers' service hours were calculated respectively in the morning, afternoon and evening.

The results are as follows：

Average service rate of each cashier desk in first time period： $\mu_1 = 61.121$ （person/hour）

Average service rate of each cashier desk in second time period： $\mu_2 = 60.742$ （person/hour）

Average service rate of each cashier desk in third time period： $\mu_3 = 59.178$ （person/hour）

Average service rate of each cashier desk ： $\mu = 60.714$ （person/hour）

4.2.3 Waiting time accepted by consumers

Consumers will lose patience and decrease their degree of satisfaction if waiting time is much too long. So the waiting time and the length of line which can be accepted by consumers should be learned. In this paper, the result about this question is attained after randomly interviewing for 60 consumers,

shown in Table 3:

Table 3   Customer Acceptable Waiting Schedule

Waiting time	5 minutes or less	5-8 minutes	8-10 minutes	10 minutes or more
Number of people	18	32	8	2
The length of the queue	5 people or less	5-10 people	10 people or more	
Number of people	21	34	5	

According to table 3, we can conclude that the average waiting time which can be accepted by consumers excepted on festivals is 6.5 minutes and the average waiting length of line accepted by consumers is 7.0003.

5 Determining Model of Cashier Queuing System

Throughout above analyzing, we can know that cashier queuing system in supermarket is a random service system because of random nature of consumers' arrival time and cashiers' service.

A queuing model about cashier system in supermarket can be defined by analyzing its input process, queuing rules and service agency.

Passenger origin can be viewed continuous because consumer's arriving is random and mutually independent. The reason why consumer's arriving is random and mutually independent is that the probability of two consumers synchronously arrive same cashier desk is very low.

The rule in supermarket's queuing system is First-Come-First-Served. When one consumer arrive at one free cashier desk, he or she will be served right now. Once there are no free cashier desks, consumer will look for the shortest line which also is the nearest line from oneself.

The system's service for consumer is one by one. Assuming that the service capabilities of every cashier desk in one period is fixed.

Assuming that the arrival situation of consumer is Poisson flow and service time is presenting negative -index distribution. The system can be regarded as n $M/M/1/\infty/\infty$ single service desks' queuing system because consumer may not move into the shortest line and merely change this shorter line once they make their decision.

In $M/M/1/\infty/\infty$ queuing model, all indexes are as follows:

(1)Service intensity in this system: $\rho = \lambda / \mu$

(2)Average number of consumers in queuing: $L_q = \lambda^2 / \mu(\mu - \lambda)$

(3)Average number of consumers in system: $L_s = \lambda / (\mu - \lambda)$

(4)Average waiting time of consumers in queuing: $W_q = \lambda / \mu(\mu - \lambda)$

(5)Average waiting time of consumers in system: $W_s = 1 / (\mu - \lambda)$

(6)The probability of n consumers in system: $P_n = (\lambda / \mu)^n P_0; P_0 = 1 - \lambda / \mu$

6 Analysis and Optimization of Queuing System

6.1 Analyzing indexes in system

According to each index in $M/M/1/\infty/\infty$ queuing model, data of index in three periods have been calculated, which is shown in Table 4:

Table 4   Various Index Table

Time periods	Service intensity (ρ)	The average number of queuing (L_q)	Average number of customers (L_s)	Average waiting time(W_q)	Average length of stay(W_s)
9:00—11:00	0.8657	5.5800	6.4456	6.3273	7.3091
14:00—16:00	0.9680	29.2618	30.2298	29.8605	30.8483
18:00—20:00	0.9460	16.5818	17.5279	17.7713	18.7852

According to above data, service intensity of this system is less than 1. As a whole, this system is

stable. In addition, the average consumers and average waiting time can satisfy consumers' demands in first period. But largish service intensity results in largish average consumers and waiting time in the second and third period, which is more than average consumers and waiting time, beyond the average waiting time 6.5 minutes and average waiting length 7.003 which is accepted by consumers expect on holidays. The best numbers of cashier desk should have following characteristics:

(1)System is in a state of statistical balance；

(2)Customer waiting time is less than the longest time which consumers can accept；

(3)Customer waiting length is less than the longest waiting length which consumers can accept.

6.2 Optimizing of queuing system

First, adding cashier desks one by one in 14:00-16:00, then calculating indexes, showed in Table 5:

When n=15

Average arrive rate of every cashier desk: $\lambda = 58.797 \times 14 / 15 = 54.877$ （person/hour）

When n=16

Average arrive rate of every cashier desk: $\lambda = 58.797 \times 14 / 16 = 51.447$ （person/hour）

When n=17

Average arrive rate of every cashier desk: $\lambda = 58.797 \times 14 / 17 = 48.421$ （person/hour）

Average service rate of every cashier desk：$\mu = 61.121$ （person/hour）

Table 5　Optimized Various Index Table

Number of service stations	Service intensity (ρ)	The average number of queuing (L_q)	Average number of customers (L_s)	Average waiting time(W_q)	Average length of stay(W_s)
15	0.8978	7.8912	8.7891	8.6279	9.6095
16	0.8417	4.4766	5.3183	5.2208	6.2024
17	0.7922	3.0205	3.8127	3.7428	4.7244

According to table 5, all five indexes including the length, waiting time, service intensity and so on are decreasing. This means that the free rate of system$(P_0 = 1 - \rho)$ is increasing. Service industry should down its cost when ensuring the satisfaction degree of consumers. Therefore, choosing open 16 cashier desk is reasonable in this time period.

Similarly, adding cashier desks one by one in 18:00-20:00, calculating each index, which shown in table 6:

Table 6　Optimized Various Index Table
