Number of service stations	Service intensity (ρ)	The average number of queuing (L_q)	Average number of customers (L_s)	Average waiting time(W_q)	Average length of stay(W_s)
15	0.8830	6.6614	7.5440	7.6488	8.6627
16	0.8278	3.9785	4.8063	4.8731	5.8870

Therefore, choosing open 16 cashier desks is reasonable in this time period.

According above analysis, data deviations and optimized results in this paper can be acquired as follows:

(1)Data deviations: data collected randomly exists on some deviations when applied into all cashier desks. What's more, this model is not absolutely $M / M / 1 / \infty / \infty$ queuing model which has some deviations. In fact, the number of queuing in supermarket is not more than 10 people when 14 cashier desks are available. However, the results calculated are more than 10, so there are some deviations in the data processing.

(2)Optimized results: the final optimized results are that 14,16,16 cashier desks opened respectively in the three period are reasonable. However, considering the two scheduling for arraiging the work of cashier in current supermarket, the number of cashier desks should arrange 14 in morning and 16 in afternoon expect on holidays.

7 Conclusion

This paper handling a single-to-many queuing system in cashier desks based on some assumptions.

Through focusing on three indexes such as system balance, consumers' waiting time and waiting length, an optimized queuing system of cashier about one supermarket has been built. Finally, a queuing system which can not only make consumers achieving satisfaction but also make supermarket reducing its service cost by optimizing all indexes has been gotten. Furthermore, classifying consumers into different groups based on the number of goods and the way of payment will make the function of cashier desks more diversified when designing cashier desks.

University Library User Knowledge Management and Service Innovation under the Network Environment

Xu Fang
Library of Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 406558049@qq.com)

Abstract: Innovation is an eternal theme of library service, and users are the final determinants of service innovation. University library under the network environment has a huge number of tacit knowledge about users. This user knowledge can be effectively managed and systematically accessed and by mining users demand rule and trend, habits and preferences, user behavior characteristics and patterns of user knowledge, modern network technology can provide strong support for library network initiative push service, library network service cross-border cooperation, library network dynamic tracking services and other innovation service modes.
Key words: Network; User knowledge management; University library; Knowledge services; Innovation

1 Introduction

At present, university library is still in its primary stage at user knowledge management, although the library has made a great effort in the management of user knowledge, but due to lack of user-oriented positioning and related research, user knowledge has not been fully utilized in university libraries. On the other hand, users of university library are mainly teachers and students. They are carrying out knowledge dissemination and innovation activities every day, their demands for library resources and utilizations are much higher than the average users. In the process of using library knowledge information, many unique insights will be formed and new valuable knowledge will be created. This knowledge becomes the external knowledge resource foundation of university library user knowledge management. The large capacity knowledge database formed by the combination of internal and external knowledge resources provides a rich content foundation for university library user knowledge management and innovative service based on user knowledge management.

2 Basic of Knowledge Management in Network Environment

Library user knowledge management refers to starting from the user requirements, effectively manage the source, features and use value of user knowledge, integrating user knowledge and internal university library knowledge, provide efficient information products and services to improve library management efficiency and realize user satisfaction. User knowledge includes explicit knowledge and tacit knowledge, while explicit knowledge includes proactive requirements information, user browsing behavior, and logs access, etc. Tacit knowledge is the potential demand that users do not express and do not realize. User knowledge analysis is a process of analyzing the inferred users' potential needs through the mining of existing user demand information and access behaviors. Then the trend of user demand change is predicted and at the same time user association analysis and user clustering are realized through user knowledge mining.This process not only requires advanced mining techniques, but also the subjective experience and judgment of subject librarians and user analysis librarians.

Information network technology provides technical support for university library user knowledge management. The user knowledge management of university library knowledge involves collection, organization, development, storage and transmission, and other management activities, which requires use of a series of advanced information network technology and tools, such as data warehouse technology, intelligent learning techniques, knowledge mining, knowledge navigation technology, etc. With the support and cooperation of these technologies, user knowledge management can be realized.

2.1 Network knowledge service and interactive system

Network knowledge service and the interactive system is one of the important means of knowledge management and It reflects the library's ability to utilize and transfer knowledge to users by using the information network platform, as well as the efficiency and effect of transferring knowledge. The realization of knowledge service is that users interacts with the system and with functional modules within the system to improve and provide knowledge service products in real time. It's essentially an interactive process consisting of multiple interaction steps, including multi-step interaction, single-step interaction and other forms. User can use knowledge service and interactive system to retrieve

knowledge, conduct BBS, discuss and communicate with community, and obtain online answers from librarians. The comprehensive, systematic, authoritative, responsive speed and humanized interface of the knowledge reflect the effect of the knowledge service and interaction system.

2.2 Intelligent user knowledge management system

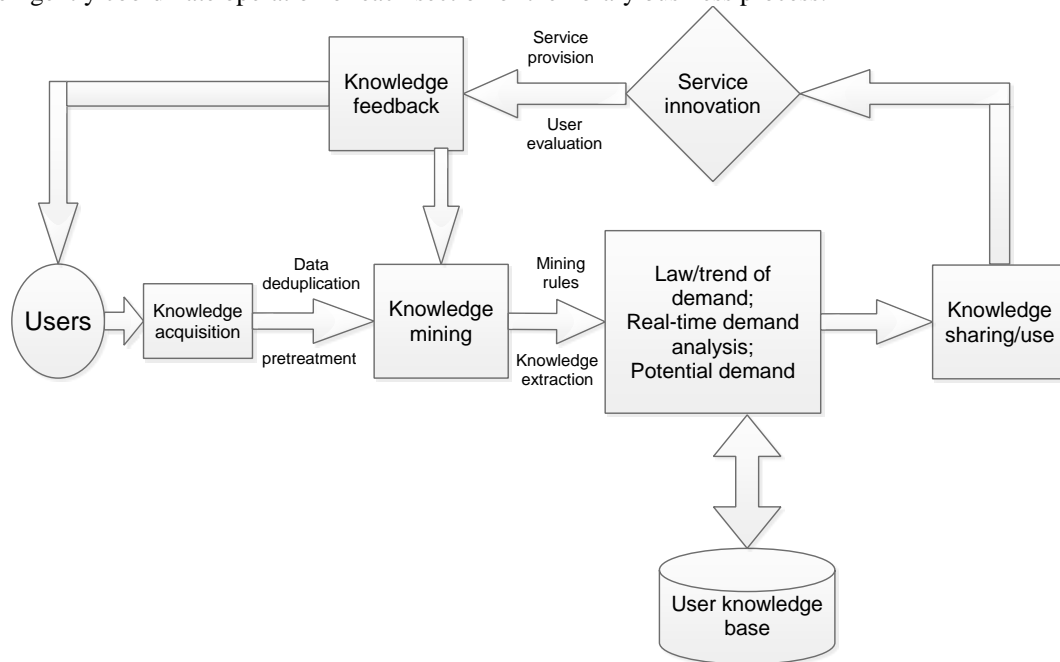
The intelligent user knowledge management system uses the user-centered database decision support system, takes the intelligent user knowledge base system as the support and bridge, and integrates multiple channels and users to conduct extensive exchanges, learning and cooperation, so as to achieve the common development with users. Intelligent user knowledge management system can recognize the user's personalized needs of knowledge, send the required knowledge to the user actively and timely, realize the library and user interaction and knowledge in the best matching between individuals. A large amount of user knowledge stored in the knowledge database can be deeply analyzed through summarization, classification, clustering, association and other ways. On the basis of this analysis, we can perform a user demand forecast, put forward scheme of trend analysis and services, generate the library work plans, proposals, and even automatically contact between librarians and users, intelligently coordinate operation of each section of the library business process.


Figure 1   User Knowledge Management Process for Service-oriented Innovation

3 Analysis of User Knowledge Management Process

Knowledge management of users in university libraries is a continuous process. From userknowledge acquisition, knowledge sharing to knowledge feedback and evaluation, a complete operation mode of management system has been formed. The process is shown in figure 1.

The knowledge acquisition of university library users under the network environment is the premise of knowledge mining analysis and sharing. This precondition includes the knowledge and history of user needs, basic user information, location and time, current activity tasks, information behavior records, and user reviews, comments, and feedback on used services, etc. Knowledge mining is a pretreatment such as cleaning, de-weighting and integration for the user data which obtained via a variety of ways. It extracts of the user's demand rule and trend, predicts the potential requirements that users are not aware of and finally forms the knowledge stored in the user knowledge base which can be used directly.Knowledge sharing and utilization shares within the library by analysis demand for knowledge mining extraction rules and trend, customer demand patterns. Based on the library innovation service university library can better meet the user's dynamic demand. Knowledge feedback is the last step of knowledge management. By understanding whether knowledge mining extraction of user information demand is true and accurate, whether service innovation based on this knowledge is really meet the demand of users, and how the user evaluates service innovation, knowledge feedback can provide improvement Suggestions for the next round of user knowledge mining and service innovation.

4 University Library Service Innovative Mode of Knowledge Management Base on Network Users

The service innovative of university library is a kind of user-oriented innovation, whose innovation direction and mode are different according to different needs of users. Users are the starting point of innovation, and the innovative ideas and directions can be provided for library services through the management and mining analysis of user knowledge.

4.1 Network active push service mode

Push service is to actively push the library services to the environment where users are located. Integrating the library services into users' scientific research and learning process, the push service creates a new equilibrium state in organically integrating of library service with user space, which provides a service to your side, to the desktop, anytime and anywhere for users. Embedded services emphasize the seamless links with users, which extends the service to all places where users exist. Users can make full use of library resources and services without visiting the library and even visiting the library website.

Push service can be realized by physical push and virtual push modes. Physical push is a shift from providing services in library buildings to service in the physical space where users are located. Virtual push refers to provide targeted services in the virtual space where users are located, including the services of embedding library services into user desktop systems, user browser, the network community and visited websites of users. Libraries can create library toolbar, library widget and other ways to embed library services into user space environment, which provides the personalized services for users.

Push service is a new concept of library user service, which is committed to break through the physical and spatial concepts in the library and establish new cooperative and interactive relations with users. User knowledge management provides the guidance for library to implement push-type service. Users can acquire their physical situation through user knowledge management. Combining with the requirements and trends of users, the appropriate services are embedded into the user workflow to realize personalized services. In addition, the installation of client software on mobile devices provides the possibility to push library services to the desktop of users' mobile devices. Librarians can also interact with users in the network community through online communication tools to improve the awareness of library resources and services, which brings a greater convenience for users to make use of library services.

4.2 Network cross-border cooperation service mode

University libraries should consider to penetrate into users' learning and scientific research life in various ways, and mobile phones or other intelligent terminals can be used to carry out mobile services. It is necessary to strengthen the cross-border cooperation with internet service providers, database providers, professional information service sites and other information service institutions. Cross-border cooperation is the seamless integration of data resources and services from different sources, which creates the composite service with new contents to provide a consistent user experience. In an open mobile network environment, it is difficult for university libraries to meet the increasingly complex and diverse dynamic information needs of users by establishing information services based on collection resources. Therefore, the integrated utilization of resources from the third-party information service institutions, organizations and individuals has become a new trend in the development of user services.

The goal of cross-border cooperative service in university libraries is to make full use of existing resources and services, which creates new services through integration and meets the diversified information needs of users. The cross-border cooperation services between libraries and search engines or other websites can be started from data cooperation, functional cooperation, channels and brand sharing. In the network of cross-border cooperation, the library is no longer the starting point of information, but a node. Library information service is no longer a process in which librarians interact with users independently relying on information resources, but serves users together with other information service providers. It is only accepted by users in such a sustainable information service.

4.3 Network dynamic tracking service mode

Compared with other users, the information demands caused by information behaviors of college users are mainly to meet their own teaching, scientific research and learning needs due to its particularity. Users in college hope to achieve their own re-creation of knowledge through the absorption and utilization of information. As the learning happens in extremely different and enriched environments, the behavior of users is more complicated, diverse and dynamic. Therefore, the mode of integrating contextual information about users in the service process and providing context-sensitive

information services has become the new direction of service innovation in university libraries at present.

Based on the user as the center, the network dynamic tracking service mode integrates the library information space with the users' physical space. In the process of embedding library services into users' active tasks, the automatic perception of real-time situational knowledge is realized through the system. Combining user knowledge management system and technology intelligence to judge users' activity behavior and purpose, the service behavior of the system is adjusted adaptively to meet the dynamic requirements of users.

Network dynamic tracking service has the characteristics of intelligence, initiative and dynamic adaptability. According to the dynamic situation information of users, the corresponding learning and knowledge resources in library is provided, which supports effectively to carry out the ubiquitous learning for teachers and students in colleges. Most of the smart terminal devices held by users in the mobile internet era are for personal use only, which creates the favorable conditions for understanding users' information habits accurately and provides more sophisticated services. For example, a more detailed and accurate location can be achieved by means of GPS navigation system. The information service is established based on location situation and dynamic information service is provided with the correct identification based on situational information. The dynamic behavior knowledge of users is acquired accurately by using the technologies such as sensor, mobile device, wireless network and context awareness. The key problem to carry out this service is to reason the users' dynamic demand preference by combining users' knowledge base.

5 Conclusion

The development of network technology has shortened the distance between libraries and users and blurred the boundaries, which has gradually realized the barrier-free communication between libraries and users. Through modern network technology, the university libraries can establish network databases and network knowledge forums to realize the link with other online search engines and expand the resource base of library external knowledge, which will build a large platform for knowledge access, knowledge exchange and knowledge creation. In such platform, libraries can know the needs of users in time, and users can put forward updated suggestions to the libraries as soon as possible. Knowledge management of users in university libraries under the network environment is a kind of management method of conforming to the development of the times, which marks that university libraries are constantly expanding their professional services by using the network technology and network platform.

Disparitiesin Open Data Efforts among Japanese Local Governments

Hideto Nakamura[1], Yoko Ishino[2]
1 Graduate School of Sciences and Technology for Innovation, Yamaguchi University, Yamaguchi, Japan, 7558611

Abstract: Opendata efforts have now become a global movement, and Japan intends to keep up with this global trend. Measures concerning open data have been undertaken since the Open Government Data Strategy was adopted in July 2012. As a result, all 47 Japanese prefectures had developed Web pages for their own open data by March in 2018. However, only 18.3% of municipalities had their open data released on the Internet. In this paper, we investigate how deeply opendata efforts have penetrated into local municipalities, not just the national average in Japan. By analyzing the opendata disparities, we then infer the factors that have facilitated opendata initiatives in local governments. We introduce an "opendata penetration rate"for each prefecture, calculating it by using the number of municipalities that have already published their own open data, and we find that there is a regional disparity in the opendata efforts. By adding qualitative information to this quantitative research, we have found that there are three types of collaborations among the local governments that have already published open data. On the basis of these findings, we discuss which type of collaboration is the most promising for small-sized municipalities.
Key words: Open data; Local government; Municipality; Regional revitalization

1 Introduction

Open data is that which is freely available for everyone to use and republish as they wish, without restrictions imposed by copyrights, patents, or other mechanisms of control (Auer, S., et al., 2007). Officially, open data is defined as public- or private-sector data held by the national government, local governments, or companies and that is published in a form to which all of the following apply: (1) The data are published under a rule allowing secondary use, whether or not for commercial purposes; (2) the data are published in a machine-readable format; and (3) the data can be used free of charge(Basic Principles on Open Data, 2017).

Opendata efforts are a global movement that was initially led by the US and UK governments, but which is rapidly spreading to many countries in Europe, Asia, and also the Americas (Takagi, S., 2014). In 2013, the Open Data Charter was agreed to by the leaders of the countries at the G8 Summit, with the aim of proactively addressing open data in the participating countries (G8 Open Data Charter, 2013).

Naturally, Japan has followed this trend. Measures concerning open data have been undertaken in Japan since the Open Government Data Strategy was adopted in July 2012 (Japan Open Data Charter Action Plan, 2013). This strategy outlined the significance and objectives of promoting the use of public data, as itemized below (Open Government Data Strategy, 2012).

- Enhance Transparency and Confidence
- Promote Public Participation and Collaboration between the Public and Private Sectors
- Economic Stimulus and Higher Efficiency in Government

Today, Japan has many problems, such as a declining birth rate and an aging population, the concentration of the population in large cities, and the sluggishness of the economy. Especially in local areas, these problems are critical, and the revitalization of such regions is an urgent matter. Opendata initiatives may be of some help for such problems.

Various positive effects are expected for Open Government Data. Making government information available to the public as machine-readable open data can facilitate government transparency and lead to increased government accountability. Also, open data can support technological innovation and economic growth by enabling third parties or private companies to develop new kinds of digital products and services. A trivial example is that statistical data released by the government can be used to determine regional differences, which may lead to the development of more effective strategies for some products or services.

The aforementioned "Open Government Data Strategy" states that both the national government and local governments are expected to drive opendata efforts forward. In reality, however, opendata

efforts have progressed mainly because of the initiative of the national government, and we question how deeply these efforts have penetrated into local municipalities.

This research therefore aims to clarify the opendata initiative ratio for each prefecture, rather than considering just the national average in Japan. By analyzing the open data disparities, we can then determine the factors that hamper or facilitate the opendata initiatives by local governments. These results can contribute to the development of a strategy to further the progress of such opendata efforts in the near future.

2 Data and Methodology

The website of IT Strategic Headquarters, "Government CIOs' Portal, Japan" contains many kinds of decision documents and statistical data on the current government-wide open data initiatives of the Japanese government (Government CIOs' Portal, Japan). This site also contains not only the national government's data concerning opendata efforts but also local municipalities' data. It includes a "list of open data sites by local governments" that is periodically updated by IT Strategic Headquarters. We took advantage of these municipal-related data, published on April 30, 2018, for our research purposes.

First, on the basis of the list of municipalities on this site, we calculated an "open-data penetration rate" for each prefecture. Since the area of a prefecture includes the cities or towns in it, we obtained the penetration rate by dividing the number of cities or towns that have already published their own open data by the total number of cities or towns existing in that individual prefecture. On the basis of the ranking of the penetration rates so-obtained, we then selected advanced local governments and scrutinized those governments' opendata efforts to determine the factors that have facilitated their opendata initiatives. Finally, we investigated duplications between a prefecture's Web site and a municipality's Web site, as well as those among different municipalities' Web sites. We did this to determine the effects of joint operations on a local government's opendata site.

3 Results and Discussions

3.1 Open data penetration rate by prefecture

All 47 Japanese prefectures had Web pages for their own open data by March 2018, according to the government's Web page (Government CIOs' Portal, Japan)(Kashihara, H.,2018). We assume that this occurred because the national government put pressure on the prefectures to follow the opendata movement. On the other hand, only 319 municipalities had their open data released on the Internet, although there were 1741 municipalities in total. In short, the opendata penetration rate for municipalities was only 18.3% on average.

Apart from the national average value, we were interested in regional gaps among opendata efforts. Since a prefecture contains many municipalities, we decided to compare the penetration rates of the opendata initiatives among prefectures. In this paper, we define the opendata penetration rate for a prefecture as the ratio of the number of municipalities with their own open data on the Internet to the number of all municipalities existing in the prefecture. On the basis of the list on the government's Web page (Government CIOs' Portal, Japan), we calculated the opendata penetration rate for each prefecture, as shown in Table 1. The geographical distribution of penetration rates for all 47 prefectures is shown in Figure 1.

Table 1 Open Data Penetration Rates by Prefecture

Ranking	Prefecture	# of Contained Municipalities	Open Data Penetration Rate	Ranking	Prefecture	# of Contained Municipalities	Open Data Penetration Rate
1	Fukui	17	94.1%	25	Fukuoka	60	11.7%
2	Shizuoka	35	77.1%	26	Shimane	19	10.5%
3	Kanagawa	33	66.7%	27	Fukushima	59	10.2%
4	Okayama	27	48.1%	28	Aomori	40	10.0%
5	Saitama	63	44.4%	29	Gifu	42	9.5%
6	Ishikawa	19	42.1%	30	Nagano	77	9.1%
7	Aichi	54	40.7%	31	Miyagi	35	8.6%
8	Tokyo	62	38.7%	32	Akita	25	8.0%
9	Tokushima	24	37.5%	33	Kyoto	26	7.7%
10	Toyama	15	33.3%	34	Ibaraki	44	6.8%
11	Tochigi	25	32.0%	35	Wakayama	30	6.7%
12	Yamaguchi	19	26.3%	36	Oita	18	5.6%
13	Niigata	30	23.3%	37	Tottori	19	5.3%
14	Chiba	54	22.2%	38	Okinawa	41	4.9%
15	Hyogo	41	22.0%	39	Nagasaki	21	4.8%
16	Hiroshima	23	21.7%	40	Kumamoto	45	4.4%
17	Shiga	19	21.1%	41	Hokkaido	179	3.9%
18	Osaka	43	20.9%	42	Yamanashi	27	3.7%
19	Mie	29	20.7%	43	Iwate	33	3.0%
20	Kagawa	17	17.6%	44	Yamagata	35	2.9%
21	Nara	39	15.4%	45	Gumma	35	2.9%
22	Miyazaki	26	15.4%	46	Kagoshima	43	2.3%
23	Ehime	20	15.0%	47	Kochi	34	0.0%
24	Saga	20	15.0%				
Figure 1 Geographical Distribution of Prefectures' OpenData Penetration Rates

As shown in Table 1, the highest and lowest values were recorded by Fukui (94.1%) and Kochi (0%), respectively. We found that there is no correlation between a prefecture's opendata penetration rate and the number of municipalities existing in the prefecture; Pearson's correlation coefficient between the two is −0.143. In addition, there were no specific regional biases regarding the prefecture's penetration rate, according to Figure 1. Then, the frequency distribution of penetration rates for all 47 prefectures is shown in Figure 2. As indicated in Figure 2, the opendata penetration rates for most prefectures turned

out to be less than 50%.
Figure 2   Histogram of Prefectures' OpenData Penetration Rates

We then wondered if the penetration rate might be affected by the fiscal size (revenue), population, or population density of a prefecture. We therefore calculated correlation and partial-correlation matrices between these variables (Tables 2 and 3). As shown in Tables 2 and 3, out of these three variables, the opendata penetration rate had the strongest correlation with population size, although the correlation coefficient was only 0.33. Figure 3 is a scatter plot showing the relationship between the open-data penetration rate and the populations of the prefectures, where each dot represents an individual prefecture. Figure 3 suggests that there is only a weak relationship between these two variables.

To determine what the important factors that have facilitated prefectures' opendata efforts are, we focused on the top five prefectures: Fukui, Shizuoka, Kanagawa, Okayama, and Saitama, and we then investigated qualitatively how each had performed its opendata initiative. We examined the Web sites of these prefectures and reviewed the interview logs that we had previously conducted with the person in charge of the opendata initiatives in each of these prefectures.

Table 2   Correlation Matrix between Variables

	Revenue	Population	Population Density	Open Data penetration Rate
Revenue	1.000	0.889	0.838	0.182
Population		1.000	0.894	0.331
Population Density			1.000	0.315
Open Data penetration Rate				1.000

Table 3   Partial-Correlation Matrix between Variables

	Revenue	Population	Population Density	Open Data penetration Rate
Revenue	1.000	0.602	0.230	-0.275
Population		1.000	0.546	0.256
Population Density			1.000	0.104
Open Data penetration Rate				1.000
Figure 3   ScatterPlot of Prefectures' OpenData Penetration Rate*vs*. Population

3.2 Details of the top five prefectures' opendata efforts

We examined the opendata sites on the Internet for the top five prefectures—Fukui, Shizuoka, Kanagawa, Okayama, and Saitama—in June 2018, and we also performed a literature survey of their opendata efforts. In addition, we reviewed in detail the logs of interviews that we had conducted in 2015 with the person in charge of the opendata initiatives in each of these prefectures. The main results were as follows:

(1)Fukui Prefecture

There were various types of information on this prefecture's open-data site.Typical examples were the following, which were released as "Open data jointly published by Fukui Prefecture and all 17 municipalities existing in Fukui:"(1)A list of evacuation sites for all municipalities, (2) information about public facilities possessed by Fukui Prefecture and/or by the municipalities, (3) a list of garbage-collection datesfor all municipalities, and (4) guidelines for trash separation ineach municipality. Fukui includes Sabae City, which has been quite advanced in its opendata efforts; in January 2012, Sabae City became the first to publish its open data (Seto, T., et al., 2015).

Generally speaking, open data may differ in machine readability, depending upon the file format.Tim Berners-Lee, who is an inventor of the Web and Linked Data, has proposed a "5-star deployment scheme" as a guide to machine readability, as shown in Figure 4. It has been widely used all over the world for judging how well opendata initiatives have progressed (Shadbolt, N., et al., 2012).

From: http://5stardata.info/en/
Figure 4   5-Star Deployment Scheme

Fukui Prefecture's opendata sites contained various files in from CSV format (3-star rating) to Linked-RDF format (5-star rating). Because most prefectures provide open data in formats of 4 stars or less, Fukui Prefecture has been highly rated by the authorities.
According to the interview we conducted in 2015, Fukui Prefecture had allocated a dedicated staff member in the information system division to driveforward this effort. He was trained to handle open

data and to promote uniformity in the datatypes of files to be uploaded.

(2)Shizuoka Prefecture

The opendata sites managed by Shizuoka Prefecture contained open data for most of the municipalities it contains. A few municipalities in this prefecture—like Mishima City—published open data in the 5-star rating file format. In August 2013, Shizuoka Prefecture published the "Open Data Catalog Shizuoka" as the first prefectural opendata portal site in Japan (White Paper 2014, 2015).

Through the interview we conducted in 2015, we found that two staff members belonging to the information system department had been assigned in charge of overseeing an open data system. Those members started to develop the open data system without outsourcing by using open-source software (OSS). This is a type of computer software for which the source code is released under a license in which the copyright holder grants users the rights to study, change, and distribute the software to anyone and for any purpose. Those staff members had tackled the opendata issue from their own perspective alone. Because of such in-house software development, there were pros and cons to this approach. An advantage is that the developers can flexibly modify the system as they want. In contrast, a disadvantage is that the performance of the system depends greatly on the ability of a limited number of developers, and no one else can operate the system without them.

(3)Kanagawa Prefecture

Kanagawa Prefecture consolidated the following data for all 33 municipalities it contains and published them on the prefecture's opendata site. The data included (1) information about the locations and services of libraries and children's halls, (2) information on the locations of parks and play equipment, and (3) information about evacuation sites for all municipalities and locations of automated external defibrillators.

(4)Okayama Prefecture

Like Shizuoka Prefecture, the opendata sites managed by Okayama Prefecture contained open data for many of the municipalities it contains. Municipalities in OkayamaPrefecture seemed to be able to publish their own data using the upload function on the Okayama portal site. The data-upload system had been built using CKAN[1], which is a type of OSS. Apart from the main opendata site, seven cities and three towns jointly run a site named "data eye: data portal of the watershed areas of Takahashi-gawa River."

(5)Saitama Prefecture

Like Shizuoka Prefecture, the opendata sites managed by Saitama Prefecture contained open data for most of the municipalities it contains. Municipalities in SaitamaPrefecture also seemed to be able to publish their own data using the upload function on the Saitama portal site. The data-upload system had been built using CKAN, like Okayama Prefecture. Some kinds of data for Saitama Prefecture were published in a 5-star-rating file format.

3.3System sharing for publishing open data

From the details of the top five prefectures' opendata efforts, we found that several prefectures had organized a collaborative opendata project with their municipalities. This collaboration seemed very important in facilitating the opendata initiatives. We therefore investigated the duplication between a prefecture's Web site and a municipality's Web site and also those among the different municipalities' Web sites. We browsed duplicate sites and inquired into the situation directly.

Eventually, we found that there are three types of collaborations between local governments for publishing open data, which are expressed in Web-site duplication or in the sharing of a site's function. These include (1) a type of collaboration in which a prefecture compiles data to be opened from its municipalities and the prefecture uploads them; (2) a type of collaboration in which a prefecture provides to its municipalities an opendata release function on a portal site, and the municipalities then use this function themselves; and (3) a type of collaboration in which several neighboring municipalities collaborate together to build a common opendata release site. In this paper, these three types of collaborations are called Types A, B, and C, respectively. We investigated which types of collaborations were used in an individual prefecture, and the results are presented in Table 4.

---

23	Ehime				47	Kochi			
24	Saga								

ODPR: Open Data Penetration Rate

Collaborations of Type A were used in Fukui, Kanagawa, and Fukushima. Type A has the problem that it forces a large administrative burden on an individual in the prefecture who then takes responsibility for publishing the data. In the case of Fukui Prefecture, a full-time staff member was assigned to the section for such a job. However, it is likely to be difficult for other municipalities to do the same thing as Fukui Prefecture, since cost reductions and personnel reductions have recently been required in most municipalities.

Type B was used in Shizuoka, Okayama, Saitama, Tokushima, and Miyazaki. As described above, Shizuoka, Okayama, and Saitama used OSS for incorporating the opendata release function on a portal site. The advantages of using OSS not only increase the flexibility of the system design but also decrease the system-development costs. In particular, CKAN, which was adopted by Okayama Prefecture and Saitama Prefecture, is customized for publishing open data, with a unique feature that enables tagging. By using this feature, CKAN easily deals with tagged open data. For example, if a different tag is set for the data from each different municipality, these tagged data are easily handled in a prefecture's portal site without confusion. Since the cost of OSS such as CKAN is inexpensive, a small-scale municipality would benefit from using this approach.

Type C was used in Okayama, Tochigi, and Fukuoka. Unlike Types A and B, Type C is a collaboration in which several municipalities cooperate to construct a common opendata release site. Since a prefecture—which has wide-ranging influence on its many municipalities—does not take part in the cooperation, it is necessary for one or another municipality to take the role of a core municipality, demonstrating leadership and coordinating ability, to facilitate the collaborative work.

In summary, judging both from the number of prefectures that have already implemented each type of collaboration and from the opendata content that has already been published, Type B seems to be the most promising approach for collaboration among local governments.

4 Conclusion

In this paper, we found that opendata efforts have progressed in some municipalities in Japan, although the efforts have not yet been introduced sufficiently in many other municipalities. We calculated the opendata penetration rate for each prefecture by using the number of municipalities that had already published their own open data, and we found that there is a regional disparity in the opendata efforts. By adding qualitative information to this quantitative research, we found that there are

three types of collaborations among local governments that facilitate the publishing of open data. Type A is a collaboration type in which a prefecture compiles data to be opened from its constituent municipalities and the prefecture uploads them. In Type B, a prefecture provides an opendata release function on a portal site to its constituent municipalities, and they upload open data by themselves using this function. In Type C, several neighboring municipalities collaborate together to build a common opendata release site. Out of these three types, Type B seems to be the most promising way for local governments to collaborate.

Third parties or private companies may develop new kinds of digital products and/or services if it is possible to invent new uses by combining different kinds of open data. This is potentially capable of leading to technological innovation and economic growth.

In the future, we plan to conduct additional interviews with key persons in charge of the opendata efforts in municipalities. In addition, we intend to conduct research to find out how open data can contribute to regional revitalization.

Internet of Things (IoT) Opportunities and Impacts of Well-being on Citizens and Society

Arnoldo José de Hoyos Guevara, José Luiz Alves da Silva
Pontifical University Catholic of São Paulo, São Paulo, Brazil
(E-mail: arnoldodehoyos@yahoo.com.br, jl.alves@uol.com.br)

Abstract: It is in the interest of all to know and anticipate the transformations that are underway and those that will be probable in the future, capturing the spirit of accelerated change that is around us, to prevent impacts, to draw personal strategies to seize opportunities and to avoid serious ruptures in our work and in our personal lives. This paper deals with questions regarding accelerated and disruptive high-tech transformations, in order to be strategically prepared and to deal with challenges ahead. In this article we present a general scenario on the theme of Internet of Things - IoT, aiming to discuss the opportunities, the impacts and the associated risks, highlighting them under the sight of well-being in our lives and society in general. The contribution for other studies is to allow ongoing discussions regarding the possible changes of behaviors coming from this new environment that will be possible by the use of the IoT. Some of these behaviors are already on its way. Still, others are to be perceived and developed. The article presents, in the first topic, the new environment of the Fourth Industrial Revolution, where it is inserted the concept of IoT. It advances, in the second topic, with the discussion of the extension of the usage of the new technology, its impact and its applications. And it ends discussing the behavioral changes that the massive use of this application may bring us regarding well-being.
Key words: IoT-Internet of things; Fourth industrial revolution; Well-being; Opportunities; Risks

1 Introduction

What are we dealing with here? The perception of what is changing around us, in the light of new scientific advances and new technologies. Of which precepts, postures and attitudes may be changing without becoming aware and how it can change our reality or the way in which we perceive it. And how this may affect citizens and a society well-being.

Our powers of observation and the way in which we understand the changes underway, give us the power to adapt, to choose the paths to go and the decisions to be taken in our personal lives or in our professions. These are the opportunities.

All around the world in which we live, we come across social, political, economic, environmental and technological turmoil that change our relations and our scale of values. Even if we wanted to keep us unrelated to this, it is not possible. The changes around us can carry us together, we can perceive them and walk beside or can participate and take advantage of this new scenario, using or discovering new applications. These are the risks.

We will discuss in this article about this scenario, called by many as the Fourth Industrial Revolution and pretentiously called by us, *"The New Digital Age"*, only with the intention of putting on paper a general design, as an initial reference base, to comment, research, analyze, develop our own opinions and propose new visions.

2 A Look Ahead to the Challenge

This is an exploratory analysis, using the vision of academics and researchers as Klaus Schwab, Alvin Toffler, Hamish McRae, Samuel Greengard and the researches of the authors regarding the disruptive technologies and changing behaviors of our society.

We are experiencing a world in constant integration. The famous researcher and entrepreneur Klaus Schwab, World Economic Forum founder and author of the book "The Fourth Industrial Revolution" (Schwab, 2016) presents us with a first vision in which shows the integration of Technological, Biological and Physical worlds. This is not just a forced and artificial joint, but the natural development of paths that started apart and slowly approached. Science, as it is known in its essence, searches for answers fully based on logic, in mathematics, in applied research and in the hypotheses proposed to explain the existing realities and build new theses. However, the barriers of technology advance and increasingly cover our relationships, our financial commitments, medicine, entertainment, production of consumer goods and services, shortening paths and allowing new behaviors. Society adapts, invents new fads or follow trends. If you look at the last years of the last century, Hamish McRae (HSM Management, 1999) has pointed out

the five forces that they were redesigning the world, focusing his look to the year 2020, now close to us:

- Technological advancement
- The process of globalization
- The changing demographic structures
- The concern with the environment
- The impact of Government actions on society

All pointed forces remain present and the trends of technological advancement are indicated, without exception, in all Megatrends studies presented by the currently main consulting companies in the world. The well-being of citizens and society in general are completely dependent on these trends. We See, in intense fashion, the impacts relating to global conflict, focused on trade, immigration and religions surpass all possible frontiers.

In the case of Klaus Schwab, strengthening the concept of technological advancement, he presents an interconnection between technological skills, which decades ago displayed a certain degree of separation, but that are now very close.
Figure 1   Fusion between Digital, Physical and Biological Worlds

The extension of this interconnection challenges us and shows us the composition of a new world, active, moving towards mergers between them and changing before our eyes.

PHYSICAL WORLD: Technologies like autonomous vehicles, 3D and 4D printing, Advanced Robotics and new materials represent this category. This environment is more palpable, and we can see its connotations closer to us. Having a 3D printer at home and being able to "print" small tools, decorative or support item won't take long. And this technology changes the basic parameter of production assembling objects through agglutination of raw material rather than material loss on its traditional production. Replicas of human organs are being tested for simulations, studies and future transplants. In the case of autonomous vehicles already have several cases reported of tests on Amazon, Google, Tesla and Uber with, unfortunately, the first case of a fatal accident, occurred in this year.

BIOLOGICAL WORLD: In this sector we include extraordinary genetic innovations, with sequencing, activations and editing genes recently made that was only possible by the computational increase. There is now the synthetic biology. Although there are serious ethical discussions involved, it has the ability to create custom bodies, applicable in agriculture, medicine or fuel, besides the possibility of specialized and personalized treatment for each individual. Let us not forget that in Brazil, we have advanced research at Embrapa, with creation of specialized seeds and adaptable to a variety of soils and climates, as well as resistant to various crop pests. In the future, considering the other developments, its scheduled the deployment of artificial memories in the brain of a human being. As well as considering the 3D printing combined with the editing of genes, will allow production, repair and regeneration of living tissue. This possibility is already being used to evaluate the creation of skin, bones, and muscle tissue in advanced medical centers of the planet.

DIGITAL WORLD: We indicate in this group, fundamental developments in progress, as the focus of this article, IoT-Internet of Things, the Blockchain, technology behind the cryptocurrency, the shared economy, the creation of new business models, social networks, with its astronomical dissemination of information and new digital platforms. Especially accentuated for the evolution of AI – Artificial Intelligence.

We emphasize the interrelationship with other categories and well-being in health, since the monitoring the human body, through sensors installed inside our body will allow the monitoring of symptoms, reactions, changes of heart rate, emergency calls or triggering the application of doses of drugs implanted under the skin. More from other interactions in the following topics.

THE NEW DIGITAL AGE: Why do we frame here, supposedly, as we said, a new concept, calling

this period *"The New Digital Age"?* Because the scope is much deeper than we have experienced before. As quoted by Klaus Schwab, "changes, in terms of size, speed and scope, are historical" (Schwab, The Fourth Industrial Revolution, pg. 12).

The second half of the 20th Century until now had an extraordinary development of technology, from a purely analog world to a digital world, more intuitive and with great interaction of people with machines, with computers and with the digital interfaces. In the history of the last 5,000 years, we're talking about only 50 years or 1% this period.

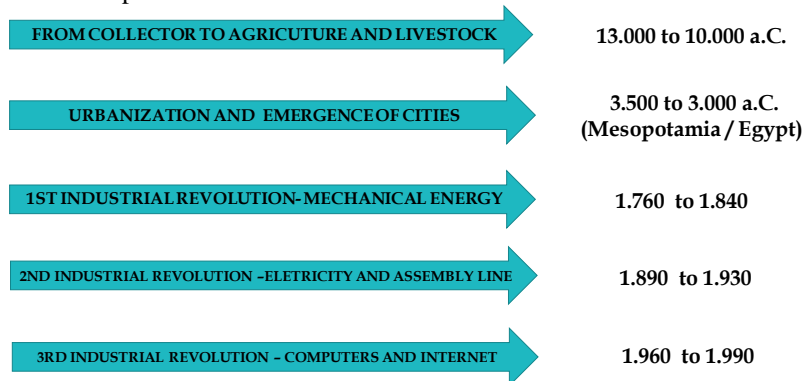
FROM COLLECTOR TO AGRICUTURE AND LIVESTOCK	**13.000 to 10.000 a.C.**
URBANIZATION AND EMERGENCE OF CITIES	**3.500 to 3.000 a.C. (Mesopotamia / Egypt)**
1ST INDUSTRIAL REVOLUTION- MECHANICAL ENERGY	**1.760 to 1.840**
2ND INDUSTRIAL REVOLUTION –ELETRICITY AND ASSEMBLY LINE	**1.890 to 1.930**
3RD INDUSTRIAL REVOLUTION – COMPUTERS AND INTERNET	**1.960 to 1.990**


Figure 2   Up to The Third Industrial Revolution

From 1990 the working tools and interaction with the reality changed gigantically. The visionary Alvin Toffler, author of "The Third Wave" and "Future Shock", he predicted, in the 70s and 80s, the so-called Knowledge Society, predicting a computer on the desk of every person. And emphasized the need for mastering knowledge, informing, in summary, that the illiterate of the 21st century would not be the one who cannot read and write, but that you couldn't learn, unlearn and relearn. He warned that we would have the knowledge revolution. The main means of production would be the brain and not the brawn. And this new era would lead us to a world with new beliefs, attitudes, ethics and jobs (Toffler, 1980).

TREND ANALYSIS ON DIGITAL CONNECTIVITY IN BRAZIL: The technological innovation as a whole, the accelerated digitization, the internet and mobile telephony with their smartphones are fundamental tools of transformation developed from the 90s. Today we have more than 7 billion mobile devices worldwide and more than 200 million in Brazil, according to data from the Brazilian site Teleco.com [1]., Cepal and ITU. This gives a capacity of connectivity and access to information, immediately and digitally, and in a unprecedented manner in the history of humanity, allowing access from most of humanity to the bases of knowledge.

As an example of this reality in Brazil, we conducted a study of trends, with the Minitab tool, to evaluate the evolution of residences and connectivity of mobile devices in the country, considering data from the last 20 years and designing them for the next ten years (till 2028). We had the following results:
Figure 3 and 4   Trends of Digital Access in Brazil for 2028

---

[1] Site Teleco.com: Estatísticas de Julho de 2016, Statistics of July 2016.UIT, Wireless Intelligence, and Teleco.com. Available in:http://www.teleco.com.br/pais/celular.asp

We note that we have constant reductions in the fixed lines, access practically to the whole population of Brazil for mobile access and almost 80 million households with internet access. The basis for the digital society is given in our country.

Although a part of the world's population still does not have access to electricity or the Internet, in part of the globe, in the last 30 years we have prepared the basis for what you see now, with deep transformations in the way in which we communicate, act, work, study and have fun. In Africa, the continent with the highest global growth delay, displays accelerated digitization growth rates. This does not mean that we will make the best use, but that reality is present.

As shown by Schwab, the current changes were never experienced before. The Speed, Breadth, Depth and the Systemic Impact are immense, and these new technologies generate for themselves new solutions, exponentially. The modifications alter the way we live and can change who we are, the productive chains and entire economic systems (Schwab, 2016)

3 Disruptive Technologies and New Trends

The disruptive technologies are those capable of radically changing aspects of the economy, of society or of our personal lives. Open spaces and opportunities that would not be possible or that were not seen previously, change habits, needs and desires. Let's check some of them briefly, highlights in the world and that give us the context for evaluation of IoT, focus of this work.

ARTIFICIAL INTELLIGENCE (AI): We speak here of one of the greatest advances of our time. The ability of cybernetic brains making decisions. Yes, that's the point. Don't we talk about the stratospheric processing capacity today already present in our businesses and our research centers. The novelty lies in the fact that the processing power increases in geometric scale and, because of this, the most advanced processors traveled paths that enable building sceneries and making decisions. Cognitive functions of a human being. You can see that we have some real indications in our world, as common examples that serve as samples of these advances. The uses are made in legal offices, to select and classify processes, in medical diagnoses and evaluation of dosage of medicines, on education and on accelerated learning, in the simulation of nature, events in process automation care and in decisions of financial investments, for example.

These advances occurred with known developments. For example, the *Deep Blue*, computer mounted by IBM, which, in 1997, in London, won a match of six chess matches against world champion and grandmaster Garry Kasparov, getting the first image of the machine winning the man. Passed by 2011, the so-called Cognitive Computing feat of known *Watson*[1], who won in a fierce dispute, in the most famous game of questions and answers of the USA, Jeopardy[2] (CBS), the two most prominent previous champions in amount of questions answered and in awards, Ken Jennings and Brad Rutter. By 2015, 2016 and 2107, by the company AlphaGo, later acquired by Google, who beat world champions in the strategy game GO, the Chinese Fan Hui, South Korean Lee Sedol and the Chinese champion KeJie, respectively.

In this way, establish new behaviors or new diagnoses, answering scripting or advanced troubleshooting, without specific programming becomes a real possibility. The Machine Learning are learning with new situations and can make decisions of production, or medications for patients. Its evolution will be direct communication with other machines.

INTERNET OF THINGS (IoT): The term Internet of things emerged based on the recognition that we are dealing with two different worlds, the digital world from the natural evolution of equipment and networks and the world unplugged, that already existed, and which would not require control and real time connection. It is formed by any of the equipment, element or supervised activities we can check in our society. The concept evolved once the needs and desires have expanded, as life became more dynamic and required greater control by people in general. What we present here is the possibility of interconnection of trillions of sensors around the world, passing data in real time to the digital world on the operation of equipment and things without direct connection to the Internet (using interfaces analog-to-digital), such as appliances, cameras, cars, houses, clothes, pipelines, toys and entire cities. We'll cover this in more detail on the second part of this article.

BIG DATA: We have to mention Big Data. If it isn't disruptive, once is continuity of processes developed for a long time, it is complementary to the two technologies mentioned earlier. We can

---

[1] Site Gizmodo: Watson. Available in: http://Gizmodo.Uol.Com.Br/Computador-Da-Ibm-Vence-De-Lavada-Dois -Cerebros-Humanos-Em-Jogo-De-Conhecimentos-Gerais/
[2] Site Tech Republic.Com: Watson. Available in: https://Www.Techrepublic.Com/Article/Ibm-Watson-The -Inside-Story-Of-How-The-Jeopardy-Winning-Supercomputer-Was-Born-And-What-It-Wants-To-Do-Next/

consider these as a basic tripod for the analysis of behavior and social scenarios drawing, today called analytical techniques or "analytics". The vision of a world controlled by the information is so big that surprising what we can accomplish today. All our behaviors feed huge databases, supplied to the extent we do purchase operations, watched movies, travel, we browsed the Internet, fill out surveys or registers or communicate with others. Previously known as Datawarehouse's, these tools worked with Structured Data, existing in pre-formatted databases in companies. Today the use of the name Big Data is required, because the new databases are powered by Unstructured Data from Social networks, Electronic media and pure Internet navigation. This information becomes Knowledge, enabling the decision making. IoT, Big Data and Artificial Intelligence will be the basis for Decision Makers or Automatized Actions in Smart Cities and Autonomous Cars, among other applications.

BLOCKCHAIN: Blockchain is a technology seen today as one of the greatest technological breaks. It is regarded as the new Digital Notary, able to record transactions of any kind, with security and traceability. It is the technology created as the basis for the cryptocurrencies, as the Bitcoin, the most popular of this universe. It was developed by the programmer of pseudonym Satoshi Nakamoto, in 2008, putting the program code available directly on the Internet. Ensures the private control and various applications such as the cataloguing of works of art, weapons or transactions with diamonds, allow and certify Authenticity and Registration of trade. There are Governments with early works for tax collection with Blockchain technology and financial banks working with end-to-end transactions. And even, in drafting laws to ban the use of cryptocurrencies in their territories, for the risk of loss of control it can represent.

QUANTUM COMPUTATION: This area of science promises to revolutionize the future of humanity, ensuring that we will have the possibility of creating processors with higher current capabilities in speed and processing power. This is because the process of development of microelectronics has its limitations. The capacity of a traditional computer chip double every 18 months, was broken recently, indicating the limits of this border. The creation of quantum processors would lead the process of performing calculations for a kind of parallel processing, in which multiple possibilities would be calculated at the same time or multiple scenarios would be handled together. However, these processors work in extremely low temperatures, bringing great challenges for your swift implementation. The attention here is because a superior capacity to process would influence all other trends discussed up to here, the performance of each one of them. And could create scenarios in which the Artificial Intelligence could reach your peak, enabling highly complex decisions.

NANOTECHNOLOGY: One of the most able developments of our times are those applied by Nanotechnology. Machinery, chemical systems, medical and pharmaceutical medicines with cell dimension, acting and performing microscopic changes, either within the human body, in agriculture or in the physical world. Some of the experiments already running, produce molecular structures working in toxic environments, which invade cells, acting on evil difficult or almost impossible to be treated with high precision, with fewer side effects. Here is one of the links between the world of technology and biology, because the existing potential extrapolate traditional treatments. Pharmaceutical nanotechnology, for example, is used for the treatment, diagnosis, monitoring and control of biological systems and has recently been named "Nanomedicine" by the National Institute of Health in the United States (Moghimi et al., 2005). In Brazil, we have the example of the pharmaceutical laboratory at State of São Paulo, which is using this technology to manufacture a pill, still in approval by ANVISA, with the antimalarial artemether, a semisynthetic substance encapsulated in microscopic doses and very intense, to get the highest efficiency and be less aggressive for the human organism.

NEW MATERIALS: In the industry we have available the development of new materials that promise to revolutionize the way of producing and transporting energy. Some of these materials are lighter, stronger and recyclable, and allow self-repair and self-cleaning applications, with resilience and return to their original forms or transducers that turn pressure into energy, a huge advantage. Others, as plastics, allow reuse parts of products that are difficult to recycle, like those used in cell phones or parts for space industry, for example. One of the greatest exponents of the moment is Graphene, one of the crystalline forms of carbon, as well as diamond or graphite. This material is considered so revolutionary as that silicon, essential to the development of semiconductors and the evolution of computers. Of high quality, is 200 times stronger than steel, lightweight, almost transparent, much thinner than a hair, an excellent conductor of heat and electricity. Is one of the strongest materials ever found, but also extremely expensive. The combination of extraordinary properties and surprising ease of isolation allowed an explosion in research about Graphene and their use in recent years. The Nobel Prize in physics of 2010 was awarded to Andre Geim and Konstantin Novoselov of the University of Manchester by innovative

experiences regarding this material.

4 IoT: Internet of Things

When we talk about the fact that we can connect things to the Internet, we are talking about our ability to receive information and make decisions from the recognition of reality. And this represents a cultural and behavioral change without dimension. When it comes to personal well-being, we become "owners" of decision making, which may be under our control. Or we can "delegate" this control to third parties or to the network that will have the power to take decisions on our place. Seems a simple situation, but it is not. In this reality we can be carried by currents or interact with it consciously. The researcher Samuel Greengard tell us that IoT is at the epicenter of one innovation shock wave that it is just getting started and it is in the way between the innovator and early adopter phases. It will someday serve as the practical framework for life and for business (Greengard, 2015).

All digital equipment that we know as smartphones, laptops, personal computers, smart-tv's, cameras, and other resources are already connected to the digital world. The world of "things not yet digital" can be connected to the network by geolocation features or interfaces that can send information. For example, RFID adhesives (radio frequency identification) for the location of a container or objects of any size inside of them. Or by monitoring mobile or satellite communication with remote sensors in aqueducts, oil pipelines, POSs (Point of Sail), cars, planes or drones. This allows a capacity of above-normal control as to the physical world that we know today and in which we live.

Combining this new connectivity to a high capacity of processing we have the opportunity to automatize processes until now unthinkable. And, main point of view, change the way how to take decision, with the possibility of automatic decisions. At the end, changing our mindset about how to live or manage our lives.

Since control the dose of a medicine inserted under the skin and monitored by IoT, remotely trigger a call and send an ambulance for heart attack, without human intervention, control traffic lights automatically at any time of day, monitor constantly the increase of cholesterol in the human body, supply our refrigerators and layoffs by the supermarket without prior request, to trigger the lights in our house and an oven to heat up our food before we get home.
Figure 5   IoT Applications

GEOPROCESSING AND SMART CITIES: One of the most fantastic tools available to dealings of the well-being and quality of life, if well used the geo-processing and geo-location. It is the possibility of using the knowledge of the society in which we are living. Opportunities for improvement of public administration are immense. Since sensing works for garbage collection, monitoring of slopes and risks of collapse in rains, sewer, water leaks through the security assessment in areas of risk for displacement of police forces, automatic sensing of the population present in certain neighborhoods to installation of health centers, schools and police stations, offset daily assessment of people and their interests. The use of APPs (applications) on mobile phones already allow currently these automatic withdrawals.

The process itself, allows the accelerated evolution of the so-called Smart Cities. We speak about cities that have intelligence to decide about the movement of people, public facilities, autonomous vehicles, garbage collection, public transport, sustainability, control flow and use of water, energy, telecommunications and fuels. Without the IoT, we will not be able for this implementation. The geolocation is an essential tool in this subject, allowing the scope of the entire physical area and/or of all its inhabitants. Automatic interaction with "public facilities", its parks, its educational institutions, its citizens, their vehicles, shops and services, possibly favor the health demands, safety and well-being in a

way never have seen before.

SMART HOMES: One of the biggest behavioral change that have already begun and directly impacts our lives is our condition to "control" remotely the environment in which we live, interacting automatically with the objects around us. Already are common and possible the Ip (Internet Protocol) cameras, connected to the Internet for remote monitoring from our homes or monitoring of babies, our elderly relatives or our PETs. With sensors placed around the House, we can control the lighting, fire alarms or emergency care without even being present. Interact with our environment allows you to plan to purchase foods that end up in our homes, with automatic requests to supermarkets. Behavioral changes. For this monitoring, sensors of IoT would need to be in the fridge, in pots or boxes of food.

Avatars began to invade our familiar surroundings in all its possibilities, since applications like Google Play, which aids in the automatic search of anything we want like electronic helpers such as the smart-TVs, seeking to turn into platform only for images, sounds and Internet access. In other words, we have new "interfaces" that will facilitate the integration of the physical and technological worlds.

HEALTH MONITORING: The possibilities are now practically limitless regarding health monitoring via sensors of IoT, stuck in our bodies or the pills we take. We already have the basic conditions for training and races that track our heartbeat or the burning of calories. However, we can easily to inject body sensors that measure our levels of adrenaline and insulin, for example, ensuring that medicines implemented under the skin can release controlled doses. Pills for schizophrenia are being tested in the USA for this purpose, for example.

Of course, this new world will not bring only advantages. With evolution, we have and we're going to have high risks associated with Cyber-attacks, exposition and control about our behaviors. The control over the citizen's life, your likes and desires, your displacement, the knowledge of their habits and your entertainment should not be conducted steadily and indiscriminately. It's a risk and requires extreme care. There are studies in some countries, projecting controls of "score" for remarkable citizens, for which would offer greater access to housing or access to credit, according a behavior considered appropriate by the standards set. The IoT would enter here with millions of cameras, sensors and APPs installation, which could provide instantly information about ongoing actions. As has been highlighted before, is not technology that presents a risk, but the way which we make use of that.

This extraordinary knowledge is also available to be exploited by hackers or crackers that use technological failures as livelihood and profit. In this way, products that needs to be developed, will need provide reliability and safety, that should be created together and provided as a basic requirement of their supply.
Figure 6　IoT Risks

5 Results: Behavior Changes

EMPLOYABILITY: In the current process of digital transformation, it is estimated that around 2025, until 47% of jobs in the USA, related to occupations with high automation potential, should disappear (Frey, Osbornet, 2010 Oxford Martin School University). This means that, with new aspirations, there will be opportunities to create jobs and get back to higher-value activities. We are able to construct them by knowledge of the environment in which we operate. So, with advanced connection will enable new possibilities of interaction with our jobs. And the IoT will enable remote workers monitor, as if they were present at the regular jobs and also will allow control of resources remotely. We will have "Employability" and no more "Formal Jobs". Data scientists, for example, already are a new career in course and currently are not required to be present to act and they can offer your work for different customers.

NEW BUSINESS MODELS: The structures that have evolved in recent years, with new concepts, challenged established views and ways to realize the contact with customers and consumers. The intermediations, considered to be part of the negotiating game, either by the infrastructure or by existing expertise, have been overcome. We have new business around the world like AirBnb, Amazon, Uber, Netflix or Brazilian companies like 99Taxi, Nubank and Ifood. Al of them need of internet and mobile devices, working as an IoT components.

Direct contact with the customers became more effective and have been forcefully changed. Today, Contact-Centers have more complete with various communication alternatives, such as chatbots, IVRs, AI, voice, e-mail, regular chats, collaboration with support of an attendant image online, or the presence of avatars, created digitally to accomplish this interaction, via voice or with the image on screen.

The Shared Economy has been the subject of opportunities that use these applications to connect consumers directly to the suppliers, without shops or promotions contrived. The APPs and sensors locate the client automatically and offer him the best experience or solutions of locomotion, as we see today, in home delivery, taxi ordering, orders monitoring, movement in the cities with Waze or Google, for example. The called Fintech's, Aggrotech's or Insurtech's, financial, agribusiness and insurance segments respectively, are using IoT to facilitate their business and increased efficiency. We have had 36% of growing of Fintechs companies at Brazil in 2017, for example. Each of these areas requires sensors installed or mobile devices such as "location providers", for carried out their tasks.

NEW BEHAVIORS: IoT sensors will spread across our clothes, during exercise, in our medical or measure the level of performance of the services consumed, automatic reading of electricity consumption, the water used, or the calories consumed, bringing us to willingness to change our decisions and not rely on what is reported by the media or by our suppliers.

The developments also reached the applications that can read the same data directly, what have done before only by companies. Apps in mobile phones, chatbots (conversations with robots), avatars and robots mounted based on AI (via automated software systems), evaluate the available data and inform directly the user of his situation. Soon, medical applications will make diagnoses based on sensors installed in your body, without the direct participation of a doctor. It is expected that the first robotic pharmacist, would be available in 2025.

The buying process itself is changing. In shops, grocery stores or arenas are offered products by simple passage or presence of the consumer, monitored by your mobile device, by your clothes or your watches, as elements of IoT.

The buying process by proximity with NFC (Near Field Communication), boarding with read code QRC (Quick Response Code), monitoring objects in stores, activation of cars by proximity, passing through tolls for vehicles on roads automatically, automatic reading of shows or programs congresses are a reality of IoT and AI.

The incorporation of new practices will lead to changes in behavior and consumer profile, as well as flexibility in the way we introduce ourselves in front of our customers, family and friends, in dress and communicate. Will we monitor each step of them by IoT and take decisions from this? Today we monitor the purchases we make, as well we are monitored by security centers that assess our shopping patterns to avoid fraud. Our personal task and professional is get necessary consciousness and decide how we can adapt.

6 Conclusion

The new technologies are undoubtedly shaping the 21st century. IoT is the open door to be connected with this new digital world. The cell phone itself is the largest "IoT personal sensor" already available. Consider the evolutions allowed by several developments cited here for IoT and other technologies that complement its use and application, since it is not possible to talk of IoT separately.

With digitized access extrapolated to a significant number of people in the world, abundant access to information, mobility, the facilities brought by social networks and the constant connectivity, we have new opportunities and possibilities opened for the exploitation of society in general. At work, we can do our tasks remotely, send our productions over the network or access solutions that are available worldwide.

Ancient books of fiction and visionaries of the past have explored these possibilities. George Orwell, in your "1984", which created the Big Brother figure, feared to be controlled by pain, by a culture contained and with fully targeted information. Aldous Huxley, in your "brave new world", understood that we would be flooded with an endless amount of information, pleasure and controlled by a trivial culture,

based in ordinary situations and distractions. In this way, we reached a point where new generations of consumers are undergoing a change in which possession is not the most important, but rather the use and experimentation. The natural status of ownership comes to be disputed in some cases.

In addition, we will pass through a discussion on the future worker, with changes in current professions and the emergence of new occupations, both formal and informal. We will carry the discussion on lasting careers in midsize and large enterprises or on the ability of employability focuses on knowledge and skill of each professional. When, what will matter will be the experiences and achievements accumulated and that will be employed and offered in different environments throughout their lives.

Staying connected and aware of the changes, participating in them becomes our best alternative and our main demand, if we want to be part of this transformation. Learning to use the technology and its potential will put us in a different situation. Evaluating the social impacts of change, proposing viable alternatives in our designs to include people and professionals and avoiding the chaos of transformation is an additional challenge of society, enterprises and a requirement of each one of us. Information, knowledge, choice and adaptability are the key weapons of this participation.   Regarding our well-being, there will be no choice but to learn more and more about the world in which we operate, where new technologies are leading us, about what can be our alternatives and how can we collaborate with society. In other words, in the opinion of these authors, the human being in the new digital society, need to carry out your role in an integrated manner, conscious and participatory. The directions here explored, in particular to the extraordinary advancement of technology and the economy. The use of durable, formal education, knowledge sharing and integration of less able will have to be a common goal of society.

These are the challenges that will require of us, academics and professionals from all areas, adaptability and constant efforts to track and discover new paths, behaviors and opportunities in these times of IoT, of the Fourth Industrial Revolution and The New Digital Age, that may help fostering a more Humane Development and the Global Well-Being.

Abstract: Closing gender gap has been one of the most esoteric problems in Japan. Technology seems to be a keyword to solve the problem. Various technologies including IoT, artificial intelligence, big data has been producing many successful cases. Gender equality was designated as Goal 5 of Sustainable Development Goals (SDGs). This research examined a utilization of an interlinkage visualization tool for SDGs targets. Especially we focused on the target 5.B "Use of technologies for women empowerment" in Goal5 and compared with linkage of China and Viet Nam in order to optimize relations of gender gap in technology and other targets and to find out the difference of linkage in each country.
Key words: Gender; Technology; SDGs; Gender gap; Interlinkage

1Introduction and Background

1.1 History and characters of SDGs

In September 2015, the 2030 Agenda, the "implementation of 17 Sustainable Development Goals (SDGs)," was agreed upon by the world community in the United Nations. There are17goals and 169targets in SDGs (ICSU, 2017).

Remarkable characters of SDGs make all countries including developed countries to pursue them with hard works and the obligations although each goal is difficult to achieve.

First, prior to SDGS, MDGs (Millennium Developing Goals) were enacted year 2000 to solve world concerns mainly poverty and hunger of developing countries.The due was 2015, but most of them did not reach the goals. Idea of SDGs was proposed by Columbia in 2011 before the Rio +20 conference (UN sustainable development conference) insisting that these problems were not only for developing counties, but for developed countries. Guatemala and other countries supported the idea. Consequently, in SDGs, every country becomes stake holders to achieve goals.

Second, SDGs creates common indicators in need to achieve global ambitions and goals in integrated and fusional ways. Index are now shared and developed. And this helps find best practices and connect stakeholders even in far countries.

Thirdly, SDGs activities are done by autonomous, distributed, and cooperative manners rather than by rules. They are not controlled by the United Nations or other organizations. So the activities may seem free and chaotic at first glance. However, thanks to the Internet and SNS, communication and exchange of detailed information in a distant country became possible. These result in greater efficiency and positive integrated actions for many stake holders.

Lastly, there is an imminent goal by 2050 that the biosphere must support 9 billion people. There are problems of global warming, water, air and soil pollution, decreasing biodiversity, population increase, food shortage, energy problems etc.

1.2 Current situation of gender equality in Japan

Gender Equality was designated as Goal 5 among 17 goals. Goal 5 is aiming to achieve "gender equality and empower all women and girls". Japan ranked 11th (80.2) in total SDGs Index score, however, its achievement of SDG5 is the lowest (60.7) among top 20 countries of SDG Index score. Hungary is the second lowest (66.1) and Czech Republic is the third (69.9) in the score. Comparing to relative values which is SDG5/SDG Index, Only Japan is scored below 80 (75.7), followed by Hungary (84.7) and Czech Republic (85.3).

According to World Economic Forum, Japan's global ranking in gender gap is 114th among 144 countries in 2017 and Japan ranked 114 in EconomicParticipationandOpportunity, 123 in political empowerment. The gender gap in Japan is larger than other developed countries and has not been improved yet. As for technology point of view, the rank of number of professional and technical workers is low (101th)(World Economic Forum, 2017).

In Japan, various policy for gender equality has been pursued. However, ranking of Japan's Gender Equality has not been improved yet.
Figure 1　Top 20 Countries' scores by SDGI and SDG5

1.3 Technology for gender equality

Nowadays, the progress of technology is making greater impact on society than ever before, causing discontinuous paradigm shift as a whole, as sharing economy and virtual currency for example.

Positive using the platform of AI, IoT, and big data might solve complicated systems, and consequently the possibilities for contribution to a sustainable society, that balances economic development and solving of social issues, could increase.Under these conditions, gender quality in technology related issues and technological approaches to attain gender equality will be crucial in order to achieve SDGS. Therefore, the question is "Can technology eliminates gender gap?", "How extent?", "How fast?", "What is impact on society"

So far, technologies have had influence on gender gap in various ways. Using ICT such as mobile phones and internet has been providing information at reasonable price and been effective on information literacy and opportunity of education, especially in less developed countries.

In Japan, gender gap in technology related issues still large. A focus group analysis on an ICT enterprise showed conventional behaviors and perceptions by both men and women pertaining to marriage, childbirth and childrearing prevented promotion of female engineers. As a result, female engineers became passive and had less chance to get technical capabilities and management skill in their work after joining a company(S. Hirata and Y. Hayashi and,2017).

Teleworking by using ICT has increased flexible working styles. Our previous research using scenario planning indicated that new working style brought by teleworking has a possibility to overcome obstacles of gender gap in leadership position and professional position in companies. Three obstacles, "expertise", "minority" and "evaluation" which prevented women's promotion showed the research above, were identified to be overcame by teleworking using ICT, big data, and data visualization (Y. Hayashi and S. Hirata,2018).

After "the Act on Promotion of Women's Participation andAdvancement in the Workplace" was enacted in August 2015, Japanese government established a database for empowering women in enterprises by visualization of gender gap index in February 2016. It obliged large companies with more than 301 workers to formulate and notify general employer action plan and publish one or more out of 14 items on the current values relating to empowerment of women. Visualization of data such as female employment ratio, gender differences of employment years, status of working hours, ratio of female managerial positions, etc. enables improvement of comparability of companies by index and ranking, evidence-based approach, and ESG investment. 9,506 out of about 12,000 obliged companies have registered the database. However, data visualization of gender gap is not enough in many areas.

2 Analytical Methods

2.1 Hypothesis

As mention above, ICT plays important role in achieving gender equality. We would like to investigate targets which have influence on gender equality by technology.

Therefore, we set up a hypothesis, that is "although gender gap tends to be diminishing with the development of technology such as ICT, some targets with strong positive or strong negative influence on the targets in Goal 5 exist," and analyze it.

2.2 Analytical tool

In this research, we used "SDG Interlinkages Analysis & Visualization Tool (V2.0)[1]" developed by IGES. This tool identifies interrelationships of 108 targets among 169 based on literature review and knowledge of international consultations such as the Inter-agency and Expert Group on SDG Indicators (IAEG-SDGs) and Sustainable Development Solutions Network (SDSN) on SDG indicators. This tool is aiming at 1) integrated approach forSDG implementation; 2)Network analysis of the general structure of SDG interlinkages and identification oftop SDG targets; 3)Quantification and the structural analysis of the networks of SDG interlinkages atthe national level; 4) providing country-specific dashboards; 5)A web tool on SDG Interlinkages and Data Visualization (X. Zhou and M. Moinuddin, 2017). Base on chronological data collected from 2001 through 2014 in nine Asian countries including Bangladesh, Cambodia, China, India, Indonesia, Japan, Korea, the Philippines, and Vietnam, the tool makes it possible to provide statistical data, the regression analysis of the series data, the mutual linkage of the quantified SDG targets, visualization of mutual linkage and identify strategic targets by applying social network analysis.

Among nine countries in the dataset of "SDG Interlinkages Analysis & Visualization Tool," we chose Viet Nam with the highest gender equality and China with the highest GDP to comparing with Japan.

SDGs' indicators are set to be globally universal indicators that have taken over some of MDGs' index. Adding to IAEG-SDGs and SDSN mentioned above, the Bertelsmann Stiftung collaborate to define and revise those indexes after discussion. Credibility of data is classified three tiers;Tier1[2],Tier2[3],Tier3[4] and Tier document contains all past updates after tier is revised based on discussion (United Nations, 2017).

2.3 Target to be analyzed

Goal5 "Gender equality" has 9 targets from 5.1 to 5.6 and 5.a to 5.c. Among 9 targets, we chose target 5.b, that is "Enhance the use of enabling technology, inparticular information and communications technology, to promote the empowerment of women," which is the only target that relates to ICT technology issue directly[5].

An indicator of 5.b, "5.b.1 Proportion of individuals who own a mobile telephone, by sex," was proposed as Tier2 initially and became Tier1 at the third meeting of IAEG-SDG saying "there is broad,global data coverage for this indicator (United Nations, 2017)." International Telecommunication Union (ITU) indicated that "discrepancies exist between the proportion of men and women that access, own, use, and benefit from ICTs and this indicator is important to track the gender digital divide", and stressed the importance of mobilephone ownership as opposed to shared ownership, for a person'sindependence and autonomy (ITU, 2015).

2.4 Limitation

Only 46 countries' index data "5.b.1 Proportion of individuals who own a mobile telephone, by sex," are available at SDG Indicators of Global Database beta 0.2.52 and 7 counties out of 46 is missing data by sex.[6] "SDG Interlinkages Analysis & Visualization Tool (V2.0)" uses "Mobile cellular subscription rate" instead. This will be difficult to know linkage with technological gender gap in this analysis.

---

[1] https://sdginterlinkages.iges.jp/

[2] Tier 1: Indicator is conceptually clear, has an internationally established methodology and standards are available, and data are regularly produced by countries for at least 50 per cent of countries and of the population in every region where the indicator is relevant.

[3] Tier 2: Indicator is conceptually clear, has an internationally established methodology and standards are available, but data are not regularly produced by countries.

[4] Tier 3: No internationally established methodology or standards are yet available for the indicator, but methodology/standards are being (or will be) developed or tested.

[5] 5.1 to 5.4 are about violence, discrimination, forced work economically, politically, and because of weak position. 5.5 is about equal opportunities for leadership at all levels ofdecision-making. 5.6 is reproductive health and reproductive rights. 5.a is rights to economic resources. 5.c is legislation for the promotion of gender equality.

[6] https://unstats.un.org/sdgs/indicators/database/

However, most of the countries in the Database, gender gap of proportion of mobile telephone is not so big especially in high proportion countries. Therefore, a country with a high proportion considers gender gap to be small. These problems of aggregated data were pointed out in SDG Index and Dashboards Report 2018 (Bertelsmann Stiftung, 2018).

It has been a longstanding problem that data did not exist or not being disclosed in Japan, as well. As mention above, the database for empowering women was established to disclose data by sex.

3 Results and Discussion

We conducted an analysis on interlinkage of 5.b with data of Japan, China and Viet Nam.

Figure1,2,3 show interlinkage of target 5.b with other targets in Japan, China, and Vietnam. A solid line means positive linkages of each target, a red line indicates negative linkage, and dotted line indicates that data do not exist but a linkage was recognized through expert group's discussion.

Table1 shows Comparison of linkages of targets among Japan, China and Viet Nam. There is some remarkable difference among three countries.

Figure 2   Japan's Interlinkage

Figure 3   China's Interlinkage

Figure 4   Vietnam's Interlinkage

Table 1　Comparison of Linkages of Targets among Japan, China and Viet Nam

	index of UN	Tier Classification	possible custodian agency	index of IGES tool	Japan	China	Viet Nam
2.1	2.1.1 Prevalence of undernourishment	Tier I	FAO	Proportion of population below minimum level of dietary energy consumption	0	0.86	0.77
	2.1.2 Prevalence of moderate or severe food insecurity in the population, based on the Food Insecurity Experience Scale (FIES)	Tier I	FAO				
2.2	2.2.1 Prevalence of stunting (height for age <−2 standard deviation from the median of the World Health Organization (WHO) Child Growth Standards) among children under 5 years of age	Tier I	UNICEF	Prevalence of wasting in children under 5 years of age, weight for height	N/A	0.8	0.72
	2.2.2 Prevalence of malnutrition (weight for height >+2 or <−2 standard deviation from the median of the WHO Child Growth Standards) among children under 5 by tipe (wasting and overweight)	Tier I	UNICEF				
2.A	2.a.1 The agriculture orientation index for government expenditure	Tier I	FAO		N/A	−0.1	0.73
	2.a.2 Total official flows (official development assistance plus other official flows) to the agriculture sector	Tier I	OECD				
2.C	2.c Adopt measures to ensure the proper functioning of food commodity markets and their derivatives and facilitate timely access to market information, including on food reserves, in order to help limit extreme food price volatility	Tier II	FAO		−0.67	−0.9	−0.87
4.3	4.3.1 Participation rate of youth and adults in formal and non−formal education and training in the previous 12 months, by sex	Tier II	UNESCO-UIS	Goss enrolment ratio, tertiary	0.98	0.97	0.91
4.4	4.4.1 Proportion of youth and adults with information and communications technology (ICT) skills, by type of skill Tier	Tier II	NESCO-UIS IT	Lower secondary completion rate, total	N/A	0.93	N/A
6.2	6.2.1 Proportion of population using safely managed sanitation services, including a hand−washing facility with soap and water	Tier I	UNICEF, WHO	Percentage of population with access to improved sanitation facilities	N/A	0.92	0.72
8.2	8.2.1 Annual growth rate of real GDP per employed person	Tier I	ILO		−0.7	0.12	−0.16
9.C	9.c.1 Proportion of population covered by a mobile network, by technology	Tier I	ITU		0.93	0.87	0.9
11.2	11.2.1 Proportion of population that has convenient access to public transport, by sex, age and persons with disabilities	Tier I	UN Habitat		N/A	0.98	0.84
13.1	13.1.1 Number of deaths, missing persons and directly affected persons attributed to disasters per 100,000 population	Tier II	UNISDR		0.01	−0.3	−0.32
	13.1.2 Number of countries that adopt and implement national disaster risk reduction strategies in line with the Sendai Framework for Disaster Risk Reduction2015−2030	Tier II	UNISDR				
	13.1.3 Proportion of local governments that adopt and implement local disaster risk reduction strategies in line with national disaster risk reduction strategies	Tier III	UNISDR				
16.10	16.10.1 Number of verified cases of killing, kidnapping, enforced disappearance, arbitrary detention and torture of journalists, associated media personnel, trade unionists and human	Tier III	OHCHR		0	0.71	0
	16.10.2 Number of countries that adopt and implement constitutional, statutory and/or policy guarantees for public access to information	Tier II	UNESCO-UIS				
17.6	17.6.1 Number of science and/or technology cooperation agreements and programmes between countries, by type of cooperation	Tier III	UNESCO-UIS	Researchers in R&D (per million people)	0.93	0.99	0.97
	17.6.2 Fixed Internet broadband subscriptions per 100 inhabitants, by speed	Tier I	ITU				
17.8	17.8.1 Proportion of individuals using the Internet	Tier I	ITU		0.97	0.99	0.97

3.1 Case of N/A

In 2.2[1], 2.A[2], 6.2[3], 11.2[4], there are data in China and Vietnam, but data is N/A in Japan. In 2.2, For example, "Prevalence of stunting" and "Prevalence of malnutrition" were surveyed by UNICEF while Japan was out of target because children's health condition seemed to be good. As for "Prevalence of

---

[1] By 2030, end all forms of malnutrition, including achieving, by 2025, the internationally agreed targets on stunting and wasting in children under 5 years of age, and address the nutritional needs of adolescent girls, pregnant and lactating women and older persons.

[2] Increase investment, including through enhanced international cooperation, in rural infrastructure, agricultural research and extension services, technology development and plant and livestock gene banks in order to enhance agricultural productive capacity in developing countries, in particular least developed countries

[3] By 2030, achieve access to adequate and equitable sanitation and hygiene for all and end open defecation, paying special attention to the needs of women and girls and those in vulnerable situations

[4] By 2030, provide access to safe, affordable, accessible and sustainable transport systems for all, improving road safety, notably by expanding public transport, with special attention to the needs of those in vulnerable situations, women, children, persons with disabilities and older persons

stunting", data of Japan exist in World Bank[1] in 1980 and 2010, and in 2010, the rate is the same range as China from 5% to 10%[2] as figure 5 shows. In both China and Vietnam, a number of stunting has been decreasing greatly. In Japan, percentage of stunning has been the same since 1980. In particular cases, some children's stunting stemmed from parents' neglect or child abuse[3].
Figure 5   Prevalence of Stunting
Source: World Bank

In the case of 6.2 as well which is "Proportion of population using safely managed sanitation services," Japan was out of target.

In 2.2, 6.2, 11.2, China and Vietnam have strong linkage with 5.b.

3.2 Difference between positive and negative

The index of 2. A, that is "The agriculture orientation index for government expenditure (AOI)", has negative linkage with 5.b of China while positive linkage with 5.b of Vietnam. According to FAO, AOI "provides a way to assess whethergovernment expenditures on agriculturereflect the economicimportance of thesector. This index iscalculated as the share of agriculture intotal government expenditure divided bythe share of agriculture in total GDP. It isan indicator of the degree to which theshare of agriculture in public expenditure iscommensurate with the weight of the sectorin GDP[10] (FAO, 2012)."

The importance of agriculture is lower in China than in the case of ICT growth, and in Vietnam the possibility is that ICT and agriculture grew as economy has grown.

3.3 Negative correlation in Japan

In index of 2.C, that is "Adopt measures to ensure the proper functioning of food commodity markets and their derivatives and facilitate timely access to market information, including on food reserves, in order to help limit extreme food price volatility," negative correlation with 5.b is smaller in Japan than in the two countries.

Japan has a strong negative correlation to Target 8.2, that is "Achieve higher levels of economic productivity through diversification, technological upgrading and innovation, including through a focus on high-value added and labor-intensive sectors," while China have weak positive correlation and Vietnam has a weak negative correlation. An index of 8.2 is "Annual growth rate of real GDP per employed person," it is difficult to reflect an objective of target.

3.4 Strong correlations in three countries

The correlations to 4.3[4], 9. c[5], 17.6[6], 17.8[1] are high in all three countries. Each target without 4.3

---

[1] data-catalog/world-development-indicators

[2] https://ourworldindata.org/hunger-and-undernourishment

[3] Nikkei: March 5th 2010; September 6th, 2010; July 25th 2013

[4] By 2030, ensure equal access for all women and men to affordable and quality technical, vocational and tertiary education, including university

[5] Significantly increase access to information and communications technology and strive to provide universal and affordable access to the Internet in least developed countries by 2020

[6] Enhance North-South, South-South and triangular regional and international cooperation on and access to science, technology and innovation and enhance knowledge sharing on mutually agreed terms, including through improved coordination among existing mechanisms, in particular at the United Nations level, and through a global technology

has relation with technology dissemination issues. Therefore, when the proportion of mobile phones increase, there is a possibility to have positive relation with each target.

3.4 Strong correlations in China

The correlation with 16.10, that is "ensure public access to information and protect fundamental freedoms, in accordance with national legislation and international agreements" with the index "Number of verified cases of killing, kidnapping, enforced disappearance, arbitrary detention and torture of journalists, associated media personnel, trade unionists and human rights advocates in the previous 12months" and the index "Number of countries that adopt and implement constitutional, statutory and/or policy guarantees for public access to information" is high only in China.

It is inferred that public access to information and protecting fundamental freedoms has been improved as development of ICT.

4.4, that is "By 2030, substantially increase the number of youth and adults who have relevant skills, including technical and vocational skills, for employment, decent jobs and entrepreneurship, "has data only in China with high correlation, too.

4 Conclusion

Finally, we concluded as follows.

-This tool helped to visualize interlinkage among targets, and it turned out that international comparison is also possible to some extent.

- As the hypothesis, there was a difference in positive or negative correlation depending on the country, even for the same target. By knowing the data being used and knowing definition of data, you can investigate the relationship of the target further more.

- At this stage, there is a limit to the data that can be acquired, and it does not necessarily reflect the contents of the targets. Problems of aggregated data are remarkable especially in gender difference. Index of 5.b did not have data by sex and UN started to collect.

As more effective indexes can be specified by selecting and analyzing, it is desirable to define and accumulate data for the indexes for future comparison.

- Just by looking at the correlation result of the data, we did not realize the essential part of correlations, but it gave us hints to learn the candidate of the problem within achieving goals. More discussion of experts will be necessary for analyzing these results.

Application of Enterprise Business Intelligence in the Background of Big Data

Zhao Jinping[1], Wang Jing[2]
1,2 School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
（E-mail: zhaojp@hotmail.com, wangwataxi@hotmail.com）

Abstract: With the advent of the 21st century, the application of advanced technologies, such as big data, cloud computing and artificial intelligence, in enterprises forms the concept of "business intelligence", which brings new methods and means to enterprise information processing. This paper uses literature review and contrast method to study and analyze the situation and trend of business intelligence application in enterprise management in China, Japan and other countries, and proposes that the application of business intelligence can greatly benefit the business operation and development. If business intelligence tools are well used in enterprise management, it will promote the decision-making capacity of enterprises. At the same time, combining their actual development situation and market changes, enterprises can flexibly use business intelligence to establish a good enterprise information management system, which can help the enterprises fully control their work and promote their sustainable development.
Key words: Big data; Business intelligence; Enterprise management

1 Introduction

In today's world, with the acceleration of information construction of most enterprises, the information construction has been greatly improved, and the amount of business data that can be stored in enterprises is also increasing. However, with the speeding-up of enterprise information construction process, it is urgent to establish a complete business management system in enterprises. If a complete business intelligence system can be introduced and established and the system and related tools can be better applied in enterprise development process, the enterprise management will get assistance to manage the company more efficiently (JinYihong, 2014). Meanwhile, it is also beneficial for the leadership to make scientific and reasonable decisions, and ultimately the competitiveness of the enterprise will be improved. Hence, the application of business intelligence system and the related tools is of great practical significance for better development of the company.

2 Overview of Domestic and Foreign Research

At present, scholars at home and abroad have made great efforts to study the business intelligence of enterprises in the context of big data. As for foreign countries, developed countries such as the United States have entered big data era earlier, and for Asian countries, Japan also has a rapid development in big data and owns a lot of research literature on big data and enterprise informatization. In addition, many foreign scholars have made further studies on business intelligence in recent years. Corinne Jeannet, a Japanese scholar, put forward the application of enterprise business intelligence system based on cloud computing in 2017. He said that it is necessary to establish and improve a business intelligence system in enterprises, and through the application of the system, companies will have an all-round development (ManelBrichni et al, 2017). At present, Japan enjoys high-level technology, and its big data and cloud computing technologies rank among the top in the world. However, in order to cope with possible risks in the future, the Japanese government has also formulated a series of policies to greatly develop IT industry, especially big data and cloud computing. In June 2013, Abe's cabinet announced "The Declaration of Creating the Most Advanced IT Country" that comprehensively described Japan's new IT strategy which put the development of public data and big data at its core from 2013 to 2020 and proposed to build Japan as the society applying information technology widely and with highest standard. In recent years, Chinese scholars have published a number of papers on business intelligence and big data research. For example, Huo Zhijin clearly pointed out in the article "The Application of Business Intelligence in Enterprise Information Construction" in 2016 that the current development of big data technology facilitates the development of enterprise information construction. Furthermore, business intelligence tools used in enterprises have also been derived, and the growth of enterprises is driven by the tools (Huo Zhijin, 2016). In his article "The Application of Cloud Computing in Business Intelligence and Its Influence on the Core Competitiveness of Enterprises" published in 2013, Zhu

Zhangxiang believed that cloud computing has brought great vitality to the development of global economy, enabling enterprises to target globalization (Zhu Zhangxiang, 2013). At the same time, business intelligence technology based on big data and cloud computing has also developed rapidly and its application model in enterprises tends to be mature. The core market competitiveness of enterprises is increasing day by day, which fosters the realization of enterprise economic construction and strategic objectives to a certain extent.

However, with relatively backward research on big data technology, China lacks sufficient understanding of business intelligence, so it needs to actively study the advanced concepts from developed countries to provide more theoretical guidance for the development of Chinese enterprises' business intelligence (Liang Ting-Peng, 2018).The application of business intelligence is beneficial to the operation and development of enterprises. In addition to effectively promoting their decision-making ability, enterprises can also flexibly apply business intelligence according to their own development and market changes to build a good enterprise information management system which can help enterprises to manage comprehensively and promote their sustainable development (Peng Yu, 2014).

3 Overview of Big Data and Business Intelligence

With entering the 21st century, big data technology emerged on the basis of the rapid development of the Internet industry. At the same time, business intelligence has developed rapidly because of e-commerce development. Hence, there is a very close relationship between big data and business intelligence. The development of big data technology has laid a solid foundation for the development of business intelligence (Wang Zhongyu, 2014).

3.1 Big data and its development

Generally speaking, big data refers to the huge flow of information, which is larger than traditional data. However, in theory, big data refers to the data sets that can't be captured, managed, and processed by conventional software tools within a certain time range, and it is the mass and diversified information assets with high growth rate that need new processing mode to obtain stronger decision-making ability, insight and process optimization capability. First, according to the latest survey, the current data magnitude has been developed to PB and even EB and ZB levels, which is beyond human imagination. Secondly, there are many types of big data, including structured, semi-structured and unstructured data. The third is that though with huge capacity, big data enjoys fast processing ability with high efficiency and accuracy. Finally, big data has a low density. Due to its low value coverage density, people need to extract valuable information from vast amounts of data. It can be seen that the rapid development and innovation of big data technology has laid a solid technical foundation for the development of business intelligence.

At present, MapReduce is the mainstream tool used by enterprises and national institutions for data calculation and processing. However, with the continuous increase of data and the growing difficulty of data processing, MapReduce can't fully meet the needs of big data anymore, so new big data computing models are being studied. At this time, batch computing, stream processing calculation, iterative calculation, graph calculation and other calculation modes emerge to calculate big data from various dimensions according to different structures of it. In addition, the application of big data in enterprises is relatively good. Big data is actively used in most enterprises to improve their operational efficiency, helping enterprises to control more data resources. The utilization of big data drives the development of business intelligence which can benefit enterprises to target globalization and promote enterprise competitiveness in the same industry (Wang Wancheng, 2015).

3.2 Business intelligence and its development

Howard Dresner, an analyst of a market R&D company Gartner, is the earliest person who put forward the concept of business intelligence. In 1996, he proposed business intelligence that could describe a series of concepts and methods and benefit commercial decision-making by a data-based analysis system. Business intelligence provides enterprises with the technology and methods to quickly collect and analyze data, and it can transform data into useful information to improve the quality of business decision-making. After more than two decades of development, its theoretical research is relatively mature. In concept, business intelligence refers to using data warehouse and data mining technology to systematically store and manage customer data, and then analyzing customer data through various statistical analysis tools, and getting various analysis reports, such as customer value evaluation, customer satisfaction evaluation, service quality appraisal, marketing effect evaluation, as well as future market demands, which offers decision-making information for enterprises in various business activities

(Pall Rikhardsson and OganYigitbasioglu, 2018). Enterprises can use modern big data technology to collect and organize information and data. Meanwhile the technology can be used to process effective information inside and outside enterprises to provide reference for the upper level decision-making (Xue Yun, 2014).

Currently, business intelligence is quite frequently applied to enterprises. Most companies in Japan have built complete business intelligence system by using a series of business intelligence tools to process information, which provides great guidance for work. Obviously, business intelligence is very crucial to economic and sustainable development of enterprises.

4 The Development of Enterprise Business Intelligence in the Background of Big Data

Business intelligence (BI) in the background of big data covers many information technologies, mainly including CRM, ERP, database and data mining. Integrating these technologies helps information construction of enterprises. Besides, the present business intelligence technology applied to enterprises has more advantages over the traditional technologies such as EIS and DSS, and it also has greater influence on corporation production, operation and even the entire industrial chain. With the advent of big data era, in most enterprises, the BI system has been set up and BI technology has been widely used, which boosts companies not only in management and decision-making but also in transformation, so the application of business intelligence is of great significance to the realization of corporate strategic goals. Although most companies are now using BI to promote their development, many of them are still not able to master it. In the circumstances, they need to actively use big data and cloud computing to improve BI technology. For instance, companies can integrate big data with search engine technology to strengthen the application of transaction-driven BI, enhance the real-time data processing capabilities of enterprise business intelligence system to provide more personalized services and demand configuration for users (Zhang Yuanxin, 2013). Over time, the informatization construction and sustainable development of enterprises can be promoted.

5 The Application of Enterprise Business Intelligence in the Background of Big Data

5.1 In enterprise e-commerce website construction

As the window of an enterprise to the Internet, e-commerce website plays a basic role in enterprise information construction. In the era of big data, the construction of e-commerce website in enterprises has been accelerated, which mainly results from the application of enterprise business intelligence technology. Firstly, the application of BI can help enterprises better process data and give them more excellent technology for high-efficiency and high-quality construction of e-commerce websites, through which more users can be served. Secondly, BI has great significance for data warehouse, on-line analysis and data mining technologies to accelerate the process of enterprise informatization. Traditional data analysis methods and data mining technology are not sufficient to support the construction of new e-commerce websites, but the business intelligence can change the situation. Thus it can be seen that BI has a relatively wide application in the construction of enterprise e-commerce websites, and it plays an important role in corporate globalization.

5.2 In enterprise information management system

Every large enterprise has its information management system, but most of them are not perfect. It is an indispensable system for enterprise information construction, and this system is of great importance for business decision-making. Moreover, the application of BI furthers enterprise information management system. With the development of big data technology and the continuous improvement of the Internet, the market has higher requirements on information processing and enterprise management, therefore generates BI, a kind of high-tech product. BI is mainly to integrate new information technology into an enterprise information management system, helping the collection, filtration, arrangement and utilization of data more efficiently for the good reliability of enterprise informatization.

For example, Japanese Panasonic Corporation and Toyota Motor has applied BI in a large scale to enterprise management, which has obtained excellent economic benefits in recent years. Panasonic Corporation's operation revenue reached US$ 68.221 billion in 2017, ranking 128th in the world's top 500; Toyota Motor's operation revenue in 2017 reached US$260.06 billion, ranking 36th in the world's top 500. These large Japanese companies all use BI system, and its application improves the enterprise

information management and information construction level of Japan. In addition, according to "2017 National Innovation Quality Report" published by "The Economist", Japan's national innovation index was 94.4, ranking third in the world in 2017, while China's innovation index was only 69.8 as they are shown in chart 1 below. It can be seen that enterprise innovation development and economic development determine national innovation index. Hence, it is quite necessary to strengthen the application of business intelligence in the construction of enterprise information management system in China and continuously innovate business intelligence and enterprise information construction for comprehensive enterprise innovation.
Figure 1   2017 National Innovation Quality Report Published in Economist

Therefore, business intelligence in the context of big data plays a vital role in enterprise information construction and sustainable development. In addition, the further application BI in the construction of enterprise information management system enables the company's leadership to make decisions more scientifically and rationally, which comprehensively promotes the enterprise's information construction and sustainable development.

6 Conclusion

To sum up, in the background of big data, enterprise management can't develop without business intelligence. The reasonable application of business intelligence tools can help enterprises effectively integrate and provide internal and external data quickly and accurately for decision-making. As a result, dynamic decision-making ability of the management can be greatly improved. In addition, by discovering the problems existing in the process of information construction, BI can help enterprises to perfect information construction with the combination of CRM, ERP, database, data mining and other technologies. In the meantime, many factors such as organization structure, management process, data supervision and continuous data improvement, data access and user support methods, information security and availability, and the application of system construction model and planning upgrade shall also be considered in information construction to help enterprises to perfect information management

system and e-commerce websites, improve corporate profits and operational efficiency and enhance business transparency for business development with a virtuous circle.

(Email: zaheddu2000@yahoo.com, wanghu61@126.com, aslam@bubt.edu.bd)

Abstract: Digital transformation in healthcare services has massive potential to ensure healthcare quality, accessibility, equality & affordability in developing countries. Bangladesh is not exception to this trend for digitalization of healthcare sector as a part of vision 2021 of digital Bangladesh. This paper aims to explore the current standing of the digital transformation in healthcare services sector of the public, private & NGOs, as well as the managerial and technical challenges facing the digitalization of healthcare projects in Bangladesh. The digital transformation in healthcare is at the introductory stage in Bangladesh. Studies explored that although digitalization of this sector remains somewhat problematic, the difficulties and challenges could be overcome. Due to lack of technological knowhow, literacy, poverty, trust, attitudes, resistance to change and infrastructural facilities, this project does not work effectively and efficiently. Based on the assessment of this sector, the scope of some fields requires further improvement. The findings will help government agencies, policymakers, healthcare providers and mobile phone companies to make effective decisions regarding the digitalization of Healthcare services.
Key words: Digital transformation; Healthcare; Challenges; Bangladesh etc

1 Introduction

As a result of rapid globalization and the exponential advancement in information and communication technology (ICT), healthcare sector has been changed dramatically over the past decade in many countries of the world. The diffusion rate of digital technologies in this sector has quickly progressed over the past ten years (Ivatury et. al., 2016). Digital transformation of healthcare could be the keystone of a successful reform of healthcare systems for improved efficiency and effectiveness for the benefit of the people. Recently, Information and communication technologies have transformed all sectors of society. The health sector is no exception to this trend. Digital transformation of healthcare creates an exciting, new realm of possibilities for medical services in rural areas that are simultaneously experiencing growth and renewal (Alami, 2017). Healthcare is a critical part of the economy of Bangladesh and improving the healthcare sector is one of the sustainable development goals. In addition, Health performance and economic performance are interlinked. But problems such as excessive costs, insufficient resources, uneven quality levels and inequalities in terms of access to healthcare plague the current healthcare industry. As a part of vision 2021 of digital Bangladesh, the application of ICT to healthcare, especially digital services are explosively advancing. Research on the adoption of e-Health which is the part of digitalization in developing countries, has shown that e-Health/mHealth can be potential solutions to provide better access to healthcare facilities for patients, physician, nurses and other healthcare staffs, increase care quality and improve collaboration (Khalifehsoltani & Gerami, 2010).

Like other developed and developing countries, healthcare sector has become the blessing of ICT in Bangladesh which has been recognized as one of 57 countries in the world with a critical shortage in health workforces (hospitals, doctors, nurses and midwives number below 2.28 per 1000 population) and number of beds (4 per 10,000) in hospitals (Mostafa R., 2016). Bangladesh has an extreme scarcity of well trained nurses, physicians and healthcare resources in comparison to the international standard (i.e. the nurse-patient ratio is 1:4 for general care, and 1:1 for intensive care). In Bangladesh, these ratios are 1:13 for general patients and physicians outnumber nurses with a ratio of 1.3:1 (Ministry of Planning, BD, 2017). So, effective initiatives need to be undertaken to improve these ratios significantly by 2021. In addition, providing affordable, accessible, equal and adequate healthcare is a challenge due to poor healthcare infrastructure and high population density. Due to explosive growth of population, poor sanitation, chronic diseases and Bangladesh faces double burden of diseases: Non-Communicable diseases: Diabetes, Cardiovascular diseases, Hypertension, Stroke, Chronic respiratory diseases, Cancer and Communicable diseases: Tuberculosis, HIV, Tetanus, Malaria, Measles, Rubella, leprosy and so on.

In order to overcome these problems, the government has started a new initiative in the health sector by incorporating digital technology for health service delivery which is a part of making digital Bangladesh by 2021. But, there are extremely few well trained individuals and there is a strong demand for capacity building and experience sharing, especially for implementation and policy making (Ahmed et. al., 2014). Most previous studies have only focused on the application of eHealth, in Bangladesh like m-Health, telemedicine, electronic health record, telecare (Hoque at el., 2014). Unfortunately, there is lack of investigation of the current status of digital transformation in health care sector of Bangladesh. So, it is imperative to examine the current status of digital transformation in health sector of public, private sector & NGOs, challenges of digitalization and finally provide recommendations & future direction at the end.

2 Key Concept of Digital Transformation in Healthcare Sector

Expansion of the computer networking is the absolute marvel that makes possible the digital transformation of health care. Impressive advances in programming languages and operating systems over the past few years also have solidified the foundations of digital health care (Jeffrey C. Bauer, 2002). Digitalization includes key areas i.e. reconfiguring the customer value proposition-what is being offered-and reshaping the operating model-how it is delivered. It is generally understood to be the application of Computer, Internet, Mobile phone and other technologies to improve the patients' health status. It involves the use of information technologies to improve health in general and the healthcare system in particular. Given the right policies, organizations, resources, and institutions, ICTs can be powerful tools in the hands of those working to improve healthcare. Surprisingly, this sector has been characterized with some uniqueness that patients have fewer self-service options than they have in other sectors, and less access to trusted information on the quality of care on offer. With regard to the potential for digital and social media, healthcare is distinct from other sectors in several important ways (Erwin Bellon, 2016).

3 Current Status

Digitalization in healthcare services sector is at the infant stage in Bangladesh. In fact, Bangladesh has not yet been prepared to properly cope with the adoption of ICT in the healthcare services sector. There are no specific rules and regulations for applying ICT efficiently and effectively in healthcare sector. In Bangladesh, the role of ICT depends on specific circumstances and some applications of ICT are more used than others. With the exponential progression of internet usages, Bangladesh has stepped down two ranks in the global ICT Development Index by securing 145th among 175 countries (Khatun F., 2015). The following table 1 shows the exponential growth of the number of internet users in Bangladesh from 2005 to 2017.

Table 1   The Numbers of Internet Users in Bangladesh from 2005 to 2017 (Millions)

Years	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
Users	0.36	1.45	2.64	3.71	4.65	5.61	6.90	7.76	10.42	15.27	19.42	21.44	70.00

Sources: Statista, 2018

Currently, Bangladesh is adopting an ambitious national ICT/eHealth policy to incorporate ICTs into their health system, aligning with the Digital Bangladesh Vision 2021. For example, Current initiatives are internet connectivity and doctors' access via mobile phone at over 800 health centers; video conferencing facilities in community clinics; database for health policy planning; OMR based patient-level data collection; rudimentary telemedicine piloted by NGOs; mobile-based helpline with doctors. These digital transformations in healthcare sector spread throughout the digital channel, digital startup and digital initiatives for social impact which are discussed in detailed in the following sections.

3.1 Digital channel

Under the umbrella of digitalization, the digital channels are incorporated into the healthcare service providers such as are telehealth, telecare, mHealth, eHealth, Electronic Health Record (EHR), Video Conferencing, Telemedicine etc. There are 26 initiatives with direct or indirect associations with mHealth and or eHealth in Bangladesh. These initiatives were undertaken by private (15.4%), private for profit (53.8%), private not for profit (15.4%) & NGOs (15.4%) (Ahmed et al., 2014).

3.2 Digital startup

The digital healthcare movement is driving a vast array of startups in Dhaka city, many working in mobile healthcare and healthcare for the last mile population. The following table 2 shows the digital

startup operated in Bangladesh.

Table 2   Digital Startup Operated in Bangladesh

Digital Startup	Remarks
Doctorola	It provides eService to mass people i.e. appointment of doctor, live chat, mobile apps and call center.
Jeeon	It organizes training program for local intermediaries and provides equipment to facilitate consultations with remote doctors in order to provide quality healthcare services to rural patients.
Rx71	It builds a huge platform of health related content in Bangla for creating health awareness and educating people on health issues in their daily life.
Tonic	It makes information and suggestions about health and illness, positive health change and editorial style content.
Doctors.bd.com	It has database regarding blood donor, hospital, medical institute, diagnostic center, clinic, kidney/eye bank and online consultations within 24 hours.
HealthPrior21.com	This platform offers health news and information, e-appointment, e-library, videos, and an e-store etc.
D.Net (Development Research Network)	It provides e-Health services through their tele-centers.

3.3 Digital initiatives for social impact

Recently, the Bangladeshi Government, private sector and NGOs have delivered voice messages to mobile subscribers in rural areas with the aim of increasing utilization of community clinic health services for primary healthcare (Islam, 2015).

4 Bangladesh's Health System

Depending upon the type of services patients required, the level of health care can be divided into three broader categories shown in table 3.

Table 3   Levels of Healthcare Services in Bangladesh

Categories of Services	Features	Remarks
Primary Care	Basic or General Healthcare Upazila hospitals are responsible for it.	Ahmed et al., 2014
Secondary Care	Medical care provided by a physician	
Tertiary Care	Medical colleges and hospitals are responsible for specialized healthcare services	

4.1 Policy initiatives

In fact, Bangladesh is currently in the process of adopting a framework for eHealth and mHealth, based on a decade of experience.   The year 1998 is a milestone for eHealth in Bangladesh as the first eHealth project was launched by Swinfen Charitable. It involved a collaboration between the Centre for the Rehabilitation of the Paralyzed (CRP) in Bangladesh and the Royal Navy Hospital Haslar. As part of the 2008 'Digital Bangladesh' campaign, the public, private and nongovernment organizations (NGOs) have started using mHealth in Bangladesh with approximately 20 mHealth initiatives (Ahmed T., at, el., 2014), including primary healthcare, disease surveillance and data collection, health promotion and disease prevention, and health information systems and support tools (Khatun F., 2014). During the same year, the Ministry of Health and Family Planning Welfare (MoHFW) initiated their first eHealth initiative i.e. Program (HPNSDP) 2011-2016 for Ministry of Health and Family Welfare (MoHFW). The HPNSDP 2011-2-16 comprises 32 operational plans (DGHS, 2012) of which one is the e-Health (Health Bulletin, 2017).

4.2 Digital initiatives in government hospital of bangladesh

Bangladesh government has a wider range of specific programs to gradually improve the e-Health infrastructure and its use in the country. In April 2009, Bangladesh has established the Internet connectivity across all health points down to the Upazila level and in 2012, three hospitals have been included for automation (DGHS, 2012). Currently, most of the private clinics and hospitals in Bangladesh are using their own database system for patient health records i.e. Apollo Hospitals, Square Hospitals &

United Hospital. 19 September of the year 2011 was a notable day for Bangladesh for the recipient of the United Nations ICT award titled, "Digital Nations General Assembly". According to Health Bulletin, 2017, Healthcare sector is providing eService to the mass people through the information technologies i.e. Usage of Mobile phone for healthcare service, Telemedicine, Telemedicine service in Community Clinics, Telecare, Telemedicine in Union information and service centers, Complaints-suggestions through SMS, Pregnancy Care advice through SMS, Health statistics by SMS, Hospital Automation, Electronic Health Record (EHR), Online Population Health Registry, Attendance Monitoring System, Human Resources Databases, Online Processing of Dental-Medical Admission Tests, ADP Progress Monitoring System, GIS in Health Service, Schedule Management Software, Bulk SMS, Digital training facility and internet connectivity in health system (Health Bulletin, 2017).

5 Challenges

The difficulties and challenges facing the digitalization of healthcare on the basis of previous studies shown in the following table 4.

Table 4   Challenges of Digital Transformation in Healthcare Services Sector of Bangladesh

Challenges	Description	References
Inadequate ICT Infrastructure	Internet networks and electricity are not sufficient.	Uddin, G. (2012)
Financial Problems	Dependency on developed countries, foreign investors, World Bank and WHO.	Uddin, G. (2012)
Resistance of Change	Lack of motivation and encouragement regarding introducing and adopting new ICTs.	Khalifeshsoltani, S.N & Gerami, M.R. (2010)
Usability & User Acceptance	Unfamiliar, Unaware, Lack of Trust, Lack of Knowledge.	Hoque (2014)
Lack of Policy and Regulations	No modern legal framework and laws against cyber-crime and laws for electronic authentication.	Uddin, G. (2012)
Leadership and governance	No standard or widely accepted operational framework for eHealth or mHealth in Bangladesh.	Ahmed et. al., (2014)
Poor Health Knowledge	Practices of healthy lifestyles and nutrition habits; health education and health research; prevention programs etc. are negligible and, in many areas, absent in Bangladesh.	S. Akter & P. Ray (2010)
Policy Incoherence	Some projects initiated by government has been abandoned due to political reason.	S. Akter & P. Ray (2010)
Monitoring and Accountability	Lack of proper monitoring mechanism and system of accountability.	Khatun F. (2016)
Poverty	Poor people are neither capable of bearing their health expenditure nor conscious of health, nutrition and sanitation.	Khatun F. (2016)
Interoperability of Systems	No central database for citizen's access. The lack of interoperability and standardization among systems.	Gao, X., et al., (2013)
Corruption	Corruption also prevails in the field of purchasing health materials or equipment i.e. food, medicine, ambulance and health personnel etc.	Alam, J. (2012)
Lack Technological Know-how	Less technical knowledges; lack of trust due to recent false report in the healthcare sector.	Alam, J. (2012)
Crisis in Personnel System	Lack of promotion prospects; Doctors are allowed to do private practice at their convenient time with fee.	BANBEIS (2008)

Over the last couple of years, although the healthcare community has witnessed many improvements in methods and technologies used in healthcare delivery, including mHealth as an emerging area of healthcare applications to improve access, reduce cost, save time, money & energy to healthcare services. However, challenges involved in implementing mHealth to optimal advantage do exist which are shown in the above table 4.

6 Conclusion

Improving healthcare sector in Bangladesh is good but not sufficient and information technology has not been introduced significantly to improve its quality, affordability and accessibility of services to the mass people. The current study shows that the overall situation of digital health care services sector in Bangladesh is not up to the mark. Due to illiteracy, lack of technological know-how, and resistance to change, the recipients of this service are not well-known to these innovations in healthcare services. On

the other hand, Bangladesh government has adopted strategic plan to improve this sector which is a critical part of the economy of Bangladesh. But the sensitivity to digital transformation in healthcare sector is conflicting. In this respect, it can be concluded that service providers have to build a quality ICT based health service that must be easily and widely available throughout the country. Government should develop policy guidelines to monitor and supervise the digitalization of healthcare sector. Future research can be conducted on e-health, m-health, telecare, telehealth, electronic health record, telemedicine, digital startups and video conferencing separately.

Relationship Between FDI and Economic Growth: Time Series Data of Indonesia

Bryna Meivitawanli

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: bry9594na@yahoo.co.id)

Abstract: Indonesia is activelypromoting foreign direct investment in the past few years. This has been done with the hope that FDI is going to help the country's economy grow. However thebenefits of FDI might not be realized without the support of sufficient internal factors. This research uses OLS to analyze whether FDI alone is enough to bring positive impact on Indonesia's economy. The paper introduces human capital and trade openness into the equation to find out whether these commonly known absorptive capacities of FDI are also applicable in the case of Indonesia. Using data from 2002 to 2014, this research concludes that FDI alone does not positively affect economic growth. Interaction of FDI and human capital as well as interaction of FDI and trade openness show significant effect on economic growth. The effect is positive for FDI and trade but negative for FDI and human capital. These results should urge the government to encourage trade openness and pay closer attention to the country's level of human capital.Promoting FDI without improving internal conditions of the country is not adequate for the growth of the economy.

Key words: FDI; Economic Growth; Indonesia; Human capital; Trade openness

1 Introduction

The topic of foreign direct investment is no longer unfamiliar in the ears of many especially among economists. This occurence has been researched for decades and explored in numerous ways. Many countries especially developing ones have taken great interest in this area. This is because there is a common belief that foreign direct investment promotes economic growth. The reasons this belief has surfaced is due to many positive effects that foreign investment from developed countries brought upon less developed countries. However many researchers have proven otherwise. At the very least, numerous literatures stated that foreign direct investment alone does not bring economic growth for the host country. There are many arguments, debates as well as empirical studies which shed some light of why this might be. The most important point is that the assumption that higher foreign direct investment results to larger economic growth in all cases should certainly be second guessed. Therefore this paper has the desire to empirically test the effect of foreign direct investment on economic growth in a country which is eagerly looking for foreign investment and that is Indonesia.

Indonesia is a developing country located in South East Asia. It is placed 4th in the world in terms of population with more than 260 million inhabitants. Its GDP ranked 16th and 8th in the world in terms of nominal and PPP respectively. Pricewaterhouse Coopers, one of the big 4 accounting firms in the world projected that Indonesia's GDP (PPP) is going to rank 4th in the world in 2050. Indonesia's GDP growth has been steady at around 5%. The current president of Indonesia has been encouraging foreign direct investment into the country as it can also be seen by the increasing trend of FDI coming into Indonesia shown in figure 1 below.
Figure 1   Indonesia's Foreign Direct Investment[1]

---

[1]Indonesia Foreign Direct Investment. Trading Economics. (2018)

The question is whether this warm welcome of foreign investment going to support the nation's future and keeps it going in its pace or whether it might actually harm the economy. Since this question should be answered by hard facts and statistics that is specific to Indonesia rather than generalizable results taking into account other countries, a time series study exclusively of Indonesia is going to be carried out in this research. Many researches have been done taking into account data from different countries at once. The result of those researches are not directly applicable to any of the countries in the dataset. Therefore,in order for the result of this research to be useful for the Indonesian government, only data from Indonesia is going to be used. Moreover, as mentioned previously, in many cases FDI does not exert an independent effect on economic growth. Therefore, this research is also going to find out whether there are other variables that induce FDI's positive effect on economic growth in the case of Indonesia. The following section of the paper is going to briefly introduce the literature related to this area of research. Afterward, the methodology adopted in this research is going to be explained on the third part of this paper. Subsequently the result of the research and discussion is shown on the following section. Last but not least, conclusion is drawn in the last section along with several recommendations and limitations of the research.

2 Literature Review

The term of foreign direct investment (FDI), although is commonly discussed in the literature, however its definition is very important to be stated in this paper. This is due to the fact that FDI should be calculated the same way worldwide so that the data can be comparable. The most commonly accepted definition is the one by International Monetary Fund (IMF) and the Organization for Economic Cooperation and Development (OECD) whereby foreign direct investment is the objective of establishing a lasting interest by a resident enterprise in one economy called direct investor, in an enterprise called direct investment enterprise, that is resident in an economy other than that of the direct investor. The definition comes along with many other concepts and principles.

However, the main question is whether FDI does affect economic growth specifically of its host country. This question has been asked and answered by a large number of researchers. There have been many empirical evidences which are conflicting with each other. Therefore in order to make sure that the result of this study adds value not only for the literature but also for practical purposes, this research is only going to take into account 1 country. It means that the result is directly applicable for that particular country, which is Indonesia.

Many empirical researches have proven that FDI does not necessarily affect economic growth in a positive manner. Some proved that the effect does not exist while others proved that it does exist if another variable is introduced into the model. The supporting variables also vary from research to research. Some of the most commonly discussed variables are human capital and trade openness. Several of the authors who support the importance of human capital factor in the relationship between FDI and economic growth are Borensztein, De Gregorio and Lee,Bengoa Calvo and Sanchez-Robles, Li and Liu, Alfaro *et al.*and Fadhil and Almsafir. All of their findings proved the positive effect that human capital exerts in realizing the benefits of FDI on economic growth. Yet, human capital's importance vary in degrees among these different literatures. Some suggested that human capital is a required factor before FDI can affect economic growth in a positive manner. While others suggested that it is important but not a necessary prerequisite.

Trade openness is also discussed deeply by researchers in the area of FDI although it is not as frequently discussed when compared to human capital. Similar with the case of human capital, there are researchers who supported and empirically proved that trade openness is an important variable in unleashing the positive impact of FDI on economic growth. Iamsiraroj & Ulubaşoğlu stated that trade openness is one out of two vital absorptive capacities that a host country should fulfill in order for FDI to have positive effect on economic growth. This result was proven long before by Balasubramanyam, Salisu, & Sapsford . They showed that trade openness is a factor that helps host country reap the benefits of FDI using data from 46 developing countries.

Based on the literature in FDI, it is reasonable to carefully reconsider the positive image of FDI. Therefore in order to ascertain FDI's positivity towards economic growth in the case of Indonesia, this research is going to empirically test several hypotheses using time series data of Indonesia. Human capital and trade openness are taken into account to determine whether the importance of these two variables are also proven in the case of Indonesia. Thus, the following section of this paper proposes several hypotheses to be tested as well as explains the methodology that is used in this research.

3 Research Hypotheses and Methodology

As explained in the literature review above, it is important to test the effect of FDI on economic growth for each country as the literature could not come to a common conclusion. Furthermore, the literature suggested 2 factors which have been proven to play significant roles in the FDI economic growth nexus for many countries. Therefore the following 3 hypotheses also incorporate these 2 factors into account to determine their roles in the specific case of Indonesia. The proposed hypotheses for this research paper are:

$$GROWTH_i = \beta_o + \beta_1 FDI_i + \beta_2 HC_i + \beta_3 TRADE_i + v_i \tag{1}$$

$$GROWTH_i = \beta_o + \beta_1 FDI_i + \beta_2 FDIHC_i + \beta_3 TRADE_i + v_i \tag{2}$$

$$GROWTH_i = \beta_o + \beta_1 FDI_i + \beta_2 FDITR_i + \beta_3 HC_i + v_i \tag{3}$$

These hypotheses are adopted from Alfaro *et al.* (2004) since the objective and model of the research is similar to this research although the data set are completely different. Alfaro *et al.* (2004) used cross-country data set from 1975 to 1995, which is a panel data, however this paper is going to use time series data of a single country. The variables introduced are also different sinceAlfaro et al.focused on financial market, while this research focuses on human capital and trade openness. *GROWTH* represents economic growth.*FDI, HC, TRADE* represent inward FDI, human capital or participation of formal education and trade openness or percentage of trade over GDP respectively. *FDIHC* is interaction form of *FDI* and *HC*,while*FDITR* is the interaction term of *FDI* and *TRADE. i* denotes the time.

The methodology used in this research is Ordinary Least Squares (OLS) which is commonly known by researchers. It is easy to comprehend and able to provide results that determine the relationship between the variables being researched.OLS is a statistical methodology used in linear regression model. As it can be seen from the hypotheses proposed above, all of them are represented in linear equations, therefore OLS can be used in this case. The results of this method is going to determine whether the variables included on the right-hand side of the equations above have impact on the variable on the left-hand side of the equations. The statistical software used to perform OLS is Eviews 7. The data itself are taken from acredible source.

4 Results and Discussion

The dataset covers 13 years from 2002 until 2014. This data range is selected based on availability of data as well as consideration of anomaly. In 2001, the inward FDI data showed a sudden huge increase that was clearly out of the trend, therefore the dataset starts from 2002 to exclude this outlier. The dataset was retrieved from a credible source, which is the Indonesia's Central Bureau of Statistics[1]. This bureau is a government body which is directly responsible to the president. They collect statistical data of Indonesia in many aspects including social, population, economy, trade, agriculture and mining. This research utilized data from trade and social section. The data was analyzed using OLS as it has been mentioned before. The results of equation 1, 2 and 3 are shown in table 1 below.

Table 1   OLS Results

Independent Variables	Dependent Variable: GROWTH		
	(1)	(2)	(3)
C	254.8257*	13.81663*	-4.465650
	(119.3465)	(6.662256)	(6.598331)
FDI	.0000000445(.0000000310)	.00000132**(.000000474)	-.00000126**(.000000531)
HC	-1.444812*(0.680147)		0.105039 (0.078420)
TRADE	-747.6825*(361.9259)	-54.53272(38.50008)	
FDIHC		-.0000000143**(.00000000539)	
FDITR			0.00000812**(.00000323)

Standard errors in parantheses, *** denotes significant at 0.01 confidence level, ** denotes significant at 5% confidence level, * denotes significant at 10% confidence level

From the results above, it can be seen that FDI has no significant impact on growth on its own. In equation 1, all independent variables are significant at 10% confidence level, only FDI is not significant. This conforms with many previous literature (Borensztein, De Gregorio and Lee, 1998; Alfaro *et al.*, 2004; Azman-Saini, Law and Ahmad, 2010; Fadhil and Almsafir, 2015) which suggested that FDI alone does not significantly affect economic growth. Therefore equation 2 and 3 are tested. In equation 2, it

---

[1]Badan Pusat Statistik. Available at: https://www.bps.go.id/ (2018)

can be seen that FDI as well as the interaction term of FDI and human capital are significantly related to economic growth. The difference is that FDI has positive significant effect on economic growth, however interaction of FDI and human capital shows a negative impact on economic growth. This is very interesting, since many researchers have proven that interaction of FDI and human capital results to positive impact on economic growth (Borensztein, De Gregorio and Lee, 1998; Solomon, 2011). This negative relationship implicates that the government should take very serious consideration when attracting FDI into the country if the country does not have a high enough level of human capital. Previous study by Fadhil and Almsafir (Fadhil and Almsafir,2015) which analyzed time series data of Malaysia found similar result whereby in the equation where interaction term of FDI and human capital was included, the coefficient for FDI alone was positive, however coefficient of the interaction term was negative. The study was similar to this study since both studies used time series data of a single Southeast Asian country. Therefore it is reasonable to arrive at similar results. As pointed out by Fadhil and Almsafir (Fadhil and Almsafir,2015), Malaysia and in this case also Indonesia need to focus on improving their human capital level in order to absorb the positivity of FDI so that it will contribute to economic growth of the country.

Moreover, the opposite result is seen from equation 3. In this equation, the interaction term of FDI and trade showed positive result, however the result of FDI alone showed negative effect on economic growth though both results are significant at 5% confidence level. Significant positive impact of FDI and trade interaction on economic growth was also proven by Iamsiraroj and Ulubaşoğlu (Iamsiraroj and Ulubaşoğlu,2015). This research's result confirmed previous finding which concluded that trade openness is an important absorptive capacity in order for FDI to bring positive effect on economy growth. It is however interesting that in the last equation where interaction term of FDI and trade was introduced, the coefficient of FDI turned negative. Regardless, the coefficient is very small and smaller compare to the coefficient of the interaction term.Therefore higher trade openness is still desired since the positive effect is larger than the negative effect of FDI alone. Overall, the results show that human capital and trade openness should be taken into account by Indonesian government when attracting FDI.

5 Conclusion

Indonesia has been growing very quickly in the past few years. The current president has been campaigning around the world to increase the amount of investment from aboard in order for the country to grow further. Therefore, it is important to find out whether FDI really brings higher economic growth for Indonesia. Many cross-country studies have been done but the results are not necessarily applicable to Indonesia. Thus this research has taken the initiative to focus on a single country so that the result is directly applicable and can be taken into account by the government. As a result, this research adds into the current body of knowledge andhas practical implications.

The results of this research showed several interesting conclusions. The first one is that the effect of FDI and human capital on economic growth is negative, this shows that the government should pay closer attention to the level of education in the country to make sure that investment from aboard can be absorbed and result to positive implications instead of negative ones. The second is that FDI and trade openness show significant positive result on economic growth. Thus trade in and out of Indonesia should be encouraged in order for FDI to exert positive impact on economic growth. The third is that FDI alone does not exert any significant impact on economic growth. It means that the government should not only focus on attracting FDI but they should focus on developing internal factors instead so that inward investment can benefit the economy as much as possible. Encouraging FDI alone without internal improvements is not doing any good for the country's economy.

There are certainly several limitations of this research. The first being limited number of variables included in the analysis. There are many other possible absorptive capacities which might be important for Indonesia. The second is the research methodology. OLS is simple and easy to comprehend, there are many other statistical methodologies to analyze time series data which can also be used. Third, the data itself. This research is only applicable to Indonesia, although it might also suggest similar results forsurrounding Southeast Asian countries, however it might not be relatable for the rest of the world.

The main suggestions for future researches are to work on the limitations of this research. Research on inward FDI to Indonesia can include variables such as financial market development and macroeconomic stability as potential absorptive capacities. This is important so that the government know exactly where to focus on. Researchers can also use more advanced methodologies to analyze the data. Last but not least, researchers from other countries should develop a time series analysis of their

own countries so that respective governments can gain many insights when developing policies regarding FDI instead of relying on cross-country analysis which might not be applicable to them.

Research on Financial Performance Evaluation of Listed Companies in Artificial Intelligence Industry of China: Empirical Test Based on Principal Component Analysis

Shen Zijing
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: shenzijing0624@163.com)

Abstract: Taking the sample of A-share listed company of artificial intelligence industry in Shanghai and Shenzhen main board market in 2014-2016 and using the statistical tool of SPSS software, this paper adopts principal component analysis method and constructs 4 principal components affecting financial performance of company.This paper also calculates comprehensive evaluation score according to each principal components' weight, which is obtained from total explaining variance. Through analysis, we can come to the conclusion that profitability is the core element deciding financial competitiveness of company, solvency is the key to enhance financial competitiveness, and operation capability and growth capability are important factors affecting financial competitiveness. Based on above conclusion, problems of some listed companies in the industry are further analyzed and feasible suggestions to improve their financial performance are proposed.
Key words: Artificial intelligence; Financial performance; Principal component analysis; Empirical test

1 Introduction

As artificial intelligence is becoming the core technology of a new round of science and technology revolution and industrial change, and widely used in all kinds of industry, its role in economic construction and national strategic level is increasingly significant. At present, researchers in academic circle have made relatively comprehensive, detailed and extensive researches on listed companies in various industries. Wu Fengxia has evaluated financial performance of iron and steel listed companies in 2006 through economic meaning of principal component. (Wu Fengxia, 2008). Xia Xueying has evaluated financial performance of coal enterprises through efficiency coefficient method and evaluated Shenhua Group from 4 aspects, i.e. profitability, asset operation capability, solvency and development capability. (Xia Xueying, 2011). Tao Xinyuan has evaluated financial performance of listed companies of real estate industry of China in 2010 by taking factor analysis method, analytic hierarchy process and correlation analysis as main methods. (Tao Xinyuan, 2013).

However, at the present stage, there are few researches to artificial intelligence industry, based on which, selecting 66 listed companies of artificial intelligence industry as samples, taking SPSS software as statistical tool, and adopting dimensionality reduction thought, this paper transforms multiple initial financial indicators affecting the financial performance of the artificial intelligence industry into a few comprehensive principal components for analysis through linear combination so as to bring enlightenment to enhancement of financial competitiveness of listed companies in artificial intelligence industry of China.

2 Research Design

2.1 Sample selection

Taking the research object of A-share listed company of artificial intelligence industry in Shanghai and Shenzhen main board market in 2014-2016, this paper eliminates total 24 ST companies and data missing companiesand selects 66 listed companies in the industry as samples. Required financial indicators and other data are sourced from CSMAR database and straight flush website, and restricted to data availability in 2017, analysis data of this paper is ended in 2016, and to reduce empirical results deviation arising from data fluctuation, 3-year mean value of each indicator is selected as the analysis data.

2.2 Indicator selection

Financial performance of enterprise is a comprehensive evaluation system, mainly including profitability, solvency, growth capability and operation capability. Based on 4 dimensions, this paper selects 11 financial indicators, i.e. asset return rate, net profit rate of total assets, net asset yield, net business interest rate, quick ratio, reciprocal of asset-liability ratio, liquidity ratio, total asset growth rate, capital accumulation rate, total asset turnover and working capital turnover, and defines them as each

variable, which is as shown in table 1.

Table 1   Variable Setting

	Name of indicators	Variable
Profitability	Asset return rate	X1
	Net profit rate of total assets	X2
	Net asset yield	X3
	Net business interest rate	X4
Solvency	Quick ratio	X5
	Reciprocal of asset-liability ratio	X6
	Liquidity ratio	X7
Growth capability	Total asset growth rate	X8
	Capital accumulation rate	X9
Operation capability	Total asset turnover	X10
	Working capital turnover	X11

3 Empirical Analysis

3.1 Descriptive statistics

Table 2   Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
X1	66	-0.0218	0.1930	0.058067	0.0403933
X2	66	-0.0164	0.2014	0.056879	0.0428478
X3	66	-0.0995	0.3075	0.087042	0.0739516
X4	66	-0.3408	0.5301	0.121595	0.1148470
X5	66	0.3005	34.1355	2.589041	4.2018109
X6	66	1.2442	34.7939	3.978898	4.3509487
X7	66	0.4416	39.2472	3.109388	4.7711668
X8	66	-0.1287	2.5594	0.400093	0.4607239
X9	66	-0.0507	10.6024	0.572403	1.3521994
X10	66	0.1366	1.7526	0.535619	0.3274614
X11	66	-215.8933	23.2962	-0.643483	27.1691734

According to analysis of table 2, compared with other indicator data, mean and standard deviation of asset return rate, net profit rate of total assets, net asset yield and net business interest rate reflecting profitability are relatively small, which shows that overall profitability of the industry is comparatively weak and there is not much difference between enterprises. Mean and standard deviation of quick ratio, reciprocal of asset-liability ratio, and liquidity ratio reflecting solvency are relatively great, which shows that solvency of the industry is comparatively strong, and individual enterprises have outstanding advantages. However, there is obvious difference among enterprises. Mean value of working capital turnover reflecting operation capability is negative with the largest standard deviation, which shows that capital of most companies in artificial intelligence industry is not sufficiently managed and used, and difference of capital management efficiency of each company is relatively great.

3.2 Applicability test of principal component analysis

This paper adopts KMO and Bartlett test (Li Xiaosheng, 2010). The test results indicate that test value of KMO is 0.622>0.6, which shows that there is a certain correlation between variables. Besides, Sig=0.000<0.05 shows that there is a significant correlation between correlation coefficient matrix and unit matrix. Therefore, sample data selected in this paper is appropriate for principal component analysis. Specific results are as shown in table 3:

Table 3   KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.622
Bartlett's Test of Sphericity	Approx. Chi-Square	1067.506
	Df	55
	Sig.	0.000

3.3 Analysis of variance contribution rate

Calculate characteristic value of each normalized variable, extract principal components with characteristic value greater than 1 (Liu Jinfu, 2008), and obtain 4 principal components in total, where variance contribution rate of 4 principal components respectively is 32.667%, 27.675%, 16.401% and 10.769%, and their accumulative variance contribution rate reaches to 87.511% with original information basically retained, which is as shown in table 4.

Table 4   Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	3.593	32.667	32.667	3.593	32.667	32.667
2	3.044	27.675	60.342	3.044	27.675	60.342

7	0.159	1.442	99.182			
8	0.054	0.491	99.674			
9	0.025	0.226	99.899			
10	0.009	0.081	99.981			
11	0.002	0.019	100.000			

3.4 Scree plot

Scree plot in figure 1 clearly and intuitionistic reflects characteristic value of each principal component, and the figure intuitionistic reflects that characteristic value of former 4 principal components is greater than 1 with relatively steep slope, and slope turns to be gentle with increase and decrease of principal components, which shows that 4 principal components include most original variable information with comparatively strong explanation power. (Shao Jingbo, 2008).
Figure 1   Scree Plot

3.5 Common factor variance

Table 5 shows that common variance of most indicators is greater than 0.9, which i that each variable is extracted with relatively great information degree, and further shows that 4 principal

components can effectively cover most of information in original variable.

Table 5 Communalities

	Initial	Extraction
X1	1.000	0.977
X2	1.000	0.973
X3	1.000	0.936
X4	1.000	0.788
X5	1.000	0.989
X6	1.000	0.977
X7	1.000	0.986
X8	1.000	0.924
X9	1.000	0.899
X10	1.000	0.721
Continual Table 5		
X11	1.000	0.458

3.6 Principal component extraction

Following component matrix in table 6 can be obtained through calculation of normalized data: X1, X2, X3 and X4have relatively high load in the first principal component, which shows that the first principal component reflects profitability of enterprise, and therefore it is defined as profit principal component; X5, X6 and X7 have relatively high load in the second principal component, which shows that the second principal component basically reflects solvency of enterprise, and therefore it is defined as debt paying principal component; X8 and X9 have relatively high load in the third principal component, which shows that the third principal component basically reflects growth capability of enterprise, and therefore it is defined as growth principal component; X10 and X11 have relatively high load in the fourth principal component, which shows that the fourth principal component basically reflects operation capability of enterprise, and therefore it is defined as operation principal component.

Table 6 Component Matrix

	Component			
	1	2	3	4
X1	0.972	0.130	0.083	0.091
X2	0.955	0.204	0.108	0.080
X3	0.946	0.127	-0.014	0.154
X4	0.716	0.314	0.307	-0.286
X5	-0.227	0.955	0.057	0.150
X6	-0.256	0.949	0.086	0.061
X7	-0.259	0.945	0.047	0.156
X8	-0.091	-0.165	0.937	0.097
X9	-0.259	-0.225	0.880	0.083
X10	0.180	-0.286	-0.157	0.763
X11	-0.190	-0.081	0.013	0.645

Composition diagram of rotation space of figure2 is sourced from 3D rotation to component matrix, and 4 principal components extracted are intuitively shown according to intensity of the variable indicator distribution, which further verifies scientificityof 4 principal components extracted above.
Figure 2 Component Plot in Rotated Space

3.7 Principal component score calculation

Following formula can be obtained according to component score coefficient matrix to calculate final score of 4 principal components:

F1=0.270X1+0.266X2+0.263X3+0.199X4-0.063X5-0.071X6-0.072X7-0.025X8-0.072X9+0.050X10-0.053X11

F2=0.043X1+0.067X2+0.042X3+0.103X4+0.314X5+0.312X6+0.310X7-0.054X8-0.074X9-0.094X10-0.027X11

F3=0.046X1+0.060X2-0.008X3+0.170X4+0.032X5+0.048X6+0.026X7+0.520X8+0.488X9-0.087X10+0.007X11

F4=0.076X1+0.067X2+0.130X-0.242X4+0.127X5+0.051X6+0.131X7+0.082X8+0.070X9+0.644X10+0.544X11.

Table 7　Component Score Coefficient Matrix

	Component			
	1	2	3	4
X1	0.270	0.043	0.046	0.076
X2	0.266	0.067	0.060	0.067
X3	0.263	0.042	-0.008	0.130
X4	0.199	0.103	0.170	-0.242
X5	-0.063	0.314	0.032	0.127
X6	-0.071	0.312	0.048	0.051
X7	-0.072	0.310	0.026	0.131
X8	-0.025	-0.054	0.520	0.082
X9	-0.072	-0.074	0.488	0.070
X10	0.050	-0.094	-0.087	0.644
X11	-0.053	-0.027	0.007	0.544

3.8 Comprehensive score

This paper uses the contribution rate as the weight to construct the comprehensive evaluation formula. *ZF=F1*0.32667+F2*0.27675+F3*0.16401+F4*0.10769*. Due to space restrictions, only top 10 and bottom 10 listed companies ranked according to comprehensive score are listed, which is shown in table 8.

Table 8　Artificial Intelligence Industry Companies Comprehensive Score Summary Table

Company Name	F1	Rank	F2	Rank	F3	Rank	F4	Rank	ZF	Rank
GLGF	-2.01215	65	6.94927	1	0.16279	19	1.67762	4	1.47	1

3.9 Robustness test

Following robustness test is made in this paper: utilize clustering analysis method to divide the indicator into 2 categories, select the representative indicator and then adopt principal component analysis method again for financial competitiveness evaluation. Make Wilcoxon sign rank test form paired samples with evaluation result after elimination of indicator and evaluation result before elimination of indicator to The test result is as shown in table 9: bilateral significance level is 0.207>0.05, which shows that there is not obvious difference between comprehensive score rankings before and after elimination of indicator, thus verifying that change in financial competitiveness ranking caused by change in financial indicator selection is not statistically significant, which means that empirical analysis of this paper has certain reference significance.

Table 9   Test Statistics

	ZF1 - ZF
Z	-1.262
Asymptotic significance (bilateral)	0.207

4 Results

According to analysis, ranking of profitability scores has maintained a high consistency with the comprehensive ranking, which is almost the same (except for Goldlok Holdings). Therefore, profitability of enterprise is core element of financial competitiveness and important reference indicator under investment by investor and basic guarantee to obtain investment income. There is a comparatively high correlation between solvency ranking and comprehensive score ranking, and if solvency is ranked top, its comprehensive score will also be ranked relatively top. Therefore, improving solvency is the key to improve the comprehensive financial competitiveness of enterprise. Operation capability and growth capability are important factors affecting financial competitiveness, and improving operation capability and growth capability is the effective way to improve the financial competitiveness of listed companies in artificial intelligence industry of China. But growth capability score of 6 companies in top 20 companies in table is negative, and operation capability score of more than half of the companies is negative, which shows that overall asset utilization efficiency of the industry is low, with less income obtained, and level of long-term development needs to be improved.

5 Conclusion

Based on above results, problems of some listed companies in the industry are further analyzed and feasible suggestions to improve their financial performance and overall development of the industry are proposed. In terms of companies, some companies rank top in terms of comprehensive ability, such as Unis Holdings, they have limited their overall rankings due to the lower ranking of individual abilities.Therefore, management negligence of the company on any financial indicator will affect the promotion of financial comprehensive competitiveness. These companies shall focus on overall development and not ignore the overall long-term development of the company just to improve its profitability or operation capability. In terms of the whole industry, China shall strengthen personnel training support and improve self-innovation capability. Specifically speaking, on one hand, China can enrich related artificial intelligence subjects, encourage the cultivation of innovative talent, and encourage universities, research institutes and enterprises to jointly cultivate professional, innovative and compound talents in key field of artificial intelligence by increasing investment in training education funds, and relying on key universities and research institutes. On the other hand, China shall actively establish international exchange platform and hold education alliance of robot engineering major nationally. (Zhu Wei, 2016)

Supported by actual data, this paper analyzes development status of artificial intelligence industry and proposes related suggestions. Other researchers can make an empirical study on the profitability and solvency status of artificial intelligence industry based on it, so as to contribute to improving profitability of artificial intelligence industry and promoting development and future development of artificial intelligence industry of China.

Business Mode Innovation of Jointown Pharmaceutical Group in the Background of Big Data

Wang Zisui, Cheng Yanxia
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 604276064@qq.com, chengyanxia221@126.com)

Abstract: The development of big data has brought a profound impact on the business decisions of all parts of life, and derived many new business modes. Focusing on Jointown, the benchmarking enterprise in the pharmaceutical industry, this paper analyzes the impact of big data on Jointown 's business mode innovation and sums up the major types of business mode innovation, including deep vertical integration mode, O2O platform mode and cross-border integration mode. Based on this, some strategies are proposed, such as establishing the idea of using big data resources to create value, setting up an information platform based on big data management, and laying out a big data-driven smart business system, so as to provide reference for the innovation of business mode in pharmaceutical industry and related enterprises.
Key words: Big data; Business model innovation; Jointown; Pharmaceutical industry

1 Introduction

With the development of new technologies on the Internet and the widespread dissemination of communication channels such as social networks and e-commerce platforms, a large number of complex data have penetrated into every industry and gradually became an important production factor.Bughin (Bughin, 2011) pointed out that big data can release tremendous value through information transparency and propose data-oriented competitive advantage. The McKinsey Global Institute (McKinsey Global Institute, 2011) has made an assessment of the potential value of big data applications in various industries in the United States. The results show that the financial industry and the pharmaceutical industry will benefit the most in the development of big data technology.Morabito (Morabito, 2015) thought big data is now becoming a key organizational asset, which represents a strategic basis for business competition.

As Peter Drucker (As Peter Drucker, 2006) said: "The competition between companies today is not the competition between products, but the competition between business modes.". At present, research on business mode innovation mainly includes three aspects. Firstly, is about the concept. Teece D J (Teece D J, 2009) pointed out the business mode refers to how the company operates to achieve the purpose of delivering value to customers within a reasonable cost range. Georg and Bock (Bock, 2011) believed the business mode is to configure the organization resources to generate new profit opportunities. Demil and Lecocq (Lecocq, 2011) pointed out that business mode innovation is a process of constant adaptation to environmental changes from an external perspective. Secondly, is about the component. Lindgadt (Lindgadt, 2009) thought business mode innovation is achieved through innovations in value propositions, operational modes, and a range of sub-elements contained in these two elements. Osterwalder (Osterwalder, 2013) designed business mode innovations from the nine components of the business mode, including customers, channels, markets, resources. After reviewing a large number of documents, Clauss (Clauss, 2017) pointed out that business mode innovation is an innovation in value creation, value proposition, and value acquisition.Thirdly, is about the influencing factors. Li Wenlian and Xia Jianming (Xia Jianming, 2013) believed that "Big data" is influencing the business ecosystem of companies in various ways. It has become the basic background of corporate business mode innovation.Gassmann (Gassmann, 2014) argued that companies need to constantly discover conflicts between business modes and the environment, then update their business modes to counter market threats. Velu C (Velu C, 2015) believed that new technologies often catalyze business mode innovation.

So, in the context of big data, how to collect, process, analyze, and utilize complex data information, then explore new business opportunities, realize business mode innovation are important issues to companies.In the face of fierce market competition,Jointown Pharmaceutical Group, relying on big data, seized the opportunity to innovate its business mode continuously, successfully broadened its profit sources to shape its competitive advantage and took the lead in the industry, which brought many advantages to the pharmaceutical industry and enterprises.

2 Background of Jointown'sBusiness ModelInnovation

The pharmaceutical industry is a special industry. It communicates directly with a large number of customers, so it has a complex and large number of customer groups. The information of it is in an explosive growth, including daily sales management data, enterprise data, upstream and downstream data in the supply chain, and so on. It's obvious that big data affects the resource environment, technology environment, and demand environment on which pharmaceutical companies depend. It also triggers the reconstruction of traditional concepts such as resources, values, relationships, and borders, which provides a new foundation and path for the business mode innovation in pharmaceutical companies.

Established in March 1999, Jointown mainly deals with Western medicine, Chinese medicine and equipment. Its main customers include medical institutions, wholesale companies, and retail pharmacies. It also provides customers with value-added services such as information and logistics. Jointown has won a large number of customers by quickly opening up the market at low prices, realizing low costs through large-volume rapid operations, and using cash transactions to reduce the risk. However, the customer's needs and consumption habits are constantly changing, the demand for personalized products and services is increasing. This has brought challenges to the traditional business mode of Jointown. Jointown began to think about how to use resources to fully tap customer needs and conduct accurate marketing for different customer groups. The advent of the era of big data has enabled Jointown to fully and accurately acquire the characteristics of customers, dynamically track the trajectories of customers, dig deeper into the individual needs of customers, and rationally configure the company's core resources. This provided support and driving force for Jointown's innovative business mode.

3 The Main Innovation Model of Jointown

3.1Excavate big data, build deep vertical integration mode

In the context of big data, Jointown uses its existing advantageous resources to develop potential needs and markets through R&D software systems and technologies, then extends its business scope both upstream and downstream of the industry chain. It establishes a pharmaceutical resource platform including upstream pharmaceutical R&D, production, pharmaceutical wholesaler, distribution, logistics distribution in the middle reaches, and downstream pharmaceutical retail, etc. Jointown has effectively integrated the upstream supply network, downstream distribution network and its own marketing network to realize the expansion of the industrial chain and the integration and sharing of resources. The efficient communication and sharing of procurement information, logistics information, and sales information make the links in the Jointown industry chain more effective. As shown in Figure 1, the deep vertical integration business mode help to reduce costs and increase efficiency.

On the one hand, Jointown makes use of big data to dig deeper into customer needs and explore the market segments upstream of the industry chain. Jointown has invested in the construction of western medicine production plants, Chinese medicine decoction pieces' production plants.It has initially formed a pharmaceutical industry chain that includes quality assurance systems such as scientific research, planting, acquisition, sales, deep processing of products, and standard decocting.

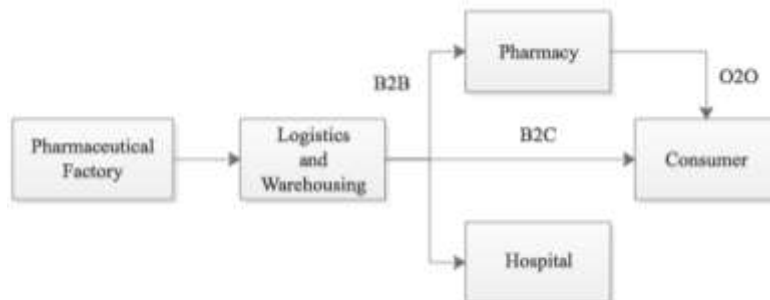
On the other hand, Jointown has entered the downstream consumer-oriented retail terminal field and established Jointown 's self-operated hospitals and chain pharmacies to achieve an effective connection between retail pharmacies, chain headquarters, and distribution centers. Through the use of big data resources and technologies to transform complex data into guidance for companies to make decisions, Jointown can simulate customer buying behaviors and trends, accurately locate potential customer groups, and achieve accurate marketing.


Figure 1   Deep Vertical Integration Mode

3.2 Connect big data, create O2O platform mode

With the development of the Internet and the popularity of mobile terminal devices, major changes have taken place in the consumer's spending habits and channels. Jointown used the big data to layout the mobile healthcare system, breaking a single offline sales channel, fully adapting to the consumption upgrade under the new market environment, and promoting the development of the O2O platform mode through innovative value creation and value transfer processes, as shown in Figure 2.

Customers can ask professional doctors on the online hospital platform of Jointown and get an e-prescription, then Jointown will deliver the medicines to the users offline, it completes the entire process of visit and form a complete service system.

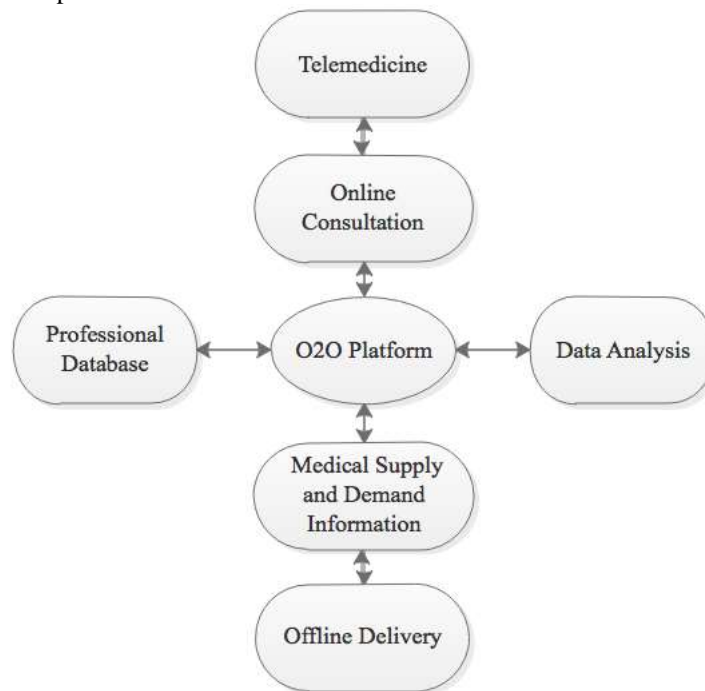
Jointown creates and transmits value through data mining, sharing, and utilization. It integrates the resources with the offline and online of the enterprise to provide customers with comprehensive and convenient products and services. Jointown meets the multi-level and personalized health needs of customers, it expands the business scope of the company, and promotes the transformation of it into a health industry service provider.


Figure 2   O2O Platform Mode

3.3 Share big data, develop cross-border integration mode

From the perspective of resource foundation theory, the boundaries of an enterprise mainly depend on the value radiation capabilities of the core resources owned by the enterprise and its control capabilities. Jointown has accumulated huge data resources, developed advanced technologies, and built a nationwide distribution network. Making use of big data, Jointown gets accurate forecast trend of the market. Combined with the resources owned by the company, it creates a cross-border business integration through value creation. The mode is shown in Figure 3.

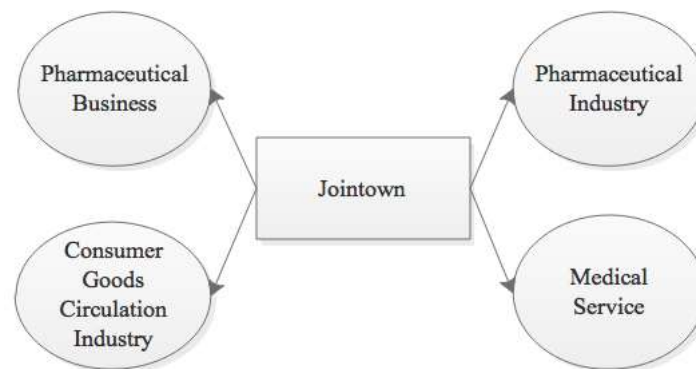
With the use of big data, Jointown has improved the foresight of market judgments and reduced the error rate and cost of market analysis. Through the integration of business operations and data, it has achieved good results by judging potential businesses with high profitability and rapid growth, entering the consumer goods circulation market. At the same time, Jointown also conducted a full-scale expansion of cross-border integration. It changed the simple trading relationship with upstream and downstream companies in the industry chain, and formed a collaborative system and partnership of the industrial chain.


Figure 3   Cross-Border Integration Mode

4 Conclusion

Nowadays, big data has gradually become an important production factor, bringing a new strategic resource and core competence to pharmaceutical companies. In the context of big data, Jointown actively adapts to changes in the environment, it makes use of big data resources and technologies to transform its own resources, structure, processes and the entire value network, finally achieve the innovation of business mode.

From the case study, the following suggestions are made for pharmaceutical companies to make business mode innovations in the context of big data.Firstly, pharmaceutical companies should recognize the business opportunities brought about by big data, and regard big data as the core resource for which companies can create value. With the cross-border integration of the Internet, pharmaceutical companies can obtain customer behavior data of e-commerce platform systems, business data of upstream and downstream partners in the supply chain, and medical health data of customers. From big data, pharmaceutical companies can learn about the composition of the industry, the characteristics of different market segments, the needs of consumers, and the status of competitors. Through the system's data collection, analysis, and excavation, the company's initiative in the market is guaranteed.

Secondly, establishing an information platform based on big data management is important.With the growth of customer demand and the expansion of enterprise scale, the massive data generated through the Internet need advanced information back-end systems based on big data management to quickly provide data basis for managers' decisions. Pharmaceutical companies can further clarify the extent to which their products and services are accepted by customers by obtaining data information and analyzing them. The establishment of a big data information management platform will help pharmaceutical companies accurately locate the market, formulate targeted marketing programs and differentiated marketing strategies. Through the mining of customer profile data, the analysis of the customer's consumer behavior characteristics, forecasting the customer's needs, and improving the ability of the customer's comprehensive system of services.

Thirdly, pharmaceutical companies need to lay out big data-driven smart business system. Pharmaceutical companies must use big data to drive changes in traditional business practices and develop in the direction of information, transparency, visualization, efficiency, and intelligence. Supported by information technology, pharmaceutical companies can use big data to make business management decisions, product and service innovation, precision marketing, and supply chain optimization. Only by taking the customer as the core, laying out a smart business system, and innovating the business mode, can companies achieve the intrinsic value of big data.

Construction of Intelligent Control and Control Collaborative Innovation Platform for Expressway Based on IoT

Jia Lifen, Zhu Shuwu, Feng Zhao

Huanghuang Expressway Management Office of Hubei provincial department of transportation, Wuhan, P.R.China, 430070

(E-mail: 283124681@qq.com, 962794614@qq.com, 112997532@qq.com)

Abstract: Huanghuang Expressway Management Office has built a cooperative control platform by means of information management through the use of internet and IoT technology. This paper mainly introduces the construction of the intelligent collaborative management and control platform of Huanghuang Expressway Management Office, and expounds its construction ideas, target system and main function design. Through the integration of resources, a very practical and comprehensive platform can be built, the platform is supported by rich data and advanced technology, it covers the functions of personnel management, financial management, asset management, operation management and so on.

Key words: Intelligent Control Platform; Informatization; Collaborative control; Internet of Things

1 Introduction

Highway management in Hubei Province has completed the construction of the information system, but it has not realized the informatization of the control, which leads to many invariances. Department-office-office-road, different levels of system have different needs, but can't achieve information exchange; road-to-land information system has different ownership, different rights and responsibilities, can't be interconnected; there are multiple sets of assets, finance, personnel, etc. in the management office. Information system forms an isolated island of information; in emergency management, early warning, disposal, and risk assessment belong to multiple systems, hence information cannot be transmitted in real time, resources cannot be allocated in time, and the situation can't be directly presented.

Huanghuang Expressway Management Office has established various business information management systems through information management methods, including toll operation management system, early warning management system, OA office automation system, electromechanical equipment management system, and road administration management. Undoubtedly, it has played an important supporting role in promoting intelligent management of expressway. However, due to the separate design and construction of each business information system of Huanghuang High-speed Management Office, different database management systems and information storage formats are adopted, the software platforms are inconsistent, lack of unified management standards, business data is dispersed in various business departments, and there is no effective centralized storage and archive. At the same time, the data resources of various departments are not shared, the utilization of information resources is not high, and the business systems are difficult to interconnect, which restricts the comprehensive utilization of information resources and the application of information technology.

With the rapid development of expressway construction, it is urgent to break the barriers between departments, strengthen the integration of information resources, pay attention to the use of data resources, improve the road network management level and operational efficiency. We need to build a comprehensive management platform with rich data, advanced technology and easy to use, so as to promote the unified processing, exchange and sharing of data resources of Huanghuang Expressway Management Office. Under the trend of internet of everything, mobile terminals can be used everywhere, smart devices can be found everywhere, and intelligent control of expressways must comprehensively apply related technologies of the IoT, with "things" as the main line, stringing up various systems to improve coordination and service efficiency.

2 Literature Review

Intelligent transportation is a new research field, and the application of IoT to solve the intelligent traffic problem is a new application direction. Although there are not many researches on the intelligent traffic information based on the technology of IoT, there are lots of researches in the fields of intelligence transportation, smart city, intelligent agriculture and intelligent home. These studies have focused on solving the problem of intelligent transportation.

Filev D P (Filev D P, 2017) used biometrics simulation technology to study vehicle identification, inter-vehicle communication and interconnection. Although the concept of vehicle networking was not explicitly mentioned, the research problems have the prototype of the Internet of Vehicles.

Dong (Dong, 2017) applied IoT technology and cloud computing technology to state monitoring and disaster warning of dams, using satellite alignment technology and observing base stations to monitor dam health data in real time, creeping and cracking of dams real-time monitoring and early warning of disaster status such as subsidence. The methods and techniques of Dong's (2012) research can also be applied to the state monitoring and disaster warning of traffic infrastructure such as highways, roads, bridges and tunnels.

Song (Song, 2016) comprehensively analyzes the collection technology of traffic information in intelligent transportation from the types of traffic information required by intelligent transportation to the advantages and disadvantages of current major information collection technologies.

Liu (Liu, 2014) applied optical fiber communication technology to explore and design the whole process of expressway vehicles. In the design process, it comprehensively involved the vehicle perception, vehicle operation information collection, and the processing and transmission of collected information. Such problems have realized the intelligence and wisdom of vehicle operation management.

Shah S H (Shah S H, 2016) summarizes and describes the application prospects, application levels and major technical difficulties and challenges of IoT applications in the field of transportation applications and major technical challenges. It gives some inspiration to the application of the IoT to solve the problem of intelligent transportation.

Li (Li, 2015) analyzed information verification, information coupling and information reliability and information security issues in IoT communication technology. Information coupling technology solves the problem of information compatibility of multiple information sources. Through the research of information verification, the redundancy of IoT information is greatly reduced, thus ensuring the security and reliability of information.

Qian (Qian, 2016), in the research process of the real-time online monitoring system for container logistics, fully utilizes the IoT technology to realize real-time online tracking, recording, and monitoring of dynamic objects, and has a good reference to the vehicle monitoring problem in intelligent traffic.

Wang (Wang, 2016) realized the vehicle's understanding of the environment through the sensing technology. At a certain level, the intelligent vehicle, the intelligent vehicle and the traffic environment were automatically coupled, and the basic characteristics of the intelligent traffic were initially established.

Dong (Dong, 2017) studied the construction mode of smart cities. The construction mode fully reflects the idea of integrating urban management systems. The existing urban management system is regarded as the middleware of the smart city system. The integration, the use of existing resources, speed up the progress of smart city construction, reference to the development of smart transportation system construction mode and system architecture.

Xue (Xue, 2014) applied the IoT technology to study the urban intelligent transportation problem. Although urban traffic and highway traffic have great differences, they have strong commonalities in the collection, processing, transmission and release of traffic information.

3 Overview of the Management Platform

In line with the "Smart Huanghuang" collaborative management and control system construction, around the strategic objectives of "up and down coordination, road coordination, resource coordination, and public collaboration", Huanghuang Management Office responded to the deployment of the superior units and integrated the status quo, and promoted the management system construction by building a collaborative management and control platform.

The collaborative management and control platform is based on the large asset platform and financial integrated management, and fully utilizes the Internet and related technologies, and extends to AR, VR, GIS, emergency management, dispatching services, information security, operational risk, BI and other related fields. At present, the platform is trying to apply the core technology such as Internet of Things, security large data intelligent analysis and so on. In the future, a collaborative integrated management platform will be formed.

The project planning has completed the existing system analysis and integration platform planning and architecture; data resource integration and collaborative management platform definition; data

resource integration and collaborative management platform infrastructure; data resource integration catalog and collaborative management platform molecular system construction. Data visualization, decision analysis, data intelligent technology implementation, data resources sharing services, external system integration, data service capabilities are being built, in the future, big data analysis, data resource service capabilities, and collaborative management and control systems will be improved.

The platform construction ideas are as follows:

(a) Platform innovation ideas

The information management system based on the IoT, based on the main line and the serial highway will be constructed to realize high-speed management and intelligent innovation.

Collaboration between the upper and lower levels: to achieve synergy between the management office and the superior leadership units and subordinate units.

Road and ground coordination: to achieve synergy between highways, highways and local resources along the line.

Resource synergy: to achieve synergy between human resources, materials, data, information and other resources.

Public collaboration: to achieve synergy between the Huanghuang Expressway and the public.

(b) Target system

Long-term goal: building the intelligent control system based on the IoT, speeding up the implementation of technology transfer and industrialization of achievements, and popularizing in the whole country.

Short-term goal: construct the intelligent control system of yellow-yellow expressway based on IoT, and try the Yellow Expressway management office.

Intelligent control system function objectives: system integration, data fusion, information intensive, management leave marks, emergency controllable.

(c) Project construction organization

Under the leadership of the ministry and the department, Huanghuang Management Office has initially established a more comprehensive information management system based on the characteristics of the managed routes, and completed the first phase of the rolling plan. Data resource integration and collaboration projects were initiated, and organizational needs research was initiated to conduct feasibility analysis.

The project is undertaken and operationalized with the mutual cooperation of both practitioner and academic researcher. The cooperative enterprise is Wuhan Weicheng Technology Co., Ltd., and the research unit is Wuhan University of Technology. Weicheng Technology is a high-tech enterprise with independent intellectual property rights, which provides long-term integrated solutions for software development, system integration and engineering construction. Now it has built a comprehensive control system for many expressways. Wuhan University of Technology has strong scientific research strength in the fields of transportation and logistics, electromechanical and automotive, information, security and emergency management.

4 Control Platform Function Design

The data resource integration of Huanghuang Expressway Management Office will become a comprehensive management and control platform to realize the management of existing people, finance, materials and operation and maintenance, mainly divided into portal homepage, personnel management, financial management, asset management, operation and maintenance management, GIS, emergency management and master data.

(a) Portal homepage

The portal homepage mainly includes functional modules such as pending audit, notification announcement, message center, OA (transceiver management, mail management) and decision-making statistical graph display.

(b) Personnel platform

The personnel platform mainly integrates the existing personnel system, and the existing personnel system business remains unchanged. The organizational structure and personnel information interface are provided for the permission system to use.

(c) Financial platform

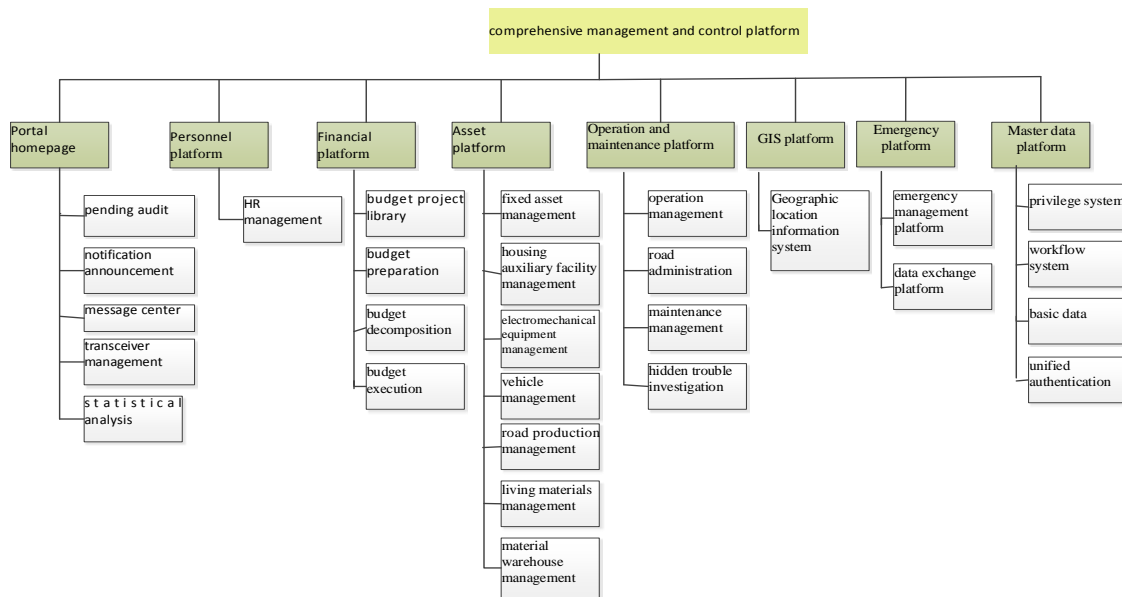
The financial platform mainly integrates the departmental budget management system, including budget project library, budget preparation, budget decomposition, budget execution and other functional modules.


Figure 1   Management Structure of the Control Platform

Budget project library: budget project library project, project candidate registration, project execution query, project performance

Budget preparation: budget income declaration, basic expenditure declaration, project expenditure declaration, budget text generation

Budget decomposition: budget decomposition, budget adjustment

Budget execution: pre-examination of budget execution, project bidding, contract management, payment management.

(d) Asset platform

The asset platform mainly integrates business modules such as fixed asset management system, housing auxiliary facility management system, electromechanical equipment management system, vehicle management, road production management, living materials management, and material warehouse management.

Fixed asset management: fixed asset management asset allocation standards, annual asset update/additional plans, sporadic procurement, inspection income pool, allocation, rental, maintenance, disposal.

Housing Subsidiary Facilities Management System: information about the yards, structures, floors, rooms, etc. of the housing facilities management station

Electromechanical equipment management system: mechanical and electrical equipment management monitoring, communication, charging, power supply and distribution, tools and other equipment

Vehicle Management: vehicle GPS, dispatch, annual review, ETC, fuel, accident, violation, vehicle Maintenance, vehicle driver management, etc.

Road production management: road management bridges, tunnels, service areas, toll stations, information boards, etc.

Living materials management: living materials management clothing and other living materials

Material warehouse management: material warehouse management material storage and storage, intelligent warehouse

(e) Operation and maintenance platform

The operation and maintenance platform mainly integrates the existing road inspection system, maintenance system and operation management system. Through data statistics, we can know the general situation of passing vehicles. For example, platform statistics, the historical data of vehicles passing toll stations. Sometimes data deviate considerably, such as the free traffic increases suddenly in a certain period of time, this may be due to seasonal reasons, or many people disguise their vehicles as free-riders. Managers should notice such abnormal data.
Figure 2   Data of vehicles passing toll stations

(f) GIS platform

The GIS platform mainly provides geographic information display, and displays objects such as stations, bridges, tunnels, structures, monitoring points, weather inspectors, construction information, rescue, and emergency on the map.

(g) Emergency platform

The emergency platform integrates the emergency management and control platform and the data exchange platform.

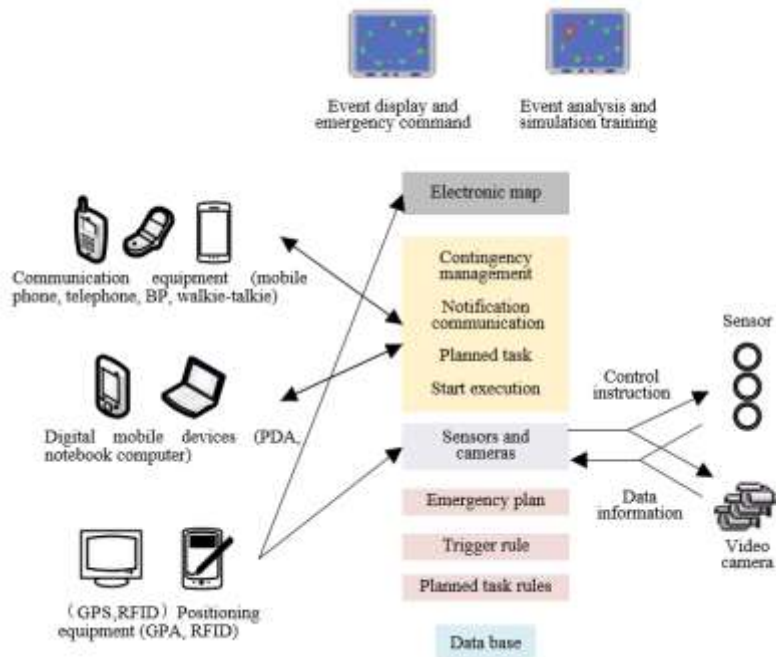
Emergency control mainly through external sensors (such as smoke sensors), video equipment, positioning equipment (GPS, RFID, etc.) for data analysis, combined with predefined event solutions for early warning processing.


Figure 3   Schematic Diagram of the Emergency Platform Work

External devices and interfaces: supports a wide range of industry-standard sensors and systems such as pyrotechnics, climate control, access control, motion detection, emergency buttons and positioning equipment (including GPS, IR, RF and LF tags), video surveillance, intelligent video detection, etc.

Event Workflow and Rule Engine: the event logic engine integrates external devices, GIS, and other real-time data based on predefined response plans and rules to navigate the entire process of event management. The event logic engine manages events, tasks, device monitoring, user and data access rights rule definitions and applications, and rule definitions.

Communication: the notification server supports automatic or manual communication. Notifications include task assignments and attachments that can be triggered by device alert or alert escalation events, or by mobile clients used by monitoring room personnel or field personnel. The notification engine supports radio, telephone, public address systems, fax, email, SMS and multimedia communications over secure networks, standard telephone interfaces, GPRS and other mobile communication protocols.

(h) Master data platform

The main data platform includes a privilege system, a workflow system, basic data, and unified authentication. The main data platform includes:

i. privilege system role authorization management

ii. workflow system process modeling, process engine, process design, etc.

iii. basic data dictionary, subjects, logs, etc.

iv. unified authentication single sign-on, unified authentication information

(i) Mobile APP

The mobile APP mainly integrates the pending waiting, the message center, the notice announcement, and the asset inventory, mechanical and electrical inspection, road maintenance inspection, and safety hazard investigation.

i. message management, notice announcement, upgrade assistant, communication, emergency message push, pending trial

ii. asset inventory through asset barcode scanning for asset inventory

iii. inspection of electromechanical equipment patrols electromechanical equipment through scan code, which can be repaired by fault

iv. checking the security hazard by setting the troubleshooting list of the hidden danger type, discovering the hidden dangers and reporting them in time, and handling the hidden dangers

v. road maintenance inspections to inspect the construction, emergency events, bridge tunnel structures, etc. on the expressway

vi. WeChat public number pushes all kinds of data information such as event alarm, emergency help, consultation, infrastructure status, traffic and weather conditions, and event status.

At the same time, in order to realize the intelligent control of expressways, ensure the smooth operation of the road network, improve the management level of the road network, and provide data and technical support for decision support, the next stage will be combined with the key measures of "Things Security Big Wisdom Mobile" to promote research.

Things - that is, the Internet of Things, deep into the "Internet of Things" technology application, through the radio frequency, infrared, positioning, laser, remote viewing, telemetry, remote control and other technologies to connect intelligent devices to communicate, to achieve intelligent ICT goal of intelligent control of highways.

Security - that is, according to the relevant requirements of the "Electronic Signature Law of the People's Republic of China" and "Technical Specifications for Electronic Signature of Public Security Information Network", and establish an electronic signature/name in conjunction with the "General Plan for the Application of Passwords in Important Business Fields of the Transportation Industry" The certification service system realizes the security, legality and traceability of information transmission, certification and signature, and strengthens the information security assurance capability.

Big- that is, big data, expand the scope of data analysis from latitudes such as time and space, and intelligently count big data, and finally form a BI (Business Intelligence) solution to present reports quickly and accurately, and provide scientific decision-making basis.

Wisdom- that is, intelligent, combining communication technology, computer network technology, and intelligent control technology to make full use of its "wisdom" and "ability" to effectively control electronic sensing, remote control, image recognition, speech recognition, video and audio analysis, etc. Ground transportation is used for platform construction.

Mobile- mobile interconnection, mobile Internet technology, supporting mobile applications, such as APP, WeChat enterprise number, public number, nailing and other diversified models, thus making the integrated management and control platform diversified, breaking through time and space restrictions, and accelerating collaborative management and control.

5 Conclusion

Hubei Huanghuang Expressway Management Office has built a cooperative control platform by means of information management through the use of Internet and IoT technology. This paper mainly introduces the construction of the intelligent collaborative management and control platform of Huanghuang Expressway Management Office, and expounds its construction ideas, target system and main function design. Through the integration of data resources, a comprehensive management platform with rich data, advanced technology and convenient use is constructed to realize the management of existing people, finances, materials and operation and maintenance.

Using H.264 Codec Remote Conference System to Realize Credit Transfer of Global MOT Course at Yamaguchi University and Overseas Universities

Naoki OHSHIMA
Graduate School of Innovation and Technology Management, Yamaguchi Universitye
(Email: nohshima@yamaguchi-u.ac.jp)

Abstract: The Yamaguchi University Graduate School of Technology Management collaborates with universities in Indonesia, Malaysia, Thailand and Vietnam to establish unit-compatible classes with overseas universities using the H.264 codec remote conference system Heisei I have been working on it since the 27 (2015) year.

We recently completed the introduction of the H.264 codec remote conference system at each university and started to develop a compatible matrix for each lesson based on the curriculum map to realize full-scale unit compatible classes. In this presentation, I will report the results so far and future prospects.

Key words: Remote Tele-conference lecture; Course sharing; Credit transfer system

1 Introduction

Graduate School of Engineering Management at Yamaguchi University is a graduate school for technical management specializing in graduate students of society. Since it was established in FY 2005, we have promoted problem-solving learning that incorporates learning methods such as active learning, technology. We have accumulated experience in management education.

From FY2010, with the aim of fostering human resources capable of globally playing an important role in expanding the base of technology management education cultivated up to now, in collaboration with influential universities in ASEAN countries, crossing the borders, academic fields, industry and academic barriers Asia Innovation Center was established as an educational base for cultivating advanced professional people promoting open innovation, and faculty members of Yamaguchi University Graduate School of Technology Management focused on dissemination of global MOT education.

In this presentation, we cooperated with universities in Malaysia, Indonesia, Thailand and Vietnam, developed the framework of international lecture using remote system, and introduced H.264 codec remote conference system as a tool for lecturing Report it.

2 Background

From now on, innovation is indispensable for sustainable growth in Japan. It is not innovation that is completed in the country, but it is necessary to create innovation that is widely accepted abroad, especially in the Asian region centered on ASEAN countries where growth is remarkable.

Innovation is not mere technological innovation but means "innovation" that succeeds as a business based on the context of society, economics and culture.

Human resources who can drive such innovation can grasp things from a compound eye viewpoint of technology and management and understand diversity of culture and society while cooperating with people in the Asian economic zone to mutually benefit the ability to create business models is required.

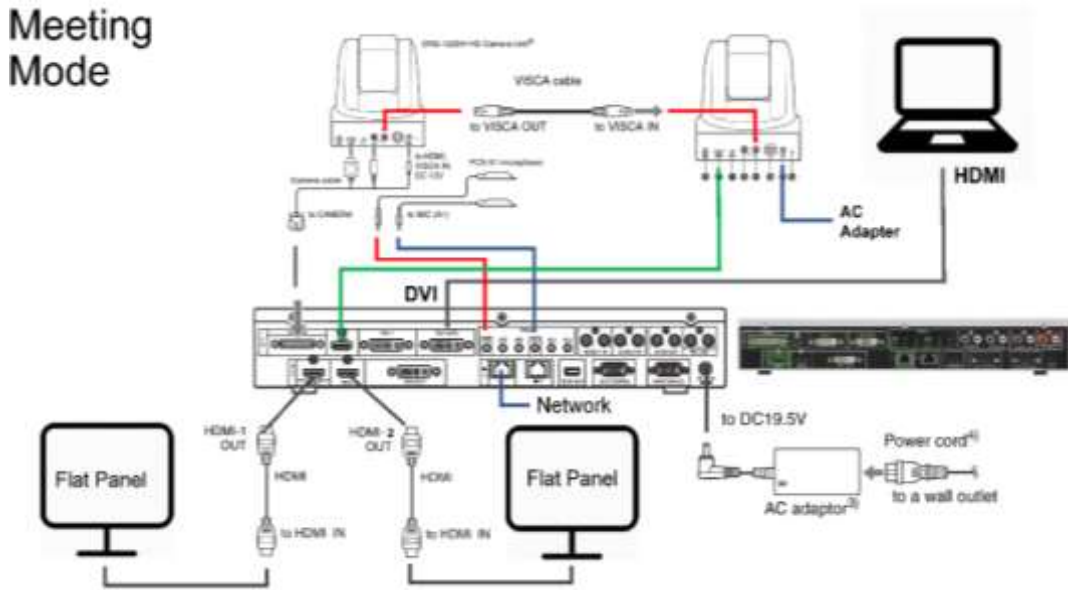
At Yamaguchi University, as an "Asia-wide Practical Innovation Education Base", with the aim of implementing an educational program (Global MOT Education Project) that trains global technicians across national borders in order to foster such human resources we opened Asia Innovation Center.


Figure 1   Connection of Equipment Compatible with Meeting Mode

3 Collaboration with Overseas Universities

3.1 Global MOT education consortium

As a cooperative university for implementing global MOT education project, Indonesia ·Bandung Institute of Technology Business School, Malaysia Institute of Technology Malaysia Japanese International Institute of Technology, Mala Institute of Technology Business School, Thai ·Chiang Mai University Business School, Vietnam ·Da Nang Science and Technology University Business We aimed to collaborate with the school and formed a consortium on global MOT education.

3.2 Study of remote tele-conference system

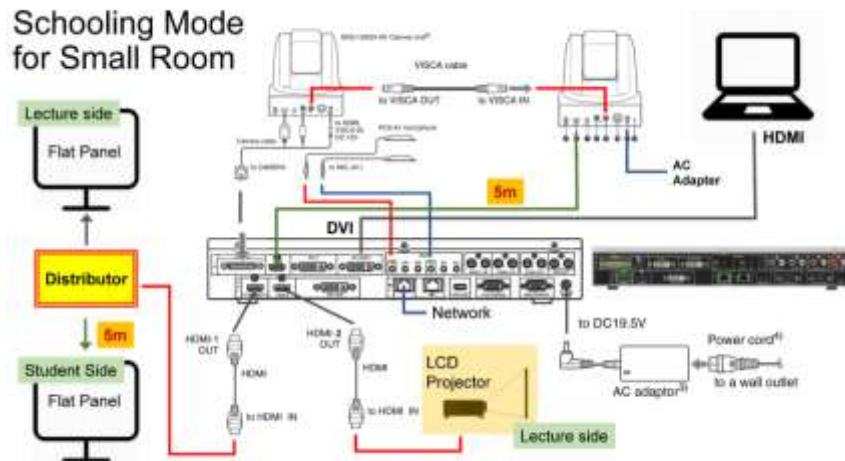
In this global MOT education project, we introduced H.264 codec-based remote conference system as communication means for connecting Yamaguchi University and each university.


Figure 2   Connection of Equipment Compatible with Schooling Mode

Utilizing the H.264 codec-based remote conference system, Yamaguchi University has accumulated experience such as remote lectures in the university and remote training in multiple campuses. The feature of the H.264 codec-based teleconferencing system is that it is possible to deliver clear lecturers' images and voices as well as personal computer images. As long as the Internet communication environment is in place, it is possible to connect anywhere in Japan and overseas. In addition, since the H.264 codec-based remote conference system installs dedicated hardware, it is easy to establish a connection by simply turning on the power of the receiver and calling the other station. In

this project, we emphasized that faculty members and students who do not have expertise on communication can communicate easily and stably easily.

3.3 H.264 codec-based remote conference system

In order to establish a smooth telecommunications connection with overseas universities, it is not enough to just introduce the H.264 codec-based remote conference system. Therefore, in this report we report examples of Vietnam ·Da Nang Science and Technology Business School introducing the same model as the H.264 codec-based remote conference system (made by SONY) used at Yamaguchi University.

Since the H.264 codec-based remote conference system is basically a system for remote conferences, it assumes a mode in which they face each other in equal positions while facing each other. We call this mode the meeting mode.

On the other hand, in distance class, it is divided into lecture delivering side (lecture station) and receiving side (student station), so we will call this style schooling mode.

Fig. 1 shows the connection diagram of the equipment compatible with the meeting mode. The equipment to be connected consists of two remote video cameras, two flat panels (about 60 inches), one codec and one personal computer.

A dedicated video camera is a type that separately connects a video signal (HDMI cable) and a control (VISCA cable), and it is possible to adjust the angle of the camel and the zoom (wide: tele) with the remote controller. In addition, if the distribution station and the receiving station are using the same manufacturer's H.264 codec-based remote conference system, remote distances such as adjusting the camera on the other side (for example, switching the camera on the Vietnam side from Japan side) Operation is possible. By allowing such instructors to perform such operations smoothly, it becomes possible for lecturers with realistic feeling to be delivered to remote locations.

Next, the connection of equipment compatible with the schooling mode is shown in FIG. In the schooling mode, from the viewpoint of the instructor on the delivery side, arrange so that the student on the remote (receiving) side seems to be in the same classroom as the local student. Also, from the students on the receiving side, arrange the lecturers on the remote (distribution) side as if they are in the classroom where they are.

(a) Full view of lecture room introducing H.264 codec-based remote conference system

(b) The secondary camera takes a lecturer and a front screen.

(c) Primary camera shoots the classroom from the instructor's point of view

(d) Classroom viewed from the primary camera (student view)

Figure 3　In the Lecture Room Introducing the H.264 Codec-based Remote Conference System, Shows the Arrangement and View of the Primary Camera and the Secondary Camera

In order to realize this arrangement, in the schooling mode, connect to two flat panel monitors and one liquid crystal projector by increasing the number of video monitors compared with the meeting mode. At that time, the two flat panel monitors display the same image through a distributor (Fig. 2).

In each station (distribution station and reception station), two cameras are arranged so that lecturer view and student view can be taken. Here, we must pay attention to the priorities of the cameras on the system. Due to limitations of the system, the primary camera is a camera that takes a student view and the secondary camera is a camera that takes a lecturer view.

Figure 3 shows a photograph showing the arrangement of equipment at Yamaguchi University.

3.4 Telecommunication connection with overseas universities

In May 1990, Yamaguchi University and Da Nang Science and Technology University were connected to demonstrate distance lecture by H.264 codec based remote conference system. This demonstration started a lecture with the Japanese side (Yamaguchi University) as the distribution station and the Vietnamese side (Danang Science and Technology University) as the receiving side. We were able to conduct interactive video live lectures such as receiving questions from Vietnamese students in the middle of the lecture and switching students' view of the cameras to each other and discussing students between Japan and Vietnam with each other. On the day of the presentation, I will show the state of the demonstration.

4 Conclusion

In order to implement the global MOT education project, Yamaguchi University has been working

with universities in Asian countries to introduce H.264 codec-based remote conference system. Following the successful completion of the demonstration tutoring lecture with the H.264 codec based remote conference system, we will begin designing the curriculum for the implementation of the code share lecture and further the unit compatible classes.

Governing Higher Education's IT in Cloud Era: Challenges and Possible Solution

Dodi Setiyawan, Wang Hu
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: dodisetiyawan2@gmail.com, wanghu61@126.com)

Abstract: One of the leading growing information technologies which appear affecting organizations in specific ways and levels is cloud computing technology. Many kinds of literature found from neither professionals nor academicians concentrating on pinpointing enabler and inhibitors in governing or embracing the cloud solutions. Nevertheless, only few who identified how such solutions would have predisposed IT Governance in an organization, in which having the effective one will consider as a guide to enduring the emerging and competitive market. Cloud computing services which have flooded over the market of business for many recent years offers almost everything to be much more at ease for anyone to occupied and access. They covered practically from personal file backup to central production server and application services completely. It can be ascertained that the cloud computing service trend is undoubtedly placing pressure on traditional IT governance processes to reconcile. For that reason, this paper aims to study the challenge and what are the possible solutions of Higher Education's IT governance in the cloud era. This paper was built through an exhaustive literature review describing IT governance including the challenge in cloud computing, in conjunction with transformations of organization cited by several researchers.
Key words: Higher education; IT governance; Cloud computing; Challenge

1 Introduction

The emerging technologies and significant challenges arising from efforts in embracing new technologies are the results of higher education all across the globe to be in persistence changes and development situation. The new category of the student which have entirely different learning needs from their precursor and the increasing of recognition of the technology utilization are requisite to delivering high-quality education in the century are becoming a primary cause. To many people, likewise student, it is noticeable that the needs of Higher education with an emphasis on higher order learning experience, changing knowledge and communication-based society (Pacesila M, 2006) demanded are unable just by addressing the traditional method of IT. IT which has become part of a Higher education institution is an essential issue. The progressive of IT evolution becomes vigorous warranty of effective and efficient to the organization (Ribeiro J., Gomes R., 2009). In addition to other institutions, Investment in IT also turns out to be noteworthy spending to Higher Education Institutions. The activity of teachings, administration, research, student learning needs IT support. However, in the case of supporting IT investment in decision making, IT performance measurement at a strategic level and comprehensive approach to risk management are essential to set in for an institution (Coen M., Kelly U., 2007). The term "governance," in common denotes the way an organization ensures that strategies have been set up, monitored, and accomplished (Weber K. et al., 2009). An almost entire aspect of universities, school's academic and business affairs already pertained to IT. Efficient IT Governance is required to convince that all kinds of costly and complicated IT process are governed adequately. Moreover, all the stakeholders will want to be satisfied. In order to support the business goals of learning, teaching, research, and administration, there had some studies in IT governance which applied in university as the point of research (Ajayi BA, Hussin H., 2014).

The new technology utilization such asa cloud computing service recently cannot be denied provided many advantages. However, it is necessary for organizations to be able to recognize and evaluate the impacts of cloud adoption to their information system before deciding to migrate to the cloud. The embracing of cloud computing technologies will bring an innovative approach in IT utilization in an organization. Nevertheless, a particular information system maturity management and the capacity for recognizing appropriate substances and facet that may predispose to the new adoption are required. Therefore, the influence of such technology on IT governance policies needs to assess before the migration process. Re-evaluation is also needed in many facets of the IT governance.The most discussed in published papers are the benefit of IT governance and or cloud service in common industry implementation, meanwhile, few who discuss what and how IT governance in Higher Education Institutions (HEI) need to have re-thought in facing the cloud era. The paper studies purposes

are to support three goals. First, to analyze the benefit of IT governance implementation in HEI, second is to obtain the benefit of cloud computing to HEI, third is to understand the challenge and possible solution in governing HEI IT in a cloud environment.

2 IT Governance and Higher Education Institution

IT Governance essentially is a whole enterprise of IT function. With a proper framework, organizations can gain quantifiable outcome in regards to succeeding their goals and strategies. IT governance also treated as a framework which intended to encourage behavior in using IT for decision making and accountability (Weill P., Ross J.W., 2004) which containing a series of arrangement process and structure in an organization to ascertain operational and strategic management perpetually managed and continually monitored (Weill P., Ross J.W., 2004). As an organizational capacity, IT Governance done by the board, executive and IT management with the objective of integrating business with IT and the implementation of IT strategy (Van Grembergen W. et al., 2004). Stakeholder's needs are also taking into account in addition to the needs of staff and the method they follow on formal program. The overall main objectives of IT Governance are to enhance business performance and conformance along with regulation (Bhattacharjya J, Chang V, 2010). Regarding the methods, ITIL, COBIT, and ISO are widely practicing framework.

Higher Education Institutions (HEI) known as an exceptional type of organization, where its technological infrastructure comprises application diversity, different program, academic systems, and used different technologies (Coen and Kelly, 2007) and knowledge in teaching learning and research as primaryactivities. It is distinguished broadly not just in their objectives, condition, arrangements, and procedures, yet additionally in their IT application, prerequisites and foundation. Studies had performed and demonstrated the contrast amongst companies and university in their IT systems and divisions (Zhen and Xin-yu, 2007). Since higher education institutions also pursue a better and more cost-effective method to perform IT service, seeing such distinction will mainly help in picking the most appropriate framework of IT Governance to be utilized in a higher education institution. Nevertheless, IT Governance mechanisms in an organization determine by the characteristics and the needs of the organization itself (Hicks et al., 2012). Like companies, higher education institutions are anxious to quickly answer to new prospects, without spending much time to perform a business-critical program. What's more, similar to organizations, higher education institutions need to understand the maximum capacity of their information to better strategic advice choices about what's to come.IT Governance employment in HEI is relatively identical with other industry and institution in benefit acquisition. Benefits of implementing IT Governance at HEI are (Khther RA, Othman M., 2013):

A. Improvement of alignment between IT and institutions strategy

B. Improvement of regulatory compliance and business performance

C. Improvement of decision making for a better direction in the organization and able to develop an important IT strategies and policies

D. Improvement of risk management associated with IT due to adequate management

E. Improvement of Communication among crucial stakeholder group for central IT includes teaching staff, students, business process owners, research, and development, divisional IT management

F. Improvement of quality of services and administrative

G. Improvement of controlled and managed the IS more efficiently

H. Improvement of a range of activities in an academic environment\

I. Reduced the incident/failure of systems

3 HEI's IT Governance in the Cloud

The IT sector advancement influences other related system development, and the current trends appear to be the cloud service concept. It is imperative for the organization to have the suitable and sufficient structures and dimensions to actualize effective governance that aligns business strategy with the IT (Van Grembergen W., 2004). When a new technology needs to implement in an organization, it will affect its governance. Hence, to have adequate governance when implementing cloud solutions, the organization must be ready, regarding capacities and structures dedicated to the cloud. Therefore, an organizational design, with the appropriate skills and expertise to support the established IT governance, is needed. To both public and private organizations, cloud technology brings prospective benefit propositions by making IT services as a commodity (Forell T. et al., 2011; Al-Ruithe M. et al., 2016). The efficiency of cost, backup and recovery, automated software incorporation, indefinite storage,

access to information, more manageable service measure, prompt establishment, and new distribution facilities are commonly entitled as the benefit of cloud computing (Ko RK., Jagadpramana P., et al., 2011). Not to mention, enhanced server usage, dynamic scalability, and reduced life cycle extension of new applications as a further value. Many factors which mostly concerning the moving of business data to be handled by a third party made cloud computing still have not adopted broadly (Niemi E., 2011), then there are also other players like cloud auditor, cloud broker, and cloud carrier (Bumpus W., 2010). Therefore, data control, security, and privacy, data quality,and assurance, can be mentioned as real concerns in adopting cloud computing business models (Ramachandra G., Iftikhar M., Khan F.A., 2017).

The usage and knowledge constructions of an influential factor for social, economic, cultural and transformation of technology in higher education required to employing cloud-based education system. Accomplishing this objectiveare unavoidably comprises technological use, which would grant knowledge transmission and generate new spreads for education, research, and development. What cloud has to affect to education sector has been put forward particularly regarding the implications of technology and open access to knowledge which attracted many researchers and attention from all over the world (Sultan N., 2010). Regarding the utilization of the assetandgenerates a customized learning environment or somewhat virtual teaching and learning, clouds offer more flexibility and agility. Teachers, staff, as well as students, can access any form of information needed from anyplace, using any device withcloud computing technology. In this manner,the adoption of this cloud technology by both public and private learning institutions considered as another way of delivering enhanced services using limited assets at their disposal. Plenty of features arrangement can be shifted to the cloud as shown in Figure 1. For instance, the use of SaaS and IaaS services of clouds providers by the students, administrative staff and lecturers can be completed. These services preferably operated through thin clients (a terminal which no more than a screen and a keyboard). Any software establishedwill stay on the SaaS cloud provider server, andit can access online. The need for disk space or further hardware is performedonline directly by the IaaS, cloud provider. The similar condition happens to the developers' group in this setting through a PaaS, cloud provider. Lastly, researchers who demand sufficiently processing power andextra server capacity for their project maycarry outwithin clicking a button over an IaaS,cloud provider.
Figure 1   Simplified Structure of Cloud Service in a Typical University (Sultan N., 2010)

The implications of cloud computing technology on higher education IT governance research and innovation, categorized as followed.

3.1 Students

It is takingnumerous effects that cloud significantly adjusted education mechanism, equally in traditional and online courses or classrooms. A typical issue with reading material in consistently changing the world is that they are immediately obsolete and unreasonably costly for both students and educational institutions to persistently obtain the recent version. This matter is almostentirely removed with cloud solutions, as the cloud-based materials can merely be real-timeupdated and continually supporting students to access to the most recent learning resources. Cloud computing like wise employed in the education division for accommodating learning management systems (LMS).In the e-learning system, teachers/trainers and students are the two primary entities where the students will be able to access exams, courses, and can submit their projects online.Utilizing cloud (SaaS) applications service, which denotes to the software program is overseen remotely and conveyed using the web.Itis feasible for the teacher/educators and the student to get to their individual information utilizing an internet browser from a PC or cell phone at school, home, library or some other place, consequently

guaranteeing proficient joint effort, correspondence and trade of shared documents, notes, and in addition contacts among other information. Cloud computing also delivers students with quick access to primary course resources and links them with one another.Following are the implications for studentsin quick summary (Ghilic-Micu B. et al., 2011):

-. Propose visibility, computer-based educational system
-. Digital Learning conditions
-. Educational process with an individual portfolio
-. Autonomous Web-based service
-. Social knowledge and Resourceful environments synchronizations

3.2 Teachers/Educators

Cloud computing technology can address many of the world education problems including inadequate infrastructure, deficiency of teachers, low rates of graduation, likewise small size classrooms. Several aspects of the previously mentioned components can effortlessly exchange to the cloudasappeared in figure 1. For instance, it is practicable for teachers and students to partake in class deprived of the school premises. Within virtual classrooms – Communications between teachers and students who geographically spreadcan be conducted in person. This technologywill allow universities the occasion to join upand gains the student diversity population.Furthermore, Instead ofthe student's advantageto get to access and delivered their assignments, course,and examin real-time, the teachers/trainers also can convey courses and homework evaluation and assignments to the students,thenboth can be connected with each other (Dong B. et al., 2009)**.**At the same time, itsignifies that both teachers and students can be versatile and accomplish their learning purposes by utilizing their interconnected devices. Teachers, staffslikewise the students might be bound to use services from service providers of (IaaS) and (SaaS) clouds which will hold accountable for numerousfeaturescontainingperforming the application and operating systems, etc. on behalf of the client. Implications for teachers or educators, in summary, are the followings (Ghilic-Micu B. et al., 2011):

-. Computer-based, incorporated and flexibility teaching systems
-. Tutoring accommodations for educational advancement
-. Convenient access to educational and research matters
-. Online knowledge collaboration
-. Software presentation utilization and advance substance

3.2 Researchers

Researchersin their daily routine and their private and professional lives are employing cloud computing, such asutilizing email (e.g., Gmail, Yahoo), social media (e.g., Facebook), online storage (e.g., GoogleDrive, DropBox), survey platform (e.g., SurveyMonkey), real-time communications (e.g., Skype, Hangouts), collaborative projects (e.g., Google Docs), or mobile apps. It is a necessity to perform investigation demanding high levels of computation and processing to support researchers and post-graduate students with the essential hardware and software. The research and teaching resources required being the primary objective of constructing such a library, and its structure should apply the planning process design involvingthe labor division through an initial concentration on the principles that escorting innovation process and creating suitable use of the existing resources. There is essential to categorize,manage, likewise to captivate the recent outstanding outcomes in using cloud computing services tied with improvement and methodical quality in the development to guarantee that the library legitimately outfitted with the essential teaching and research resources. Furthermore, researchers can complete their project assignments with huge processing ability in demand through cloud(IaaS) provider. The followings are the Implications for researchers in summary (Ghilic-Micu B. et al., 2011):

-. Partaking and Cooperation research infrastructure
-. Access to digital data and information
-. Economic challenge knowledge and supporting research

4 Discussions

Critical key process in maximizing the value that every institution received from its investment in IT sector is by having effective governance. All the technologies needed for supporting the research, teaching and administrative processes demanding an effective IT governance framework which composed of structures, processes, and relational mechanisms. Every mechanism has its function and once implemented, should positively influence the organization. The process of recognizing the right

mechanisms to a specific condition is a complicated endeavor. Studies had reported that the organizations which have taken on formal mechanisms of IT governance improving their accomplishment and profit (Weill and Ross, 2004; Lunardi GL. et al., 2014). Moreover, the effectiveness of IT governance had specified will assists an institution in attaining its objectives by employing IT resources in an optimum method (Grama JL., 2015). It is quite famous that each type of organization is essentials to have formal IT governance to obtain decent results in the organizational performance. The ineffectively of an IT governance ishighly possible to predisposing the organization performance, quality of services, management of operations and costs(Ali & Green, 2012; Pang, 2014). In higher education institutions occasion, this ineffectively of IT governance will predispose the standard of teaching, research, and internal management processes.

What cloud technology proposes for IT directions is flexibility, efficiency, faster, cheaper of resources and services. Nevertheless, its implementation has an impact on the IT function. Many aspects must be reviewed and rethought. Managing top-down decision making regarding cloud technology adoption makes it more challenging due to its simplicity of acquisitions where buying or signing up cloud service possible to be completed by anyone. The campus community will be arranged by a consideration of in which way the decisions are taken and who made them within an integrated, effective and established IT governance campus structure.   Also can be saying that that decision in the cloud can derive top down and vice versa, however fully transparent and well-coordinated are the critical foundation. IT governance which demonstrates the process of institutional IT decision-making, considered as mature IT governance. The uniqueness of Culture and mission of Higher education institutions affect how decisions about cloud computing are made.

(1) Dedication to students. Cloud technology is about meet up students' needs as it is also about creating campus efficiency. Greater interoperability platform, secure access, reliable network, and the capacity to provide, convey, and share content through devices amongst university and students required to be delivered by IT departments. In other words, it has to serve the students along with their own devices on the campus.

(2) Higher education complicated finance type strained and involving several educational funds composite.

(3) Decision-making method. The culture of governance in higher education in taking top-down decisions in participatory methods is frequently barring or a bit complex. Particularly while attempt to reaching a concurrence in deciding where to allocate limited resources which involving the stakeholders. Stakeholders in this kind of situation are essentials to grasp thoroughly to the advantages of cloud-based services.

Highlighting and portfolio administration to a certain level also subjected to good IT governance. The university portfolio of IT services might develop rapidly within the used of cloud service. IT governance with the awareness of cloud technology should take a role in managing the use of these services by dealing their availability and prioritizing the necessities to prevent a repetition of effort and to influence the economies of scale. In order to develop good IT governance model that integrates cloud, below crucial functions shall be included (ECAR, 2015):

(1) Providing an instrument to authorize for both top-down and bottom-up needs to be involved in the process

(2) Providing decision-making rights and accountability frameworks that are agile and easy to use by IT decision makers

(3) Preserve the institution and its behalf

(4) Recognize and managing risk

(5) Pay attention to privacy and security matters, as well as policy and regulatory compliance

(6) Make confident that administrative as well as academic units are entirely contributing in the process, on behalf of a business, IT, legal, risk, procurement, compliance, and other institutional perspectives

(7) Make sure that the centralized and decentralized IT units mutually are synchronizing their needs and opportunities.

Prior adoption of cloud computing into existing IT governance, a review would become an optimum process. Governance shall endorse institutions in developing a reliable process which builds credentials by means of responsiveness. Drawing up specification or criteria for higher education institutions to contemplate when deciding to adopt a new cloud service or making substantial changes to an existing cloud service is assisting reliability and speed at the same time. For instance, IT decisions supporting research activity might be excluded by several institutions review or on behalf of community

usage some particular tools might be allowed. These following criteria might incorporate (in no specific order) in addition to standard criteria that existed which considered through the review of IT Governance regarding additional cloud particular concern effort: Current services assessments, trouble-free access, data sensitivity, security and privacy, audit compliance, exit strategy, campus business operation transformation, staff endeavor, contract agreement, budget operation, and risk and policy management.

5 Conclusion

Responsibility, strategy, acquisition, performance, conformance, and human behavior, specifically are the essential construction of principles of IT governance in HEI. These principles are supposed to have good performance either for governance practices or management practices and likewise, will determine that every performed phase aligned with the vision and mission of the university's stakeholder. The IT governance committee could make a further decision about the optimal approach to accomplishing ITgovernance primary objective in the cloud within the engagement of the right stakeholder. This may bring clarity and liability to cloud decision making and incorporate lessening cost from duplication, data privacy, sensitivity protection, and giving better support to the environment. This procedure may integrate some intentional central decision-making hand-over through IT governance committee for mutual and more decentralized methods.

IT governance should be no longer as the duty of the IT unit/division only but has to be as an integrated part of the university as an institution. Therefore corporate governance related to conformance processes can be improved, and business governance related to performance is also allowed to produce something beneficial for the university. Specific inference about the mechanisms of IT governance in higher education institutions practice is that many committees had been formed. Every committee has their own purposes and intentions in the IT governance of the organization. The upcoming IT governance in higher education's institutions shall be shifting to cloud computing services. Confidential data, safety control, will still always becomes a critical and crucial matter since social media as a platform, and the growth of data will incorporate with current data from various sources. Traditional IT governance security will not successfully adapt to the cloud. Further solutions need to be delivered to focus on governance in the cloud era. The governance framework is primarily essential in cloud computing. Several vital regulations need to be measured, but the existence of the framework itself is very crucial regarding maintaining the cloud process at high parameters.

The Future Developing Path and Constraints of Wearable Smart Services Based on Health Management

Liao Xianhui[1], Wang lin[2]
1,2 School of Sports, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 920776507@qq.com, 632287629@qq.com)

Abstract: Health is an important basis for all life activities.For the purpose of managing health, this paper studies wearable smart devices.Combined with the current situation and existing problems of wearable smart devices in health management, it is expected to provide some feasible Suggestions on the futuredevelopment path of wearable smart devices based on health management. Forexample,Layout Sign Signal Monitoring, Data Accuracy, Health IoT Management System, Health Cloud Database, Medical Alert Service.The value of the research, the methods used, the conclusions drawn, and the significance.
Key words: Health management; Wearable smart devices; Healthy internet of things; Development path

1 Introduction

In Ci Hai, the concept of health is that the human organs are well-developed, functional, healthy, energetic and have good working efficiency (Xia Zhengnong, 2010). Health management is in the late 1950 s in the United States put forward the concept of the first (Managed Care), its core content is the medical insurance institutions through medical insurance to its customers (including disease patients or high-risk groups) to carry out the system of health management, to effectively control the occurrence of diseases or development, the purpose of reducing the loss of medical insurance claims. Health management is the process of comprehensive management of health risk factors of individuals or groups. Its important significance is to manage health scientifically.In this era of rapid social development, people's health problems will become more and more prominent, and the concept of health management has been put on the agenda. Health management refers to a process of comprehensive management of health risk factors of individuals or groups (Zhang Fenglou, 2011). In 2017, Xi Jiping, general secretary in the report pointed out that socialism with Chinese characteristics into a new era, the main contradiction in our society has changed, according to the "much starker choices-and graver consequences-in" health and health planning "the instruction spirit, our country put forward the" health". To build, we will put the improvement of the national health management level at the strategic height of the country, and people's health will shift from medical treatment to prevention.With the help of wearable smart devices to help build healthy habits and habits, people are constantly improving their awareness of self-health management.

The idea and prototype of wearable devices was proposed by the media lab of the Massachusetts institute of technology in the 1960s (Kong Bin, 2013). Products and electronic devices that can be worn on users can be used to record and organize their daily activities or to monitor and protect their physical health.Wearable and more intelligent device to have part of the calculation function, can connect mobile phones and portable accessories of all kinds of terminal, the mainstream product forms include supported by wrist watch class (including watches and bracelets and other products), supported by the feet of shoes (including shoes, socks, or other leg wear products in the future), supported by the head of Glass (including glasses, helmet, headband, etc.), as well as smart clothing, bag, crutch, accessories and other kinds of non-mainstream products form.With the rapid development of electronic products, various wearable products have also entered our life, among which, wearable products such as smart bracelet and watch have been well known by many people. However, there are still many bottlenecks in the development of wearable devices, such as high cost, short battery life, low data accuracy, inability to use independently and incomplete functions (Yang Chenxiao, 2018). The mainstream product forms include wrist watches (including watches and wristbands, etc.), which are supported by the feet. The shoes (including shoes, socks, or other leg wear products in the future), head-supported glasses (including glasses, helmets, headbands, etc.), and smart clothes, school bags, crutches, accessories, etc. Mainstream product form. With the rapid development of electronic products, various wearable products have also entered our lives (Zhong Yi, 2017). Among them, wearable products such as smart wristbands and watches have been well-known to many people. However, there are still many bottlenecks in the development of wearable devices, such as: high cost, short battery life, low data accuracy, cannot be used independently, incomplete functions (Xie Lingqin, 2015). With the development and progress of

wearable technology, wearable devices will be mainly implantable and ex-situ devices in the future. With the continuous development of wearable smart devices, wearable devices can be implanted in the human body to rely on the human body's energy to run, real-time monitoring of the human body's physiological indicators, through intelligent system analysis, to provide people with accurate, intelligent services (Cui Hai, 2018).

2 Application Status in Health Management
2.1 Health monitoring
The pace of social life is getting faster and faster, the pressure of life and work is increasing, and people are paying more and more attention to the health status of their bodies.The function of sports health monitoring is the key to the rapid growth of the wearable industry. Throughout the industry status quo, wearable products industry is almost all sports health demand, in almost all of the wearable equipment, including bracelets, watches, smart shoes, clothes, health function is indispensable.Sports health monitoring is mainly divided into two categories: one is human physiological condition monitoring, the other is environmental perception monitoring.Human physiological state monitor, such as sports fitness class of wearable intelligent bracelet is using sports interactive class sensor to sense the user's motion state and sleep, there are other types of wearable intelligent device by monitoring steps to collect, heart rate, blood pressure, blood oxygen, exercise, body fat, body temperature, calories, etc.;Environmental awareness monitoring such as start-ups in Vancouver, Canada (TZOA) research and development of a wearable environment detection sensor TZOA size of a button, can clip on clothes, used to detect the air quality, such as ultraviolet light, humidity and temperature indicators.Therefore, wearable smart devices in the health management function is quite limited, the data and physical signs for the future needs to be together, can generate more useful data and judgment and feedback to the user, to give the user more comprehensive experience.

2.2 Gender and age distribution
Global wearable retail market size in 2015 forecast for 72 million units, up 132% from a year earlier, the public awareness of the wearable intelligent devices is rapidly increase, the first year of 2015 is regarded as wearable markets.In terms of users, the survey results show that the majority of wearables users are male, accounting for 85%.However, because the key technologies related to wearable smart devices are difficult to break through, the application development of sports monitoring and sports health management is slow.Female users will become a new growth factor, intelligent health deserve to act the role of science and technology company, for example, developed in 2017 called widgets "Leaf Urban" a metal Mosaic Leaf pendant, not only have the regular steps, monitoring of sleep, also can pass the physiological changes to monitor the user's mental health, once detected abnormal psychological pressure, the app will automatically recommend corresponding relief activities and schedule, to help users relieves stress.Also, from an age perspective, the older you are, the more likely you are to use a bracelet.37.3% of the post-70s have used or are using smart bracelets, compared with 26.1% of the post-90s, and only 21% of the post-2000 generation. In addition, the number of people born in the 1980s and 1990s who use mobile phone rings is the same as that of mobile apps.As a result, the community of wearables users is quietly changing, and the need for movement and health monitoring has not diminished.

2.3 Price factor
In classical economics and Marxist economics, price is the external embodiment of the intrinsic value of goods (Karl Marx, 2010). In modern market economics, prices are generated by the mutual influence and balance between supply and demand (Bender, 2010). The price of goods reflects the value of goods. Simply, cheap goods are not good, good goods are not cheap. Nowadays, wearable intelligent hand ring, for example, within one hundred yuan intelligent bracelets you could have many choices. It's not wisely to attract users by lower price, only to meet the needs of users can solve the pain points.According to the research data from the leading edge industries research institute, the largest percentage (48.2%) of the reasons for not buying wearable smart devices is "functionally useless".Therefore, at present, wearable smart devices have little effect on health intervention in functional applications, and cannot affect users in functional applications. It's a cautionary tale for wearable smart devices. Users' eyes are bright, and only by focusing all their efforts on solving users' pain points can they succeed in the business competition.

3 Problems of Wearable Smart Devices in Health Management

3.1 Low accuracy of monitoring data

Scientific monitoring data is the core of wearable smart devices to manage users' health.Currently, the data monitored by wearable smart devices on the market are mainly steps, heart rate, blood pressure and calorie consumption.However, some intelligent device manufacturers do not consider the complete product function definition, but only want to gain market share. For example, if the function of movement bracelet is not very accurate, playing several rounds of mah-jongg, and making a bus in the back, you may rank among the top in the APP.On monitoringheart rate and blood pressure, wearable intelligent devices provide data is an instantaneous value, cannot provide the result of visualization of data analysis all the time, for users, this type of health information has little function, and it's unscientific for usersto choose sports or rest refer to these data. Thus, wearable intelligent device to improve the user's health habits, provide reliable health planning advice, the top priority is to improve the accuracy of testing data, and provide users with personalized, accurate service through the data analysis.

3.2 Poor user stickiness

Wearable smart devices are said to be the next breakthrough leading the technological revolution, attracting as much attention as smartphones. Smartphones have human organs function extension, wearable smart devices compared with smartphones, almost all the people all the time need to mobile phone, but not all people need wearable smart devices. In the case of people who use smart bracelets, it's not as if they're always around as if they're on a cellphone. Most of the time, take it for a few days, then take it off, and if you remember it, carry it on, and if you can't remember it, it can be put on hold for a few days -- it's not at all the way to a product with a rigid demand. So, show that the needs of the masses have not been well met -- I need, but you've given me the wrong things.Meeting the needs of the public, especially exploring the "irreplaceable value of existence", is the key to the selection of wearable smart devices by the public.

3.3 Information security risks

From 2013 to 2017, the production of wearable smart devices has increased rapidly, and the market capacity will become larger and larger.Therefore, in the increasingly popular future of wearable sports devices, personal information and data are at great risk of leakage, and are still leaked unconsciously. If personal information and privacy protection, then the future of information crime in society will increase significantly. In this way, the product experience of users will be hurt, which is not conducive to the accumulation of user reputation, and the development of wearable intelligent equipment industry.For the fitness crowd, it is too easy to get their track, range and range of motion on the Internet.For some criminals, it is easy to get personal information about their home and work places, leaving a hidden danger for their personal safety.Therefore, strengthening information protection is also an important problem to be solved by wearable smart devices.

4 Paths of Future Development

4.1 Layout and sign monitoring

The wearable intelligent device on the market at present stage mainly functioned in the human body signs as: heart rate monitoring, temperature monitoring, energy consumption, sleep monitoring, etc. (Wang Hao, 2014). Only such signs can not get the purpose of monitoring user's health. Therefore, if want to layout health management from the beginning, we must speed up the related technical research of wearable intelligent equipment, to provide support on policy, financing, taxation of wearable intelligent device which makes wearable intelligent development enterprises have a good development environment to introduce core key technology as much as possible.Only in this way can we obtain as much, comprehensive and accurate physical data as possible.

4.2 Improve the accuracy of data

At present, most of the healthy wearable devices cannot meet people's needs for personalized health management and monitoring (Liang Wei, 2013). Although the current intelligent bracelet or watch can monitor data, but the data is relatively single and not accurate, the user just pure data usually, the accuracy of the data itself and the significance of data back to the user has no way to know. Facing of China's digital health trend, people have begun to monitor their health status and share information with health care workers through the Internet. The vast majority of medical professionals believe that everyone will use interlocking technology to help manage their health in the future. Imagine, the body data can be real-time monitored, don't have to go to the hospital to obtain professional, personalized health guidance and counseling, which makes the digitization and personalized Internet medical

solutions for the effective management of personal health and prevention provides a new train of thought. From this point of view, the most valuable thing is the data itself, which is the premise to ensure the validity of all data extension, so the accuracy of data is the core of digital health management.

4.3 Healthy internet of things management system

The health Internet of things is the application of the Internet of things in medical and health industries (Cui Hao, 2018). The health Internet of things will complete the collection and transmission of health information, providing strong technical support for the development of medical and health information. The establishment of the health Internet of things will greatly improve the health information and intelligent problems. Health education, health sign monitoring, prevention and other comprehensive health services are provided to users of wearable smart devices through the health Internet of things.It helps people adjust their lifestyle and pace of life, keep approaching the ideal health status, and achieve the real effect of "cure before illness".

4.4 Mobile medical service

Based on wearable smart device GPS and wireless communication technology, or rely only on the positioning of wireless communication technology (Xu Yuebin, 2018). In the practical application, all kinds of health information such as vital signs monitoring, temperature detection and telemetry of patients or sub-health groups are collected independently. No matter when and where the user is, by monitoring the body physiological index deviated from its normal value can provide the user a reasonable evaluation and the suggestionin time, to assist the user the most scientific and rational processing meansin dangerous circumstances. At the same time, professional health care workers can obtain comprehensive body data indicators through longer data collection, and medical decisions will become more personalized.

5 Conclusion

There are still many problems in the health management of wearable smart devices that have not been solved. Under current technological conditions, wearable smart devices do not currently have the ability to manage health. Wearable smart devices can only play a supporting role. Users who want to manage their health must change from their subjective intentions and become Your own lifestyle and lifestyle. However, with the development of science and technology and breakthroughs in related key technologies, wearable smart devices can assist users to establish healthy living habits and methods to a certain extent, so as to achieve the purpose of health management.

Expressway Mobile Patrol System Based on Cloud Platform

Lin Jingfei, Luo Xiaofang, Liu Tao

Huanghuang Expressway Management Office of Hubei provincial department of transportation, Wuhan, P.R.China, 430070

(E-mail: 1455466541@qq.com, 22287734@qq.com, liut_1980@163.com)

Abstract: Huanghuang Expressway Management Office of Hubei provincial department of transportation established an information management system of road administration supported by GIS technology, which adopted the idea of Service-Oriented Architecture (SOA). This paper mainly focuses on the application and development of mobile patrol technology in Huanghuang Expressway Management Office, expounding the core function design of mobile patrol system as well as the development idea of cloud platform it based on. By building cloud platforms and using handheld mobile terminals, we can easily realize intelligent management of road production, road maintenance, assessment and supervision, and emergency response.

Key words: Mobile patrol; Cloud platform; Highway management; Internet of things; GIS

1 Introduction

Promotion of information technology in highway operation is a huge project. Not only does it need to establish and maintain amultipartite communication channels, but also itrequires an effective way of information collection and information processing. Road Administration inspection is one of the key links of highway operation. Traditional road inspection often involves organizing staffs to drive on the road to record and check the road conditions. But there is no effective information transmission and feedback mechanism, because the way of recording and oral cannot be detailed or comprehensively feeds back information, furthermore, it may even lead to information distortion. There are certain limitations in general rules and regulations which governing and standardizing road inspections. On the one hand, it's hard to know whether employees operate in accordance with the process. On the other hand, once there is a situation beyond the ability of the inspectors,a lot of complicated procedures are needed, such as dispatching experts, communication and scheduling, and then the management office can gradually identify problems, analyze causes and form solutions.For a long time, the satisfaction degree of the highway patrol has been very low. Although it has invested a lot of manpower and material resources, it is still weak in dealing with the crisis and danger.

The development of cloud computing and internet of things has brought great changes to our life and work, using these technologies in combination with mobile terminals, such as mobile phones, tablets, and vehicle equipment can greatly improve both efficiency and ability of our inspecting staffs. The real-time information transmission and information feedback channels can not only standardize the inspection work, making the workflow more standardized, but also help to guide inspecting staffs to deal with emergency. On the basis of management and control platform, Huanghuang Expressway Management Office applied cloud computing technology in the process of informatization to research and develop an intelligent mobile patrol system.

2 Literature Review

In both government service and business purpose, the research of cloud platform is very extensive.Alibaba's cloud server uses a distributed system developed by Ali, which provides infrastructure services through virtualization technology. Open Storage Service (OSS) is an external cloud storage service provided by Ali.

Hua P, Huang Z and He Z proposed that the integrated service platform includes information service foreground and background, information service foreground can be the unified public information service website; information service background is a shared public information database. They also proposed a concept of cloud image platform based on cloud computing infrastructure, such as the video cloud platform and Google maps, which can provide various image business management and services for individuals or businesses.

Based on the meaning of large data, Du and Bian analyzed the relationship between spatial data and large data, reviewed the existing problems of traditional spatial data mining. She discussed the latest research progress of spatial big data mining from two aspects: platform and algorithm.

Professor Ashton (MIT Auto-ID center) first proposed the concept of internet of things at the time

of studying RFID in 1999. The second China Mobile Government Seminar "knowledge society and innovation" in 2008, pronounced that development of mobile technology and internet of things technology represented a new generation of information technology, leading to the transformation of economic, social forms and innovative forms. It promotes the formation of the next generation of innovation which oriented to the knowledge society. Innovation and development pay more attention to users and it is people oriented.

In recent years, Internet of things has become a competitive field in many countries. Japanese "U society" strategy based on the Internet of things, European "Internet of things action plan" and the United States "smart grid", "smart earth" are national strategic planning.

In 2016, Microchip announced that they have launched an end to end solution for IOT devices. It's the first end to end solution designed to connect to the Amazon Web Services IoT (AWS IoT). Internet of things devices connected to the AWS IOT platform can easily achieve mutual authenticationwith other platforms.

Li and Gong (Information security research center of China Institute of electronic technology standardization) have made a detailed analysis of the security status of internet of things in China. It is considered that the safety protection of internet of things in our country need to focus on "beforehand", special standards and specifications need to be set up.

Mobile patrol technology has been used in electronic equipment and production management for a long time. Gu (Gu, 2016) put forward a standardized inspection system PDA, which is developed by a small handheld mobile digital device combined with its own business needs. The PDA which can record inspector's place automatically is composed of the front user interface and the backstage database system. In that case, the system can realize the function of defining inspection contents and uploading data. At the same time, users need to be trained.

GIS technology is an important auxiliary technology for mobile patrol. Zeng and Bao mentioned that the GIS road maintenance patrol system can help inspectors to obtain their inspection tasks. Terminal automatically calculates optimal patrol line and send order of inspection according to the current position of the inspectors. It shows the patrol task in various forms, such as drawings, texts, sounds, images and so on. At the same time, the monitoring center can issue command and dispatch instructions according to the location and status of patrol personnel.

Ziani A, Sadouq Z A and Medouri A put forward that GIS technology can display both spatial data and attribute data, manage them completely, scientifically and effectively.

3 General Framework of Highway Mobile Patrol System

The highway mobile patrol system based on cloud platform aims to maintain inspection services such as inspection task, inspection result, inspection track, inspection point, disease management, summary report and other functional sections, thus regulating maintenance inspection, road administration inspection, electromechanical patrol and so on. With the cloud platform, intelligent highway inspection management can be realized through technology such as internet of things, cloud computing, GIS, GPS, radio frequency technology, virtual reality, speech synthesis and others. Generally speaking, mobile patrol is part of the construction of intelligent information system of expressway, its system framework and function are attached to the chief information management system. The ultimate goal is to achieve "cloud" + "end" collaborative management.

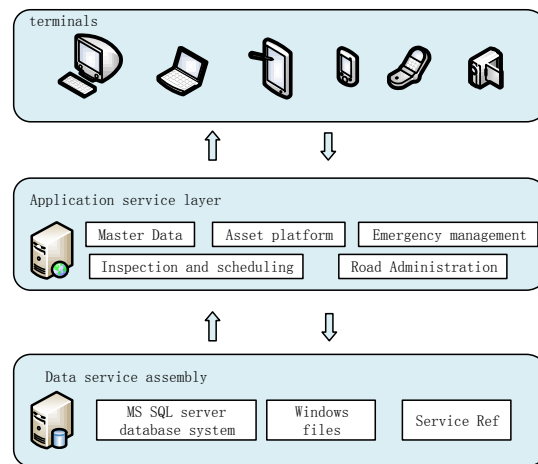
Platform construction combined with AOP and SOA architecture interfaces programming between various layers. By means of isolating business system from each other, service simulation decouples the relationship between logical business processes and enables them to be implemented independently.


Figure 1   General Framework of Highway Mobile Patrol System

Development framework becomes highly reusable and easy to expand, it improves the efficiency of developing and is benefit to the maintenance of the code either. The application service layer provides service to external distribution and supports distributed deployment. AOP (Aspect Oriented Programming) is a technology cutting surface programming to achieve unified maintenance of program functions through pre-compilation and runtime dynamic agents. SOA, stands for service-oriented architecture, is a component model that connects different functional units of the application through well-defined interface and contract between these service. The design of cloud platform technical scheme which introduces the construction mode of ESB (Enterprise Service Bus) extends the architecture of SOA and combines the framework of JSON and web service technology. Using the "bus" mode to manage and configure the application services, application service units are independent, it can be combined and pluggable freely. Each application service unit is combined through a unified service management program and service configuration to construct an application service library model of the development framework.

Mobile patrol system is mainly composed of three parts of the intelligent management system of freeway. First, the application layer client directly operated by the staff, that is, the terminal. Application layer client program can be independently developed and deployed. In theory, all the intelligent terminal devices are supported, such as PC, notebook, tablet, PDA, cell phone and remote. According to the supporting terminal devices, we need to design and develop applications that response the platform. The application service adopts the SOAP protocol to maximize the service support for heterogeneous platforms or operating system, so as to realize the diversification of client programs. Second, the application service program hosts in the Windows operating system helps to realize service in the restful style. It provides independent service management procedures to support the integration of various business system services into application services in a "pluggable" way. Business system services support distributed mode development, and service management program integrates the assembly files uploaded by the business system by way of configuration. Third, a set of data service assemblies. Data service module is provided by the framework program set, and the application service layer invokes the performance function by referencing the data service to complete the data storage function.

In order to satisfy the heterogeneous data source and reduce the maintenance cost brought by the change of the data source, the data service interface "I Base Repository" is unified in the data service layer according to the storage mode. Traditional relational database is connected by the "ado.net entity framework". The service uses "http client" object to simulate the client to access the data. The process of communication and interaction between application layer, application service layer and data service layer is based on the defined interface service standards and specifications. The interface programming is implemented when the layers are accessed, and the interface implementation layer can be replaced and reconstructed according to the actual requirements of the project.

4 The Operation of the Motorway Mobile Patrol
4.1 Data access and management

Using handheld mobile patrol equipment which connect the cloud platform can efficiently

complete the data transmission work, that is, the recording and reporting process is reduced, and the distortion of information is avoided. In addition, there are many kinds of data which needs to be recorded in the work of highway inspection, and the amount of data is large. The requirements for the collection of data for different tasks are not the same. Traditional road inspection cannot meet the needs of expressway maintenance management, as well as road inspection and road production management. Using the mobile patrol system, inspectors can enter data strictly according to the standardized information collection form through the information transfer mechanism between the handheld terminal and the platform. Then, platform can classify the data, in case data need to be transferred at any time. With the "cloud" + "end" mobile inspection system, even if the inspectors do not have the complex professional knowledge, they can also use the terminal to connect with the experts. Some data and information that needed in various situations can be clearly defined by remote instruction. In that case, inspectors can collect detailed information about road production status, report details of events and so on. In addition, the mobile patrol system can also achieve the docking with other external institutions, Data sharing can be achieved through cloud platform when consulting external organizations or assisting external agencies.

4.2 Due diligence

The duty state of the road inspection has been difficult to present effectively. The lack of efficiency in patrol work may be the factor of the inspectors themselves, or the unreasonable management of inspection regulations and rules. Application of GIS technology to mobile inspection can realize the supervision of fixed location. It can also optimize the patrol route through the data service function of the cloud platform and identify the key inspection area. Furthermore, GIS function data configuration can set up organization, display, query, event and field of GIS data, Realize the visual management of location information data in housing, road, production, mechanical and electrical, vehicle, emergency and single soldier ground. In addition, based on the GIS platform, the integration of freeway video and electronic map can be realized, and the location of the fixed video monitoring can be displayed on the electronic map with icons. By clicking on icons, the basic information of video surveillance equipment and video surveillance images are displayed. Real-time monitoring can not only reduce the repeated patrol route, but also check the inspectors in place and guide the inspection.

Figure 2   Interface of Control Platform

4.3 Emergency response

Sudden event of expressway needs timely treatment. The cloud platform of mobile patrol can help inspectors to report information directly to corresponding emergency treatment units in crisis, when it comes to a crisis, a danger or a disaster, thus Simplifying the multifarious information transfer program. Emergency management and control mainly through external sensors (such as smoke fog), video equipment, positioning equipment (GPS, RFID, etc.) to conduct data analysis, then a pre-defined event solution is used.

Through the inspection status and data from monitoring facilities, management and control platform can command warnings according to the pre-set plan. For example, during the snowfall, cloud

platform would choose a plan based on feedback information from mobile patrol system.

Table 1   Rain and Snow Warning Scheme

Warning level	Snowfall (mm/h)	Snowfall (mm/h)	Description	Speed limit(km/h)	Safe distance(m)
Green alarm	Safe	<0.08	Flurry	-	-
Blue warming	Threat	(0.08-0.25)	Snow	50	>100
Yellow warming	Dangerous	(0.25-0.5)	Heavy snow	40	>80
Orange warming	Perilous	>0.5	Blizzard	20	>50

The external devices and interfaces of the cloud platform support various industrial standards of sensors and systems, such as smoke fire detection, climate detection, biological detection, mobile detection, emergency buttons and positioning equipment (including GPS, IR, RF and LF tags), video surveillance, intelligent video detection and so on. Event logic engine can control the whole process of event management by integrating external devices, GIS and other real-time data according to pre-defined response plans and rules. Event logic engine is responsible for events, tasks, device monitoring, user and definition and application of data access rules.

4.4 Signs of road problems

The main contents of road maintenance inspection are signs of road problems. Notification server support automatic or manual communication. The notification includes task allocation and attachments, which can be sent by device alarm or alert escalation events, and can also be sent through mobile clients by the monitoring room personnel or on-site personnel. The notification engine supports radio, telephone, public broadcasting systems, fax, e-mail, SMS and multimedia communications through security networks, standard telephone interfaces, GPRS and other mobile communication protocols.

5 Conclusion

Based on the work requirement of the highway mobile inspection, this paper analyzes and designs the structure and function of a "cloud" + "end" system for expressway mobile patrol. Through the data service function provided by the cloud platform, it can manage the information collected by the terminal systematically, and realize the information sharing and information processing function. In addition, the cloud platform can easily realize the dynamic expansion of the service scale, invoke the required terminal equipment for the inspectors, simplify the complex workflow and improve the efficiency of inspection work.

To build a mobile patrol system based on cloud platform needs professional training for inspectors to help them understand the operation mode and operation method of the system. In addition, it needs to introduce more advanced handheld mobile terminals, and promote the standardization, informatization and intelligentization of inspection work.

Global Synchronization of Uncertain Time-varying Networks

Zhang Ming
Office, Wuhan University of Technology, Wuhan, P.R.China, 430070
(Email: zhang_ming@whut.edu.cn)

Abstract: Complex dynamical networks based on big data have attracted a lot of attention in the fields of sociology, biology, mathematics, and engineering science. To date, little attention is paid to the networks with uncertain time-varying couplings. In the manuscript, the global synchronization in the absence of control of a general uncertain time-varying coupled network is investigated. For an uncertain time-varying coupled map network, several less conventional synchronization criteria are proposed by stability analysis and maximum singular value theory. Simulation results illustrate that the proposed novel synchronization criteria work effectively.
Key words: Big data; Complex network; Time-varying; Synchronization

1 Introduction

Nowadays, it has been demonstrated that various complex dynamical networks based on big data exist in many fields of our daily life. Complex network based on big data with the well-known small-world (SW) property (D. J. Watts and S. H. Strogatz, 1998) and scale-free (SF) property (A.-L. Barabasi and R. Albet, 1999) have attracted a lot of attention including sociology, biology, mathematics, engineering science and so on (C. V. Loan, 1992; G. Yan, Petra E. Vértes, Emma K. Towlson, Yee Lian Chew, Denise S. Walker, William R. Schafer and Albert-László Barabási, 2017; S. H. Strogatz,2001;Y Fang and T G Kincaid, 1996; Y. Zhang and J. Sun,2004;Z. Zahreddine, 2003). In general, a complex dynamical network is a large set of interconnected nodes, where a node is a fundamental unit with detailed contents. Many interesting properties of realistic complex networks can be well understood by considering the interactions of the every pair of nodes. Such as synchronization, a collective motion displayed by many large-scale complex dynamical networks, is mainly determined by dynamics of each single node and the coupling scheme.

Despite the great majority of research activities have been focused on synchronization of static networks whose connectivity and coupling strengths are constants, there are applications where the coupling strengths and even the network topology can evolve with time. Examples of such networked systems pervade nature at every scale, including for instance discrete-time coupled map lattices and continuous-time cellular neural networks. For coupled map networks, some studies on synchronization of random networks(P. M. Gade,1996), small-world networks (P. M. Gade, C-K,2000), and coupling delays networks (C. G. Li, G. Chen,2004) have been achieved. However, there has been little theoreticalresults dealing explicitly with synchronization in general discrete time-varying coupled networks, especially when the network coupling is an unknown nonlinear function. Even in the literatures (H.Shi, Y. Sun, L. Miao, and Z. Duan, 2016; J.Zhou, J. Lu and J. Lü, 2006) on synchronization for uncertain time-invariant coupled complex dynamical networks, controlled network models have been considered.

In the manuscript, we further investigate synchronization of such uncertain time-varying coupled network models, in the absence of controller.By using the matrix singular value analysis and the stability theory(H.Shi, et al.,2016; J.Zhou, J. Chen, J. Lu and J. Lü,2017; J.Zhou, et al.,2006;Y Fang and T G Kincaid,1996;Z. Zahreddine,2003), some globally asymptotic stable synchronization criteria are presented for a general uncertain time-varying coupled map network. Provided with certain conditions, the synchronous solution of the uncertain map network is globally asymptotic stable. In particular, the results proposed in the manuscript are applied for the networks with not only directed but also undirected topology.

The left paper is organized as follows. In Section 2, the general uncertain time-varying coupled network models are introduced. Section 3 establishes globally synchronization theorem and its corollary for the general time-varying coupled map network. Illustrative numerical examples are given in Section 4 to verify the effectiveness of our synchronization criteria. Summary conclusions are finally drawn in Section 5.

2 A General Model of Uncertain Time-Varying Coupled Map Network

Consider a general uncertain time-vary map network consisting of N diffusively coupled identical

nodes, being each node an *n*-dimensional dynamical system. The proposed uncertain map network is described by

$$\mathbf{x}_i \ (m + 1) = \mathbf{f}(\mathbf{x}_i(m)) + \mathbf{h}_i \ (\mathbf{x}_1,..., \ \mathbf{x}N, \ m), \ i = 1,2,...,N, \tag{1}$$

where $\mathbf{x}_i = (x_{i1}, x_{i2},...,x_{in})^T \in \mathbf{R}^n$ is state vector of the *i*th node, $\mathbf{f} : \Omega \times \mathbf{N} \to \mathbf{R}^n$ ($\Omega \subseteq \mathbf{R}^n$)is a smooth nonlinear function vector, the individual node dynamics is$\mathbf{x}_i(m+1) = \mathbf{f}(x_i(m))$, $\mathbf{h}_i : \Omega \times .. \times \Omega \times \mathbf{N} \to \mathbf{R}^n$ is an unknown diffusive coupling function vector at time *m*, $\mathbf{h}_i$ istime-varying, nonlinear, smooth and satisfying $\mathbf{h}_i(\mathbf{x},...,\mathbf{x},m) = 0$.

Suppose that $\mathbf{x} = \mathbf{s} \ (m; \ m_0, \ \mathbf{x}_0)$, denoted as $\mathbf{s}(m)$, is a solution of single node system $\mathbf{x} \ (m + 1) = \mathbf{f}(\mathbf{x}(m))$. Then the vector $\mathbf{S}(m) = (\mathbf{s}^T(m), \ \mathbf{s}\mathbf{T}(m),...,\mathbf{s}^T(m))^T$ is a synchronous solution of the uncertain time-varying coupled map network model (1) since it is a diffusive coupling network. Denote the error vector as

$$\mathbf{e}_i(m) = \mathbf{x}_i(m) - \mathbf{s}(m), \qquad\qquad i = 1, 2,..., N.$$

Then the error system can be retained as

$$\mathbf{e}_i(m+1) = \overline{\mathbf{f}}(\mathbf{x}_i(m) \ , \ \mathbf{s}(m)) + \overline{\mathbf{h}}_i(\mathbf{x}_1,\ldots,\mathbf{x}_N ,\mathbf{s},m), \qquad i = 1,2,...,N, \tag{2}$$

where $\overline{\mathbf{f}}(\mathbf{x}_i(m) \ , \ \mathbf{s}(m)) = \mathbf{f}(\mathbf{x}_i(m)) - \mathbf{f}(\mathbf{s}(m))$ and $\overline{\mathbf{h}}_i(\mathbf{x}_1,\ldots,\mathbf{x}_N,\mathbf{s},m) = \mathbf{h}_i(\mathbf{x}_1,\ldots,\mathbf{x}_N ,m) - \mathbf{h}_i(\mathbf{s},\ldots,\mathbf{s},m)$.

3 Synchronization Criteria

In this section, several global synchronization criteria for the uncertain time-varying coupled map network model (1) are derived.

At first, two useful assumptions are introduced in order to reach our main results.

Assumption 1(A1). Assume that there exists a positive constant α such that

$$\left\| f(\mathbf{y}) - f(\mathbf{z}) \right\| \leq \alpha \left\| \mathbf{y} - \mathbf{z} \right\|,$$

where $\mathbf{y}, \mathbf{z}$ are time-varying vectors, $\| \cdot \|$ represents 2-norm of a matrix or a vector.

The assumption A1 reveals that the individual dynamics is Lipchitz-continuous. It can be satisfied easily for many dynamical systems, such as all the linear systems, Chen system (G. Chen and T. Ueta,1999) and many new chaotic systems (I. Pehlivan and Y. Uyaroglu,2014).

Assumption 2(A2). Assume that there exist a set of time-varying term $\gamma_{ij}(m)$ ($1 \leq i, j \leq N$)satisfying

$$\left\| \overline{\mathbf{h}}_i(\mathbf{x}_1,\ldots,\mathbf{x}_N,\mathbf{s},m) \right\| \leq \sum_{j=1}^{N} \gamma_{ij}(m) \left\| \mathbf{e}_j(m) \right\|,$$

where $1 \leq i \leq N$.

The assumption A2 shows that the couplings in the network satisfy the Lipchitz-like condition, which guarantees the uniqueness of the synchronous solution.

Based on these two assumptions and error system (2), one has

$$\left\| \mathbf{e}_i(m+1) \right\| \leq \alpha \left\| \mathbf{e}_i(m) \right\| + \sum_{j=1}^{N} \gamma_{ij}(m) \left\| \mathbf{e}_j(m) \right\|$$

and then has

$$\eta \ (m + 1) \leq (\mathbf{\Gamma}(m) + \alpha \mathbf{I}_N) \ \eta(m)$$

where $\eta(m) = (\left\| \mathbf{e}_1(m) \right\|, \left\| \mathbf{e}_2(m) \right\|,...,\left\| \mathbf{e}_N(m) \right\|)^T$, $\mathbf{\Gamma}(m) = (\gamma_{ij}(m)) \in \mathbf{R}^{N \times N}$.

As a result, a global synchronization criterion for coupled map network (1) can be obtained by rigorous theoretical deduction.

Theorem 1. Consider the uncertain time-varying coupled map network (1). Suppose that A1 and A2 hold. Then the synchronous solution $\mathbf{S}(m)$ of (1) is globally asymptotic stable if

$$\prod_{k=m_0}^{+\infty} \sigma_{\max}(\mathbf{\Gamma}(k) + \alpha \mathbf{I}_N) = 0 \tag{3}$$

where $\sigma_{\max}$ represents the maximum singular value of a matrix. In particular, if there exists a positive constant $0 < \epsilon < 1$ such that for all sufficiently large m,

$$\sigma_{\max}(\mathbf{\Gamma}(m) + \alpha \mathbf{I}_N) \leq \epsilon, \tag{4}$$

then the synchronous solution of (1) is globally asymptotic stable.

Proof:Consider the function $W(m) = \left\| \eta(m) \right\| = \sqrt{(\eta(m))^T \eta(m)}$. Since the elements of vector $\eta(m)$ are nonnegative, it is shown that

$$W^2(m + 1) = (\eta \ (m + 1)) \ T\eta \ (m+ 1)$$

$$\leq (\eta(m))^T (\Gamma(m) + \alpha \mathbf{I}_N) \; \mathbf{T} \; (\Gamma(m) + \alpha \mathbf{I}_N) \; \boldsymbol{\eta}(m)$$
$$\leq \sigma_{\max}^{\;2} (\Gamma(m) + \alpha \mathbf{I}_N) \; W^2(m)$$

Then one has

$$\|\eta(m+1)\| = W(m+1) \leq \sigma_{\max}(\Gamma(m) + \alpha \mathbf{I}_N) W(m) \leq \ldots \leq \prod_{k=m_0}^{+\infty} \sigma_{\max}(\Gamma(k) + \alpha \mathbf{I}_N) W(m_0)$$

and

$$\lim_{m \to +\infty} \|\eta(m+1)\| \leq W(m_0) \prod_{k=m_0}^{+\infty} \sigma_{\max}(\Gamma(k) + \alpha \mathbf{I}_N) = 0 \;,$$

by using the stability theory. That is, if Equation(3) is satisfied, the vector $\eta(m)$ will uniformly asymptotically converge to zero, which means that the synchronous solution $\mathbf{S}(m)$ of the network is globally asymptotic stable.

Besides, provided that $\sigma_{\max}(\Gamma(m) + \alpha \mathbf{I}_N) \leq \epsilon$ for all $m \geq M$, where M is an appropriate constant, one has

$$\|\eta(m+1)\| = W(m+1) \leq W(M)\epsilon^{m-M}$$

Since $W(M)$ is a constant, model (1) is globally asymptotic stable.

This completes the proof.

For the case that the coupling scheme of model (1) is linear time-varying satisfying

$$\mathbf{h}_i(\mathbf{x}_1,\ldots,\mathbf{x}_N,m) = \sum_{j=1}^{N} c_{ij}(m)\mathbf{A}(m)\mathbf{x}_j(m) \;,$$

where $1 \leq i \leq N$, $\mathbf{C}(m) = (c_{ij}(m)) \in \mathbf{R}^{N \times N}$ is diffusive time-varying outer coupling scheme and $\mathbf{A}(m)$ is time-varying inner coupling matrix. Then coupled map network (1) is recast as

$$\mathbf{x}_i(m+1) = \mathbf{f}(\mathbf{x}_i(m)) + \sum_{j=1}^{N} c_{ij}(m)\mathbf{A}(m)\mathbf{x}_j(m) \;,i = 1,2,\ldots,N. \tag{5}$$

It is obvious that A2 holds by choosing $\gamma_{ij}(m) = |c_{ij}(m)| \cdot \|\mathbf{A}(m)\|$. Then the following corollary can be deduced accordingly.

Corollary1.Suppose that Equation (3) and A1 hold. Then the synchronous solution of linear time-varying coupled map network (5) will be globally asymptotic stable. In particular, if there exists a positive constant $0 < \epsilon < 1$ such that Equation (4) holds, then the synchronous solution of model (5) is globally asymptotic stable.

4 Numerical Examples

To show the effectiveness of the presented synchronization criteria, a linearly time-varying coupled map network consisting of 30 identical systems is considered in this subsection. The dynamical map is described by

$$\mathbf{x}_i(m+1) = \mathbf{f}(\mathbf{x}_i(m)) + \sum_{j=1}^{30} c_{ij}(m)\mathbf{A}(m)\mathbf{x}_j(m) \;, \quad i = 1,2,\ldots,30, \tag{6}$$

where $\mathbf{A}(m) = diag\left\{\frac{1}{8},\frac{1}{9},\frac{1}{10}\right\}$ is a diagonal matrix, $\mathbf{C}(m) = (c_{ij}(m)) \in \mathbf{R}^{30 \times 30}$ is chosen as

$$c_{ij}(m) = \begin{cases} -2\sin(m) \text{ if } j=i \\ 2\sin(m) \text{ if } j=i-1 \\ 2\sin(m) \quad \text{if } i=1,j=30 \\ 0 \qquad\qquad\qquad \text{otherwise} \end{cases} \quad i,j = 1,2,\ldots,30,$$

and dynamics of each single node $\mathbf{x}(m+1) = \mathbf{f}(\mathbf{x}(m))$ is given by

$$\begin{cases} \xi(m+1) = \dfrac{1}{4}\xi(m) - \dfrac{1}{8}\eta(m) \\ \eta(m+1) = \dfrac{1}{4}\xi(m) - \dfrac{1}{6}\zeta(m) \\ \zeta(m+1) = -\dfrac{1}{8}\xi(m) + \dfrac{1}{8}\eta(m) + \dfrac{1}{4}\zeta(m) \end{cases}$$

It is clear that $\|\mathbf{A}\| = \frac{1}{8}$ and that A1 holds for $\alpha = 0.4586$. By numerical calculation, it is found

that $0.4586 \leq \sigma_{\max}(\mathbf{\Gamma}(m) + \alpha\mathbf{I}_N) \leq 0.9586$, thus Equation (4) holds.

According to Corollary 1, the synchronous solution of linearly time-varying coupled map network (6) is globally asymptotic stable.

In this simulation, take the initial values $\mathbf{x}_i(0)$=(1+0.5i,2+0.5i,3+0.5i)^T, $\mathbf{s}(0)$ = (1,2,3)^T, where $1 \leq i \leq 30$. The synchronous errors are plotted in Figure 1, which illustrates the states of the synchronous errors. Obviously, synchronization of the time-varying map has been reached quite soon.

(a) $e_{i1}(1 \leq i \leq 30)$ (b) $e_{i2}(1 \leq i \leq 30)$ (c) $e_{i3}(1 \leq i \leq 30)$
Figure 1   Synchronous Errors of the Linearly Time-varying Coupled Map Network (6).

5 Conclusion

Synchronization phenomena in the absence of control of a general uncertain time-varying coupled map network is investigated in the manuscript. By using the matrix singular value and the matrix measure theory, some synchronization criteria for such network have been proposed. In particular, corollary has been deduced for special types of time-varying couplings of such networks. Compared with similar literature, our network model considered is more novel and our synchronization criteria presented are rather unconventional. The results are more convenient to be applied to many practical networks. Illustrative numerical example has been shown to verify the effectivenessof the synchronization criteria established in the manuscript.

Abstract: The rapid development of artificial intelligence (AI) has changed the understanding of the general public on certain occupations and industries and has also enriched the connotation of them. At present, machine translation and AI translation not only make great progress but also pose huge challenges to the traditional society. This paper reviews the development of AI and its impacts on translation industry and teaching modes of translation and interpretation, discusses the innovative cultivation of translation and interpretation majors. The paper takes positive views to predict that in the next 2 or 3 decades, AI will be a good assistant to translators during translation, and high-level translators will be in short supply.
Key words: Artificial intelligence; Translation industry; Translation and interpretation major; Innovation

1 Introduction

In 1947, the pioneer of Information Theory Warren Weaver generated the idea of automatic translation with machine and put forward it formally in Translation Memorandum in 1949. In 1954, the American Georgetown-IBM Laboratory successfully used the IBM 701 computer to translate 60 sentences from Russian into English. Then in the past 7 decades, machine translation never stopped advancing. Currently, the general public has systems such as Google Translation and Baidu Translation on hand. Besides practice, machine translation theory is also under way. From 1954 machine translation has started gaining attentions from scholars. One significant representative is M.A.K. Halliday who criticized that researchers and developers ignored the linguistic elements of machine translation in his Linguistics and Machine Translation (Halliday, 2007). Domestically, machine translation emerged in 1957. Before 1988, domestic scholars focused on the translation evaluation, and after 1988, the studies extended to the application, evaluation, impact and prospect of machine translation.

In the last two decades, scientists tried to apply AI to improve the quality of machine translation and have made made significant progress. This paper, through analyzing the development and prospect of AI translation, combined with the current condition of translation education, translation industry and translation majors, will study the impact of AI translation on translation industry. It is assumed that AI translation will enhance the reform of translation education and translation industry and the future trend is the cooperation between AI translation and manual translation.

2 The Development of Artificial Intelligence (AI) Translation

2.1 Machine translation: the predecessor of AI translation

Machine translation stared in 1954 from the experiment mentioned before. From 1950s to early 1960s, machine translation research was on the rise because the two superpowers have provided a large amount of financial support out of their military, political and economic purposes. China started studying machine translation in 1956 and carried out the experiment of Russian-Chinese machine translation and translated 9 relatively complicated sentences of different types in 1957. From 1964 to 1975, machine translation sank into stagnation. During 1970s, with the development of science and technology and the frequent exchanges of scientific and technological information among countries, machine translation was urgently needed again. Currently, driven by market needs, the commercial machine translation has entered the practical stage and has gone to the market. By now, many advanced machine translation apps are available to mobile phone users.

Through the development of six decades, machine translation has already had many advantages compared with manual translation, including higher speed, lower expense and more languages with less time and space limitation. Yet machine translation can't replace manual translation in the next several decades for the limitation of technology. According to the report of China Workshop on Machine Translation (CWMT) 2011, machine translation performed relatively better in similar languages but not

in the translation of Chinese to English (Zhao & Lv & Ben & Huang & Liu, 2012). Meanwhile, machine translation fails in providing qualified translation of literature works because of being unable to understand the context and connotation. Last but not least, the basis of machine translation is the corpus or existing translation versions, which are established by translators. All in all, the prospect of machine translation is bright, especially after adopting AI.

2.2 The booming development of AI translation

During 1970 machine translation started to recovery with the adoption of AI. Machine translation can be divided into Rule-Based machine translation and Corpus-Based machine translation. Rule-Based machine translation is based on dictionaries and rule base. Corpus-Base translation can be subdivided into Example-Based machine translation and Statistics-Based machine translation. In 1985, in Translation by Analogy, Makoto Nagao put forward the fundamental idea of Example-based machine translation: machine, based on existing experience and knowledge, translated through the method of analogy rather than in-depth analysis (Xu & Liu, 2017). Statistics-translation selects the sentence with the greatest probability, such as Google Translation.

In 2013 neural machine translation became a breakthrough of AI translation in three aspects: Firstly, the core of AI translation is a deep neural network with massive nodes (neurons), which can automatically learn translation knowledge from the corpus; secondly, with the in-depth learning ability, AI translation will be able to form a virtuous circle. AI translation will preliminarily translate the text, and translators will modify the translation, especially for literary works and professional texts. In this process of revising, AI will also be involved and keep studying translation knowledge based on its study ability. Although AI translation has advanced in last decade, the technology of AI translation is not yet mature.

As for near practice, in 2016, Wang Xiaochuan, CEO of Sougou corporation, claimed that the developed real-time machine translation by his company can reach the accuracy rate of translation at least 90%, but the performances of this new technology failed at twice. Incidents like this show the instability of current AI translation. Meanwhile, the same as machine translation, AI translation also need the support of big data such as language rules, which is created and enriched constantly by linguists and translators.

3 The Challenges of Cultivation of Translation Majors

3.1 The changing translation industry

During 21st century, because of the global economic integration and the Belt and Road Initiative, the language service market has developed rapidly. According to the statistics of the State Administration of Industry and Commerce, from 1980 to 2011, the number of enterprises providing language services has increased from 16 to more than 35,000, a 30.3% increase rate annually. In 2013, the number of full-time translators is 1.19 million and of part-time is over 3.3 million (Teng&Zhang, 2013). In fact, the quality of translators is uneven and the supply of high-end translators is inadequate to demand. Quite a few problems are appearing with booming, including the uneven quality of translation, seldom regulation of translation market and vicious competition of price and quality. At the same time, the limited scale of domestic translation company restricts the development of translation industry.

The translation industry has also gone through changes in the last decade. In 1999, China published Occupational Classification of the People's Republic of China, in which, the item "translator" was classified under the category "News Publishing, Cultural Workers" and was tied with reporters, editors, and proofreaders. In 2015, the item "translator" was revised due to the new development of occupation. From the revision, the traditional translation industry has already been affected deeply by machine translation, which also indicated that the relationship between translators and machine translation would be cooperation rather than competition. And translation education, as one responsibility of translators, should also be reformed based on the changes in the industry.

3.2 The current situation of translation and interpretation major

The Academic Degree Commission of the State Council has set MTI (Master of Translation and Interpreting) in 2007. From 2007 to 2016, the number of schools that set MTI has grown from 15 to 205 with over 60,000 students in progress. MTI includes translating and interpreting, the curriculum of them are different based on the needs of translation market. Nearly, all MTI majors of different colleges have similar curriculum design, i.e. public compulsory course, required courses and optional course. While, the differences among schools are majorly embodied in the set of optional courses. For example, the

MTI of Beijing University has set the course Corpus Construction and Literature Search and the PLA University of Foreign Languages has set Senior Military Translation.

Actually, many graduate of MTI majors cannot find ideal jobs. Because good translation work opportunities concentrated in first-tier cities and some second-tier cities, and the traditional curriculum design has not been updated in many colleges, the graduates cannot meet the new demands of the translation industry. What's more, vicious competition among translators and translation companies also makes the loss of translation talents. Currently, the price of translation even is as low as 20 yuan per thousand words. In general, machine translation has made great progress in the past decade, especially after applying AI technology. With some overblown reports, even some MTI majors believe that in the future, manual translation will be totally replaced by AI translation, which is only a matter of time. In fact, the market is calling for high-end translators and interpreters. Many companies are still providing high price to attract translators with expert knowledge such as pharmaceutic translator and biology translator.

4 The Impact of Development of AI Translation
4.1 The positive impact on healthy development of translation and interpretation major
Although the "AI Threat Theory" is popular, the positive impact of AI translation will influence translation majors. First of all, the development of AI translation will change the job content of translators. Wang Xiangling and Jia Yanfang predicted the translation mode in the future would be AI translation plus manual post-editing (Wang&Jia, 2018). Machine translation post-editing is human-computer interaction translation, which is the process of editing and modifying the results of machine translation, so that the translation quality can meet the needs of terminal users (TAUS, 2017). In the future, the main task of translators will be much less time- and energy- consuming.

The change of job content will enhance the reform of MTI education subsequently. MTI majors will be trained to master machine translation and its post-editing. Meanwhile, the market need interdisciplinary translators as AI translation still cannot distinguish terminologies in certain context, therefore MTI education will include more expert knowledge of inter-discipline. Current MTI education put less emphasis on literary translation, but when AI translation completes most non-literary translations, students of MTI should focus more on literary translation. All in all, MTI majors will be involved in AI translation research, majorly the evaluation of AI translation quality and establishing and enriching the big data behind AI translation.

4.2 The prospect of translation industry
Because of the development of emerging economies, translation service is involving more languages. It seems that sole manual translation is hard to satisfy market needs. Currently, the most feasible method is AI translation plus crowd-sourcing. The primary mode of translation crowd-sourcing is based on the concept UGC (user-generated content). Translation companies can use their online platform to release specific translation tasks to the broad users of the online community, who are actively involved in the translation (Zhu, 2016). In such translation, because of a great amount of participants, the effective management and incentive measures will make the translation be speedily carried out with high quality. In this mode, AI translation deals with the basic translation firstly, then the post-editing tasks are delivered through crowd-sourcing and translators just correct the errors made by machine translation. Subsequently, the advanced translator will further improve the literariness or professionalism of the translation. This streamline operation will bring higher efficiency and quality. And AI is helpful to not only artificial translation but also personnel assignment. For example, in the case of crowd-sourcing translators, AI will understand the specialty of different translators. By collecting and analyzing such data, AI can assign different translation tasks to suitable translators.

4.3 The concern of development of ai translation
Although the results of recent experiments and practices of AI translation are not as satisfactory as expected, opinions on it maintain optimistic. In 2017, scholars in University of California Berkeley published the paper A Berkeley View of Systems Challenges, which analyzed the research directions and future challenges of AI. Generally speaking, AI translation will affect our life more widely. And the subjects such as sustainable learning ability and privacy security will be further focused on (Stoica, et al, 2017). For the future relationship between manual translation and AI translation, the CEO of Iflytek said that the future translation must be a positive interaction between translators and AI. In the future, some scholars believe that in the field of AI Translation, there will be many translation institutions that take advantage of minor languages. In addition, because text is an important carrier of culture, AI translation

will also play a critical role in cultural heritage and exchanges of various nations (Luo&Pan&Yi, 2017). It should be mentioned that China is regarded as a forerunner in AI translation. In the latest AI industry research report China's Rise in Artificial Intelligence released by Goldman Sachs in September 2017, it is pointed out that China has become the main rival in AI, especially BAT (Rong, 2017).

The debate was whether AI translation was possible or not, but nowadays, the debate has become whether the AI translation will replace manual translation or not. It seems that AI translation has already been in overwhelming status. Under this circumstance, some scholars have put forward sensible opinions. Zhang Keliang claimed that although being short of latest public test data, it is an indisputable fact that the quality of machine translation has not yet achieved breakthroughs (Zhang, 2016). Luo Jimei and Li Mei compared the machine translation and manual translation of 100,000 sentences from auto technology literature translation corpus of Tongji university. The outcome was negative as presented in following figures. Figure 1 is the accurate rate of machine translation and figure 2 is the occurrence frequency of the three main errors of machine translation in this experiment (Luo & Li, 2012).
Figure 1　Accuracy Rate
Figure 2　Occurrence Frequency of Three Main Errors

From these concerns, it can be concluded that the prediction of AI translation is positive in general. Meanwhile, existing problems should also be paid attentions to for sustainable and healthy development.

5 Conclusion

Through studying related papers and analyzing the latest application and experiments of AI translation, this paper studied the development of AI translation and the impact of AI translation on translation industry and translation education and draw a conclusion that the prospect of AI translation is promising and its development will enhance the reform of translation industry and MTI education. It is also predicted that in the next several decades, AI translation will positively interact with manual translation and the possible mode is AI translation plus crowd-sourcing. Due to limited time and fund, this research has no access to latest AI translation, the evaluation of AI translation mentioned in this paper considered other authoritative reports or papers. AI translation has gained increasing attentions from many scholars. Yet most scholars focused on the development of machine translation method and AI translation quality evaluation. Therefore, further researches of AI translation can focus on the machine translation post-editing and the AI translation evaluation system.

Abstract: The aim of this paper is to show the evolution of Science and Spirituality to come-to a convergence, as the focus of Science changed from the Object to the Subject in Post Modernity. Love from the spiritual wisdom is recognized as the possibility of subtle connections like in quantum Physics. Human kind awareness of Transcendent Reality, rather than belief is a very important point to help create constructively, in tune with the whole and individual experiences are essential to lead to a positive inner cohesion that may make a difference in the world, considering the Self, the other and the environment as Sacred. A Vision / Approach of Creative Inner Processes may be a possibility to help the process, with the consciousness of the inner Worth, which leads to the perception of Wholeness. This is the dawning of a new era characterized by Conscious Evolution.
Key words: Interdisciplinarity; Levels of consciousness; Wholeness

1 Introduction

Mankind has long been striving childishly along life using inner and outer powers mostly because of lack of higher awareness deriving from the Know Thyself; but now it may come the time to go faster in particular to follow closer the accelerated advances and convergence of Neurosciences and Quantum Physics. So, if in some areas in Science and Technology one may be speaking of Tipping Points that represent disruptive innovations, something similar may be happening with Evolutionary Consciousness. These kind of process may have inspired Theilard de Chardin some time ago when he envisioned and suggested that in the future, after fostering all kinds of Renewable Energies, Mankind would learn to foster for God the Energies of Love; quite a tipping point in our Evolutionary Journey of Consciousness.

2 An Outline of Evolution of Science and Spirituality towards Wholeness

Humanity has been living a great transformation. We have been to the moon, to other planets and to the heart of an atom, but we have also built atomic bombs. We have moved from the first industrial to the 2nd and 3rd and now to the 4th faster and faster which makes our life better but not for all; and without taking care of our Mother Earth, and all that because our level of Values and Consciousness is getting behind.

Around the year zero, with Greek Philosophy and the emergence of Traditions such as Buddhism and Christianism, there was a deep awareness of the Sacred. Such consciousness did not extend to the whole population, but to the "Masters" who brought significant messages, like Socrates or Plato in Philosophy or Buddha and Jesus Christ in religion. Humanity as a whole, until then, had felt attached to various deities, which had led to rituals, sacrifices - even with humans, and supplications. Humanity had been in an age of childhood, more egocentric than ecocentric and still far from cosmocentric.

Along the twenty centuries, whichfollowed from then on, there has been a growing development of reason, culminating in an encounter, albeit unreal, with the sacred. The *Church of Reason* began in France. In other words, the Holy Dimension was "rationalized". That corresponds to adolescence of Human Beings who wanted to reaffirm itself – with the exclusive world of doing.

According to Descartes, a few centuries ago, the Human Beings should cope with Science, whereas the Church with the Spirit. It must have been a strategy of the philosopher, so that Science escaped the Inquisition or did not suffer like Galileu and Giordano Bruno in the VII Century that were trying to break the system with new ideas and scientific knowledge. Nonetheless, our evolutionary process continued breaking barriers in Spirituality with the St. Francis movement, in Art with the Renascence, that awakened our feelings as needed for and opening to a next state.

All this made possible because of a hidden rational cognitive and intuitive genetic potential that was socially being awakening along the time, as mentioned in the recent book Sapiens by Yuval Noah Harari as breakthroughs. Harari describes several stages of our evolutionary process: The Cognitive, The Agricultural, The Social and The Scientific Revolution; and alert us that now Homo Sapiens wants to overcome himself and become Homo Deus and wonders about the risks of losing control due to

accelerated development in Artificial Intelligence and Genetic Engineering in particular.

If Science advanced, so much and nowadays so faster, the same did not happen with the religions, which were left with the responsibility of the "Spirit". In the twentieth century, the majority of the population was seeking for an independent experience of what the Sacred would be. The State and the Church wereseparated in a unique way in history, left few communities with such connected realities, particularly in the East where it still occurs, as mentioned by Reza Aslan on his book *God: A Human History*.

Nevertheless, Science itself turned to a transcendent view of Life with some outstanding thinkers like Jung in Psychology, Einstein and David Bhom in Physics and so many of their followers and companions. Jung pointed to the integration of the ego with the self, so that the process of individuation could occur, and quantum Physics pointed to the deep unity of Life – wholeness, including a vision of mystery in the essence of its Origin.

Such a mystery appears in science as coming from the fact that all known living beings are born biologically "ready" for life, except for the Human Being, who brings the trace of the source of what we call "mystery", which is their "freedom". The Human Being can "create" or "destroy" from the inner strength. The lack of awareness of such an inner force, that is, the absence of self-knowledge can prevent the Human Being from contacting what we call the Sacred. Of course, there are different views. However, those who followed Jung or Capra, for example, nowadays bring this returnto the Sacred in a clear way! Yes, it is the moment when Transpersonal Psychology arises, together with the perception of the possibilities of connections in the heart of matter and perception of inter / transdisciplinarity as a consequence of the unity of knowledge, transcending dualities.

Actually, Jung insisted on the coincidence of opposites, as a sign of a unity of knowledge, which is gradually moving towards the interdisciplinary position. A vision of "Being and Doing" brought by Goswami also appears. Why do these facts mentioned above turn to what we call the Sacred?

In fact, Jungian Psychology pioneered in the 20th century by turning to the transcendent dimension of the human being when he stated that in the unconscious mind there were not only the "repressions" proclaimed by Freud, but also the "self" which, if ignored, it would prevent the process of individuation. Such process surely came to mean the possibility to Know Thyself announced by Socrates, over twenty centuries ago as the beginning of all wisdom, actually fundamental in several traditions. Certainly, the whole foundation of Jung's work leads us to perceive the spiritual dimension of the so-called self, and eastern religious traditions talk about transcending the self.

The drama of ignorance of this reality is the use of this transcendent energy in a destructive and conducive way, for example, to an atomic bomb, as mentioned above. In what concerns quantum Physics, we do not only have Newton's perception of the religiosity of the Universe brought by Einstein, but also the question of the mystery of the emptiness of an atom, different from Newton's "billiard balls". Such emptiness of the atom, which contains invisible particles, presents the already mentioned possibilities of connections in the work *Mutation Point* by Fritjof Capra or in his *Tao of Physics*. What is the deep meaning of such possibilities? There is a Symbolic Encounter with the Traditions, which affirm in the clearest case of the Christian Tradition, that the Creator is Love and that Human Being wascreated in His Image and Likeness! Such a metaphorical view that our essence is Love will coincide with the image of possibilities of connections, coming from the scientific view! Love is connection, which brings us the vision of synchronicity, as by Jung who would say, between Science and Faith. It would be the Encounter of Faith with Science, *Fides et Ratio that are like the two wings with which the human spirit rises towards the contemplation of the truth* (Pope John Paulo II).

On the other hand, the view of Matter Unity also arising from quantum Physics will coincide with the view of Unity also brought by the Christian Tradition, when it states that "*we should be One, as Jesus and the Father are*". Unity will lead us to aninter or transdisciplinary attitude, that is, the Unity of Knowledge.

What would be, from the point of view of Religions, this perception of the Sacred Coming from Science? One of the first thinkers to manifest in *this direction was the Jesuit priest Theilard de Chardin when he stated in his work "Human Phenomenon" that: "After going through the Path of Analysis for a long time, the Human Being comes to the luminous Synthesis".*

Later, Pope John XXIII, who called a historic Council, (Vatican II), came to bring to the Catholic Church, in this case, a remarkably ecumenical vision and a deep respect for the universe of science. It would be too long for the dimension of this article to go further in these considerations, but today we feel a deep integration of scientists and religious people in countless fundamental actions of the present world. We could mention Mother Tereza of Calcutta, among other religious people. Mother who was a clear

example of the universe of Being and Doing.

Another fundamental point for the deepening of the Sacred in this moment is the recognition of two more facts of extreme synchronicity: one occurred in the 19th century and the other in 1.945. In the nineteenth century, with the emergence of the *Church of Reason* in Paris, the appearance of kardecism took place in the same country and city, which did not mean a new religion, but rather a scientific study of the spiritual existence of the human being. It was an event that "shouted": "*you have reached the peak of reason with Augustus Comte, but do not forget that the Spirit is also present*"! The reading of *The Book of Spirits* will make clear the reflection in this direction. The second fact, and as synchronistic as the first, was the emergence of Nag Hamadi documents in Egypt in the same year of the atomic bomb explosion in 1945. From scratch, an Egyptian peasant finds documents in a cave from two thousand years ago, which come to be the so-called "Apocryphal Gospels", widely studied by authors such as Jean Yves Leloup in his vast work, among others. Such documents, added to those of the Dead Sea, found in the sequence, reveal an incredible vision of a spiritual renewal.

3 Complex Thinking and Transdisciplinarity

All that mentioned before may be considered from the point of view of Complex Thinking brought by Morin or the transdisciplinary view, as presented by Basarab Nicolescu or Ubiratan D'Ambrósio, among others. In fact, the Long Walk of Science towards the transcendent and the unitary view of Life brings the interdisciplinary view proclaimed by Ivani Fazenda with expertise as one of its consequences. The Encounter with the Sacred will be the inevitable consequence of the attitude of unity in face of Knowledge, bringing awareness of our spiritual dimension, as shown in the following poem by Ruy Cezar.

The Way from Believing to Knowing ...

Knowing is to feel what is most within
*It is **to awake** the eternal child who "fell asleep" with adolescence*
Believing is to look at our image, narcissistically.
With the adolescent, competitive look

Knowing is to look with the soul
That was awaken
Believing is not looking
It's having eyes and not seeing

Knowing is to perceive with the Spirit
It's starting the journey, in the eternity of the Moment ...
Believing is to perceive with the senses
Searching for "security"

Knowing is quantum change, which promotes love
The Infinite Connection with Life
Believing is keeping the power
Recluse in the "ego"

Knowing is to walk towards transcendence
Discover the inner time - "kairós"
Believing is to see yourself as a number ... One more ...
The getting lost in the crowd

Knowing makes spirituality conscious
Which was "in" the unconscious mind
Believing keeps selfishness
Leaving the Light under the "bushel"

Knowing is to be with the Creator
It is to live the Image and Likeness "announced"

Believing is to be with one's own beliefs
"Crawling" in the adolescence of life ...

Awareness liberates
And we realize, then, that only Truth gives us freedom ...
Believing keeps the Spirit attached to concepts and prejudices
It is what we call "suffering" ... Unhappiness ...

Knowing is to find happiness
And Joy, its first fruit
Believing is keeping oneself in suffering
Regarding oneself as an eternal victim ...

Knowing is to perceive beyond the appearance
It is to find the deep meaning of existence
Believing is seeing with the eyes
Without anything to see

Knowing, as Jesus did it
Is resurrection after the crucifixion ...
The deep wisdom we all need to "learn"
And celebrate.

Moreover, the change of focus in Science from the Object to the Subject in Post Modernity enables the Encounter with Spirituality. In these inevitable Encounter of Science and Spirituality, so individual experiences, which have always been part of Human existence, find epistemology, at last.

Society built on references of the Object, in Education, Work and even Family, mostly developed based on models and patterns from outside, came to an extreme point that highly threatened the life on planet Earth. The single bottom line – economical profitability – a reflection of linearity of thinking, took time to give way to the triple bottom line, including the environment and Human Being, as elements considered in Management of enterprises and schools. The difference between machines and humans need to be considered for companies to really make a competitive advantage. Competitive advantage or a difference to Humanity? The choice of words mean a huge difference, between linear or Complex Thinking. Indeed, to really understand the difference, perception of own Worth has to emerge from inside as a new level of ethics and consciousness.

Interdisciplinarity, besides being an attitude to knowledge allowing for the integration of disciplines, also regards the ontological and praxiological aspects of the researcher for epistemology. It was in this line that a Vision and Approach developed from the Creation to the Realization of proposals, shows that the experience of the Creative Inner Processes leads to the consciousness of the inner Worth. Regarding the being as full of possibilities in the Knowing and Doing is essential to activate the spiral of creation, which involves all the dimensions of the Being. When one opens to perceptions on a topic and registers what emerges through words, one collects invaluable raw material. The movement of creation of the proposal follows with the correlation of words, and detection of the meaning of the correlations, individually and collectively. The 4 quadrants by Ken Wilber may be used, bringing individual and collective inner and outer consciousness.   Along this Creative Inner Process, it may be possible to gain depth of meaning, concerning the topic, themselves and the decisions involved to constructive, innovative solutions. Three other movements follow in this Vision and Approach: the Definition of the Unity of the proposal which provides insights for the own Unity and wholeness; the Way, with the opportunity to adjust the aspects involved in the proposal, feeling the possible inconveniences, assuring their aim is constructive. All that brings clarity and harmony for implementing a proposal with a sense of Achievement with Self   Realization, which needs commitment as, mentioned by Goethe in one of his poems *"Until one is committed, there is hesitancy, the chance to draw back, always ineffectiveness. Concerning all acts of initiative and creation. However, at the moment one definitely commits oneself, Then Providence moves too. All sorts of things occur to help one that would never otherwise have occurred."*

Hence, there is the perception that as we have the will power to begin something, Providence moves too. This is actually what was stressed at the time when Peter Senge et al at MIT started developing a

revolutionary system thinking approach, that led to another level of Cognitive Capacity; and from where Otto Scharmer was inspired to devleop his U Theory. This approach shows how by reinforcing Presence one may allow synchronicities to happen and become more consciously involved (Commitment) in co-creating the future as it emerges (Providence).

An evidence of Wholeness, even if may take time as was the case of the centenary Mandela that spent 27 years in jail because of his fight against apartheid and wrote this beautiful poem about the critical importance of the awareness of our Light: "*Our deepest fear is not that we are inadequate. Our deepest fear is that we are powerful beyond measure. It is our light, not our darkness, that most frightens us... You are a child of the universe... We are born to make manifest the glory of the universe that is within us. It is not just in some of us: it is in everyone. In addition, as we let our own light shine, we unconsciously give other people permission to do the same. As we are liberated from our own fear, our presence automatically liberates others.*"

With the consciousness of our spiritual dimension, we could bring expansion and well-being to everyone. Indeed, the Human Being potential is full of possibilities. As an example one could even see that recent approaches to Marketing 3.0 by Philip Kotler calling for the need to awakening marketers to reexamine their theory and practices by a growing recognition of planetary finite resources and high environmental costs. Marketers hence need to reexamine their theory and practices and even start considering the various dimensions of the Human Being (Mind, Hearth and Spirit) and their impacts on their organizations mindset (Mission, Vision and Values). Moreover, Richard Barret its Values Center already provides metrics to help building values-driven organizations and societies, somewhat based on contributions by Ken Wilber ś Integral approach as well as the Spiral Dynamics model.

At a Global Level, one could see that important organizations like the UN is getting very much involved into implementing a global new Sustainable Development (UNSDG) with goals focusing in particular *to end poverty, protect the planet and ensure prosperity for all.* Moreover, Klaus Schwab founder and director of the World Economic Forum (WEF) mentioned at the release of his 4th Industrial Revolution book the need of a more *prosperous, equitable, humane, and ecologically sustainable society.* Finally, now that we are in the middle of a complex economical, social, and environmental crisis comes Pope Francis with its *Laudato Si* message suggesting a holistic approach to *Care of our Common home* reminding us that everything is interconnected and that all of creation is a *kind of universal family.*

4 Conclusion

How can we reach higher levels of consciousness and spirituality? Undoubtedly, as we get more mature this may help; but we could also experience internal cohesion with the alignment of every single thought, feeling, speech and action in a constructive way in the studies, work, and personal life. Then we may consider our life as a mission, reflecting the divine purpose of life in the individual Human Being towards the whole. Moreover, ancient wisdom and various religions could bring us a contribution; and maybe, as presented in the book by Kurt Jonhson and David Robert we are at the dawning of an age of interspirituality. This will be welcome particularly nowadays that from the convergence of neurosciences and quantum mechanics is emerging a greater need to understand more deeply what consciousness is, how mind and matter interact; and how this could lead us to a deeper sense of unity, interconnectedness and wholeness. However, for that to happen we may need a methamorphosis as suggested by Edgar Morin.

Patent Documentation as a Source of Innovation for Sustainable Development

Paulo Melo[1], Sérgio Maravilhas[2], Arnoldo José de Hoyos Guevara[3]

Abstract: Patent documentation may help provide growth of innovativeness and development of clean technologies. Technology transfer via patent documentations has fostered and revealed itself of high economic importance because of the ability to leverage innovativeness more quickly with low cost and low use of resources and efforts. However, organizations still don t seem to take the advantage and monetize their full potential related with the use of patent information that could stimulate more innovation resulting in greater economic growth. This paper presents that a coherent and effective use of patent information from existing R&D activities with operational application may contribute more efficiently to solve problems and to foster innovation through the creation of new products, services and processes with sustainability and social responsibility. The use of unexploited inventions and the formulation of new products based on successful R&D experiences may be adapted to create sustainable solutions, attend new global needs, generate new jobs, and protect natural resources and the environment as a whole.
Key words: Patent information; Sustainability; Intellectual property; Innovation and natural resources

1 Introduction

The concept of sustainable development has its origins in the attempt of integrating environmental aspects in economic policy, bringing the ideas of environmentalists to the central area of world politics that currently focuses on Economy (Dresner, 2008, p. 69) even though is becoming more aware and concerned on impacts of Climate Change(IPCC, UNFCCC). Sustainable development seeks to carefully balance environmental concerns with economic development, a difficult task when immediate concerns focus ever more on economic aspects than in preserving the environment and natural resources.

This concern is of particular importance in economic models adopted in developing countries, mostly located in the southern hemisphere. These countries concentrate most of natural resources available that should be used more for the sake of improving the lives of the people who lives there.

Another concern, directly related to economic issues, is the one related to difficulties for developing countries in accessing the most updated innovation and technologies. These countries are those where companies often seek to sell outdated products, which no longer have demand in developed markets. These products have caused environmental problems contributing to the increase of level of pollution with negative impacts on the local environment.

In order to shorten the path of reducing environmental impacts though innovation and use of new technologies, patent information may help to prevent the waste of time, material and financial resources. Thus, it may avoid reinventing what already exists and has consumed resources to be invented (Jolly & Philpott, 2009). In addition, this strategy allows the realization of sustainable solutions, by the use of unexploited inventions (new products based on research and development - R&D already available) that may be adapted to new global needs and by protecting the environment and natural resources.

Patent documentation is an important source of information that covers scientific and technical activities of human creativity that being coded allows quick recovery and use. Then, patent information repositories, in the format of databases and digital libraries are the largest sources of scientific and technical information, available freely via the Web globally.

The analysis of this type of information allows the free exploitation of certain inventions, without the obligation to pay any license fees if the patent is in public domain and free to be used (Petroski, 2008). This is the case of generic drugs. Some active substances of certain medicines reached their protection limit and are free to be explored, what has been done successfully by various national and international companies along the time.

The authors of this paper argue that a coherent and effective use of patent documentation, containing information resulting from R&D activities with practical applications may contribute to the increase of firms' innovativeness through the creative use of this open-source information in order to

solve real problems. This organizational strategy may generate benefits for the sustainability of countries due to the use of resources more efficiently by reducing costs and resources spent.

Several environmentally friendly technologies are available to be exploited and some of them at no cost. Some of these technologies, for instance, are using clean energy with relevant economic advantages for those (people, organizations and countries) who want to implement them. As a matter of fact the X-Prize foundation from the Silicon Valley has being fostering Large Scale Impact Innovation that may help Global Well-Being.

Then, this research aims to contribute to the increase of the use of patent documentation as an important source of innovation, in order to stimulate the development of clean and sustainable solutions in many areas such as manufacturing, service and even educational ones. The outcome of this strategy might be the minimization or reduction of cost and resources creating a business environment much friendlier for both: organizations themselves and society as a whole with benefits for all stakeholders involved.

2 Origin and Advantages of Patent Information

Ullrich (1989) argues that Intellectual Property (IP) , especially patents and utility models, represent relevant economic and industrial policy tools as they play an important role as a stimulus for innovation. This stimulation is achieved by the temporary protection granted to the commercial exploitation of the outcome of R&D activities.

In the case of patents, during the registration and grant process, the Patent Offices will generate one or more legal documents that are designated by patent literature. The information that these documents contain is called patent information.

After patent application has been registered in the respective patent office (the granting of protection is only given three years after application on average), this information may take normally 18 months to become publicly available for those who wish to consult it.

In the patent document package may be found the following information: " i) The 'state of the art' of the technical knowledge available to date in the area in which the invention was carried out; ii) Type and nature of the technical problems that the invention will solve; iii) Detailed description of the invention and how it works; iv) Illustrations, diagrams and drawings of the constituent parts of the invention for easier understanding of it, where necessary and appropriate and furthermore, patent information can clarify and supplement articles published by the inventor" (Macedo & Barbosa, 2000, p. 58).

One of the prerogatives so that the patent may be granted, is that the information in the patent application is in such detail that a skilled person in the area will be able to perform the invention (product or process). Thus, analyzing patent information may allow the development of products leading to cost reductions and driving their holders to competitive advantages (Petroski, 2008).

Intellectual property has as its main function, the dissemination of technical and economic information that stimulates the economic performance of a country and individual business units. IP also has the merit of supporting technology transfer processes by establishing the link between university R&D activities, business centers and the economic and financial structure characterized by market architecture.

The patent document discloses the invention necessarily liable of industrial application, but also defines the scope of protection required if the respective patent is obtained and granted by the responsible Office (Jolly & Philpott, 2009). The disclosure of technical secrets contained in the documents resulting from a patent application disseminates valuable information to the public about the 'state of the art' in a given area by promoting through that knowledge technological development.

Because of this disclosure, constituent parts of an invention could be used, provided they do not incur in any violation of the claims contained and described in the patent. This procedure can lead to the attempt to develop competing products to those found in patent documents, by inventing more lucrative or more effective alternatives of use (Rivette& Kline, 2000).

Patent information, in addition to providing an excellent source of information to generate ideas, also has the advantage of being used as a source of inspiration when there is need to find the solution to assist in solving technology-related problems particularly in developing countries.

3 Advantages of Patents for Developing Countries

Sherwood (Sherwood, 1992) argued that "the protection of innovation has been the yeast of the economic development of many countries." This can be seen because "countries with advanced economies tend to be those who have property protection systems in which the public deposits a certain degree of confidence" (1992, p. 11).

Having said that, developing countries have to adopt effective measures of intellectual property (IP) protection in all aspects (patents, brands, utility models, designs, etc.) at a risk that they watch escape to other countries their great asset: the intellectual capital, because of lack of means to protect their inventions, making inventors to seek other countries for protecting their inventions. An economic outcome is that the generation of wealth instead of being in developing countries where they need most, will benefit just foreign countries, most likely in developed ones.

Thus, developed countries continue to develop themselves and emergent countries 'stagnate' without new ideas that could be channeled into new sources of wealth instead of exploiting their natural resources only. Also for the same reason, multinational companies do not invest heavily in these countries for fear of being dispossessed of their source of income due to the possibility of illegal appropriation of their discoveries and inventions, motivated by the weak property protection of intangible assets that characterize IP.

This position is also shared by Idris (Idris, 2003) defending the need to implement strict IP laws in developing countries in order to stimulate the creation of innovative companies, local or international ones. The creation of a secure institutional environment shall help those companies to set up new businesses locally because they feel safe and secure, therefore promoting technological development that will increase economic growth by the competition they promote in the market.

In developing countries, a much more safe and secure institutional environment could facilitate interactions among economic agents and therefore help to increase the process of technology transfers. In this sense, Hansen (Hansen, 1980) in her analysis of the economic aspects as a result from technology transfer in developing countries introduces the idea of 'absorption' of technology.

The term "absorption" of technology could be defined as the induction of technical progress based on a 'transferred' technology. For this phenomenon to occur, it is required the presence of several factors such as, adaptation, improvement and further development of the transferred technology according to the conditions of the economy such as resources, production factors and weather among others.

The mechanisms of absorption of new knowledge of a given economy stresses that the capacity to absorb such scientific and technical expertise,   contains three closely interrelated aspects, which are: i) the ability to recognize possibilities of adaptation of more advanced foreign technologies; ii) the ability to adapt the technology to the physical, social and economic contexts of the country; iii) the ability to adapt the social and economic conditions to the requirements of these new technologies and iv) the ability to provide economic growth and sustainable development.

4 Sustainable Development and Economic Growth

Patent information as a source for innovation is only justified when they generate an improvement of society and country as a whole. These improvements include economic, social and environmental dimensions. As mentioned before, since most of the patents are granted in developed countries, benefits from new technologies are felt only in these countries. In developing countries, on the other hand, due to the lack of policies to guarantee IP protection generate a huge inequality.

Just an example, according to a study held together by the European Patent Office (EPO), United Nations Environment Programme (UNEP), and the International Centre for Trade and Sustainable Development (ICTSD) in 2010, six countries hold about 80% of the innovations developed worldwide in the field of clean energy technologies. This finding came from an analysis of 400,000 patents from Espacenet database (Espacenet is a patent search tool in a digital platform with millions of patent documents).

Several other technologies using natural energy resources such as the energy of the sun, wind and sea waves and tides need to be implemented but face problems of lacking of financial investors; who still believe and bet on old natural sources of energy dominated by the coal and oil industries (Yeomans, 2006), two of the major causes of   environmental problems of the planet (Esty & Winston, 2008; Krupp & Horn, 2009).

Now with the start of oil scarcity and the environmental costs of unsustainable fossil materials, new solutions need to be found to meet the energy needs of humanity (Dresner, 2008), whereby hydrogen is a candidate to consider (Yeomans, 2006).

The development of patents in the clean energy technologies (CET) area shows that innovation may be focused on benefits to the environment and society. The increasing number of CET patents coincides with the adoption of the Kyoto Protocol in 1997, making it clear that political decisions could be a major factor in stimulating the development of key technologies to combat global warming and

climate change. Also, statistical analysis has shown that the number of patents in the mentioned technology areas increased by about 20% per year since 1997, surpassing patents of traditional fossil energy sources and nuclear energy.

Among the six countries leading the area, Japan is the one who developed and patented most technologies, followed by the United States of America, Germany, South Korea, France and the United Kingdom. China is fast approaching South Korea as far as patents in the solar photovoltaic area. Regarding technology licensing, there is a reduced licensing activity between organizations from developing countries, being these activities limited to countries like China, India and Brazil and more recently Chile.

Innovation with focus on sustainable development benefits not only developed and developing countries and society, but organization as well. As a matter of fact companies that invest in green technologies and adopt environmentally sustainable attitudes grow faster with better performances in the markets where they operate.

Because these companies are committed to the mission of making the world a better place through social and environmental management policies, they acquire an intrinsic advantage gained by the respect and trust that their reputation generates among informed and responsible consumers.

Sustainable environmental strategies generate competitive advantage to organizations, allowing lower costs with raw materials and energy necessary for the operation of some industrial activities (Esty & Winston, 2008). Investments in clean and green innovations reduce environmental degradation and at the same time impact positively organizations' public image, capturing greater number of customers and consumers without spending on advertising. Dresner (2008) argues that this is the result of the economy been immersed in sustainability issues. In Brazil a recent Private-Public initiatives gave rise to a very promising Solar Energy Program: Goias Solar.

Instead of wasting precious time and resources causing more environmental damages, the ideal strategy would be to search for existing solutions available in patent depositories to solve the current problems. In this case, patent information may contain the solution to adopt.

5 Where to Search Information for Sustainable Patents and Inventions

The Internet has brought many changes and advantages in the access to information. The amount, extent and speed in which we can access the required information make internet a privileged resource for the search and analysis of information. According to Idris (2003), the possibility of access to the information available in patent databases is the factor behind the creation of knowledge and increasing the growth of wealth.

According to the same author, it relies on the generation and management of what he means by 3 "**i**'s", namely, **I**nnovation, **I**nformation and **I**deas, supported by a fourth "**i**" which stands for **I**nternet. For him, these fuel powers the incredible current of the technological progress. The ownership or access to such source and the information conveyed by them are vital for any company that wants to keep on top of their area of expertise.

The use of this information allows the creation of innovative products and services or finds innovative ways of producing existing products with better cost effectiveness. According to Maia (1996), patent databases allow in a quick and efficient manner: i) be certain of the originality of planned research programs; ii) search inventions useful for further innovations; iii) get an overview of new trends in R&D activities in a particular area of technological development and iv) monitor the marketing strategies of competitors discovering the countries where they required patent protection.

The possibilities that modern technology have to offer with regard to patent information search can prove to be very useful for allowing discovering inventions with high economic potential that are not being properly exploited. Many inventions with environmental benefits have not yet been exploited because of the economic dominance of companies based on traditional energy sources such as coal, oil and nuclear energy that do have strong lobbys.

Companies such as IBM, Sony, Nokia and Pitney Bowes in collaboration with the World Business Council for Sustainable Development (WBCSD) launched in 2008 a digital platform so called Ecopatent Commons (http://ecopatentcommons.org/) for promoting information of environmental and sustainable inventions. Other platforms are as follow: i) WIPO GREEN, supported by the World Intellectual property organization (https://www3.wipo.int/wipogreen/en/) and The GreenXchange Project (http://creativecommons.org/), supported by Nike and Best Buy. An interesting paper, regarding Patent Commons by B. Hall and C. Helmers, suggest thinking on Open Collaborative Innovation alternatives, same as the case of the paper of R. Chafale and O Brian from the Oxford University for the

International Centre for Trade and Sustainable Development - ICTSD.   Actually more recently F. Tietze from The University of Cambridge made some comments regarding how Protectionism regarding Intellectual Property makes it harder to foster Sustainable Systems a overcome status quo; so we need a more Open IP to enable Sustainable Transitions, and that process needs to go faster.

Digital platforms could make available, to those who want to explore new technologies with focus on environment and sustainability of the planet, a set of patents from ecofriendly inventions to opportunities for partnerships and collaborations between companies who own the patents and entrepreneurs who have projects to use them. These initiatives must be cherished because lots of companies have several non-used patents that could be explored, in a useful and ecofriendly way, benefiting all humanity. An example of such a case is the Free Patents On line – FPO.

Besides these specific information resources, directed to the promotion of sustainable inventions, other solutions might arise from the analysis of patent information. The use of available inventions with other purposes that could be adapted for the solution of problems related to sustainable development and better management of natural resources.

Currently, almost all industrialized countries offer via Internet their patent collections for easy access and consultation. Usually the documents are in the countries official language, which is not always easy for those who perform the research. Hence, access to information provided by the World Intellectual Property Organization – WIPO since 1998, has large amounts of summaries (abstracts) in English, and in addition they provide support for research in key Asian offices. In fact, WIPO provides an Inventor Assistance Program (IAP) for developing-country inventors offering patent attorneys who give them free legal advice on patenting.

The advantage of all the sources of patent information presented in this work is that, besides they all being free, may have an easy open digital access. All these sources are of vital importance to obtain information in order to reduce costs and waste while increasing the chances of creating viable solutions to global problems.

6 Some Examples of Patent Information for Creating Sustainable Businesses

The 'Solar Oven' developed by Prof. Manuel Colares Pereira was inspired in a patent already expired, in public domain, of a similar invention called the '*Phyreheliophoro*' (See Figure 1) but used for different functions like melting metals and make fertilizers. The consultation of this patent showed that the invention belonged to a Portuguese priest, Father Manuel Antonio Gomes, better known as MAG Himalaya, that at the beginning of the 20th century, in 1904, won the 1st prize in a science competition in the Universal Fair in St. Louis, Missouri, USA (Rodrigues, 1999).   This invention uses only the sun energy, is non-polluting, eliminates the need to cut trees for firewood for cooking and reduce deforestation.

In the case of less developed countries, the "Solar Oven" (See Figure 2) could allow the creation of family businesses, like cooking to sell meals, enabling the realization of capital for the creation of other businesses and improve the quality of life of the local communities. Therefore, an ecological product allows sustainable businesses with inherent economic and environmental benefits.

Figure 1   The *'Phyreheliophoro'* in Portugal and in St. Louis, Missouri, USA, in 1904 (Rodrigues, 1999)

Figure 2   The Sun Cook – Solar Oven by Sun C℃ – Cia. de Energia Solar S.A
(http://www.sun-cook.com)

This new invention and innovation, inspired in a 1900 technology, is patentable itself, since the solution found is new, it is not contained in the technical characteristics at that time and is not intended for the same use of the previous invention.

If analyzing an invention created with a certain purpose and intention, like melting metals, made possible the cognitive jump to the creation of a solar oven for food confection. Visualizing patent information, which already has available inventions, may allow the insight necessary to create new businesses based on these inventions.

Dou (2004) cited other example of the use of patent information for sustainable businesses regarding the situation experienced in an Indonesian province without large economic resources but with great abundance of coconuts. The fruit was eaten and its juice drunk (coconut water), but the shells resulted in a serious environmental problem, as they were not given any use and constituted debris piles scattered around the island.

In order to face this situation people were trained to use computers in the local public library to conduct research in digital patent platforms such as Espacenet involving the use of coconut. Thanks to documents available in these platforms, they found new uses of coconuts in many different applications such as jams, sweets, cakes and liqueurs. Regarding shells, they may be used in many ways: as fertilizer, as raw material for furniture, building materials and insulation, toys and decorative articles or craft products. Such knowledge made possible a huge number of new successful family businesses. Most of the technologies and patents discovered were of Brazilian origin, not protected in Indonesia, and that could be used without any hindrance or payment of fees.

7 Conclusion

The examples above show the true value of information in these patent repositories and, also, emphasize the idea of using natural products and resources for solving problems in a sustainable way, eliminating waste that would otherwise be a problem to solve.

Undoubtly, the relationship between IP and sustainable economic development is feasible and closely related to the ability to access patent information in order to innovate and gain competitive advantage. Thus, it is possible to innovate without a high initial cost of R&D activities and sometimes, local natural resources could be used to solve complex problems just using information from unexploited inventions. Although patent information is available to all, not everybody benefits from it. Also, it is not sufficient to access it, but it is necessary to do something with this information such as innovative products and services.

Finally, patent information could be used to the development of clean technologies and its analysis is a task to be considered by entrepreneurs and researchers, because a monetization opportunity can be discovered for some invention that can be used or adapted for cost-effective sustainable practices.

Study on the Punishment Mechanism of Residents' Waste Classification Based on Game Theory

Zhu Yanxia, Yang Qing
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(Email: 18702603370@163.com, yangq@whut.edu.cn)

Abstract: Waste classification has become one of the necessary measures to solvethe rapid growth of China's waste.This paper believes that it is difficult to break the situation of waste siege by relying solely on the residents' self-consciousness. Therefore, this paper uses the game theory approach to construct the game between residents and residents, government and residents, and concludes that the introduction of government punishment mechanism can promote residents'waste classification. In the end, based on the results of the analysis, this paper proposes measures to encourage residents to classify waste.

Key words: Residents; Waste classification; Punishment mechanism; Game theory

1 Introduction

The problem of waste classification has aroused the attention of many scholars.From the perspective of research methods, the research methods for waste classification are mostly based on theoretical analysis and statistical analysis.In terms of theoretical analysis, there are mainly suggestions for China based on the problems existing in domestic waste classification and the experience of analyzing foreign waste classification (Hu Qianyu et al., 2013; Zhang Haodong, Li Zhen& Xiao Xin, 2017; Shi Xiangrong et al., 2017; Lü Licai& Chen Jiawei, 2017). In terms of statistical analysis, it mainly involves regression analysis, factor analysis, path analysis and covariance analysis, etc. Howenstine (Howenstine, 1993) constructed a factor analysis model to analyze 12 reasons for not classifying waste in the Chicago area.

Based on game theory, it is mainly reflected in the different players and the different types of games. In terms of players, researchersestablished the game model between government and property companies (Geng Yanhu, 2014), builders and the public (Yin Qianliang, 2013), college students and college students (Li Xiaofei&Li Da, 2018), college and college students (Li Da, 2017). In terms of game types, researchers constructed the incomplete information static game, complete information dynamic game and full information static game, etc.

At present, there are few literatures on the study of waste classification management using game theory methods at home and abroad. However, as a special kind of public goods, the use of game theory to explore the behavior of waste classification participants is also appropriate. In addition, the game between residents and residents with the largest proportion of waste classification is rarely involved. This paper constructs the game model between residents and residents, government and residents in the waste classification, anduses the research method of evolutionary game. Finally, this paper discusses the punishment mechanism that affects residents' waste classification and proposes suggestions tobreak the situation of waste siege.

2 The Construction and Analysisof Game Models

Residents tend to place waste freely. In order to encourage residents to classify waste, the government should take punitive measures to supervise the behavior of residents.

2.1 The game between residents and residents

If the government chooses to supervise, and give certain punishments f to residents who do not classify waste. In addition, suppose that if there exists waste classification by residents, the probability of the residents who do not classify waste were found by government is m. Other assumptions are as follows:(1) Players are resident A and resident B.(2) Decision set is {classification, non-classification}. (3)Players are not completely rational, and they choose strategies based on maximum utility.(4)All parameters are positive.

The parameters are explained as follows:Rrepresents the long-term returnof their community or urban environment that have been made by both residents' waste classification.$r$represents the long-term return of the community or urban environment that has been improved by the waste classification of only one resident$(r<R)$.Crepresents the time and physical cost that residents spend on waste

classification, and assumingthat the costs are high, so that$r<C<R, R-C<r$.The payment matrix between residents is shown in Table1.

Table 1   Game Payoff Matrix Between Residents

		Resident B	
		classification	non-classification
Resident A	classification	$R-C$, $R-C$	$r-C$, $r-mf$
	non-classification	$r-mf$, $r-C$	$-f$, $-f$

Assuming that the probability that residents choose classification strategy is$x$, the probability of choosing non-classification strategy is$1-x$.E_1represents the expected return of the classification strategy,E_2represents the expected return of the non-classification strategy, and$E$represents the average expected return of the two strategies.

$$E_1 = xR - xr + r - C \tag{1}$$

$$E_2 = xr - xmf - f + xf \tag{2}$$

The replicated dynamic equation of choosing classification strategy is:

$$dx/dt = x(E_1 - E) = x(1-x)[x(R-2r+mf-f)+r-C+f] \tag{3}$$

Finding possible stable points： $x_1^* = 0$, $x_2^* = 1$, $x_3^* = -(r-C+f)/(R-2r+mf-f)$

$$F'(x) = (1-2x)[(R-2r+mf-f)x+(r-C+f)]+x(1-x)(R-2r+mf-f) \tag{4}$$

$$F'(0) = r - C + f , F'(1) = -(R-C-r+mf) ,$$

$$F'(x_3^*) = -[(r-C+f)(R-C-r+mf)]/[(r-C+f)(R-C-r+mf)] \tag{5}$$

Analysis of $F'(x)$, and get the following three results.

①If$f<C-r$, then0 is the only evolutionary stable strategies. It shows that all residents will not classify waste when the government's punishment for residents is very small.

②If$C-r<f<(R-C-r)/m$, thenx_3 is the only evolutionary stable strategy. It shows that when the government's punishment is in a certain range, the residents classify waste with the probabilityx_3, and the government's punishment needs to be improved.

③ If$(R-C-r)/m<f$, then1 is the only evolutionary stable strategy. It shows that when the government's punishment reaches a certain level, residents can basically classify waste.

In real life, it is difficult to achieve the third situation. The second case is a common phenomenon. Therefore, it is necessary to improve the probability of residents' waste classification as much as possible. This probability is positively correlated with the government's punishment amount and punishment probability for unclassified residents.Therefore, the government cannot do nothing in the waste classification.The government needs to actively explore appropriate punishment mechanism to promote residents' waste classification. In addition to increasing fines, the government must increase supervision.

2.2 The game between government and residents

The government adopts fines to supervise the behavior of residents and punish unclassified residents. The following assumptions are made: (1) Players are government and residents, and both are not completely rational. (2) The government's decision set is {supervision, non-supervision}, and the residents' decision set is {classification, non-classification}. (3) All parameters are positive.

The parameters are explained as follows:r represents the long-term return of the residents' waste classification to improve the environment.R represents the return of the government when the residents classify waste. c_1 represents the physical and time cost of the residents for waste classification. C_1represents the government's supervision cost.c_2 represents the future environmental deterioration expenditure caused by residents not classify waste. C_2represents the reputation loss that the government does not supervise when residents do not classify waste. f represents the government's punishment for residents who do not classify waste.The payment matrix between government and residents is shown in Table 2.

Table 2   Game Payoff Matrix Between Government and Residents

		Government	
		supervision	non-supervision
Residents	classification	$r-c_1$, $R-C_1$	$r-c_1$, R
	non-classification	$-f-c_2$, $f-C_1$	$-c_2$, $-C_2$

Assuming that the probability that residents choose classification strategy is x, the probability of choosing non-classification strategy is $1-x$. E_1 represents the expected return of the classification strategy, E_2 represents the expected return of the non-classification strategy, and E represents the average expected return of the two strategies. And assuming that the probability that the government choose supervision strategy is y, the probability of choosing non-supervision strategy is $1-y$. U_1 represents the expected return of the supervision strategy, U_2 represents the expected return of the non-supervision strategy, and U represents the average expected return of the two strategies.

$$E_1 = y(r - c_1) + (1 - y)(r - c_1) = r - c_1 \tag{6}$$

$$E_2 = y(-f - c_2) + (1 - y)(-c_2) = -yf - c_2 \tag{7}$$

$$U_1 = x(R - C_1) + (1 - x)(f - C_1) = x(R - f) + f - C_1 \tag{8}$$

$$U_2 = xR + (1 - x)(-C_2) = x(R + C_2) - C_2 \tag{9}$$

The replicated dynamic equation of choosing classification strategy is:

$$dx/dt = x(E_1 - E) = x(1 - x)(r + yf - c_1 + c_2) \tag{10}$$

The replicated dynamic equation of choosing supervision strategy is:

$$dy/dt = y(U_1 - U) = y(1 - y)[f - C_1 + C_2 - x(f + C_2)] \tag{11}$$

Solve the replicated dynamic equations and find that the equilibrium point are: (0,0), (1,0), (1,1),(0,1),((f-C_1+C_2)/(f+C_2), (c_1-c_2-r)/f).

Finally, the Jacobian matrix is:

$$J = \begin{pmatrix} (1 - 2x)(r + yf - c_1 + c_2) & x(1 - x)f \\ -y(1 - y)(f + C_2) & (1 - 2y)[f - C_1 + C_2 - x(f + C_2)] \end{pmatrix} \tag{12}$$

Analysis of the Jacobian matrix, and get the following four results.

①If c_1-r<c_2, (1,0) is the evolutionary stable strategy. It shows that the residents choose waste classification, and the government does not choose supervision.

②If $c_2 \leq c_1$-r<f+c_2 and C_1<C_2+f, ((f-C_1+C_2)/(f+C_2), (c_1-c_2-r)/f) is the evolutionary stable strategy. It shows that the residents choose waste classification with the probability of (f-C_1+C_2)/(f+C_2), and the government chooses supervision with the probability of (c_1-c_2-r)/f.

③ If $c_2 \leq c_1$-r and $C_1 \geq C_2$+f, (0,0) is the evolutionary stable strategy. It shows that the residents choose waste non-classification, and the government chooses non-supervision.

④ If c_1-$r \geq f$+c_2 and C_1<C_2+f, (0,1) is the evolutionary stable strategy. It shows that the residents do not choose classify waste, and the government chooses to supervise.

In the real world, it is difficult to achieve the first situation, because residents always pay attention to immediate interests and ignore long-term interests. Many residents do not spontaneously classify waste. The third case is a common phenomenon, so it is necessary to improve the probability of residents' waste classification. This probability is positively correlated with the government's punishment for unclassified residents, so the government needs to increase punishment for unclassified residents.

From the above two games, it is found that the government's punishment mechanism can promote residents to classify waste.

3 Conclusion

Based on the behavior of residents in the process of implementing waste classification, this paper constructs the game models between residents and residents, government and residents. The analysis shows that the punishment will affect the residents' decision. When the punishment reaches a certain intensity, it can improve the residents' waste classification probability. In addition, it has also been found that the certain level of government supervision can also increase the probability of waste classification.

Based on the above research, the following suggestions are given. (1) The government needs to establish a strict punishment mechanism. In addition to providing direct economic penalties, the government can also record the behavior of residents' waste non-classification into the integrity system, conduct community broadcasting criticism for residents who do not classify and so on.(2) The government should implement effective supervision measures. First, the government should clarify the supervision responsibilities of various functional departments and formulate clear assessment rules. Secondly, the government can introduce professional third-party supervision or openly select social supervisors from the public. Finally, the government can consider the diversification of supervision

forms.

　　Promoting the residents' waste classification can also be seen as a process of promoting human cooperation. Human cooperation is a very complicated activity. Future research can be combined with some disciplines that have traditionally been considered impossible, such as statistical physics (Perc et al., 2017), to explore ways to implement waste classification.

Political Instability and Economic Growth: Evidence from Madagascar (1996-2011)

Andriamahery Anselme, Zhou Jun
School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: andriamaheryanselme@yahoo.fr, zhoujun601@sina.com)

Abstract: The present paper aims to investigate the influence of political instability on Madagascar economic growth for the period 1996 to 2011. The theoretical study explores different models that explain the effect of political instability on growth while the empirical section discusses the evidence on the predictions generated by theoretical models. Despite its recent progress, Madagascar has faced by a cycle of profound political instability and, therefore, it deteriorates economic growth. To estimate its effects, we test the correlation between political stability and growth by using the ARDL model approach which is significantly positive. The results suggest that, in Madagascar with a high propensity of regime change, growth is significantly low. This implies negative effects of instability on growth.
Key words: Political instability; Economic growth and ARDL model

1 Introduction

In today's world, political instability remains the most questionable issues and hard to tackle especially in Sub-Saharan Africa (SSA). The relationship between political instability and economic growth has been debating for longtime among the economists. Madagascar, an Indian Ocean island country, has witnessed cycles of political instability for years (Andriamahery and Zhou, 2018). Political instability has its main factors including government instability, internal and external conflicts, corruption, democratic accountability and bureaucracy quality (Kaplan and Akçoraoğlu, 2017). We just focus on how instability affects economic growth in Madagascar.

Political stability plays a significant role in economic growth of a country in point of view of modern theory of political economy. Thus, an unstable political system could seriously hinder economic growth. Within the theoretical framework of modern political economy, a government is considered to be inefficient if policy objectives vary over a short period of time. Thus, coalition governments are a serious threat and to be more prone to the political stability.

Madagascar's long-term economic performance is a true enigma in which its GDP per capita has been declining steadily since independence in 1960. Hence, each time the country has found a path to growth, this has been hindered by some socio-political instability (Razafindrakoto et al, 2015). This negative growth has great effects in every parts of Madagascar economy and can hamper the goal of poverty reduction (Helal, 2013).

The year of 1996 marked a birth of Second Republic of Madagascar which ushered in what was expected to be enduring democracy. Since 1996, however, Madagascar has been enjoying uninterrupted democratic governance which presupposes political stability yet the growth of the economy seems illusionary. It is this reality that informed this study given the fact that democratic governance should ordinarily, among other things, usher in societal development, inclusion and participation of citizens in governance. Also, studies on the impact of political instability on economic growth in Madagascar are scarce in literature, even the few available ones in literature are more of content analysis. This study, therefore, differs from existing studies in that, it quantitatively investigated the relationship between political instability and economic growth in Madagascar using time series data over the period between 1996 and 2011. We only study the data from that period as they are considered most recent in terms of their availability and also involve the era of longest uninterrupted democratic regimes.

2 Literature Review

2.1 Conceptual Framework

In this paper, political instability is defined as the propensity of a change in the government, either by "constitutional" or "unconstitutional" means. Political instability has negative effect on economic development because it doesn't only disturb market activities and labor relations, but also it affects investment negatively (Chawdhury, 2016). We know that accountability and transparency on the government level as well as a stable political environment attract investment which leads to increase growth of the country. Indeed, the majority of academic research reveals that corruption impedes

economic growth and creates political instability which lowers the quality of public investment (Gaspar and Hagan, 2016).Higher political instability leads to lower GDP per capita growth rates via its effect on productivity growth as well as physical and human capital accumulation (Aisen and Veiga, 2013). Weak economic performance is one of the determinants of poverty and instability seems only to exacerbate poverty in Madagascar.

According to (Kindleberger in Jhingan, 2007), Economic growth as more output, while economic development implies both more output and changes in the technical and institutional arrangement by which it is produced and distributed. Friedman in his fashion defines growth as an expansion of the system in one or more dimension without a change in its structure, and development as an innovative process leading to the structural transformation of a social system. According to Iyoha (1999), economic growth is defined as a persistent rise in the national income over a range of time of not less than five years. In economic growth theory, growth is usually calculated in real terms, that is, inflation-adjusted terms, in order to obviate the distorting effect of inflation hence, the use of real gross domestic product in most growth literature.

2.1 Theoretical and empirical framework

Many researchers have developed the relationship between political stability and economic growth in various ways, however, most of their studies link political instability rather than stability with economic growth. For example, using cross-sectional analysis, (Barro, 1991) stated that economic growth is negatively affected by political instability.

Taking a panel data of four countries, (Bildirici, 2004) examined the relationship between political instability and economic growth which the study found out that there is a negative relationship between the variables under study. (Yunis et al., 2008) investigated the effects of various political instability factors on economic growth for selected Asian countries during 1990-2005. Their study found close relationship between political stability and economic growth and the results showed that the role of political stability is more important than economic freedom. (Aisen and Veiga, 2010) used GMM estimator for linear dynamic panel data models on a sample of 169 countries, and 5-year periods from 1960 to 2004 to investigate the link between political instability and economic growth and found that lower growth is associated with higher degree of political instability. Also, (Muñoz, 2009) used ARDL framework to investigate the link between political instability and economic growth for Venezuela for the period of 1983 to 2000. He found that political instability affects growth negatively but not through the channel of investment.

In terms of country studies, Campos and (Karanasos, 2007) used power ARCH framework with yearly data for Argentina for the period 1896-2000 and came up with the conclusion that both the informal political stability (assassinations and strikes) and the formal political stability (constitutional and legislative changes) have direct negative effect on economic performance. The effect of formal instability was stronger in the long run while the effect of informal instability was stronger in the short run in their study.

3 Research Methodology

In order to study the relationship between political instability and growth in Madagascar,the hypothesis of this study is stated like this follows: political stability affects positively on economic growth while there is a negative effect of political instability on Madagascar economic growth.

3.1 Development of model

Political instability, as opposed to political stability which is a description of a well-functioning government (Andriamahery and Zhou, 2018), is associated with greater uncertainty regarding future economic policy. It is likely to harmfully affect investment and, therefore, physical capital accumulation. In fact, (Alesina and Perotti, 1996) have identified a negative relationship between political instability and investment. Therefore, political instability may affect negatively human capital accumulation. To uncover this relationship, we adopted an augmented Solow production function (Solow, 1956) that, in general, makes output a function of physical capital, human capital, labor, and technology. In a Cobb–Douglas production function framework, we have:

$$Y = A(PK)^{\alpha} \ L^{\beta} \ (HK)^{\theta} \tag{1}$$

Where Y is total output, while PK, L, HK and A respectively express the physical capital, labor, human capital stock and technology.

The technology A is broken into constant a and country specific deviation ε and became $A=a+\varepsilon$ as stated in (Mankiw et al., 1992). With this, they successfully dump the effect of technology into the

regression error term. Considering logarithm and differentiating, equation (1) becomes:

$$Y = \alpha + 6PK + \beta L + \theta HK + \varepsilon \qquad (2)$$

(North, 1990) stated that institutions in a country determine its long-run economic performance. The institutions, that North mentioned here, are quality of government, political stability, independent judicial system, political rights, property rights and so forth. Political stability can directly affect the growth through affecting Total Factor Productivity (TFP) of Madagascar. Therefore, we can modify the augmented Solow model in equation 2 in line with his argument and the model for the study becomes:

$$Y = \alpha + 6PK + \beta L + \Phi PI + \delta GE + \Omega RC + \varepsilon \qquad (3)$$

Where *PI, GE* and *RC* stand respectively for Political Stability Index, Government Effectiveness and Regime Changes. While 6 and β are the estimated coefficients, *Φ, δ* and *Ω* are the Total Factor Productivity terms and ε is the intercept term.

3.2 Data

This paper used mainly secondary data on the Malagasy economy between 1996 and 2011 which is a period related to the availability of data. They were sourced from National Institute of Statistics of Madagascar (INSTAT), (International Monetary Fund (IMF), World Bank, 2011), Central Bank of Madagascar and World Bank's GlobalEconomy.com. Data from the above sourced were cross-checked and matched to ensure uniformity. The variable takes zero (0) for any change of government at the center and one (1) if otherwise which is constructed by the author.

3.3 Methodology

The Autoregressive Distributed Lag Model (ARDL) is used in this study to estimate the relationship between political instability and economic growth in Madagascar. (Pesaran and Shin, 1998) developed first the ARDL Bounds Cointegration Test and later extended by (Pesaran et al., 2001). Well, unlike the Johansen-Juselius cointegration test, this model allows for cointegration testing even when all variables are integrated of order I(0) or I(1), or a mix of the two. In addition, it is not sensitive to the values of error parameters hence making it ideal for small sample estimation. Lastly, the model is proven to provide unbiased long run estimates with valid t-statistics even when some of the cointegrated variables are endogenous (Amusa et al., 2009). The above features makes the ARDL Bounds approach to cointegration ideal for use in this paper particularly since the data sample is small and the variables are a mix of I(0) and I(1). Therefore, an ARDL representation of equation (2) can be specified in equations as follows:

$$\Delta Y = \alpha \sum_{i=1}^{p} \Psi \Delta Y_{t-1} + \sum_{i=1}^{p} 6\Delta PK_{t-1} + \sum_{i=1}^{p} \beta \Delta L_{t-1} + \sum_{i=1}^{p} \Phi \Delta PI_{t-1} + \sum_{i=1}^{p} \delta \Delta GE_{t-1} + \sum_{i=1}^{p} \Omega \Delta RC_{t-1} + \lambda EC \quad (4)$$

Where: EC is the residuals (the error correction term) obtained from equation 3. Ψ is the coefficient of the lagged total output and λ is the speed of adjustment parameter that is expected to be negative and statistically significant to further confirm the existence of a cointegrating relationship.

3.4 Estimation and discussion of results

The application of unit root tests in the ARDL method might still be needed in order to ensure that the regression is integrated of order one and none of the variables is integrated of order 2 or beyond because the computed F-statistics provided by (Pesaran et al., 2001) are valid for only variables that are I(0) or I(1). The first step in the estimation of time series data set is to verify the existence or otherwise of unit root. This is particularly important because, if an OLS regression is estimated with non-stationary data and residuals, the regression estimates are most likely spurious. To do this, the logged series were first plotted against time to observe their properties (Figure 1).

Madagascar Economic Growth   Madagascar Government Effectiveness
Figure 1   Line Plot of the Variables Used for the Study

The trends in Figure 1 revealed wide fluctuations likely to produce positive autocorrelation which makes a series non-stationary. For that reason, it is important to test for the stationarity and correct the non-stationary series. The best way to correcting the non-stationary series into a stationary series is through the method of differencing. And we use the Augmented Dickey Fuller Test (ADF) to verify the stationarity or otherwise of the original and the differenced series, based on 5% significance level. The table below shows us our result:

Table 1   ADF Unit-Root Test Result for the Series

Series	ADF T-Statistic @ Level	ADF T-Statistic @ 1st Difference	Decision
EG	-3.6936(-3.0810)	-	Stationary @ I(0)
PK	-0.8017(-3.0810)	-3.7695(-3.1199)*	Stationary @ I(1)
L	-1.0183(-3.1199)	-6.8739(-3.0889)*	Stationary @ I(1)
PI	-8.0127(-3.1199)*	-	Stationary @ I(0)
GE	-4.7091(-3.0810)*	-	Stationary @ I(0)
RC	-6.2450(-3.1199)*	-	Stationary @ I(0)

Source: Author's computation (Eviews 9.0) and number in brackets are the critical values at significance level of 5%.

Table 1 shows a mixed order of integration (I (0) and I (1)) among the variables. The variables EG, PSI, GE and RC are integrated of order zero (I(0)) while PK and L variables are integrated of order one (I(1)). Consequently, since the variables under the study are not integrated of the same order and none of the variables is stationary at I(2), the application of ARDL is justified. In addition, the use of bounds approach to cointegration over other conventional approaches need the variables to be integrated of the same order.

3.5 ARDL bounds test for cointegration

Taking a consideration of the use of annual data and a relatively small sample size, a lag length of 1 is used in the bounds test, (Pesaran and Shin, 1998). The critical values used in this paper are extracted from the ARDL results using Microfit software. And the bound test results are shown in table 2.

Table 2   ARDL Bounds Test for Cointegration

F-statistic	Critical Values	Lower bound	Upper bound value
	1%	3.7421	5.0614
5.21	5%	2.6051	3.9403
	10%	2.1077	3.2851

Remark: Critical Values are cited from (Pesaran et al., 2001: p.300), the last table CI (iii) which is no trend for K = 5.

F_{EG} (PK, L, PI, GE, RC) as the computed F-statistics value in Table 2 (5.21) is above the upper bounds of the critical value of 4.01 at significance level of 5%. This implies that there is cointegration (long run relationship) between Economic Growth, Capital Investment, Unemployment Rates, Political Stability Index, Government Effectiveness Index, and Regime Change. As a result, the null hypothesis of no cointegration between the variables is rejected and the alternative hypothesis is accepted implying that, a long run relationship exists among the variables of the study.

3.6 Estimated long run relationship

The existence of a long run relationship among the variables of the study suggests the estimation of long run coefficients and short run dynamic parameters. The estimation of the ARDL model is based on the Schwarz Bayesian Criterion (SBC). The table below shows the long-run results and the diagnostic test statistics of the estimated model:

Table 3   Estimated Long Run Relationship using ARDL Approach (0,1,1,1,1,0)

Dependent variable: EG

Regressor	Coefficient	Standard Error	T-Ratio	Prob
PK	5.3645	0.8745	6.1344	0.000
L	-2.0411	0.4452	-4.5847	0.001
PI	0.2541	0.0354	7.1780	0.000
GE	-5.6702	0.6354	-8.9238	0.000
RC	-0.1412	0.1052	-1.3422	0.245
INTP	4.3654	0.2411	18.106	0.000

The table 3 shows the result of the estimated coefficients of the long run relationship which indicates that capital investment (PK) and political stability index have a positive and significant effect on economic growth at probability level of 5%. Their estimated coefficients are respectively 5.3645 and 0.2541 which imply that a unit change in capital investment and political stability will affect economic growth positively by 5.3645 and 0.2541. However, unemployment rate (L), government effectiveness index (GE) and regime change (RC) affect negatively on economic growth in Madagascar. A unit change in each will affect respectively economic growth by 2.0411, 5.6702 and 0.1412. All the variables except regime change (RC) are significant at probability level of 5%. The short run relationship result is presented here below:

Table 4   Estimated Short Run Relationship using ARDL Approach

Dependent variable is d(EG)

Regressor	Coefficient	Standard Error	T-Ratio	[Prob]
d(PK)	2.1640	0.8291	2.6104	[.028]
dL	-4.4842	0.6454	-6.9479	[.000]
d(PI)	2.5653	0.3354	7.6574	[.000]
dGE	-10.095	0.6354	-15.888	[.000]
dRC	-0.2434	0.1052	2.3137	[.031]
ECM(-1)	-0.7851	0.2144	-3.6618	[.011]
R-Squared	0.88940	R-Bar-Squared		0.74194
S.E. of Regression	5.37650	F-Stat. F(5,9)	9.6500	[.002]
DW-statistic	1.79021	Schwarz Bayesian Criterion		-51.8288

Table 4 shows the results of the short run dynamic coefficients associated with the long run relationships obtained from the error correction model. The signs of the short run dynamic interactions are consistent with that of the long run relationship. The estimated error correction coefficient of -0.7851 with a probability value of 0.011 is highly significant. It has the correct sign, and implies a fairly high speed of adjustment to equilibrium after a shock. Approximately 78.5% of disequilibria from the previous year's shock converge back to the long run equilibrium in the current year. All the variables of the study were found to be significant at probability level of 5%.

3.7 Diagnostic tests

The Lagrange multiplier test of residual serial correlation outcome, Ramsey's RESET test, Jarque Bera normality test and Heteroscedasticity test indicate the model passed all the tests (Table 5). Hence, this implies that it has a correct functional form and its residuals are serially uncorrelated, normally distributed and homoscedastic.

Table 5   ARDL Model Diagnostic Test

| LM Test Statistics		Prob.
Lagrange multiplier test of residual serial correlation	$\chi^2(1) = 0.8323$	0.1422
Ramsey's RESET test using the square of the fitted values	$\chi^2(1) = 1.4152$	0.6337
Based on a test of Skewness and Kurtosis of residuals	$\chi^2(1) = 0.6496$	0.9852
Based on the regression of squared residuals on squared fitted values	$\chi^2(1) = 3.4512$	0.4851

4 Conclusion

The use of the Autoregressive Distributed Lag Model (ARDL) in this study helps us to find out the relationship between political instability and growth in Madagascar. The result of the estimated coefficients of the long run relationship indicates that capital investment (PK) and political stability index have a positive and significant effect on economic growth. In addition, using time series data on different variables from the bound testing approach to cointegration, the analysis result revealed that there is a positive and significant relationship between political stability and economic growth both in the long run and short run. However, political stability is the opposite of political instability, then, the study concludes that political instability affects negatively economic growth in Madagascar. In addition, a stable political environment is a key element for economic growth and the Madagascar government should find out the root causes of political instability and try to mitigate its effects in order to ensure sustained and inclusive economic growth in Madagascar. In future work, we propose examining investment, output and the composition of government change in a structural framework, which will give us a more precise understanding of the sources of this aspect of instability to growth.

Study on Income Gap Between Urban and Rural Residents in Henan Province

Ruan Jin, Cheng Yanxia
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 648926323@qq.com, chengyanxia221@126.com)

Abstract: In recent years, Chinese rapid economic development and the large income gap between urban and rural residents have become the most compelling issue in Chinese economic development. This article takes Henan Province as a research object and conducts an empirical research on the history, current situation, and future trends of income disparity between urban and rural residents in Henan Province. It also analyzes the four sources of household income as the starting point. Four income sources have different effects on the income gap between urban and rural residents.Finally, the conclusion is drawn that the income gap between urban and rural residents in Henan will slow down and how to reduce the income gap between urban and rural residents in Henan province.
Key words: Residence income; Urban-rural gap; Sources of income; Economic development

1 Introduction

China is one of the countries with the greatest gap between urban and rural areas. As is known to all, if the urban-rural income gap is too large, it will be detrimental to economic development and social stability and the reform process. According to relevant department statistics, the income gap between urban and rural areas in Henan Province ranks very high among the 34 provincial-level administrative units in the country. The income gap is due to the unreasonable distribution of income. In the past, many Western schools studied the theory of income distribution, including the Marx doctrine, neo classical economics, Keynes school and so on. Many scholars in China have also studied the theory. Among them, the "inverted U" theory put forward by Professor Chen Zongsheng was earlier known. Later, many studies on Henan province appeared, Dai Xiaoli pointed out that the absolute number of rural residents in Henan is far lower than the income of urban residents, but the annual growth rate is slightly higher than the annual growth rate of urban residents'income. Wang Chenxi thinks that if we want to narrow the income gap between urban and rural residents in Henan Province, we must first increase the income of farmers. Qin Buhuan pointed out that the gap between the living standard of urban and rural residents in Henan province has been narrowing year by year from the Engel coefficient alone, but its Gene coefficient is still high. Formerly, scholars have studied from the qualitative point of view, lack of quantitative proof, and have less research on the classification of income sources. This paper, based on the classification of income sources, combined with sufficient data to study the income gap between urban and rural residents in Henan province and draws a conclusion. Therefore, this research topic not only has important implications, but also reflects the actual policy reference value.

2 Analysis of Income Gap between Urban and Rural Residents in Henan Province

2.1 The status of income gap between urban and rural residents in henan province

The research data in this paper select the income of urban and rural residents in Henan Province from 1992 to 2016. The data analysis was conducted using the indicators of urban-rural per capita income difference and urban-rural income ratio. The former expresses the absolute income gap between urban and rural residents, while the latter expresses its relative gap. The trend of these two indicators is shown in Figure 1.

Since 1992, the per capita disposable income of urban and rural residents in Henan Province has significantly increased, but their respective increases have led to changes in the gap between the two. It can be seen from Figure 1 that the income gap between urban and rural residents in Henan Province has continued to widen over the years, indicating that the income of urban and rural residents in the region has grown rapidly while the absolute gap has also changed significantly. Figure 1 also shows that from 1992 to 2016, the urban-rural income ratio in Henan province fluctuates continuously and reaches a peak in 2003 and then steadily decreases. This trend shows that the rate of widening urban-rural income gap has slowed in Henan Province, but the urban-rural income ratio is still hovering at a high level. This situation is still very serious.
**Figure 1   Trends in Rates and Ratios of Urban and Rural Residents' Income
in Henan Province from 1992 to 2016**

2.2 Analyzing the income gap between urban and rural residents in Henan Province from the perspective of income sources

The source of residents' income basically consists of the following four blocks: wage income, operating income, property income, and transfer income. This article selected data from four income sources of urban and rural residents in Henan Province from 2006 to 2015 for a brief analysis. Figure 2 shows the average proportion of income from sub-items of urban and rural residents in Henan Province from 2006 to 2015.
Figure 2   Average Income of Sub-items of Urban and Rural Residents in Henan Province from 2006 to 2015

As can be seen from Figure 2, the primary source of income for urban residents is wage income, which accounts for about 67%. The ranking of the other three sources of income in the total income is in descending order: transfer income, operating income, and property income; and for rural residents, operating income is its main source of income, and the other three the proportion of the income of the items in the total income from big to small is wage income, transfer income, and property income. Obviously, the factors that can affect the four residents' sources of income will inevitably lead to changes in the income gap between urban and rural residents. Based on the collected data, the following will briefly analyze its impact on the urban-rural income gap in Henan Province from these four aspects.
2.2.1 Wages income

Wages income occupies a large proportion of the income of urban and rural residents. It can be seen that the difference in wage income between urban residents and rural residents has the greatest effect on the overall income gap between the two. The main reasons are: 1. Wage income accounts for the largest proportion of urban residents' income and it also occupies a large proportion of the income of rural residents. 2. The wage gap between urban and rural residents is too large. In 2006, the ratio of per capita gross income of urban and rural residents in Henan Province was 3.01:1.00, and the ratio of wage income to income was 6.71:1.00. By 2010, the former was 2.88:1.00, and the latter was 5.56:1.00; in 2015, the former It is 2.36:1.00 and the latter is 4.19:1.00. We can conclude that the most important reason that has caused the excessive urban-rural income gap in Henan Province is wage income. In addition, we can generally see that the proportion of wage income in the total per capita income of

farmers shows an upward trend in the overall data. And the proportion of this income in urban residents' per capita total income has decreased. This change has made the impact of the wage income gap between urban and rural residents in Henan Province on their total income gap. However, although the impact of the wage-income gap has weakened, the gap has still had a large impact on the overall income gap between urban and rural residents in Henan.

2.2.2 Operating income

Operating income accounts for the largest proportion of rural residents' income in Henan Province, and it accounts for a relatively large proportion of urban residents' income. It can be considered that the difference in the operating income gap between urban and rural residents has a greater impact on the change in the overall income gap between the two. The following discussion on the specific impact of the relevant data, from 2006 to 2015, the average income per capita of rural residents in Henan Province accounted for an average of 54.7% of the total income, and this indicator in the total income of urban residents at this stage the average accounted for 10.6%, the former is much higher than the latter. On the other hand, from the standpoint of absolute indicators, rural residents have much higher operating income than urban residents. So we can draw a conclusion that operating income makes the overall income gap between urban and rural residents shrink, and this effect is very significant. In short, operating income has played an important role in reducing the income gap between urban and rural residents in Henan Province. The following comparison will illustrate how this effect will change: From 2006 to 2015, the average annual growth rate of urban residents' per capita operating income in Henan Province was 18.67%, while the average annual growth rate of rural residents in this indicator was only It is 6.55%; in 2006, the per capita annual operating income of rural residents in Henan Province was 2.74 times that of urban residents. In 2010, the ratio was 2.19, and by 2015, the ratio was reduced to 1.26. It can be seen that the operational income gap gradually reduces the effect of narrowing the income gap between urban and rural residents in Henan Province. The reason for this result is mainly because the city is much faster than rural areas in terms of the growth rate of operating income.

2.2.3 Property income

This indicator occupies a small proportion of the income of urban and rural residents in Henan Province. The annual average of the selected data was 2.7% and 1.4%, respectively. From this point of view, property income has very little impact on the urban-rural income gap in Henan Province. From these data alone, the difference in the income gap between urban and rural residents in Henan Province affected by this indicator is not clear. The reasons may be: First, due to the short selection year; Second, changes in the capital market. The sources of income have a greater impact, and changes in the capital market are due to a combination of factors. However, it can be determined that the proportion of property income in the total income of urban and rural residents will continue to increase with the continuous development of Chinese market economy and the increase in residents' property. More importantly, due to the cumulative nature of property income itself and the "Matthew effect", property income may grow faster and faster between urban and rural areas. Therefore, looking at this issue from a long-term perspective, we will find that the overall income disparity between urban and rural residents will continue to increase due to the impact of property income.

2.2.4 Transfer income

In 2006, urban residents received 28.7 times as much transfer income as rural residents. In 2010, it was 16.6 times. Until 2013, the ratio was far greater than the ratio of urban and rural residents' wage income. So far, it is precisely because of the transfer income policy of urban-rural division, that is, the impact of the income redistribution system with discrimination that has caused the transfer income gap between urban and rural residents in Henan Province to be so large. However, in the past two years this ratio has suddenly dropped. This may be due to the fact that in recent years, government policies have tended to improve the living conditions of rural residents and provided more and more favorable agricultural policies and policy support.For historical reasons, the long-standing fragmentation of urban and rural areas in China has led rural residents to enjoy some of the social benefits and protection that ordinary urban residents can enjoy. The expansion of the transfer income gap has widened the per capita gross income of urban and rural residents. On the whole, transfer income accounts for much less than wage income in the total per capita income of urban and rural residents. This indicator does not have the impact on income disparity between urban and rural residents in Henan Province as much as wage income. And due to policy tilt, the gap between this indicator will continue to narrow. Therefore, the impact of the transfer income gap between urban and rural residents on the gap between their per capita total income may weaken.

3 Conclusion

Based on the above four aspects, we can draw the following conclusions:

(1) The order of these four sources of income for the income gap between urban and rural residents in descending order is wage income, operating income, transfer income, and property income. Among them, operating income has the greatest impact, and property income has the least influence.

(2) The impact of these four sources of income on the per capita total income of urban and rural residents is also different. Among these, wage income, transfer income, and property income have all contributed to the increase in the total income gap. And operating income will lead to a reduction in the total income gap. The gap in per capita income between urban and rural residents can be narrowed by narrowing the gap between urban and rural residents' wage income, transfer income, and property income.

(3) The four sources of income have different trends in the impact of the per capita household income gap. First of all, in the aspect of widening the gap, there is a marked decline in wage income, followed by transfer income and property income. Second, the trend of operating income, which plays a major role in narrowing the income gap, is also weakening.

Because China is a big agricultural country and Henan province is a big agricultural province, the key to solve the problem of large gap between urban and rural areas is farmers, agriculture and rural areas. In order to further narrow the income gap between urban and rural residents in Henan Province, the following suggestions are put forward:

(1) Strengthen the government's macro-control, use the tax mechanism and reform the income distribution system to improve the income of the rural residents, and also make various preferential policies to encourage and support the input of various social resources to the rural social security through various media, so as to ensure the stability and harmony of the society, and indirectly reduce the income of urban and rural areas. Enter the gap. In addition, it is necessary to ensure that the state subsidies really enter the rural areas, fall into the real place, avoid the loss of funds, which requires the government to effectively regulate the part of the funds.

(2) To further improve the urbanization rate, to provide more abundant employment opportunities for the rural population to work in the city, and then increase the wage income of rural families to reduce the income gap between urban and rural areas. While restraining the excessive increase of urban residents' incomes, we should increase the income of rural residents, emphasize the common development of urban and rural areas, and take cities and towns with rural areas.

(3) Vigorously promote the development of agriculture, promote agriculture by science and technology, and increase the proportion of agriculture in Henan province. It will improve the living standard of farmers, raise farmers' income and narrow the income gap between urban and rural areas as a whole. We should increase the intensity of policy tilt and increase the corresponding public services in rural areas so as to truly benefit farmers.

Abstract: With the theory of super-network and the variational inequality method, this paper establishes a super-network model of economic development in three aspects, builds a new indicator system for measuring economic development, and calculates the equilibrium conditions for the balance of economic development. Firstly, the economic development is divided into three parts: economic growth, ecological environment optimization and scientific and technological progress. Respectively, with the set of measuring indicators in three aspects as a point of super-network and the link between these indicators as a super edge, thus a super-network model is established. Secondly, the hierarchical variable clustering analysis method is used to analyze the tightness of the links among the nodes in the super-network; and the objective function is established by using the partial measurement index, which simplifies the model. Finally, the variational inequality and projection iterative algorithm are used to calculate the equilibrium condition of the whole model. The main conclusions in this paper are as follows: (1) The indicators of economic development are interrelated with each other. (2) It can contribute to the balanced development of the economy in satisfied certain conditions.

Key words: Super-network; Economic development; Clustering analysis; Variational inequality; Equilibrium condition

1 Introduction

In the current information age, the application of super-network theory has spread to various fields, and the introduction of mathematical related calculation methods has made the research of super-network gradually change from qualitative to quantitative, making the established model more scientific.The topology of the super-network is hypergraph, proposed by Claude Berge in 1970. He established the theory of undirected hypergraph systematically and defined the super-network with hypergraph. The vertices v_1, v_2, ..., v_n of the hypergraph form the set V, and the non-empty set e_i is used to describe the edge of the hypergraph, that is, the super edge, and the set of the super side is E, then the binary relationship H=(V, E) forms a super map (Claude Berge,1973). In addition, how to divide the complex network and the advantages and disadvantages of variational inequality algorithms remain to be studied. And how to more closely simulate the construction of objective functions is one of the issues that must be considered when applying this theory.

Initially, in the United States, the Ministry of Commerce calculated the GDP per capita to measure economic development. Later, the American association for overseas development proposed to ignore income and use the actual quality of life index including infant mortality, life expectancy and basic literacy rates in the same weight, which is a great progress compared to only GDP per capita to measure economic development. However, the income is neglected by this index reflection some respects such as the availability of goods and services. Hence, the United Nations Development Program built a Human Development Index (HDI) that also includes income considering health, knowledge and income per capita as factors contributing to measure the country's economic development. HDI adjusts the income per capita of countries by ignoring high incomes to emphasize the diminishing marginal utility of high-income levels. It indicates that higher incomes are not necessarily associated with higher living standards (Office UHDR,1998). However, the HDI measurement method includes the items and the manner they are given the same weight is not scientific, so it is not a perfect indicator.

In this paper, we focus on the three main aspects including economic growth, ecological environment optimization and scientific and technological progress in the various aspects of economic development, which have their own indicators. Since these indicators are closely interrelated to each other, the nesting relationship of the network can be analyzed by super-network theory. The purpose of this paper is to apply the super-network theory to the measurement of economic development, establish the index system and then use the variational inequality to study the equilibrium condition. The rest of the sections in this paper are organized as follows. Section II illustrates the model assumptions and descriptions. Section III describes the data and methodology. Section IV presents results of computation. And finally the paper is included in Section V.

2 Model Assumptions and Descriptions

The interrelationship between the indicators that measure economic development can be described by the network. In all aspects of economic development, this paper selects three main aspects of economic growth, ecological environment optimization and scientific and technological cultural progress. These three aspects have their own measurement indicators, and each indicator is related to each other. The nested relationship of the network including the network can be analyzed by the super-network theory, that is, the theory of super-network is used to analyze the measurement of economic development, and the relationship between each measurement index is described, so as to comprehensively analyze economic development. Then, based on the model establishment, the variational inequality is used to study the equilibrium condition.

The scope of economic development includes economic growth, economic structure optimization, people's living standards, the gap between rich and poor, ecological environment, sustainable development, technological progress and the development of civilization and other aspects. This paper focuses on three aspects consist of the economic growth, ecological environment and science and technology culture to measure, while assuming that these aspects of economic development are the decisive factors. These indicators are discussed in detailed as the following.

2.1 Economic growth

Generally, a country's economic growth is defined as the long-term increase in the ability to provide a growing variety of economic commodities for people, that is, an increase in economic output capacity.

The output capacity of the economy is determined by the factors of production and production technology, thus the capital, manpower, technology used and natural resources are the direct influencing factors (Mankun, 2000). In macroeconomics, the total expenditure is divided into four parts by expenditure: consumption, investment, government purchases and net exports, in which consumption is determined by income, investment is determined by interest rates, government purchases depend on government policies, net exports are directly related to the exchange rate (Xiang Rongmei, 1996). Therefore, GDP per capita, interest rates, government policies, exchange rates, investments and foreign trade can be used as a measure of economic growth. On the other hand, economic growth depends on savings, population growth, and technological progress according to the economic growth model of Solow (Solow, 2004). In addition, the economic growth capacity is affected by the economic structure (Liu Wei, 2008), so the proportion of the three industries to GDP is also one of the indicators that reflect economic growth. From the analysis mentioned above, there are a lot of factors that affect economic growth in the study of national economic growth, often with a series of described indicators. The most important of which are GDP, urban registered unemployment rate, the consumer price index, import and export trade, foreign exchange reserves, the total investment in fixed assets, the tertiary industry added value, disposable income per capita and the natural population growth rate. These indicators are labeled as $a_1, a_2, a_3, a_4, a_5, a_6, a_7, a_8, a_9$, the set of indicators is

$$A = \{a_1, a_2, a_3, a_4, a_5, a_6, a_7, a_8, a_9\}.$$
Figure 1   Indicator Network for Economic Growth

It is clearly shown that these indicators such as GDP, the natural growth rate of the population are not isolated but interrelated. Especially, there is a close relationship between the amount of import and export trade and foreign exchange reserves. In Okun's law, the change in GDP has a direct linear relationship with the unemployment rate. Concretely, the unemployment rate rises by one percentage

point while the growth of the real GDP is generally reduced by 2%. These relationships can be used to simulate the diagram, in which indicators act as the edge nodes, and the link presents the relationship between them, as shown in Figure 1.

2.2 Eco-environment optimization

With economic growth, the ecological environment problems tend to be more and more. Some countries blindly pursue GDP growth at the high expense of the environment, but this kind of way is clearly unsustainable for the economic development. In case of economic growth and environmental protection, we should also pay attention to the ecological environment optimization problem in the economic development.

The energy consumption per unit of GDP is a very common measure of eco-environmental benefits, and the negative impacts of economic growth on the environment are also reflections of economic development, such as industrial waste water waste and emissions, the number of environmental pollution and damage every year (Li Yongkui, 2010). The results of environmental protection are also the vane of ecological environment optimization. The investment in environmental management is determined by the degree of environmental damage and the factors that determine environmental protection and effectiveness. The treatment efficiency of the industrial emission determines the quality of air quality; forest coverage is also a scale; the establishment of nature reserves has played a significant role in the protection of ecological diversity; the use of clean energy has significantly reduced the traditional industry the pollution.

The ecological environment optimization index system can be expressed by

$$B = \{b_1, b_2, b_3, b_4, b_5, b_6, b_7, b_8\}$$
Figure 2   Eco-environment Optimization Indicators Network

Where b_1, b_2, b_3, b_4, b_5, b_6, b_7, and b_8 are the total energy consumption per unit of GDP, the total amount of industrial exhaust emissions, the rate of industrial wastewater discharge and the total area of afforestation, the total area of nature reserves, the total investment in environmental pollution control, the investment of industrial pollution control and the number of environmental pollution and destruction, respectively. Similarly, the topology can be used to approximate this relationship, as shown in Figure 2.

2.3 Technological and cultural progress

The progress of science and technology is to bring people more convenient production and lifestyle. Therefore, the production efficiency continues to improve. Obviously, the use of new materials and technology to reduce environmental pollution is more efficient economic development. In addition, cultural progress is the improvement of the quality of social civilization, spiritual civilization and material civilization is equally important.

In the actual production, the progress of science and technology is often reflected in the emergence of new products (Li Zibiao, 2006). The output value of new products is higher and higher in the whole industrial production value which to a certain extent reflects the welfare the production process of technological progress for people. The proportion of research inputs in GDP has affected the number of research projects, and the innovations by scientific research determine the species and quantity of new products adopted. The proportion of new products reflects the speed of scientific and technological progress. Research and development projects (R&D) expenditure and the number of employees in R&D reflect the degree of attention on the pursuit of scientific research and development progress. From the

aspect of cultural progress, education has a direct effect, so the proportion of cultural industries in GDP and the proportion of investment in education can be used to measure the development of culture Hence, the development of education is reflected in a series of indicators such as adult literacy rate, school-age children enrollment rate, the quality of enterprise employees, per capita education and etc.

The collection of scientific and technological progress indicators as
$$C = \{c_1, c_2, c_3, c_4, c_5, c_6, c_7, c_8, c_9\},$$
Figure 3   Scientific and Technological Progress Indicator Network

Where c_1, c_2, c_3, c_4, c_5, c_6, c_7, c_8, c_9 are the output value of new products, R&D funds internal expenses, R&D staff full-time equivalent, the technical market turnover, the number of scientific and technological achievements, cultural institutions, the total income of the performing arts group, school-age children net enrollment rate and education funding, respectively. The topological structure is shown in Figure 3.

2.4 Economic development super-network model

The measurement of economic development can be carried out mainly from three aspects: economic growth, ecological environment optimization and technological and cultural progress. These three aspects measure economic development from different angles and have a certain relationship between them and each other. The above three indicators are discussed separately, and these indicators and the linkages between them are now used to establish a super-network model for measuring economic development. As mentioned above, we discuss the three index systems, and we now use these indicators and the link between indicators to establish a super-network model to measure economic development.

From the perspective of economic development, this network can be used to construct a super-network. The economic development super network can be expressed as: $G = (V, E)$, where V is the set of nodes, and V = {A is the set of nodes of economic growth index, B is the set of nodes of ecological environment optimization index, C is the set of nodes of scientific and technological progress indicators, E is the set of edges, and $E = \{E_{A-A}, E_{A-B}, E_{A-C}, E_{B-B}, E_{B-C}, E_{C-C}\}$. Topology of the super-network is called hypergraph. It can use a plan to simply simulate the hypergraph, as shown in Figure 4.
Figure 4   The Hypergraph Model Preliminarily Simulated of the Economic Development Index System

3 Data and Methodology

In the following, mathematical relations will be used to quantify the relationship between the strengths and weaknesses of these links in a more scientific way. Firstly, the quantitative analysis is carried out by using the statistical software to obtain the core indicators and the tightness of the links between the indicators, namely the cluster analysis. Then variational inequality is used to study the equilibrium conditions the model should meet.

3.1 Cluster analysis

There are total 26 indicators in the super-network model for economic development, and the degree of affinity among the indicators is different. When all the variables are taken into account to measure the economic development, the workload is too large and inefficient. Therefore, we can use cluster analysis method to select the core indicators with the tightness among indicators as a standard for further study. Cluster analysis is usually done by using statistical analysis software, thus, the SPSS software is used in this paper. With economic variables processed, they become indicators that can be compared to each other without a scale. To reflect the status of economic development fully, the annual growth rate index of each indicator is adopted. The calculation method is as follows: the index of this year's growth index = this year of the index value / index value of the previous year×100). The value of indicators from year 2004 to year 2015 can be found in the Chinese statistical yearbook. According to the calculation method above, the data can be processed to the growth index of 26 indicators in the ten years from 2005 to 2015, and then can use statistical software to analyze the data to achieve clustering.

From the third cluster analysis, it can be seen that the highest correlation between the other variables is the five variables in the first category as the following: a_1 (GDP index), a_3 (consumer price index), a_7 The three-industry added value index), a_8 (per capita disposable income index) and c_9 (education expenditure index), these variables are closely linked to each other, therefore, they are the most important indicators of economic development in the measurement; followed by higher correlation b_2 (total emissions of industrial emissions), c_4 (technical market turnover index), c_8 (net enrollment rate of school-age children) in category 2.

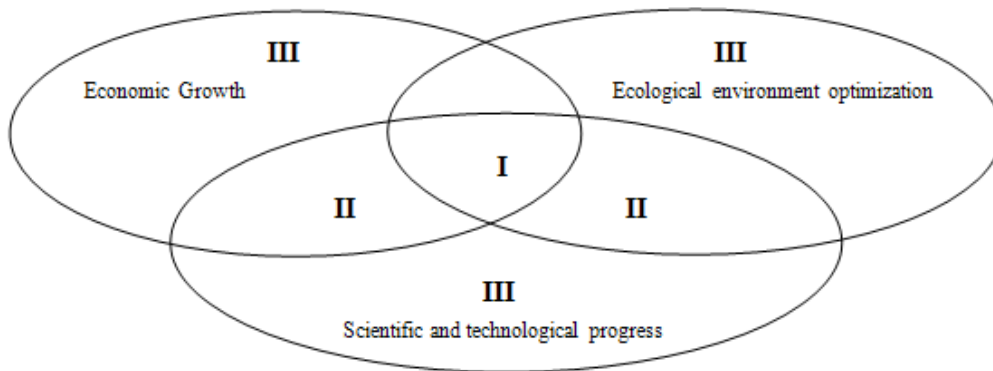
After the division of 26 indicators, it is possible to simplify the model. Namely, ignoring the indicators in Part III, we only consider the eight indicators in the part I and part II, and keep these important indicators as the core indicators of economic development.


Figure 5   Simplified Model after Cluster Analysis

（Which I, including a_1, a_3, a_7, a_8, c_9 five indicators; II, including b_2, c_4, c_8 three indicators; III, including other indicators）

3.2 Objective function of the model

From the established super-network model of economic development measurement indicators, we can analyze the objectives of economic development from various indicator systems. When analyzing the objectives of economic development from three aspects: economic growth, ecological environment optimization, and scientific and technological cultural progress, each part should achieve coordinated development to achieve the optimization of the entire system, that is to achieve the most favorable economic development under the existing resource constraints while achieving the goal of optimizing their respective development by realizing the game trade-offs of economic growth, ecological environment and scientific and technological cultural progress. In the results of cluster analysis, the model is simplified to a system with only eight indicators by considering a_1, a_3, a_7, a_8 in economic growth, b_2 in the aspect of ecological environment optimization, and c_4, c_8, and c_9 in scientific and technological progress.

So we can get the objective function of the economic growth maximization as followed: Max $f(a_1, a_3 - p_0, a_7, a_8)$.

It can write the objective function to optimize the ecological environment: Min $g(b_2)$.

We can get the objective function to maximize the scientific and technological progress: Max $h(c_4, c_8, c_9)$.

The objective function maximizing the economic development can be obtained by the objective function maximizing the three aspects above:

$$\text{Max } \lambda f(a_1, a_3 - p_0, a_7, a_8) - \mu g(b_2) + \eta h(c_4, c_8, c_9)$$

Which, λ , μ , η , represent the weight of contributions the three parts making in the economic development.

The objective function maximizing the economic development obtained in the above can be transformed into the variational inequality form:

$$
\left(\begin{aligned}
&\sum_{i=1,3,7,8}[\mu\frac{\partial g(b_2)}{\partial a_i}-\lambda\frac{\partial f(a_1,a_3-p_0,a_7,a_8)}{\partial a_i}-\eta\frac{\partial h(c_4,c_8,c_9)}{\partial a_i}]\times(a_i-a_i^*)\\
&+\sum_{j=2}[\mu\frac{\partial g(b_2)}{\partial b_j}-\lambda\frac{\partial f(a_1,a_3-p_0,a_7,a_8)}{\partial b_j}-\eta\frac{\partial h(c_4,c_8,c_9)}{\partial b_j}]\times(b_j-b_j^*)\\
&+\sum_{h=4,8,9}[\mu\frac{\partial g(b_2)}{\partial c_h}-\lambda\frac{\partial f(a_1,a_3-p_0,a_7,a_8)}{\partial c_h}-\eta\frac{\partial h(c_4,c_8,c_9)}{\partial c_h}]\times(c_h-c_h^*)
\end{aligned}\right)\geq 0 \tag{1}
$$

3.3 Projection iterative algorithm

At present, there are three main methods for solving the variational inequality. They are projection algorithm, non-smooth equations and smoothing method. The projection algorithm is a simple algorithm that relies mainly on the projection iteration $x^{k+1}=P_{\Omega_k}(x^k-\alpha_k d_k)$, which Ω_k is the convex set containing X, d_k is the search direction, $\alpha_k>0$ is the step, $P_{\Omega_k}(\cdot)$ is the vector x to the projection on the set Ω_k, that is $P_{\Omega_k}(x)=\arg\min\{\|x-y\|,y\in\Omega\}$.

A typical modified iterative method with an initial solution in a feasible domain is commanding $x^{k+1}=P_{\Omega_k}(x^k-\alpha F(\overline{X}^k))$, where $\overline{X}^k=P_{\Omega_k}(x^k-\alpha F(x^k))$; α is a positive number.

We present the steps to solve the variational inequality by this method:

Step 1: Suppose $X^0\in K$, and command $0\leq\alpha\leq\frac{1}{L}$, Where L is the Lipsets constant, k is the number of iterations, and k = 1

Step 2: Iterative calculations. First calculate $(\overline{a}_1^k,\overline{a}_3^k,\overline{a}_7^k,\overline{a}_8^k,\overline{b}_2^k,\overline{c}_4^k,\overline{c}_8^k,\overline{c}_9^k)\in K$,so that:

$$
\left(\begin{aligned}
&\sum_{i=1,3,7,8}\overline{a}_i^k+\alpha[\mu\frac{\partial g(b_2^{k-1})}{\partial a_i}-\lambda\frac{\partial f(a_1^{k-1},a_3^{k-1}-p_0,a_7^{k-1},a_8^{k-1})}{\partial a_i}-\eta\frac{\partial h(c_4^{k-1},c_8^{k-1},c_9^{k-1})}{\partial a_i}]-a_i^{k-1}\}\times(a_i-\overline{a}_i^k)\\
&+\sum_{j=2}\overline{b}_j^k+\alpha[\mu\frac{\partial g(b_2^{k-1})}{\partial b_j}-\lambda\frac{\partial f(a_1^{k-1},a_3^{k-1}-p_0,a_7^{k-1},a_8^{k-1})}{\partial b_j}-\eta\frac{\partial h(c_4^{k-1},c_8^{k-1},c_9^{k-1})}{\partial b_j}]-b_j^{k-1}\}\times(b_j-\overline{b}_j^k)\\
&+\sum_{h=4,8,9}\overline{c}_h^k+\alpha[\mu\frac{\partial g(b_2^{k-1})}{\partial c_h}-\lambda\frac{\partial f(a_1^{k-1},a_3^{k-1}-p_0,a_7^{k-1},a_8^{k-1})}{\partial c_h}-\eta\frac{\partial h(c_4^{k-1},c_8^{k-1},c_9^{k-1})}{\partial c_h}]-c_h^{k-1}\}\times(c_h-\overline{c}_h^k)
\end{aligned}\right)\geq 0 \tag{2}
$$

And then through the iterative calculation $(a_1^k,a_3^k,a_7^k,a_8^k,b_2^k,c_4^k,c_8^k,c_9^k)\in K$, so that:

$$
\left(\begin{aligned}
&\sum_{i=1,3,7,8}a_i^k+\alpha[\mu\frac{\partial g(b_2^{k-1})}{\partial a_i}-\lambda\frac{\partial f(a_1^{k-1},a_3^{k-1}-p_0,a_7^{k-1},a_8^{k-1})}{\partial a_i}-\eta\frac{\partial h(c_4^{k-1},c_8^{k-1},c_9^{k-1})}{\partial a_i}]-a_i^{k-1}\}\times(a_i-\overline{a}_i^k)\\
&+\sum_{j=2}b_j^k+\alpha[\mu\frac{\partial g(b_2^{k-1})}{\partial b_j}-\lambda\frac{\partial f(a_1^{k-1},a_3^{k-1}-p_0,a_7^{k-1},a_8^{k-1})}{\partial b_j}-\eta\frac{\partial h(c_4^{k-1},c_8^{k-1},c_9^{k-1})}{\partial b_j}]-b_j^{k-1}\}\times(b_j-\overline{b}_j^k)\\
&+\sum_{h=4,8,9}c_h^k+\alpha[\mu\frac{\partial g(b_2^{k-1})}{\partial c_h}-\lambda\frac{\partial f(a_1^{k-1},a_3^{k-1}-p_0,a_7^{k-1},a_8^{k-1})}{\partial c_h}-\eta\frac{\partial h(c_4^{k-1},c_8^{k-1},c_9^{k-1})}{\partial c_h}]-c_h^{k-1}\}\times(c_h-\overline{c}_h^k)
\end{aligned}\right)\geq 0 \tag{3}
$$

Until the given $\varepsilon>0$,satisfies $|a_i^k-a_i^{k-1}|\leq\varepsilon,|b_2^k-b_2^{k-1}|\leq\varepsilon,|c_j^k-c_j^{k-1}|\leq\varepsilon$,where i=1,3,7,8;j=2; h=4,8,9, The convergence of the solution of the variational inequality is achieved and the loop is exited; otherwise, let $k=k+1$, return to step 2 to iterate.

4 Results of computation
4.1 Solution of the model

The final solution of the model can be obtained by the existence of the uniqueness of the solution and the iterative algorithm that using to solve the variational inequality.

$$\overline{a}_i^k = a_i^{k-1} - \alpha [\mu \frac{\partial g(b_2^{k-1})}{\partial a_i} - \lambda \frac{\partial f(a_1^{k-1}, a_3^{k-1} - p_0, a_7^{k-1}, a_8^{k-1})}{\partial a_i} - \eta \frac{\partial h(c_4^{k-1}, c_8^{k-1}, c_9^{k-1})}{\partial a_i}](i=1,3,7,8) ;\quad (4)$$

$$\overline{b}_2^k = b_2^{k-1} - \alpha [\mu \frac{\partial g(b_2^{k-1})}{\partial b_2} - \lambda \frac{\partial f(a_1^{k-1}, a_3^{k-1} - p_0, a_7^{k-1}, a_8^{k-1})}{\partial b_2} - \eta \frac{\partial h(c_4^{k-1}, c_8^{k-1}, c_9^{k-1})}{\partial b_2}] ;\quad (5)$$

$$\overline{c}_j^k = c_j^{k-1} - \alpha [\mu \frac{\partial g(b_2^{k-1})}{\partial c_j} - \lambda \frac{\partial f(a_1^{k-1}, a_3^{k-1} - p_0, a_7^{k-1}, a_8^{k-1})}{\partial c_j} - \eta \frac{\partial h(c_4^{k-1}, c_8^{k-1}, c_9^{k-1})}{\partial c_j}](j=4,8,9) ;\quad (6)$$

4.2 Description of the results

In the above mentioned, equation (4) is the condition that indicators of economic growth should solve, equation (5) is the condition that the indicators of the ecological environment should satisfy, and equation (6) is the condition that the indicators of science and technology culture should meet. While satisfying (4) (5) (6), we can achieve the goal of balanced development of the whole economy.

In the equilibrium conditions obtained above, we can see that economic development should be balanced and optimized. The indicators must be coordinated with each other, which are the same as that envisaged before establishing the model objective function, and is consistent with the original intention of building the model on the basis of the interrelationship between indicators. This means that the maximization of the objective of the economic development objective determines that the purpose is not to maximize the economic growth, the optimization of the ecological environment, and the advancement of the culture of science and technology, but to maximize the coordination of the overall objective function, which may be contrary to the maximization of a particular aspect, but through the coordination of the overall optimization can be achieved, that is, some of the best is not necessarily the overall optimal, and the overall optimal is not necessarily which contains all the parts of the optimal.

4.3 Equilibrium in change

In (4) (5) (6) the formula is the balance conditions of optimal economic development, in fact, in these conditions it can also see how other indicators to change accordingly to achieve the new equilibrium when a particular indicator changes, that is, to achieve the balance problem in the changes of the model.

Consider the change in gross national product (a_1), assuming that the change of a_1 is m (the increase is positive and the decrease is negative, only the increase is considered, the decrease is the opposite trend, that is, m is greater than 0), a_3, a_7, a_8 will be a corresponding increase seen from the (4), b_2 will increase seen from the (5), c_4, c_8, c_9 will be a corresponding increase seen from (6), but the degree of increase due to the relevancy of a_1 in the index system respectively, the greater the impact of the indicators the greater the impact.

This means that the indicators of economic growth, ecological environment and science and technology coordinate with each other under the constraints of economic development optimization, and the degree of mutual influence between the indicators is determined by partial derivative of the function, that is, by the interconnection between the degrees of tightness of indicators.

Therefore, we can analyze the influence of mutual restraint or interrelations on other aspects when the policy affects one aspect based on this super-network model, and combine with the correlation matrix between the economic indicators obtained in the cluster analysis. It is also possible to analyze the conditions that must be met in all other aspects when a goal of a particular economic development is achieved. In addition, it can also analyze how the other indicators should be changed to ensure the ultimate achievement of economic development when an indicator changes.

5 Conclusion

In this paper, the super-network theory is applied to the measurement of economic development, so as to study the super-network model of economic development measure. Firstly, the complex system with multiple indexes is simplified by cluster analysis, and only important factors are studied. Secondly, the objective function is established according to the contribution degree of each index. Finally, the maximization problem of objective function is analyzed by variational inequality.

Theoretical contribution and practical significance of the conclusions: In theory, a measurement index system is established to improve the one-sided deficiencies of the single indicator with the application of super-network theory in the measurement of economic development, thereby further expanding its research field. Finally, the results of the model analysis are used to propose corresponding policy recommendations for macroeconomic operation. In reality, a new indicator system for measuring

economic development is proposed. This is not a denial and substitution of GDP, but a promotion and improvement of it. It is to build a new indicator system to make up for the shortcomings and defects of the existing GDP. This is not only an inevitable requirement for the new era of ecological civilization and the construction of socialist ecological civilization, but also provides a new way for the government to evaluate economic development.

The super-network model of the economic development measure established in this paper is only preliminary, and there are still many aspects to be studied further in the future. Finally, how to give the weight more reasonable, that is μ, λ, η, the objective functions of this article, so that the objective function is more realistic economic life is also a problem to be solved.

Abstract: This paper discusses the sustainable forest management plan in Brazilian context. The theory shows that is relevant in the development of local policies with global impact. These are factors that have been widely promoted by the international community and the mechanism to combat amazon deforestation. This research utilized was the methodological approach of qualitative method and the data collection was through semi-structured interviews, observation and document analysis. We conclude that integration between actors (government, manager forests resource and community) is important for positive results in sustainable environmental.
Key words: Deforestation; Management forest; Brazilian.

1 Introduction

Local crises are of concern to all part the word today. Each region presents specific local problems, but these problems have an impact on a large scale (Ostrom, Burger, Field, Norgaard and Policansky, 2009). The case of problems with the management of forest resources is more serious because the problem is not local; the impact is global (García-Ruiz, López-Moreno, Vicente-Serrano, Lasanta–Martínez and Beguería, 2011). Fearnside (2012, p. 70) states that the Brazilian "Amazon rainforest provides an important environmental service with its storage of carbon, thereby reducing global warming".

Many are the causes of Amazonian deforestation, but logging has relevant participation (Pires and Costa, 2013). Brazilian Legal Amazon has about 5 million square kilometers, occupying approximately 59% of the national territory. It has 510 million hectares of vegetation cover equivalent to one third of the Tropical Forests of the world and approximately one billion cubic meters of sawn wood of high quality that could be worth trillions US dollars (Amin, Motel, Combes, Kere, Olinga and Schwartz, 2014). The rich biodiversity of the Amazon rainforest may be scaled evaluating each hectare of forest. It is estimated the presence of 150 species of trees, which corresponds to an average total biomass is 300 tons / ha. The species are commercially usable only 6 to 10 trees / ha, or wood volume ranging from 20 to 50 m³. The rational forestry takes 10% of the trees (Amin et al, 2014).

Therefore, the administration of the forest to obtain economic, social and environmental benefits must respect the mechanisms sustaining ecosystem with forest management (Brazilian Law 11.284/2006). Is necessary to the preservation of the Amazonian biome and define a boundary between natural resources that should remain untouched and management areas that can generate economic and social benefits for the region (Ministry of the Environment, 1998).

Management of sustainable production in Tropical Forests is a way to keep the main environmental functions of forests. But is the issue of forest management only was importance after the publicity of the acts of imports of unsustainably produced timber (i.e. TV, scientists, Internet, and others actors). Forest management for multiple uses means the administration of an area with forest cover, with different use purposes (e. g. the protection of watersheds and watercourses, recreation, scenic beauty) and maintenance of habitat for wildlife, including logging production (Robinson, 2013).

This study indicates that a solution is a set of elements based on interactions among the actors involved. Furthermore, the positive nature of collaboration between the actors that control and use the forests resources is solution for best outcomes. Nevertheless, previous studies on solutions have not focused exclusively on investigating the involvement of the professional administrator in the management of forest resources and adoption of forest concessions policy how viable alternatives. Therefore, the issues in the interplay of relationships between actors (i.e. private administrator of forests and government or legal agents) are few explored.

To address this gap, this paper show that is possible in solution networks of actors integrate resources in interaction to develop solutions in the forest resources, and identify the related benefits for

the two or more part involved . The theoretical point of departure for the study is that interaction between actors and the resource integration is the primary characteristic successful in the management of forest resources.

2 Professional Administrator in the Management of Forest Resources

The science of management has how characteristic the participation of several areas in your structure of formation (transversal) (Taylor, 1911). Actually the administrators have work in positions of quite unusual sectors, including forests manager (Regi, Schuch, Gomes and Kneipp, 2014). The professionalization of managers of parks and forests is essential for the conservation and proper use of natural resources (Mulkey and Day, 2012). Basso et al. (2011, p. 160) claim that other aspect important in this process is the forest certification. It forces managers to seek qualification to meet the requirements of certifying agencies and governments. The contribution from the professional administrator in this process is important in preservation of the environment, the social contribution to local communities (native) and economic development (Roberts and Gilliam, 1995).

Thus, the role of the forests manager may include educator, technician, mediator, conflict manager, public relations and others competencies. In the relationship collaborative among managers, scientists, government agents and the public general to address the institutional barriers and incentives to local strategies for forests management can be the solution for global problems. This important role for manager (administration) of resources environmental in a bridge for conflict solutions of interest in different objectives (i.e. social, economic and environmental, state, local community, legal policies, private sectors) (Cortner, Wallace, Burke and Moote, 1998; Danielsen, Skutsch, Burgess, Jensen, Andrianandrasana, Karky, and Zahabu, 2011).

Back Office
Activity planning and control in the extraction of trees;
Sales and evaluation of results;
Administration of internal teams;
Learning about new technologies, knowledge and legislation;
Zoning and categorization of trees in managed forest areas;

Integration Solutions
Evaluate the best strategies to lower impact on the consumption of resources and implement measures for the revitalization of forest resources in the long run;

Interaction Area
Relationship with the community, governments and researchers;
Negotiating with environmental groups and unions worker;
Dialogue with banks and lenders;
Present results proving the preservation of forest resources in the extraction of trees in forest management;

Figure 1   Activity Manager Forests Resource

For this reason, multiple competences and roles may be needed of forests manager professional. Your mission is to work with balance at different context and diverse people through internal activities (office) and externals (in locus - forests and community native) (Nijnik and Bizikova, 2008). But, your contribution big is the ethical work, transparency in action, dialogue with local institutions and global commitment , decision, planning for future with base in actions relevant for next generations (Sewpaul and Jones, 2005). This work to can divides in three independent areas (back office, interaction between stakeholders and integration solutions), but integrated by collective and social interests.

Then, notes (figure 1) that the work of the forests manager has a key role in the balance between the use of natural resources and environmental conservation. Its function is to establish connection with the various sectors of society in order to promote sustainability in the conscious use of renewable natural resources and non-renewable.

3 Adoption of Forest Concessions Policy in Brazil

The sustainability of management brings the assurance quest for continuous improvement of the systems used and the development of new systems, considering the high number of variables found in

Amazonian forests (IMM 2002; Amin et al, 2014). The plan for sustainable forest management refers to the management of the forest to obtain economic and social benefits, respecting the mechanisms sustaining ecosystem. This definition shows that to be sustainable it must be economically viable, environmentally sustainable and socially just (IBAMA, 2013; Amin et al, 2014).

At this point, it should be noted that the Legal Amazon is divided into western and eastern Amazonia. The Western Brazilian Amazon consists of the states of Acre, Amazonas, Rondônia and Roraima, having total area of 2.18 million square kilometers, equivalent to 42.8% of the Brazilian Amazon area and 25.6% of the national territory. The eastern Amazonia consists of the states of Pará, Maranhão, Amapá, Tocantins and Mato Grosso, with an area of about 3.0 million km2

The history of commercial logging in the Amazon has more than three hundred years. Since the sixteenth century, hardwoods were removed from the forests nearby riverbanks and exported in logs for European metropolises. There was no legal protection for the forests in the extraction of trees. That changed because the operation plans of extracting trees must conform to the norm of the State Decree No. 12,447 of October 10, 2006 (Based on CONAMA Resolution No. 406 and Ordinance 186).

Rondônia is one of the Brazilian states that more deforestation. It is the fourth-ranked (Pará, Mato Grosso, Maranhão and Rondônia). However, in proportional terms Rondônia had greater deforestation. Among the identified key factors that contributed to growth of deforestation in the state are: the opening of roads, infrastructure investments, growth of cattle, expansion of mechanized agriculture, the timber industry migration to frontier areas, land grabbing and lack land regularization[1].

The Government intends to tackle this problem through the Plan for the Prevention, Control and Alternatives to Deforestation in Rondônia. The aim is gradually reduce deforestation in Rondônia State. He wants that in year 2015 the indicators of annual increment is zero. The plan is organized into four themes: spatial planning and land regulation, encouragement for sustainable production, command and control actions to prevent deforestation and capacity building for decentralization of environmental management. The Government will use as strategy development social inclusion, integrating society, economic actors and politicians (data analysis of documentary research).

Studies IMAZON-Institute of Man and Environment in the Amazon shows that in the years 1998 to 2004 there was a fall in consumption of raw material (logs trees) in the Amazon region. The reasons identified were intensifying enforcement against illegal logging and the cancellation of hundreds of the management plan in 2003 for reasons of irregularity. However, survey data from Mercoeste / SENAI-2005 show that players of low production and development of Forest Bases industry factors could be reduced in the short term. The segment demonstrates positive trend to expand its participation in the regional economy and has the potential to expand their participation in markets.

4 Local Solutions for Global Benefits

The main objective of the Brazilian Federal Government to the policy of forest concessions is to conserve the green cover of forests by improving the quality of life of people living in its surroundings and stimulating the formal economy with products and services from managed forests. The Law of Public Forest Management (Law 11.284 / 2006), which established the Forest Service, created the possibility of concession of public forests[2].

The government can grant companies and communities the right to manage public forests to extract trees and provide tourism services. The counterpart to the right of the sustainable use is the payment to the government of amounts that vary according to the price proposal submitted during the bidding process. The forest concession policy allows federal, state and local governments to manage their forest assets in order to combat the invasions of public lands for the predatory exploitation of existing resources (e.g. livestock and agriculture). The contracts only allow obtaining the forest resource by the techniques of forest management and reduced impact logging. The forest granted remains standing and is used in a rotation system that allows continuous and sustainable timber production. Only four to six trees per hectare are removed and the return to the same area will occur every 30 years.

Municipalities and communities neighboring the concession area being favored by generating jobs,

investment in services, infrastructure, financial returns arising from the payment for the products that have been granted and benefits guaranteed by the concession contract. All citizens could benefit with the conservation of forest resources and the certainty of buying products that respect the forest. The concession agreement prohibits access to genetic resources, the use of water resources, exploitation of mineral resources, fisheries or wildlife and commercialization of carbon credits. The ownership of the land remains with the government throughout the concession period and the buyer receives the right to conduct forest management in the area. Law 11.284 / 2006 is the legal framework for the realization of the concessions. It is describing how the process that involves the lifting of the concession areas suitable for the preparation of the notice, public hearings with the population and monitoring the activity occurs.

Table 1   Local Solutions for Global Benefits

Standard	Factor	Group (Local/Global)
Environmental impact	Monitoring of growth dynamics and forest recovery.	Local and Global
	Reducing damage to the remaining forest during harvesting.	Local and Global
	Investments in infrastructure and services for the local community.	Local
Direct social benefits	Generation of local jobs	Local
	Employment generation of forest concession	Local
	Diversity of products exploited in the management unit (Consumption and exports)	Local/Global
Efficiency	Diversity of exploited species in the management unit (Consumption and exports)	Local/Global
	Diversity of services operating in the management unit	Local
Adding value	Degree of local processing the product	Local/Global

5 Methodological Approach

The methodological approach, empirically based, was through qualitative research, descriptive typology; with application of the case study. The focus of this study is to explore management sustainable logging in Brazilian Amazon Forests: local responses to global challenges. The methodological approach was through qualitative research, descriptive typology; with application of the case study how empirical based. The focus of this study is to explore management sustainable logging in Brazilian Amazon Forests: local responses to global challenges. The study has been carried out during 2013-2014 when 13 personal interviews were carried out with representatives from both sides of the dyad (government agents and forests private manager).

Additional data was gathered through participant observation and document analysis. The time span of the case is about nine months, from September 2013 to May 2014. The data has been analyzed through content analysis of the interview transcripts. The analysis has been ongoing since the first interview. Partial participant observation has been an important way to gather data. This has been possible due to good access to the case. The adductive research process used enables to go back and forth between theory and practice as the research process evolves. The research method applied can be defined as a qualitative, exploratory case study. This choice rules out direct applicability on other country. However, this choice allows the researcher to go deeper into the subject and explore something new and unique.

6 Data Analysis

This section is divided into three parts. The first part presents a synthesis of the content analyzed the interviews, the second part presents the photographic records of the work locus of observation and, finally, to analyze documentary. A summary of the discussion containing the interview analysis may be seen in Table II. The table includes four theses about sustainable management of forests, which according to our analysis provide an understanding of the important process of preserving forests.

These are focal issues in management sustainable logging. Furthermore, they offer a help for researchers and practitioners to understand the various roles of important actors in value for local and global action of Amazon forest preservation and to analyze opportunities for professional manager beyond its conventional borders (professional new sector).

The contemporary literature emphasizes the role of manager in preservation forests. It also stresses the importance of interaction with others actors (government, community, certificate organs, researchers

and scientists, legal system). From an environmental point of view, this means that human elements are the focus. Consequently, as the first thesis implies, the goal for the low environmental impact is to support the decision and action of use coordinated and controlled resource in forests explore.

Table 2 Synthesis of the Content Analyzed the Interviews

Theses	Comments
The goal for sustainable management of forests support the lower impacts environmental;	When there is control by the government; an educational system aimed to raise awareness of the value of preserving the environment; the local community realizes the value of forest resources for subsistence get without destroying, the degradation impacts are smaller. The professional manager of public forests has an important role in all these local actions have global scope.
The sustainable management of forests is a global responsibility;	The natural resources of the forests are removed to be consumed by distant buyer extraction area. When local communities understand the value of the forest, they act as protectors against degradation scale. Thus, even if the buyer wants to buy without knowing the origin, the native community avoided the removal of the forest well into the illegal sale.
The local effects of the sustainable management of forests can be achieved globally;	The results of preserving forests positively affect the global climate, preserves the symbiosis of fauna and flora, allows the use of renewable resources with global distribution, creating new forms of interaction between people (ecological tourism) and provides hope for continuity of the planet.
The positive effects of sustainable management of forests are perceived in economic, social and environmental determinants.	The community must work and incomes, the industry can use without destroying the environment that renews its resources for future use (as photographic records).

The Figure 2 show the community inserted in place forest work with sustainable management. The effect of employment generates dignity of life and improved the health and education through professional engagement.

Figure 2 Field Staff

Forest is mapped and selected the trees that can be removed. The spaces left by trees harvested favors the development of new trees by inserting the sunlight and forest regeneration is faster when there is no disorderly devastation. The government issues and environmental certification makes police surveillance, but the main tax is the community that may or may not report irregularities.

Figure 3   Measurement to Harvest Trees

Documentary analysis demonstrates that the private manager of public forests has an obligation to comply with legislation. When errors are found is criminally punished and must indemnify the State. However, was observed during the interviews that there are still many gaps in oversight. The main problem is the amount of police for surveillance.

Figure 4   Environmental License

Each property has geodesic mapping. It serves to state control of compliance with legal obligations. It is also a security administrator for the forest resource.
Figure 5 Geodesic Mapping

Our approach is managerial, and in a forest resource context, we study the relation between professional manager and control of forests resource in study analysis. To be able to understand and manage the forests resource the manager need integrated effort together community and government agents for to get the goal of preserve the environment.

This means, as implied by the third thesis, that the sustainable management of forests is a global responsibility. This conclusion is important because it makes it possible to first analyze the role of the government as legal provider in a context of forest protection. This is in line with the underpinning understood of the management perspective, because the manager has a duty to contribute to the environmental protection compliance process. Second, a distinct meaning of concept participative manager in protection environmental may be developed.

7 Conclusion

We conclude that the issues can be resolved through integration between government policies (legislation, control and punishment for irregularities) and developed competencies in the management of forests. The local community plays have important role in preserving and monitoring of legal compliance. When all stakeholders are involved in the same goal is easier to preserve the environment and used of natural resources in a forests.

Note that the environmental preservation of forests is based on a set of elements that are cared for by governments, administrators and community. Each actor plays a role in the expected results and only with the alignment of roles and commitment to the individual responsibilities can to preserve forest resources. When results are achieved all of humanity and the planet has benefits. Therefore, no matter if the forest is in America, Asia or Europe, because the planet will always win with the best environmental outcomes generated by human protection to the natural resources of forests.

The predation modifies the structure of forests with changes in land use. Forest management is the instrument recognized worldwide as a mechanism capable of maintaining tropical forests sustainably. For it is necessary for surveillance, monitoring, research, dissemination of knowledge and incentives of the various spheres of society and the government to adopt continuously.

With the implementation of forest concessions, the supervision and monitoring are the weakest elements of the system. Need a strong action in education and responsiveness of local people (government officials, administrators, and community) with the goal of not compromising sustainability forests under concession. Therefore, the limit for illegal logging is of paramount importance in order to reduce deforestation and increase the competitiveness of wood originated from areas under forest management. At this point the administrator of forest management plans can contribute to the development of integrated solutions with government and the community.

Research on Discovery of Urban Waste Crisis Transformation Path Based on Bayesian Evolution

He Rui

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 13281511696@163.com)

Abstract: The continuous development of society brings great benefits, but it also has many social problems. The process of urban waste disposal from "landfilling" to "burning" has encountered huge obstacles, resulting in "Not in My Backyard (NIMBY)" incidents. The conventional solution to the "NIMBY" incident approach treats the cause of it in isolation and did not form a complete solution. Based on the Bayesian network, this paper analyzes the evolution path of the "NIMBY" event comprehensively and carefully, and forms a complete "NIMBY" crisis event solution. This scheme can effectively reduce the probability of occurrence of "NIMBY" events and provide decision support for relevant decision makers.

Key words: NIMBY incidents; Bayesian network; Waste incineration; Decision

1 Introduction

In the process of urbanization in China, the amount of garbage generated is increasing. According to statistics, China's municipal solid waste production is growing at an annual rate of 8% to 10% and is expected to reach 323 million tons by 2020. 95% of China's waste disposal methods are landfills, but existing landfills are no longer able to meet the demand in the foreseeable future.

The municipal solid waste incineration treatment has the advantages of occupying a small area, shorter time for site selection, significant reduction (weight reduction is generally 80%, volume reduction is generally 90%), the harmlessness is more thorough and waste heat can be recovered. However, China's waste incineration started late. During the process of project implementation, residents are reluctant to allow waste incineration plants to be built in the local place. In many places, there were also "NIMBY" incidents, which seriously endangers social stability.There is an urgent need for a solution to the "NIMBY" event.

Many scholars have studied the issue of "NIMBY" in different aspects. Gao Junbo (Gao Junbo, 2016) found that the essence of the "NIMBY" dilemma stems from the inconsistencies between the interests of the government, the market, and the society. Wu Yunqing (Wu Yunqing, 2012) analyzed the research progress of "NIMBY" facilities at home and abroad, he summarized the progress of domestic and foreign "NIMBY" facilities' types, size, location selection, coordination with surrounding environment, predicament, "NIMBY" conflict, and the shortage of solutions. Wang Xiaoli (Wang Xiaoli, 2012) conducted a comprehensive analysis of domestic and foreign scholars from the aspects of the meaning, reasons, characteristics, countermeasures, and reflections of the "NIMBY" problem, and clarified the context of research on "NIMBY". Although scholars have done a lot of research on the "NIMBY" incidents and revealed the causes of them. However, scholars often cut in from one side, but did not comprehensively consider the connection between various factors andso failed to provide a set of solutions to solve the "NIMBY" incident.

This article is to solve this problem. Bayesian Networks (BN) is a powerful knowledge representation and reasoning model with the ability to describe event polymorphisms and non-deterministic logical relationships, which is very effective in solving the "NIMBY" problem. Based on the Bayesian network, this paper analyzes the classic cases of successful processing of "NIMBY" events and evolves the optimal Bayesian path. It is hoped to promote the "harmless" and "reduction" process of domestic waste disposal, thus providing scientific and reasonable decision support for decision makers.

2 Urban Garbage Crisis Bayesian Evolution

2.1 Bayesian evolution

Bayesian network is a decision analysis tool based on probability and statistics. It is an organic combination of graph representation method and probability knowledge, reflecting the potential dependencies among variables and reveals the intrinsic relationship of domain objects. It is a compact expression method of complex full probability distribution. Bayesian network has a great advantage in

dealing with uncertainties.

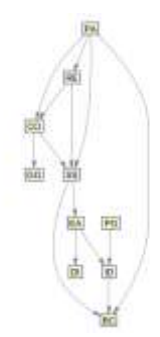
A Bayesian network with N nodes can be represented by B=<G, P>, which includes two parts. (1) G denotes a Directed Acyclic Graph (DAG) with N nodes, where nodes are in one-to-one correspondence with random variables, and two nodes in G are connected by connecting arcs in a certain direction to represent variables relationship. (2) P represents a set of Conditional Probability Distribution (CPD) associated with each node, which can quantitatively describe the effect of all parent nodes on their child nodes.

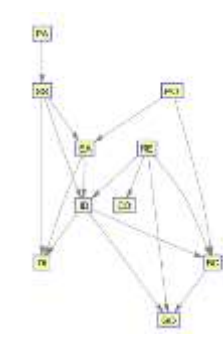
Bayesian network is essentially a concise method of representing the joint probability distribution of variable sets. Bayesian network inference is based on conditional independence and conditional probability distribution, using Bayesian probability method to calculate nodes of interest. The probability of occurrence is based on the following inference algorithm formula:

$$P(X_i = e_i | X_j = e_j) = \frac{\sum_{except X_i, X_j} P(X_k = e_k, X_i = e_i, X_j = e_j)}{\sum_{except X_j} P(X_j = e_j) P(X_m = e_m | X_j = e_j))}$$

2.2 Bayesian-based urban garbage crisis expression

2.2.1 Data Sources and Node Selection

This article uses web crawler technology to obtain data from major websites. Based on the keyword list of urban garbage crisis, it analyzes the chapter structure of key articles to obtain web articles with the highest correlation with the urban garbage crisis. After obtaining the article, the natural language processing technology is used to split the article into various keywords, and the frequency of occurrence of each keyword in the text is counted to realize the effect of the article structure.




A suitable node can ensure that Bayesian path evolution can provide reasonable advice for decision makers. Therefore, the selection of nodes is very important, and it should fully reflect the characteristics of the "NIMBY" events and cover the basic aspects of the "NIMBY" events. At the same time, nodes should be as simple and representative as possible. The choice of nodes in this paper is mainly from macroscopic to microscopic, from top to bottom, including the core elements of participating entities and government strategies. The establishment of high-tech in China lacks consideration of institutional factors. Therefore, in the node selection process, not only the "government" factor but also the institutional factors such as "consultation" and "regulation" have been selected. These factors are closely related to the theme of "NIMBY" and basically constitute the whole picture of the "NIMBY" incident. This option makes the Bayesian evolutionary path more representative.

2.2.2 Case Application

The Pearson correlation coefficient is used to measure the linear correlation between the two variables X and Y. It is suitable for the population showing positive distribution. The "NIMBY" event belongs to the social events and has the characteristics of positive distribution. Therefore, the Pearson algorithm is suitable for this paper. After the structured article, this paper first uses the Pearson algorithm to cluster all the urban garbage crisis events, and obtains the correlation between each event. We found that the successful cases and the failed cases were separated from each other and gathered together.

After calculating the similarity of cases, first, the basic topological structure of Bayesian network is constructed by referring to the experts' opinions of the urban neighborhood. Then we use MATLAB software to construct Bayesian conditional probability table to get Bayesian evolution path. Through the analysis of the evolutionary path, we iterate the initial basic topology, train the Bias network repeatedly, and finally get the result(As shown below).

Table 1 Bayesian Structure

Residents	RE		
Site selection	SS		
Pollution	PO		
EIA	EA		
conflict	CO		
participate	PA		
Information disclosure	ID		
Dioxins	DI		
make up	BC	Success type event Bayesian structure	Failed type event Bayesian structure

3 The Discovery of the Transformation Path of Urban Garbage Crisis

According to the Bayesian principle, its network structure shows the relationship between key factors of urban garbage crisis events. The Bayesian network structure evolved from the successful case reveals the potential law between the advanced experience and experience of successful cases. The evolution to the optimal Bayesian structure is essentially a solution that draws on the best types of events.　Based on this, we have obtained the transformation path of the urban crisis.

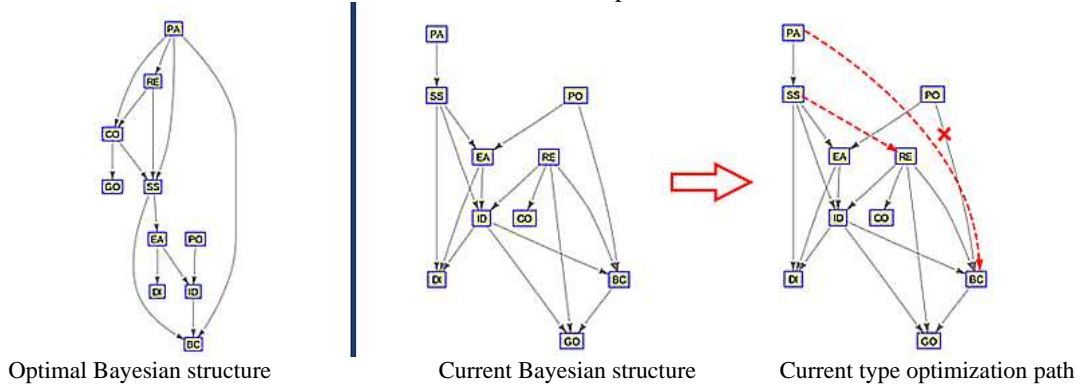
Optimal Bayesian structure　　　　Current Bayesian structure　　　　Current type optimization path


Figure 1　Bayesian Path Conversion

Through the Bayesian path transformation, we get the solution:

Increase the correlation between PA and BC: When formulating the compensation plan, the participation of the public should be fully guaranteed to ensure the residents' understanding and support for the compensation plan.　Highlight the association between RE and SS, indicating that the site selection process should fully guarantee residents' participation.　Weakening the correlation between PO and BC: It is necessary to formulate a scientific and reasonable compensation mechanism for the pollution caused by the "NIMBY" project.

The main strategy of this program is: in the process of formulating compensation plans and project site selection, the decision-makers must ensure the full participation of the people and obtain the people's full understanding and support for decision-making; the decision-makers should eliminate the possibility that the "NIMBY" project may bring Pollution and minimize unavoidable pollution. They should formulate scientific and reasonable compensation mechanisms.

4 Conclusion

At present, large-scale public security incidents caused by improper disposal of urban waste incineration projects still occur frequently in China. This shows that China has not yet formed a set of scientific urban waste incineration crisis conversion plans.　This article expounds the current crisis of urban waste incineration in China and introduces the significance of Bayesian evolution theory in solving the "NIMBY" incident.　The original data is obtained by the web crawler, the natural language processing technology is used to vectorize and categorize the case articles, and the Bayesian path evolution is performed by using the MATLAB tool.　Finally, through the analysis of the differences between the successful path and the failed path, this study has obtained a scientific and complete solution to the "NIMBY" event which comprehensively considers the various factors that cause the "NIMBY" incident.

Construction of Word List for Municipal Waste Incineration Crisis

Bai Wentao, He Rui, Zhu Keyao
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: bwt1997@126.com, 13281511696@163.com, 924235396@qq.com)

Abstract: Domain word list is important in text mining and data analysis in certain specialized fields. It can vectorize textual information and is the basis for further mathematical analysis. Waste incineration and the group incident crisis it poses are an important social issue in our country. This paper takes the crawler to capture the text data of waste incineration on the Internet, uses natural language processingtechniqueswith manual analysis methods to process the data, and then designs the keyword selection algorithm according to the principle of combination and stability to extracts the word list of waste incineration fields, which lays a solid foundation for subsequent research to solve theabove social issue.
Key words: Waste incineration; Crisis management; Domain word list; Natural language processing

1 Introduction

With the growing of urban population in China, the output of urban waste and the amount of waste clean-up are also increasing dramatically.   Nowadays, more than 440 cities in China are faced with the problem of "garbage siege". As a "harmless, reduced, and resource-based" waste treatment method (T Sabbas, APolettini, R Pomi, 2003), waste incineration and power generation has attracted national attention.   However, in the process of advancing the waste incineration technology, it often encounters resistance from the public. How to successfully implement the waste incineration project has become a major social issue facing the government today.

In the process of studying such issues, we found that relevant data and information are often presented in the form of government reports and news reports.   For this type of unstructured text data, the traditional empirical research and data analysis methods are often difficult to work on, and due to the large amount of data and extensive coverage, manual methods cannot be the main analytical tools. Therefore, in virtue of computer tools, text mining with natural language processing technology has become the best way to study this issue (Wang Zhanyi, 2012). Text mining is a technology that uses computer tools like natural language processing techniques to extract effective information from unstructured text data.

Domain word list is a basis for using text mining when studying text data in the corresponding domain, and is also a basis for building knowledge and rules (Fred J. Damerau,1993).Cai Guozhen (Cai Guozhen, 2010) used WorldNet to calculate the similarity between nouns and designed a search clustering method based on semantic knowledge(Cai Guozhen, 2010).Wang Aihua (Wang Aihua, 2013) conducted a text mining study(Wang Aihua,2013) on the corruption of engineering projects by constructing a list of engineering corruption terms. Yan Dong (Yan Dong, 2015) finally clearly demonstrated the shale gas field (Yan Dong, PanYi, ChenXiaohong, et al, 2015) by constructing domain ontology in the field of shale gas.

In the field of waste incineration, there is a lack in targeted domain vocabularies at this stage, hindering the development of text mining research in this field. But the methods used in previous studies are not general applicablein the field of waste incineration, and because of the particularity of Chinese text, such as there is no natural separator between words and words, the method of constructing the English word list have to adapt for the new situation. This research aims to construct a vocabulary list of waste incineration fields through web crawlers and natural language processing techniques, supplemented by expert consultations, and provide data analysis entry points and research foundations for in-depth research on waste incineration projects and social issues to resolve groups resisting crises.

2 Waste Incineration Crisis Features

The waste incineration project involves a wide range of areas and affects a large number of people. The causes of the mass incidents are also complicated.   Analyzed from the perspective of reasons, the root causes of dissatisfaction among the public mainly stem from the following three aspects: 1. Poor communication of information among government, individual, and company; 2. Unfair feelings of residents caused by unbalanced distribution of benefits; 3. Civil civic awareness and The rising demand for environmental protection (Bai Wentao, DuZhihong, He Rui, 2018). This reflects the higher demands

of the public for satisfaction when the food and clothing problem has been solved (Maslow A. H., 1943).

For the main body of waste incineration projects, namely government and enterprises, the final project construction results can be measured from the following two dimensions. The first dimension is reputation and the second dimension is interest.   The behavior of government and enterprises in the process of project design and implementation often directly leads to the final outcome of the project, gaining or losing reputation and trust, and earning or losing benefits.

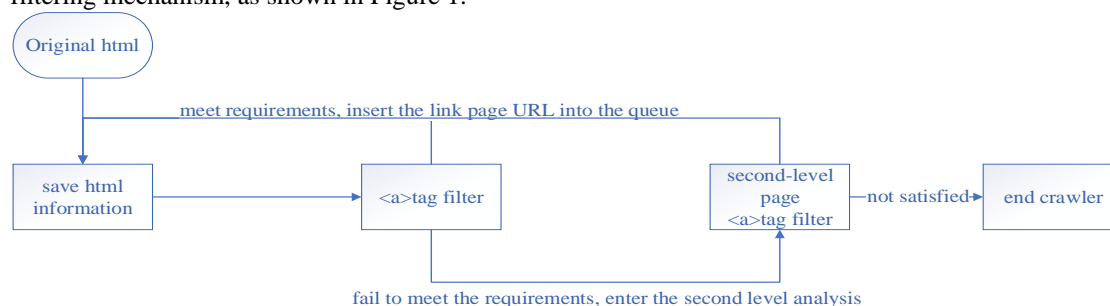
3 Construction of City Waste Domain Word List
3.1 Data acquisition
In order to obtain text data in the waste incineration field, it is necessary to design a web crawler to crawl relevant information on the Internet, mainly including news reports and government reports. Web crawler refers to a program that automatically crawls Internet information according to established rules, directed or not (Liu Jinhong, Lu Yuliang, 2007). Web crawler can capture large amounts of data at a high efficiency and when the amount of data is large enough, a small number of atypical data will not affect the overall statistical law. In view of the fact that the related information of waste incineration is distributed on the Internet, we have designed a generic crawler that crawls content on the Internet through link tags. The web crawler uses Scrapy framework design and elaborately constructs a two-tier filtering mechanism, as shown in Figure 1.


Figure 1   Two-tier Filtering Mechanism

3.2 Data cleaning
The text data in the waste incineration domain can be obtained by performing text extraction on the crawled web page raw data (HTML format).   In the text extraction process of this study, two layers of data cleaning filters were designed. One is to segment the titles of web pages, and to screen out titles that have no practical meaning or inductive keywords (such as suppliers, tenders, merchandise, etc.). The second is to design the HTML structure for web pages from the perspective of the text level and text length. The screening algorithm is used to filter, and finally a web page file with a relatively high relevance key page is obtained and its text data is extracted.

3.3 Data processing
In order to know the keywords that are most closely related to the waste incineration field, in the first place we need to segment the text data obtained in the above process.   Because people often use different words to express the same meaning in written records, this will lead to deviations in the statistics of word frequency and word relationships. Therefore, before the analysis, we must first analyze the similarity between word meanings, and replace the similar words with similar contents. Table 1 is the excerpt of our word similarity substitution table, and the similarity is obtained based on the Baidu natural language processing open interface.

Table 1   Word Similarity Substitution Table

Word A	Word B	Similarity Value
Local Government	Government	0.84623
Citizens	Residents	0.844015
Rubbish	Living Garbage	0.836175
National	Government	0.836481
Environmental Impact	EIA	0.834894
Landfill	Landfill Site	0.826828
Secondary Pollution	Pollution	0.825864
Standard	Emission Standards	0.817001

Continual Table 1

Word A	Word B	Similarity Value
Municipal Committee	Government	0.816235
Country	Government	0.814586
Oversight	Supervision	0.824241
Emissions	Emission Standards	0.812505
Contradiction	Conflict	0.807780
……	……	……

3.4 Word list construction

Based on past experience, we can know that an important keyword in a field must appear in a relatively high frequency in the textual information of the field, and should follow the basic principle of "combination and stability" (Beijing University of Aeronautics and Astronautics,1993). For this principle, we have designed a high-probability keyword filtering algorithm as shown below. W(word times) represents the total number of times a keyword appears in all articles, and E(essay times) represents the number of article texts where the keyword appears. R (ralevance times) represents the number of times the keyword appears with other high frequency words (less than 15 Chinese words).

$$P_i = \left(\frac{W_i}{W_{max}} * 0.5 + \frac{E_i}{E_{max}} * 0.25 + \frac{\sum_{j=1}^{n} R_{ij}}{Max(\sum_{j=1}^{n} R_{ij} | 1 < i < n)} * 0.25 \right) * 100\%$$

The algorithm divides the key probability into three different weight components. The first part examines the frequency of keyword occurrences. The second part examines the stability of keywords in different articles. The third part examines the keywords. The correlation with other keywords is the degree of closeness.   Through this algorithm, we can use computers to initially screen more important keywords.   However, due to the variety of Chinese text expressions and the complex grammar, we selected the first 50 keywords of computer screening to perform manual selection.   Manual selection is conducted in the form of consulting experts and government reports, and follows the five basic principles of "scientific, comprehensive, representative, feasible, and dynamic".   In the end, we got the word list of waste incineration fields, as shown in the table below.

Table 2   Waste Incineration Domain Word List

Living Garbage	Residents	Site Selection	Government	Emission Standards
Participate	Information Disclosure	Supervision	Dioxins	Risk
Pollution	EIA	Landfill Site	Conflict	Opinion
Protest	Compensation	Negotiate	Solicit Opinions	Trust

3.5 Results analysis

After we got the word list of waste incineration domain, we mapped the domain word list from the perspective of the keyword distance in the original text, as shown in the figure below.
Figure 2   Keyword Distance Map

In the relational network diagram, the degree of connection between the nodes represents the degree of connection between the nodes, that is, the frequency of occurrence of the two keywords in the original text is less than 15 Chinese words.

The keyword distance map show some important thing of the domain of waste incineration, and can by exam of our keyword list building work. Through the distance map, we can see that "living garbage" is the core vocabulary of the keyword list in the field of waste incineration, which also meets our subjective knowledge of this issue.　Some of the key words most closely linked to "Living garbage" are "Residents",　"Governments",　"Landfills site" , "Emission standards " and "Site selection", which are the most important points in rubbish Incineration project as well .

4 Conclusion

Waste incineration, as the best way to deal with urban waste nowadays, is developing rapidly and faces many challenges.　Text mining has a wide range of applications in text classification, analysis and key information extraction. It is mainly used in the fields of news, finance, biology and information retrieval (Huang M L,Ding S L,Wang H N,et al,2008). With this method, the analysis and research on the past cases and experiences of garbage incineration is also an effective way for the government and enterprises to face and solve these challenges.

In this study, related web pages of the waste incineration on the Internet were crawled, cleaned and processed, and a Domain word list of waste incineration fields was constructed.　The construction of this vocabulary makes it possible that social issues in the field of waste incineration can be further studied through the form of text mining. For example to vectorize the text and use similarity algorithm to find connection between cases and case, and even to research the deep causes of the abovesocial issueby Bayesian network based on the word list. Finallyproviding more scientific solutions for quantitative analysis.

Research on Industrial Production Efficiency of Hubei Based on Three-stage DEA-Malmquist Index Method

Zou Wei[1,2], Chen Mengxue[2]
1 Manufacturing Industry Development Research Center on Wuhan City Circle,
Wuhan, P.R.China, 430056
2 Business School, Jianghan University, Wuhan, P.R.China, 430056
(E-mail: zou_wei@126.com, 184722704@qq.com)

Abstract: By constructing the three-stage DEA-Malmquist index model, this paper made an empirical study on the production efficiency of 28 industries with manufacturing scale and above in Hubei province from 2011 to 2015. The research results demonstrated that government subsidy, the level of opening to the outside world and the cost of financing increase the redundancy of enterprises input, which has negative effect on the efficiency of production. The expansion of industry has a positive effect on the improvement of production efficiency. At the same time, the technology efficiency and scale efficiency were underestimated because of the environmental factors and random error, and the difference of technology progress and pure technology efficiency was more obvious. After removing external environmental factors, the total factor productivity of most of the manufacturing industries in Hubei province increased and the total factor productivity of the industry as a whole increased by 13 %. Further, according to pure technology efficiency and scale efficiency, these industries were divided into four types. Before adjustment, most industries were in the "two-level" type, after adjustment, most industries were in the "two-level" type, which showed that most industries in Hubei province are mature in technology and management. Finally, according to the research results, the corresponding countermeasures were put forward to improve the production efficiency of various industries.
Key words: Industrial production efficiency; Three-stage DEA-malmquist; Total Factor productivity

1 Introduction

Manufacturing industry is the foundation of a country and occupies an extremely important position in our national economy. The level of manufacturing development in a region directly determines the level of science and technology and the level of economic development in the region. For the old industrial base in Hubei Province, the role of manufacturing is even more pronounced. In the past five years, the role of Hubei manufacturing in the development of the national economy has become increasingly significant.

Foreign scholars took the extensive and in-depth research on the measurement methods of production efficiency at first. Farrell (Farrell, 1957) used data envelopment analysis (DEA) to study the efficiency of production agricultural first and put forward a frontier measurement method of technical efficiency for the first time. The DEA method is a deterministic frontier method that does not consider the impact of random factors on productivity and efficiency. Stochastic Frontier Analysis (SFA) solved this problem. Subsequently, many scholars began to use the Data Envelopment Analysis (DEA) and Stochastic Frontier Analysis (SFA) to study the issue of production efficiency. However, DEA model can only evaluate the static efficiency of the research object, and cannot reflect the dynamic efficiency in a period of time. Therefore, Malmquist proposed the Malmquist index in 1953. Caves D W, Christense L R and Diewert W E began applying the Malmquist Index to the calculation of production efficiency in 1982. But for a long time, the empirical research on this theory almost disappeared. Until 1994, Rolf Fare et al. combined a non-parametric linear programming method of this theory with data envelopment analysis (DEA) theory, which made the Malmquist index widely used. Today, this method is widely used in the calculation of productivity in the financial, industrial, and medical sectors. Han (Han, 1994), Kloos (Kloos, 2004), Hsiao (Hsiao, 2005) applied the DEA model and SFA model to study the efficiency of industrial production in various countries. Shi G M et al. (Shi G M et al., 2010) and Gong S et al. (Gong S et al., 2017) used the DEA model to study energy efficiency.

Domestic scholars mainly apply data envelopment analysis (DEA) based on nonparametric analysis and stochastic frontier production function method (SFA) based on parameter analysis and Malmquist index to study industrial production efficiency. Guo Yajun (Guo Yajun, 2012) used the three-stage DEA model to study the industrial production efficiency of China in 2009. Zhang Yali (Zhang Yali, 2014) used the three-stage DEA model to evaluate the industrial efficiency of 31 provinces and municipalities

in China in 2013. Zhu FuYun et al. (Zhu FuYun et al., 2016) used the three-stage DEA-Malmquist index model to analyze the changes in total factor productivity of China's light industry from 2000 to 2010. Zeng Yuandong (Zeng Yuandong, 2017) selected the three-stage DEA-Malmquist index method to measure the industrial production efficiency of Yunnan Province from 2010 to 2014, and analyzed the reasons for the differences in industrial production efficiency in various cities. In general, they selected different input-output indicators (and environmental variables) from various angles to analyze the overall status and influencing factors of industrial production efficiency, and put forward targeted countermeasures to improve efficiency.

The research on industrial production efficiency in the existing literature is gradually improving and perfecting from the method model to the research object, which has certain reference significance for the development of this research. However, there are also some shortcomings. On the one hand, the selection of environmental variables. The factors influencing industrial production are multifaceted. In addition to the input of the most basic factors of production, there are many internal and external environmental factors. These factors of production and environmental factors change with the development of the times. For example, during the industrial revolution, industrial input factors mainly included manpower, material resources, and financial resources. Now, with the advent of the knowledge economy era, resources such as knowledge, big data, and the Internet have become important inputs for industrial production. Although the later three-stage DEA method can eliminate the influence of environmental factors and the productivity of random errors, the selection of environmental variables varies from person to person due to the differences of specific research objects. Starting from the actual situation of Hubei industry, it is very necessary to select appropriate environmental variables for analysis and to study industrial production efficiency from a new perspective in the new historical period. On the other hand, Hubei is an old industrial base with a wide variety of industries and large differences. If the overall efficiency of the industry is analyzed in general, the expected results will not be achieved. Therefore, it is more appropriate to conduct analysis in different industries. Based on the actual situation of industrial development in Hubei Province, the appropriate input and output and environmental variables will be selected to analyze the industrial production efficiency of Hubei Province from the perspective of industry, and then make recommendations.

2 Research Methods and Data Description
2.1 Three-stage DEA-malmquist index model
The three-stage DEA-Malmquist index model can effectively eliminate the impact of operating factors (external environment and random errors) on efficiency, and can also reflect the dynamic changes in efficiency over a period of time, so that the calculated efficiency values can more faithfully reflect the internal management level of the decision units. Its construction and application are mainly divided into three phases:

The first stage: the traditional DEA model. The DEA model was proposed by American operations researchers A. Chames, W. Cooper, and E. Rhodes in 1978 to evaluate the relative effectiveness of decision-making units in the "multiple inputs, multiple outputs" model. This method has been produced and developed to this day, and the theory is relatively mature, and will not be repeated here.

The traditional DEA model can only evaluate the efficiency statically, but not the dynamic change of the efficiency of the decision unit over a period of time. The Malmquist index just makes up for the shortcomings of the CCR model and the BCC model. It can be used not only for panel models, but also for vertical analysis and comparison.

The Malmquist index was originally proposed by Malmquist (Malmquist,1953) as a consumer index. Based on the extension of Sten Malmquist's ideas, Caves et al applied it to the measure of productivity change, which reflects the productivity of the decision-making unit (DUM). Changes can be used to measure productivity growth and can be broken down into technological changes and efficiency changes.

The second stage: similar SFA regression model. The input slack variable obtained in the first stage is affected by three factors: environmental factors, random errors and management efficiency. In order to obtain a real efficiency value, it needs to be separated. Taking input orientation as an example, there are no decision units. Each decision unit has m inputs. Suppose there are p environmental variables. SFA analysis is performed on the input variables of each decision unit. The SFA equation can be constructed as follows:

$$S_{ik} = f^i\left(z_k; \beta^i\right) + v_{ik} + u_{ik}$$

Among them, $_pS_{ik}$ denotes the slack variable of the i input of the k decision unit, $i=1,2,...,$ $=1,2,...$; $z_k=\left(z_{1k},z_{2k},\cdots,z_{pk}\right)$ represents p environmental variables, β^i is an underestimate parameter of the environmental variable; $f^i\left(z_k;\beta^i\right)$ represents the impact of the environmental variable on the input slack variable , $f^i\left(z_k;\beta^i\right)=z_k\beta^i$. $v_{ik}+u_{ik}$ is the mixed error terms, v_{ik} is the random interference, suppose $v_{ik}\sim N\left(0,\sigma_{vi}^2\right)$; u_{ik} indicates that management is inefficient, assuming it is subject to a truncated normal distribution, that is, $u_{ik}\sim N^+\left(u^i,\sigma_{ui}^2\right)$; u_{ik} and v_{ik} is independent. $\gamma=\dfrac{\sigma_{ui}^2}{\sigma_{ui}^2+\sigma_{vi}^2}$ for the proportion of technical inefficient variance to total variance, when the value of γ approaches 1, the management factor dominates; when γ approaches 0, the effect of random error dominates.Using the SFA regression results to adjust the input, so that each decision unit is in the same environment and luck, the formula is as follows:

$$\hat{x}_{ik}=x_{ik}+\left[\max_k\left\{z_k\,\beta^i\right\}-z_k\beta^i\right]+\left[\max_k\left\{\hat{v}_{ik}\right\}-\hat{v}_{ik}\right]$$

Among them, x_{ik} represents the actual value of the k input of the i decision unit, $i=1,2,...,=1,$ $2,...n$, $\hat{x}_{ik}$ is the adjusted value; β^i is the estimated value of the environmental variable; and $\hat{v}_{ik}$ is the estimated value of the random disturbance.

The third stage: adjusted DEA model. The input data adjusted after the second stage replaces the original input data, and the output is still the original output, calculate the efficiency with the DEA-Malmquist index model again, and the efficiency value after eliminating external environmental factors and random errors is obtained.

2.2 Selection of input indicators, output indicators, environmental variables and data sources
2.2.1 Selection of Input and Output Indicators

The industrial output index selected in this paper is the total industrial output value above the scale. From the existing literature, the measurement of output indicators is generally selected from industrial output value, industrial added value and main business income. Through the comparative analysis of related literature and the availability of data, this paper finally selected the total industrial output value as the output index. This article used Pearson correlation test to calculate the correlation between total industrial output value, main business income, and input indicators. The results showed that the correlation between total industrial output value and input indicators is stronger. Therefore, this article chose the total industrial output value as the output indicators. This is consistent with the selection of Guo Yajun (Guo Yajun, 2012) and Zhao Shuang(Zhao Shuang,2016).

Three indicators were selected as the industrial input indicators, which were the average number of employees, net fixed assets and R&D expenditure. They respectively represented the company's investment in labor, capital and R&D investment. This is consistent with the selection of Guo Yajun (2012).As shown in Table 1, the input and output variables both pass the two-tailed test at the 1% level of significance.

Table 1   Pearson Correlation Coefficient of Input and Output Variables of 28 Industries Above Designated Size in Hubei Province from 2011 to 2015

Input	Average number of employees	Net fixed assets	R&D expenditure
Total industrial output	0.892** （0.000）	0.839** （0.000）	0.671** （0.000）

Note: ** indicates significant at 1% significance (bilateral); p values in parentheses.

2.2.2 Selection and Description of Environmental Variables

Environmental variables generally refer to factors that have an impact on industrial productivity but are not subjectively controlled. Considering politics, economy, and technology factors, the availability of data into account, five environmental indicators were selected: government grants, export delivery value divided by industrial sales output value, financial expenses, number of industrial enterprises, and electricity consumption of 10,000 yuan output value.

In terms of policy, government subsidies (100 million yuan) were selected to measure the government's support for various industries.

In terms of economy, the export delivery value divided by industrial sales output value were selected to measure the export status of the industry, with the research of Li Peng (Li Peng,2014). When the export delivery value accounts for a large proportion of the industrial sales value, the degree of market opening is relatively high, which is conducive to promoting production. This is consistent with the study by Xu Wei (Xu Wei,2016). Financial costs (billion yuan) were selected to measure the financing costs of the company, with the research of Li Hongwei (Li Hongwei,2012) and Fu Bingjun (Fu Bingjun,2017).

In terms of technology, the use of 10,000 yuan in electricity consumption (kWh/million) was used to measure the level of resource utilization, with the research of Guo Yajun (Guo Yajun,2012).

2.2.3 Source and Selection of Data

The input and output indicators of this article and the related raw data of environmental variables are all derived from the "Hubei Statistical Yearbook" for 2012 to 2016, and are calculated and collated then, so it is true and reliable. The reasons for selecting the period from 2010 to 2015 as the study period are: Since 2010, the automobile manufacturing industry was not listed as a separate industry, and the automobile manufacturing industry occupies a very important position in the industrial economic development of Hubei Province and cannot be ignored. Therefore the research period of this article started in 2010. In addition, R&D expenditures for various industries are lacking, so the research period ends in 2015. The reason for selecting 28 industries is that the manufacturing industry in the Statistical Yearbook of Hubei Province from 2010 to 2016 includes 31 industries, but due to three industries (leather, fur, feathers and their products and footwear, comprehensive utilization of waste resources, Metal products, machinery and equipment repair industry) lack of data, 28 industries (as the note shown)are measured.

3 Empirical Results Analysis

3.1 The results of first stage traditional dea empirical results

Using DEAP 2.1 software, the traditional DEA-Malmquist index was calculated the production efficiency of 28 industries in Hubei Province from 2010 to 2015. The results are shown in Table 2.

Table 2   Traditional DEA-Malmquist Index and Its Decomposition

Industry number	Malmquist index	Effch	Techch	Pech	Sech
4	1.279	1.002	1.277	1.000	1.002
8	1.236	1.123	1.100	1.000	1.123
26	1.181	0.964	1.224	1.164	0.828
11	1.156	0.963	1.200	1.000	0.963
6	1.076	1.042	1.033	1.086	0.959
10	1.071	0.880	1.217	0.924	0.952
20	1.050	0.824	1.274	0.976	0.845
21	1.043	0.842	1.239	0.987	0.853

16	1.037	0.872	1.189	1.008	0.865
22	1.025	0.803	1.276	0.919	0.874
25	1.005	0.824	1.220	0.988	0.834
9	0.981	0.935	1.049	0.938	0.998
13	0.980	0.871	1.124	1.035	0.842
15	0.968	0.842	1.150	1.000	0.842
23	0.965	0.850	1.135	1.000	0.850
14	0.960	0.797	1.204	0.911	0.876
1	0.954	0.843	1.131	1.000	0.843
24	0.953	0.778	1.224	0.790	0.985
28	0.952	0.739	1.289	0.920	0.803
18	0.950	0.905	1.050	0.870	1.040
2	0.941	0.874	1.077	1.009	0.867
5	0.941	0.900	1.046	1.040	0.865

Continual Table 2

Industry number	Malmquist index	Effch	Techch	Pech	Sech
7	0.941	0.880	1.069	0.872	1.009
27	0.937	0.756	1.240	0.855	0.884
3	0.934	0.850	1.099	1.017	0.835
12	0.919	0.948	0.969	1.000	0.948
19	0.897	0.755	1.188	0.842	0.897
mean	1.009	0.876	1.152	0.969	0.904

From Table 2, we can see that without removing environmental variables and random factors, the overall efficiency of Hubei's industry is on the rise, with an average productivity of 1.09, an average annual increase of 0.9%, and the growth rate is not obvious. The main reason is that the rate of technological progress has increased by 15.2%, while technical efficiency has shown a downward trend with a decrease of 12.4%. Among the 28 industries, the production efficiency of 12 industries shows an upward trend, which is mainly attributed to technological progress; the production efficiency of 16 industries shows a downward trend, which is mainly attributed to the decline of technical efficiency. The technical efficiency of 25 industries shows a downward trend, which is mainly due to the decline of pure technical efficiency and scale efficiency. Because this result includes the interference of environmental factors and random factors, it cannot reflect the actual efficiency of each industry, so further adjustments and calculations are needed.

18	0.977	0.901	1.084	0.996	0.905
mean	1.139	1.056	1.079	1	1.055

The slack variables of the input variables separated in the first stage are used as the explanatory variables, and the environment variables are used as explanatory variables. The Frontier4.1 software is used to perform SFA regression analysis. The calculation results are shown in Table 3. It can be seen from the above that most of the coefficients of the variables of the environmental variables on input slack can pass the significance test, indicating that external environmental factors have a significant impact on the redundancy of industrial production inputs. Further, the γ of the labor input slack variable and the R&D investment slack variable are 0.7863 and 0.6391, respectively, which are close to 1, and all reach a significant level of 1%, which indicating that the influence of management factors in these two inputs accounts for the dominant position; for the capital investment slack variable, the γ value is 0.3904, which is close to 0, and reaches a 1% level of significance, which indicating that the impact of random errors dominates the capital investment. This result shows that management factors and random errors have a significant impact on industrial production efficiency. Therefore, it is necessary to apply SFA to separate management factors and random errors.

3.3 The DEA empirical results after the third stage adjustment

The adjusted input variable and original output were calculated again using the traditional DEA-Malmquist index model, and the efficiency values after eliminating environmental variables and random factors were obtained. The results are shown in Table 4.

The technical efficiency index, technical progress index, pure technical efficiency index, and scale efficiency index before and after adjustment are compared respectively (Figure 1 to Figure 4). It can be seen that from the overall situation, the industrial efficiency of Hubei Province The scale efficiency was underestimated before the adjustment, and the technological progress index and pure technology index fluctuate even more. After the adjustment, the industrial technology efficiency and scale efficiency of Hubei Province increased, and the technical progress index and pure technology index of various industries fluctuate less and more stable. This shows that environmental factors and random errors have caused the technical efficiency and scale efficiency of various industries in Hubei Province to decrease, and the gap between technological progress and pure technological efficiency in various industries has become even greater.

4 Conclusion

Based on the above analysis, the following conclusions can be drawn:

(1) After the second stage of environmental factors and random error adjustment, the production efficiency of various industries has changed significantly. This shows that environmental factors and random errors do have an important impact on the industrial production efficiency of Hubei Province. After the adjustment, the industries of total factor productivity above 1 increased from 12 to 27, and only one industry of ferrous metal smelting and rolling and processing industry is less than 1 before and after the adjustment, indicating that the efficiency of the industry needs to be improved. Both technical efficiency and scale efficiency need to be improved.

(2) The industrial total factor productivity achieved rapid growth during the five years from 2011 to 2015 in Hubei, with a growth rate of 13.9%. It is mainly due to the combined effect of technological efficiency and technological progress.

(3) Through the second-stage regression analysis of SFA, it can be seen that government subsidies may lead to over-investment of enterprises and thus reduce production efficiency; the improvement of opening-up level will increase the ability of enterprises to innovate in science and technology, but it may also cause hidden problems in information security; the increase of financing costs will lead to a reduction in fixed assets and R&D investment, which will reduce outputs. The blind expansion of the industry scale may also increase the blind increase in fixed asset investment and R&D investment, resulting in unreasonable allocation of funds and thus lower production efficiency.

(4) The presence of environmental factors and random errors has led to the underestimation of technical efficiency and scale efficiency, making the gap between technological progress and pure technical efficiency of various industries more obvious. It shows that the removal of environmental factors and random errors is very necessary.

(5) It can be seen from figure 6 that the pure technical efficiency value of each industry in the third stage of adjustment has approached 1 and the scale efficiency value of most industries is greater than 1, indicating that scale efficiency is the main factor affecting industry efficiency and enlarging or reducing the scale of the industry reasonably will help reduce the waste of input elements and increase the efficiency of resource utilization.

In order to improve the industrial productivity of Hubei Province further, this article will propose the following suggestions for reference:

(1) Considering the importance and uncontrollability of the external environment and random error, this paper believes that external environmental factors should be used reasonably to improve efficiency. The state should reasonably control the support and give appropriate government subsidies to avoid situations that are too far behind; enterprises should adhere to the combination of going out and introducing, focusing on improving the level of science and technology and the competitiveness of the international market, preventing the leakage of technology and information; and rationally selecting financing channels. Reduce the cost of financing; appropriately increase the number of enterprises, control the scale of the industry, and make full use of the benefits brought by the scale effect while avoiding its potential risks.

(2) The efficiency level of each industry is different. The low-efficiency industry should actively reflect on it, clearly recognize its own situation, rationally allocate input resources, strengthen

innovation, make full use of various external conditions favorable to the development of the enterprise, seize opportunities, and transform and upgrade. Focus on improving the technical level and management level. High-efficiency industries should be aware of their key to success, enhance their core competitiveness, and maintain a positive development trend.

(3) Adhere to the combination of production, education and research to improve the quality of employees. Enterprises should actively absorb the high-level talents of higher education institutions, and carry out scientific entry and training, and regularly carry out management skills and technical skills training in the course of work, and cultivate comprehensive talents.

(4) Both the government and enterprises should perform their duties, clarify their responsibilities in the market economy and their social responsibilities. The government should actively carry out macroeconomic regulation and control under the conditions of market failure to create a good development environment for enterprises. It should also have a development vision and be based on long-term development.

Of course, the research in this paper is also insufficient. It does not accurately analyze and grasp the characteristics of various industries, so as to analyze the underlying causes that affect the efficiency of various industries. This is also a research difficulty. On the basis of the research of this paper, taking a specific industry as the research object, studying its efficiency status, and proposing countermeasures based on the in-depth analysis of the characteristics of the industry, will be solved.

An Empirical Study on the Effect of Executive Compensation Structure on the Voluntary Disclosure of Environmental Information of Listed Companies

Fang Ming, Guo Xuan
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: fxlasting@whut.edu.cn; 453405607@qq.com)

Abstract: The frequent occurrence of environmental pollution issues has made investors increasingly concerned about the disclosure of environmental information of listed companies. This article selects 148 listed companies that voluntarily disclosed environmental information during the period of 2012-2016 from Shanghai and Shenzhen Stock Exchanges as research samples, and uses Logistic regression model to analyze the composition, proportions, gaps, and other sides of executive compensation. The study found that short-term remuneration ratio, long-term remuneration ratio, and executive remuneration gaps have a significant impact on the voluntary disclosure of environmental information of listed companies.

Key words: Executive compensation structure; Voluntary disclosure of environmental information; Heterogeneity of top management teams; Listed companies

1 Introduction

As an important part of corporate governance, executive compensation designs a scientific and reasonable executive compensation structure, which can coordinate the interests of executives and enterprises, effectively alleviate the agency problem, encourage executives to fulfill the corporate social responsibility, and further improve the disclosure system of the company's environmental information. Discussing the relationship between executive compensation structure, team heterogeneity and voluntary disclosure of environmental information can optimize the rational allocation of senior management team, ensure the incentive effect of salary structure, and improve the voluntary disclosure of environmental information of listed companies.

The research question in this articleis: How does the executive compensation structure affect the voluntary disclosure of environmental information? In view of the above problem, this article analyzes the impact of executive compensation structure on voluntary disclosure of environmental information from the aspects of composition, proportion and gap of executive compensation.

2 Literature Review and Research Hypothesis

2.1 Effect of executive short-term compensation on the voluntary disclosure of environmental information

Barnea and Rubin (Barnea and Rubin, 2010) found that companies with low insider control and leverage ratios tend to be socially responsible for rent-seeking behavior. Executives tend to overinvest in corporate social responsibility activities because the agency costs and financial costs of undertaking similar activities are lower. In view of this, opportunism in environmental information disclosure leads senior executives to prefer compensation structures with high proportion of short-term remuneration and low uncertainty in the future, rather than long-term compensation structures such as equity incentive plans. It is assumed that:

H1: The higher the short-term salary of senior executives, the less likely the company's environmental information will be disclosed voluntarily.

2.2 Effect of executive long-term compensation on the voluntary disclosure of environmental information

Milbourn (Milbourn, 2003) found that there is a positive correlation between the reputation of senior executives and the sensitivity of the stock options granted to senior executives. Based on the above analysis, it can be introduced that the implementation of equity incentives and other long-term remuneration for senior executives in China can closely combine the personal interests of senior executives and shareholders to reduce agency costs, thereby effectively avoiding the short-sighted behavior of senior executives and urging them to be motivated. Actively perform social responsibility activities such as environmental information disclosure. So assume that:

H2:The higher the long-term salary of senior executives, the more likely the company's environmental information will be disclosed voluntarily.

Firth's (Firth, 2006) research shows that increasing the proportion of long-term compensation in the compensation structure is beneficial to reducing agency costs and has a significant long-term incentive effect for senior executives, thus continuously improving the corporate environmental information disclosure system. So assume that:

H3: The higher the proportion of long-term executive compensation, the more likely it is for the company to disclose environmental information voluntarily.

2.3 Influence of executive remuneration gap on the voluntary disclosure of environmental information

Lu Haifan's (Lu Haifan, 2007) study found that the widening remuneration gap would cause pressure and discomfort of non-core management personnel, thus deepening the psychological and even hostile attitudes of high-remunerationing executives, and breaking the unity, harmony, and friendly competition of the team. When the remuneration gap among senior executives gradually widens, the low-paid executives will experience negative completion and adverse selection. They believe that they are unfairly treated or even exploited by the company, which is detrimental to the establishment of a corporate environmental information disclosure system. So assume that:

H4: The smaller the remuneration gap between executives, the greater the possibility of voluntary disclosure of company environmental information.

3 Research Design

3.1 Sample selection and data sources

This article uses Shen Hongtao's (Shen Hongtao, 2010) environmental information disclosure evaluation method in the Shenzhen and Shanghai A-share listed companies during the period of 5 years from 2012 to 2016.The sample companies ultimately acquired 148 listed companies. The data used in this article comes from the database of corporate governance structure of the CSMARDatabase, the China Securities Regulatory Commission website, the WIND database, and the CNINFO website. The data of this article mainly use Excel, SPSS20.0 software to complete statistical analysis.

3.2 Variable selection

In the A-share listed companies in Shenzhen and Shanghai during the 5-year period from 2012 to 2016, this article adopts the enterprise environmental information disclosure evaluation method proposed by Shen Hongtao (Shen Hongtao, 2010), and selects the listing company of voluntary disclosure of environmental information in the annual report and social responsibility report. In order to ensure the validity of the data, in the screening of samples, the A-share listed companies that issued B shares or H shares at the same time were excluded, the total short-term compensation data of executives, the number of executives and the background characteristics of executives were unclear or not disclosed. The company eventually won 148 listed companies, including 5 samples in 2012, 7 samples in 2013, 18 samples in 2014, 44 samples in 2015, and 74 samples in 2016. At the same time, this article selected another 148 companies with similar industry and asset scales as control samples.

The data used in this article comes from the company's corporate governance structure executive database dynamic database and environmental information disclosure database of CSMAR database, China Securities Regulatory Commission website, WIND database and Juchao information network, etc. Some data are incomplete, need to refer to the annual report of the listed company and processing calculation Acquired. In order to effectively avoid the impact of intra-group transactions, the data used is the data in the consolidated report. The data in this article mainly uses Excel and SPSS20.0 software to complete statistical analysis.

The meaning of variables is shown in Table 1:

Table 1   Study Variable Definition Table

Variable Type	Symbol	Variable Name	Calculation Formula
Dependent variable	VED	Voluntary disclosure of environmental information	There is a voluntary environmental information disclosure =1, otherwise =0
independent Variable	X_1	Short-term remuneration for top management	ln(Total annual salary of directors, supervisors and executives / top management's number)
	X_2	Long-term remuneration for top management	top management share ratio / top management's number
	X_3	The ratio of long-term compensation of top management	top management stock holdings * year-end stock price / (top management short-term salary + top management shareholding * stock price at end of year)

Continual Table 1

Variable Type	Symbol	Variable Name	Calculation Formula
Moderating Variable	X_4	Top management remuneration gap	ln[Core top management compensation /3-noncore top management remuneration / top management's number -3]
	AGE	Top Management Team Heterogeneity	$\sqrt{\sum_{i=1}^{n}\left(A_i - \overline{A}\right)^2} / \overline{A}$
	TEN	Top Management Team Tenure Heterogeneity	$\sqrt{\sum_{i=1}^{n}\left(B_i - \overline{B}\right)^2} / \overline{B}$
	EDU	Top Management Team Educational Heterogeneity	$1 - \sum_{i=1}^{n} P_i^2$
Control Variable	LEV	asset-liability ratio	Total liabilities / total assets
	SIZE	scale of the enterprise	ln（The book value of the company's total assets at the end of the year）
	INDUSTRY	industry	High pollution industry =1, otherwise =0

3.3 Model design

Based on the above assumptions and variables, the article establishes the following logistic regression model based on the research on the executive compensation structure and environmental information voluntary disclosure of companies at home and abroad.

Model 1：

$$\ln\left(\frac{\Pr(VED=1)}{1-\Pr(VED=1)}\right) = \sigma + \alpha_1 X_1 + \alpha_2 X_2 + \alpha_3 X_3 + \alpha_4 X_4 + \beta_1 LEV + \beta_2 SIZE + \beta_3 INDUSTRY + \varepsilon_1$$

Model 2：

$$\ln\left(\frac{\Pr(VED=1)}{1-\Pr(VED=1)}\right) = \sigma + \alpha_1 X_1 + \alpha_2 X_2 + \alpha_3 X_3 + \alpha_4 X_4 + \mu_1 TMT + \beta_1 LEV + \beta_2 SIZE$$
$$+ \beta_3 INDUSTRY + \varepsilon_2$$

4 Empirical Analysis

4.1 Descriptive statistical analysis

This article makes descriptive statistics on sample groups: one group is listed companies that voluntarily disclose environmental information, and the other group is listed companies that do not voluntarily disclose environmental information. The results of the descriptive statistics analysis are shown in Table 2 and Table 3.

Table 2 Descriptive Statistics of Voluntary Disclosure of Environmental Information Sample Companies

	N	Min	Max	Mean	Standard Deviation
X_1	148	10.840	14.83	12.725	.833
X_2	148	.000	.063	.007	.016

SIZE	148	16.120	25.290	22.072	1.409
INDUSTRY	148	0	1	.75	.454

4.2 Correlation analysis

In order to judge the direction and extent of correlation between executive compensation structure and environmental information disclosure, this article also conducts Pearson correlation analysis on each variable. Theoretically speaking, the correlation coefficient exceeds 0.8, indicating that the correlation is strong. It can be seen from the results in Table 4 that there is no strong correlation between the variables.

Table 4   Result of Correlation Analysis

	VED	X_1	X_2	X_3	X_4	AGE	TEN	EDU	LEV	SIZE	INDUSTRY

INDUSTRY	.062	-.170	.063	.123	.039	.124	-.123	.183*	.251	-.143	1

4.3 Multicollinearity test

In this article, a multi-collinearity test was performed on all variables before binomial regression analysis. As shown in Table 5, the tolerance between each variable is higher than 0.1, and the variance expansion factor VIF is also between 0-10, indicating that there is no multicollinearity problem between the variables, and the latter logistic regression analysis can be performed.

Table 5   Multicollinearity Analysis of Related Variables

	$EDU \times X_3$	.342	3.019
	$EDU \times X_4$	.426	2.504

4.4 Regression analysis on the effect of executive compensation structure on the voluntary disclosure of environmental information

Binomial logistic regression was used to test the impact of executive compensation structure on voluntary disclosure of environmental information. It can be seen from Table 6 that the observed value of the Hosmer-Lmemshow statistic is 5.380, and the associated probability p is 0.735, which is significantly greater than the significance level of 0.05, indicating that the actual value equation fits the data well.

Table 6   Hosmer and Lemeshow Test

Step	Chi-square	df	Sig.
1	5.380	8	.735

From the regression coefficient in Table 4,The regression coefficients of executive short-term compensation (X_1), executive long-term compensation (X_2), executive long-term compensation (X_3), and executive compensation gap (X_4) are -1.860, 0.216, 0.016, - 2.609, respectively. The short-term salary (X_1), the long-term salary ratio of executives (X_3), and the executive compensation gap (X_4) have p-values of 0.003, 0.017, and 0.000, respectively, which are less than the significance level of 0.05, indicating the short-term salary and long-term salary of executives. There is a significant correlation between the ratio of compensation and the gap between wages and voluntary disclosure of environmental information.

1. The impact of short-term remuneration of senior executives on the voluntary disclosure of environmental information passed a significant test. The assumption H1 is established. The main reason is that higher short-term salary is likely to cause short-term behavior of the senior management team, which in turn hinders the establishment and improvement of corporate environmental information disclosure system.

2. The effect of long-term salary of senior executives on the voluntary disclosure of environmental information did not pass the significance test. The assumption H2 is not established. The reason for this is that the composition of executive compensation for listed companies in China is mainly short-term. The role and role of long-term remuneration has not been taken seriously by companies, which has led to the lack of effective long-term incentives in the disclosure of environmental information in listed companies in China.

3. The influence of long-term salary proportion of senior executives on the voluntary disclosure of environmental information passed a significant test. The assumption H3 is established, that is, the larger the long-term remuneration ratio of senior executives, the more likely the company is to voluntarily disclose environmental information. In conclusion, simply increasing long-term remuneration does not help companies establish an environmental information disclosure system, but increasing the proportion of long-term remuneration can significantly promote companies to voluntarily disclose environmental information.

4. The impact of executive remuneration gaps on the voluntary disclosure of environmental

information passed a significant test, the assumption H4 is established. This means that the small remuneration gap between executives is conducive to promoting team cooperation, mobilizing the enthusiasm of the senior executives, and encouraging them to build a more complete environmental information disclosure system for the company.

Table 7　Regression Analysis of Executive Compensation Structure on the Voluntary Disclosure of Environmental Information

	B	S.E.	Wald	df	Sig.	Exp(B)	95% C.I.for EXP(B) Lower	Upper
X_1	-1.860	.60	9.75	1	.003	.151	.052	.485
X_2	.216	.178	1.360	1	.255	1.239	.878	1.750
X_3	.016	.008	5.646	1	.017	.994	.971	.997

SIZE	.091	.242	.134	1	.825	1.095	.789	1.808
INDUSTRY	-.075	.553	.019	1	.892	.928	.314	2.739
Constant	-6.973	4.845	1.522	1	.333	.003		

4.5 Robustness analysis

In order to ensure the reliability of the research conclusions, the article carries out the following robustness test. According to the principle of correlation, comparability, qualitative and quantitative, combined with the requirements of the "Guidelines for Environmental Information Disclosure of Listed Companies" issued by the Ministry of Environmental Protection, the environment is constructed. The information disclosure indicator system was scored by the "content analysis method", and 148 companies were provided with the Environmental Disclosure Index (EDI). Using EDI as an alternative to environmental information disclosure VED, the above regression test was repeated, and the test results (Table 8) were basically consistent with the conclusions of this article, which verified the robustness of the conclusions of this article.

Table 8　Regression Analysis of Executive Compensation Structure on EDI

Variable	Dependent variable: Environmental Information Disclosure （EDI）	
	Regression coefficients	T
Constant	-6.768***	-4.123
X_1	-1.456***	-2.301
X_2	.201	-.012
X_3	.126***	.247
X_4	-1.863***	-4.120
LEV	-2.013	-1.213
SIZE	.471	.241
INDUSTRY	-.165	-.204
Adjusted R^2	0.087	
F	2.769	

5 Conclusion

This article concludes the following conclusions by analyzing the influence of the composition, proportion, and gap of executive compensation on the voluntary disclosure of environmental information:

First, there is a negative correlation between short-term remuneration and the level of environmental information disclosure, which shows that when executives' short-term remuneration is high, their emphasis on environmental information disclosure is reduced. Secondly, the effect of long-term salary of senior executives on the voluntary disclosure of environmental information of listed companies fails to pass the significance test, but the proportion of long-term compensation is more obvious for the voluntary disclosure of environmental information of listed companies. This shows that although long-term remuneration has not yet exerted its proper incentive role, increasing the proportion of long-term remuneration of senior executives in total remuneration can prompt the company's

environmental information disclosure system to be closely related to the business behavior of senior executives. Finally, the relatively small remuneration gap has also had a significant impact on the voluntary disclosure of environmental information by listed companies.

Empirical Research on Performance of Listed Companies in Coal Industry of China

Cao Wenfei

School of Management, Wuhan University of Technology, Wuhan, Hubei Province, P.R.China, 430070
(E-mail: 2933643759@qq.com)

Abstract: Empirical research is carried out in this thesis by virtues of the factor analysis method of STATA software, with the financial indices of listed companies in coal industry of China between 2014 and 2016 published by CSMAR Database as data. 12 financial indices are taken as the initial basic variables based on the solvency, operation capacity, profitability and development capacity, to extract three factors, including profit and sustainable growth, debt repayment and operation, build up the evaluation system for the performance of listed companies in coal industry, and calculate the scores and ranks of each listed company based on it. The results show that the profit and sustainable growth factors have significant positive correlation with the financial conditions of the listed companies; further researches show that listed companies in coal industry generally have the problems about excessive idle assets and low fund utilization rate. On a basis of it, the significance of efficiently using idle assets and expanding profit channel for the listed companies in coal industry is deduced, and related recommendations for the sustainable and sound development of the coal industry are proposed.
Key words: Coal industry; Factor analysis; Performance level; Sustainable and sound development

1 Introduction

The current situation of resources in China determines that coal is dominant in the energy production and consumption (Chen Guangsheng, 2012), and the coal industry is the cornerstone for the development of the energy industry in China, and also the basic industry of national economy. In China, coal is the major supply resource of four downstream industries, namely iron and steel, power, chemical engineering and building material; taking the power sector for an example, currently thermal power generation depending on coal accounts for 70% gross generation (Wang Meiling, 2013). Therefore, the sound development of the coal industry is closely linked with the construction of people's livelihood.

On the other hand, as "ten-year golden cycle" of the coal industry in China came to an end in 2013, the coal industry in China has been depressed once (Wang Meiling, 2013), the market supply and demand have changed, the price has continued to decrease and the industrial production capacity has been excessive, which greatly reduced the benefits of listed companies in coal industry. Therefore, it is critical to seek for the sustainable and sound development of listed companies in coal industries.

The performance of listed companies in the coal industry is evaluated. On the one hand, it provides a comparison between the performance of a certain enterprise and other enterprises in the industry, so asto find out the gap between them and the enterprise's competitive advantage. Then the business operation status can be improved on this basis. On the other hand, the main factors affecting the performance of the coal industry is analyzed, which is helpful to conduct relevant reforms in the coal industry in a targeted manner and promote its sustainable development.

The study of industry performance evaluation mainly starts from the DuPont analysis system. Combined with the characteristics of the industry and the needs of the enterprise itself, the DuPont analysis system is revised, and relevant financial indicators are selected for factor analysis. However, most of the existing papers take the performance analysis as part of the overall evaluation. They roughly select two or three indicators representing the financial capabilities of a certain aspect to construct the indicator system; while the reasons for the indicator selection are not explained. As a result, these papers have no persuasion but poor practicability.

2 Empirical Research on Performance of Listed Companies in Coal Industry

2.1 Selection of research object and evaluation indices

According to Flush Software statistics, there are totally 33 listed companies in coal industry in China, and special treatment of cancellation is carried out in this thesis based on the reliability principle of the data analysis, to remove three companies, namely Pingzhuang Energy (Inner Mongolia Pingzhuang Energy Co., Ltd.), Zhengzhou Coal Industry (Group) Co., Ltd. and Henan Dayou Energy Co., Ltd., and take the remaining listed companies as the analysis objects, take the financial data

published by CSMAR Database in 2014, 2015 and 2016 as sources, and to finally obtain 90 samples.

In the existing related literature, Luo Xun (2006) built a financial quality index evaluation system for listed companies in China's coal industry, based on the previous research and combined with DuPont analysis system as well as current China's securities evaluation system. He selected 14 evaluation indicators from four aspects including profitability, operational ability, solvency and sustainable development ability. Sheng Lin (2009) took the financial indicators of the "Evaluation Rules on State-owned Enterprise Performance" as the main body and screened relevant financial indicators using the highly irrelevant method. Finally 7 financial indicators were obtained. On this basis, the factor analysis method was used to establish a financial evaluation model. Thus, starting from the four aspects of solvency, operational ability, profitability and development ability, relevant index variables are selected in this paper. Eventually, according to the principle of relevance, 12 index variables are determined as the initial basic variables for statistical analysis, depict the quantitative relation among factors, apply dimensionality reduction concept to classify the observational variables, find out representative common factors, build up related mathematical models based on it, set up comprehensive evaluation index system, measure the performance level of listed companies in coal industry of China(Zhu Wenli and Yang Xiaoyuan, 2016), and so as to analyze the major factors affecting the development of listed companies in coal industry; specific variables are defined in Table 1.

Table 1　Table of Variable Definition

Financial capacity	Name of index	Symbol	Definition of index
Solvency	Asset-liability ratio	X_1	Total liabilities/assets; measurement of long-term solvency
	Equity ratio	X_2	Total liabilities/owner's equity; measurement of long-term solvency
	Liquidity ratio	X_3	Current assets/current liabilities; measurement of short-term solvency
Operation capacity	Turnover of fixed assets	X_4	Operating income/net amount of fixed assets at the end of the period
	Total assets turnover	X_5	Operating income/balance of total assets at the end of the period
Profitability	Return on assets	X_6	(Total profits and financial expenses)/total assets
	Rate of return on total assets	X_7	Net profits/total asset balances
	Net assets returns ratio	X_8	Net profits/balance of stockholder's equity
	Return ratio of long-term capitals	X_9	(Total profits and financial expenses)/long-term asset amounts
	Net operating profit ratio	X_{10}	Net profits/operating income
Development capacity	Growth rate of basic earnings per share	X_{11}	（ (Single-quarter amount of basic earnings per share in current period of the year- amount of basic earnings per share in previous single quarter)/ amount of basic earnings per share in previous single quarter
	Growth rate of owner's equity	X_{12}	(Closing value of owner's equity in current period-opening value of owner's equity in current period)/ opening value of owner's equity in current period

2.2 Factor analysis and its results

2.2.1 Index system inspection

STATA Software is used to carry out Kmo inspection on the selected indices to judge the suitability of factor analysis. Generally, when Kmo statistics is more than 0.9, the factor analysis will achieve the best effect, and when it is below 0.5, factor analysis is improper. The inspection results are listed in Table 2, and Kmo is 0.6729, and thus the results of factor analysis are acceptable.

Table 2　KMO Inspection Results

Variable	X_1	X_2	X_3	X_4	X_5	X_6	X_7	X_8	X_9	X_{10}	X_{11}	X_{12}	Overall
kmo	0.6541	0.536	0.4477	0.294	0.5118	0.6794	0.8371	0.7324	0.8422	0.7926	0.3969	0.7556	0.6729

2.2.2 Eigenvalue and accumulated variance contribution rate

Specific results are shown in Table 3.

Table 3   Eigenvalue and Accumulated Variance Contribution Rate

Factor	Eigenvalue	Difference	Proportion	Cumulative
Factor1	6.1934	4.21901	0.6209	0.6209
Factor2	1.97439	0.76115	0.1979	0.8189
Factor3	1.21324	0.93941	0.1216	0.9405
Factor4	0.27383	0.03383	0.0275	0.9679
Factor5	0.24	0.13407	0.0241	0.992
Factor6	0.10593	0.02939	0.0106	1.0026
Factor7	0.07654	0.05588	0.0077	1.0103
Factor8	0.02067	0.02543	0.0021	1.0124
Factor9	-0.00477	0.0093	-0.0005	1.0119
Factor10	-0.01407	0.01446	-0.0014	1.0105
Factor11	-0.02853	0.04741	-0.0029	1.0076
Factor12	-0.07594	0.033	-0.0076	1

Principal factor method is used for analysis in this thesis to get the eigenvalue, explained variance and accumulated variance contribution values of each common factor listed in Table 3. In general, the extraction standard for principal factor is: eigenvalue no less than 1. The results show that the eigenvalues of the first three common factors are more than 1 and the accumulated variance contribution rate reaches 94.05%, which explains most of information about the sample index, and thus the first three common factors are selected as the principal factors for factor analysis. Among them, F1 explained variance contribution rate reaches 62.09%, becoming a key factor affecting the performance of listed companies in coal industry.

2.2.3 Component matrix

The typical representative variables of principal factors have been initially shown in the component matrix listed in Table 4, but the logical relation among factor is not obvious now, and thus it is necessary to rotate and re-distribute the explained variance proportion of each factor, to make its load coefficient closer to 1 or 0 and to achieve better explanation and naming.

Table 4   Component Matrix

Variable	Factor1	Factor2	Factor3	Factor4	Factor5	Factor6	Factor7	Factor8	Uniqueness
X_1	-0.7513	0.1753	0.5242	0.2159	0.0404	0.0601	0.0911	-0.0458	0.0677

2.2.4 Factor load rotation

The rotation component matrix obtained from factor load rotation is shown in Table 6, in which F_1 has larger load in X_6 return on assets, X_7 rate of return on total assets, X_8 net assets returns ratio, X_9 return ratio of long-term capitals, X_{10} net operating profit ratio and X_{12} growth rate of owner's equity, and the first five items reflect the profitability of listed companies, and the last one reflects the growth rate of the retained incomes, representing the sustainable growth capacity of companies, and thus F_1 may be called the profit and sustainable growth factor; F_2 has larger load in X_1 asset-liability ratio, X_2 equity ratio and X_3 liquidity ratio; therefore, F_2 is named as solvency factor; F_3 has larger load in

X_4 fixed assets turnover and X_5 total assets turnover, and these two indices are used to measure the operation capacity of listed company, and thus F_3 may be called operating factor.

Table 5   Eigenvalue and Accumulated Variance Contribution Rate upon Rotation

Factor	Variance	Difference	Proportion	Cumulative
Factor1	5.02141	2.77988	0.5034	0.5034

X_{11}	0.02083	-0.02506	-0.03615	0.162	0.14718	0.02621	-0.09888	0.22096
X_{12}	-0.02664	-0.05495	-0.06599	-0.06589	0.41247	0.41292	0.012	-0.53304

$$F_1 = 0.18568X_1 - 0.01442X_2 - 0.03912X_3 + 0.07189X_4 - 0.00615X_5 + 0.74066X_6 + 0.19950X_7$$
$$+ 0.01436X_8 + 0.15521X_9 + 0.00284X_{10} + 0.02083X_{11} - 0.02664X_{12}$$
$$F_2 = -0.35140X_1 - 0.91989X_2 - 0.04166X_3 + 0.20519X_4 + 0.00334X_5 - 0.04686X_6 + 0.12203X_7$$
$$- 0.25366X_8 - 0.19103X_9 - 0.08251X_{10} - 0.02506X_{11} - 0.05495X_{12}$$

$$F_3 = -0.10043X_1 - 0.07328X_2 + 0.02798X_3 + 0.68014X_4 + 0.26958X_5 - 0.32519X_6 - 0.15734X_7$$
$$- 0.00458X_8 + 0.37246X_9 + 0.09801X_{10} - 0.03615X_{11} - 0.06599X_{12}$$

The variance value and accumulated variance contribution rate corresponding to each principal factor shown in Table 5 are used to obtain the integrate score function for the performance of listed companies in coal industry:

$$F = (0.5034F_1 + 0.2247F_2 + 0.1938F_3)/0.9220$$

Now therefore, the score rank and integrate score rank of each principal factor of listed companies in coal industry may be obtained.

Table 8   Score Rank and Integrate Score Rank of Each Principal Factor of Listed Companies in Coal Industry

	factor1	Rank	factor2	Rank	factor3	Rank	F	Rank

3 Result Analysis

Xinji Energy has the best rank and the highest performance level. In the rank of three factors, F_1 profit and sustainable growth rate factor ranks the first, F_2 solvency factor and F_3 operating factor are at the midstream level. On the one hand, the experimental results fully show F_1 profit and sustainable growth rate factor is of strong promoting function on the integrate rank; on the other hand, it also shows this enterprise is of lower operating risk and better development prospect.

Shanghai Energy ranks last in F_1 profit and sustainable growth rate factor; although it reveals stronger fund utilization efficiency and performance development capacity, it ranks the fourth in F_3 operating factor and at the midstream level in F_2 solvency factor; but its integrate rank still ranks the third from bottom, and is not greatly improved due to good performance of F_2 and F_3. The example of Shanghai Energy also demonstrates that F_1 profit and sustainable growth rate factor has an important effect on the performance of listed companies in the coal industry.

Jinrui Mineral ranks the first in F_2 solvency factor, showing the Company has stronger solvency and internally sufficient disposable current assets available. But another two factors ranks at the mid-low level, especially F_1 profit and sustainable growth rate factor ranking the 22nd, which result ranks the 14th finally in the integrate ranking. It is a common situation of listed companies in the coal industry; Meijin Energy, China Shenhua Energy and Beijing Haohua Energy Resource have similar problems, such as many idle assets and low fund utilization rate, resulting in poor profitability and the absence of sustainable development motivation.

4 Recommendations for Economic Development of Listed Companies in Coal Industry

4.1 Expanding profit channel and enhancing sustainable development capacity of the industry

It is found in the researches of this thesis that F_1 profit and sustainable growth rate factor has significant positive correlation with the performance of listed companies in the coal industry, and it is important to start from profit and development to enhance the financial capacity of the listed companies. On the one hand, supply and demand imbalance of coal industry in the market remains and the coal price continues to decrease; under such background, enterprises rather need to continuously strengthen its own construction, carry out technological innovation, update business development mode, enhance industrial concentration and develop economies of scale. Longitudinally, the development to downstream industries such as power and chemical industry is necessary; horizontally, expansion of business and penetration into transportation, building materials and other fields are in need. Economies of scale can be formed through mergers and shareholdings; on the other hand, listed companies need to further adjust their production capacity structure, accelerate the technical innovation and reform of clean coal, improve coal's energy utilization rate and control the harm to the environment in the mining and combustion process. These measures will enhance the sustainable development capacity of the industry.

4.2 Efficiently using idle assets to improve the fund utilization rate

Low fund utilization rate becomes a common problem of listed companies in the coal industry, and thus it is critical to efficiently use idle assets and enhance the circulation and utilization of internal funds and other assets of companies. Try to re-utilize and efficiently use the idle assets, externally lease unneeded assets. Idle houses and equipment can be reutilized through leasing and investment, thus increasing the amount of current assets; carry out resource allocation, and re-distribute the idle resources in the enterprises, thus improve the production capacity of the enterprise; the third is to technically transform the idle resources. Transforming the eliminated coal mining equipment is able to re-establish production capacity. Full utilization of internal idle resources of the companies will enable the enterprises to effectively operate and provide more authentic and reliable financial information.

5 Conclusion

Through the measurement and comparison among performances of listed companies in the coal industry, it is shown that F1 profit and sustainable growth rate factor has significant positive correlation with the performance of listed companies in the coal industry, and companies with higher F1 score will have the advantages in the comprehensive competition. Further researches show that listed companies in the coal industry have common problems about low utilization rate of fund or other assets, which severely affects the operation, profitability and sustainable development capacity of the companies. Therefore, it is necessary to start from profit and sustainable development to enhance the development of listed companies in the coal industry, and at the same time consider the utilization efficiency of internal resources of enterprises, enhance the competitiveness and vitality of the industry, and thus to drive the sustainable and sound development of the coal industry.

Analysis on Comprehensive Benefit Evaluation System of New Energy Bus: Based on Stakeholder Dimension

Gao Qinglu, Pei Qianqian, Xia De
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: gaoqinglu@whut.edu.cn, 2998761792@qq.com,xiade@whut.edu.cn)

Abstract: Based on the concept of total cost of ownership and GREET model, the evaluation indexes of economic and environmental benefits are established in this paper. The social benefit evaluation indexes are constructed considering the interests of bus stakeholders: the government, residents, passengers, public opinion.This paper establishes a comprehensive benefits evaluation index system ofNEBs from the perspective of stakeholders and provides a comprehensive basis for busoperators to make rational decisions onwhether to introduceNEBs.
Key words: New energy bus (NEB); Stakeholders; Social benefit; Total cost of ownership; GREETmodel

1 Introduction

Recent years saw the spreading ofnew energy bus(NEB), the increase of government subsidy and the prevalence of green consumptionphilosophy. In this social context, bus operators are faced with the decision whether to introduce NEBs. Only considering economic benefits directly does not necessarily guarantee the maximization of their interests. Therefore, before introducing and operating NEBs, bus operators should take theeconomic, environmental and social benefits into account.

Scholars have three different perspectives on the benenfits of NEBs operation: economic benefits, environmental benefits and social benefits.

From the research on the economic benefits of introducing NEBs, some foreign scholars believe that the implementation of government subsidy policy plays an important role in reducing the purchase cost of NEBs, and indirectly promotes the development of NEBs. Most scholars mainly use the concept of total cost of ownership to compareand analyze NEBs and ICV, and put forward some suggestions for improving the economic benefits of NEBs.

To sum up, although purchase subsidies and tax exemption can reduce the purchase cost of NEBs, when comparing with ICV, it is the consensus that the total cost of ownership should be basis method to compare their economic profit.Based on that point and the operation practice of NEBs in China, the total cost of ownership of NEBs can be divided into four parts: purchase cost, government subsidy, energy consumption cost, maintenance cost, which will be considered as evaluation indexes of economic benefits.

Table 1　Economic Benefit Index Table of NEBs

Project	Speific Indexes	Literature Sources
Economic Benefit	Purchase Cost	Christian Thiel et al.(2010); V.Gass et al.(2014)
	Government Subsidy	Kuniaki Yabe et al.(2012);Reinhart Kiihne(2010)
	Energy Consumption Cost	Chengtao Lin et al.(2013);Deng Yuting(2017); N.Whitehouse(2009)
	Maintenance Cost	EVANTHIA A N et al.(2013);WanJian,et al.(2015)

As for the research on the NEBs environmental benefits, based on the fact that although there areno any emissions in the driving phase of NEBs, the NEBs actually incurred emissions in the production of its electric energy, scholars have proposed to measure environmental benefits more comprehensively and accurately between ICV and NEBs from a life-cycle perspective.

In measuring the environmental benefits of NEBs, GREET model is the well-accepted method to measure the CO_2 emissionsand other conventional pollutants (NO_x, SO_2, PM)in the life cycle. The GREET model, which was developed by Agonne National Laboratory in 1995, was used to evaluate the environmental benefits of the bus throughout its life cycle (WTW, Well.To Wheels). The carbon dioxide emissions for the whole cycle of a bus consist of two parts, namely, the amount of carbon dioxide emitted during the operation of the vehicle (PTW, Pump To Wheel) and the amount of carbon dioxide emitted in other stages (WTP,Well To Pump).

Table 2   Environmental Benefit Index Table of NEBs

Project	Speific Indexes	Literature Sources
Environmental Benefit	CO2	Caulfield et al.(2010); Kliucininkas et al.(2012) R.Sharmaa et al.(2013);Nanaki et al.(2014)
	NOx	McKenzie et al.(2012);R.Sharmaa et al.(2013)
	SO2	Sanchez et al.(2012); R.Sharmaa et al.(2013); Nanaki et al.(2014)
	PM	McKenzie et al.(2012);Nanaki et al.(2014)

At present, there are few researches on the social benefits of NEBs operation. Liu Wei believes that for the surrounding residents, the implementation of clean and renewable energy projects will affect the quality of life and health care[18].At the same time, for the whole city and society, the introduction of NEBs will help the government to obtain public support, improve the image of the city, and upgrade the urban infrastructure. Mingming Chen et al. and Gu Jieweipoint out that the social benefits of NEBs on passengers mainly are travel time and travel safety.

Table 3   Social Benefit Index Table of NEBs

Project	category	Speific Indexes	Literature Sources
Social Benefit	Resident	Public quality of life	Liu Wei（2009）
		Public health care	Liu Wei（2009）
		Real estate appreciation	Hao Cheng(2008)
	Passenger	Travel safety	Mingming Chen(2012); Gu Jiewei(2017)
		Save passenger time	Mingming Chen(2012); Gu Jiewei(2017)
	Government	Public support	Liu Wei（2009）
		Government image	Liu Wei（2009）
		Urban infrastructure	Liu Wei（2009）
	Public Opinion	Energy conservation	Hao Cheng(2008)
		Public consciousness	Hao Cheng(2008)
		City image	Mingming Chen(2012); Gu Jiewei(2017)
		Impact on other regions	Mingming Chen(2012); Gu Jiewei(2017)

To sum up, researches on the measurement ofeconomic benefits of NEBs' operation are relatively mature. However the measurement of environmental benefits is mainly considering CO_2, which also needs to consider conventional pollutants. In addition, the research on social benefits is still relatively few and has not formed a satisfactory evaluation index system.

3 A case study of NEB in Wuhan 295 Road

Wuhan Bus Company plans to adopt NEB on the 295 bus, which results in the decision of synthetically considering the benefits ofBYD K9 and Yutong ZK6128HG.

3.1Analytic hierarchy process to determine weights

Scored by experts and tested for its consistency, get the relative weight of final indexes. The AHP was adopted to calculate the composite weight as follows:

Table 4   Synthetic Weight of Comprehensive Benefit Evaluation Index for NEB

Criterion layer	Index layer	Sub index layer	Composition weight
Economic benefit 0.724	purchase cost 0.493	Purchase cost 1	0.3569
	Government subsidy 0.35	Government subsidy 1	0.2534
	Energy consumption cost 0.106	Energy consumption cost 1	0.0767
	Maintenance cost 0.051	Maintenance cost 1	0.0369
Environmental benefit 0.193	CO_2 0.444	CO_2 1	0.0857
	NO_2 0.222	NO_x 1	0.0428
	SO_2 0.222	SO_2 1	0.0428
	PM 0.112	PM 1	0.0216

Criterion layer	Index layer	Sub index layer	Composition weight
Social benefit 0.083	Resident 0.288	Public quality of life 0.54	0.0129
		Public health care 0.297	0.0071
		Real estate appreciation 0.163	0.0039
	Passenger 0.532	Travel safety 0.667	0.0295
		Save passenger time 0.333	0.0147
	Government 0.068	Public support 0.333	0.0019
		Government image 0.667	0.0038
	Public opinion 0.112	Urban infrastructure 0.092	0.0009
		Energy conservation 0.25	0.0023
		City image 0.548	0.0051
		Impact on other regions 0.042	0.0004
		Public consciousness 0.067	0.0006

3.2 Scoring criteria

According to the actual situation of bus operation in China, after soliciting expert opinion, the index scoring standard is obtained as table 5. In order to make the indicators comparable, the evaluation score is set at 0-1.

Table 5   Indicator Scoring Standard Table

Specific indicators	Similar buses Possible range of values	Criterion
Purchase cost(C1)	min0.5million yuan, max2.5 million yuan	The highest selling price 2.5 million yuan is set to 0 and the lowest selling 5 million yuan is set to 1, according to the linear function assignment
Government subsidy(C2)	min 0million yuan, max0.6 million yuan	Minimum allowance 0million yuan set at 0 and maximum allowance 0.6 million yuan set at 1,according to the linear function assignment
Energy consumption cost(C3)	min0.35million yuan, max1.2 million yuan	The maximum energy consumption 1.2 million yuan is set to 0 and the minimum energy consumption 0.35million yuan is set to 1,according to the linear function assignment
Maintenance cost(C4)	min0.08millionyuan, max0.6 million yuan	The maximum cost 0.6 million yuan is set to 0 and the minimum cost 0.08 million yuan is set to 1, according to the linear function assignment
CO_2(D1)	min384.8t,max456t	Set maximum emission 456t to 0 and minimum 384.8t to 1, according to the linear function assignment
NO_x(D2)	min0.92g,max2.85g	Set maximum emission 2.85g to 0 and minimum 0.92g to 1,according to the linear function assignment
SO_2(D3)	min1.57g,max3.9g	Set maximum emission 3.9g to 0 and minimum 1.57g to 1, according to the linear function assignment
PM(D4)	min0.008g,max0.030g	Set maximum emission 0.03g to 0 and minimum 0.008g to 1,according to the linear function assignment
Public quality of life(F1)	Subjective index	To be rated by an expert or an investigation.
Public health care(F2)	Subjective index	To be rated by an expert or an investigation.
Real estate appreciation(F3)	Subjective index	To be rated by an expert or an investigation.
Travel safety(G1)	Subjective index	To be rated by an expert or an investigation.
Save passenger time(G2)	Subjective index	To be rated by an expert or an investigation.
Public support(H1)	Subjective index	To be rated by an expert or an investigation.
Government image(H2)	Subjective index	To be rated by an expert or an investigation.
Urban infrastructure(I1)	Subjective index	To be rated by an expert or an investigation.
Energy conservation(I2)	Subjective index	To be rated by an expert or an investigation.
City image(I3)	Subjective index	To be rated by an expert or an investigation.
Impact on other regions(I4)	Subjective index	To be rated by an expert or an investigation.
Public consciousness(I5)	Subjective index	To be rated by an expert or an investigation.

3.3 Evaluation Results

Table 6   BYD K9 and Yutong ZK6128HG Total Score Table

Specific indicators	Synthetic weight	Index score BYD K9	Index score ZK6128HG Yutong	Weighted score BYD K9	Weighted score Yutong ZK6128HG
Purchase cost(C1)	0.3569	0.2780	0.0000	0.0992	0.0000
Government subsidy(C2)	0.2534	0.8330	0.0000	0.2111	0.0000
Energy consumption cost(C3)	0.0767	0.5840	0.6440	0.0448	0.0494

SO_2(D3)	0.0428	0.9630	0.3000	0.0413	0.0129
PM(D4)	0.0216	0.2860	0.5560	0.0062	0.0120
Public quality of life(F1)	0.0129	0.7500	0.3500	0.0097	0.0045
Public health care(F2)	0.0071	0.6500	0.2500	0.0046	0.0018
Real estate appreciation(F3)	0.0039	0.5500	0.1500	0.0021	0.0006
Travel safety(G1)	0.0295	0.6300	0.5700	0.0186	0.0168
Save passenger time(G2)	0.0147	0.8500	0.6500	0.0125	0.0096
Public support(H1)	0.0019	0.6500	0.0500	0.0012	0.0001
Government image(H2)	0.0038	0.8500	0.0100	0.0032	0.0000
Urban infrastructure(I1)	0.0009	0.6500	0.2500	0.0006	0.0002
Energy conservation(I2)	0.0023	0.7500	0.3500	0.0017	0.0008
City image(I3)	0.0051	0.8500	0.1500	0.0043	0.0008
Impact on other regions(I4)	0.0004	0.5500	0.2500	0.0002	0.0001
Public consciousness(I5)	0.0006	0.4500	0.0500	0.0003	0.0000
Total score	1.0000			0.5079	0.1486

From the evalutaion, we can see that the comprehensive benefit of BYDK9 is higher than that of Yutong ZK6128HG, so that the Wuhan public transport company should launch the NEB BYDK9in 295 lines.

4 Conclusion

The existing research onNEBs related decision-making pays more attention to the economic and environmental benefits, and pays little attention to the social benefits. But for bus operators, the government, passengers, residents, public opinion's concern on NEBs operation must be considered to bear its responsibility. Therefore, busoperators should consider the economic, environmental and social benefits when making decisions to introduce NEBs.

Considering stakeholders' concern as social benefits, this paper establishes a comprehensive benefits evaluation index system ofNEBs from the perspective of stakeholders. The above index system is applied to the introduction decision of Wuhan 295 Road NEB.

Evaluation Research on Financial Competitiveness of New Energy Listed Companies

He Yuerong
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 15927095633@163.com)

Abstract: With A-share listed company of new energy industry in stock markets in Shanghai and Shenzhen from 2012 to 2016 as research sample, SPSS software is applied and principal component analysis is adopted to establish and evaluate three main components of financial competitiveness of listed new energy companies and deduce component score coefficient matrix in the Paper. Based on the quantitative and qualitative dimensions, this paper conducts evaluation research on the financial competitiveness of listed companies of new energy resources. It holds that the new energy companies in China suffer many disadvantages, such as low-level development with large gap and high financial risk. On this basis, it puts forward feasible suggestions to provide reference for finding how to make these new energy companies more competitive financially.
Key words: New energy; Financial competitiveness; Principal component analysis; The listed company

1 Introduction

General Secretary Xi proposed to "accelerate energy production and consumption revolution and construct clean and low-carbon, safe and high-efficient energy system" in the report of the 19th National Congress of the Communist Party of China in 2017. The development strategy of supporting development of electric vehicles and fuel cell cars, mastering low-carbon, information and intelligent core technologies of vehicles continuously was clarified with "energy-efficient and new energy vehicles" proposed in Made in China 2025 as key development field in 2015. It was proposed in the "13th Five-Year" development plan of national strategic emerging industries in 2016 that during the period of the "12th Five-Year Plan", new energy industry developed rapidly in China, competitiveness of a batch of enterprises entered into the first matrix of international market in the field and new energy revolution was changing existing international resource energy territory. Risk Analysis Report on New Energy and Renewable Energy Industry in 2017 indicated that developing new energy industry had become an important choice for China to change production modes and adjust energy structures in 2017. However, new energy development in China is still confronted with problems of relatively high cost and weaker market competitiveness. So how to evaluate financial competitiveness of new energy enterprises scientifically and fairly has become an important subject in the field of financial research.

Pei Yu (Pei Yu, 2011)analyzed the current situation and characteristics of new energy enterprises, expounding the causes and phenomena of financial risks in such new energy enterprises, and constructing a warning index for such financial risks from the aspects of management status, financial management status, financial situation and operation condition. Xiao Yanchun (Xiao Yanchun, 2013), with the help of the theories and methods regarding the investment value of listed companies, systematically studied the investment value of listed new energy companies, and built a comprehensive evaluation model. Yang Min (Yang Min, 2016)analyzed the influence of the financing structure of listed new energy companies on the performance of such companies based on the factor analysis method, finding that the capital structure of listed companies in the new energy industry is not reasonable, which adds great burden on such companies. Zhang Tong (Zhang Tong, 2017) selected the annual financial data of new companies regarding national equities exchange and quotations to make a performance research system. Based on the comprehensive model, the business level and development potential of such enterprises were analyzed. The existing studies related can provide a reference for the listed new energy companies in Chine to understand their position in the industry and their own shortcomings in management, which promotes the development of such companies. However, in terms of the evaluation of the financial competitiveness of such new energy enterprises, it still faces inadequate combination of their own characteristics.

Three principal components influencing financial competitiveness of listed new energy companies are extracted, comprehensive score calculation equation of financial competitiveness of listed new energy companies is deduced. Based on the combination of the characteristics of new energy industry, the objective evaluation of financial competitiveness for new energy enterprises is realized in the Paper through analysis on panel data of listed new energy companies from 2012 to 2016, by applying SPSS

software and based on principal component analysis method. The research hopes to provide feasible suggestions for new energy industries to improve financial competitiveness and seek more healthy and continuous development.

2 Research Design

2.1 Sample selection

142 listed new energy companies in stock markets of Shanghai and Shenzhen are adopted as initial sample in the Paper. Samples are eliminated according to the following conditions: (1) eliminate companies listed in 2012 and beyond; (2) eliminate samples with incomplete data. According to the above standards, 123 samples are selected finally. In order to improve reliability of data, average values of data from 2012 to 2016 these five years are adopted as initial data. Related data for research in the Paper are derived from CSMAR database and the software used for empirical analysis is SPSS22.0.

2.2 Index selection

With financial competitiveness of listed new energy companies as research object ang *Detailed Rules for The Implementation of Comprehensive Performance Evaluation of Central Enterprises* formulatedby the State-owned Assets Supervision and Administration Commission of the State Council as reference basis, 9 factors are selected as initial indexes (variable involves profitability, debt-paying ability and development ability of enterprises these three aspects) for empirical analysis in the Paper. Initial indexes selection is shown in Table 1.

Table 1　Variable Set

Index types	Index name	Variable code
Profitability	Earnings per share	X1
	Return on assets	X2
	Gross operating profit	X3
	Operating profit ratio	X4
Debt-paying ability	Asset-liability ratio	X5
	Liquidity ratio	X6
	Quick ratio	X7
Development ability	Operating profit growth rate	X8
	Net profit growth rate	X9

3 Empirical Analysis

3.1 KMO and bartlett test

KMO test statistic is the index used to compare partial correlation coefficient among variables. Generally, KMO>0.6 shows that selected indexes are relatively appropriate to be provided with principal component analysis; Bartlett test of sphericity is used to verify whether all variables are independent respectively. Generally, obtained P value is required to be less than 0.05. It can be known from Table 2 that KMO value of this analysis is 0.641, which shows that correlation among variables is relatively strong; P value is much less than 0.05, which shows that correlation matrix is not unit matrix and null hypothesis is rejected. In conclusion, it can be judged that selected indexes are appropriate to be provided with principal component analysis.

Table 2　KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.641
Bartlett's Test of Sphericity	Approx. Chi-Square	658.268
	df	36
	Sig.	.000

3.2 Total explained variance

It can be seen from Table 3 that the first three indexes can be extracted as principal component following the extraction principle that characteristic value is more than 1, and accumulative variance explanation ratio of the first three indexes is 66.496%, it can be reflected from this that explanation force of selected principal components is relatively large.

Table 3   Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	2.790	31.004	31.004	2.790	31.004	31.004
2	2.150	23.884	54.887	2.150	23.884	54.887
3	1.045	11.608	66.496	1.045	11.608	66.496
4	.982	10.909	77.405			
5	.852	9.472	86.877			
6	.596	6.625	93.501			
7	.341	3.792	97.293			
8	.228	2.533	99.826			
9	.016	.174	100.000			
Extraction Method: Principal Component Analysis.						

3.3 Communalities

Communalities reflect explanation force of selected principal component for each variable. It is shown in Table 4 that extraction degree of most variables is above 60%, where extraction degree of liquidity ratio and quick ratio is higher than 90%, which shows that extracted principal component contains most original information and extraction effect of principal components is better.

Table 4   Communalities

	Initial	Extraction
Zscore (average net profit growth rate X9)	1.000	.639
Zscore (average operating profit growth rate X8)	1.000	.428
Zscore (average liquidity rate X6)	1.000	.939
Zscore (average quick rate X7)	1.000	.926
Zscore (average asset-ability ratio X5)	1.000	.760
Zscore (average earnings per share X1)	1.000	.321
Zscore (average return on asset X2)	1.000	.813
Zscore (average operating margin X3)	1.000	.465
Zscore (average operating profit ratio X4)	1.000	.694
Extraction Method: Principal Component Analysis.		

3.4 Scree plot

It is reflected in Fig. 1 intuitively that characteristic values of the first three principal components are more than 1 and the slope is steep, while characteristic values of several subsequent components are less than 1 and the slope tends to be flat, which verifies reasonability of extracting three principal components again.
Figure 1   Scree Plot

3.5 Component plot in rotated space

Three principal components are described in Fig. 2 more intuitively. It can be known according to sample distance that extracted three principal components are: (1) net return on equity, return on invested capital and return on assets (2) gross operating profit, operating profit ratio (3) liquidity ratio, quick ratio and asset-liability ratio (4) net profit growth rate and operating profit growth rate.
Figure 2   Component Plot

3.6 Component score coefficient matrix

Principal component scoring equation is deduced according to component score coefficient matrix in Table 5. The equation is as follows:

$F1=0.912X9+0.912X8-0.839X6+0.203X7+0.329X5+0.093X1+0.472X2+0.178X3-0.103X4$

$F2=-0.311X9-0.289X8+0.213X6+0.879X7+0.765X5+0.559X1+0.488X2+0.006X3-0.125X4$

$F3=-0.103X9-0.104X8-0.101X6+0.007X7+0.009X5-0.016X1+0.061X2+0.779X3-0.634X4$

Variance contribution ratio is taken for all principal factor weights. The equation of calculating composite score is:

$F=(0.31004\times F1+0.23884\times F2+0.11608\times F3)/0.6649$

Table 5   Component Score Coefficient Matrix

	Component		
	1	2	3
Zscore(average net profit growth rate X9)	.064	.003	.746
Zscore(average operating profit growth rate X8)	-.037	-.058	.607
Zscore(average liquidity rate X6)	.327	-.145	-.099
Zscore(average quick rate X7)	.327	-.135	-.100
Zscore(average asset-ability ratio X5)	-.301	.099	-.096
Zscore(average earnings per share X1)	.033	.260	-.015
Zscore(average return on asset X2)	.073	.409	.007
Zscore(average operating margin X3)	.169	.227	.058
Zscore(average operating profit ratio X4)	.118	.356	.009

Extraction Method: Principal Component Analysis.
Component Scores.

Based on the above analysis, selected indexes can be divided into three principal components. Liquidity ratio, quick ratio and asset-liability ratio reflect debt-paying ability of companies and have larger load on the first principal component, so the first principal component is generalized into debt-paying ability; return on assets, earnings per share, operating margin and operating profit ratio reflect corporate profitability and have larger load on the second principal component, so the second principal component is generalized into profitability; net profit growth rate and profit growth rate reflect growth ability of enterprises and have larger load on the third principal component, so the third principal component is generalized into growth ability.

3.7 Robustness test

In order to verify correctness and reliability of the above-mentioned conclusions, the following robustness test is implemented.

Insurance companies are divided into two types by cluster analysis. After the type with less number of companies is eliminated, composite score of financial competitiveness is deduced for the other type of companies according to steps same as the above research. Table 6 is obtained by verifying robustness of competitiveness evaluation results of companies by signed rank test.

Table 6   Related-Samples WIlcoxon Signed Rank Test

Null Hypothesis	Sig	Decision
The median of differences between 1 and 2 equals 0	0.156	Retain the null hypothesis

It can be obtained from results in the Table that: bilateral significance level is 0.156 and is far more than 0.05. Therefore, it can be regarded that difference between composite score of companies in test group and composite score of original companies is not significant. Both samples are from the same population and with same population distribution. It is proved that reliability of original empirical results is relatively strong and passed robustness test.

3.8 Composite score result and analysis

According to analysis results of correlation matrix, based on three above indexes and their weights, principal component score and composite score of all samples are calculated and top 10 and bottom 10 enterprises are listed, as shown in Table 7.

Table 7   Summary table of the top 10 and top 10

stock code	REGR factor score 1 for analysis 1	ranking	REGR factor score 2 for analysis 1	ranking	REGR factor score 3 for analysis 1	ranking	composite scores	ranking

3.8.1 General analysis

In general, overall debt-paying ability of listed new energy enterprises in China is weaker and financial risk is relatively high. Debt-paying ability is the first principal component, which shows that debt-paying ability has the most obvious influence on financial competitiveness of listed new energy companies. However, there are only 52 companies with debt-paying ability score being positive among listed new energy companies in China. The proportion is about 41% and is less than a half; where there are only 17 companies with debt-paying ability score more than 1 and the proportion is only 13%.

Overall profitability development is imbalanced with a great difference and still has great space for improvement. There are 62 companies with profitability score being positive among listed new energy companies and the proportion is more than 50%; where there are 54 companies with score more than 1 and the proportion reaches 43%; the highest score is 4.54202 and the lowest score is -6.67516. It can be reflected from this that profitability of about a half of companies is good among listed new energy companies in China, but there are still about a half of enterprises with negative profitability. The difference between enterprises with profitability ranking top and rank bottom is obvious.

Overall growth ability is weaker, difference of companies is great and the conditions is relative severe. Growth ability is of great importance for continuous healthy development of new energy industry, but there are only 56 companies with growth ability score being positive among listed new energy companies in China and the proportion is 45%; where there are 26 companies with score more than 1 and the proportion is 26%; the highest score is 4.89081 and the lowest score is -7.54231, so it is reflected that new energy companies in China have poor growth at present, the score difference of companies ranking top and bottom is about 13 scores with great difference.

Based on the above analysis, comprehensive development conditions of new energy companies in China is not optimistic with low level, great difference and many problems. Necessary measures are waiting to be adopted to improve development level further.

3.8.2 Individual enterprise analysis

Jingsheng Mechanical & Electrical Co., Ltd. (300316) ranks first comprehensively. Through analysis for related data, it is found that the debt-paying ability is in the first place with score of 4.59548, which reflects that debt-paying, risk response and continuous operation ability of the Company are relatively strong; but the growth ability score is -2.7242 and ranks the 117th place, which shows growth of the Company is poor and development speed is slow. It is suggested for the enterprise to adopt necessary measures to obtain capital, expand operation and improve market share.

Xiangtan Electric Manufacturing Co., Ltd. (600416) ranks bottom comprehensively. Ability scores of three aspects are negative, where growth ability score is -7.54231 and ranks the last, which shows that the company has relatively serious problem in the aspect of paying debts, obtaining profits and continuous operation and so on, and development speed is slow; it warns decision-makers and

management personnel of the company to pay attention to financial status of enterprises more and adopt necessary response measures.

Zongyi Group ranks the second comprehensively. Through analysis, the profitability is in the top place with score of 4.54202, which shows that the company has relatively strong profitability and market competitiveness and greater development potential; the debt-paying ability score is 0.72637, which shows that the enterprise has certain ability of paying debts and undertaking risks, but there is a difference between debt-paying ability score and the maximum score of 5 points approximately and is less than 1, which shows that debt-paying ability of the enterprise is waiting to be improved further; the growth ability score is 0.11383, which shows that the enterprise has growth but the growth is weak, and decision-makers of the enterprise need to expand operation and improve market share.

Guodian Nanjing Automation Co., Ltd. ranks the 55th place. Growth ability of the company is in the top place with score of 4.89081, which shows that the enterprise has relatively large business scale and market share, relatively fast development speed and greater development prospect. Profitability score is -.76818 and is in the 108th place, which shows that profitability of the enterprise is insufficient.

By comparing with companies with different financial competitiveness levels, it can be found that electronic and electrical industry development momentum is strong in new energy industry. Jingsheng Mechanical & Electrical Co., Ltd., Capchem, Camel Group, Kstar and Shenzhen Huicheng belong to electronic and electrical industry in companies with comprehensive competitiveness ranking top ten, accounting for 50% of top ten.

4 Conclusion

This article makes use of the "principal component analysis method" to analyze the index system of financial competitiveness of new energy listed companies. Panel data studies for 2012-2017 show that solvency, profitability, and development capability are important indicators for evaluating new energy listed companies. In particular, debt repayment ability has a high correlation with the financial competitiveness of new energy companies. Moreover, through further research and analysis, it has also been found that, at current stage, the electronic and electric industries have the most comprehensive competitiveness in the new energy industry.

The enlightenment of this study to China's new energy industry is that it is necessary to comprehensively consider three aspects of capabilities in the development of new energy companies, including solvency, profitability, and development capability. Through the improvement of solvency, it's hoped to lay a solid foundation for R&D and innovation of technology. Moreover, we will conduct further investigation and research on the reasons that have affected the comprehensive competitiveness of the electronics and electrical industries.

In terms of sample selection, this article is just limited to new energy listed companies, but the actual application scope of the system has not yet been extended to those companies that have not been listed. On the selection of indicators, non-financial indicators have not been included in the study, which can't be further reflected the impact of non - financial indicators on the comprehensive financial competence of new energy listed companies.These limitations will be further improved in subsequent studies.

Jiangxi Industrial Trade Career Technical College

Abstract: Energy management and control system (EMCS) realizes the networking of the enterprises'energy management and control. Combined with the energy situationand the energy consumption of manufacturing enterprises, in China,this paper proposes a method of energy-saving Control and Intelligent control system in Manufacturing Enterprises which based on the complete decomposition Model and laspeyres Index method,also makes the network extension of manufacturing enterprises' energy consumption and energy saving data. Through the interconnection of energy consumption and energy saving resources by government or third party like the energy consumption processing center, to analysis on the networking and intellectualization of the energy consumption and energy saving , energy consumption prediction and the extention of the experience and methods of high quality energy saving ,for the purpose to build a large-scale interconnected energy transmission system in orde to improve the energy consumption prediction, control and energy saving among manufacturing enterprises , regions and governments, and realize the collaborative development of the three that it is beneficial for the manufacturing enterprises to change their energy consumption into clean and low carbonization.

Key words: Energy consumption; Enterprise energy saving; Energy management and control; Intelligence; Eetworking

1 Introduction

As the global economy recovers, energy consumption recovers, energy consumption structures accelerated change further into cleanliness, low carbonization , the proportion of coal consumption drops slightly, the proportion of natural gas and non-water renewable energy consumption increases slightly.The Korean government formulate ten areas of technology such as energy, resources, machinery, manufacturing and intensified energy storage technology and continue to expand investment in machinery manufacturing enterprises intelligentialize and service-oriented; U.S.A has proposed a "Priority Energy Plan for the United States", proposing to embrace the revolution of shale oil and gas, develop the technology of clean coal and revitalize American coal industry; The European Commission has released an upgraded version of the SET-Plan. European Union will focus on four core priority areas in renewable energy, intelligent energy systems, energy efficiency and the sustainable transportation , as well as the specific areas of carbon capture and sequestration and nuclear energy,and take a range of actions to research and preferential innovation.

China is the second largest energy consumer in the world, and the name card "made in China" has been famous for a long time, accompanied by a largely increase in energy consumption.To improve the energy consumption, energy conservation analysis and experience of manufacturing enterprises in data network, and meet the "global energy Internet" proposed by general secretary xi. Manufacturing enterprise energy consumption and energy saving data interconnection to form a large interconnected energy transmission system, It is one of the research directions of China's current energy control system. according to the energy situation of China and the energy consumption of manufacturing enterprises,this paper analyzed the energy saving in the Manufacturing Enterprise, trying to solve three questions like the energy efficiency and the trend of energy saving , also the research on the development of energy Intelligent control system and network of control system in manufacturing enterprises.

2 The Analysis of Energy Status and Energy Consumption of Manuf-acturing Enterprises in China.

As shown in Figure 1, in the rapid development process of economic in China, due to the various conditions,the proportion of coal is high and it is difficult to change the energy pattern that the coal as the main source of energy. At present, the coal unilization ratio in China is high and the natural gas usage rate is low, the high quality energy is relatively insufficient, the energy resources are unevenly

distributed, the energy structure is unreasonable, which restricts the scientific development of china's energy resources. If this situation continues, it will bring more pressure to the ecological environment. Only by increasing the energy efficiency, eliminating the enterprises with hight energy-consuming improving the energy market system, and standardizing the energy regulatory system, To intelligentialize and Internetlize the control of energy resources iisthe trend of energy resources use, energy consumption control and energy consumption guidance.

From the Figure 2 and Figure 3, we can see that in the process of rapid economic development, the total output value of manufacturing industry has increased year by year, and the increasing speed has slowed down, while the rate of growth of manufacturing industry has changed a lot, and has been greatly affected by international and policy factors, the energy consumption has remained high,the energy density has dropped dramatically, gradually changing into a clean, low-carbon, safe and efficient energy system. In order to achieve a breakthrough in the new energy reforming,China must take actions to use energy and control the energy consumption in the manufacturing industry ,in the direction of intelligentialization and Internetlization.

Figure1-3 data sources: China Statistical Yearbook, China Industrial Economic Statistics Yearbook, China Energy Statistics Yearbook.
Figure 1   Analysis of china's energyresources consumption from 2007 to 2016
Figure 2   China's Total Output Value and the Growth Rate of manufacturing industry from 2007 to 2016
Figure 3   China's Total Output Value of Manufacturing Industry, Energy Resources Consumption and Energy Density from 1990 to 2015

The technology innovation of energy consumption control of "Made in China in 2025",not only refers to the subversive technology in the traditional sense, but also includes the organic integration of energy consumption control technology and enterprise industry chain and value chain. Manufacturing enterprises should stand at the height of energy reform and social progress, actively seek change, take the "global energy Internet" as an opportunity to continuously integrate, and make use of the innovation ability and integration of the Internet,to form a set of the systemic solutions in energy consumption and control

among the enterprises, regions, industries ,to realize the data intelligence, regionalization, interconnection and other different levels of energy consumption control, energy distribution, energy conservation promotion ,also to take effective measures to break the links among the energy use, energy consumption control and energy-saving to achieve intelligent energy control and networking that is the right direction of the manufacturing companies, government and third-party agencies need to work together.Total Output Value of　Manufacturing Industry,Energy Resources Consumption and　Energy Density.

3　The Implementation Approach of Energy Control System on Energy Conservation,Intelligent Control in the Manufacturing Enterprises

To realize the intelligent control,the manufacturing enterprises 'energy control system firstly collects the energy itemized metering information,water, gas (hydrogen, oxygen, nitrogen and inert gas), fuel gas (gas and natural gas, etc),electricity, steam, coal, oil, etc. Secondly ,controls and coordinates the energies.The energy control mainly reports the energy data periodically , which includes the statistics and forecasts, and compares the actual energy consumption with the expected energy consumption calculated on the basis of actual production parameters. In order to improve the reliability of energy data measurement and calculation and realize the energy intelligent control system for planning, observation and control, for making a plan of the implementation of energy-saving technology projects . Energy coordination is a comprehensive dynamic balance between all energy sources. According to the production plan and the energy prediction, the energy supply and control can be coordinated intelligently, which can not only meet the energy demand of production process, but also avoid load peak reasonably. Through the above two steps to achieve the dynamic control of energy quality and energy indicators.The dynamic control of energy quality is through certain means of detection, such as the quality analysis, quality tracking, trend assessment, warning of crossing line , dynamic quality monitoring, intelligent analysis and control of the output provided by the energy center ,balances the contradiction between the production power and the cost of the enterprise, the dynamic monitoring and control of the energy index is based on the statistical energy metering data, the production data, the energy consumption data of each energy consumption equipment , and the control index is put forward, and the energy performance evaluation and management are carried out for each user. The data of energy consumption are obtained through the above methods, and the network intelligent analysis, processing and energy cost accounting, and energy prediction and energy equipment management are carried out.

Energy cost accounting is based on energy measurement data, according to energy input, output value, cost accounting analysis;Energy forecasting is the energy center to account the energy units according to real-time energy database and historical energy database, also using data mining model or multivariate statistical method to caculate the intelligent prediction and analysis according to different production and operation states, to propose the trend of energy consumption;the management of energy consumption equipment is to maintaint the basic data information and give the intelligent analysis,prediction and early warning of the running state and service life of the equipment according to the operation parameters and state curves of the equipment ,which under the accumulation of a large amount of historical data, only in that way it provides the basis for the planned maintenance of the equipment, also it carries on the intelligent control via the utilization ratio, the operating rate,the operation record and the fault record and so on.

4 The Energy Saving Analysis of Energy Management and Control Intelligent Control system in Manufacturing Enterprises

The study of energy efficiency in foreign countries started early and accumulated abundant literature, which generally uses energy density to measure energy efficiency. For example, Mukherjee defined the energy density as the amount of energy consumed per unit of output or activity,M. G Pattersonian 1996) defined energy efficiency as producing a limited number of services or useful production with less energy. Wei Chu China(Wei Chu China, 2007)pointed out that the energy efficiency defined by the DEA method was a measure of the current energy investment and the optimal achievable energy investment under the framework of total factor production, and the influence of other factors on the output is considered synthetically. It is a better indicator of technological efficiency change. In this paper discusses the energy saving problem in the process of intelligent energy management and control system of manufacturing enterprises in China by useing the method of J.W.Sun et al. (J.W.Sun et al., 1999) ,which based on the Laspeyres exponent complete decomposition model.

Firstly,let's set the the energy saving analysis model and method of energy management and control

intelligent control system in a manufacturing enterprise,and assumW_t as the energy consumption of the manufacturing enterprise in period t ;and Q_t as the GEP (gross domestic product of the manufacturing enterprise)in the period -t ; $I_t = \frac{W_t}{Q_t}$ represents the energy intensity of the manufacturing enterprise at time -t;$S_t = \frac{Q_t}{GEP_t}$, represents the proportion of GEP in period -t in this manufacturing enterprise,that is the output structure. so the total energy consumption in production of manufacturing enterprises:

$$W_t = \sum_1^n \frac{W_t}{Q_t} \times \frac{Q_t}{GEP_t} \times GEP_t = \sum_1^n I_t \times S_t \times GEP_t \tag{1}$$

According to the complete decomposition model(J, W, Sun, etc., 1999), the variation of energy consumption can be reduced to three aspects,the increasing effect of production output value of manufacturing enterprises (energy consumption change caused by the increase of total production volume), energy intensity effect (energy efficiency improvement caused by the progress of production technology), structure change effect (the effect of the change of production capacity proportion on energy consumption).

The energy intensity effect can be expressed as:

$$W_I = \sum_1^n (I_{t+1} - I_t) \times S_t \times GEP_t + \frac{1}{2}\sum_1^n (I_{t+1} - I_t) \times [(S_{t+1} - S_t) \times GEP_t + S_t \times (GEP_{t+1} - GEP_t)]$$
$$+ \frac{1}{3}\sum_1^n (I_{t+1} - I_t) \times (S_{t+1} - S_t) \times (GEP_{t+1} - GEP_t)$$
$$= \sum_1^n \Delta I \times S_t \times GEP_t + \frac{1}{2}\sum_1^n \Delta I \times (\Delta S \times GEP_t + S_t \times \Delta GEP) + \frac{1}{3}\sum_1^n \Delta I \times \Delta S \times \Delta GEP \tag{2}$$

The structural effects can be expressed as:

$$W_S = \sum_1^n \Delta S \times I_t \times GEP_t + \frac{1}{2}\sum_1^n \Delta S \times (\Delta I \times GEP_t + I_t \times \Delta GEP) + \frac{1}{3}\sum_1^n \Delta I \times \Delta S \times \Delta GEP \tag{3}$$

The growth effect of output value can be expressed as:

$$W_G = \sum_1^n \Delta GEP \times I_t \times S_t + \frac{1}{2}\sum_1^n \Delta GEP \times (\Delta I \times S_t + I_t \times \Delta S) + \frac{1}{3}\sum_1^n \Delta I \times \Delta S \times \Delta GEP \tag{4}$$

According to the above mode , the energy saving prediction formula of the manufacturing enterprise is as follows :

$$ES = -(W_I + W_s) = -\Big[GEP_{t-1} \times \sum S_{t-1} \times \Delta I + \frac{1}{2}\sum \Delta I \times (S_{t-1} \times \Delta GEP + GEP_{t-1} \times \Delta S) +$$
$$\frac{1}{3}\Delta GEP \times \sum \Delta I \times \Delta S + GEP_{t-1} \times \sum I_{t-1} \times \Delta S + \frac{1}{2}\sum_i \Delta S \times (I_{t-1} \times \Delta GEP + GEP_{t-1} \times \Delta I) + \frac{1}{3}\Delta GEP \times$$
$$\sum \Delta I \times \Delta S \Big] \tag{5}$$

Compared with the general energy saving prediction formula:$Es = -(I_t \times GEP_t - I_0 \times GEP_t) = -GEP \times \Delta I$,Because it takes the changes in dynamic process of energy intensity and the effect of economic structure in manufacturing enterprises into account, it can reflect the actual situation well and the efficiency of energy saving in period T is:

$$ES_{R,\ t} = \frac{ES_t}{W_{t-1} + W_{G,\ t}} \times 100\% \tag{6}$$

Take W_t、Q_t、I_t into the formulae①~⑥which are the energy saving analysis model of intelligent management and control system ,we can get the energy saving estimate ES ,also analysis the energy saving efficiency $ES_{R,\ t}$in period t .As shown in Figure 4, it is the energy saving and energy saving rate of a manufacturing enterprise in 2017.
Figure 4　Energy Saving (100 tons of standard coal) and Energy Saving Rate of a Manufacturing Enterprise in 2017

5 The Networking of Intelligent Control System in Manufacturing Enterprises' Energy Management and Control

The EMCS is a management and control interconnection systemwhich combines computer technology, network communication, automation instrument and data intelligent analysis technology .It can monitor the energy management and control of enterprises and provide the basis for energy dispatch. Achieve the purpose of energy saving via systematic intelligent control, and analysis the energy and data resources for the regional interconnection and sharing, providing practical experience and basis for energy saving, which is good for the government or region to analyse data as a whole. Through that way,it is good to distribute the regional Energy and promot the effective Energy Saving methods,so it is an inevitable trend for enterprises, regions and governments to popularize regional energy distribution and effective energy saving methods and it is convenient to promote the efficiency of energy management in enterprises, regions and governments, and it is also the necessary for the development of enterprises.

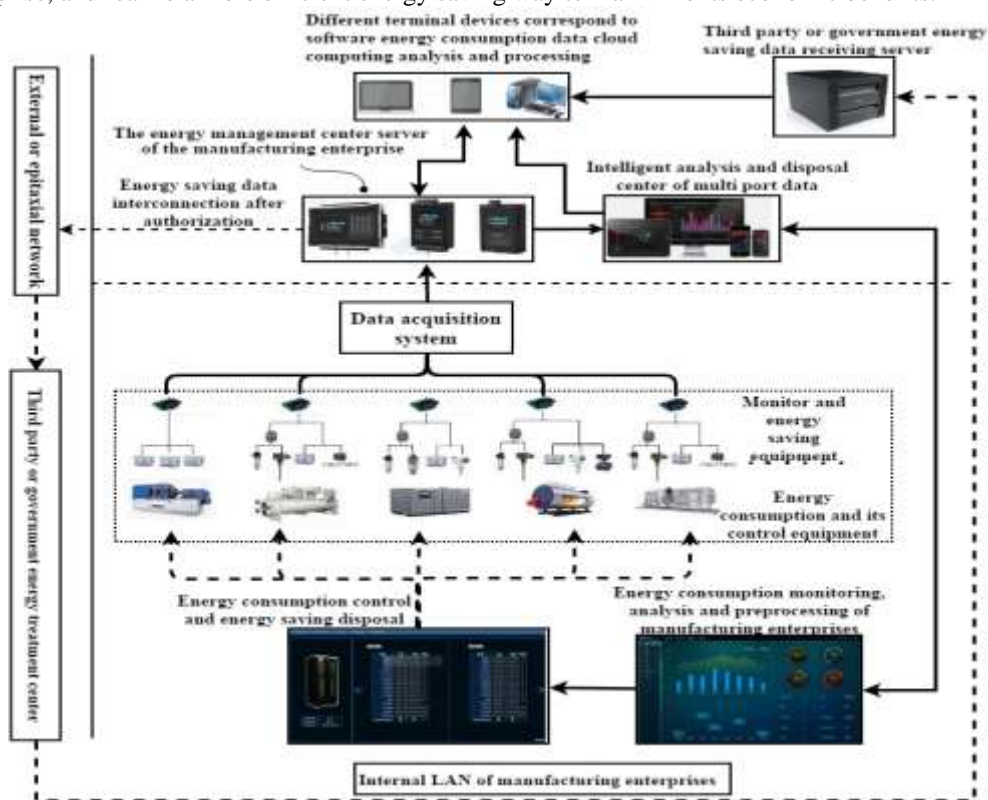
As the Figure 5 shows that manufacturing enterprises collect the data of the energy consumption equipment, energy consumption control equipment and energy saving equipment via different terminal equipment, then transmit the data to the server of energy management center where the multi-port data intelligent analysis and processing center (based on the complete decomposition model of Laspeyres exponent method for energy saving and energy saving rate analysis) is used to analyze and process the energy consumption data in cloud computing, so as to facilitate the energy consumption monitoring of manufacturing enterprises. The intelligent energy saving control is realized by analyzing and preprocessing and manually confirming the disposal after intelligent analysis and early warning. After authorizing the third party or government energy consumption processing center, the energy consumption and energy saving data of manufacturing enterprises are interlinked with energy consumption and energy saving resources through external or extension network, so as to realize data analysised, managed, shared together. At the same time, the manufacturing enterprise can also receive the data by the third party or the government energy saving data receiving server, so that the enterprise can intelligently analyze and select the energy saving experience and method which can help its own enterprise, and realize a more efficient energy saving way to maximize its economic benefits.


Figure 5   The Networking of Intelligent Control System in the Manufacturing Enterprises'energy Management and Control

6 Conclusion

This paper focuses on the energy management and control system's intelligent, networking and data interconnection in the manufacturing enterprises ,and to realize the intelligent analyzing of energy consumption and energy saving model which is based on completlydecomposit the Laspeyres index method which combining the process of energy consumption and energy-saving intelligent analysis and manual early warning treatment disposal at the same time ,also combining intelligence and networking.With using the technology of networking,automatization, software and data Information Server in the process of network platform design,for the purpose to improve the reliability and practicability of the system. Based on analyzing, sharing,managing the the data of disadvantages in the process of energy using by the third party or the Government's energy consumption and energy-saving data analysis and disposal Center .It plays an important role in optimizing energy-saving measures ,enhancing the energy efficiency of enterprises.It also provide the emergency early warning in the process of energy consumption and the reasonable pre-disposal in time ,to reasonably adjust and balance the energy consumption.

Rhetoric Moves and Linguistic Realizations in Research Article Abstracts

Xiao Xianming

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: ericaxiaoxm@163.com)

Abstract: Theabstract tends to be the vehicle used to decide if the article is of sufficient interest to be read in its entirety and, to some extent, it 'sells' the article. Therefore, it is prudent for novice writers to take the time to acquire the skills of writing an abstract to enter the discourse community of their discipline. Based on200 abstracts from four journals, the present study aims at exploring the rhetorical moves and the linguistic realizations of abstracts in the fields of scientific and technological disciplines. The result indicates that three moves---the research background, the methodology, and the result moves, are obligatory in the generic structure of abstracts. The findings of the study have some pedagogical implications for academic writing courses for graduate students, especially students from non-English backgrounds.

Key words: Abstract; Rhetorical moves; Linguistic realization

1 Introduction

Research paper abstracts are an important site for the visibility of scientific endeavour. An abstract is a concise summary of a research project that concisely describes the content and scope of the project and identifies the project's objective, its methodology and its findings, conclusions, or intended results. In articles, the abstract serves as an accurately condensed version of the article helping the potential readers to decide whether to read the whole article or not. Hyland, for example, maintains that an abstract may "provide a decision making point for readers to judge whether the entire article merits further attention or not"(Hyland, 2009). Mart ń-Martín notes that "abstracts constitute, after the paper's title, the reader's first encounter with the text". Therefore, he pointed out that "there are few scholarly journals that do not require an abstract to be sent together with the original paper"(Mart ń , 2003).

In the academic publication, most scholarly Journals require that a homotopic abstract accompany each original article, eventhe articles written in languages other than English. Thus, acquiring the skills of writing an abstract is critical for novice writers to enter the discourse community of their discipline. As a result of the great importance, the studies of abstracts have witnessed a far leaping interest from scientific researchers and linguists since the 1980s.

Abstracts from a great variety of disciplines have been analysed in order to feature the linguistic characteristics that published scientific research papers are written since Swales developed his ground-breaking genre theory for organizing abstracts—— the "IMRD" model (Swales, 1990). By skimming from the works of Swales (Swales，1990), Bhatia (Bhatia, 1993), Hyland (Hyland, 2008) and Dudley-Evans (Dudley-Evans, 1986), the comprehensive generic texts of abstract will be obtained. One of the important windows to explore the abstract is the "move". The concept of move in abstract is defined by Swales based on the genre theory, as "discoursal or rhetorical unit that performs a coherent communicative function in a written or spoken discourse"(Swales, 2004), referring to a linguistic segment embodying specific communicative function and purpose inside the structure of the abstract text.While Santos, when explaining the choice of move as a unit of analysis of abstracts, states that "a move is to be considered as a genre stage which has a particular, minor communicative purpose to fulfill, which in turn serves the major communicative purpose of the genre"(Dos Santos, 1996). Therefore, an abstract could be the mechanical combination of moves in text.

Generally speaking, previous studies on the RA abstracts mainly concentrated on the schematic models of the abstracts(Hyland & Tse, 2004, Santos, 1996). A few researchers attempted to describe the linguistic features of abstracts and its realizations through different moves in the abstracts. For example, Hyland compared the move structures of abstracts across eight disciplines, but his purpose was to test the practicability of his abstract model from the linguistic perspective. Santos also studied the linguistic features, such as tense, voice and perfective in abstracts. However, most of the studies employed the materials mainly in the discipline of applied linguistics or social science. The linguistic studies of abstracts in the scientific and technological articles are in crying need.

As an inevitable part-genre within RAs, the abstract has become the most read type of research literature with the exponentially increasing research output. The present study thus attempts to not only explore the rhetorical moves of abstracts in the fields of science and technology, but also reveal the linguistic realization of moves in the RA abstracts.

However, the literature of academic English writing reveals that novice writers still have difficulty constructing well-structured abstracts that are appropriate to the norms set by their scientific community. Therefore, the plausibly approach to teaching novice writers and graduate students how to write the well-organized abstracts will be of great value. In response to this need, this paper will examine the features that constitute the abstracts of research articles at the macro-level of textual organization and content as well as at the micro-level of textual analysis. To these ends, 100 abstracts in three leading Journals (Nature, Science, and Cell) from the field of material science, chemistry and biology are considered.

2 Methodology

2.1 RA abstracts corpus construction

The research aims to take the quantitative approach to explore the linguistic characteristics of RA abstracts. Therefore, the corpus-driving method has been employed in the exploration that a total of 200 RA article abstracts were selected form four scientific research journals in the disciplines of material science, chemistry, biology and physics: 50 from Nature, 50 form Science, 50 from Biomaterial Science (BS) and 50 form Physical Review Journals (PRJ). The high impact factors are the main reason that those four journals were chosen to be sample extracted. On the other hand, those articles are closed related to the majority research fields of modern science and technology. For the manual text analysis, only abstracts in those articles were extracted intentionally.

Considering the rhetorical structure and linguistic features of RA can be marginally different from those of empirical research articles, only the informative RA abstracts with brief purpose statement of IMRD or IPMRD were input into the corpus. Another criterion cast upon the time validity, namely, all the articles include in the corpus were published between 2010and 2017, accessible online and download properly. Moreover, the total number of sentences in the corpus and the number of words within different abstracts were counted manually.

2.2 Approach to rhetoric analyses on moves

The research thought of this article is to study the linguistic realization of moves in RA abstracts. Therefore, the first step in the analysis is to identify the moves in the abstracts collected in the corpus. After then, the typical linguistic features of each move would be investigated. However, identifying the moves as subjectivity suffered the insufficient linguistic clues to mark the boundaries within the moves in the same abstract. Connectives, phrases and certain clauses, such as "the article discusses, this paper is concerned with, the result shows …" would be helpful identify the boundaries between moves. As an initial assumption, each move in the abstract would contain one sentence, but some moves might be signalled by single words or clauses, they (the same sentence) would be both regarded as Move 1 and Move 2 etc. Therefore, they were marked as two different moves. Those phenomena often occur in the Move 2 and 3 as illustrated in such that "In order to bridge the gap, the present paper offers a different analysis of…This research is designed to determine".

The theoretical framework for the rhetoric analysis on moves in this article resorts to Swales' genre theory, Santos's model (Santos, 1996) and Pho's research article abstract model. Swales, as elaborated in the literature review, is the great contributor for the genre theory in which he proposed IMRD for abstract writing and CARS for the introduction organization in RA articles. But Santos absorbed Swales' CARS thought and divided the Move1 and Move2 into sub-moves, thus forming five Moves in his model. Pho made slight changes in one of the moves based on Santos's model, introducing a set of questions and functions for more practical dealing of moves in abstracts, as shown in Table 1(Pho, 2008).

Table 1 Framework for Move Construction, Adapted from Pho.

Abstract Moves	Function/Description	Question Asked	Move Labels along with Abbreviations in the Present Study
Situating the research (STR)	setting the scene for the current research	What is known in the field?	introduction (I)
Presenting the research (PTR)	stating the purpose of the study, research questions and hypotheses	What is the study about?	purpose (P)

Continual Table 1

Abstract Moves	Function/Description	Question Asked	Move Labels along with Abbreviations in the Present Study
Describing the methodology (DTM)	describing the materials, subjects, variables, procedures, etc.	How was the research done?	methods (M)
Summarizing the findings (STF)	reporting the main findings of the study	What did the researcher find?	results (R)
Discussing the research (DTR)			
(a)	interpreting the results/findings and/or giving recommendations	What do the results mean?	discussion (D-a)
(b)	no discussions or recommendations		pseudo-discussion (D-b)

3 Results and Discussion

The sequence of moves in the abstracts from the corpus were clearly presented in the data. Generally, they were arranged in the order of STR (move 1), PTR (move2), DTM (move3), STF (move 4) and DTR (move5). This order was mostly in line with Santos's model with a few exceptions of the samples from BS and PRJ.

Data analyses show that most of the selected abstracts in the corpus are signalled by four to five moves, whereas a few abstracts from Physical Review Journals just include three moves. For all the four journals, a further look at the structures of all abstracts in the corpus reveals that three basic moves are inevitably higher frequency, namely, the Background move, to "present the research", with 98%, the method move, to "describe the methodology" with 98% and the Result move, to "summarize the findings", with 93%. Those data firmly indicate that Move 2, 3 and 4 are inseparable for the RA abstracts. They are undertaking the main information for readers. The move 1, "situating the research" with 44% frequency occurs comparatively less than the others in abstracts, which is a little beyond of the supposed idea. The figures are closely in consistent with Santos's original findings in his abstract move model.

However, the comparatively lower frequency of move 1 (44 %) and move 5 (57%) does not support the opinion proposed by Hyland that there is an increasing trend of the appearance of STR (situating the research) and DTR (discussing the research) moves in abstracts. The underlying reason for this distance may be due to the different samples that Hyland's declaration is mostly concluded from the social science while the samples in this article are selected among the scientific journals. On the other hand, the 57% frequency of move 5 also indicates that a vague strategy has been employed by the academic writer to blur the discussion of result rather than explicitly argue for the importance of their own research. This strategy is called by Hyland as hedging approach.

Table 2   Occurrence of Moves in the Abstracts Within Corpus

Moves	Number of Nature abstracts containing move(N=50)	Number of Science abstracts containing move (N=50)	Number of BS abstracts containing move (N=50)	Number of PRJ abstracts containing move (N=50)
Situating the research (Move 1)	21	25	30	12
Presenting the research (Move 2)	50	47	49	50
Describing the methodology (Move 3)	50	50	50	46
Summarizing the findings (Move 4)	27	34	28	25
Discussing the research (Move 5)	36	35	42	24

Data also show that abstracts in the empirical investigation articles mark their boundaries more clearly and efficiently with the use of verbs, such as argue, examine and claim. In the transition of each move, the markers are more tentative. In move 1, the writers often take two different stances: one for the third address , such as "The article advocates/ analyses/ shows/ considers/ explains/ describes/

establishes…", and the other the paper's stance, such as " The article advocates/ analyses/ shows/ considers/ explains/ describes/ establishes/ introduces/ proposes/ discusses/ develops/ presents/ provides/ studies/ represents/ features/contains/concentrates on/ demonstrates the feasibility of /focuses on/ deals with/gives detailed explanation for/investigates into/ holds that/aims to give a comprehensive account of/ offers a solution to / serves as an introduction to …".

Although the style of an abstract may differ from discipline to discipline, the structure and information provided is quite formulaic. The present tense is most frequently used in abstracts to state facts, describe methods, make comparisons, and give results. The past tense is preferred when reference is made to the author's own experiments, calculations, observations, etc. The journal abstract contains certain textual and linguistic characteristics.

4 Conclusion

This study constructed a little-scale abstract corpus with 200 RA abstracts published recently in four scientific academic journals. Then, the total number of the sentences and the moves were identified manually. The rhetoric structures of the abstracts were considered. The quantitative and qualitative methods are both employed to analyse the realization of rhetoric and moves in abstracts writing. The statistical data were used to make the comparisons with Santos's model and Pho's abstract models. The analysis indicates that not all the scientific RA contain the full five moves in their abstracts, but three moves are inevitable for the abstract structure. Although the concrete arrangement of the moves would be in variable in abstract organizations, the higher frequently occurring moves are move 2 (PTR), move 3 (DTM) and move 4 (STF). However, the frequencies of move 1 and move 5 demonstrate to be the non-obligatory moves in abstracts, which does not support Hyland's idea of the increasing tendency of the two moves in RA abstract. With regard to the differences between the five-move abstracts and the three-move abstracts, the analysis show that although the three moves can work out a general guideline in terms of what the paper has been designed to do, the lack of another two moves would leave readers in puzzling with insufficient information.

The results also suggest that a combination of certain linguistic features such as thematic progression patterns, grammatical subjects, verb tense and voice can help distinguish moves in the abstract. The findings of the study have some pedagogical implications for academic writing courses for graduate students, especially students from non-English backgrounds. The three models of abstract writing proposed respective by Swales, Santos and Pho in this article would be of great value for the inexperienced writers to mock and for the teachers to stipulate their teaching approaches to RA abstract writing.

A Review on Research of Healthy Cities Using Spatial Analysis Approach

Xie Hongjie, Wang Qiankun
School of Civil Engineering and Architecture, Wuhan University of Technology, Wuhan,
P.R.China, 430070
(E-mail: h.j.xie@whut.edu.cn, wangqk@whut.edu.cn)

Abstract: Objective: This report surveys and evaluates the scientific research on the application of several spatial statistical analysis methods, and GIS or other software in the research of healthy city planning. Methods: Research teams conducted a new and more ex-haustive search for rigorous empirical studies that link the research of healthy cities by spatial analysis such us GIS, GWR(Geographically weighted regression). Results: This review found a growing body of the application of spatial analysis approaches to assessment of healthy cities planning in order to improve the prevention and control of spatial related diseases.
Key words: Healthy cities; Spatial related disease; Spatial statistical analysis; GIS software

1 Introduction

Only recently city become a densely populated and highly structured settlement. A safer and healthier environment for people is the core of urban planning. The origin of urban planning is closely related to public health. (Corburn, 2009)However, with the rapid development of medical technology, public health gradually fade away from the scope of urban planning. Nowadays, with the change of travel style, sedentary and less activity make chronic diseases(cardiovascular disease, diabetes …) is becoming a main threat of human health(FrankAndresenet al., 2004). A large number of studies have shown that chronic diseases are not only affected by biological factors, lifestyle, but also directly related to the built environmental factors such as land use, density, traffic and urban space(FengGlasset al., 2010).

Although the link between the built environment and the risk of chronic diseases has long been known, so far we still lack deep and relatively correct cognition of how the built environment affects health. ((Garfinkel-CastroKimet al., 2015). In the past decade, GPS,RS(remote sensing),GIS space research technology has been applied in the fields of healthy city research. Healthy city research has achieved a lot of fruitful results (LaiMak, 2007).

2 Methods

The application of planning space technology in public health at the beginning of the century. Using academic search engine PubMed, Google scholar, Web of Science, an database that covers the most recent years of literature (2001-2018) was analyzed. Keywords in headings and abstracts include public health, urban Planning, geographic information systems, or global positioning systems, remote sensing, image processing. The literature selection elements include: (1) It should include public health and environmental impact factors, such as foodcape, built environment, or related to chronic diseases, such as dietary behavior, physical activity, etc. (2) It should contain one or more space technologies, such as spatial data or methods. The review's aim is to understand the present situation of past relate studies, identify the major problems that need further study, and understand the methods used in similar studies.

3 The Use of Spatial Analysis Approach in Healthy Cities Research

3.1 The focus of research on healthy city in the past decades

Research on the health effects of built environment in the past decade is mainly exists in the two carriers. The one is physical activity, and the other is Foodcape.

(1) Healthy impact of physical activity

Physical activity's extension is larger than physical exercise. It includes not only physical exercise nor physical work, but also slow physical activity such as walking and cycling. Sedentary, lack of physical activity, and lifestyles depending on motor travel are one of the major causes of the rapid growth of chronic diseases ((SaelensSalliset al., 2003).

The objective assessment of built environment has always been the focus of scholars. The most

representative theory is famous 3D Model which was proposed by Cervero first in 1997.The 3D model was consist of Density, Diversity and Design. Subsequently it was extended to 5D model with added factors : Destination Accessibility and Distance to Bus stop(EwingHandyet al., 2006). It has been widely used in the world. The other widely used theory framework include 5 elements (HandyClifton, 2007), 3 factors framework (FrankAndresenet al., 2004), and 4 elements framework (EwingHandyet al., 2006)

Diversity: Ewing And Other people's research found that physical activity and land mix Utilization degree (Land use Mixture , LUM) has a strong correlation between(FrankSalliset al., 2006) . Land use can increase the accessibility of the destination and increase the likelihood of using a physical mode of transportation, thereby reducing the risk of chronic diseases (PapasAlberget al., 2007).

Density: density can be measured by population, building density (volume rate), employment, etc. High density often means that land use is more compact, which helps to reduce the mobility of motor vehicles, but too much density can also lead to residential repression. Dunphy and Other people's studies show that when the population of each square mile exceeds 7500 , walking and cycling activities can increase significantly (Dunphy & Fisher, 1996). A large number of scholar studies have confirmed this judgment (SturmDatar, 2005) (RundleRouxet al., 2007).

Design: pedestrians and cyclists have a high demand for sidewalks, public transport sites, visual richness and aesthetics, and many of the design factors for the built environment are the best-of- pace index (Walk Index , WI), rich design content makes people feel more safe, self-confidence and comfort make people more inclined to choose walking and cycling. (Saelens & Sallis et al., 2003). There are 2 Different research directions, one of which is the attractiveness of the street from a user's point of view (attractiveness), and the other is the connectivity of the street from the road function (Connectivity) .the higher the accessibility of public service facilities, the better the system, the better the quality, and the higher the road connectivity, the greater the probability of physical traffic travel (Frank & Andresen et al., 2004) , thus reducing the risk of chronic diseases (Oluyomi, 2011; Ball & Lamb et al,).

Public transport density: is another important variable that causes chronic ann drew ·Rundle (Andrew Rundle A study of the relationship between public transportation system and the prevalence of chronic illnesses in New York City shows that the density of bus stations and the density of rail transit sites affect the community residents ' BMI important factors for values (Rundle & Roux et al.,) . The research shows that when the bus station is located in the area with high accessibility of the road network, the utilization rate of the public transport station will be greatly improved (Lund & Willson et al., 2006).

Green vegetation: Some studies have found a link between green vegetation and walking tendencies. If people have a green environment (including agricultural and natural green spaces) within the 1~3km range, they have higher self-perceived health (Maas & Verheij et al., 2006) . Tirt and others used objective measurements and self-assessment methods to study the impact of destination accessibility and normalized vegetation index (NDVI) on walking and Body mass index (BMI). The landscape green area in the 1km range of the respondents ' residence was calculated by satellite images. Data show that respondents who live in areas with high accessibility and high NDVI values have a Lower BMI (Tilt & Unfried et al.).

Bird points out that there is no linear mechanism of influence between the built environment factors, physical activity and health outcomes, and this mechanism will vary greatly depending on the subject, the purpose of the action and the location characteristics. (Bird & Grant) .

In summary, the environmental factors such as density, land use, index, public transport density, green vegetation, urban space design can significantly change the travel behavior and physical activity, so it is becoming a cross-field research hotspot in urban and rural planning, public health and urban transportation. However, the conclusion of the study on the factors related to the obesity of built environment is not identical.

(2)City fastfood map (foodscape)

Generally speaking, chronic diseases such as cardiovascular disease and overweight in relation to the intake of high-energy foods, City View Map (Foodscape refers to the distribution of fast food restaurants (which provide high-calorie, high-fat food) and supermarkets (providing healthy food) in the city, Land use and spatial planning determine the accessibility of supermarkets and fast food restaurants, thus affecting the public's choice of healthy food and ultimately the impact on individual health. The application of GIS and the drawing of "healthy food scene map" has become a new research direction in recent years. American scholar Andrew ·Rundle and other health food outlets, which are not prone to chronic diseases, are distributed throughout the city, discovering their density and BMI Value

Negative Correlation (Rundle & Neckerman et al.) .

(3) Chinese research in this fields

Chinese research is relatively fragmented, and is still in the introduction and introduction of foreign theoretical stage, Most studies tend to stay in the qualitative and descriptive, rare empirical and quantitative studies. after entering The century, the research of the environmental health impact mechanism of the built environment starts from introduction and introduction of Western theories (Kobe Lee , 2003; Xu from Bao, Trebizond, etc. , 2005) , 2006Binyi Liu introduced the American "Design for Positive living" campaign (Binyi Liu, Guo Yan , 2006) , Tan Shaohua put forward the viewpoint of active intervention health from the environment of human settlements (Tan Shaohua, Guo Jianfeng, etc.) . In the past ten years, scholars have made some preliminary achievements in the study of the built environmental health factors of physical activity as carrier (li Zhiming, Zhang Yi), Mainly related to the framework of healthy urban planning (Tianli, Jinwei, etc.), the path and elements of Healthy city planning (Wang Lan, Liu Shuwen, etc.), Health impact assessment HIA (Li Yu, Wang Yueyi , Zhang Yalan, Cai Chunting, etc.). By using the data of "Chinese Family Tracking survey CFPS", the research on the environmental factors, personal travel characteristics and socioeconomic characteristics of the residents' chronic diseases in the community Built Environment (Bindong, Shanhong, etc.), Wang Lan and other factors affecting the distribution of particles in the urban space cause respiratory diseases (Wang Lan, Chaoxiao, etc.), Su Chang, etc. using the "China residents ' health and nutrition Survey" to investigate BMI Changes and the relationship between BMI and dietary and environmental factors (Su Chang, Zhang Bing, etc.) . Yangdong and so on the use of comparative case analysis of the 4 communities in Dalian, the preliminary identification of the supermarket distribution of the elderly physical activity has a significant role in promoting or restricting the establishment of environmental factors(Yangdong, Liu Zhengying ,) .

3.2 The application of spatial analysis approaches in healthy cities

The spatial analysis method is seldom used before the study of the factors affecting the establishment of chronic diseases. According to the China Center for Disease Control and Prevention, "China's chronic disease and its risk Factors monitoring report ", obesity and other chronic diseases in the space there is a certain aggregation, China's obesity population distribution, from north to south gradually tightening trend, the northern fat is too much, Southern Fat Less, the Northeast is the fat "hardest hit"(China Center for Disease Prevention and Control). In Jiangsu Province, a similar phenomenon of spatial aggregation of people with chronic diseases (Leeson, Huang Hui, etc.)was found in the surveillance of national physique.

Figure 1   Chinese Obesity Index Map

The occurrence of chronic diseases is related to heredity, bad living habits, etc. , also related to geographical environment, built environment, living habits, climate and pollution. The reason that overweight rate in north is higher than that in South is related to the regional climate, eating habits and other objective factors. The low rate of obesity in Southerners includes many factors, the key reason being that heat causes the local people to metabolize quickly. In addition to the weather, obesity may also be linked to the local diet structure (Beijing Evening News).

Spatial Analysis (Exploratory Spatial Data analysis) is a set of spatial data analysis methods and techniques, taking the spatial correlation measure as the core, through describing and visualizing the spatial distribution pattern of things or phenomena, discovering spatial agglomeration and spatial anomaly, revealing the spatial interaction mechanism between the research objects. (chenfang lv, Shange, etc.) .

In the early 1980 years, GIS it was applied to the Canadian forest management system for the first time. Geographic Information systems (GIS), Global Positioning systems (GPS) and Remote sensing (RS) represent the development of spatial analysis techniques and statistical methods, as well as public, governmental and media concerns about environmental and health issues in recent years, Greatly promoted the development and application of spatial epidemiology (Alick Zhou, Yang Guoying, etc.), e.g. using GIS Technology has made great progress in the field of public health in the research on infectious diseases such as schistosomiasis, tuberculosis, hepatitis and AIDS. International Conference onGIS and Health in Hong Kong (Lai, Poh C & Mak, Ann S H ; national experts discussed the application and practice of GIS technology in health and environment research.

Although chronic illnesses are a cause and mechanism of relatively complex chronic noncommunicable diseases, their epidemiological characteristics have a common denominator with infectious diseases -- The distribution of the population has obvious spatial and geographical characteristics, so it can also be used GIS derived spatial analysis technology to describe the prevalence of chronic diseases, geographical characteristics, distribution patterns, spatial aggregation and chronic diseases and density, land use, and other factors of the establishment of the environment, to reveal the prevalence of chronic disease and spatial distribution characteristics, provide reference for intervention and prevention from planning and urban design point of view (Tan & Shah et al., 2013; Wang & Wen et al.).

3.3 Summary

To sum up, the existing research has the following three aspects worth attracting attention:

First , the current research on environmental health effects is concentrated in the west, especially in North America, Europe and Australia . (li Zhiming, Zhang Yi) , domestic research has just started. As we all know, the urban environment in North America and Australia is very different from the domestic urban environment, the United States and Australian cities are mostly sparsely populated, the living density is low, the urban sprawl (Citycrawl) degree is serious, the European city scale is small, the road is narrow, China's urban population, large living density, wide road, dense traffic, building volume ratio (density) is also large, so some of the conclusions from western cities are still applicable to the completely different Chinese urban environment, is still unknown.

The second, from the existing Western related research, there are also shortcomings: first, the precise quantification method and means of the built environment is scarce before, its scientificity and validity are difficult to be verified; The study shows that the socioeconomic status (Social economic status, SES) can also affect physical activity. How to eliminate the self-selection deviation of the spatial distribution of chronic disease population (selection bias) is another important problem to be solved in this study. The spatial aggregation of chronically ill people often ignores the effects from neighboring regions, but the population of chronic diseases is spatial aggregation (China Centers for Disease Control and Prevention), That is, "spatial autocorrelation", which has a certain effect on the authenticity of the results autocorrelation.

The third, although there is already a large number of studies on a certain type of disease or a single built environmental factors, but these studies are still more scattered and fragmented, and did not form a systematic theoretical framework (Chen Haiying, in a van ,) due to the lack of core theory guidance, the conclusions of the study are not identical or even contradictory. (Bindong Building, Shanhong, etc.) . From the present research situation of our country, the research on the introduction and introduction of Western theory and the fat effect of built environment has not been extensively entered into the mainstream theory of urban planning.

4 Conclusion

The above is a summary of the research progress of the physical activity and the food scene map of the Healthy building environment research from two perspectives, in fact, with the attention of the Government, society and the public to health issues, relevant interdisciplinary studies including public health, urban planning, epidemiology, spatial statistics and other developments in recent decades, But there are still many challenges to face:

4.1 The theoretical research needs to be deepened

In 2013, Harris studied 2764 network analysis of the related literature of the built environment and physical activity shows the evolution of the research in this field, indicating that in the past - years of researchin this field are still in the exploratory stageto Sallis, Ewing, Brownson , Frank , Giles-corti and other representative scholars have made important contributions to the development of this field. (Harris & Lecy et al.), but the core theory has not been established, the relevant research is often only a single factor or local factor of the built environment, the research scale and standard vary greatly, and the tendency of fragmentation and localization is presented. (Chen Haiying, in a van, Li Mengfei) . In addition, due to the differences in the built environment between China and foreign countries, there are conflicting and even contradictory research conclusions, such as the study on density and accessibility, the conclusions are contradictory and conflict (bindong , Shanhong) .

4.2 Research tools need to be innovative

Previous studies have proved to varying degrees that there is a correlation between built environment and health, but often due to lack of deep longitudinal study, the establishment of causal relationship between specific factors and health effects appears to be quite difficult. The Spatial analysis method of the fat effect needs a large amount of accurate data support,before the popularization ofGIS , because it is unable to directly objectively measure the impact of environment on health, the relevant research mainly adopts the way of interview and questionnaire survey. because of the Self-Reporting Act (self-report and lateral research methods, often because of the difficulty in controlling self-selection deviations (Self selection bias) and Error (Handy & Cao et al., 2006; Cao & Mokhtarian et al., 2008; James & Hart et al.), It is impossible to draw sufficient conclusions and establish precise correlations, and Many of the findings are questioned as pseudo-correlations, This has also become a major weakness in similar research (Ewing & Cervero).

4.3 Research and application prospects

The American Urban Land Research Institute (Urban land Institute) guidelines for the design of health sites have been promulgated (Building Healthy Places Toolkit), including the total of urban function mix, street density, building density, slow line system, environmental lighting, accessibility of natural environment, etc. -project planning and design tools (Institute, U l, 2015) , it has a great impact on urban planning in North America. As the research enters the stage of implementation evaluation, the impact mechanism of community built environmental factors on health is expected to be further revealed.

From the above research progress can be found that the current domestic and foreign academic The research on the relationship between built environment and population health is mainly found in the developed countries and regions such as North America, Europe and Australia, the related research in our country has less accumulation, and the empirical research combined with our country's national conditions is very scarce, especially the lack of longitudinal in-depth study on some kinds of space-related diseases. This project uses the method of big data statistics and spatial measurement analysis to study the risk factors and influence mechanism of the built environment, and explores the strategies of active intervention from the perspective of planning and design.

Research on the Crisis Conversion Countermeasures of Garbage Incineration "Nimby" Event Based on Text Segmentation and Structural Similarity Calculation

Xie Hao, Du Zhihong, Wang Linlan
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 442667228@qq.com, 1428996195@qq.com, 787569597@qq.com)

Abstract: Based on the theoretical basis of text segmentation, case structure similarity calculation and Bayesian evolution, combined with text mining method, this paper proposes a set of crisis transformation management innovation methods of waste incineration "nimby (not in my back yard)" event. Compared with traditional qualitative research methods, this method can more effectively learn from previous successful experiences through quantitative analysis and data support. With the accumulation of case training sets, the accuracy of decision-making suggestions will gradually increase. In this paper, the quantitative analysis and research on the "nimby" incident of waste incineration are carried out by this method, and the keyword list of "nimby" of waste incineration is constructed. Bayesian evolution of different angles is carried out for different types of waste incineration "nimby" cases. The solution to the "nimby" problem is summarized, we should propose accurate and effective countermeasures mainly from the aspects of information communication and diversified governance system, funding source reporting, scientific distribution mechanism and compensation mode.
Key words: Text segmentation; Similarity calculation; Nimby; Crisis transformation

1 Introduction

With the increasing level of urbanization, land resources are becoming increasingly tense, and as residents' living standards improve, the residents' awareness of environmental protection becomes stronger and stronger. Waste-to-energy technologies such as waste incineration and power generation are used to implement waste disposal methods that are harmless, resource-reduced, and reduced. But it is particularly difficult to get up (Fang Chengxian, 2009). According to statistics, about 32% of the mass incidents in China with a scale of more than 100 people in recent years are closely related to "nimby" projects such as garbage incineration. Therefore, how to learn from past successful experiences and minimize the losses and social impacts caused by the incident are of vital importance to building an ecological civilization and building a harmonious society.

In recent years, Chinese scholars have discussed the "nimby" problem mainly by analyzing and comparing real cases. Using the perspectives and research methods of economics, political science, and sociology, they have come up with many suggestions that have guiding significance for reality. In general, in the current domestic literature on "nimby" issues, the research methods are still dominated by qualitative methods, while the literature using quantitative analysis is still relatively small. This is in contrast to a large amount of quantitative analysis and data-based support in Western academic circles. And there is a big gap. With respect to the study of semantic similarity analysis, Chen YJ. proposed a semantic-based case knowledge representation model, which decomposes the case knowledge into four semantic levels, aiming to acquire new knowledge through knowledge inference rules between the same level and between different levels (Chen Y J,2010); Sebastian CB uses semantic technology to model the design process, product knowledge, documentation, and decision process in the case, and takes flexible ontology rules as the core to provide a case knowledge management and integration platform for engineering design (Sebastian C B,2008); The semantic knowledge-based case knowledge and model proposed by Lily S is composed of requirement ontology, case knowledge ontology and domain ontology. By capturing the needs of the designers, inference algorithms are used to obtain knowledge from the case knowledge base to realize the analysis and processing of personalized information (Lily S,2010).The above studies added semantic information for case knowledge from different perspectives but did not really apply semantic similarity to emergency case analysis.

This paper proposes a crisis transformation method based on the theoretical basis of text segmentation, case structure similarity calculation and so on. Taking the garbage incineration "nimby" event as an example, the implementation process of Bayesian transformation effective path is explored from special perspectives, and a precise and effective countermeasure and suggest is proposed for the new case.

2 Theoretical Basis

2.1 Text segmentation based on "jieba" word segmentation of Python

The "jieba" word segmentation supports the three segmentation modes of the precise mode, the full mode, and the search engine mode (Hu Fagang,2015). The precise mode refers to the most accurate separation of sentences and applies to text analysis. The full mode refers to the scanning of all the possible words in a sentence. Its advantage is very fast, but can not solve the ambiguity, search engine model refers to the accurate model based on the long-segmented again, improve the recall rate, suitable for search engine segmentation.

The "jieba" word segmentation comes with a text dictionary named "dict.txt" which contains more than 20,000 words and contains the number of occurrences of each term as well as part of speech (the number of entries is based on the training of people and other word resources and other resource creators). The "jieba" word segmentation is a word segmentation of a conceptual language model. The so-called word segmentation of a conceptual language model refers to finding a segmentation scheme S in all the results obtained by the full segmentation so that P(S) is the largest.

2.2 Bayesian network model tree structure

Bayesian Networks (BN), also known as reliability network or causal network, is a graphical model for solving the joint probability calculation problem in probability theory (Gao Xiaoguang, 2016), and is a graphical model for describing the dependencies between data variables. It is also a model used for reasoning (Xiao Zhongming, 2017), and a set of directed acyclic graphs and model parameters (Yan Chunling, 2018). In the Bayesian network, the two variables X and Y are directly connected, which means they have a direct dependency relationship. Understanding of X will affect the reliability of Y, and vice versa. In this sense, we say that information can be passed between two directly connected nodes.

On the other hand, if the two variables X and Y are not directly connected, then the information needs to be passed between the other variables. If all information channels between X and Y are blocked, then information cannot be passed between them. At this time, understanding one of the variables does not affect the reliability of the other and thus is independent of the mutual conditions.

If we consider the basic case in which the two variables X and Y are indirectly connected through the third variable Z, the Bayesian network can be decomposed into three basic structures (Zhang Ru, 2014).

2.3 Similarity calculation of Chinese cases based on ontology

Ontology-based Chinese case representation is divided into two modules:

a). Extraction of concept collections. Firstly, keyword matching technology is used to express the explicit knowledge in the case using concepts and relationships in the domain ontology. Then, with the help of the extracted relationships and related rules, the inference mechanism of the ontology is used to represent the tacit knowledge in the case, thus extracting the conceptual collection of case representation ontology (Zhang Wei, 2014).

b). Extraction of concept relationships. Other elements of the ontology other than the concept, such as instances, attributes, etc., are linked by the four basic relationships between concepts. Therefore, based on the concept set formed, referring to the four basic relationships of the constructed domain ontology, it is possible to extend and select concepts, attributes, etc. of the concept, and reconstruct the hierarchical structure between the concepts, and achieve the use of the ontology to indicate the purpose of the case eventually.

The similarity "Sim (p_i, p_j)" between p_i and p_j is calculated as follows:

$$Sim(p_i, p_j) = \frac{\alpha}{dis(p_i, p_j) + \alpha}$$

Among them: The dis (p_i, p_j) express the shortest distance of the proto-top p_i, p_j. In this paper, we use the node weight calculation. The parameter α is an adjustment parameter, which can be adjusted according to the depth of each tree structure hierarchy of the original meaning.

From the analysis of the tree hierarchy of   Yoshihara, the semantics of a concept that is closer to the root is more abstract and wider in scope. The lower the concept is, the finer the classification is. And the more specific the semantics of the concept, the narrower the scope of use is. Thus, according to the depth of the concept, the semantic distance is improved, that is, the similarity of the concept increases with the sum of the levels in which they are located, and decreases with the increase in the difference of the levels at which they are located, forming a new similarity calculation method, the formula is as follows:

$$Sim(p_i, p_j) = \frac{\alpha}{dis(p_i, p_j) + \alpha} \times \frac{depth(p_i) + depth(p_j)}{\max\left(\left|depth(p_i) - depth(p_j)\right|, 1\right)}$$

Among them: depth(p_i) represents the depth of the Yoshihara node p_i.

Calculate the similarity of the composite concept using the arithmetic average method (where $SimPair_i$ represents the semantic similarity of the same node in the two tree structures):

$$Sim(S1，S2) = \frac{1}{k} \sum_{1 \le i \le k} SimPair_i$$

3 Case Application - Waste Incineration Incident

This paper takes the waste incineration "nimby" event as an example to study the countermeasures through the above text segmentation, Bayesian evolution and similarity calculation methods. First of all, we crawled a large number of cases related to waste incineration through online crawling, and conducted two screenings on the crawler's direction and content. The first is title segmentation matching based on keyword table and stop word list. The second is to screen through the HTML structure filtering algorithm designed for the chapter structure, and finally, obtain the webpage file of the key page with high relevance to the research. Then we use Python "jieba" word segmentation for text segmentation. Since many synonym words appear (the original word frequency table is shown in Table 1), we use Baidu's NLP (Natural Language Processing) interface for word similarity substitution (the word meaning similarity substitution table as Table 2). Finally, the frequency and weight calculation of each word are carried out, through the manual screening of field experts, the ten keywords most relevant to the garbage incineration avoidance event are sorted out (Table 3). Then we divide the garbage incineration cases that the network crawls into two categories: one that is successfully completed (Class A), and the other that is subject to "nimby" conflicts (Class B). We use Bayesian construction (Figure 1). The ten keywords in the keyword table are Bayesian nodes. And the classified cases are used as various training sets. Using the Matlab tool, the effective transformation of the "Class B to Class A" path is discussed from a special perspective. At the same time, it is worth pointing out that, with the increase and decrease of cases and the improvement of methods, the crisis transformation path will undergo dynamic changes, and it will not be the same level.

Table 1　Original Word Frequency Table (Excerpt)

Word	Frequency	Word	Frequency	Word	Frequency
Waste incineration	159	Project	144	Rubbish	143
Life	124	Construction	121	Power plant	94

Standard	Emission Standards	0.817001
Municipal party committee	Government	0.816235
Supervision	Supervision	0.824241
Emissions	Emission Standards	0.812505
Contradiction	Conflict	0.80778

Table 3   Key Word List of Garbage Incineration "Nimby" Events

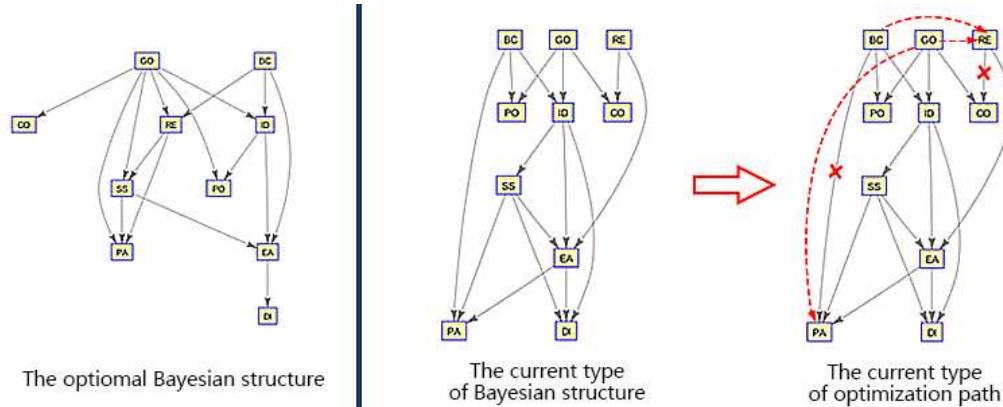
Residents	Site selection	Pollution	Environmental Impact Assessment	Conflict
RE	SS	PO	EA	CO
Participate	Information disclosure	Dioxins	Compensate	Government
PA	ID	DI	BC	GO


Figure 1   The Conversion of Class B to Class A

The optimized plan: Increase the association between GO and RE, highlight the communication between the government and the people, and improve the communication mechanism. Strengthen the relationship between GO and PA, promote public participation, and actively guide the public. Raising the correlation between BC and RE is based on local conditions and provides people with effective compensation in economic, psychological, and ecological aspects.

The weakening of the relationship between BC and PA is intended to compensate for the formulation of the plan. It should not indulge people's unreasonable demands, but should satisfy residents' reasonable needs and moderate participation.   Reducing the correlation between RE and CO shows that the government must fully understand public opinion and meet the public's voice.

The similarity between the current type of Bayesian tree and the optimal Bayesian tree is calculated using the formula of   Yoshihara similarity:

$$\text{Sim}(S1, S2) = \frac{1}{k}\sum_{1 \le i \le k} SimPair_i = 0.65$$

The similarity between the Bayesian tree and the optimal Bayesian tree after the current type of optimization is:

$$\text{Sim}(S1, S2) = \frac{1}{k}\sum_{1 \le i \le k} SimPair_i = 0.78$$

The main strategy of this program is: The policymakers should increase communication with the public, understand public opinion in depth, promote the active participation of the people, establish and improve the communication mechanism with the people. And in the process of formulating a compensation plan, policymakers must ensure that the resident's requirements but do not condone the residents' excessive demands. This scheme increases the similarity between Class B and Class A structure from 0.65 to 0.78.

4 Conclusion

This paper breaks the limitations of the traditional qualitative research methods and incorporates quantitative research and data analysis into the crisis study of waste incineration "nimby" events, which can more effectively learn from past successful experiences and provide the scientific basis for decision-makers to make more accurate and effective decisions. It is concluded that for different cases of "nimby" of waste incineration, countermeasures should be proposed mainly from the aspects of information communication and diversified governance system, funding source reporting and scientific distribution mechanism, and compensation mode, so as to solve waste incineration "nimby" problem fundamentally. This paper designs a set of research methods for crisis transformation of garbage incineration "nimby" events based on theories such as text segmentation, case structure similarity calculation, Bayesian evolution, etc. which provides a new solution to the transformation of sudden incident crisis similar to the waste incineration "nimby" event.

kaminisi@yamaguchi-u.ac.jp, haruyama@yamaguchi-u.ac.jp)

Abstract: This research is aimed at identifying the trend of technology and time emergence of the dominant design of inkjet printer and NC machine by using F-term in Japanese Patent. F-term was employed instead of International Patent Classification (IPC) because of the multi view point of the theme and it provides the certain technical area. The firm's product entering time to the market was evaluated to the S curve of the product lifecycle and technology life cycle was also investigated.
Key words: Dominant design; Product life cycle; Japanese patent; F-term

1 Introduction

In global competitiveness, it is important to make a long-term strategic decision in research and technology development. The potential direction of technology development and innovation can be determined by forecasting the trend of technology (A. K. Firat, et.al., 2008) (S. Jun, 2011) (D. Kang, et.al., 2013). However, forecasting technology is difficult because most of the forecasting method was using the expert subjective experience (S. Jun and S. Joo Lee, 2012). In addition, most of the previous study was only depicted the simply current condition, not describing the future trend of technology (J. Kim, et.al., 2012). Some related studies of technology trend analysis and forecasting application to predict the future technology development were conducted.

The comparative study between decision tree and statistical feature analysis and Gartner's forecasting model was done for technology trend analysis and forecasting application (J. Kim, et.al., 2012). The analysis on this study was using three sub models namely Technology Life Cycle Discovery (TLCD model, Technology Maturity Forecasting (TMF) model, and Emerging Technology Discovery (ETD) model. TLCD model was made by the analysis of papers and patents.

The identification of future trends was done by a mixed methodology using journal content analysis, focus group and trend reports on the academic libraries. The most popular topic was concluded with the highest number of downloaded article (R. Gwyer, 2015). There is no previous study stated the correlation between the number of downloads article and the popular topics that would indicate the trend.

The trend of innovation of Small Medium Enterprise's companies was conducted by using American standard industry classification (SIC) data (Z. J. Acs and D. B. Audretsch, 1988). Although the evaluation method of this research is an effective means for evaluating the trend of the American manufacturing industry, it may not viable to be applied to the evaluation of the Japanese manufacturing industry.

Previous studies have employed the patent document to predict the future state of technology (S. Jun and S. Joo Lee, 2012)(Jun, S. et. al., 2012) (Shrivastava, S., et. al., 2015) (Jun, S. and Park, S.S., 2013) (Kim, G. and Bae. J, 2017) (P. L Chan, et.al., 2010). The study of technology forecasting employed the International Patent Classification Code. The IPC code was used in Path analysis. The patent documents that concerning nanotechnology as the target technology was analyzed for verifying the analysis result (S. Jun and S. Joo Lee, 2012). The other study was also employed IPC code to search the direction and trend of technology over patent period (Shrivastava, S., et. al., 2015) (Jun, S. and Park, S.S., 2013). In International Patent Classification, there is the limitation of subdivision of IPC (FI) and inadequate segmentation. There are too many documents that are included in one symbol. This is also a single view point that from IPC only. The F-term indexing system is based on multiple viewpoints differing from those in IPC.

In this study, we propose the patent information analysis method using the F-term as Japanese patent classification code. The patent information analysis was used to predict the technology trend particularly on inkjet printing technology (IJ) and microfabrication equipment (MC) as the target technology in the case study company. The F-term is the more detailed information related to the patent

information that derived from the IPC. This is a unique and more specific classification. By using the F-term in Japanese patent, we able to find the more specific technology that related to the target technology in this study. By understanding the trend of technology, the product innovation process will be on the right path. It is important to integrate the product innovation process to the product life cycle management (A. Staisch et.al, 2012).

It is important to discern technology trends and the timing of the new technology for emerging the product to the market. In response to the issue of how to view the market and technology trends, we used the concept of technology and market change that was shown in "Dominant Design Theory" of James M. Utterback (Utterback) (J. Utterback, 1998) (J. Utterback,et.al., 2006). Utterback´s model for innovation defined three phases of innovation in the marketplace for product namely the Fluid, Transitional and Specific phases. Some studies work on recognizing the dominant design (Bakker, S. et.al., 2010) (P. Anderson and M. L. Tushman, 1990) (R. Roy, 2016) (M. Hekkert and R. van den Hoed, 2004) (H. Sievers, 2015) (F. Suarez, 2015) (S. Wilson, 2007) (A. Brem et.al., 2016).

Nobeoka (Nobeoka Kentaro, 2006) states that the problem of Japan's manufacturing is the manufactures in Japan only suffers in "making things" as well, but it is not linking to the customer's satisfaction or profits. It makes creating the "value creation" is not possible. For linking to the "value creation", there are two important points, namely the technology uniqueness / differentiation and a high customer value.

Therefore, we must recognize the dominant design of our product in a pre-market phase of development. To be dominant in the market share, we must understand our dominant design. When a dominant design is defined, we are mostly out of the product innovation phase. The phase take place when all players start to optimize their processes, improving the quality and reducing the cost of their products. Therefore, in this research, we devised a method to evaluate the change of product and process innovation by patent analysis and investigate the dominant design of target technology.

2 Research Methodology

As a case study research, we conducted the study in a manufacturing company in Japan. As a target technology of company, we selected two products namely small NC microfabrication equipment (MC) and inkjet printer device (IJ). The research methodology is shown in Figure 1. Related to the company's target technology, the previous studies, and Japanese patents documents were reviewed. The trend of technology was obtained from the F-term as a specific term in Japanese patent. the S-shaped curve of technology is evaluated by diminishing down FI (File Index) to the Japanese patent application and obtaining the number of technology applications. The Japanese patent was reviewed over period 1998 – 2016. The overview of F-terms in the Japanese patent classification and its correlation to the International Patent Classification (IPC) is shown in Figure 2. In the F-term indexing system of Japan patent classification, the entire technical area is divided into small areas called "theme" and patent documents are analyzed in each "theme". Each "theme" has "F-terms", which are search keys. After obtaining the theme from the F-term of.

In this research, "technology trend" refers to the next market and technology evaluation factor.

1."S curve of technology" representing market growth and product life cycle

2."Product innovation" and "process innovation" representing the status of innovation

3."Dominant design" (period of emergence, technical elements) representing the transition period of "process innovation" from "product innovation"

Figure 1   Research Methodology

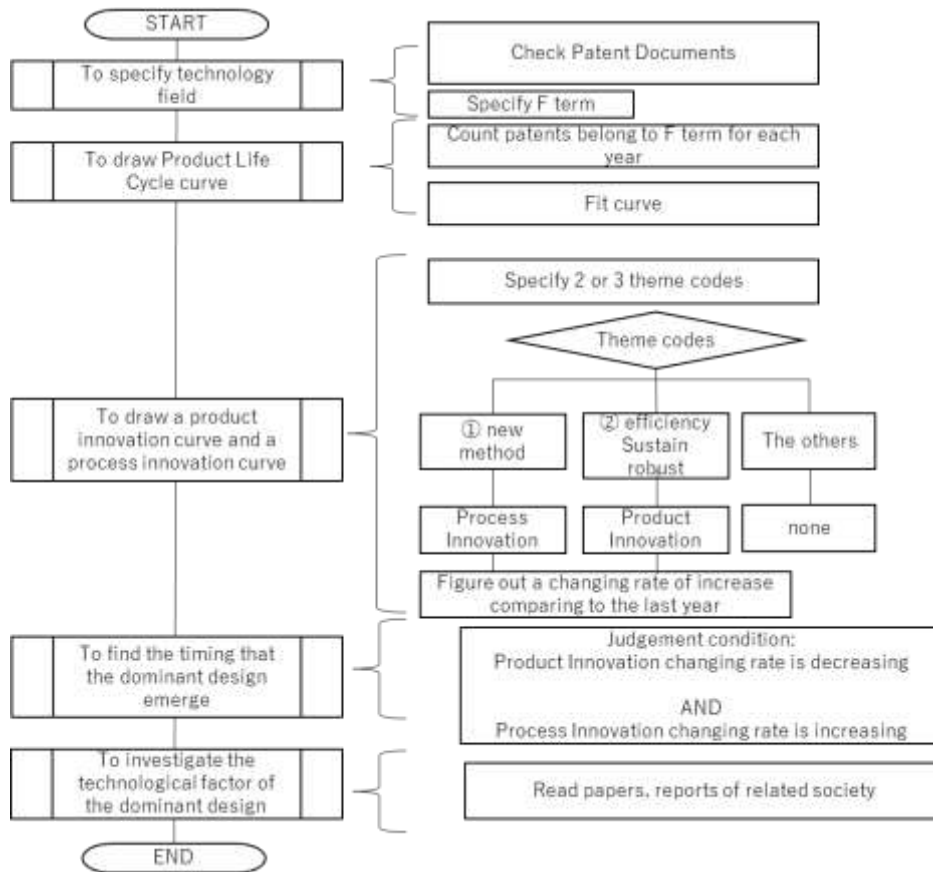
70,000 entries 190,000 entries   380,000 entries


Figure 2   Overview of IPC, FI and F term

3 The Emergence Time of Dominant Design of IJ and NC Machine Technology

As described in Figure 2(Japan Patent Office, 2013), the theme code was obtained from the F-term in the Japanese patent classification. This code is the unique and specific code according to the specific field in Japan's technology. The theme codes that employed in determining the dominant design of IJ technology from the Japanese patent application were 2C 056, 2 C 057. Subsequently, the S-curve of technology was obtained and shown in Figure 3. The figure shows that the S-shaped curve of technology has reached the peak phase around 2006, and after 2017 it is at the "declining period". The innovation of

product and process were investigated by using the number of cases from F-term in Japanese Patents. Both product and process innovation are fluctuating and recognized as the dominant design at around 1990 until 2003. The dominant design of IJ then obtained from academic journals over period 1990 – 2003, namely "on-demand printer" and "line printer".
Figure 3   S-curve and Innovation of IJ Technology

It depicted in Figure 3 that the company as the object of this research entered to introduce its product to the market in around 2013. The period of entering the market indicated in the specific phase as in Utterback Innovation model. Therefore, the company must make a new breakthrough in innovation and using it to move from the end of the innovation cycle to the beginning of a new one with the next innovation of product. The company must create a wave of radical innovation to sweeps across existing technologies and make it become obsolete. As the current result, this company's IJ business has not reached to making big benefit for 6 years.

The "S-curve of technology" and the innovation of the NC machine technology is shown in Figure 4. The theme code used is 3C001 (machine tool). As shown in Fig. 4, the S curve of technology reached its peak around 1994 and declining in 2017. It is judged as 'declining period'. The innovation of product and process increased until 2009 and currently declining. From the viewpoint of technology development, the NC machine field is not as active as the IJ device. The dominant design emerged around 1993 - 2004. The company entered the market before the period of dominant design ended. After the dominant design period, the innovation of process increasing significantly. The company entered the market prior to the rapid increase in technology development pursuing Quality, Cost, and Delivery (QCD), in a situation where various technical elements are easily accessible to small and medium-sized enterprises.
Figure 4   S-curve and Innovation of NC Machine Technology

The market segments are clear and therefore the company able to concentrate on serving specific

customers. It can be stated that they introduced their product at the correct time and can be successfully grasped the customers who need special orders. As the result, the company has obtained the niche market concerning R&D laboratory of the enterprises and universities with steady benefit for 16 years. Furthermore, product innovation is in the specific phase, waiting for the new radical development on the product for jumping to the new cycle of innovation.

4 Conclusion

The objective of this research is to identify trends of technology and examine the product's introduction time to the market.   The trend of technology was evaluated by using the theme code of F-term in Japanese Patent Classification. The emergence time of dominant design of Inkjet printer (IJ) and NC machine was investigated.   From the S curve and innovation lifecycle, it was determined the period of emergence time of dominant design for inkjet printer technology over period 1990 until 2003. The introduction time of inkjet printer to the market was behind the dominant design period. The introduction time of NC machine to the market was in the vicinity period of dominant design around 1993 until 2004. The company entered the NC machine's market prior to the rapid increase in technology development pursuing Quality, Cost, and Delivery (QCD). It becomes viable for the firm to successfully grasp and concentrate on the customers who need special orders.

Co-design of Service Innovation Through Problem Based Learning in Higher Education Incorporating Living Labs

Sadayo Hirata

Graduate School of Engineering Management, Shibaura Institute of Technology, Tokyo, Japan, 1085048

(E-mail: hirata-s@shibaura-it.ac.jp)

Abstract: The aim of this research is to propose a model of problem based learning to develop service innovators. This model futures empirical finding for problem solving by implementing with enterprises and higher education institutions. This study focuses on craftsmanship in the manufacturing small enterprises in Japan. It is because the management of a small enterprise is tight and it is difficult to demonstrate the value of excellent craftsmanship. This study shows a model of co-design of service innovation and the execution process of the model by enterprises and higher education institutions incorporating living labs which is one methodology to practice open innovation.

Key words: Human resource development; Living labs; Manufacturing; Production service; Service innovation; SME

1 Introduction

There are lots of small and medium enterprises (SMEs) in Japan. Despite its small scale, SMEs are supporting the Japanese economy. As shown in figure 1, in Japan, 99.7% of the enterprises are SMEs (Ministry of Economy, Trade and Industry in Japan, Small and medium enterprise agency, 2014). In terms of the number of enterprises, SMEs are overwhelmingly larger than large enterprises. In terms of the number of employees, SMEs are also lager.

SMEs are largely involved in subcontracted manufacturing which is the backbone of a number of principal industries of Japan, such as the automobile industry. Therefore, SMEs accumulate potential technologies and skills in order to meet the strict demands of large enterprises (Ministry of economy, Trade and industry, Labor and welfare editing in Japan, 2016).

However, the management of SMEs are tight and SMEs are lack the core personnel to lead research and development in addition to manufacturing. It is difficult for SMEs alone to demonstrate its value. Therefore, discovering superior craftsmanship and translating it into earning power is a problem that requires urgent attention (Small and medium enterprise agency in Japan, 2015).

2 Aim and Method of This Study

The aim of this research is to propose a model of problem based learning to develop service innovators. Both of enterprises and higher education institution future empirical finding for problem solving by implementing this model.

Figure 1　Ratio of Manufacturing Enterprises in Japan

In this research, participation observation (J. Blomberg, M. Burrell, and G. Guest, 2002) and interview were used for data collection. In addition, co-design (J. Blomberg, M. Burrell, and G. Guest, 2002) and living labs (European Network of Living Labs, 2018, F. Akasaka, A. Kimura, 2017) were used for analysis and problem solving. Co-design is is one methodology for value creation and an approach to involve various stakeholders and work together to solve problems. Living lab is one

methodology of open innovation and an approach to understand and solve problems at workplace and society's site.

This study shows a model of co-design of service innovation and the execution process of the model by enterprises and higher education institutions incorporating living labs which is one methodology to practice open innovation. This model futures empirical finding for problem solving by implementing with enterprises and higher education institutions.

3 Issues to be Solved
3.1 Lack of human resources capable of management leading to service innovation
Japanese government advocate strengthening of power to make profits by not only reforming by traditional cost reduction and time reduction, but also by improving productivity and value creation, in order to realize differentiation by high quality and high added value (Baines T.S., et al., 2009).

Meanwhile, manufacturing companies in Japan have accumulated techniques and experiences of manufacturing, but it can not be said that they are fully working on intangible value creation and grasping customer satisfaction. That is Japanese manufacturing companies are not good at service innovation yet.

Consequently, management reforms that cause service innovations are necessary for manufacturing industry. Due to the spread of design thinking, the idea creation method which is possible to be applied to manufacturing has become known (). However, many enterprises haven't learned such service innovation that had not mentioned in the past education of engineers. In Japan, the definition of service is not clearly recognized yet (T. Arai, Y. Shimomura, T. Hara, 2007). Even the academic conference in Japan only presented reference standards for servisology. Therefore, the manufacturing enterprises need to learn about value creation again (R. F. Lusch, S. L. Vargo, 2014).

3.2 Lack of educational opportunities in SMEs
99% of all Japanese companies are SMEs. Many of which are engaged in contract manufacturing from large companies. As in Europe and the United States, small and medium enterprises need to complement innovation knowledge to enhance their profitability centered on their own specialty, in order to independently trade with overseas markets as well as large enterprises.

Large enterprises can learn through OJT (On the Job Training) in departments such as in-house education, study abroad, research and development, marketing, etc. On the other hand, small enterprises with limited management resources do not have much opportunity to learn again like large enterprises do. However, because it is small and medium scale, there is a possibility that the educational effect will be penetrated and practiced quickly.

3.3 Lack of higher education to help to solve problems of enterprises in the traditional curriculum
Traditionally, universities have built a curriculum centered on subjects in accordance with educational policy. Meanwhile, the environment surrounding enterprises and companies is rapidly changing. As mentioned in 2.1 and 2.2, in recent years, there has been a strong demand for value creation by service innovation to make the manufacturing industry survive.

However, higher education to solve new problems in the industry was not found in the traditional curriculum that teaching industrial technology. There is concern about the gap between the traditional curriculum and higher education necessary for enterprises. The higher education is required to design provide new problem-solving education. Therefore, the universities need to understand concretely what kinds of problems the enterprises suffer from before the preparation of the new problem-solving education.

4 Survey of Problems of Manufacturing SMEs
4.1 Overview of the survey
As shown in Table 1, this survey was conducted between 2015 and 2017 to understand the problems that manufacturing SMEs have.

The subjects to be investigated were four manufacturing SMEs ranging in size from tens to 100 employees. This survey was conducted by the enterprises, six students and one faculty member in cooperation. The participated observation and interview were used for the survey methods.

The participated observation was focused on the servitization.of manufacturing industry. It is the servitization.that how far each enterprise's service innovation was progressing.

We focused on management problems and ingenuity to solve problems by management and employees through living labs.

Table 1 Overview of Survey

Enterprise	Production type	Investigation (hour)		
		Observation	Interview	Total
A	Metal processing	3.5	2.5	6
B	Metal processing	3	3	6
C	Electronic parts	4	3	7
D	Motor	5	1.5	6.5

4.2 The results of the survey

4.2.1 Progress of servitization

As a result of the survey shown in 3.1, the following information was revealed.

In participated observation, we understood the difference of servitization among the enterprises. The progress of manufacturing servitization of each enterprise was classified based on the four steps of the industrial revolution, "Mechanization, water power, steam power," "Assembly line, electricity," "Computer and automation," and "Cyber-physical systems". A summary of the results about servitization of each enterprise is shown in Table 2.

Table 2 A Summary of the Results about Servitization

Enterprise	Production Type	Delayed← Mechanization, water power, steam power	Servitization Assembly line, electricity	Computer and automation	→Leading Cyber-physical systems
A	Metal processing		→		
B	Metal processing		→		
C	Electronic parts			→	
D	Motor				→

In the interview, several common terms and differences were extracted about management problems about management problems and ingenuity to solve problems. A summary of the survey results is shown in Table 3.

4.2.2 Comparison of management problems and ingenuity to solve problems

All of the four enterprises were in common in that they were also engaged in multi-product small-volume production that was difficult to set up a production line, but also challenge the prototyping of new products and new services using the excellent technology.

In particular, several characteristics were clarified in the homepage and leaflet brochure. All of the enterprises listed their core technologies. Furthermore, enterprise C and D were appealing the value of their technologies to customers for the usage by customers.

Table 3 A Summary of the Results about Management Problems and Ingenuity to Solve Problems

No.	Management Problems and Ingenuity to Solve Problems	Servitization Delayed		Leading	
		A	B	C	D
1	Multi-product Small-volume Production which is difficult to set up production line	Y	Y	Y	Y
2	Utilize production management tool	Y	Y	Y	Y
3	Creation of the prototype of new product / service with good skill	Y	Y	Y	Y
4	Presentation of their superior technology through the website etc.	Y	Y	Y	Y
5	Accountability of value of superior technology giving to customers through the website etc.	Not yet	Not yet	Y	Y
6	Adjustment to increase orders to take use of their excellent technology	Not yet	Not yet	Y	Y
7	Pricing including the value of their excellent technology for customers	Not yet	Not yet	Y	Y
8	Pioneering new customers at overseas exhibitions	Not yet	Not yet	Y	Y

According to participated observation and interview, enterprise C and D calculated prices from added value and negotiated with customers rather than accumulating costs. Enterprise C and D were implementing selection of orders to take advantage of core technologies. Although competition in the market was severe, enterprise C and D seemed to have accumulated experience of explanation their excellent technologies to customers.

On the other hand, enterprise A and B had habitually accepted prices proposed by large companies. Enterprise A and B were always waiting for any order by large companies and had never refused any order. Although enterprise A and B were able to maintain relations with certain large companies, they received few orders using their excellent technologies.

4.2.3 Higher education required by enterprises

These survey results were shared with four companies and discussed. As a result, the following view was obtained.

‐ Even without the assemble line for mass production which the large companies in the manufacturing industry are all working on, service development can be promoted while using strengths.

‐ It is difficult to create value simply by having excellent technologies .

‐ Explanation of value for customers is necessary for both price negotiation and market competition.

‐ Compared with mass production, multi-product small-volume production can provide various values, but the explanation of the value is diverse and difficult.

‐ Regarding improvement of technology, the method of training in-house training is mature, but training in-house for improvement of the explanation of value is not easy.

Ultimately, we conclude that improving the capability of the explanation about the value that the excellence of technologies brings to customers is the top priority.

Therefore, enterprise A, students and the faculty member cooperated and tried to visualize core technology of enterprise A based on living labs methodology at their workplace in enterprise A (S. Hirata, 2016).

5 A Case of Problem Based Learning in SMEs through Industry-Academia Collaboration

5.1 The extraction of visualization of core technology through participant observation of enterprise

An excerpt from the visualization of the core technology through living labs methodology at the workplace of enterprise A is shown below.

Time was spent with the craftsmen at their factory and office in order to gain a practical understanding of the efforts required and ingenious devices implemented in the individual processes of metal casting through participant observation (Y. Yamaguchi, S. Odajima, S. Hirata, 2016). We carefully observed the work of the craftsmen's usual work and recorded what we understood. For instance, the extent of contraction, expansion, and bending differs depending on the thickness and shape of the metal to be poured later. Therefore, the dimensions of a wood model to make the mold must be determined in advance in order to control for such a complicated variable. The design of a part to be larger or smaller depends on tacit knowledge gained from the experience of each craftsman.

A variety of polishing tools with varying widths have been fabricated by individuals at their own personal expense in order to create complex surfaces. Standardizing or formulating manuals for such gut feelings and experience is difficult, and these skills must be acquired through on-the-job training by repeatedly forging alongside an expert. Since there is a limit to how much the gut feelings and experience of an expert can convey, creating memos for items of consideration and operations and making them available for search by ICT is believed to be effective.

5.2 Solutions for problem solving by so-design

The result of the participant observations in 4.1 were recorded in notes, pictures and videos as Table 4. Based on these data, we conducted co-design to develop a system that explains the superior technology among enterprise A, students and the faculty member.

As a result of the co-design, by registering the above data in the database and reading the ID of each work tool with a sensor, the explanation of the technology related to each tool could be displayed from the personal computers by text, photo and video. Proposal was made to use this system for training human resources and negotiating with customers in order to account the excellent technologies.

Table 4   Extraction of Superior Technology and Classification of its Accounting Method

Superior Technology	Classification of its Accounting Method				
	Possibility of Application of Automation to Replace Humans with Machines	Documents	Photo	Video	OJT
(1) Capable of determining the dimensions of patterns and anticipating shrinkage allowance and warpage of finished model.	-Computer-aided design(CAD)/ Computer-aided manufacturing(CAM) -Three-dimensional (3D) data - Sensor -Vibration controller] -Power assist - Traceability through business model management	NG	NG	NG	Best
(2) Capable of increasing the purity of metal to be casted by adding a groove and inflection to the mold for precipitation and flotation of impurities.		Best	Good	NG	Good
(3) Capable of adding a projection that enables product to be taken out without breaking the mold upon dismantling.		Good	Best	NG	Good
:		:	:	:	:
(13) Capable of controlling quality standards for each client.		Best	NG	NG	Good

Legends for judgment standard: Best: optimal as an option, Good: can be an option, NG: inappropriate for an option

6 Conclusion

Based on this empirical study, a model of problem based learning for higher education through industry-academia collaboration was indicated as shown in figure 2. In addition, the process of practicing this model through living labs, in cooperation with enterprises and higher education institutions was shown.

Application of this model to higher education institutions and enterprises would support sustainable development of human resources who lead service innovation. This model can be applied not only to SMEs but also to large companies.

Stakeholders' Trust towards the Role of Auditors: A Synopsis of Audit Expectation Gap

Akther Taslima[1,2], Xu Fengju[1]
1 School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
2 Department of Accounting & Information Systems, Jagannath University, Dhaka-1100, Bangladesh
(E-mail: limaais.du@yahoo.com, xufju@163.com)

Abstract: The role of external auditor has always been a dubious issue since the emergence of the profession whereas public expectation is beyond imagination regarding the role of auditors. With the inevitable facts that the business entity assumption separates the business and owners; agency conflict exists between the parties and the role of external auditors rises as a means of monitoring the task of management on behalf of owners. As auditing, is a powerful tool to retain stakeholders' confidence on the result of business operations, numerous expectations ambiances the role, played by the external auditors. This paper is an attempt towards empathizing the Audit Expectation Gap (AEG) and offers a rational to look upon the issue, based on the extensive literature review .Further, the study portrays the necessity of involving stakeholder's expectation towards the auditing profession by developing a conceptual model of AEG and the variables affecting the AEG. Auditors should not skip the issue merely enunciating that it is a self-regulatory profession; otherwise, stakeholders will lose faith on auditors, and its consequence is far reaching.
Key words: External auditors; Stakeholders trust; Audit expectation gap (AEG); Conceptual model of AEG

1 Introduction

Massive Global corporate scandals, financial crisis and collapses of large entities such as Barings, HIH, Parmalat, Enron and Lehman Brothers have diluted the stakeholders confidence in the worlds capital market .The auditing profession has also come under the spotlight, following   the melodramatic flop of eminent companies without any prior warning signals in audit reports and highlighted the miracle phenomena, the audit expectation gap (AEG).The collapse of the big companies have always been costly to the auditing profession in many ways, such as compromising the professional reputation, incurring high cost of litigation in order to settle down these cases in courts, and the possibility of taking increased responsibilities and the most importantly loosing stakeholders faith (Wolf, Tackett, & Claypool, 1999).

In the eve of 2018, the collapse of Carillion Construction Company in UK has made the situation worse and the Audit Expectation Gap has been noticed from a newfangled perspective and this downfall indicates, it is stint to reassess the role of auditors. Carillion is the latest in a string of cases where auditors have conveyed a clean message about the health of companies soon afore austere financial snags arose that in many cases evidenced ruinous. Most users of accounts undoubtedly surmise that if an auditor signs off a company's accounts without qualification there should exist next to zero risk of being bankrupt within a year where as Carillion collapsed just after ten months of its being audited .If through the legislation, it can be decided, what users want from the audit process, only then the profession will know where it stands, as a consequence an acceptable outcomes-based   auditing model can be achieved (Kingsley Stephen, 2018).Either auditors need to start excavating extensive into latent glitches or people should start expecting less of them or customers of audited accounts must be articulated the fact that they are just expecting too much (Wighton David, 2018).

The Big Four firm's failure to hook a years-long fraud containing made-up mortgages at Colonial Bank happened due to professional negligence; a recent verdict referred on the case of Colonial bank collapsed in USA.The testimonial was found that, the auditor of the aforesaid bank did not design the audit procedures to detect fraud and very junior level employee, as like as college-aged intern were assigned and sent to evaluate such a big issues and the consequence was catastrophic(Masters Brooke, 2018).As investors believe on the financial figures produced by the company's executives and they can demand higher standards regarding auditors' independence and judgment and it   is high time to lessen the dependency of auditors on the lucrative non audit work, therefore urge for the breakup of big four firm into consultancy and audit only services (Ford Jonathan, 2018).

This paper articulates an overview of the audit expectation gap (AEG), the contributing factors

behind the AEG, the consequences of not handling the AEG properly and also infer some ways of mitigating AEG and the pluses of doing so. Moreover, the study proposes a conceptual model relating the causes, consequences, and the ways of mitigating AEG; whereas the ultimate upshot is enhancing stakeholder's confidence on the auditors.

2 An Overview of the Audit Expectation Gap

Liggio (Liggio, 1974) demarcated, Audit Expectation Gap (AEG) as the difference between the levels of expected performance as anticipated by both the user of a financial statement and the independent accountant. The Cohen commissions (1978) defined Audit Expectation Gap as the gap what the public expects or desires and what auditors can and should reasonably expect to accomplish. According to the American Institution of Certified Public Accountants (AICPA, 1992), AEG is the gap concerning what the public and financial statement consumers believe auditors are responsible for and what auditors themselves believe their responsibilities are. Moreover, Porter (Porter, 1991) came with a comprehensive definition of AEG and introduced the term reasonableness gap and performance gap.

a. Reasonableness gap: The difference between what the public believes auditors to achieve and what they can practically be likely to achieve.

b. The deficient standards gap: The difference between what can sensibly be expected from auditors and auditors' existing duties as defined by the law and professional standards.

c. The deficient performance gap: The gap between the expected standard of performance of auditors' existing duties and auditors' perceived performance, as perceived by the public.

AEG is the deviation of notion between auditors and the public about the duties and responsibilities assumed by auditors and the messages conveyed by audit reports (Monroe & Woodliff, 1994) as well as the AEG subsists when auditors and the public embrace dissimilar beliefs regarding the auditor's obligations and responsibilities and the messages channeled by audit report (Chye Koh & Woo, 1998; Frank, Jordan Lowe, & Smith, 2001; Wolf et al., 1999)

Accounting and auditing literature and the institutional setup seems to assent the presence of AEG and has entitled to litigate in order to moderate the gap or to edge its influence on auditors (Cohen1987, Porter 199, AICPA1978, Mock et al., 2012, Gold, Gronewold, & Pott, 2012). Liggio (1974),noted a wide expectations gap between what users of company accounts consider auditors' job is and what the auditors and their regulators think. The significant causes of AEG is the self-regulatory framework of the profession that enable the profession to set audit objective though it may give less importance to public expectation. The need for government interference and renovating the legal proclamation regarding auditor's responsibilities, selection and compensation of auditors may bridge the gap (Onulaka & Samy, 2017).The audit expectation gap curtails from the permutation of the insufficient auditors performance, divergence in the audit standards and regulations, irrational expectations and misconceptions of audit functions. Considering numerous corporate scandals the role of external auditors come into question and users are more concerned regarding the auditors independence and objectivity towards the entity subject to auditing, auditor's responsibility to evaluate the entity's viability; and the influence of auditing fees and remuneration on audit quality (Mansur & Tangl, 2018).

Replicating the study ofSchelluch (Schelluch, 1996), significant reasonableness gap was discovered in Lebanon (Munir Sidani, 2007) as well as AEG was identified in the expanseauditor errands for fraud prevention, conservation of accounting records, and auditor decision in the assortment of audit techniques and also the dependability of audit and audited financial statements, and the expediency of audit in Egypt (Dixon, Woodhead, & Sohliman, 2006); in Malaysia (Nazri Fadzly & Ahmad, 2004); in Singapore (Best, Buckby, & Tan, 2001) identified AEG mostly in the area of auditors responsibility and trustworthiness of the audited financial statements.Meanwhile, Chowdhury, Innes, & Kouhy (Chowdhury, Innes, & Kouhy, 2005) ascertained AEG mostly in the area of accountability and audit independence in the Public sector auditors of Bangladesh as well Siddiqui, Nasreen, & Choudhury-Lema (Bangladesh Siddiqui, Nasreen, Choudhury-Lema, 2009) portrayed that there is significant audit expectation gap in Bangladesh in the area of auditors responsibility and somewhere auditors responsibility in fraud detection while education plays an important role in reducing AEG in an emergence economy setup like Bangladesh.

An audit report on the general purpose financial statements articulates a positive and unbiased opinion providing a high but not absolute level of assurance whereas the report on review engagement provides a moderate level of assurance, which is a lower level of assurance (Gay, Schelluch, & Baines, 1998). Moreover significant AEG was found in respect of Auditors independence and in respect of the

short form of audit report (P Schelluch, 1996). Lin & Chen (2004) revealed AEG in the areas of role of auditors, objectives of audit, and auditors' role regarding the discovery of fraud in China.

　　The artifact of an audit is amplified trustworthiness committed to the audited financial statements whereas biasness, conflict of interest and lack of perceived independence make the audit report nothing just a company commercial, whereas huge monetary and reputation losses, misplacing credibility to the profession, augmented legal fees, exorbitant out-of-court settlements,　elevating　insurance premiums, and susceptible guideline are some of the costs associated with not responding to the AEG properly(Wolf et al.,1999)

　　The auditing professions anxiety about the appearance of expectation gap is justified; however, steps should be taken to lessen the gap. More literate, conversant and educated users stretch less burden to auditors, conversely professional bodies should take active steps regarding educating users about the duties and responsibilities of the auditors and the meaning of auditors report. Moreover, the wording of the audit report have significant effect on the gap as different audit report will bear different wording and the responsibilities of the auditors to be specified clearly (Monroe & Woodliff, 1993, 1994). Ameliorating auditors professional training, ensuring quality control and enhancement of audit methods were suggested to bridge the auditors performance gap, Expansion of auditors independence and responsibility were put to bridge the standard gap and finally educating people and society about the role of auditors and introducing the extended (long form) audit reports to bridge the reasonableness gap in Hungary (Füredi-Fülöp, 2015).

　　Public has extravagant expectations of auditors' responsibilities beneath the present professional standards as they face difficulty in evaluating the auditor's performance and auditors are not effusively alert of their responsibilities. Limited information content of the audit opinion is one of the major causes of AEG. Changes in the content of the audit report is probable to narrow the gap,　however, compulsory auditors rotation and a prohibition on providing non-audit services, may lessen the gap only to a smaller extent (Ruhnke & Schmidt, 2014). Pourheydari & Abousaiedi (Pourheydari & Abousaiedi, 2011), found Audit expectation gap in the areas of auditor responsibility for fraud detection, internal control soundness, and the preparation of financial statements. Furthermore, they ground peanut upshot whether audit purpose could be accredited to the culture of reliance amid auditors and stakeholders in Iran. Progresses in auditor-user communication, audit reports, auditing framework, and auditor integrity could be the probable propositions in narrowing AEG in the existing state of affairs.

　　The standard audit report　provides users a ominously upper degree　of assurance in the company's management, investment soundness, and achievement of strategic objectives although there is differences in the perception among the auditors and different level of users in understanding of the massage carried out　by the SAR and inferring the technical word in SAR (Asare & Wright, 2012). Sweeney (Sweeney, 1997) notified that educating the public as to what the audit function currently entails and changing the nature of the audit function to meet the public expectation. The revenues earned from consultancy outweigh the revenues earned from audit by the accounting firm where as less proficient auditors performing the riskiest audits and in the end an upturn in audit failures and external appointment of auditors, required auditor rotation and a market based instrument that would hedge against inevitable audit failure(Wolf et al., 1999).

　　Stakeholders confidence is distorted regarding the financial reporting drill and related audit functions in this epochs(Rezaee, 2004).The auditing profession has undergone with　the hasty erosion of stakeholders' buoyancy for several eons particularly later the demise of numerous valuable　companies though the exterior auditors delivered fresh report about the strength of the companies just afore their downfall (Onulaka & Samy, 2017).Auditor should alter the approach from self- vindication, self-protection to meet the stakeholder's expectation. Considering the significant causes of AEG, consequences of AEG, ways to reduce the AEG and the impacts of reduced AEG has been portrayed as the basic theme of this paper.

3 Conceptual AEG Model

　　A theoretical model (Figure 1) has been developed that reflect the relationship among the audit expectation gap and the variables affects such gap. Lack of perceived independence is the prime causes of AEG, biasness and lack of objectivity make the audit report nothing just a company advertisement (Wolf et al.,1999).Other causes of AEG are self-regulatory framework of the profession (Onulaka & Samy, 2017), responsibility for fraud detection,viability of the audited financial statements (Ruhnke & Schmidt,2014; Pourheydari & Abousaiedi, 2011), reliability of the audited financial statements (Dixon, Woodhead, & Sohliman, 2006; Nazri Fadzly & Ahmad, 2004; Best, Buckby, & Tan, 2001), difficulties in understanding the meaning of audit report (Asare & Wright, 2012). The consequences of AEG is also

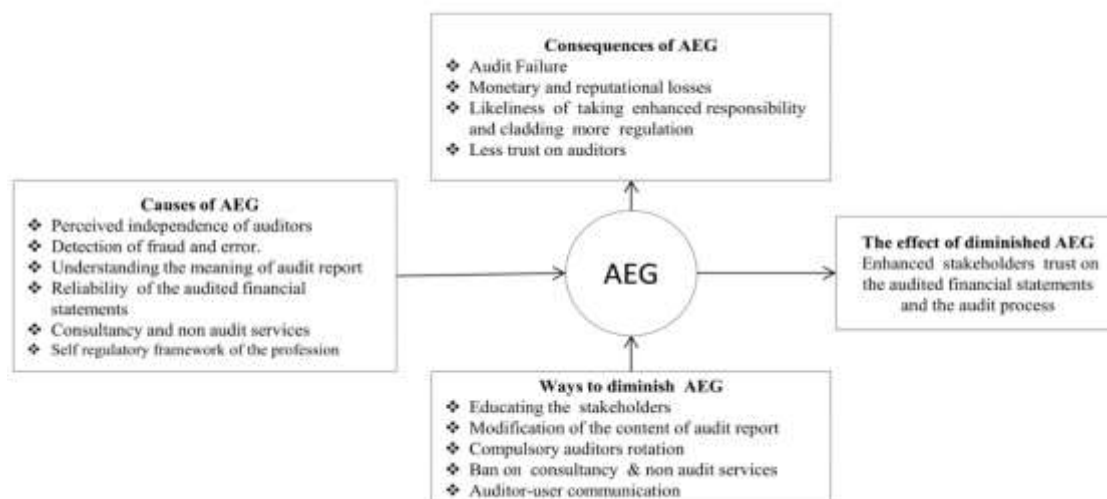
fatal such as huge financial and status losses, dropping integrity to the profession, amplified legal fees, overpriced out-of-court settlements, elevating insurance premiums, and inclined guideline and finally losing the stakeholders' faith on auditors, are some of the costs associated   with not responding to the AEG properly (Wolf et al.,1999). However, it is possible to keep the AEG in a control mode and earning stakeholders' confidence, and it is vital because if stakeholders loose trust on auditors, the necessity of the existence of auditors is questionable. Educating the society regarding the role and responsibility of the auditors beneath the particular standard set up is the most effective way of diminishing AEG (Monroe & Woodliff, 1993, 1994; Sweeney 1997; Füredi-Fülöp, 2015) and the consequence of diminished AEG is the enhanced stakeholder's confidence in the auditing process.


Figure 1   Conceptual AEG model

4 Conclusion

Notwithstanding the self regulatory eminence of the profession,contradictory institutional structure,inequality in the circulation of wealth,influence,politics and power, as well as   in a fluctuating social context , AEG is an incessant phenomena.However , to retain stakeholders   trust and confidence in the profession and placing rationalities to the birth of auditors,the auditors should be responsive towards AEG.The number of proposed mechanism such as, educating the public towards the role and reponsibilities of auditors,ensuring perceived independence,demand for the inhanced regulation such as modification for the content of auditotors report, limiting the mix of service provided by auditors,mandatory auditors rotation, regulating the appointement of auditors and so on may act as arbitrator to lessen the GAP; where cost of audit may increase considerably, neverthless may and will not exceed the cost procured to the profession through the AEG. The study concludes that   instead of fetching huge professional   disgrace and fronting lawsuit, it is punter to uphold perceived independence, ensure the reliability and the usefulness of the audited finacial statemnets in order to lesen the AEG, hence retaining stakeholders trust and confidence towards the auditing profession. Moreover this study contributes in the AEG literature by unfolding AEG in a more vibrant ways, and provides a future route for research involving the stakeholders confidence in the auditing process.

Study on the Evaluation of the Transfer of Management Rights of East Lake Greenway Station

Zhang Haiyan[1], Zhao Zhengbang[2]

1 School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
2 No.5 Engineering Co., LTD., Gezhouba Group, P.R.China
(E-mail: 1989057406@qq.com)

Abstract: The transfer of management rights in tourist attractions is one of the most important ways of the development of tourist attractions in China in recent years. It is also an important driving force to promote the market management of tourist attractions. In view of the transfer projects of Wuhan East Lake greenway station, this paper discusses the feasible methods of evaluating the value of the management rights of the post station, calculates the post station income with the grey forecast model, and forecasts the excess income based on income method of the asset evaluation. It is believed that the value of the management rights transfer obtained by this method is more suitable to the market value. Instead of the overall value of scenic resources that have been studied by previous scholars, the value is more easily accepted by the assignee to achieve the goal of win-win cooperation, thus ensuring the healthy and sustainable development of the East Lake scenic area.
Key words: East Lake greenway; Transfer of management rights; Value assessment; Tourist attraction

1 Introduction

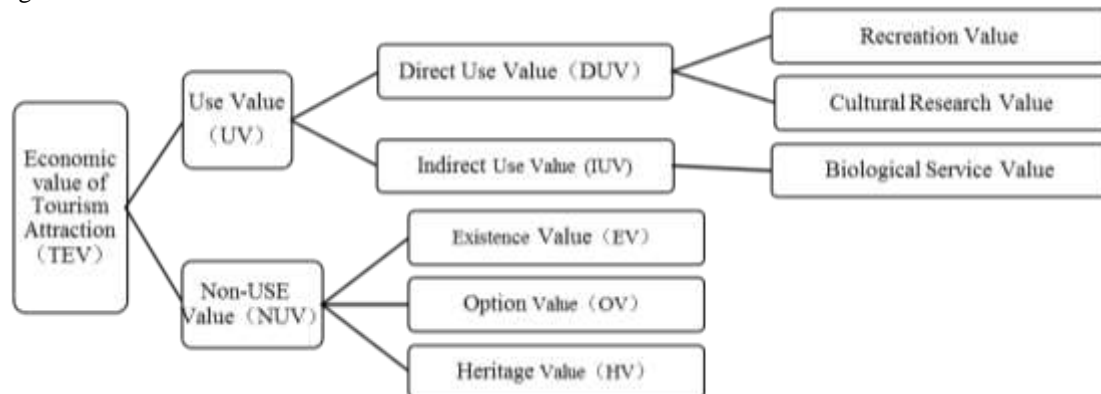
The value of the management rights of the tourist attractions depends on the economic value of the scenic spots, and the economic value of the tourist attractions has become the key element of the value evaluation of the transfer of management rights. Foreign scholars began to study the value theory of resource assets in 1960s (Krutilla, 1967; Pearce D W, 1994).Chinese scholar, Lu Dinghuan (1985), started to study the economic value of forest park and he believed it was mainly reflected as recreation value. From then on, Chinese scholars have made a comprehensive analysis of the economic value of tourist attractions. They think the economic value of tourism scenic spot includes entertainment value, cultural research value, biological service value, existence value, option value and heritage value. All of these values can be divided into two categories: use value and non-use value. Thus, the economic value classification system of tourism scenic spot (Li Xiumei, 2011) has been established as the following figure.


Figure 1   Economic Value Classification System of Tourism Scenic Spot

East Lake greenway connects East Lake's major scenic spots. Most of these scenic spots are open to the public without charging fee. As a world-class greenway, it is not only the first choice for marathon riding, but also a leisure place for the citizens to adjust the rhythm of life. As a tourism attraction, its value includes the use value of economic function and the non-use value of social function. Cheng Shaowen and Xu Qiaoli set up an evaluation index system (2004) for the lake tourist destination, and applied it to Wuhan East Lake scenic spot to evaluate its transfer value. But nowadays the management mode of lake tourism spot has changed, for example, in East Lake scenic spot ticket proceeds are no longer the main source of income. The common calculation methods used in the past are

needed to analyze its applicability, so the value of the management rights transfer of East Lake greenway station has the significance of research.

2 An Overview of the Management Right Transfer of East Lake Greenway Station

2.1 The meaning of the management right transfer of east lake greenway station

The management right transfer of East Lake greenway station is that the station owner transfers the management right of station to quality enterprises by leasing, contracting and buying, allowing the enterprises to manage the station and carry out market operations under the premise of reasonable protection of the resources of East Lake scenic spot.

2.2 The Forms of the management right transfer of east lake greenway station

At present, the main forms of the transfer of the management rights of tourist attractions in China are three types: share cooperation, holistic lease and franchise. Wuhan East Lake scenic spot is a national scenic spot, after more than 50 years of development, its ability of tourist reception and service facilities have taken shape. Although East Lake greenway was officially opened at the end of 2016, it connects all parts of the scenic area organically and turns East Lake scenic area into an inseparable whole. The greenway stations have been completed by the East Lake Green Road Management Co., Ltd. of Wuhan, it is suitable for the use of the overall lease for the East Lake greenway stations.

On August 2, 2016, Wuhan East Lake Green Road Management Co., Ltd. made a bid for the overall management rights of East Lake greenway station ($4100m^2$) and achieved success on August 8, 2016. The relevant contents are shown in Table 1.

Table 1　Projects of Management Right Transfer

Project Name	The Management Rights of Wuhan East Lake Greenway Station ($4100m^2$)
Service Items	Bicycle rent, Sightseeing battery car, Cruise ship, Shop, Public toilet, Direct drinking water
Date of Transaction	2016,8,8
Validity	6 years
Volume of Transaction	1582,0000 Yuan

3 Methods of Evaluating the Management Rights of East Lake Greenway Station

There are five principal methods to assess the value of tourism attractions. They are TCM (travel cost method), CVM (contingent valuation method), ICM (income capitalization method), EM (entertainment method), and HPM (hedonic price method). The most commonly used methods are travel cost method (TCM) (Zha Aipin, 2015) and contingent valuation method (CVM) (You Weibin, 2014).

3.1 Travel cost method

TCM is a mature method for evaluating the value of non-market goods, which is mainly applicable to leisure and recreation, nature reserves, national parks and other tourist destinations, such as reservoirs, dams and wetlands. Although these natural scenic spots may not require tourists to pay fees, tourists need to pay for the traffic. This cost of the tourists can be regarded as the actual payment for these recreational or natural scenic spots.

3.2 Contingent valuation method

CVM is mainly used for the evaluation of the non-use value of East Lake greenway. CVM, based on the utility maximization theory, inquires each tourist's willingness to pay for the East Lake greenway, then counts all these samples, finally adopts the median value as the willingness to pay for the scenic spot. Therefore, the non-use value of the scenic spot can be obtained according to annual tourist number.

3.3 Income capitalization method

There are 24 stations in East Lake greenway. They provide not only profit services of various entertainments but also non-profit services such as toilet and drinking water for tourists. So the transfer of management right of East Lake greenway stations should pay more attention to the recreation value of tourism resources, which can combine both "profit" and "non-profit" characters of East Lake greenway stations, thus calculating the excess earnings reasonably. Both travel cost method and contingent valuation method can not accurately explain the contribution of each tourist resource in scenic spots to the whole recreation value of scenic spots (RT Carson, 1996), so this paper also evaluates the value of management rights by using the income capitalization method. ICM, once a common method of evaluating estate market value, has been applied to value appraisal system of

tourism resources. Furthermore, along with the appearance of management right transfer of scenic spot in recent years, it becomes an important means to evaluate the economic value of scenic spots.

As the relevant information of the project is not open to public, it is impossible to know whether the assessment of the project has been performed by a professional agency, and how the income of 1582, 0000 Yuan has been calculated. If the income capitalization method is used to assess the profitability of the operational assets of tourist attractions, the profitability should be determined through market supply and demand. But the operation time of greenway station is short and the data collected are limited, so the prediction hides great uncertainty. Therefore, this paper tries to use GM (1, 1) model (Liang Yuhong, 2012) in grey system theory to predict future income.

4 Basic Ideas of Income Capitalization Method to Assess the Value of Management Rights of Greenway Station

The theoretical basis of income capitalization method is utility theory of value, which determines the value of assets through the future income. The basic ideas of evaluating the management right value of greenway station by means of ICM are as follows. Firstly, determine the discount rate; secondly, determine the term of income; thirdly, determine the amount of income; fourthly, calculate the assessed value of management rights of greenway station within the income term.

The discount rate is determined by the commonly used capital asset pricing model. The term of income is determined by the transfer period of the project, that is, 5 years. The amount of income is expressed by the annual after-tax net profits of greenway station. The annual cash inflow minus the operating cost last year is the net cash flow of greenway station management rights. This paper tries to use the GM (1, 1) model of grey system theory to model, so as to predict the future revenue of greenway station.

4.1 The determination of income amount

The original data of East Lake greenway station revenue are taken as data, and the corresponding 1 cumulative sequence is

$$\left\{ x^{(0)}(i) \mid i = 1, 2, 3, 4, 5 \right\} \tag{1}$$

$$\left\{ x^{(1)}(i) \mid i = 1, 2, 3, 4, 5 \right\} \tag{2}$$

$$x^{(1)}(i) = \sum_{j=1}^{i} x^{(0)}(j)$$

The GM (1, 1) model is used to predict the income, and the GM (1, 1) model is

$$\frac{dx^{(1)}}{dt} + ax^{(1)} = u \tag{3}$$

In the formula, a and u are grey parameters of the grey equation. The identification formula of the parameter list is

$$\overline{a} = [B^T B]^{-1} B^T y \tag{4}$$

$$B = \begin{bmatrix} -\frac{1}{2} x^{(1)}(2) + x^{(1)}(1) & 1 \\ -\frac{1}{2} x^{(1)}(3) + x^{(1)}(2) & 1 \\ \dots & \dots \\ -\frac{1}{2} x^{(1)}(N) + x^{(1)}(N-1) & 1 \end{bmatrix} \tag{5}$$

$$y = \left[x^{(0)}(1), x^{(0)}(2), x^{(0)}(3), x^{(0)}(4), x^{(0)}(5), \right]^T \tag{6}$$

Then the GM (1, 1) model in the form of discrete solution is obtained

$$\overline{x}(k) = (x^{(1)}(0) - \frac{u}{a})e^{-a(k-1)} + \frac{u}{a} \tag{7}$$

The cumulative fitting values of income sequence can be reduced to original prediction values through the formula (8).

$$\overline{x}^{(0)}(k) = \overline{x}^{(1)}(k) - \overline{x}^{(1)}(k-1) \tag{8}$$

With the increase of K value by 1, the forecast value of East Lake greenway station revenue can be obtained. After deducting the relevant cost and the average profit of the industry, we get the excess return from the project.

4.2 Assessed value of the management rights of East Lake greenway station

Based on the above analysis of the relevant parameters of the value of management rights of greenway station by using the income method, the corresponding calculation model is obtained. It can be expressed as:

$$P = \sum_{t=o}^{T} \frac{R_t}{(1+r)^t} \tag{9}$$

Among them, P is the assessed value of management rights, R is the discount rate, T is the project operation period, and R_t is the excess return of T years.

5 Findings and Suggestions

Through the above methods, it can be found that some factors have influenced the value of management right transfer. Pricing and competitors are the most important factors among them.

Firstly, let's discuss product pricing in scenic spots. Most shops of station are national chains, so the prices of products are fair and reasonable. However, there are problems in the fare of sightseeing cars and cruise ships. The prices of 40 Yuan for sightseeing cars and 80 Yuan per hour for cruise ships are expensive for most tourists. This is also the reason for the suspension of cruise ships. So at the beginning of pricing, we need to take into account consumers' feelings, measure their purchasing power and willingness, and adopt some adjustments of products' prices.

Secondly, competitor is also an important factor. When evaluating the value of the management rights of East Lake greenway station, it is necessary for us to consider whether there are competitors or not in the scenic area. In theory, there should be no competitors in scenic area, but in fact competitors do exist in these areas, such as roadside vendors and shared bicycles. The guarantee deposit of renting a car at the post station is 800 Yuan and the rental fee per hour is about 10-20 Yuan; however, the rents for all kinds of shared bicycles are only 1 Yuan per hour. So few tourists want to rent station bicycles and the business keeps going on by painstaking effort. So, administrators of East Lake greenway should ensure that competitors such as these are forbidden to enter into scenic spot.

6 Conclusion

The transfer of management rights of tourist attractions is the road of tourism development with Chinese characteristics. It is a unique topic of tourism research in China, and has both theoretical value and practical significance. Its success has a significant impact on the development of tourist attractions and tourism industry in China. The research on this topic should not only have international vision, grasp the general characteristics and trends of international tourism development, but also take root in the China's present situations of economy, society and tourism development, so as to not only reach international standards but also reflect the characteristics of China's tourism. To evaluate the value of the transfer of management rights of East Lake greenway station, this article analyses the above bidding projects, and hopes to arouse more scholars' attention to this respect. Hence, they will provide theoretical guidance for the practices of the transfer of management rights of tourist attractions in future and realize the sustainable, healthy, orderly and harmonious development of tourism industry in China.

Research on the Performance Evaluation of the Students from Economically Disadvantaged Families in Colleges and Universities

Guo Na, Shang Yijun

School of Resources and Environmental Engineering, Wuhan University of Technology,
Wuhan, P.R. China, 430070
(E-mail: guomeina@whut.edu.cn, shangyijun723@163.com)

Abstract: In recent years, a series of funding policies for students from poor families are issued to ensure that they have the equitable access to receive higher education opportunities. In this paper, the fuzzy comprehensive evaluation method is selected to evaluate the performance of the funding work and the analytic hierarchy process is used to determine the weights of the performance evaluation indexes. A college of science and engineering of a university in Wuhan is taken as an example to make an empirical analysis. Combined with the evaluation, the precision identification mechanism of poor students should be optimized and the multi-dimensional model of the funding should be perfected. The qualitative and quantitative methods can provide the scientific basis for the further financing work for poor students in colleges. And then, the precise funding and the educational function can be achieved.
These methods can be used to achieve the precision funding and educational function.
Key words: Performance evaluation; Poor students; Suggestion; Mode; the evaluation index system

1 Introduction

In recent years, the scale of college students' funding has been expanded, and the amount of funding is also increased. In 2017, a variety of policies and measures established by governments, universities and public have contributed to 42.76 million students in national institutions of higher learning, and the subsidy amounted to 105.07 billion, increased by 9.93 percent on the previous year (Ministry of Education, 2018). The funding work in the universities has been greatly improved with the development of economic society. However, the effectiveness of some colleges' funding work has been a decline in a certain extent with the rapid growth of funding scale and amount. The main reason led to this situation is that funding work can't meet accurately the need of students with financial difficulties. So it makes higher demands for the colleges' accurate funding.

Research on the performance evaluation of college student financial aid in foreign countries is mainly discussed from the perspective of higher education funding efficiency. Ronald. Feeso has systematically studied issues such as student financial assistance in the quality of student financial assistance programs, in which the effectiveness of the student financial assistance from the perspective of efficiency is mainly discussed. Robert b. Axchibald discussed the current development status and existing problems of the current financial aid system from the perspective of efficiency in the article of "reestablishing the financial aid system", and tried to explore the establishment of financial aid programs that are better suited to the real development of the education. The domestic research mainly focuses on the connotation and characteristics of performance evaluation of poor students' financial aid. In recent years, more and more attention has been paid to the research on the construction of the evaluation index system of college poverty students' financial aid with the gradual improvement of the idea of the targeted poverty alleviation. At present, we have established the student funding policy system covering from preschool education to postgraduate education. College students can apply for 12 kinds of funding policies like state grants, state educational loans, college bursaries and grants, work-study, allowance of special difficulty and tuition waiver, etc. (Ministry of Education, 2018). In the implementation of the funding policy, colleges basically follow the principle of dynamic management and universal coverage to carry out the financial assistance management for the poor students. However, the development of the funding work for poor students in colleges is uneven and the best result of the funding performance to poor students in colleges has been not achieved. It mainly focuses on the following aspects (Bai Hua, 2013):

(1) The economic aid is paid too much attention and the spiritual incentive is neglected in the funding for poor students.

(2) The funding allocation is unreasonable.

(3) The financing channel is single.

(4) The funding policy implementation is inadequate.

So how to evaluate the financial performance and the implementation effectiveness to find the

weakness of the financing work has become a subject to be solved urgently. In view of the importance and complexity of performance evaluation research for poor college students, this paper will use qualitative and quantitative methods, which can provide the scientific basis for the further financing work for poor students in colleges.

2 Theoretical Perspectives and Conceptual Framework

The performance evaluation of poor students in colleges referring to the index system of the performance evaluation of poor students is constructed by the use of scientific evaluation method and mathematical statistics analysis method and the effect is evaluated by integrating quantitative and qualitative analyses (Zhong Yibiao, 2010). It is aimed at assessing and evaluating the effectiveness and the benefit of the funding work, finding out the problems in the process of the funding, and putting forward the methods and paths to further improve the performance.

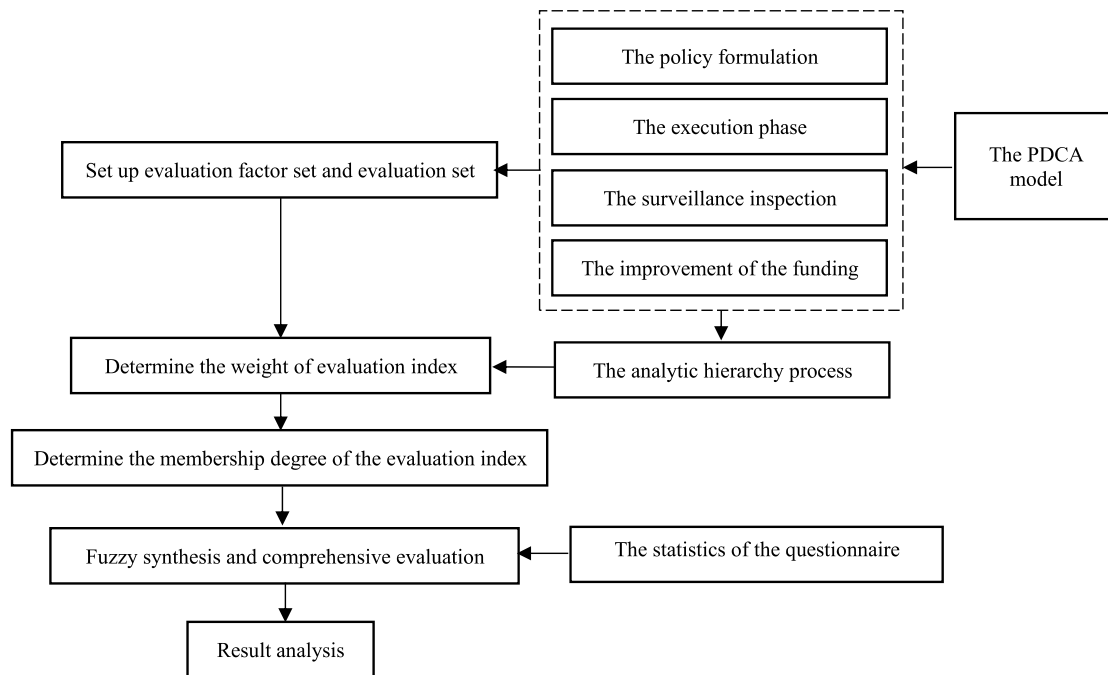
In this paper, the fuzzy comprehensive evaluation method is selected to evaluate the performance of the funding work for poor students in colleges, so as to solve the fuzziness, complexity and uncertainty of the performance evaluation. This method is to quantify the factors which are not easy to be quantified on the basic principle of fuzzy mathematics, and the membership of the object evaluated is evaluated comprehensively from the multi-level assessment indicator system (Minola Tommaso and Giorgino Marco, 2008). The construction of fuzzy comprehensive evaluation model mainly includes the following steps which are in Figure 1.


Figure 1   The Construction Steps of Fuzzy Comprehensive Evaluation Model

3 The Construction of the Model
3.1 The design of the evaluation index system
3.1.1 The design of the indexes based on the process management theory

The funding for the poor students is a systematic job. In this paper, the process management theory is used for the scientific management of the funding work, and the benefit of the funding is maximized (Bai Hua and Xu Ying, 2014). The whole process of the funding is designed and controlled according to the PDCA model, divided into four sub processes: the policy formulation, the execution phase, the surveillance inspection and the improvement of the funding (Liang Jun, He Liping, and Chen Yu, 2010). On the basis of the existing research results, the framework of the evaluation index system for the funding is determined, which is made of the identification, fund raising, funding resource disposition, funding surveillance and tracking, social effect of funding and funding policy (Xu Ying, 2016).
3.1.2 The determination of the performance evaluation indexes' weight

In this paper, the analytic hierarchy process (AHP) is used to determine the weight of the performance evaluation indexes. The qualitative analysis and the quantitative analysis are combined in this method, and the weight calculation is more scientific and objective compared with other qualitative methods such as Delphi method. It is divided into three steps: (1) Determine the relative evaluation criteria for indexes to construe the judgment matrix. (2) Calculate the maximum characteristic root and corresponding eigenvector, and complete the consistency check. (3) Calculate the absolute weight of the indexes (Zhao Jie, 2005).

Based on the results of the literature research and the 1-9 scale method, the evaluation indexes are intercompared and determined quantitatively in Table 1. The judgment matrix is construed to calculate the relative importance of each evaluation index.

Table 1   The Scale of The Judgment Matrix

item	a_1	a_2	a_3	a_4	a_5	a_6
the identification	1	3	5	7	3	1
the fund raising	1/3	1	3	5	1	1/3
the funding resource disposition	1/5	1/3	1	3	1/3	1/5
the funding surveillance and tracking	1/7	1/5	1/5	1	1/5	1/7
the social effect of funding	1/3	1	1/3	5	1	1/3
the funding policy	1	3	3	7	3	1

So the judgment matrix of the evaluation index can be obtained as follows:

$$\mathbf{A} = \begin{bmatrix} 1 & 3 & 5 & 7 & 3 & 1 \\ 1/3 & 1 & 3 & 5 & 1 & 1/3 \\ 1/5 & 1/3 & 1 & 3 & 1/3 & 1/5 \\ 1/7 & 1/5 & 1/5 & 1 & 1/5 & 1/7 \\ 1/3 & 1 & 1/3 & 5 & 1 & 1/3 \\ 1 & 3 & 5 & 7 & 3 & 1 \end{bmatrix} \tag{1}$$

The product of each row is:

$$M_i = \prod_{j=1}^{n} A_{ij} \tag{2}$$

and the n-root of M_i is:

$$\overline{W_i} = \sqrt[n]{M_i} \tag{3}$$

The normalization process of the vectors $(\overline{W_i})$ is carried out, and the eigenvectors are obtained:

$$W_i = \frac{\overline{W_i}}{\sum_{j=1}^{n} W_j} \tag{4}$$

The result calculated through the formula is W= (0.3270, 0.1401, 0.0645, 0.0318, 0.1096, 0.3270). So the weights of six indexes are following: the identification is 0.3270, the fund raising is 0.1401, the funding resource disposition is 0.0645, the funding surveillance and tracking is 0.0318, the social effect of funding is 0.1096 and the funding policy is 0.3270.

Finally the consistency check of the matrix is evaluated, in which the largest eigenvalue is calculated through the following formula (5):

$$\lambda_{max} = \frac{1}{n} \sum_{i=1}^{n} \frac{(AW)_I}{W_i} \tag{5}$$

The result is λ_{max} =6.2792.

Then the coincidence indicator (C.I) of the matrix is calculated through the formula (6):

$$C.I = \frac{\lambda_{max} - n}{n - 1} \tag{6}$$

The final obtained is C.I=0.0558.

In the situation of n=6, the average random coincidence indicator (RI) is 1.24 in the standard value check list. So the consistency ratio (CR) can be obtained by the formula (7):

$$CR = CI/RI \tag{7}$$

The result (CR) is 0.045 which is less than 0.1. So the result has passed the consistency test, which indicates that the judgment matrix of the evaluation indexes for the funding is consistent and reliable. W= [W_1, W_2, W_3, W_4, W_5, W_5] = [0.3270, 0.1401, 0.0645, 0.0318, 0.1096, 0.3270].

4 The Case Analysis

4.1 The statistic of the questionnaire

This survey is mainly based on teachers and poor students at a college of science and engineering of a university in Wuhan. The data is collected and sorted out by the network questionnaire, which mainly involves the teachers' and students' overall evaluation of funding based on the above 6 evaluation indexes. The results of the questionnaire are coded uniformly, and the data is counted and analyzed by SPSS. A total of 400 questionnaires were sent out and 377 were recovered, and the percent recovery is 94.25%. The basic situation of the survey samples is as follows in Figure 2.
Figure 2   The Basic Situation of The Survey Samples

The performance of the funding for poor students in the university is evaluated and the results are shown in the Table 2.

Table 2   The Statistical Results of The Questionnaire

opinion target	statistical results			
	excellent	good	Common	substandard
the identification	261	84	29	3
the fund raising	205	118	46	8
the funding resource disposition	218	112	37	10
the funding surveillance and tracking	212	135	26	4
the social effect of funding	189	137	44	7
the funding policy	193	126	57	1

The evaluation results are converted into the specific numerical valves as follows:

$X_1 = B \cdot V^T = (261/377, 84/377, 29/377, 3/377) \cdot (90, 75, 60, 45)^T = 83.99$

$X_2 = B \cdot V^T = (205/377, 118/377, 46/377, 8/377) \cdot (90, 75, 60, 45)^T = 80.69$

$X_3 = B \cdot V^T = (218/377, 112/377, 37/377, 10/377) \cdot (90, 75, 60, 45)^T = 81.41$

$X_4 = B \cdot V^T = (212/377, 135/377, 26/377, 4/377) \cdot (90, 75, 60, 45)^T = 82.08$

$X_5 = B \cdot V^T = (189/377, 137/377, 44/377, 7/377) \cdot (90, 75, 60, 45)^T = 80.21$

$X_6 = B \cdot V^T = (193/377, 126/377, 57/377, 1/377) \cdot (90, 75, 60, 45)^T = 80.33$

The whole evaluation index $X = X_i \ W^T = (83.99, 80.69, 81.41, 82.08, 80.21, 80.33) \cdot (0.3270, 0.1401, 0.0645, 0.0318, 0.1096, 0.3270)^T = 81.69$

4.2 The result analysis

The evaluation results are divided into four grades, which are excellent, good, common and poor. Their score intervals are respectively [90, 100], [75, 90], [60, 75] and [45, 60]. Through the analysis of the scores and the weights of the indexes, the evaluation result of the funding for poor students in the college of science and engineering is at a good level and the scores are all more than 80. Among these,

the score of the social effect is the lowest. The reason may be due to our excessive attention to funding itself (Yang Hongbo, 2014). The satisfaction of the identification is highest, which can be seen that the formulation and the publicity of the funding policy have been universally recognized. The results of the all indexes have not reached the excellent standard. And about 30-60 investigators in the process of the evaluation consider that the indexes are in a common or poor level. It is undoubtedly a higher requirement for our funding work. Besides, all the evaluation results of the funding raising, the social effect of fund, and the funding policy are slightly above the good level. So it is necessary to broaden the financing channels further for funding, to pay attention further to the social effect of funding, and to improve further the funding policy. It is clear that the establishing of the complete set of performance evaluation index system for funding is conducive to evaluate scientifically the effectiveness of the funding for poor students in colleges and universities, and to find the problems and the loopholes in the funding process. Furthermore, the effective measures should be taken to solve the identified problems and the function of the funding and education is better performed.

5 Suggestions

5.1 The precision identification mechanism of poor students should be optimized

The identification of poor students is the basic work of the funding and the prerequisite for ensuring the smooth development of the funding, which is to achieve the precise identification. Therefore, we should optimize further the identification mechanism of the funding for poor students and construct the precise identification mechanism. Firstly, it is an important link of the funding to structure the information network of students from economically disadvantaged families (Chen Faxiang, 2013). The civil administration department and the statistical department of the local government should make a detail statistic about the household incomes per capita, the consumption and the sudden consumption induced by the irresistible factors, and the students' family economic information database system in which the connection of primary school, secondary school and university is established. The students from economically disadvantaged families are scientifically identified by combining the local economic development and the poverty line division. It is not simply to list the economic situation of the students and other relevant information. The poverty degree of poor students is established and the standard for the identification of poor students is unified through the analysis of these basic information, and these provide an operable database information system for the identification work. Besides, we should keep the dynamic of the data, and the data of the family economic situation is updated at any time. The relevant stakeholders in the local government departments and universities should ensure the accuracy of the information, and prevent the occurrence of the falsification of the family economic situation, and the relevant persons who provide false data will be severely punished.

5.2 The multi-dimensional model of the funding is perfected

The effectiveness of the funding for poor students in colleges and universities depends on the allocation of the funding resources. In order to maximize the financial aid output, the most appropriate funding projects should be given to students according to the different types of difficulties and the degree of difficulty. The allocation concept of the funding resources should be optimized. The proportion of the free funding should be reduced and more compensation funding is provided to poor students. Through this way, not only the economic difficulties of poor students can be solved, but also the comprehensive quality of them is exercised. On the basis of the identification, the funding resources are overall planned to realize the optimal allocation among different majors and different difficulty groups. The differential funding is achieved to realize the pertinence by the use of big data (Zhu Ping, 2017). The material need and the spiritual need of the subsidized object are meted, in which the studies are smoothly finished and the students are encouraged to become self-confidence and self-reliance. All these ensure the benign operation of the funding system and the efficiency of education (Zhang Yuanhang, 2016).

6 Conclusion

It is an important measure to realize the fairness of education and resolve the social contradictions. The performance evaluation is helpful to improve the efficiency and the overall development level of the funding. Through the continuous promotion of the funding system and the improvement of the funding level, the funding for poor students in colleges and universities plays a more important role in the process of undergraduates' comprehensive healthy growth, and the precise funding and the educational function can be finally achieved.

Solving Electricity Deficit in Kinshasa with Solar Kits

Jody Ngongo N.
School of Management, University of Kinshasa, Congo, D.R.
(E-mail: jodyngongo@yahoo.com)

Abstract: This paper highlights the importance of adopting use of solar kits to overcome the shortage of electricity supply in the city of Kinshasa instead of polluting generators. Given a need for electricity delivery estimated at 5 kwh for a poor household of three occupants, a 1KWsolar inverter coupled with 1000W solar modules and appropriate accessories sold for US$ 990 would perfectly replace SNEL network, the unique electric utility company that uses rolling blackout to handle its low power supply capability within the town, with all the environmental benefits in lieu of a 4 kw power generator sold at US$ 900 with all   consequences related to the use of fossil fuels in terms of CO_2 emissions harmful to health and the environment. Similarly for a middle class household of 5 occupants, a solar kit of 3 kW to 2700 dollars or 5 kW to 4600 dollars, is far preferable to an8kw generator ofUS$ 4155which pollutes and entails expenses related to the fuel consumption.
Key words: Power generator; Load Sshedding; Rolling blackout; Solar kit

1 Introduction

A nation's energy resources contribute fully to its economic growth through the achievements they make possible. Energy is important for all sectors of the economy; the mastery of energy is the motor of human activity. Of all forms of energy, electricity remains a vital resource for economic and human development (Pierre Jacquet et Al, 2010). Thus developed nations had long understood the vital importance of energy in the development model. (Séraphin M. Kasemuan, 2006). All forms of energy can be transformed into electrical energy for the development of industrial, commercial and agricultural activities as well as essential social services such as education and health However,despite its energy potential (Uranium, Coal, Oil, Congo River, etc.), the DRCongo has a huge energy deficit. Thoughts substantial hydroelectric resources estimated at around 100,000 MW, the country has not be able to take full profit of this potential to provide most of the energy needed to operate businesses, supply transportation, and provide comfortable living ... Its energy deficit is reflected today in a low rate of service in electricity estimated at only 9% for a population of nearly 80 million inhabitants. Many households in rural areas are still dependent on solid fuels for cooking, heating and have no access to electricity. And even those who have access to electricity, they constantly face the problem ofrotational load shedding, which means a partial distribution in electricity. Households are often deprived temporarily of power for 24, 48 or 72 hours. Due to this situation, Congolese invent new forms of social organization through acquisition of generators to, at least, iron, watch TV in the evening and especially turn on lights when it is dark. Cooking is provided by a charcoal industry commonly called "makala" preferred over oil and gas for its relatively low cost. The poorest people who cannot afford charcoal, are content with less common sources of energy such as sawdust. This survival behavior, a portrait of widespread poverty, is far from relieving the population because it has very negative environmental consequences. Thus, through this paper, we analyze the possibility of initiating other energy alternatives for this country and especially for the capital city of Kinshasa, such as solar energy with all its advantages in terms of cost, installation and protection of the environment.

2 Issue of Electricity in Africa

Compared to other regions of the world, Africa is lagging behind in terms of electricity generation capacity, per capita electricity consumption and household access to electricity, according to the World Bank's Africa Renewable Energy and Accees Program. (AFREA). Fifteen of the top last 20 countries in the world for electricity consumption are in Africa (IEA, World Bank 2016). For those countries that seem to be connected whatsoever, disparity between urban and rural areas is striking. South Asia, the second largest region in the world with the lowest rates of access to electricity, however, has more than double the number of inhabitants with access to electricity compared to Africa (79%) and five times more among rural residents (70%). (Masami Kojima and Chris Trimble, 2016).

Several authors, agencies and international institutions have sought to address this issue of access to electricity in Africa due to its impact on economic development: lighting, powering engines, powering computers and generating heat, enabling the supply of services such as communications,

health care and education as well as many amenities available in modern economies. (James Morrissey, Oxfam 2017). It should be remembered that electricity consumption is considered even as a key factor in the human development index, indicating better than GDP, the quality of development of a country. (Paul Mathis, 2014).

It is also interesting to note that for many authors, the question is not addressed in the general sense of energy but rather in the exploitation of electricity as the main application with more advantages than others. (Switzerland Energy, 2014).

This raises the problem of lack of access to electricity as a hindrance to Africa's development. IndeedAgbeti Komi notes the low rate of 23% access to electricity in Togo as an obstacle to development. (INSEED TOGO). GIZ, a service provider in the field of international cooperation for sustainable development and international education work through the project on promotion of electrification for renewable energies reveals that only 15% of Malagasy have access to electricity. Recent reports by the international energy agency estimate access to electricity at 7% for Liberia, 14% for the Central African Republic, 25% for Rwanda, 9% for the Democratic Republic of Congo and so on…bringing together a figure of 1.6 billion people still living without access to any electric source of what to compromise the industrialization. (AQCIE, 2013).

This unfortunate finding has led the international community to recognize access to electricity as essential to achieving the Millennium Development Goals. (OECD, 2006). Many studies have been undertaken in order to make a diagnosis and propose remedies. This has led to a number of causes ranging from the exorbitant cost of investments to mowed governments (Masani Kojima and Chris Trimble 2016); the problem of profitability of investments faced with the multiple connection to a meter of low-income households. (Christine HEURAUX, Alain GUINEBAULT, Benjamin AUGÉ, Lassane OUEDRAOGO, Seydou KEITA, Fran çois GEMENNE, 2011).

Various solutions have been proposed, such as off-grid electrification, which is less costly than connecting the grid with micro power plants; exploiting new technologies with hybrid solar-generator systems, (ARE, Sd, Bhattacharyya, 2015). Pierre Radanne, a specialist in energy issues, highlights the use of renewable energies (ADEME, 2002). Looking at the solar potential in Africa, in the light of technological advances in photovoltaic energy also motivate solutions to private initiatives (UNDP 2013). This is the trend that our research is looking at because expanding people's access to an unreliable network without addressing the capacity issue would likely increase the pressure on the system and make the network less reliable for those who are already connected. (Bhattacharyya 2012, Murphy 2014).

3 Data and Methodology

This study is based primarily on the analysis of existing documents and previous studies. We capitalized existing data and information from specialized agencies, periodicals, newspapers and specialized books on energy Secondly, efforts were made to assess households' electricity needs based on household electrical and electronic assets as well as the illuminated surface. Thus, methodological approaches led to the finding of indicators approaching the estimated values of the national report on "Sustainable energy for all by 2030" initiated by UNDP. Finally, when the data proved to be unreliable or non-existent, internet was of great benefit to us. An analytical and comparative method is then used to evaluate electricity supply and demand in the city of Kinshasa and thus propose more practical solutions in terms of solar energy.

4 Estimation of Households' Electricity Demand in the City of Kinshasa
4.1 Demographic evolution of the city

The city of Kinshasa shows a strong demographic evolution accentuated by an influx of war refugees and an ever increasing urbanization. The demand for electricity would have quadrupled in ten years following this booming population shown in the graph below.
Figure 1   Demographic Evolution of Kinshasa Population
Source: Data from World Development indicators 2017

This population growth reflects ever-increasing energy needs. The chart starting from 1960, the year of independence, reveals the challenges facing the country in terms of energy needs to cover.

4.2 Household demand for electricity

To understand the household need for electricity, a practical method much more realistic prevailed over the ones used in many literatures that only take statistics on the electricity production divided by the population.Our main goal being to estimate the real need in terms of electrical consumption that is a function of the occupied surface, the number of rooms to be lit, appliances available, living habits of the occupants, we have targeted three types of households for the city of Kinshasa: poor households, middle class households and rich households. In this paper, the estimate is made only for poor and middle class household

(1) Assumptions

The identification of the type of household is based on the wealth in possession at home, the area occupied by inhabitants as well as the number of adult occupants. Rather than referring to income, which is a non-existent variable in the Congo, material possession seemed more convenient to determine the electricity needs of a household, which, moreover, depends on the size of the house, the number of occupants, the number of rooms to be enlighten, the cooking system (charcoal or electric), the domestic hot water production system (electric stove, electric water heater, or gas stove ...) and finally the number of appliances and their energy label. It is also necessary to add the lifestyle of the occupants of the dwelling and their consumption habits. Indeed, a person staying at home most of the time will consume more energy than a person who is regularly absent.

(2) Poor household

We consider as a poor household, a family of three adults occupying a three-room residence with a TV set, an iron, a fan, a radio, and three phones. From these assets, below an estimate of the electricity consumption.

Table 1   Estimate on Poor Household Energy Consumption Need

Electrical Appliance	Power	Operating hours per day	Energy consumption/day
1CRT TV	120 w	15 h	1800 w
1 Iron	750 w	1h	750 w
1 fan	45 w	6h	270 w
1 radio	6 w	18h	108 w
2 bulbs	75 w	8h	1200 w
1 bulb	100 w	12h	1200 w
Total			**5328 w**

Source: Survey from the field.

(3) Middle class household

A middle class household for our paper is a five adult's family occupying a residence of more or less six rooms and having two televisions, an iron, a refrigerator, a radio, an air conditioner, a fan, a

laptop and ten cellphones.

Table 2   Estimate on Middle Class Household Energy Consumption Need

Electrical Appliance	Power	Operating hours per day	Energy consumption/day
2 LCD TV	100 w	14h	2800 w
1CRT TV	120 w	3h	360 w
1 refrigerator	500 w	24h	12000w
10 cellphones	5w	2h	100w
1 iron	750w	1h	750w
1laptop	8w	2h	160w
1radio	6w	6h	36w
1cooker	1800w	3h	5400w
1 air conditioner	3500w	4h	14000w
1 fan	45w	4h	180w
1 chandelier	360w	4h	1440w
Interior light	360w	6h	2160 w
Exterior light	400w	12h	4800w
Total			**44186 w**

Source: Survey from the field.

From these assumptions, an estimate of about 2kwh for a poor household and 44kwh for a middle class household is evaluated in terms of electricity consumption. An alternative approach of electricity demand per capita according to each social rank, will end up with 1.776 kWh / inhabitant for a poor household and 8.8372kwh / inhabitant for a middle-class household. For lighting only our two households need 2.4 kWh and 8.40 kWh respectively. The basic need for lighting, fan leads the choicefor generators as alternatives to electricity.

4.3 Household electricity supply

The electricity supply in Kinshasa is a task devoted to SNEL, a public national company. Due to poor management, this company fail in production and delivery of electricity. This company currently operates only 480 megawatts to meet the need of this city of 8 to 10 million inhabitants. A simple computing applying electrical distribution rules, taking into account the efficiency of 0.8, the available megawatt electric (MWe) capacity would be of 384 as explained in the table below.

Table 3   Kinshasa Power Supply

		Power
Power, MW		480,00
efficiency	0,80	
Power MWe		384
Hours par an	8 760	
Energy, E = MWh		3 363 840,00
1 MWh = y KWh	1 000	
E, KWeh		3 363 840 000,00

Source: Made from SNEL General Manager statement

From 384 MWe, the real efficiency obtained, taking into account losses due to transport and distribution, an estimate of the real offer is of 3,363,840,000.00. This capacity represents an average per capita electricity consumption of 336.384 kWh or 420.48 kWh / inhab. depending on whether the population is estimated at 10 or 8 million. This annual electricity consumption gives us daily figures of 0.93 kWh / person / day or 1.1 kWh / person/day depending on whether we are 8 or 10 million inhabitants. An obvious deficit in the supply of electricity. This lower power supply capability is recognized by the head of SNEL and justified by a poor production, transmission and distribution infrastructure of management in electrical energy. Consequently, rolling blackout or rotational load shedding every day, is the last-resort measure used to fill the power gap in all municipalities of the capital.

To face with this situation, adaptation behaviors have been developed, ranging from the use of gas, charcoal and use of an electric generator to overcome the need for electricity without integrating the environmental aspects of these electricity sources alternatives. The next paragraph highlight some aspects related to the use of generators as energy alternatives.

4.3.1 Generators alternatives

a. Generator description

A generator is an autonomous device capable of generating electricity. Generators are used either in the areas where electricity delivery is stopped for non-overlapping periods of time over different parts of the distribution region, or to alleviate a possible power failure, or as a complement to an uninterrupted power supply consisting of a storage battery that powers a power supply.   The power of a generator is expressed in kva (kilo volt amps). They work from all fuels. The most common are gasoline, diesel, natural gas, LPG, biofuels and the most powerful heavy fuel oil. However, the models commonly used in the Congo, mostly coming from China, Dubai or Lebanon, run on gasoline and diesel.

b. Cost of generator acquisition

Table 4   Price for Generators in Kinshasa Market

Rated output/Max Output		Price
KW	KVA	($)
2,24	2,8	360
2,8	3,5	400
4	5	900
4,4	5,5 (silent)	1450
4,8	6 (silent)	1580
5,2	6,5	840
8	10	4155
8	10 (silent)	5000
12	15 (silent)	13500

Source: Source: Jehovah jireh shop, Id. Nat. 01-929-N766986W

Gasoline as well as fuel oil, main source of electricity generation in power generators is polluting. It is necessary at this time of green initiative to inspire awareness by calculating the CO_2 emissions according to the amount of fuel consumed to take into account externalities to be incorporated into the real cost of this alternative.

c. Operating cost

Diesel

1 liter of diesel weighs 835 grams. Diesel is 86.2% carbon (C), which corresponds to 720 g of C per liter of diesel. To burn this C in CO_2, 1920 g of oxygen is needed. The sum therefore gives us 720 + 1920 = 2640 g of CO2 per liter of diesel.

Table 5   Operating Costs Related to Diesel Generator

Power	Consumption	Emissions	Cost of diesel
(kwh)	(l)	(kg CO2)	($)
2.5	0.2328	0.2699	0.28
5	0.4655	1.3495	0.57
7	0.6517	1.8893	0.80
10	0.931	2.699	1.15
45	4.1895	12.14	5,16

*1l of diesel for 1970 FC = 1.23 US $ Source: Inspired from data collected from the field.

Gasoline

1 liter of gasoline weighs 750 grams. Gasoline is 87% carbon (C), which corresponds to 652 g of C per liter of gasoline. To burn this C in CO2, 1740 g of oxygen are necessary. The sum therefore gives us 652 + 1740 = 2392 g of CO2 per liter of gasoline.

Table 6   Operating Costs Related to Diesel Generator

Power	Consumption	Emissions	Cost of gasoline
(kwh)	(l)	(kg CO2)	($)
2,5	0,2595	0,66	0,32
5	0,519	1,32	0,64
7	0,7266	1,848	0,9
10	1,038	2,64	1,28
45	4,671	11,88	5,78

*1l of gasoline for 1980 FC = 1.24 US $

The use of generators as an alternative to electricity generation leads to a fuel consumption and an estimate of CO_2 emissions evaluated through the table above.

For a 5 kWh need, a poor family would pay more or less of 900 US dollars for the acquisition and a little less than a dollar for thefuel supply.

For 45 kWh need, a middle-class family would pay more than $ 4,155 for the acquisition and almostUS$ 6 for the fuel supply.

The evaluation of the costs involved should not however end at the cost of acquisition and the operating cost. It is imperative to integrate other costs.

d. Environmental cost of current energy alternatives.

Generators produce carbon dioxide, an asphyxiating gas, as well as carbon monoxide, extremely toxic and more or less undetectable. Even in good condition and placed in an airy room like a garage, but adjoining a part of occupied housing, they can be the cause of fatal intoxications. The generator user is exposed daily to intoxication by the fact that he uses public transport during the day time for his daily activity exposing himself to the CO_2 released by an obsolete transport system and on his return home, he still aspire emissions from his own generator

The coal industry is not without danger, it causes deforestation and the scarcity of wood resources. The smoke caused by wood for cooking is very polluting and causes many diseases. The fuels used for lamps at night causes a black smoke harmful to health. The use of a renewable energy source such as solar energy can help solve these problems. And in this area, the Congo has considerable assets.

4.3.2 Solar kit alternatives

4.3.2.1 Solar potential in Congo

The Democratic Republic of Congo is in a very high band of sunshine whose values are between 3,250 and 6,000 Watt peak / m ²/ J for solar energy. Kinshasa the capital also has a considerable solar potential, the average sunshine varies between 3.22 and 4.89 kWh / m2 / d, values well above the PACA acronym for the Provence-Alpes-Côte d'Azur region in France, which is considered as a region characterized by excellent sunshine with an irradiation of 3 kWh / m², the first French solar region in terms of power connected to the grid. Note that under standard solar conditions, the maximum power of a cell when the sky is clear, is 1000 W / m², at a temperature of 25 °C and a standardization of the spectrum of light AM 1.5 (atmospheric mass). With this potentiality, the country can take advantage of photovoltaic electricity applications.

4.3.2.2 Photovoltaic electricity

The sun's rays can be transformed through solar cells to produce electricity. This is what we call photovoltaic energy. A solar cell is an electronic component that, exposed to light, produces electricity. It consists of a thin silicon wafer with a thickness between 0.2 and 0.3 mm, called "wafer". The set of solar cells connected in series constitutes a module. And several modules connected in series constitute a photovoltaic installation otherwise called solar photovoltaic panel. A photovoltaic power plant is therefore the set of several photovoltaic installations. For domestic use, useful applications are lighting, cold (refrigerator, air conditioning etc.), water supply and communication (radio, TV, telephone etc.). The amount of sunshine striking the surface our planet annually provides more than 10.000 times the amount of energy that all of humanity can use in a year

4.3.2.3Solar kit

For individual photovoltaic project, two installation systems can be built. An installation connected to the network and a stand-alone installation. In the case of an installation connected to the network, sizing can be done in different ways. The three most used criteria are: electricity consumption, available space and budget.

Four elements are important to set up the solar kit.

a. Solar panels also called photovoltaic modules, which convert light into electricity.

b. Batteries: provide energy storage to run the system when there is no sun. Its other role is to power devices more powerful than the cumulative panels.

c. The regulator or solar charger: its role is to stop the charge of the battery when it is already fully charged and thus avoid overcharging.

d. The inverter: it plays the role of converter, it is a power electronics device for converting the direct current received from the panels in alternating current

Table 7   Preferential Price of Solar Kits in Kinshasa

Power(kW)	Price (US $)
1	990
3	2700
5	4600
8	7500
10	9800

Source: SOLARANDU STD LTD

Prices may vary according to several criteria for the same desired power. For our analysis, our choice is based on SOLARANDU's company offer.

A poor family or household can meet his electricity need with a1 kW solar kit for 990 dollars that can power the lighting, television and even a small refrigerator (100-120w). A middle class household would end up with a3kwsolar kit of 2700 dollars that would support the light, television, refrigerator and even a split. A capacity of 5 kW solar kit would be well within the reach of a wealthy family. The next paper will address this issue.

An annual assessment of the two alternatives as response to electricity deficit in Kinshasa reveals the supremacy of the solar kits on generators currently in vogue on the Kinshasa market. Results have estimated that a poor family would cover their electricity needs with a 5Kva generator, which translates to an acquisition cost of $ 900. The operating cost expressed through fuel consumption is $ 230 a year. The total annual cost without taking into account the cost of maintenance of the machine and the cost of externalities that could not be less because of pollution not limited to the user but has the whole neighborhood, is 1130 dollars,

On the other hand with 990 dollars disbursed for an autonomous solar system, a poor family ensures its comfort of electricity supply and cannot envisage other relative expenses only after three years for replacements in battery. An investment that is much better than a generator on a financial level

As for a modest or middle class family, if the choice is made, to ensure his electricity consumption on a10 KVA group for 4155 dollars, annual expenses without integrating the cost of externality and maintenance would amount to 6335.8 dollars, a cost significantly higher than the solar kit of 5 kw capable of providing lighting, appliances and even running a split. With the new technologies available nowadays, mentioned S. Doty and turner, the energy consumption can be reduced by 50 percent and then comply with lower power solar kit.

Moreover, the photovoltaic systems release no greenhouse gases and guarantees the permanence of the electricity even for days not very sunny. In fact, they don't need direct sunlight to produce energy; they just need daylight and this means they can operate even during cloudy and less bright days. Electricity can also be conserved through the bank of batteries. Generators are rather sources of noise and environmental pollution with CO_2 emissions whose health effects are harmful with symptoms of intoxication ranging from vertigo, headache, drowsiness, visual disturbances and a reduction of lucidity and loss of reflexes. Above all, these emissions contribute to global warming. The choice on solar system is by far the best for the amount of sunshine striking the surface our planet annually provides more than 10.000 times the amount of energy that all of humanity can use in a year.

5 Conclusion

This paper work focused on evaluating the opportunities offered by solar energy in the household electricity consumption model, revealed in many ways the need to integrate this energy source into the energy supply. The analysis helped us to circumscribe the energy deficit in the city of Kinshasa, the capital of the Democratic Republic of Congo, a city whose population growth rate and the influx rate of refugees fleeing wars continues to grow.   Data collected from several sources showed that the National Electricity Company, the only company in charge of the production and distribution of electricity, was not able to ensure a permanent supply that matched demand. From the mouths of its leaders only half of the city need estimated at 1000 MW could be covered by a current yield of 480 to 510 Mw hence management marked by rotational load shedding to cover the supply of all municipalities in the city. Faced with this situation, substitution behavior has beendeveloped through the use of power generators to make up for the energy deficit. However, these fuel-powered generators contribute to CO_2 emissions that are harmful to health and the environment. An assessment of local potential has allowed us to appreciate the solar potential of the city which would lead to a better use of solar alternatives, the country being in a very high band of sunshine whose values are between 3,250 and 6,000 Watt peak / m ²/ J for solar energy. Comparing usable solar kits for households, we conclude that solar alternatives would be far better as a solution to the generator set. Despite the relatively high acquisition cost according to the needs of households, meaning US$ 990 for one kilowatt solar kit capacity and $ 2700 for 3 kilowatt solar kit capacity againstUS$ 900 for a4 kilowattspower generator and US$ 4155 for 8 kilowatt generator, an annual operational cost reveals a financial benefit of solar kits beyond ecological benefits. An annual operational cost by a poor family gives an envelope of expenses estimated at 1130 dollars, cost of maintenance and externalities not included against 990 dollars for a solar kit.

For a middle class family, the annual envelope in terms of operating cost is estimated at $ 6335.8

for generator use against $ 4600 for a solar kit of 5 kW. Even at equal capacity, an 8-kilowatt solar kit that costs $ 7500 would be amortized after just under three years at a fuel cost of $ 3.14 per day to ensure the need for power consumption with a group of 8 kW. In other words, after two and a half years the user of a generator will have reached the investment required for a solar kit that would keep him safe from daily financial expenses and safe from health problems and free of the responsibility of negative externalities over the community.

It is therefore essential to consider awareness campaigns on the merits of adopting solar alternatives as well as to create household support systems to finance the acquisition of solar kits. On the other hand investment facilities in the solar field will have to be supported by government to promote electricity coverage and the social development of communities.

A Study on the Integration Model of Sports Industry Serving for Health Care Industry

Duan Qianbing

Chengdu University Of Information Engineering, Chengdu，P.R.China, 610000

(E-mail: dqb316@cuit.edu.cn)

Abstract: Through the literature review method, logic analysis and other research methods, starting from the social needs of the elderly population in China and the social significance of the development of sports for the aged, this paper analyzes the necessity for the sports industry to serve the health care industry for the aged, This paper discusses the main problems of the current sports industry serving the health care industry,and analyzes the model of the sports industry serving the community pension and the model of the sports industry service institutions and the development countermeasures. It is hoped that it can inspire the integrated development of China's sports industry and pension service industry.

Key words: Sports industry; Healthy old-age care service model; Integrated development; Existing problems; Development strategy

1 Introduction

Sports industry is a large and complex economy. In recent years, with the raise of people's health consciousness and increase of sports participation, the growing demand for all kinds of sports services, sports industry has entered a phase of rapid development.At the same time, with Chinese aging of the population rising importance of pension industry gradually highlights, countries began to advocate and encourage fully open pension market, let market main body into pension services industry. In 2013 the state council issued "the several opinions on accelerating the development of pension services under the state council, the land and resources issued 2014" land for old-age service facilities guidance";In 2017, the ministry of civil affairs issued a "about support the development of the integration of idle social resources endowment service of the notice, the country continues to promote the development of pension services, to satisfy the increasing of social endowment service needs.Physical exercise is an effective way for the elderly to keep healthy and enhance their physical fitnessSports industry (Wang Hongmei, 2012), how to fusion by means of industrial convergence and pension industry, all kinds of sports pension for the elderly sports industry resources, not only can effectively improve the service level of the pension industry, make endowment industry become more rich and colorfulbecause of the integration of sports service, At the same time, it is also possible to broaden the industrial field of the sports industry and make the sports industry more dynamic because of its entry into and development of the pension industry.

2 Necessity of the Sports Industry to Serve the Health and Old-Age Care Industry

2.1 Social needs of the elderly population

2.1.1 The growing elderly population

China entered the aging society in 1999, and now has a total population of 200 million, and the annual growth rate is 10 million.By 2020, China will have 270-280 million old people over 60, and 180 million old people over 65, which will be about 24% of the world's elderly population.It took only 18 years for China to enter an old-age society, and the aging process in developed countries lasted for decades to 100 years.In 2015 China's fifth national census data show that 88.11 million people have been more than 65 years old, accounting for 6.96% of the population, in terms of the structure of the population of international standard, China has basically entered the old-age society.By 2030, the number of elderly people will increase from 88.11 million to 310 million, accounting for 20.42 percent of the total population. By 2050, it will probably increase to 468 million, accounting for 27.77 percent(Wang Zhankun, 2013).

2.1.2 Declining health quality of the elderly population

In the field of gerontology research studies have demonstrated that aging population in terms of health, one of the most prominent feature is "weak", what is actually reflected is a real problem of the decline in the quality of the elderly population. According to Lockwood's study (2005) of elderly population "weak" status, can be subdivided into seven different categories, and in the "weak" state of the elderly population or health status evaluation, is the main reference of the body weak and mental

weak index.Chinese scholars refer to Lockwood's definition of using the physical weakness index and mental weakness index to evaluate the overall health status of the elderly population in China. It is found that the degree of weakness of the elderly population increases with age, in other words, the older the age, the higher the degree of weakness and the lower the quality of health.

2.2 The social significance of developing sports for the aged

2.2.1 Promote physical and mental health of the elderly

Physical exercise can reduce stress, regulate emotions, improve immunity, increase self-confidence, and promote mental health. Regular physical exercise can enhance the function of the elderly in various body systems. In the process of participating in the exercise, the elderly can strengthen the cooperation with others and help themselves to adjust the role of the elderly.The physical and mental weakness of the elderly were significantly reduced (Fan Chengwen, Liu Qing, 2012). The development of sports for the aged has positive effects on physical and mental health of the aged.

2.2.2 Promote the development of China's sports industry

China's elderly now account for only 10 per cent of total consumption. The annual demand for the elderly market is about 764.1 billion yuan. It reached 1.4 trillion yuan in 2010, but less than 100 billion yuan in supplies for the elderly. So there's a huge opportunity between supply and demand (Song Yawei, 2008). More and more senior citizens are willing to invest in health, which has played a positive role in promoting the development of sports apparel and sports equipment, sports leisure, sports consultation and guiding the development of the industry.

2.2.3 Promote the development of mass sports in China

The elderly population is an important strength of social cultural atmosphere. The development of old-age sports creates a good atmosphere of sports culture, plays a certain role in the fitness activities of the elderly, affects more people to participate in sports activities, and plays an important role in promoting the development of sports. (Chu Jijun, Chu Xiao, 2016).

3 Major Problems of the Sports Industry in Serving the Health Care Industry

3.1 China's sports industry is still in the development stage

China's sports industry has a weak position in the national economy. According to economic census data, the added value of China's sports industry in 2004 only accounted for 0.38 percent of the gross national product. In 2008, China's sports industry accounted for the highest proportion of 0.65%, but then showed a downward trend year by year, dropping to 0.41% in 2013, slightly higher than it in 2004, and failing to surpass the 2008 level. Compared with other major sports power in the world, in 2008 the United States, Britain, France, Germany, Australia, Spain, South Korea, Japan and Brazil and other countries of the sports industry average was 1.92%. In the same period, the proportion of China's sports industry was only 0.65%, there is a huge gap (Ren Ha, 2015). It shows that China's sports industry is still in its infancy, which is not optimistic.

3.2 The unbalanced regional development between sports industry services and healthy pension industry

The imbalance between the sports industry service and the healthy pension industry is mainly reflected in the two major aspects of the imbalance between the provinces and the imbalance between urban and rural development. Firstly, there is a problem of imbalance between the sports industry and the health care industry in the province. At present, the development of the sports industry's service pension industry is clearly ahead of some regions and provinces with low economic development levels in cities and regions with high economic development levels such as Beijing and Shanghai. In areas with low levels of economic development, due to insufficient release of market consumer demand, it has caused certain obstacles for the sports industry to support the aged care industry, which has led to a situation of imbalanced regional development in the sports industry service pension industry. Second, the sports industry's service and health care industry has a problem of uneven development between urban and rural areas (Wang Jun,Gong Qiang, Wang Wei, 2012). As a whole, the urban elderly population has higher health awareness and more economic conditions. Therefore, the urban elderly population is more willing to accept the elderly sports service, and the participation of the elderly sports is also higher. In this case, the problem of uneven development between urban and rural areas has gradually emerged in China's sports industry serving the healthy old-age care industry. The development of urban areas is obviously better than that of rural areas.

3.3 Relevant laws and policies are not perfect enough

Perfect policies and regulations are an important guarantee for the healthy and sound development of industry. The integration between the sports industry and the pension industry is a new industrial development perspective and industrial development thought that has only emerged in recent years (Sui Xiaoqin, Zhao Baochun, Li Tian And Wan Zhongping, 2006). Therefore, there is no specific laws, regulations and policies for the current China and standardize various problems in the development process of the fusion, from the long-term perspective, imperfect laws, regulations and policies will inevitably affect the condition of the sports industry and the interaction between pension industry.Therefore, it is a key problem that needs to be solved urgently in the process of the integration and development of sports industry and old-age care industry to formulate specialized regulations and policies and establish a perfect regulatory and policy system.

3.4 The elderly have weak consumption awareness of health care

The nation's elderly does release the ten thousands of elderly endowment condition that occupy the home city survey shows that China's current pension in healthy older men, consumer consciousness remains generally weak, old people buy home endowment service consumer consciousness has not yet universal form, insufficient effective demand for health care (Wang Kaizhen, Wang Liu, 2014). Many old people in all think buy health care is a "waste of money, and even some of the elderly said understanding and willing to buy health care, but expectations of health care of the price is relatively low, with the actual price there is a big gap between the current market, the questions and health of the elderly endowment also there is a large relationship between consumer consciousness is weak.

4 The Integration Model of Sports Industry Serving forHealth Care Industry

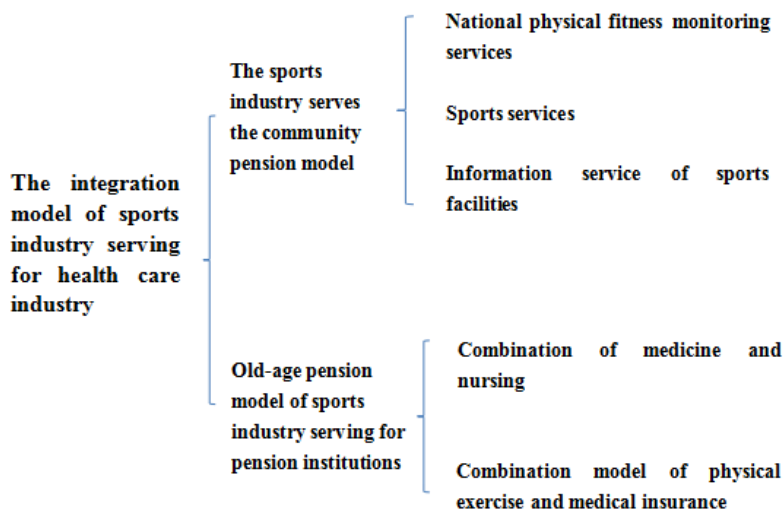
This paper proposes the service industry from two aspects. As shown in the figure 1, one is that the sports industry serves the community pension model, which includes the national physical fitness monitoring services, sports service, information service of sports facilities; the other is old-age pension model of sports industry serving forpension institutions includes a combination of medicine and nursing and a combination model of physical exercise and medical insurance.


Figure 1   Integration Model of Sports Industry Serving forHealth Care Industry

4.1 The sports industry serves the community pension model

Community home care for the aged is a popular way of care in the world, which is widely valued by governments of all countries and welcomed by the elderly (Li Wenpu, Gong Zhengwei, 2014). Community home endowment has the following advantages: one is the community home endowment and institution endowment, compared with less investment, low cost, wide service, the characteristics of low charge, quick effect, still can release the pressure of the institutions endowment service; Second, the community day care center can meet the needs of home-based elderly people who leave home and stay away from home and spend less money on old-age care. Third, the embedded community pension can provide the community elderly with health care, TCM outpatient service, rehabilitation therapy, daily care, cultural leisure and other services, so that the elderly can live in the familiar environment. Integrated family endowment and community endowment, professional pension and other kinds of

resources, and establish a home endowment service project, launched "endowment service pack""personalized package", etc., the embedded community endowment service facilities built community for the elderly "one-stop" integrated services platform.

Taking Chengdu as an example, Chengdu has built 139 community nursing homes and 2,414 community day care centers, covering 91% of urban communities and more than 35% of rural communities. 150 rural home-based old-age care service centers have been set up to provide diversified home-based old-age care services for rural people over 60 years old. The city has 243 social organizations to develop old-age care services and set up 576 catering service centers for the elderly.

4.1.1 National physical fitness monitoring services

National physical fitness monitoring is an important standard to measure the achievements of national fitness activities and sports development, and it is also the main content of China's national fitness service. "National sports law", "national fitness plan" and "regulations on national fitness" clearly require the development of national fitness activities and physical fitness. National physical fitness monitoring is to establish a physical health monitoring service system. Using the scientific method to the subjects' body shape, body function and physical quality comprehensive evaluation, and the constitution monitoring and follow-up study on the different populations, the formation of physique monitoring and early warning mechanism. To publish the results of physical monitoring and guide citizens to pay attention to physical fitness and health.

Zhejiang province has established a number of provincial physical fitness monitoring centers, national physical fitness monitoring stations, county (city, district) national physical fitness monitoring stations (stations) composed of the national physical fitness monitoring network. In management, the system of classification is implemented, and the funds come from sports (culture and sports) departments at all levels from their operating funds or sports lottery public welfare funds. At present, Zhejiang province has established 119 provincial centers, more than 730 townships and street monitoring stations, providing more than 1,500 testing samples of different populations to the national physique monitoring database every year.

4.1.2 Sports services

The 18th national congress of the communist party of China (CPC) proposed that extensive national fitness activities and the development of mass sports and competitive sports should be carried out. Sports activities for the aged are an important part of national fitness. Good sports service for the aged is the unshirkable responsibility of building socialist cultural force (Ma Hongbin, 2015). The ideal public service supply structure for the elderly is the coordinated supply of government, sports organization and market. But at present, China's elderly sports service supply is relatively monotonous and the market development is not perfect. The elderly sports associations mainly rely on the government supply and the supplement of the elderly sports associations. The penetration rate of sports activities for the elderly is not high and there are not many participants.

4.1.3 Information service of sports facilities

Sports facilities are the hardware environment to meet the needs of elderly sports fitness services. Necessary sports facilities provide guarantee for the elderly to carry out sports and fitness activities, and are also important hardware indicators to measure the government's ability to provide public sports services. Sports information service mainly refers to the Internet. LED large screen, radio and television, sports health lecture and other channels to disseminate sports information, providing physical fitness knowledge, sports information, stadium information, sports training, elderly sports competition, etc. Sports skills, rules, etc. are conducive to elderly sports participation in sports public services (Ren Ha, 2006). Sports information service plays an important role in stimulating the demand preference of elderly sports public service. In terms of facilities, taking Chengdu as an example, a total of 18 public service facilities have been divided into eight categories. By 2020, there will be 2,557 new stadiums in the city, with a total investment of about 89 billion yuan. The overall implementation rate of sports facilities in urban built-up areas increased from 61% to more than 75%, and the "15-minute public sports service circle" was initially established.

4.2 Old-age pension model of sports industry serving forpension institutions

4.2.1 Combination of medicine and nursing

There are three ways to implement the mode of combining medical care with medical care: setting up a medical institution in a pension institution, setting up a service institution combining medical care with medical care in a hospital, and cooperating between pension institution and medical institution.In these ways, the sports industry exists as a value added to medical institutions, such as rehabilitation training or preventive care (Han Song, Wang Li, 2017).

However, from the perspective of China's national conditions and the development status of the pension service system, the institutional pension model plays an auxiliary role in the whole pension service system of China. The influence of Chinese people's concept of old-age care and filial piety, as well as the economic situation of different elderly people, most of them still choose to live in the community when they are old. Although some elderly medical problem can by expanding the service function of medical institutions or the construction of large aged care community to solve, but for the vast majority of the elderly is still difficult. Western nursing, prevention, health care, medical rehabilitation, training, education, entertainment and other services can only meet some of the elderly care needs, it is difficult to fundamentally solve the problem of China's elderly endowment.

Chengdu innovates the development model of "traditional Chinese medicine + endowment + community" to deliver health services to the masses. The venture of Chengdu museum with new good Angle of traditional Chinese medicine of traditional Chinese medicine is the epitome of "two house corner" construction of Chengdu, it from Chengdu on the basis of the demand of the elderly, innovative ideas, strengthen the construction of the museum of traditional Chinese medicine, Chinese medicine Angle make TCM service positions at the grass-roots level, efforts to build 15 minutes of traditional Chinese medicine health services. Venture "two house" in the corner of the construction of the organic combination of traditional Chinese medicine, pension, community three elements, the formation of "Chinese medicine + pension" and "Chinese medicine + community" innovation development pattern of traditional Chinese medicine, the traditional Chinese medicine service to the masses, make people at home can enjoy the high quality services of traditional Chinese medicine, more convenient to improve the masses get feeling, is worth learning and using for reference.

4.2.2 Combination model of physical exercise and medical insurance

"Combination of medical insurance and physical exercise" refers to the connection between medical insurance system and mass sports training system.Physical exercise can promote people's health and reduce the pressure and burden of medical insurance fund expenditure. The combination of medical insurance and physical exercise, physical exercise plays the role of preventing diseases, and medical insurance plays the role of assisting diseases. It not only solves the health problems of the elderly from the perspective of medical assistance, but also promotes the physical and mental health of the elderly from the perspective of disease prevention. Its common purpose is to protect the health of the elderly, which is also the connection point between medical insurance and physical exercise. The concept of health and health in the elderly, popularize health knowledge, help them to establish a scientific way of life, such as not smoking, drink less, moderate exercise, reasonable diet, happy mood, regular physical examination, etc. Benefit from some diseases. Present or relieve symptoms. If you don't get sick, you can not only save medical expenses, but more importantly, you can alleviate the pain of the elderly and make them healthy and enjoy life.

5 Countermeasures for the Integrated Development of Health Care Industry in Sports Industry

5.1 Increase investment in the development of healthy old-age care and elderly sports

The well-being of the elderly plays an important role in promoting social stability. We should pay more attention to health care and old-age sports, strengthen relevant policies and systems, and increase investment. We will formulate preferential policies, actively guide and support industries for the aged, and make full use of existing resources and facilities to provide conditions for the development of the old-age pension industry (Qu Tianmin, Xu Xia, Li Shufeng, 2011).

5.2 Improve welfare security and legal system

At present, China's sports industry serves a healthy and old-age industry with regional imbalances. In order to improve this situation, local governments at all levels should establish an old-age sports organization management system, manage and operate old-age sports organizations, establish a responsibility system, reward and punishment system, and establish a supervision mechanism for organizational members in accordance with relevant national laws and regulations and local conditions. Fair participation (DaiZhipeng, MaWeiping, 2013). Guide the sharing mechanism of foreign schools and community sports facilities to guide the healthy development of the elderly sports industry. Strengthen the government's macro guidance, introduce local laws and policy documents, strengthen the protection of the rights and interests of the elderly, and implement the healthy aging strategy into long-term planning. Serve the national economy and social development.

5.3 Take senior sports as one of the key points of community sports work

Taking the old-age sports as the focus of community sports has become an important measure to promote the effective integration of the sports industry and the old-age industry.Community workers should actively incorporate the elderly physical fitness service system into the community service system, and gradually promote the construction of community old-age sports associations, and improve the community's elderly sports facilities, and raise funds for sports activities for the elderly.It is also necessary to pay attention to building a team of senior sports instructors in the community to provide scientific fitness guidance services for the elderly.

5.4 Improve the management model of elderly sports organizations

In order to actively respond to the aging of the population, China should introduce organizations and systems for managing and organizing sports activities for the elderly.China should learn from the practices of developed countries and regions, combine China's national conditions, promulgate support policies, provide financial assistance, develop public welfare, and create a market-oriented and open comprehensive old-age sports organization.It also seeks sponsorship in funding and encourages companies to increase investment in the sports industry for the elderly. At the same time, innovation in business models, breaking the limitations of thinking, improving the efficiency of organizational institutions, and promoting the industrialization of the elderly sports.

5.5 Combination of sports industry and "Internet + pension"

With the help of "Internet +", we will build a new model of sports and residence for the aged. With the increasing economic level, "travel pension" is becoming a new trend of life for many old people in China. The elderly believe that travel can help them find more happiness and sense of belonging and reduce the burden on their children. As a new way of pension,how to combine the advantages of Internet technology with the traditional sports industry and tourism industry and the old-age industry is a new development direction for the sports and residential care service industry, which requires online and offline synchronization. In terms of "Internet + pension", Chengdu also has new measures. Launch "care map" of Chengdu, can understand the distribution of urban elderly, physical condition, economic income and pension service demand, understand the city's various pension institutions, community centers and other facilities, for the elderly endowment facilities and provide good service. It can make the service of the elderly more convenient and accurate and solve the problem of information asymmetry in the pension resources.

5.6 Explore the pension project of the sports industrial park

The current development of the sports health industry park pension project is strong. It is necessary to strengthen the planning of the sports health industrial park, improve relevant supporting services, encourage enterprises to practice hard and create new internal achievements, and promote the sustainable development of the sports great health industrial park. The first is planning to achieve a balanced and coordinated layout of sports and health industrial parks.It is suggested to strengthen the development planning and industrial planning of sports industrial park from the central level. Second, improve the supporting facilities, create a good ecological environment, and develop the sports and fitness industrial park. The healthy development of the health industrial park cannot be separated from perfect supporting policies and services, and the establishment of preferential industrial policies, investment and financing, taxation, achievement transformation and other related healthy enterprises. Third, deepen the combination of industry, education and research, encourage enterprises to give full play to their inherent advantages, and provide endogenous power for the development of the sports and fitness industrial park. Fourth, according to regional characteristics, the sports fitness industrial park should be built according to local conditions. Starting from the planning, the characteristics and target orientation of the development industry of the park will be clarified.

6 Conclusion

The sports industry is an economic complex. In recent years, the demand for various kinds of sports services has been increasing, and the sports industry has entered a rapid development stage.At the same time, as Chinese aging population rising, the Chinese sports industry is still in development stage, the imperfection of the relevant laws, regulations and policies, the elderly health pension problems of weak consumer consciousness.Therefore, to increase the pension to the health and the development of the elderly sports investment, perfecting the welfare safeguard and the legal system, and the elderly sports as one of the community sports work and improve the elderly sports organization management mode, the sports industry combined with "Internet + endowment", explore the sports industrial park project of provide for the aged, fundamentally solve the problem of China's elderly endowment.

Study on Valuation Method of the Safety Awareness Based on the Gray Relational Analysis Model

Li Chaoxin, Ma Jiaming
Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: whutlcx@qq.com)

Abstract: Whether one's behavior is safe or not, it's mostly decided by his safety awareness. Most safety accidents show that the lack of safety awareness and wrong operation is the root reason of frequent accidents. Based on present material and documents upon safety awareness, this paper discusses the connotation and structure of it, expounds the relationship between safety awareness and safety behavior, puts forward the applicable framework of evaluation index system of safety awareness and builds the quantitative evaluation model of safety awareness by using the gray relational evaluation method, supplying basis of the quantitative evaluation of safety awareness level.
Key words: Safety awareness; Gray relational analysis; Evaluation method; Model

1 Introduction

In recent years, with the rapid development of the social economy, safety issues have drawn more attention from the government, enterprises and the public. As the main body of safety activities, human beings are the most frequent and active component in the safety system and the key factor for the achievement of safe production, whose unsafe behavior can be one of the main hidden risks of accidents (Dong Lixia, 2016). However, the safety of one's behavior mostly depends on the safety awareness. Therefore, a systematic analysis on safety awareness and an in-depth study on the evaluation index system of safety awareness and on its evaluation methods can be of great significance for improvement of people's safety awareness and reduction of safety risks, thus preventing and decreasing various safety accidents.

In the 1980s and 1990s, with the deepening of research on the causes of security incidents, security awareness has received more and more attention from researchers. Developed countries such as the United States and Japan, due to the early industrial development, have carried out investigations and studies on human factors in industrial security earlier in some fields, and have obtained some research results, which provides a large amount of basic data for security work in other countries(Gao Lina，2015). Compared with foreign countries, China's research on security awareness started late. Only in the 1990s, scholars gradually engaged in research in this area(Chen Lijuan, 2016).A lot of literatures have carried out research on the safety awareness of college students from problem solving to problem solving, but the general discussion is mostly. Although there have been special investigations on safety awareness through questionnaires, there is no good use of statistical data for in-depth analysis. The conclusions of the surveys are mostly shallow, and there is no major problem that can fully exploit the security awareness. Theoretical statements are more common in analyzing the main factors affecting the formation of safety awareness, but the emphasis on the reasons is not clear enough(Zou Yong, 2014).

In general, different industries and departments have studied the safety awareness of employees and their development status from the characteristics of their respective fields, and put forward many theories and methods worthy of reference. A lot of literatures have analyzed the safety awareness. At present, the research on safety awareness evaluation mostly adopts the form of scale. The method of using the scale to evaluate safety awareness has design flexibility and wide implementation, and has become a commonly used tool and means for studying safety awareness. However, the current assessment of safety awareness has not formed a unified standard, nor a unified evaluation indicator(Jiang Qinyao, 2016).Therefore, there is an urgent need to study the scientific evaluation method of safety awareness.

2 Establishment of the Evaluation Index System of Safety Awareness

2.1 Connotation of the safety awareness

Safety means that humans can successfully achieve their goals in the purposeful activities without violating their wills. Awareness defines a unique reflection of the objective existence, which can be called human observation (Wu Xiaoyong, 2017). Safety awareness is a branch of human awareness, and it is also a concept with a wide coverage. For many years, scholars have given various definitions to

safety awareness from different angles. Although different definitions are given from dissimilar perspectives, they are basically focused on a main factor——"the human psychological reaction to safety issues". Consequently, safety awareness is generally a mental state of alertness to the external environment in which personal injury and other damages may occur in the production process. It mainly includes two aspects of psychological activities: one is to judge the cognition, evaluation and consequence of the external objective world; another is to determine the individual's behavior and adjust oneself to an appropriate psychological state based on the judgement of cognition, evaluation and consequence so as to ensure a smooth operation of safe production (Wang Dangqing, 2013).

2.2 Relation between safety awareness and safety behavior

Safety awareness comes from human safety practices while it has a positive and subjective influence on safe production, which includes understandings of the working object, environment and other related factors, and assumptions and simulations of accidents under safe conditions as well as various behavior determinations. Safety behavior is materialized. It stems from the pushing and control of safety awareness, which is usually reflected in real daily operations and simulated special exercises. Awareness guides behavior and behavior comes from awareness.

Awareness should coexist with behavior, and they are tightly connected and mutually affected, which is not only the philosophical guidance for us to understand and transform the objective world, but also the primary condition for us to secure safety works. Once they are distanced or deviated from each other, accidents will be inevitable or hard to handle.

2.3 Structure of safety awareness

The structure of safety awareness refers to the various components of the awareness and their mutual relations. The academic circle holds several viewpoints on the structure of safety awareness. The first one is that safety awareness has three aspects——cognition, emotion and will. The second one is that safety awareness is divided into safety knowledge, safety attitude and safety action taken accordingly. The last one, as some researchers suggest, is that safety awareness contains safety ability, safety wisdom and safety knowledge. Safety awareness is a behavior-oriented element and a high-level psychological activity. As a result, to divide the structure of safety awareness should be based on its psychological characteristics and the divided structural elements should reflect the features of human psychological activities on different aspects. Based on the analysis of existing documents and research results, this paper divides the safety awareness of employees into four aspects: psychological quality, professional competence, safety attitude and safety behavior tendency.

2.4 Evaluation index system

The key to a quantitative evaluation of safety awareness is to build a scientific index system, which is directly related to the reliability and effectiveness of the evaluation. Based on the existing research foundation, the author refers to the connotation and structure of safety consciousness explained in the previous article, and based on the principles of science, purpose, independence, system and measurability, from psychological quality, professional quality, safety attitude and safe behavior. Tend the four dimensions to establish a safety awareness evaluation index system, which is shown in Table 1.

Due to the wide coverage of safety awareness, it requires specific focuses towards different human groups. Therefore, the fourth level of safety awareness (i.e. subdivision indicators) are not specified here, except for only when necessary.

Table 1   Evaluation Index System of Safety Awareness

Number	First-Level Indicator	Second-Level Indicator	Third-Level Indicator
1	safety awareness	psychological quality	service awareness in work
2			responsibility in work
3			self-discipline in safe production
4			ambition in work
5			braveness in improving and creating safe production
6			emotional stability
7			satisfaction for work
8		professional competence	basic and essential knowledge for safe production
9			significance of safety
10			understanding of policies and regulations related to safe production
11			experience and operative ability in safety work

Number	First-Level Indicator	Second-Level Indicator	Third-Level Indicator
12			general attitude towards safe production
13			attitude towards accidents
14		safety attitude	attitude towards management
15			attitude towards disobedience against rules
16			judgement and cognition of safety
17	safety awareness		attitude towards current jobs
18			positive and active attitude towards safety training and related activities
19		safety behavior tendency	obedience to normal operation rules
20			ability to plan safe production work
21			working practices
22			coordination with colleagues and leaders

3 Establishment of the Evaluation Model of Safety Awareness

3.1 Gray relational theory

The gray system theory was created in 1982 by Professor Deng Julong, which has been widely applied in various fields such as industry, agriculture and social economy. The gray relational evaluation method is the most important component of the gray system theory, and has unique advantages in the fields of quantitative analysis and evaluation of nonlinear, discrete and dynamic data (Yu Dingyong, 2015). And its basic principle is to distinguish the correlation degree of multiple factors in a system by comparing the geometric relation of statistical sequences (Zeng Sheng, 2013), and then rank the calculated correlation degrees, and finally obtain the correlation degree sequence, that is, the sequence of the evaluated data sequence. It means that the greater the correlation degree between certain evaluated data sequence and the standard data sequence is, the closer the evaluated sequence is to the standard.

3.2 Determination of the evaluated data sequence and the standard sequence

According to 4 second-level indicators and 22 third-level indicators shown in Table 1, the evaluated data of each subject is determined to form an evaluated data sequence. Supposing that n employees are involved, the evaluated data sequence is described as:

$$\begin{pmatrix} X_1 = \left\{ X_1(1), \ X_1(2), \cdots, \ X_1(22) \right\} \\ X_2 = \left\{ X_2(1), \ X_2(2), \cdots, \ X_2(22) \right\} \\ \vdots \\ X_n = \left\{ X_n(1), \ X_n(2), \cdots, \ X_n(22) \right\} \end{pmatrix}$$

With regard to each evaluated indicator, different values are obtained among the tested employees. And the maximum values for each evaluated indicator are taken by the author as a reference for the standard data, thus forming a standard data sequence described as:

$$X_0 = \left\{ X_0(1), \ X_0(2), \cdots, \ X_0(22) \right\}$$

3.3 Initialization of data

In the evaluation index system, the priority of data processing is to quantify the qualitative indicators because of the existence of quantitative and qualitative indicators. While some indicators present the "minimum-type" (smaller data, better result), some are the "maximum-type" (bigger data, better result), which causes the need for the data conformance processing like turning the "minimum-type" data to the "maximum-type" one by using the reciprocal method in mathematics. In the evaluation process, given that data dimensions of each indicator are dissimilar, the evaluated data have a large difference in quantity and the correlation evaluation cannot be performed. Therefore, the data of each indicator need to be normalized. The normalization processing model is：

$$X_i^*(k) = \frac{x_i(k) - \min x_i(k)}{\max x_i(k) - \min x_i(k)}$$

where $k = 1, 2, \cdots, 22; i = 1, 2, \cdots, n$

3.4 Gray relational coefficient

In order to calculate the gray relational degree, the first step is to calculate the gray correlation

degree for each indicator in the standard data sequence corresponding to that in the evaluated data sequence, which is called the gray relational coefficient. The gray relational coefficient $\gamma_{0,i}(k)$ for certain indicator $x_0(k)$ in the standard data sequence corresponding to certain indicator $x_i(k)$ in the evaluated data sequence is defined as (Liu Sifeng, 2014):

$$\gamma_{0,i}(k) = \frac{\min\limits_{i}\min\limits_{k}\left|x_0(k) - X_i^*(k)\right| + \xi \cdot \max\limits_{i}\max\limits_{k}\left|x_0(k) - X_i^*(k)\right|}{\left|x_0(k) - X_i^*(k)\right| + \xi \cdot \max\limits_{i}\max\limits_{k}\left|x_0(k) - X_i^*(k)\right|}$$

where

$\left|x_0(k) - X_i^*(k)\right| = \Delta_i(k)$; $\min\limits_{k}\left|x_0(k) - X_i^*(k)\right|$ is the first-level minimum difference;

$\min\limits_{i}\min\limits_{k}\left|x_0(k) - X_i^*(k)\right|$ is the second-level minimum difference;

$\max\limits_{i}\max\limits_{k}\left|x_0(k) - X_i^*(k)\right|$ is the second-level maximum difference;

ξ is the distinguishing coefficient, a given number from researchers, which is used to weaken the influence of data distortion caused by the maximum absolute difference so as to improve the difference significance among gray correlation coefficients, ranging from 0.1 to 1.0, normally taken as 0.5.

3.5 Gray relational degree

Given that gray relational coefficients $\gamma_{0,i}(k)$ are numerous, the data is scattered and cannot be compared in a comprehensive way. Therefore, the average number γ_i for each coefficient in every group of the evaluated data is taken as:

$$\gamma_i = \frac{1}{n}\sum_{k=1}^{n}\gamma_{0,i}(k)$$

The number γ_i is defined as the gray relational degree between the overall evaluated value of safety awareness of employee $No.i$ with the standard value.

3.6 Overall evaluation

The number γ_i is ranked to obtain a correlation sequence which is the result sequence of the evaluated data sequence, and the safety awareness evaluation on each subject is obtained.

4 Conclusion

4.1 Meaning

The connotation and structure of safety awareness have been studied and the evaluation index system of employee safety awareness has been generally established from 4 aspects, such as psychological quality, professional competence, safety attitude, safety behavior tendency. Safety management staff can improve safety work according to various indicators and improve the safety awareness of employees. This paper proposes a quantitative evaluation method, which can accurately measure people's safety awareness, so as to fully understand the employee's safety state, and provides an important reference for employee training, assessment and selection. At the same time, it can also provide employees with guidance for the job allocation. For example, employees with lower evaluation results can be arranged at the position with lower accident rate, thereby reducing the probability of accidents and improving the efficiency of safety management.

The evaluation model in this paper uses the method of grey relational analysis to make up for the shortcomings of system analysis using mathematical statistics method. It is suitable for the case where the sample size is small and the sample size law is unknown, and the calculation amount is small, which is very simple. It is judged based on the degree of similarity of the sequence curve geometry. Evaluate safety awareness and provide reference for improving safety awareness and safety education.

4.2 Discussion

The evaluation index system of safety awareness has been initially established in this paper but its rationality and practicality need to be proved. Meanwhile, the quantitative evaluation method of safety awareness is also proposed, however, due to the dynamic conditions and complexity of employees, it is difficult to achieve a complete quantitative evaluation of people's safety awareness. Some indicators of the evaluation index system in this paper are ambiguous because the objective data is difficult to obtain. For example, indicators such as emotional stability are difficult to quantify. In view of the above

problems, it is necessary to combine the knowledge of psychology, behavioral and other academic fields, and draw on feasible means and methods to measure the accurate data of various indicators so as to achieve an objective evaluation. In addition, this paper has not considered the primary and secondary relationship of each indicator. In this paper the weights of each indicator are equal, but they are actually different according to different evaluation objects and evaluation targets in the practical application, which leads to complex calculation. However, it can be programmed with computers to achieve efficient and intelligent evaluation. These areas will be researched in the future.

The value of the resolution coefficient in the paper is selected with reference to the existing literature. It is also the research direction of this evaluation method to further adjust whether different populations and industry backgrounds need to be adjusted.

Abstract: Corporate governance practice is perceived as a major factor that can either contribute to corporate failure or efficient corporate management, hence influencing the performance of firms. This paper establishes how corporate governance practice affects the performance of firms in Ghana. The study adopted a survey to cover 40 firms in Ghana using Analysis of Variance (ANOVA) to test the data collected and hypothesis formulated.The results revealed that, with the exception of corporate governance code which shows adverse relationship with firm performance, corporate governance practices, number of independent directors, board size, and corporate disclosure reported positive associations with firm performance. Adherence to good corporate governance practices contributes to higher firm performance. Managers of firms need to implement effective systems that permits control of operations, promotes good corporate governance practices and reduces agency cost so as to maximise corporate value.
Key words: Corporate governance practices; Firm performance; ANOVA; Ghana

1 Introduction

The need to show more emphasis on corporate governance increased in global business from a relative obscurity after the collapse of high profile companies around the world. Enron and World Com stunned the business world in terms of the scale and age of their unethical and unlawful operations,worse, they appeared to indicate only a hint of a risky situation for business operation. While corporate practices in companies came under serious attack, it seemed that the problem was far more prevalent. From big and reliable companies to the multinational groups came the revelation of significantly inherent problems in corporate governance. Unilateral decision making, nonexistence of transparency in audit and financial reports, ineffectiveness and mismanagement are some of the challenges that can arise in situations where corporate governance practices are not applied. Nonetheless, this imperatively proposes how the concept of corporate governance is of great importance. Undeniably, corporate governance practices are relevant tools which when ignored could have adverse consequence on the performance of firms in Ghana. Internationally, the commencement of corporate governance is seen as a response to many corporate failures and wide spread dissatisfaction about the functioning of the corporate sector. Corporate governance is pictured as a distinctive brand and yardstick in the profile of corporate excellence. Corporate governance attempts to initiate prevailing systems by which organizations can be directed and controlled so as to make them more accountable to shareholders in particular and the stakeholders at large. Corporate governance is the guidelines and practices that govern the association between managers and shareholders of a corporation, including stakeholders. Corporate governance which is seen as the structures and procedures for the direction and control of companies contributes to growth and financial stability by reinforcing trust and integrity in the financial market and economic efficiency (Organization for Economic Cooperation and Development (OECD), 2004). As a result, corporate governance allocates the rights and responsibilities amongst the numerous participants in a company, such as the board, managers, shareholders and other stakeholders; it also guarantees that guidelines and procedures for making decisions regarding corporate affairs are clear (Feleaga et al., 2011). Corporate governance practice is considered an internal mechanism for monitoring management. Ghabayen (Ghabayen, 2012) posits that good corporate governance is an effective device for assisting a firm to reach improved performance and contributes to maintainable economic development by improving the performance of companies and enhancing their access to external capital (IFC, 2011). Okeahalem and Akinboade, (Okeahalem and Akinboade, 2003) states that, a survey conducted by the Institute of Directors (IOD) in 2000 for top 100 private companies and some public-sector enterprises with the aim to examine the state of corporate governance practices in these organizations revealed that firms in Ghana and several sub-Saharan countries have adopted good corporate governance practices. Mulili and Wong (Mulili and Wong, 2011) concluded that developing countries vary from developed

countries in many ways and as such, there is the necessity for developing countries to come out with their own corporate governance models that consider the cultural, political, and technological changes in each African country.

A poor corporate governance practice is one of the major factors that contribute to poor performance among the firms in developing countries which includes Ghana. Soludo (Soludo, 2004) posits that, weak corporate governance practice is attributed to factors such as fragile internal control systems, extreme risk taking, override of internal control measures, lack of or non-adherence to bounds of authority, neglect for cannons of judicious lending, nonexistence of risk management processes, inside abuses and fraudulent practices, and these remain a worrying feature of the banking system. Subsequently series of major corporate failures and scandals in the 1990s, made it apparent for something to be done to rein in the way limited companies are directed, controlled and governed. The problem was more prominent with the public limited companies which have directors, some of whom are external. The principal-agent problem came to a head as shareholders anticipations frequently departed extensively from those of directors, who notwithstanding poor performances, awarded themselves weighty annual bonuses which in some circumstances were unmaintainable and undeserved, executive mansions and vehicles, paid-for holidays, and many other mouth-watering fringe benefits.However, it not automatic that those corporate bodies that embarks on good governance processes will perform well or be immune from failure.The current study intends to explore how corporate governance practices impacts on the performance of firms in Ghana. We therefore propose that the corporate governance practices adopted by firms influence firm performance, hence the hypotheses for this study is:

H: Corporate governance practices positively affects firm performance.

The rest of the paper is arranged in the following order; a brief review of the extant empirical literature, the research methodology, presentation of empirical findings, and conclusions.

2 Review of Empirical Literature

This section presents the review of studies on corporate governance and firm performance conducted by earlier researchers to enable us understand and appreciate the current study so as to meet the purpose of the study. Presently, academicians and professionals have shown growing interest in the study of corporate governance which enhances the knowledge of how corporate governance influences firm's management, strategies and performance. Researchers have come out with many definitions of corporate governance and is challenging to come across a generally acceptable definition for corporate governance. The definition may be country, environment or context-specific.Corporate governance is a system by which companies are directed and controlled (Cadbury, 1992). Corporate governance is explained as a set of interactions between an organization's management, the board, owners and other stakeholders in which power is exercised in the management of economic and social resources for enhanced performance and sustainable development (OECD, 2004).It concentrates on the configuration of control mechanisms that attempts to limit problems arising from potential conflict of interest between the different members in the firm, that is, managers, shareholders, employees, creditors and others. Aoki (2000) defines corporate governance as the structure of the privileges and tasks of stakeholders in a firm. It is a system of checks and balances put in place by stakeholders to ensure accountability and socially responsible behaviour of firms (Solomon, 2007).Corporate governance is also explained by Gillan and Starks (2000) as a scheme of laws, rules and issues that regulate operations of a corporation. They further explained that, it refers to the spreading of rights and accountabilities among different members in the organization such as the board of directors, managers, shareholders and other stakeholders. It similarly details the guidelines and processes for making decisions on corporate affairs. After extensive review of various schools of thought on corporate governance definitions, Pillai and Al-Malkawi (Pillai and Al-Malkawi, 2017) conclude that the definition of corporate governance is either shareholder based or stakeholder based. Complete corporate governance makes companies stronger, extra effective and answerable, and supports implementation of good environmental and communal practices. Evidence from literature suggest that, good corporate governance creates investor goodwill and confidence. Gompers et al. (Gompers et al., 2003) stated that, the existence of good corporate governance upsurges the firm's valuations and lifts the bottom line. Claessens and Yurtoglu (Claessens and Yurtoglu, 2013)contends that improved corporate frameworks profit firms through greater access to financing, lower cost of capital, improved performance and more favourable treatment of all stakeholders. Corporate governance enhances corporate disclosure (Gruner, 2002), it ensures detection and analysis of

failure (Parker et al., 2002) and enhances value creation within the firm (Isshaq et al., 2009; Villanueva-Villar et al., 2016). According to Shleifer and Vishny (Shleifer and Vishny, 1997), corporate governance mechanisms guarantee investors in corporations of receiving sufficient returns on their investments. They are of the view that, if these mechanisms are not present or function appropriately, external investors would not lend to firms and firms would be forced to depend completely on their own internally generated cash flows and accumulated financial resources to finance continuing operations and lucrative investment opportunities. In order to reduce agency costs, a good corporate governance scheme should combine some type of large investors with lawful safeguard of both their rights and those of small investors (Shleifer and Vishny, 1997). From the perspective of agency theory, corporate value can be maximized by decreasing agency costs as well as encouraging managers to behave in the interests of shareholders. Accordingly, an essential objective of governance research is to ascertain which precise mechanisms contribute to the boosting of corporate value.Erkens et al. (Erkens et al., 2013) provided evidence that weak corporate governance practices affected the performance of financial firms during the global financial crises.

Sylvie (Sylvie, 2012) investigated the relationship that exist among corporate governance practices or mechanism and firm value, measured by accounting and market data, resorting to a structural approach by using a partial least square regression model, reported that, governance practices such as independent directors on the board, the use of stock options and the frequency of board meetings are significantly and adversely associated with the firm's net book value or income, while most individual governance practices had no significant impact on the firms' market value.Munisi and Randøy (Munisi and Randøy, 2013) concluded that, companies in sub-Saharan African had partially executed good corporate governance practices, and reported a positive link between the constructed index of good corporate governance practices and accounting performance and a negative relationship with that of the market valuation. Their sub-indices reported that, the board of directors and the audit committee are related positively and significantly with accounting performance, with the audit committee associated negatively and significantly with market valuation. Akbar et al. (Akbar et al., 2016) used a more robust methodology, Generalized Method of Moments (GMM) Estimation and reported that,compliance with corporate governance regulations is not a causative factor of corporate performance in the UK, arguing that, results from previous studies showing a positive influence of corporate governance on firms' performance may be influenced as they failed to control for possible endogeneity.

3 Research Methodology

Mouton (Mouton, 2001) views research methodology as concentrating on the research process and the kind of tools and techniques to be applied. Our work takes into account the location of research participants (firms), tools of data collection and time frame for the study. Mixed method approach in form of survey design is adopted along with quantitative, exploratory and explanatory designs to carry out this study. Firms operating in Ghana were considered as the population for the study. The statistical analysis and inferences are based on variables extracted and modelled from the published annual financial and corporate governance reports of 40 firms operating in Ghana.

3.1 Model specification of the regression

The study adopted the regression model by Arshad and Safder (Safder, 2009) for data analysis. The general form of the model is specified as below:

$$LEV_{it} = \beta_0 + \beta_1 (Log\ BZ)_{it} + \beta_2 (\%\ NEID)_{it} + \beta_3 (\%\ CORPDIS)_{it} + \beta_4 (CORPGOV\ \%)_{it} + \beta_5 (ROA)_{it} + \beta_6 (Log\ SZ)_{it} + \varepsilon_t \dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots$$

Where:*LEV = Leverage on corporate governance*
BZ= Board size (Logarithm of total number of board members)
NED= Number of independent Directors
CORPDIS = Corporate disclosure
CORPGOV = corporate governance code
ROA = Return on Assets (company's net earnings divided by its total assets)
SZ = Size of Firm (as logarithm of total assets)
ε= Error Term
β 0 = Intercept of the equation
β = Marginal effect of variable
$FIRPERM_{it} = \alpha + \beta * Y_{it} + \theta_{it}$ corporate governance variables+ φ_{it} control variables $\chi_i + \gamma_t$

+εit …….2

Where:

Y$_{it}$is alternatively ROA$_{it}$andROE$_{it}$, and Return$_{it}$for firm at a time,the firm performance is the natural logarithmof executive pay for i$_{th}$ firm at time t.

The variables for the study serving as a predictor of a firm's performancewere identified as corporate governance practice, number of independent directors, board size, corporate disclosure and corporate governance code. The control variables are number of independent directors, board size, corporate disclosure and corporate governance code.

3.2 Presentation and analysis of data

We used inferential statistic to analyze the data for our work. Analysis of Variance (ANOVA), an inferential statistic was employed to test the data collected and hypothesis formulated. Regression analysis was adopted to explore the link between corporate governance practices and firm performance. The regression model consists of three tables which include the model summary, ANOVA and the coefficient table. The adjusted R^2 in the model summary table provides accurate estimation of the true population value. It is the percent of the variance in the dependent explained by the independents variable, the value of F-ratio explains the overall significance of the model in the ANVOA table. The Beta parameter under standardized coefficients was used to compare and also determined the influence of the independent variable on the dependent variable. The significant value was used to measure the statistic significant contribution of each independent variable.

4 Results of Analysis

The study sought to examine the correlation between corporate governance practices embraced by firms in Ghana and their performance.

4.1 Regression analysis between corporate governance practices and firm performance

The Model summary in Table 4.1 shows the R Square is 0.060 and the Adjusted R Square 0.057 representing 6 percent of the observations explains the model. This is very weak but it may be due to the small sample size used in the estimation.

Table 1   Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.245[a]	.060	.057	1.30020

a. Predictors: (Constant), Corporate governance practices

The ANOVA which is the overall regression model shows F ratio of 17.148 for the regression model, significant at 1% level. This is because p-valve= (0.00) < 0.01. The cumulative effect of the predictors on the dependent variable was significant as reported by the ANOVA in Table 4.2.

Table 2   ANOVA

	Model	Sum of Squares	Df	Mean Square	F	Sig.
	Regression	28.989	1	28.989	17.148	.000[b]
1	Residual	453.059	268	1.691		
	Total	482.048	269			

a. Dependent Variable: Firm performance
b. Predictors: (Constant), Corporate governance practices

The output report indicates that corporate governance practice and corporate governance code are statistically significant at 1% level. Whereas the corporate disclosure was significant at 10% level, the rest of the variables were not significant but the research was to show the path casual effect of the variables on the dependent variable, firm performance. All the variables attained their hypnotized directions of effect which is positive relationship except corporate governance code which shows negative relationship with firm performance. Corporate governance practices explains 24.5% of the variations in the firm performance. Number of independent directors and board size explains about 8% each in the variations. Corporate disclosure account for 31.5% of the changes in firm performance and lastly corporate governance code impacted negatively of about 58%. The results of the study is in line with the findings of Munisi and Rand øy (2013), but contrary to the findings ofAkbar et al. (2016), who reported that corporate governance practice has no effect on frim performance.

Table 3　Regression coefficient

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	4.101	.243		16.887	.000
	Corporate governance practices	.660	.159	.245	-4.141	.000
2	Number of independent directors	.007	.012	.081	.599	.554
3	Board size	0.13	.022	.085	.592	.558
4	Corporate disclosure and	.717	.396	.315	1.809	.080
5	Corporate governance code	-6.706	1.890	-.585	*3.548	.001

a. Dependent Variable: Firm performance

5 Conclusion

The study aimed to explore the impact of corporate governance practices on the performance of firms in Ghana, using Analysis of Variance (ANOVA), an inferential statistic to test the hypothesis formulated. The results revealed that, with the exception of corporate governance code which shows negative relationship with firm performance, the rest of the predictors, corporate governance practices, number of independent directors, board size, and corporate disclosure reported positive association with firm performance. It can be concluded that corporate governance practices contributes to higher profit margins. Therefore, it is imperative for management of firms to work in the interest of shareholders by reducing agency cost as well as practicing effective corporate governance practices to maximise corporate value.

On Language Dilemma and International Promotion Strategies of Chinese University English Websites

Wu Yijing[1], Zhu Hanxiong[2]
1 School of Law, Literature and Foreign Languages, Wuchang University of Technology, Wuhan, P.R. China, 430223
2 School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 350977547@qq.com, wuthxzhu@qq.com)

Abstract: With the penetration of the Internet into all fields of society, major universities in China are also using the Internet as a medium to promote themselves and build their own websites. However, on English websites of some Chinese universities, a large number of errors and inappropriate translations could be found, and the translation quality of university websites urgently needs to be improved. This paper has a systematic study on the English translation of Chinese university websites, sorting out the translation errors that have appeared in the classified university English websites, and contrasting them with the parallel texts of famous American universities, and putting forward some corresponding translation strategies based on Reception Aesthetics.
Key words: English translation of university websites; Reception Aesthetics; Translation errors; Translation strategies

1 Introduction

With the penetration of the Internet into all fields of society, the Internet has become an important carrier of information dissemination and has become an indispensable part of people's work and life. Major universities in China are also using the Internet as a medium to promote themselves and build their own websites, including the corresponding English versions, making them an important window on the external publicity of colleges and universities. However, due to the influence of many factors such as the differences of language and culture between China and western countries, the number of translation errors in university English websites has increased which not only affects the effective external publicity of universities, but also damages the international reputation of relevant universities. Therefore, the research on English websites of Chinese universities is of great significance, and the translation quality of university websites urgently needs to be improved.

Reception Aesthetics is a literary theory and an aesthetic theory based on the Phenomenology and Hermeneutics. In 1987, Yang Wuneng published a paper entitled *The circulation of Hermeneutics, Reception and Recreation* which marked the fact that Reception Aesthetics has been introduced into the field of translation studies in China. Reception Aesthetics shifts the focus of literary theory and aesthetics research from the text to the reader, placing more emphasis on the reader's position in aesthetic activities. English websites of Chinese University are also facing the readers, thus the reader's status shall not be ignored. Many studies on Chinese university English websites have been done from various perspectives. Gao Hui (2009) has a comparative study on the translation of Chinese and American university website profiles based on a self-bulit parallel corpus and comparable corpus. From the perspective of Meme theory, Bao Jing and Yuan Yinning(2013) compare the English translated text of 10 Chinese colleges and universities' profiles with that of ten well-known universities from the Britain and American. They suggest reproducing the language meme of foreign universities' profiles to provide guidance for the text form and text content of the English translation of Chinese colleges and universities' profiles. According to those studies, some translation strategies and existing problems on English websites of Chinese universities can be found out. Some scholars try to use all kinds of theories to guide university websites translation, but it seems very superficial. The present study will look into the existing problems and conduct error analysis in a more systematic way.

2 Research Design

This paper employs qualitative methods, including comparison, induction, analysis, and synthesis for conducting the research. Comprehensiveness, objectiveness, and logicality are the major principles. The paper will analyze the major problems of Chinese university websites translation by comparing with American university websites. Then, based on the theory of Reception Aesthetics, appropriate translation strategies will be suggested to help translators engaged in the university websites translation.

    The paper will analyze the major translation errors on English websites of Chinese universities by comparing with some well-known American university websites as parallel texts, or "*native texts of the same type or genre in different cultures*" (Nord, 2001: 56), in order to ensure the objectivity of the analysis. Then, based on the theory of Reception Aesthetics, appropriate translation strategies will be suggested to help translators engaged in the university websites translation. The research object selected in this paper is the English websites of 30 Chinese "211 Project" universities, which are randomly sampled from 116 "211 Project" universities in China by using the random sampling website (https://www.graphpad.com/quickcalcs/). The reason for choosing "211 Project" universities is that these universities have strong potential for development and demand for outreach, and the status of websites translation is also representative and researchable. The sampling result has been shown in the following Table 1.

Table 1   Random Sampling Result

Sequence	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Group	29	89	51	48	4	81	12	39	41	50	36	105	76	42	90
Sequence	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30
Group	15	14	86	26	17	78	112	99	79	2	8	84	100	38	66

3 Error Analysis

    Profile is one of the most important sections in Chinese university websites, which includes several parts, such as general information, history, message from the president. Readers can look through the profile to get many important and necessary information quickly. So the quality of English translation of profile shall be taken into consideration. According to analyzing errors in profile translations of the 30 Chinese universities, errors can be classified into linguistic errors in translation, cultural errors in translation, pragmatic errors in translation and errors in metric units conversion and layout, and some causes of the translation errors can be preliminarily explored. The proportional distribution of specific translation errors can be found in Figure 1.
Figure 1   Proportional Distribution of Translation Errors

    As is shown in the results above, the most frequently occurred translation errors in the profiles of the 30 universities' English websites are grammatical mistakes, followed by the translation errors of national education projects and special honorary titles, and of layout. For analyzing the proportional distribution of the translation errors, the translator's competence might be the major reason, since the number of grammatical mistakes accounts for the highest proportions. However, the national education projects and special honorary titles are all cultural specific items. It is the translator who has not handled the transfer between the two cultures very well. The translators might have not taken into account the cultural background of target language readers due to their own negligence, or they might not be able to completely interpret the meaning of the source text due to the translator's lack of target language cultural knowledge thus have influenced the target language readers' acceptance of the translation.

    "*Wolfram Wilss(1976) outlines three aspects of translator competence: first, receptive competence in a source language; second, productive competence in a target language; and third, transfer competence between two languages.*" (Chu Dongwei, 2012:20) So a qualified translator is required to have competence in source and target language as well as transfer competence between two languages and two cultures. If the translators' competence is not proficient enough, they may not be able to use both languages flexibly, thus affecting the accuracy and practicality of the translation.

3.1 Linguistic errors in translation

Linguistic errors in translation mainly refer to errors that violate the linguistic norms or conventions of the target language. Although its impact on the translation is not as serious as errors in pragmatic translation and cultural translation, its influence on the effective communication cannot be neglected. Linguistic errors in translation not only affect the fluency and naturalness of the translation, but also reduce the readability and acceptability of the target text, or even seriously affect the effectiveness of the external publicity of university websites. Linguistic errors in translation can be divided into misspellings and grammatical mistakes, where grammatical mistakes include misuse of part of speech, misuse of single and plural forms, and missing sentence components and so on. For example:

(1) After *gruaduation*, students from the base class may has the following jobs: researches in universities or *instituts*, (http://www.ncepu.edu.cn/xxgk/xxjj/index.htm)

(2) As Vice President Member of China Electricity Council, ……to undertake important *researches* and development projects, ……(http://english.ncepu.edu.cn/hdgk/29718.html)

In example 1 the spelling of "graduation" and "institutes" is incorrect. In example 2, the word "research" is an uncountable noun, and cannot add suffix "es", acting as a plural. The same error can be found in many university websites, which have been pointed out by some scholars, but it has not attracted much attention.

3.2 Cultural errors in translation

Translation is not only the communication between two languages, but also the communication between two cultures. Cultural translation errors refer to translations that conflict with the culture of target language in translation. They are the concrete manifestation of pragmatic translation errors. Because of the cultural differences between the source language and the target language, there are no corresponding cultural words or phrases in the target language. Cultural errors in translation of Chinese university websites will be elaborated from the translation of national education projects, honorary titles, political terms, historic culture as well as names and places. As shown in examples below:

(3) It is also one of the "*211 Project" and "985 Project*" universities with full support in the construction and development from the central and local government of China. (http://en.whu.edu.cn/About_WHU1/Overview.htm)

(4) 43 Chair professors invited by "*Cheung Kong Scholar Award Program*" (http://en.hit.edu.cn/about/statistics)

(5) For the past 70 years, the university has kept serving for the main tasks of the Party and the country and stuck to the *Yan'an spirit* in running the school and educating the students. (http://english.bit.edu.cn/AboutBIT/History/index.htm)

According to italics in the above examples, "211 Project" and "985 Project" are important education projects taken by the Chinese government to promote the development of higher education. "Cheung Kong Scholar" is a kind of honorary titles. Yan'an Spirit is a kind of revolutionary spirit created by the Communist Party of China, which related to the historic culture. All of these cultural factors are intended to reach effective external publicity, but they were translated literally without any annotation or explanation. For target language readers who do not have knowledge on Chinese social and cultural background, they are unable to understand the meaning of the important information and affect the effective external publicity.

3.3 Pragmatic errors in translation

In some Chinese universities' English websites, there are often sentences that are very fluent in language expression and also conform to grammar rules of the target languages, but they do not meet the pragmatic rules, which make the target language readers difficult to understand. Pragmatic errors in the English translation of university websites can be divided into chinglish and information redundancy and missing.

"*Chinglish is that misshapen, hybrid language that is neither English nor Chinese but that might be described as 'English with Chinese characteristics'*" (Joan Pinkham, 2012:1) Since the translator focuses too much on the original words and wants to translate the source text word by word. These kinds of translation seem to be faithful to the source text. However, in fact, the true meanings of the source text have been missed. For example:

(6) Dalian University of Technology is the first *formal university of a new type* founded by the Communist Party of China *on the eve of the founding of the People's Republic of China,* for the construction of China's industrial system.

In the example 6, this translation word for word is not necessary. The expression "the eve of" can be omitted and the meaning expressed will be more accurate. "The first formal university of a new type"

will also cause misunderstanding, readers might be wondering whether there are informal universities in China, except the formal universities. Meanwhile, in the parallel texts of overseas university websites, they usually describe their university as "a leading university" and "a research university", and never use "formal" or "informal".

Besides, translation is like writing. It transfers the meanings of the source text to the target text, while the language should be simple, the meaning should be clear. A redundant translation will not only increase the reading burden of target language readers, and will appear unidiomatic which looks like the Chinglish. If the translation is too long, with too many unnecessary words, it will become barriers for readers to read; the omission of important information will also affect the acceptance of the translation, and thus cannot meet the readers' expectations.

(7) At present, it has *an enrollment of* over 56,000 full-time undergraduates and 15,000 full-time postgraduates *enrolled from all over China* as well as 1,600 *international students from over 60 countries and regions.*(http://english.zzu.edu.cn/gaikuang_en.htm）

(8) The University, which is based in Cambridge and Boston, Massachusetts, has an enrollment of over 20,000 *degree candidates, including undergraduate, graduate, and professional students.* (https://www.harvard.edu/about-harvard)

In the translation of example 7 and 8, when the number of students is displayed, the term is too cumbersome. The expression "has an enrollment of" and "enrolled from all over China" have the same meaning, which is too redundant. Reference to the parallel text of Harvard University, the phrase "degree candidates" could directly be used before the specific type of students.

In addition to the three translation errors of language, culture, and pragmatics, errors in metric unit conversion and layout on the English websites of Chinese universities have also been found. Although such errors are not serious enough to affect the acceptability of the translation, it will still cause the translation to be not fluent. For example, there is "mu" in traditional Chinese metric units. The translation should retain both the traditional metric units of Chinese language and providing extra information on its counterparts in international metric units, indicating that the translators have taken into account the reception ability of target language readers.

4 International Promotion Strategies from the Perspective of Reception Aesthetics
4.1 Emphasis on the transfer of pragmatic information in translation

In the process of translation, the translator is first a reader of the source text, and communicates with the source text by using his horizon of expectations. The translator understands and interprets the information contained in the source text according to his pre-existing ideas, culture, knowledge, abilities, experiences, habits, etc., and concretizes the "blanks", "indeterminacy" and "gap" of the source text. The translator's horizon of expectations of his aesthetic experience has determined his aesthetic perception and understanding direction.

After a careful reading and comprehension of the text, the translator shall try his best to realize the fusion of his horizon of expectations with that of the source text, so that the translator can understand the meaning of the source text maximally and interpret them in translation as much as possible. This requires translators to have sufficient social and cultural knowledge of the source language and the target language, as well as bilingual and cultural transfer competence.

Although pragmatic errors in translation are the most difficult translation errors to be resolved and have the greatest impact, language and cultural errors in translation can lead to pragmatic errors. The reason is that the pragmatic meaning of the source text cannot be expressed in the translation; as a consequence the translation will be inaccurate, thus affecting the reception of target language readers, where the target language readers may not achieve the same text effect with that of the source language readers. Therefore, the translation of cultural specific items on university websites shall be processed appropriately. Translation methods such as explanation, omission and amplification can be adopted to accurately transfer the pragmatic information of cultural items in translation.

4.2 Emphasis on the reception level of the target language readers

As a recipient of a translated work, the reader is the ultimate part in the realization of translation values and meaning. Only after the readers accomplish their reading activities can the meaning of the translation be truly realized. However，the readership is a very complex group, "*who have been affected by too many factors: nationality, race, gender, age, occupation, level, hobby, experience, pursuit, etc. Even the same reader may often have various mental condition and aesthetic requirements in different time and space.*" (Zhang Boran, 2002: 10). Different readers will have different horizon of expectations,

different psychological motivation and needs, different emotion and affection, as well as different aesthetic needs. So they will have different requirements for translation. Therefore, the translator must consider the implicit readers' horizon of expectations, and the degree of fusion of their horizons of expectations and the translation; they shall also lay emphasis on the reader's aesthetic taste and reception level.

At the same time, the translation should conform to the cultural norms of the parallel texts of the English-speaking countries. On the one hand, the parallel texts can help the translators to properly process the content of the source text and delete information that are useless to the target readers. On the other hand, the parallel texts can serve as reference texts for translations. In order to meet the target language readers' horizon of expectations, needs of psychological motivation, emotion and information, as well as the reception ability and reading habits, there are three methods for adjustment that is simplification, conversion and restructuring.

5 Conclusion

Based on error analysis from the perspective of Reception Aesthetics, this paper has proposed some translation strategies from target language readers' horizon of expectations and translators' considerations for target language readers, including emphasis on the transfer of pragmatic information in translation and the reception level of the target language readers. Translation techniques, such as explanation, omission, amplification, simplification and restructuring, can be used to promote the quality of university website translation. Besides, translators need to improve their bilingual competence and cultural competence of both the source language and the target language as well as the transfer competence between the two languages. Meanwhile, the web texts should be paid attention to its characteristics of conciseness and the use of hypertext structures.

However, there are still some limitations of this paper. First, the research object selected in this paper is not comprehensive and the random sampled universities are not enough to represent the present situation of English translation of all university websites in China. Second, the examples presented are not comprehensive enough. Third, because of the author's limited academic attainments and most of the research materials come from books and the Internet, which cannot obtain the most direct feedback from the target language readers and may not be absolutely objective.

Therefore, the expectation is that more attentions shall be paid to the study of English translation of Chinese university websites in the future, and researchers who wish to engage in this field can make improvements to the above problems, propose more objective and effective solutions to the problems arising therein, and study the Chinese university English websites in a more systematic way so as to promote quality of Chinese university English websites for achieving effective external publicity.

Research on Financial Performance Evaluation Index System in Colleges and Universities

Li Yu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(Email: 1875409972@qq.com)

Abstract: How to quantify and evaluate financial performance of colleges and universities scientifically is always research hotspot in politics field and academic field. The Paper selects 5 general indexes and 18 sub-indexes to evaluate financial performance of colleges and universities, and traces out causal graph of all performance indexes by Vensim software and endows weight to all performance indexes by applying percentage model and correlation judgment matrix and constructs index system of financial performance of colleges and universities finally based on full consideration of scientificity, flexibility, relative property and integrality, etc. It is found out by research that the proportion of financial appropriation in total income, graduation rate of graduating students and annual increase percentage of teaching expenditure investment have great weight contribution in evaluating financial performance of colleges and universities, which shows that these indexes are important to evaluate financial performance of colleges and universities. Therefore, suggestions to improve graduation rate of graduating students by utilizing financial appropriation are provided for reference significance of improving financial performance of colleges and universities.

Key words: Financial performance of colleges and universities; System dynamics; Judgment matrix; Evaluation index system;

1 Introduction

General Secretary Xi proposed to develop educational industry in priority, deepen educational system reform and accelerate education modernization in report of the 19th National Congress of the Communist Party of China. In the same year, the Ministry of Education proposed to implement effectively and control comprehensively to integrate performance concepts into various financial systems. Since strategy of revitalizing the country through science and technology and strategy of reinvigorating China through human resource development were put forward in 1990s, the government has increased continuously investment and attention degree to educational business. As the cradle of personnel training, universities should demonstrate the effect of demonstration. Improve the utilization efficiency, efficiency and efficiency of educational resources (Wu Yingjuan, Qin Huimin, 2013), and train high-quality talents for the country. Li Rui, a scholar, puts forward that financial performance evaluation in Colleges and universities is based on a comparative analysis of the financial status, profitability and operational ability of universities. (Li Rui, 2014) at present, there are still many problems in the construction of financial performance evaluation index system in Chinese universities. If the system put forward by relevant scholars in 2012 lacks the corresponding legal support, lacks integrity and lacks unified standards. (Xu Yueli, 2012) Fu Qiang and other scholars also stressed that the construction of the evaluation index system of financial performance should meet the requirements of science, flexibility, contrast and integrity. (FU Qiang, 2013) therefore, how to quantify the efficient use of educational funds and optimize the allocation of educational resources has always been a hot topic in the political, educational and academic circles.

The Paper has collected and sorted out financial performance index data of 75 colleges and universities that are directly subordinate to Ministry of Education and has borrowed and integrated relevant research achievements of domestic and foreign excellent scholars and has constructed research system to evaluate the performance index by utilizing system dynamics, centesimal system and correlation judgment matrix (Han Fengmei, 2016) to evaluate financial performance of all colleges and universities in scientific quantitative angle, explore route to promote financial performance of colleges and universities and put forward reasonable suggestion for theory reference significance of improving financial performance of colleges and universities.

2 Existing Problems of Financial Performance Evaluation Index System for China's Colleges and Universities

2.1 Colleges and universities' financial performance evaluation system lacks the corresponding

legal supports

Nowadays Chinese colleges and universities' financial performance evaluation index system is determined by governments at all levels according to the relevant national policies and strategies. Since the policies and strategies can be adjusted and updated due to the social and economic developments, the corresponding financial performance evaluation index system is time-sensitive and uncertain. The newly-established evaluation system can be abolished when some new policies are launched. Laws, as the behavioral regulations, are guaranteed by the coercive force of the state, with some features, such as preciseness, ever-lasting and general applicability. Currently, laws and regulations directly relevant to the financial performance evaluation haven't been enacted in China. The imperfections in the legal construction reduce the validity of evaluation system, and its implementation is also greatly restrained.

2.2 Colleges and universities' financial performance evaluation lacks integrity

In evaluating the financial performance, the unavailability of some data leads to the lack of integrity of evaluation results. Besides, some indexes are unlikely to be quantitatively processed, such as the reputation of school. The lack of those index and data will cause big flaws of the whole evaluation system.

2.3 Colleges and universities' financial performance evaluation lacks unified standards

Colleges and universities have different standards of selecting indexes to evaluate the financial performance (Xu Yueli, 2012). Due the differences in size, majors and infrastructure, some problems may occur regarding data selection and standardized processing in computing indexes and data. For example, the graduation rate of current year's graduates can be used to evaluate the quality of graduates, or the monthly salaries of current year's graduates after their graduation can be used to evaluate this index. The selection of different data corresponds to the different evaluation standards. If the colleges and universities use no quantitative standards to evaluate and compare this index, the comparison has no significance.

3 Empirical Research

3.1 Index selection

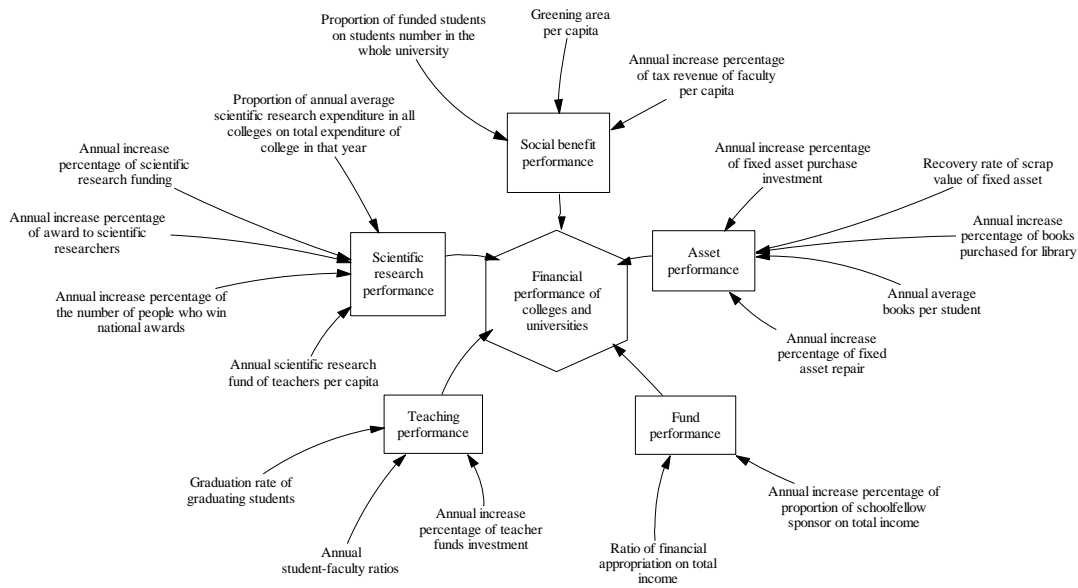
A large number of domestic and foreign documents have been collected in this paper. Based on the index system established by relevant scholars, in consideration that construction of financial performance evaluation index system of colleges and universities shall meet requirements of scientificity this paper has added several new indicators. After screening and screening, 5 omnibus indicators were selected, including scientific and research performance, asset performance, teaching performance (Meng Fang, 2010), fund performance and social benefit performance (Gu Xiaoyu, 2018). Sub-indexes are set for each general index. Sub-indexes of science and research performance include: annual increase percentage of science and research investment, annual increase percentage of the number of people for national awards, proportion of annual average science and research expenditure of all colleges on total expenditure of the college in that year, annual science and research expenditure of teachers per capita and annual increase percentage of researchers. Sub-indexes of fund performance include: annual increase percentage of fixed asset purchase investment, annual increase percentage of fixed asset repair, recovery of scrap value of fixed assets, annual average number of books per student and annual increase percentage of book purchase in library. Sub-indexes of teaching performance include: graduation rate of graduating student, annual ratio of teacher to student and annual increase percentage of teaching expenditure investment. Capital performance indexes include: proportion of financial appropriation on total income, annual increase percentage of financial appropriation and annual increase percentage of school fellow support on total income. Sub-indexes of social benefit performance include: proportion of financed students on the number of students in whole school, green area per capita and annual revenue increase percentage of teaching and administrative staff per capita. To describe relation among all performance indexes, this paper has described causal relationship among financial performance, general index and sub-index by adopting causal relationship diagram in system dynamics, as shown in Figure 1.


Figure 1   System Dynamics-Causal Graph

Table 1   Construction of Financial Performance Evaluation Index System in Colleges and Universities

	General index	Sub-index	Calculation standard
Financial performance evaluation index system in colleges and universities	Scientific research performance (A_1)	Annual increase percentage of scientific research funding (A_{11})	(Investment amount of scientific research fund in that year - investment amount of scientific research fund in last year)/investment amount of scientific research fund in last year
		Annual increase percentage of the number of people who win national awards (A_{12})	The number of people who win national awards in that year - the number of people who win national awards in last year/the number of people who win national awards in last year
		Proportion of annual average scientific research expenditure in all colleges on total expenditure of college in that year (A_{13})	$\sum$(scientific research funds expenditure of colleges in that very year)/total number of colleges in the university
		Annual scientific research fund of teachers per capita (A_{14})	Total of scientific research funds expenditure in that year/total of teachers in the university in that year
		Annual increase percentage of award to scientific researchers (A_{15})	(Award to researchers in that year – award to researchers in last year) / award to researchers in last year
	Asset performance (A_2)	Annual increase percentage of fixed asset purchase investment (A_{21})	(Investment of fixed asset purchase investment in that year – investment of fixed asset purchase in last year)/investment of fixed asset purchase in last year
		Annual increase percentage of fixed asset repair (A_{22})	(Fixed asset repair expense in that year – fixed asset repair expense in last year)/fixed asset repair expense in last year
		Recovery rate of scrap value of fixed asset (A_{23})	Recovery rate of scrap value of fixed asset in that year/original value of fixed asset

Continual Table 1

	General index	Sub-index	Calculation standard
Financial performance evaluation index system in colleges and universities	Asset performance (A_2)	Annual average books per student (A_{24})	Total number of books in college library in that year/total number of students in college in that year
		Annual increase percentage of books purchased for library (A_{25})	(The number of books in library in that year – the number of books in library in last year)/ the number of books in library in last year
	Teaching performance (A_3)	Graduation rate of graduating students (A_{31})	(The number of people of graduating students accrued in that year – the number of students for graduation delay – the number of students who cannot graduate normally for other reasons)/the number of graduating students accrued in that year
		Annual student-faculty ratios (A_{32})	The number of faculty in that year/students enrollment in that year
		Annual increase percentage of teacher funds investment (A_{33})	(Teaching funds investment in that year – teaching funds investment in last year)/teaching funds investment in last year
	Fund performance (A_4)	Ratio of financial appropriation on total income (A_{41})	Financial appropriation amount/(financial appropriation + undertaking revenue + schoolfellow contribution amount + social donation)
		Annual increase percentage of proportion of schoolfellow sponsor on total income (A_{42})	(Proportion of schoolfellow sponsor on total income in that year - proportion of schoolfellow sponsor on total income in last year)/ proportion of schoolfellow sponsor on total income in last year
	Social benefit performance (A_5)	Proportion of funded students on students number in the whole university (A_{51})	The number of students funded in that year/the number of students in university in that year
		Greening area per capita (A_{52})	University greening area/$\sum$ (the number of faculty in that year + number of students in that year)
		Annual increase percentage of tax revenue of faculty per capita (A_{53})	$\sum$total tax payment of faculty in that year/$\sum$the total number of faculty in that year

3.2 Weight allocation

Considering that the influence degree of all general indexes to financial performance is different and all sub-indexes occupy different loads on general index evaluation, different weights are endowed to all general indexes and all sub-indexes to reflect its important degree. Because distribution of all index weights is not easy to be confirmed and has very strong subjectivity, to reach uniform quantitative criteria (Jin Yan, 2011), this paper endows all-level index weight by adopting centesimal system based on analyzing a lot of data and literatures and distribution condition and reason of weight are as follows.

In 5 general indexes, teaching performance and scientific research performance can better reflect actual teaching level of colleges, but teaching level influences indexes, such as graduation rate of graduating students, annual increase percentage of teaching funds investment and general income of financial appropriation, etc. Thereby, teaching performance and scientific research performance can directly or indirectly influence financial performance of colleges and influence on financial performance of colleges is more profound, so this Paper endows 20% weight of the two indexes. Asset performance reflects hard power of facility in colleges and level of facility equipment will influence teaching performance and scientific research performance to certain degree; therefore, 30% weight is endowed. Fund performance reflects income and expenditure condition of college funds and can better reflect operation ability of colleges compared with social benefit performance, therefore, 18% weight is

endowed to fund performance and 12% weight is endowed to social benefit.

Because correlation of sub-index under all general indexes is significant, this paper endows weight to all sub-indexes by adopting correlation judgment matrix (Wang Shihong, Su Qianqian, 2017). See Table 2-6 specifically.

Table 2   Sub-index Judgment Matrix of Scientific Research Performance

Index	A_{11}	A_{12}	A_{13}	A_{14}	A_{15}
A_{11}	1	0.5	0.33	0.25	2
A_{12}	2	1	0.25	0.2	1
A_{13}	3	4	1	0.5	2
A_{14}	4	5	2	1	3
A_{15}	0.5	1	0.5	0.33	1

Table 3   Sub-index Judgment Matrix of Capital Performance

Index	A_{21}	A_{22}	A_{23}	A_{24}	A_{25}
A_{21}	1	0.5	2	0.33	0.33
A_{22}	2	1	0.5	0.25	0.25
A_{23}	0.5	2	1	0.33	0.33
A_{24}	3	4	3	1	2
A_{25}	3	4	3	0.5	1

Table 4   Sub-index Judgment Matrix of Teaching Performance

Index	A_{31}	A_{32}	A_{33}
A_{31}	1	4	3
A_{32}	0.25	1	0.2
A_{33}	0.33	5	1

Table 5   Sub-index Judgment Matrix of Fund Performance

Index	A_{41}	A_{42}
A_{41}	1	5
A_{42}	0.2	1

Table 6   Sub-index Judgment Matrix of Social Benefit

Index	A_{51}	A_{52}	A_{53}
A_{51}	1	4	3
A_{52}	0.25	1	0.33
A_{53}	0.33	3	1

Value in relevant judgment matrix shows important degree of horizontal index compared with longitudinal indicators. Therefore, weight of all sub-indexes in general index and financial performance index evaluation can be calculated and calculation formula is:

Weight of certain sub-index in corresponding general index=∑Important degree of the sub-index on rest sub-indexes/∑Important degree of all sub-indexes on rest sub-indexes

Weight of certain sub-index on financial performance evaluation=Weight of the sub-index on corresponding general index × Weight of corresponding general index of the sub-index on financial performance index evaluation

Table 7   Weight Distribution Table of Financial Performance Evaluation Index System in Colleges and Universities

	General index	Weight	Sub-index	Weight of sub-index on general index	Weight of sub-index on financial performance evaluation	Ranking
Financial performance evaluation index system of colleges and universities	A_1	0.2	A_{11}	0.095	0.0190	12
			A_{12}	0.106	0.0212	10
			A_{13}	0.294	0.0588	8
			A_{14}	0.433	0.0866	4
			A_{15}	0.072	0.0144	13

	A_5	0.12	A_{51}	0.642	0.0770	5
			A_{52}	0.053	0.0064	16
			A_{53}	0.305	0.0366	9

4 Results

As shown in Table 7, it can be known that proportion of financial appropriation on total income and weight of financial appropriation on financial performance evaluation has reached 17.32% and the weight ranks the first, which shows that the index is representative in evaluating financial performance of colleges and universities. However, weight of greening area per capita on financial performance evaluation is 0.64% and weight ranks the No.16 and weight in financial performance evaluation of colleges and universities is the minimal, which shows that persuasion of the index is not strong enough when evaluating financial performance of colleges and universities and shall not be used separately. Weights of graduation rate of graduating students and annual increase percentage of teaching funds investment on financial performance evaluation index system of colleges and universities are respectively 16.44% and 12.51%, ranking No.2 and No.3, which shows that contribution rate of the two indexes to construction of index system is relatively large and the two indexes are more persuasive on evaluating financial performance of colleges and universities compared with other indexes. Annual increase percentage of proportion of schoolfellow sponsor on total income and weight of annual student-faculty ratio are respectively 0.68% and 1.05%, which shows that evaluation influence of the two indexes on financial performance is very small compared with that of other indexes.

5 Conclusion

This paper has selected 5 general indexes of scientific research performance, asset performance, teaching performance, fund performance and social benefit performance and annual increase percentage of scientific research funds by taking 75 colleges and universities directly subordinate to the Ministry of Education as research objects. Mechanism diagram of casual relationship of financial performance of colleges and universities and all general indexes and sub-indexes is deduced by casual relationship and weight is endowed to general index and all sub-indexes by establishing percentage model and correlation judgment matrix and financial performance evaluation index system of colleges and universities is constructed finally. It is found out by research that contribution rate of proportion of financial appropriation of colleges and universities on total income is the maximal compared with the whole evaluation system and proportion of annual increase percentage of graduation rate and teaching funds of graduating students ranks the second when evaluating financial performance of colleges, which shows that the three indexes have very strong credibility when evaluating financial performance of colleges and universities. However, greening area per capita is the minimal compared with the whole evaluating system and accumulated weight contribution rate of the index with annual increase percentage of schoolfellow sponsor on total income and annual student-faculty ratio is only 2.37%, which shows that credibility of the three indexes in evaluating financial performance of colleges and universities is not strong and performance of colleges and universities can be evaluated by support of other indexes with larger weight.

In the existing research, the proportion of the income of the teaching activities in the total income

generally believes that the contribution rate of the financial performance index system is the largest, while the annual growth rate of the scientific research activities is the smallest. The reason for the difference between the conclusion of this paper and the general research conclusion lies in the view that the financial appropriation has the largest proportion in the sources of funds, and it can represent the performance of funds more, thus giving it a greater weight. And the performance of social benefit is also a part of financial performance. Therefore, this paper has added social efficiency performance to build a financial performance evaluation system on the basis of the existing research. Through the quantitative calculation, the proportion of per capita afforestation area in social benefit performance is the smallest in the whole system.

Therefore, this Paper puts forward the following suggestions for improving financial performance of colleges and universities. Make use of financial appropriation efficiently. The Ministry of Education and the Ministry of Finance adopt quoted special subsidy mode for financial appropriation of colleges of universities. No matter quoted subsidy or special subsidy, colleges and universities all implement in place and record income and expenditure condition per fund in details and apply financial appropriation to practical place. Improve graduation rate of graduating students. Graduation rate of graduating student is influenced by the number of graduating students accrued and the number of students who cannot graduate normally for various reasons; because the number of graduating students accrued in that year cannot be changed, improvement of graduation rate of graduating students can be implemented by reducing the number of students who cannot graduate on schedule for various reasons. Try to avoid graduation delay of students for objective factors by strengthening management to lessons and life of students. Increase investment of teaching funds phase by phase. Sufficient funds shall be invested to teaching, one of the most important businesses in colleges and universities to ensure health and continuous proceeding of teaching.

Abstract: The export-led growth hypothesis is most likely to be an option of creating national competiveness of economies. This paper employs the Autoregressive Distributed Lag (ARDL-Bounds) and Granger causality to analyze time series over the period 1990-2016.   The ARDL results present the long run nexus between variables and granger causality only testifies one-way causation running from exports to economic growth which implies that exports act as initiator factor not as transit factor to economic growth as FDI doesn't neither granger cause exports nor economic growth. Based on findings, the export-led growth hypothesis is confirmed for the case of Rwanda. Making exports diversification and exports quality policies should be promoted as well as policies that induce FDI to go for imports substitutions or for exports production which will reduce the current large trade deficit otherwise the adopted wide openness policies can will not be rationally exploited.
Key words: Exports; Economic growth; FDI; Rwanda

1 Introduction

The importance of exports to spur economic growth has widely been a matter of researchers over time till today. Illuminating this linkage is valuable for developing countries in order to serve them in their development plans. Despite disagreements in research findings the positive linkage of exports-growth nexus got a good number of supports. Most of researchers, advocate that best exporting practices and trade openness induce economic growth through more specialization that sustains the comparative advantage, more innovative ideas, large market size and technological progress (J. Aboret al.,2008).A big number of researches employing both time –series or cross-sectional   data has been focused too much on exports -economic growth long- run nexus (Anne O. Krueger, 1978; Fosu, 1990; Jarreau & Poncet, 2012; Yee, 2016;   Fatemah & Qayyum, 2018). However, a significant number of researchers stated that ignoring the direction of causality in the relationship studies may mislead policies formulation and leads sometimes to adverse results.

To fill this gap of knowing ways of causation between exports and economic growth was vital in their works of (Ahmad & Kwan,1991;Szkorupová, 2014; Tekin, 2012; Foon,W., & Ozturk, 2015; Mahmoodi & Mahmoodi, 2016). Knowing where the causality runs from between exports and economic growth, successfully serves in crafting appropriates exports policies that incite the economic growth.

Although, numerous studies rigorously examined the long–run relationship and causality between exports, FDI and economic growth; the context of checking the effects of leading economic strategies that an economy is applying towards the economic growth was not much considered while it is important to policy makers to know how the economic strategies that they believe are engine of the growth are rewarding and influencing other factors of growth.

However, this work intends to verify the export-led growth hypothesis in the context of open economy where FDI is expected to play a vital role to empower the exports capacity and economic growth through availing finance, acquiring new technologies and know-how by less developing countries. It is essential to study how FDI affect the interactions between exports and economic growth in Rwanda as since 2000, Rwanda adopted open up economic policies Rwanda has adopted   open up in order to become more business friendly place. To achieve this goal, Rwanda became a member of different economic integration communities at regional and international level and has done various investment reforms in order to attract foreign direct investments such providing investment incentives to investors according to their sector of activity. As results of those reforms, the global competitiveness report 2015- 2016, ranked Rwanda the 3rd country of fast growing economy after Mauritius and South Africa and World Bank Doing business report ranked in 2016 as 2[nd]in Africa. Even if the Rwanda's economy recently reported a large trade deficit but the value of exports increased and kept the positive trend as per World Bank database 2016.

In addition to the contribution made by other researchers in this field, this paper aims to add to the literature in two aspects. First, to employ foreign direct investments (FDI) promotion policies context in

order to appraise and argue how much exports affect economic growth. Second, this work wishes to enlarge the realistic literature by presenting the existing and current status of variables as well as providing recommendations in order to assist policies formulation process in order to achieve the middle income level that Rwanda has planned to achieve by 2020.

2 The Theoretical Debate on Exports-Led Growth

There exists a huge amount of empirical evidences study the nexus between FDI and exports, exports and economic growth as well as the existence of linkage between the three variables in various contexts. At the country level, (Chaido. et al.; 2014) found a bidirectional linkage between exports and economic growth in Croatia; (Szkorupová, 2014) found the same results in Slovakia. At cross-country level, (Tekin, 2012) found that exports cause GDP in some least developed countries under study. Chia Yee Ee (2016) found exports-led growth hypothesis valid in Sub-Saharan African Countries. The export-led growth hypothesis is empirically witnessed by numerous studies in different scenarios but the emphasis on the source of exporting capacity was not extensively verified especially for less developing countries. This study seeks to check if exporting capacity that spurs growth is driven by FDI in country like Rwanda that has prioritized the trade and economic liberalization.

3 Data and Methodology

Normally less developed countries open up when they want to attract FDIs, so that they can gain either through imports substitution or sophisticated exports production due to learning from higher competencies that foreign companies have or simply local companies imitate new ideas from strong foreign companies. Advanced technologies from MNCs which will spur growth through job creation, increase of aggregate demand and it will correct the persistent trade deficit which has negative impact even on the value of domestic currency. In order to clearly figure out the contribution of this work, the research structure is designed in a way to check if the efforts made by Rwanda to attract foreign direct investments result into economic growth through empowering export capacity. It is useful to know whether there exist interactions between variables under the study and how they affect each other in order to assist the accurate economic growth policies formulation. To test the hypothesized study, the following hypotheses are arranged as follow:

H1: The economic growth resulted from empowered exports capacity by FDIs. In the literature researchers evidenced that FDI may affect economic growth through promoting exports (Baliamoune-Lutz, 2004; Zhang, K. H. (2006); Khan, 2007). It means that policies regarding exports promotion have to care about FDIs policies in Rwanda.

H2: Exports affect growth independently without sourcing from FDI. In this case the exports promote economic growth due to various exports promotion policies initiated by the country itself(Fatemah & Qayyum, 2018) It means that exports promotion policies and FDIs policies works independently to yields growth. Reference made on (Szkorupová, 2014), the model is specified as follow:

$$\text{Light} = \alpha 1 + \varphi \text{LEXPt} + \Psi \text{LFDIt} + \varepsilon t \qquad (1)$$

Where, (Y_t) proxies real gross domestic product per capita, (EX) stands for exports and (FDI) represents foreign direct investment net inflows serve as a conditional factor as the factor of the hypothesized study. The φ, Ψ are coefficients of independent variables, α= constant, L=logarithm ε = error term, study time series data expressed in millions of American dollar for 1990-2016 sources from World Bank database 2016.

3.1 Methodology

In order to verify the hypothesized study, the ARDL-Bounds and Granger causality methods are to be used.

3.1.1 Autoregressive Distributed Lag (ARDL-Bounds)

This article utilizes Autoregressive Distributed Lag (ARDL-Bounds) testing approach introduced by (Pesaran et al.,2001) as advantageous to analyze variables with mixtures of level of integration (I(0) or I (1) and it provides efficient and consistent test results in small and large sample sizes. The ARDL model is arranged as follow:

$$\Delta LYt = \alpha 1 + \sum_{i=1}^{p1} \beta 1i\Delta LYt\text{-}i + \sum_{j=0}^{q1} \varphi 1j\Delta LEX1t\text{-}j + \sum_{k=0}^{r1} \Psi 1k\Delta LFDI2t\text{-}k + \gamma 1LYt\text{-}1 + \gamma 2LEXt\text{-}1 + \gamma 3FDIt\text{-}1 + \varepsilon 1t \quad (2)$$

The long run among variables is tested by F-test where joint significance of the coefficients of

lagged variables is checked. The absence of long-run relationship between the variables is (Ho: ɤ1= ɤ2= ɤ3=0) while the existence of long run relationship among variables is proved by the rejection of Ho if F-value > upper bound, if F-value < lower bound the Ho is held which means the non-long run relationship among variables while F-value≥ lower bound and ≤ upper bound, then the decision is inconclusive. Once long run exists, the next step is the estimation of short run and long run relationships stated as follow:

$$\Delta LY_t = \alpha2 + \sum_{i=1}^{p2} \beta2i\Delta LYt\text{-}i + \sum_{j=0}^{q2} \phi2j\Delta LEXt\text{-}j + \sum_{k=0}^{r2} \Psi2k\Delta LFDIt\text{-}k + \omega ECTt\text{-}1 + \varepsilon2t \tag{3}$$

$$LYP_t = \alpha3 += \sum_{i=1}^{p3} \beta3iLYt + \sum_{j=0}^{q3} \phi3jLEXP_t\text{-}j + \sum_{k=0}^{r3} \Psi3kLFDIt\text{-}k + \varepsilon3t \tag{4}$$

Where Δthe difference operator, ω is the coefficient of error adjustment term that expresses how quick variables back to the equilibrium and it should be statistically significant of negative.

3.1.2 Causality Analysis

The vector error correction modeling of Granger (1987) is employed to verify the ways of causality. The error correction models are estimated based on residuals of long run model in Equation (4). Therefore, the VCE equations: 5, 6 and 7 are used to test the direction of causality among variables:

$$\Delta LY_t = \alpha4 + \sum_{i=1}^{p4} \beta4i\Delta_{LYt\text{-}i} + \sum_{j=0}^{q4} \phi4j \Delta LEXt\text{-}j + \sum_{k=0}^{r4} \Psi4k\Delta LFDIt\text{-}k + \varepsilon4t \tag{5}$$

$$\Delta LEXt = \alpha5 + \sum_{i=1}^{p5} \beta5i\Delta_{LYt\text{-}i} + \sum_{j=0}^{q5} \phi5j \Delta LEXt\text{-}j + \sum_{k=0}^{r5} \Psi5k\Delta LFDIt\text{-}k + \varepsilon5t \tag{6}$$

$$\Delta LFDIt = \alpha6 + \sum_{i=1}^{p6} \beta6i\Delta_{LYt\text{-}i} + \phi\Delta LEXt\text{-}j + \sum_{k=0}^{r6} \Psi6k\Delta LFDIt\text{-}k + \varepsilon6t \tag{7}$$

The error terms, ε_{4t}, ε_{5t}, ε_{6t} are autonomously and normally distributed with zero mean and constant variance. The null hypotheses rejection shows the meaningful impact of independent variables to the dependent variable.

4 Empirical Results
4.1 Unit root test for time series
The Augmented Dickey- Fuller (ADF) test helps to know the level of integration as a condition for using bound test.

Table 1　Results of Stationarity Test

Variable	At level	At First Difference	Conclusion of Stationarity
LY	- 3.74**	-	Integrated at level
LEX	-	-4.02***	Integrated at First Difference
LFDI	-	-8.72***	Integrated at First Difference

*, ** and *** indicates rejection of the null hypothesis of unit root at 10%, 5% and 1% significant level, respectively.

4.2 The analysis of ARDL bound test approach
The ARDL results prove long run relationship between real gross domestic product s and FDI. The calculated F-statistic of **7.00** is high than the upper bound critical value of 6.36; thus the no cointegration hypothesis is rejected even bellow at 1% level of significance.

Table 2　Results of ARDL Bound Test

Estimated equation	LY =f(LIEX,LFDI)	
Test Statistic	Value	k
F-statistic	7.002127	2
Critical Value Bounds		
Significance	Lower bound(I0)	Upper Bound (I1)
10%	3.17	4.14
5%	3.79	4.85
2.5%	4.41	5.52
1%	5.15	6.36

4.3 Cointagration results

Based on the ARDL cointegrating equation results, exports affect in long and short run the economic growth in Rwanda as well as FDI do. The outcome of this work supports. The disequilibrium will be annually adjusted at the rate of 45.5% per table 3.

Table 3   ARDL Results for Short Run and Long Run

Long run relationship among variables :$LY_t = 4.8752 + 0.1690LEX_t + 0.0834LFDI_t$				
Variable	Coefficient	Std. Error	t-Statistic	P-Values.
LEX_t	0.168976	0.079145	2.135022	0.0453
$LFDI_t$	0.083382	0.031333	2.661142	0.0150
	4.875152	0.396357	12.299895	0.0000
Short run relationship among variables				
CointEq(-1)	**-0.455578**	0.114171	-3.990321	0.0007
$D(LEX_t)$	0.076982	0.042833	1.797264	0.0874
$D(LFDI_t)$	0.056993	0.008560	6.658409	0.0000

4.4 Causality results

The occurrence of relationships by ARDL approach indicates that there must be one way or two ways Granger causality among proposed variables in equations (5), (6) and (7). The Granger causality findings are partially similar to results of (Mahmoodi, 2016). In this study, exports revealed unidirectional granger causality to economic growth that contradicts the hypothesized idea that Rwanda's exports are empowered by FDI in order to promote the economic growth comparatively results validated the hypothesis that exports independently affect economic growth as per findings of Zhang, K. H. (2006). The table 4 indicates results of Granger Causality among proposed variables.

Table 4   Results of Granger Causality Test

Null hypothesis	obs	F-Statistic	Prob.
LFDI does not Granger Cause LY	24	0.30715	0.7391
LY does not Granger Cause LFDI			
LEXP does not Granger Cause LY	**25**	**3.13640**	**0.0653**
LY does not Granger Cause LEXP		1.03779	0.3725
LEX does not Granger Cause LFDI	24	1.8917	0.1781
LFDI does not Granger Cause LEX		0.25540	0.7772

Note: ***, **, * are 1%, 5%and 10% significance levels, respectively

4.5 Results of diagnostic tests

To keep away from the miss-specification of the model, diagnostic tests for residuals and stability tests have been performed. The results of diagnostics tests revealed the following:(1) The strong stability and consistency of parameters for the model, as are rely on the plot of 5% critical bound by CUSUM proposed by Brown et al. (1975), (2) Absence of serial correlation up to the 2nd lag with F-statistics of 1.128822 and probability of 0.2483 greater than 10% level of significance. (3) The residuals were found normally distributed under Jarque-Bera normality test of 4.41 with probability of 0.119797 which is greater than 10%, (4) The Wald test confirmed that coefficients of independent variables jointly affect the dependent variable with F-statistic of 59.28and probability of 0.0000.

5 Conclusion

This paper intended to study the exports-growth hypothesis under condition of FDI in Rwanda for the sample period of 2000-2016. The ARDL bound test has confirmed the short and long run relationship between Economic growth, exports and FDI but granger causality test rejected that causation of exports to the economic Growth is not influenced by FDI. Making exports diversification and exports quality policies should be promoted as well as policies that induce FDI to go for imports substitutions or for exports production which will reduce the current large trade deficit otherwise the adopted wide openness policies will not be rationally exploited.

Study on the Social Impact of Share Economy on Youth Groups Base on Three-dimensional Reshaping Model

Yue Fengli

Commission for Discipline Inspection Wuhan University of Technology, Wuhan, P.R.China, 430070
（E-mail: 969577082@qq.com）

Abstract: With the developmentof the mobile Internet, the share economy becomes a new Internet form based on core elements of idleness, platforms, and people. Its development philosophy is highly compatible with young people. 'Share everything' has become a new way to participate in the Internet for young people. This article analyzes the social impacts of the share economy on youth groups from the three dimensions of resources, relationships, and emotions. It considers that the social interactions of young people have changed from atomization to intra-layer linkage in the process of share space and time, which provides new possibilities for the creation of the community. With the help of the Internet platform, the idleness resources in circulation has reallocated more efficiently, which has impacted the monopoly position of consumer society. At the same time, the youth's emotional model has undergone a sentiment change between expression and construction of feelings. This article proposes that the three-dimensional reshaping model of resources, relationships and emotions which has both positive values and some risks and predicaments for youth groups. It is necessary to promote the efficiency of resourceallocation, increase flexible employment and improve the color of social life to construct a new global and ecological economy.

Key words: Share economy; Resources; Relationships; Emotions; Reshape

1 Introduction

With the deep development of the information age, Internet economy is the most active field. In recent years, share economy has become a hot topic. At the same time, because the related concepts are highly compatible with young people, the share economy shows new vitality different from other economic forms and has broad prospects for development. The share economy is becoming more and more popular with the rise of the mobile Internet. It is a resource recycling mode with extensive social access by means of intermediary functionsof Internet platforms and through profitable or public benefit formsto increase the social utilization of idle resources or reduce the idle rate of potential resources. Formally, the share economy includes peer-to-peer market places, gift economy, commons-based peer production, solidarity economy/democratic wealth, collaborative consumption, P2P lending, crowdfunding, vehicle share and many other categories. There are four basic business paradigms: C2C (Customer to Customer), C2B (Customer to Business), B2B (Business to Business), and B2C (Business to Customer). They all have obvious Internet genes which emphasize that both supply and demand participate in direct transactions. It can be seen that the share economy covers a wide range based on internet technology, which everything can be shared whether it is food, clothing, shelter, or a spiritual world.

For the youth groups, because the share economyemphasizes on idle resources, share platforms, everyone's participation, varied participation forms and characteristics of multi-disciplinary novelties has strong affinity with their groups' characteristics. At the same time, compared with other groups, young people are the quickest ones to master mobile internet technologies. By using these tools, they see a world that is much larger than young people in any other era, which provides them with convenient conditions to enter the share economy. This article attempts to answer from a sociological perspective: What does the share economy mean for young people? What extent does it reshape their working lives and perceptions? How can young people promote the share economy into the future in the process of the subject's practice and participation experience?

2 The Social Impact of the Share Economy on Young People

From the perspective of the distribution of netizens in China, young people are indeed the main participants in the share economy. According to the 40th Statistical Report on Internet Development in China, as of June 2017, the number of Chinese netizens reached 751 million, and the number of mobile Internet users reached 724 million. The proportion of Internet users using mobile phones to access the Internet increased from 95.1% at the end of 2016. To 96.3%. Netizens are still dominated by 10 to

39-year-olds, accounting for 72.1% of the total. The proportion of netizens in the 20 to 29-year-old age group is the highest, which is 29.7%. According to China's Share Economic Development Report (2017), China's share economic market transactions in 2016 was approximately 345 billion yuan, the financing scale was approximately 171 billion yuan, more than 600 million people participated in economic activities and the number of service providers was approximately 60 million. (as shown in figure 1)

Figure 1   The age (years old)construction of Chinses netizen

Faced with such a large number of participator, there have been a growing number of share projects recently emerged in China, which are relatively mature ones, such as the sharing bicycles to provide convenient for city trips (such as OfO, Mobai) and sharing vehicles (such as Zipcar); the sharing house (such as Airbnb) that solves accommodation problems of domestic and overseas travel; and provides sharing knowledge and skills (such as Zhihu) for users with cognitive upgrade needs. Based on the reshaping of space and time in the mobile Internet, a livelihood of idle resources is achieved; but there also is only a traditional lease that is dressed in a share economic garment. The new network-share economy has refreshed the youth's online life. They have been attracted by rounds of share projects, and have participated and enjoyed them. More importantly, many entrepreneurs who share projects are also young people. They direct and plan many the share projects to share the traditional economic life.

Furthermore, the mobile Internet has played a shaping role in social interaction, social expression, collective action and social differentiation and has promoted social transformation in the Internet age. As part of the mobile Internet, the share economy has also played a unique role in reshaping society. For example, the share economy has brought about new changes in organizational models, competition order and patterns, new requirements for industry management and new property rights system. As young people are increasingly involved in the share economy, it has also increasingly reshaped young people. What is more important is that the share economy promotes resources flow processes, has also reshaped the relationship between people and opened up new emotional models, which have a far-reaching impact on the social life of young people.

3 Let the Resources Flow: Opposition to the Consumer Society for the Youth People

Judging from the concept of share economy, the recycling of idle resources is one of the most important points. It can integrate various types of scattered resources, accurately find diversified demands and realize optimal resource allocation methods that quickly match supply and demand. Botsman and Rogers directly equate the share economy with 'consumptive consumption' and believe that 'it has transcended the ideology between capitalism and socialism and found a common way of distributing social resources". Therefore, the essence of the share economy is to move resources through technology platforms. This sort of resource flow is the redistribution of idleness and clever resistance to waste. In Baudrillard's consumer society, people are in a position where consumption controls the entire life and the consumption 'substitutes all ideology alone, and at the same time carries the burden of overall social integration alone, just like the rank of the original society or what religious etiquettes do. Moreover, in the face of the growth and abundance of post-industrial society, it is practical significance to waste. People in the consumer age consume all things under the influence of mass media such as advertisements. With the deepening of the consumer society, this kind of resource usage patterns that emphasize individual and occupation also bring about excessive waste and environmental deterioration,

even meaning loss and community void. Thus, high consumerism that began in the 1950s has encountered reflection and resistance in the information age.

The resistance from the so-called "millennials" is particularly evident because Internet technologies such as big data and cloud computing provide them with basic conditions. Technology has greatly improved the matching range and efficiency between demand and supply of underutilized resources, which make possible to direct collaborative consumption between people. On the one hand, on account of the people after 85s' and 90s'of grow up in the era of excess abundance, they have not experienced material shortages and have not strong martial desire, which lead to that consuming everything is not particularly attractive to them. On the other hand, young people who witness environmental pollution by high consumption are gravely are deeply disturbed by the lack of community. Therefore, sharing everything can impress them higher. In fact, the share economy is prevalent in their main creation and personal participation.

From consume everything to share everything, the share economy relying on the Internet reshapes the youth consumer's world by resource flow. After making resources flow, it has indeed achieved the function of optimizing the allocation, reducing costs, improving efficiency and has contributed to the creation of a sustainable sharing era. However, it is not uncommon for resources to be wasted under the banner of the share economy. For example, the commercial war of share bicycles has forgotten the original intentions of saving and environmental protection. Unordered competition has led to the closure of most projects, the idleness created has been unreasonable and the concept of sharing and win-win has not yet fully penetrated the hearts of people.

4 Intra-layer Linkage: Reshaping Youth's Social Relationship

Kevin Kelly, the Silicon Valley prophet, thinks that technology has laid a foundation for the network economy, but only relationship can make it stand out. The relationship refers to the relationship that depends on technology. For this point, the share economy has a typical meaning how to achieve share in the process of resource circulation which depends on whether the relationship is stable and predictable to a large extent. It generally is believed that one of social consequence of share economic or collaborative consumption is to strengthen the community senses among community members which improve the unity and integration of the community. Botzman and Rogers think that the new rules of social networks have broken the original totalitarian rule and strict hierarchy and created a new society that is open, highly involved and fully free. In fact, this integration function is the common pursuit in the atomized society. Since the birth of the Internet, one of the reasons is that the respective types of online communication are different whether the Internet has been promoted the community through online connections or lack ties has made more alienated. As far as share economy is concerned, the so-called 'integration' of social relations for youth groups is expressed as an 'intra-layer linkage' including two aspects: one is that share economy has indeed increased people-to-people links with strong role of the weak ties; the other is that this reinforcement is more just happening within the stratum and the digital divide mechanism is still working with increasing trend.

Specifically, unlike Granovetter's 'the strength of weak ties', the integration role of share economy for young people is based on network technology which can still be to achieve a strong role in weak relations. As Kevin Kelly pointed out that the primary task of the network economy is to repair the symmetry of information to achieve the goal of requiring attention to the soft elements of reputation, privacy, loyalty and trust when creating relational technology. All share economic platforms are committed to providing information symmetry between supply and demand. The general share platform needs to conduct both parties' authentication (real name, real face, identity card information, etc.), provide fund guarantee platform and insurance service and open up the cumulative credit evaluation and so on. These means strengthen the share of trust between the two sides, develops the friendship brought about by the shared space and promotes the creation of a new small community. On the other hand, different youth groups have different levels of understanding and use of the share economy leading to infrequent exchange of relationships between classes, which limits the realization of the new society with openness, high participation and full freedom. The digital divide of young Internet users is evident which is reflected in the information use, online entertainment and communication and business transactions. It is significantly higher in urban areas than in rural areas, especially in the Internet literature, online shopping, and online payment, which leads to the gap between urban and rural areas is still increasing. This digital divide is not only manifested in the differences between urban and rural areas, but also the level of education, family status, and income levels affecting the achievement of relationships and differences of participation in

share economy. For example, in the field of knowledge share, different levels of youth participate in different types of knowledge share, which leads to a closer association of young people with the same cognitive level and it is impossible to meet for different levels of knowledge. In other words, differences in the degree of digitalization will lead to a greater digital divide and even social stratification and structural breakdown. The closer the internal strata are, the more obvious the gap between stratums becomes. Thus, the strengthening of intra-layer linkage may increase social differentiation.

5 Take Sharing as Feelings: Intertwining of Youth's Emotional Patterns

In the process of transferring of share economy, the mixed emotions are very obvious. The emotional phenomenon has undergone fierce changes in the period of social transformation, which intertwined with various forms such as happiness and deprivation, resentment and recognition, ecstasy and anxiety. Since young people are the most active, stand at the forefront of the times, grasping their emotional tone is catching the liveliest era pulse.

Judging from the individual level, young people practice the logic of emotional expression in the share economy. First of all, participating in the share economy for the youth is a kind of resistance to high consumerism since young people are willing to advertise greener and healthier slogans. The symphony of emotions in the three fields of work, communication and life embodies the combined effects of three kinds of emotional systems, including tricks, experiences and performances. In fact, the participation in share economy is the meeting point of the three main areas of work, communication and life for the youth. Second, the youth participating in share economy is a yearning for the community. Because different types of online behaviors may lead to different joining ways. The organic combination of the share economy (co-consume), online and offline, reflects a community trend. Sharing with others is a more respected value which reflects a yearning for the community and is a salvation in the individualized survival. Finally, the participation of youth in the share economy is a pursuit of deep emotions. Due to the speed and passion of the Internet, young people are emotionally caught up in the entertainment to death situation, but share economy is an exploration of deep emotions except shallow and thin. On the basis of the community's aspiration, young people have actively created a number of gatherings by share economy, when facial expressions, body movements, accents and intonations have all been untied from the line and entered face-to-face interactions. This is another attempt by the Internet to bridge virtual and reality to provide more possibilities for deeper emotions.

From the social perspective, share economy promotes the process of sentiment construction. The social media once promoted the 'consumption of everything' in the consumer society has shouted the slogan of 'share everything' with the help of the share economy. Because of changes in exchanges, experience, and power, social structures will more profound change under the influence of the Internet and form a brand-new network society. The online society and the consumer society are part of a post-industrial society with different emphasis. Under such circumstances, vocabulary such as green, environmental protection, equality, ease, fun, convenience, flexibility, trust and experience, etc. becomes the label for share economy which set the tone for share economy. These emotional elements are in line with the values of young people. Those who participate in share are constructed as people with feelings. In this way, share has become popular as a sentiment.

6 Share the Future: Reshaping the New Network Economy

As a new form of networking, the share economy that emphasizes idleness, platforms and everybody has brought about many changes in resources, relationships, and emotions to the social life of young people. The idleness in circulation has redistributed resources, changed the young people's life state of consumption of everything, which has become the main force against high consumerism. With the support of the Internet platform, the seamless link between online and offline brings together dispersed atomized individuals and creates conditions for the creation of communities. In the process of share everything, youth's emotional patterns have changed and they have transmitted the 'cool' cognitive style and 'love' attitude towards life. As a new social form, the online society has strengthened this feeling and constructed a feeling of share atmosphere in a more direct and powerful way.

However, it is not to say that the share economy has brought about pastoral and pastoral joys and with continuing chaos. The so-called idling is not idle, but the guise of saving energy is wasting. In other words, there are many people who are affixed with shared labels in the new network economy. They are mixed with leases, pseudo-needs or hot spots, which need to be carefully identified. The fact that a large number of share projects have closed down or have been suspended in recent years, so effective

supervision is particularly important. In addition, the social impact of share economy must also be thought-provoking, for example, new ideas for social integration due to social differentiation caused by intra-layer linkage; the road of sustainable development due to declining in share heat with the changes in social emotional trends and young people like novelty, and the share economy as a sport still has a long way to go. As a result, the three-dimensional reshaping of the youth by the share economy is both positive and negative (as shown in Figure 2). The former is a gift to young people's social life through the new network economy, while the latter is a possible side effect. It is necessary to manage in different ways.
Figure 2   Three-dimensional reshaping model of Share Economy on Youth Groups

7 Conclusion

In general, the share economy is a new product of the information age and a new development brought about by technological progress., it is expected that the share economy will continue to maintain an average annual growth rate of around 40% in the next few years. By 2020, the share of the three-dimensional remodeling economy for youth groups will reach 10% or more of GDP. In 2025, the growth of share economy in GDP will climb to about 20%. Moreover, while the share economy is striving to resolve chaos and overcome the development difficulties, it will promote the efficient of resources allocation, increase flexible employment, increase color and social life, and promote the construction of new globalized and ecological economic form. Youth groups can play a huge role in this process who are not only active participants but also powerful creators. To share the future will be an important contribution to the information age for youth groups.

Research on Hubei College Students' Identification of Excellent Chinese Traditional Culture Based on Factor Analysis

Zhu Jiangbin, Wang Zijian, Yang Zijing, Li Wandong
School of Politics and Administration, Wuhan University of Technology, Wuhan, P.R.China, 430063
(Email: jbzhu@whut.edu. Cn, 15071483079@163.com, m15071307659@163.com,
1159998102@qq.com)

Abstract: This paper analyzes the status quo of current Hubei college students' excellent traditional culture identity by questionnaire survey and factor analysis, then sums up four factors that identify the excellent Chinese traditional culture identification of Hubei university students: value identification, behavior identification, emotional identity and ideological identity. Through the analysis of these four factors, this paper infers: From the macro level, the current college students in Hubei Province have an intermediate level of recognition of the excellent Chinese traditional culture; from the micro level, there is a problem that current university students don't have a match between behavior and consciousness. Finally, through literature research and data analysis results, the authors found out the factors affecting the status quo of Hubei's college students' excellent traditional culture identity: First, the current status of social and cultural development; second, the collaborative education mechanism for outstanding traditional culture of college students is not perfect.
Key words: Excellent traditional culture; Sense of identity; Factor analysis; Influence factors

1 Introduction

　　Chinese fine traditional culture is the essence of the Chinese nation that has accumulated over thousands of years and has been built up. The contemporary college students' sense of identity in the excellent Chinese traditional culture plays an important role in advancing the development of socialist culture, making it prosperous, and enhancing national self-confidence.

　　Currently, the academic researches mainly focus on the definitions, categories and promoting strategies of the Chinese traditional cultural identification. In terms of the definitions of the advanced traditional culture, Taylor (Taylor, 1871) defines the culture or the civilization as a complex that contains all of the knowledge, belief, arts, morality, laws, customs and the capabilities and habits that people have had and accepted.Zhang Xinyue (Zhang Xinyue, 2017) considers that the Chinese traditional culture is the sum of the spiritual wealth, as well as the core and essence of Chinese traditional culture, which is created by the social and historical development in thousands of years.Related to the identification of the Chinese advanced traditional culture, Cai Zhiling (Cai Zhiling, 2013) thinks the identification as an emotional recognition and acceptance.Ding Daoqun and Jiang Shanshanbelieve that the identification is the positive perception and judgment, and the subjective emotional feeling which will not change over a long period time. Wang Xinqiang, Zeng Lihong, Zhang Dajun and Li Senthink the identification is to recognize and experience the Chinese advanced traditional culture.In terms of the categories of the Chinese advanced traditional cultural identification, Liu Xiaojie (Liu Xiaojie, 2016) considers that the psychological identification mechanisms contain mainly rational identification mechanism, emotional identification, belief identification mechanism and practice strengthening mechanism.As for the researches of the strategies to promote college students' advanced traditional cultural identification, Strong, LaToya (LaToya, 2016) thinks that the identification has a close connection with cultural activities in which college students take part.Wan Xiuyi (Wan Xiuyi, 2015) points out that we should take measures out of the college students' living environment and mental aspects to promote the their cultural identification.Wang Xiaoling (Wang Xiaoling, 2017)thinks that we should take advantage of the Internet such as the We chat, Micro-bloc and other websites to learn the Chinese advanced traditional culture in any time and any place.

　　In summary, academic research on the identification of excellent traditional Chinese culture mainly includes the following two aspects: in terms of research content, research on the identification of Chinese students with excellent traditional culture in China mainly focuses on the connotation, problems and strategies of identity. There is less measurement of the components of identity and evaluation of the status quo. In terms of methods, the relevant literature mainly adopts qualitative research methods, and lacks quantitative research methods such as questionnaire survey and factor analysis. Therefore, this paper adopts questionnaire survey and factor analysis methods to understand the current level of college students' overall recognition of traditional Chinese culture in the current stage. It also clarifies the

undergraduates' recognition of what content is low and causes. Finally, it proposes tactics to improve the outstanding students'recognition of traditional Chinese culture. The tactics of traditional cultural identity can achieve the purpose of improving the national identity and national identity of college students.

2 The methodologyof College Students' Identification of Excellent Chinese Traditional Culture in Hubei Province

2.1 Questionnaire design

This research combines the core values of socialism, the theory of cultural inheritance and integration, and the status quo and issues of domestic and international recognition of traditional Chinese culture .The research carries out the conceptualization of college students' excellent traditional cultural identity from six dimensions of cognitive, emotional, awareness, expectation, values, and behavioral identity，and conducts questionnaire design based on the six dimensions outlined. Finally, a total of 45 topics including basic information questions and multiple choice questions have been designed. The measurement type of the question which uses Likert scale form contains three, four, five grades.

2.2 Data collection and analysis methods

2.2.1 Data Collection

In this empirical research, Wuhan University, Hubei University, Wuhan University of Technology, Huazhong Agricultural University, Hubei University of Economics, and Wuhan Maritime Vocational and Technical College were selected to conduct a questionnaire survey. 340 questionnaires were distributed and 322 questionnaires were collected. Finally, the effective rate of the questionnaire was 93.6%. Among them, Wuhan University of Technology collected 57 questionnaires, Wuhan Maritime Vocational College collected 69 copies, Wuhan University collected 56 copies, and Huazhong Agricultural University and Hubei Economics College collected 80 and 60 copies respectively. In the sample data, all levels of education are involved, with sophomores accounting for 37.27%, freshmen, juniors, seniors, graduates and above accounting for 19.25%, 10.25%, 9.01%, and 24.22%, respectively.

2.2.2 Analysis Methods

Through the reliability and validity test of the questionnaire, the reliability and validity of the questionnaire are relatively high. The survey data is more suitable for factor analysis. The specific test conditions for data validity and reliability are as follows:

(1) Analysis of validity of college students' excellent traditional culture identity in Hubei Province.

The validity of the questionnaire refers to the degree of coincidence between the measurement result and the investigation content. The more consistent the measurement result with the investigation content is, the higher the validity is. Conversely, the lower the validity is. Before the validity analysis, this article first excludes topics that represent categorical variables, such as basic information questions and multiple choice questions. The remaining 26 topics are put into the SPSS for analysis, and appropriate sampling (KMO) and Bartlett sphere test to test the validity of sample data to test whether the results of this survey are suitable for factor analysis. KMO is the Kaiser-Meyer-Olkin sampling suitability measure (its value is between 0 and 1). If the KMO value is less than 0.5, factor analysis should not be performed. As shown in the following table, the KMO value of the questionnaire was 0.787, and the Bartlett test's significance probability (Sig.) was 0.000, less than 0.001, indicating that the survey data is of high validity.

(2) Analysis on the reliability of the research on the identification of excellent traditional culture among college students in Hubei Province.

After the validity analysis is completed, it is necessary to continue the reliability test at all levels of the questionnaire and the total table. Reliability refers to the stability and consistency of the results measured by the test or the scale tools. The greater the reliability of the scale, the smaller the standard error of measurement is. The most commonly used reliability test method in the Likert scale method is Cronbach's Alpha coefficient. Therefore, this research uses Cronbach's Alpha coefficient to test the reliability of the questionnaire. For the entire scale, Cronbach's Alpha is greater than 0.7 and the result is acceptable. After excluding divergence questions such as basic information and multiple choice questions, the Cronbach's Alpha coefficient of the questionnaire was 0.778, indicating that the overall reliability of the scale was high.

3 Empirical Research on the Status Quo of the Advanced Traditional Cultural Recognition

3.1 The research variables of the status quo of the outstanding traditional chinese culture

3.1.1 Descriptive Statistics of Research Variables

The research variables in this paper include 46 variables such as demographic variables, meanings and types of excellent traditional culture, and ways of dissemination, as shown in Table 1. For variables of the Likert scale type, the higher the value is, the more positive the respondent's attitude towards the subject's response to the question is. From the table, we can see that there is no extreme value in the statistical results, and the questionnaire can be analyzed in the next step.

Table 1　Questionnaire Variable

Variable	N	Min	Max	Mean	Variable	N	Min	max	Mean
V1 grade	322	1	5	2.82	V13-1 pathway :learning in the classroom	322	0	1	0.74
V2 Professional	320	1	3	1.74	V13-2 pathway : Internet and TV	322	0	1	0.75
V3 political outlook	322	1	4	1.83	V13-3 pathway :Newspaper or Books	322	0	1	0.62
V4 excellent traditional cultural meaning	320	1	3	2.70	V13-4 Pathway: Promotion Campaign	322	0	3	0.47
					……				
V12-2Mohist	300	1	5	3.55	V25 practice	319	0	1	0.79
V12-3Legalists	297	1	5	3.47					

3.1.2 Factor Extraction of Research Variables

In order to facilitate factor analysis, this research will exclude basic information, multiple-choice questions, and non-five-level evaluation questions before factor analysis, and finally includes the remaining 14 topics for analysis. In the course of the research, the validity and reliability of the subject were tested again. The test results showed that the remaining 14 subjects had their KMO score improved to 0.812, and the score of Cronbach's Alpha was increased to 0.804, which is suitable for factor analysis.

In this research, we used the principal component analysis method to extract common factors. After running the SPSS software, we extracted 4 common factors from 14 variables after the factor rotation. The explanation rate of these 4 common factors to 14 variables has reached 64.092%, and it can already explain most meaning of the 14 variables. In the rotation component matrix, the larger the factor load, the closer the relationship between the variable and the common factor. According to this principle, we can see from Table 3 that the variables of V12-1Legalist, V12-2Mohist, V12 -3Taoist, and V12-4 Confucianism have a higher load on Factor 1, and this research classifies this variable as Factor 1. The V9-1 Water Margin, V9-2 Romance of the Three Kingdoms and V9-3 Journey to the West have higher load on Factor 2, which is classified as Factor 2 in this research. The V8 Book of Songs, V8 Records, V8 Lao Tzu and V9-4 Dream of the Red Chamber have higher load on factor 3, which is classified as factor 3 in this research. the level of preference for poetry and painting, the willingness to participate in traditional festivals, and the love of Peking opera have higher load on factor 4, so we will sum it to factor 4. According to the characteristics and commonalities of the measured variables, this article names Factor 1, Factor 2, Factor 3, and Factor 4: values of identity, behavioral identity, emotional identity, and awareness of identity. The value of identity indicates the degree of coherence between ideals and beliefs conveyed by college students and excellent traditional culture. Behavioral identity indicates that college students consciously learn and practice Chinese excellent traditional culture, and take correct actions on the concepts and ideas reflected in traditional Chinese culture. Emotional identity represents a unique sense of pride and belonging that university students maintain about the excellent Chinese traditional culture. Awareness of identity expresses the university students' love of Chinese excellent traditional culture from the subconscious level and their willingness to accept and have a strong will to implement the ideas and concepts conveyed by traditional culture.

3.2 College students in Hubei province have a modest level of recognition of Chinese excellent traditional culture

This research will use the calculation formula to grasp the overall status of the traditional culture of college students in Hubei Province. According to the four public factors extracted from this paper, the variance contribution rate has reached 64.092%, and it can already explain most of the information of the original variable. Therefore, the variance contribution rate can be used as the weight of the comprehensive evaluation. According to the variance contribution rate of the four factors, each factor is weighted and added. Its comprehensive evaluation formula is:

$$F=31.812\%*F1+14.727\%*F2+10.034\%*F3+7.520\%*F4 \tag{1}$$

According to the evaluation formula, the statistical results of the final score are shown in the figure below. The frequency distribution histogram roughly shows the characteristics of normal distribution. From this, we can infer that the majority of college students in Hubei province have a modest level of recognition of Chinese excellent traditional culture.

3.3 A mismatch between the behavior and consciousness of college students on the identification

Through the previous data analysis, the research extracted four common factors including value identification, behavioral identification, emotional identification, and ideological identification. According to the rotation scoring matrix, we obtained the formula for calculating the score of each factor as follows (F1, F2, F3 and F4 denote values, identity, emotion, and awareness, respectively):

$$F1=0.823*V12\text{-}1 +0.810*V12\text{-}2+\cdots0.268*V11 \tag{2}$$

$$F2=0.079*V12\text{-}1 +0.071*V12\text{-}2+\cdots0.202*V11 \tag{3}$$

$$F3=0.001*V12\text{-}1+0.810*V12\text{-}2+\cdots0.293*V11 \tag{4}$$

$$F4=0.075*V12\text{-}1+0.004*V12\text{-}2+\cdots0.497*V11 \tag{5}$$

As can be seen from the following table (Table 4), in the four public factors extracted in this paper, from the average of factor scores, the behavioral identity factor has the highest score, the emotional identity factor score has the second highest score, and the value identification and consciousness recognition factor have the lowest score. It can be seen that there is a certain degree of mismatch between the behaviors and consciousness of college students in Hubei Province on the identification of excellent Chinese traditional culture.

Table 4   Factor Ranking

Factor score descriptive statistics					
factor	N	Min	Max	Average	Average ranking
Value recognition	286	-4.02473094	2.63873942	-0.0000001399	3

4 Influencing Factors on the Status Quo of College Students' Recognition

4.1 The factor of current social and cultural development status

As China has moved from a traditional agricultural society to a new industrial society, the cultural landscape has undergone tremendous changes. In traditional agricultural societies, our country's economic shape is a self-sufficient small-scale peasant economy. As a result, cultural exchanges and collisions cannot be as intense and frequent as the new industrial society. In addition, people gradually realized that in order to be in an undefeated position in the competition of modern society, we must strengthen our country's cultural development and carry out cultural competition. Therefore, Western countries use their own economic and market advantages to infiltrate China's culture. For university students, they are in the period of shaping and forming the "three views," lacking a certain ability to discriminate and being vulnerable to foreign consciousness. [10] In addition, due to the profound Chinese traditional culture, traditional ideas and traditional literature and art are obscure to college students, resulting in the lack of learning and understanding of Chinese traditional culture. Therefore, to a certain extent, it has led to the recognition of excellent traditional Chinese culture in terms of emotion, values, and consciousness. However, under the influence of the public opinion environment, society requires college students to love our country's traditional culture and regulate their own behaviors. Undergraduates follow the trend, which shows that they have a higher recognition of Chinese traditional culture. Eventually this led to the problem of mismatched behavior and consciousness among college students in Hubei Province in terms of excellent traditional cultural identity.

4.2 The cooperative education mechanism of excellent traditional culture of undergraduates is not perfect

The shaping of college students' excellent traditional cultural identity is a systematic project. Specifically, the shaping of college students' excellent traditional cultural identity should start from the whole and establish a collaborative education mechanism for society, schools, families and individuals. [11] In reality, this mechanism has not been established, which can be shown as the following aspects: First of all, some unfavorable factors in the social environment have created resistance to the promotion of excellent traditional cultural identity of college students. In general, China's social environment is good, but there are still some undesirable phenomena, such as the bad culture of the network, the Sino-Kazakhstan culture, etc. Secondly, the Ministry of Education perfects the excellent traditional culture of college students. On the one hand, many universities set relatively few excellent Chinese traditional culture courses. Even if related courses are set, they take the form of elective courses, which greatly reduces the effectiveness of traditional culture education. [12] On the other hand, many courses offered in universities are not comprehensive in terms of content. Most of them are introduced to traditional thoughts, traditional literature and art, and traditional architecture. Students lack a comprehensive understanding of Chinese traditional culture; once again, at the family level, although many families give their children enough material support, they neglect the growth of their children's spirit. Due to the different styles of the family, the shaping of the children's recognition of the excellent Chinese traditional culture is not the same; finally, for the current college students, most of them belong to the 90's, and their individuality, self-centeredness, and ability to accept new things are strong. However, due to the diversity of its own environment and the instability of its own values, there are differences in the identification of excellent Chinese traditional culture.

5 Conclusion

According to Empirical study, we find out the status quo of outstanding traditional cultural identity among Hubei college students: one is that universitystudents in Hubei province have a medium-level recognition of Chinese excellent traditional culture; the other is that there is a certain degree of mismatch between the behaviors and consciousness of Hubei collegestudents'recognition of Chinese excellent traditional culture. Then, based on the results of empirical research and literature research, the authors find out the influencing factors of the status quo of Hubei University students' recognition of Chinese excellent traditional culture: First, the current social and cultural development, and second, the coordinated education mechanism of excellent traditional culture of college students is not perfect.

According to the current situation and influencing factors of Hubei University students' recognition of Chinese excellent traditional culture, there are following threesuggestions that may promote college students' cultural identification: first, to create a social environment suitable for the dissemination of excellent traditional culture, especially to pay attention to campus cultural environment，and handle well the relationship between ethnic culture and foreign culture, excellent culture and dross culture. It fundamentally enhances the recognition of Chinese students for their excellent traditional culture and actively accepts and learns the excellent traditional Chinese culture.The second is to guide college students to consciously practice the Chinese traditional culture and promote its internalization. First of all, from the individual college students, it is necessary to guide the students to establish a conscious cultural aesthetic taste and rational spirit. Secondly, from the peer group of college students, it is necessary to play a role model demonstration role among the peer group of college students, and actively guide the peers of the university to consciously integrate into the social and cultural life.[13] The third is to establish a collaborative education mechanism for society, schools, families and individualsto realize the healthy mutualcomplementarity among education in social, schools, families and individuals and to form social synergies.[14] Specifically, for the society, it is mainly to create a fair, equitable and harmonious social environment. For the school, it is mainly to actively promote the excellent traditional Chinese culture education for undergraduates, strengthen the construction of grassroots facilities, focus on improving the faculty, and rationally set the course content. For the family, it is mainly to create a harmonious and happy family environment. For college students themselves, it is mainly to consciously strive to improve their cultural accomplishment.

Tax Reform and Earnings Management: A Study on Listed Firms in China

Li Shuqi

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: fantasticlsq@163.com)

Abstract: Using the natural experiment of "Business Tax-to-VAT Pilot Program" announced on November 16, 2011 and the variations in the implementation of the reform across different regions and industries, this paper explores the impact of the macro-level tax system on firm's tax avoidance and earnings management. Our empirical findings suggest that firms which enjoyed reduction in turnover tax tended to use accruals to reduce the taxable profit, while the impact on actual earnings management is uncertain. On the other hand, firms which suffered from increased turnover tax payments did not show significant changes in the behavior of earnings management. This paper provides empirical evidence for the reaction of private sector in response to a change in the taxation system.

Key words: Tax reform; Turnover taxes; Real earnings management; Accrued earnings management

1 Introduction

In this paper we focus on how the value-added tax reform has influenced earnings management of listed firms in China. The two main ways of earnings management, accrued earnings management and actual earnings management differ greatly in the ways of manipulation, manipulation risks and economic consequences. Poirier studies have focused on earnings management from the perspective of corporate governance and tax planning. However, few literatures focused on the impact of the tax reform on earnings management, especially on the choice of earnings management.

To replace the sales tax with a value-added tax is a part of the fiscal reform in China, also an important step of structural tax reductions. VAT differs from sales tax by using output tax minus input tax to eliminate duplicated taxation on fixed cost. The VAT reform can be separated to three stages: first in Shanghai in the beginning of 2012; then in 8 provinces (Beijing, Jiangsu, Anhui, Guangdong, Fujian, Tianjin, Zhejiang and Hubei) in the fourth quarter of 2012; finally expanded nationwide in 2013. Pilot sectors including transport industry, modern service sectors and radio, film and television industries also expanded gradually.

Thus, the VAT reform provided a new motivation for companies to manage their earnings: reducing turnover tax burden. Companies would manipulate their earnings to avoid tax, especially in the beginning of the reform. A company would adopt the best way of earnings management to achieve the goal of tax planning. Therefore, we further explore how companies with different turnover tax burden choose their way of earnings management.

In this paper we choose the listed companies of the real estate, construction and transportation industries as the primary samples. 250 listed companies are selected for empirical analysis after further screening. We use the revised Jones (Jones, 1991) model and Roychowdhury (Roychowdhury, 2006) model to quantify accrued earnings management and actual earnings management. Then we use them as dependent variables to analyze the impact of VAT reform on ways of earnings manipulation, controlling size of the company, ROA, asset-liability ratio and so on. We show that: firstly, levels of earnings management have improved significantly in the exact year of VAT reform; secondly, companies with different changes in turnover tax burden chose different earnings management methods to carry out tax planning, thus reducing overall tax burdens.

2 Hypotheses

2.1 Literature

Previous studies thatfocused on the impact of the VAT reform on earnings management are quite limited. Tax planning of small businesses could both increase profits and help the government achieve macro-regulation targets; see CarolineandPaul (Caroline, Paul, 2001). Expanding the procurement of raw materials and investment of fixed assets are new ways for earnings management for firms after the VAT reform; see Jiao Hu and Hui Peng (Jiao Hu, Hui Peng, 2016). A firm with more completed chain of VAT deduction adopts higher level of earnings management; see Zhen Yang (Zhen Yang, 2015). Firms could reduce turnover tax burden by appropriate tax planning at the beginning of the VAT reform; see

Lianhua Jin et al. (Lianhua Jin et al., 2017). Firms in transportation industry used actual transactions to reduce turnover tax burden after the VAT reform; see Lingxun Meng (Lingxun Meng, 2015).

2.2 Theoretical analysis

The VAT reform directly affects firms' operating incomes for sales tax is included in price while VAT is not. On the other hand operating costs can be influenced since outsourced labor cost and material cost can be deducted. Firms that enjoyed reduction in turnover tax payment could adopt actual earnings management such as constructing real trading activities to avoid tax. However this would directly affect their normal operating activities and increase operating risks; see Zengfu Li et al. (Zengfu Li et al., 2012). Adopting actual earnings management to reduce turnover tax payment couldsimultaneously increase operating risks; management of a firm should make a trade-off between the revenue and the cost of actual earnings management. Thus we make our fist hypothesis that:

H1: Behavior of actual earnings management is uncertain for firms that enjoyed reduction in turnover tax in the exact year of the VAT reform.

In the exact year of the VAT reform, firms mightadopt negative earnings management to manipulate accrued item, either by postponing the confirmation of receivables or advancing the counting of costs to gain time value of money.From the perspective of the cost of risks, accrued earnings management would not attract too much attention of regulators, reducing audit risks; see Cohen et al. (Cohen et al., 2005). Also, the increasing cost of actual earnings management leads to more accrued earnings management; see Qihui Gong et al. (Qihui Gong et al., 2015). Firms that enjoyed reduction in turnover tax have strong motivations to implement tax planning by accrued earnings management. Thus we make our second hypothesis that:

H2: Firms that enjoyed reduction in turnover tax tend to defer earnings in accrued items for tax avoidance in the exact year of the VAT reform.

Firms that suffered from increased turnover tax payments might have difficulties getting special invoices to deduct input tax, or they might experience a longer cycle to renew their fixed assets. Thus such firms' could have insignificant actual earnings management. As for accrued earnings management, compared with accrued earnings management, it can be reversal; see Mikko (2005). Firms have to consider the cost and revenue at present and in the future before adopting accrued earnings management. However, firms that suffered from increased turnover tax payments have various expectations of future tax burden, making different decisions on accrued earnings management. Therefore, firms of this kind would not adopt significant earnings management on the whole. The third hypothesis follows that:

H3: Firms that suffered increased turnover tax payments did not show significant changes in the behavior of both actual and accrued earnings managementin the exact year of the VAT reform.

3 Empirical Analysis and Results

3.1 Data

We choose the listed companies of the real estate, construction and transportation industries as the primary samples to study on their behavior of earnings management from the year before the VAT reform to the exact year of the reform. Then we screen out ST firms and firms with missing data and winsorize data at 1% level. Among the 250 selected firms, 117 are from real estate industry, 69 are from construction industry and 64 are from transportation industry (data source: CSMAR).Since turnover tax burden cannot be precisely calculated based on cash flow, we use Yue Cao and Jing Li's (Yue Cao, Jing Li, 2016) method, which is based on accrual basis to calculate turnover tax burden. 145 firms in the sample enjoyed reduction in turnover tax while the other 105 experienced increased turnover tax burden.

3.2Model

We use the revised Jones (Jones, 1991) model to quantify accrued earnings management as follows.

$$DA_t = TA_t/A_{t-1} - NDA_t \tag{1}$$

DA_trepresentsthe absolute level of accrued earnings management in year t;

TA_trepresents total accruals in year t, equaling $NI_t - CFO_t$ (net operating cash flow);

NDA_trepresentsaccruals that are not discretionary in year t, adjusted by total asset in year t-1:

$$NDA_t = \hat{b}_0\left(\frac{1}{A_{t-1}}\right) + \hat{b}_1\left(\frac{\Delta REV_t - \Delta REC_t}{A_{t-1}}\right) + \hat{b}_2\left(\frac{PPE_t}{A_{t-1}}\right) \tag{2}$$

ΔREV_trepresents the difference between revenue in year t and t-1;

ΔREC_trepresents the difference between accruals in year t and t-1;

PPE_trepresents the original value of fixed assets at the end of year t;

$\hat{b}_0$、$\hat{b}_1$ and $\hat{b}_2$are industry characteristic parameters, achieved by the following regression:

$$\frac{TA_t}{A_{t-1}} = b_0 \left(\frac{1}{A_{t-1}}\right) + b_1 \left(\frac{\Delta REV_t}{A_{t-1}}\right) + b_2 \left(\frac{PPE_t}{A_{t-1}}\right) + \varepsilon_t \tag{3}$$

According to Roychowdhury (2006) model, we use abnormal production cost, abnormal operating cash flow and abnormal discretionary expenditure to quantify actual earnings management, calculated as follows.

$$\frac{PROD_t}{A_{t-1}} = \alpha_1 \left(\frac{1}{A_{t-1}}\right) + \alpha_2 \left(\frac{REV_t}{A_{t-1}}\right) + \alpha_3 \left(\frac{\Delta REV_t}{A_{t-1}}\right) + \alpha_4 \left(\frac{\Delta REV_{t-1}}{A_{t-1}}\right) + \varepsilon_t \tag{4}$$

$$\frac{CFO_t}{A_{t-1}} = \beta_1 \left(\frac{1}{A_{t-1}}\right) + \beta_2 \left(\frac{REV_t}{A_{t-1}}\right) + \beta_3 \left(\frac{\Delta REV_t}{A_{t-1}}\right) + \varepsilon_t \tag{5}$$

$$\frac{DISEXP_t}{A_{t-1}} = \gamma_1 \left(\frac{1}{A_{t-1}}\right) + \gamma_2 \left(\frac{REV_t}{A_{t-1}}\right) + \varepsilon_t \tag{6}$$

According to Cohen and Zarowin (2010), the level of actual earnings management is positively related to abnormal production cost and negatively related to abnormal operating cash flow and abnormal discretionary expenditure. Thus we use $RM_t = AbPROD_t - AbCFO_t - AbDISEXP_t$ to represent the level of actual earnings management of a firm.

DA and RM are dependent variables. The independent variable, Reform is a dummy variable which equals 1 in the exact year of the VAT reform and equals 0 in the year before. The exogeneity of the VAT reform helps to solve the endogeneity problem of variables. As is mentioned above, the purpose of the VAT reform is to avoid double taxation, making the tax system and the model of tax collection and management more reasonable and more convenient. Control variables include SIZE (the natural logarithm of total assets at the end of the year), ROA (net return divided by total assets), H_5 (sum of squares of the top 5 shareholders' proportion of shares), LEV (total liabilities divided by total assets at the end of the year) and Big4 (dummy variable, equals 1 if audited by the big four accountancy firms and equals 0 if not).

To test the three hypotheses mentioned above, we construct the model as follows:

$$DA = \beta_0 + \beta_1 \textbf{Reform} + \beta_2 RM + \beta_3 SIZE + \beta_4 ROA + \beta_5 H_5 + \beta_6 LEV + \beta_7 Big4 \tag{7}$$
$$RM = \beta_0 + \beta_1 \textbf{Reform} + \beta_2 DA + \beta_3 SIZE + \beta_4 ROA + \beta_5 H_5 + \beta_6 LEV + \beta_7 Big4 \tag{8}$$

We divide the sample into two groups, one with increased turnover tax burden and the other with decreased turnover tax burden. Then we run the regressions separately to study on how changes in turnover tax burden influence earnings management.

3.3 Results

Table 1 reports summary statistics for the two dependent variables. It shows that most firms that enjoyed reduction in turnover tax squeezed profits by accrued earnings management and had roughly equal level of positive and negative actual earnings management. Firms that experienced increased turnover tax burden used negative accrued earnings management and used actual earnings management to squeeze profits. The means and medians of control variables are about the same, suggesting that their distributions are stable.

Table 1   Summary Statistics

Moving direction		Decreased tax burden (N=145)			Increased tax burden (N=105)		
Variable	Year	Mean	Median	Std.Dev	Mean	Median	Std.Dev
DA	he previous year	0.035	0.000	0.227	0.003	0.015	0.348
	the exact year	-0.036	-0.024	0.216	-0.041	-0.026	0.283
RM	the previous year	0.025	-0.015	0.355	-0.038	-0.021	0.437
	the exact year	0.000	-0.010	0.521	-0.009	-0.005	0.364

We perform t-test on the means of DA and RM to see whether firms with different changes on tax burden have different ways of earnings management in the year of the VAT reform. As is shown in table 2, only the difference in the mean of DA of firms that enjoyed reduction in turnover tax passed t-test. Thus the three hypotheses mentioned above are preliminarily verified.

Table 2   Difference Test

variable	Year Changes in tax burden	the previous year Mean	Median	the exact year Mean	Median	Difference Test Difference in mean	t value
DA	Decreased	0.035	0.000	-0.036	-0.024	-0.071***	-2.72
	Increased	0.003	0.015	-0.041	-0.026	-0.044	-0.15
RM	Decreased	0.025	-0.015	0.000	-0.010	-0.025	-0.32
	Increased	-0.038	-0.021	-0.009	-0.005	0.029	0.30

T-values are in the parentheses; *, ** and *** indicate statistical significance at 10% level, 5% level and 1% level, respectively.

According to model (3.7) and model (3.8), we perform multiple linear regressions to further test H1, H2 and H3. As is shown in table 3, the coefficient of Reform is significant only in the model (3.7) for firms enjoyed decreased tax burden. This again validates the three hypotheses. Compared with firms experienced increased tax burden, firms enjoyed decreased tax burden might have greater confidence in the management of VAT invoices, obtaining enough invoices to deduct input taxation. So they have stronger motivation to adopt accrued earnings management to further lessen turnover tax burden. Although actual earnings management could bring short-term tax deductions, it would adversely affect a firm's operating cash flow in the long run. Thus the reform had obscure influence on actual earnings management of both two kinds of firms.

Table 3   Results of Multiple Linear Regression

Changes in tax burden	DA Decreased	Increased	RM Decreased	Increased
Reform	-0.0597**	-0.0607	0.0297	0.0558
	(-2.92)	(-1.41)	(0.75)	(1.00)
DA			1.084***	0.468*
			(3.46)	(2.03)
RM	0.272**	0.303		
	(3.07)	(1.88)		

T-values are in the parentheses; *, ** and *** indicate statistical significance at 10% level, 5% level and 1% level, respectively.

As for coefficients of control variables, their signs are reasonable; however, most of them are not statistically significant. This might be caused by the limited scale of sample. At last, this paper conducted robustness test on the research results by replacing RM by $AbPROD_t$, $AbCFO_t$ and $AbDISEXP_t$ in model (4.8). The results are still consistent with the hypotheses, as is shown is table 4. Signs and significant levels of the coefficient of Reform are consistent with the three hypotheses.

Table 4   Robustness Test

	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
	Model (3.7)		Model (3.8)					
	DA		AbPROD		AbCFO		AbDISEXP	
Changes in tax burden	Decreased	Increased	Decreased	Increased	Decreased	Increased	Decreased	Increased
Reform	-0.0510**	-0.0652	0.00651	-0.0107	-0.0366***	-0.0649***	-0.0000515	-0.00413
	(-2.90)	(-1.51)	(0.19)	(-0.18)	(-3.91)	(-4.21)	(-0.02)	(-0.74)
RM	0.268**	0.305						
	(3.06)	(1.88)						
DA			0.550***	-0.469	-0.905***	-0.859***	-0.0137	-0.0837***
			(3.44)	(-1.73)	(-21.68)	(-16.18)	(-1.35)	(-3.99)

T-values are in the parentheses; *, ** and *** indicate statistical significance at 10% level, 5% level and 1% level, respectively.

5 Conclusion

In this paper we study on how tax reform influenced earnings management under the background of the VAT reform in China. We show that firms that enjoyed reduction in turnover tax tended to use accruals to reduce the taxable profit, while the impact on actual earnings management is uncertain. On

the other hand, firms that suffered increased turnover tax payments did not show significant changes in the behavior of earnings management. On the one hand, firms can lessen turnover tax burden by appropriate earnings management after the VAT reform. On the other hand, the government should improve the intensity of collection and regulation. Also, outside investor should interpret the performance disclosure of a firm reasonably.

Abstract: With the rapid development and application of China's Internet, especially the mobile Internet, it has had a profound and revolutionary impact on the tourism industry. In the face of the huge changes in the structure, content and form of demand in the consumer market, Sichuan provincial tourism authorities insist on implementing innovation driven strategy, taking the purpose of serving tourists as the basis, focusing on key projects, taking data integration and application promotion as the core, constantly consolidating the construction of infrastructure and information resources, and vigorously promoting tourism intelligence management and intelligence services, actively innovating the network marketing and public information services, thus have built a systematic thinking framework for the intelligent tourism construction system, and achieved remarkable results in practice.
Keywords: Internet; Smart tourism; Innovation driven; Practice in sichuan

1 Introduction

In 2014, the State Council issued A Number of Comments on Promoting the Reform and Development of Tourism Industry [National Issue [2014] No. 31], which made it clear that we should "formulate tourism information standards, speed up the construction of intelligent scenic spots, intelligent tourism enterprises, and improve the tourism information service system." In 2015, the general office of the State Council issued a number of comments on further promoting investment and consumption of tourism industry [State Office Issue [2015] 62], and again emphasized the active development of "Internet + tourism", pointing out that by 2020, the national 4A level scenic spots and intelligent rural tourism pilot spots will have been fully covered with free Wi-Fi, intelligent tour guide and electronic interpretation, online booking, information push and other functions, and 10,000 intelligent scenic spots and intelligent tourist villages will have been built throughout the country. It fully shows that the state strongly advocates and promotes the basic orientation of developing smart tourism throughout the country. At the same time, the Internet, especially the mobile Internet, has not only promoted the new tourism industry, but also significantly changed the consumption behavior of tourists, and pushed China into the era of self-assistance travel consumption. With the rapid change of the objective environment, how could the tourism industry apply information information and develop smartly has become the key to the tourism administration departments at all levels to meet the realistic challenges, and to promote the transformation and upgrading of the tourism industry from the traditional service industry to the modern service industry.

2 A Transformational Impact of the Internet on Tourism

On the basis of real-time, globalization, interaction, multimedia and other characteristics of the Internet, the mobile Internet, which is more portable, real-time, accurate, **personalized** has promoted profound changes in the behavior of three closely related subjects of tourists, tourism enterprises and government tourism authorities.

2.1 The influence of Internet on tourists' demand behavior

In the traditional era, tourists get information and share the travel experience and other needs, mainly by the traditional media, such as newspapers, books, radio, television, film, and other forms of conversation, letters and telephone with relatives and friends. With less information channels, limited information and **narrow information transmission**, tourists usually make purchase decision of tourism products depending mainly on the tourism products provided by various travel agencies and are often misled by the "induced product information" promoted by the suppliers. The asymmetry and the one-way transmission of the information often result in a lot of uncertainty, or even full of pitfalls and risks when tourists make the purchase decision. Not enough attention is paid to the tourists' personal

needs, thus it is difficult for them to obtain a satisfactory travel experience. In the Internet Age, especially with the mobility of mobile terminal and its application functions such as shooting pictures, sound recording, text input and geographical positioning, the Internet becomes completely "vivid", and the most subversive change is that tourists themselves become the makers and publishers of tourism information, which has not only greatly enriched and manufactured the tourism information, but also gradually promoted tourists to form the habit to get information online, customize personalized tourism products and share travel experience gradually.(Huang Ping, Su Qian, Ren Yun et al.2014)

According to the statistics report issued by the China Internet Network Information Center (abbreviated as CNNIC), by December 2017, the scale of Chinese netizens has reached 772 million and the Internet popularity rate is 55.8%, 4.1 percentage points more than the average global level and 9.1 percentage points over the average Asian level. Among them, the number of mobile phone users reached 753 million, and 97.5% of the netizens got on line through the mobile phones, and the mobile internet users in China outnumbered any other countries worldwide.[1] By June 2013, 133 million Chinese netizens had booked flight tickets, hotels, train tickets and holiday products on the Internet, accounting for 22.4% of the total number of Internet users, of which mobile subscribers accounted for 39.8%. [2] However, by December 2017, the number of Chinese Internet users booking travels on online had increased to 376 million, 243 million more, about 2.8 times of the number in June 2013. The number of mobile subscribers increased to 340 million, accounting for 91.9%, 50% more than the number in 2013.[3] In addition, in 2014, nearly 90% of Chinese tourists got information through Internet media, and 84% of the Chinese tourists used the social media, who spent as much time in sharing their travel experience as in travelin itself and their demand for internet in traveling is rising.[4]

The popularity of the Internet, the rapid development of electronic commerce and mobile APP have created huge space and freedom for the tourists to choose their own tourism products, promoted a large number of self-help tours and self-driving tours to a certain extent, and pushed China step into the era of self-help travel quickly. Under the influence of increasingly fragmented, personalized and experiential changes in the demand of tourists, the content of their demand has also expanded from the traditional offline six elements of "food, lodging, transport, traveling, phurchase, and amusement" to the "6+N" demand elements of online and offline interaction, including the "before trip" consultation, virtual experience, online travel booking and so on, tourism products purchase instant travel experience sharing "during the trip" , and sharing the journey or complaints "after the trip" etc. (Fig. 1).

2.2 The influence of Internet on the business behavior of tourism enterprises

In the traditional tourism era, the requirements of tourists are mainly completed by group tour organized by the travel agency. In the business model of the travel agency as the leading business model, the tourism enterprises focus on the stable cooperative relationship between "one to one", and the lack of two-way or multi direction communication mechanism between the upstream and downstream enterprises in the horizontal interest chain and the relevance. Although it is very strong, but the flexibility is insufficient, it is difficult for enterprises to skip over a value node with other enterprises to keep the contact and adjustment, the efficiency of tourism operation is low, and the mutual restriction is strong. Once the problem occurs in an important link in the interest chain, the business operation of the whole interest chain is easily lost to the total paralysis.(Hao Kang Li, Liu Jianyao,2014) Therefore, traditional tourism enterprises generally have such problems as single business, small scale, weak ability to resist risks and small competitive strength.

However, in the Internet age, traditional tourism enterprises, such as tourist attractions and hotels, can realize their own operation and management information, including enterprise resource management (ERP), customer relationship management (CRM) and so on. It can also use the Internet to combine entity services with virtual services, move from offline to online, and carry out e-commerce, so that the consumers can face tourism products and services directly without the participation of any travel agencies or other intermediary agencies. Therefore, it not only improves the relative single, formula, and homogenization of the products and services in the traditional tourism era, but also realizes the diversified cooperation mechanism of "one to many", "multi to many" and "multi to one", thus the traditional travel agency start to offer online services, realizing the transformation and upgrading of the traditional format. At the same time, there appear a large number of online tourism e-business enterprises based on Internet search, information integration and professional services, as well as new concept enterprises engaged in the network technology environment of tourism APP software development, thus the original combination mode of tourism industry has been radically changed and a group of online travel new giants are rapidly rising. For example, the comprehensive tourism enterprise represented by Ctrip and LY.COM, the professional tourism enterprise represented by Tuniu, the tourism social media represented by "Mafengwo"， the tourism group-buying e-business enterprise represented by Lvmama and Nuomi, have thrived in the e-commerce industry throughout China in recent years. As these brands compete fiercely, they gradually possess a strong development strength. According to the information issued by the China Tourism Research Institute, the number and ranking of the 2011-2017 years' list of the "China Top Twenty Tourism Group" have increased and upgraded (Table 1).

Table 1   The Online Travel Enterprises in the Top 20 Ranking of China Tourism Group in 2011-2017

Online enterprise name	2011	2012	2013	2014	2015	2016	2017
Ctrip Tourism Group	2	2	2	1	1	1	1
Qunar (Beijing Quna Software Technology Co., Ltd.)	20	10	7	4	2	—	—
LV.COM Network Technology Co., Ltd.	—	15	13	9	8	5	6
Joyu International Tourism Operation Group	—	16	17	18	18	12	10

Source: sorted information according to the Chinese Academy of Tourism, see http://www.ctaweb.org/html/. Ctrip merged and acquired Qunar in 2016

In the Internet era, the online tourism market released huge demand. According to the data published by ARI, the volume of China's online tourism market reached 220.46 billion yuan in 2013, increasing by 29% from 172.97 billion yuan in 2012, far exceeding the growth rate of 9% in traditional tourism industry. Among them, the online travel (OTA) market revenue grew from 9.4 billion yuan in 2012 to 11.76 billion yuan in 2013, and increased by 26.2% compared with 2012. China's online tourism market increased rapidly, mainly due to the increase of the subdivision markets in deferent degrees including air ticket, hotel, tourist holiday and so on. In specific, based on its highly developed booing system, the online booking of the flight tickets continues to permeate the traditional ticket booking at a faster rate; the hotel online reservation rate is low, but with the expansion of the online business of the core OTA and chain hotels, the market recognition of the prepaid products, such as the hotel group purchase, the hotel online reservation is fast growing; traveling on holidays, with the developing heat of the perimeter tour, outbound travel and the rise of destination marketing, traveling on holidays has become the fastest growing subdivision market. See ERI Consulting: China's online travel market trade

reaches 172. 97 million in 2013. [1]

In 2017, the trading scale of China's online tourism market reached 738 billion yuan, and China's online travel (OTA) market traded at 40 billion yuan, with its growth 4.26 times more than the number in 2012. If we say it is a transformational opportunity for the traditional tourism enterprise to step into the internet, then the mobile and wireless network services will become the second opportunity for the tourism enterprises to change, and the existing market pattern will also be subverted in the transition. Since 2013, online tourism enterprises have begun to snatch the mobile market share in succession. In addition to Ctrip and Yilong who carried out the mobile travel strategy, the Alibaba also upgraded "Taobao Travel" to a brand new independent tourism brand in October 2014, and put forward wireless, service, innovation and platform as four strategies, focusing on consumer demand for holiday travel. In 2016, when Ctrip bought and merged Qunar, Ali's travel "Go" also changed into "Flying pig", which set the market target in the independent travel of young people, opened a new round of competition, and fully demonstrated the huge business opportunities of Mobile Tourism in the Internet age. For tourism enterprises, the transformation and development trend has been determined whether they provide entity services or information services; whether they choose the operation mode of B2B, C2C, or B2C, O2O, the nature of providing services for the tourists will not change, and the only they will have to make is how to provide tourists with more satisfying service.

2.3 The impact of Internet on the management and service behavior of government tourism sector

As a national administrative organization, the government tourism sector not only plays an important role as an administrator and a coordinator in people' s social, economic and cultural life, but also shoulders a large number of management and service functions of tourism public affairs. The efficiency, interactivity and integration of the Internet provide unprecedented conditions and conveniences for the scientific, efficient and forward-looking management of the government. It has promoted the information construction of the government departments of tourism in China and constructed the new system of "e-government" based on the e-government affairs including the government to the government (G2G), the government to business (G2B), and the government to consumer (G2C).(Hao Kang Li, Pei Hongyi, 2012)

In the traditional tourism era, the management and service of government are top-down hierarchies with its information asymmetry, not timely and opaque, which reduces the scientificity and rationality of decision-making, and leads to low administrative efficiency. In the Internet age, the diversified tourism e-government platform, which is open to the public, is not only an important bridge and link between the governments, tourism enterprises and tourists at all levels, but also makes the management and service function of the government travel department close to the needs of the users, and promote the transparency and public management of the government. In order to improve the government's management level and efficiency, improve the government's competitive strength and scientific foresight, the government can play a decisive role in promoting the market's allocation of tourism resources, ensuring the healthy and sustainable development of tourism industry under the market rules and industry rules has a significant impact. Especially in the ways of management and service innovation, the Internet provides a great practical space for the government tourism department by establishing the tourism operation monitoring platform, the security emergency command management platform, the outdoor emergency rescue platform, the global customer oriented tourism information platform, the various new media platforms and the like. It will form an effective "push-pull" force in emergency management, image building, marketing communication and tourist services.

3 Innovative Thinking of Sichuan Intelligent Tourism Construction System under Internet Thinking

The transformation of tourism has become the development theme of the Internet age. In 2014, the state clearly pointed out that we should build "setting up a scientific tourism concept", "innovative development concept", "accelerating the transformation of development mode", and clearly pointed out the direction of China's government departments to take action and embrace change for the next period of time. Of course, in the Internet era, we must adapt to the "Internet thinking" and actively explore the intelligence development of tourism.

3.1 How to understand internet thinking

---

[1] http://ec.iresearch.cn/reservation/20130128/192196.shtml. 2013-01-28.

Internet thinking is the topic that the media and industry have talked about at present, but people hold different opinions on what Internet thinking is. As we know, "Internet thinking" consists four aspects: innovation, user, win-win and reconstruction. Among them, innovation is the driving force, users are the core, win-win situation is the premise, and reconstruction is the most important foundation. The foothold of "innovation" lies in the "new" with its essence breakthrough, which means to breakthrough the old thinking set and the old conventional precepts, in order to make all the reasonable new ideas, new ideas and new activities possible. "User" means user-centered, understanding users' needs, guiding users' needs, and meeting users' needs. "Win-win" means equality and opening, breaking the competition between industry and related industries in the traditional tourism era, and turning to the healthy development mechanism of cooperation and win-win. "Reconfiguration" mainly includes the reconstruction of the business format, the product, the organization, the management and so on. Through reconfiguration, better conditions and opportunities have been provided for the innovation of tourism industry, tourism products and tourism service mode, to make it possible that all the innovative ideas of traveling meet the needs of the users based on the Internet thinking, thus truly promote the transformation and upgrading of tourism industry and leap-forward development. (Hao Kang Li, Pei Hongyi, 2013)

3.2 Intelligent tourism construction system

Although there is no unified understanding of the concept of Intelligent Tourism in the domestic tourism industry and academia, the construction of intelligent tourism has begun under the leadership of the government and has become a great success. (Zhang Lingyun, 2013) In July 2011, the State Tourism Administration proposed that China would spend ten years or so to realize the "Intelligent Tourism" based on information technology to make the business activities of tourism enterprises fully information-based, and to develop the tourism industry into a modern service industry with high information content and intensive knowledge. Then, in the China Tourism "12th Five-Year" Development Planning Information Special Plan", the State Tourism Bureau has identified 18 cities including Beijing and Chengdu as the first batch of national intelligent tourist cities, and the Qingchengshan Dujiangyan scenic area, the Mount Emei scenic area, and other 22 scenic areas are designated as the pilot of the national intelligent tourist attractions. In 2014, the national tourism theme year was determined to be "the year of China's intellegent tourism". Many cities focus on the theme of Intelligent Tourism, actively developing which intelligent tourism cities, intelligent tourist attractions, intelligent hotels, intelligent catering, intelligent transportation, intelligent travel routes and other types of intelligent tourism.

However, if it is not clear what the subject and content of the intelligent tourism construction system is, the promotion of the construction practice of Intelligent Tourism in various places is likely to take a roundabout course and cause unnecessary waste of construction. We believe that intelligent tourism is not the same as tourism informationization and the intelligent tourism can realize only when the tourism informationization serves tourists as the core or when intelligent tourism is regarded as the advanced stage of tourism informationization. It is mainly embodied in two aspects of technology and application. On the technical level, with the help of information technology and network platform, Intelligent Tourism realizes the integration, coordination, optimization and promotion of tourism informationization service in the whole process of tourism, the whole time and space, the whole media and all related interest groups. It eliminates the information asymmetry and incomplete phenomenon of tourism supply and demand, and truly achieves the goal that the information service is transparent and open, co-constructive and sharing, real-time interactive and highly efficient. From the application level, intelligent tourism has three application objectives: first, it aims to provide more convenient and intelligent tourist information service and tourism experience for all kinds of tourists; second, it aims to provide a more efficient and intelligent information management platform for industry management; third, it aims to promote the integration, developmen and utilization of the tourism resources, and to create new products and tourism destination service system of high quality and high satisfaction.

It can be seen that the construction of intelligent tourism is not only the responsibility of the government, but also the target of the main tourism market and the pursuit of tourists. Therefore, the main body of intelligent tourism construction system contains government management departments, tourism enterprises and tourists, among which the government mainly offers tourism public management and public service, tourism enterprises mainly provide professional business services while tourists share the experience of intelligent tourism and participate in the provision of tourism information. (Zhang Lingyun, 2012)The three main bodies are indispensable, influencial and promotive to one another. Meanwhile, under the intelligent tourism construction system with its core serving the tourists

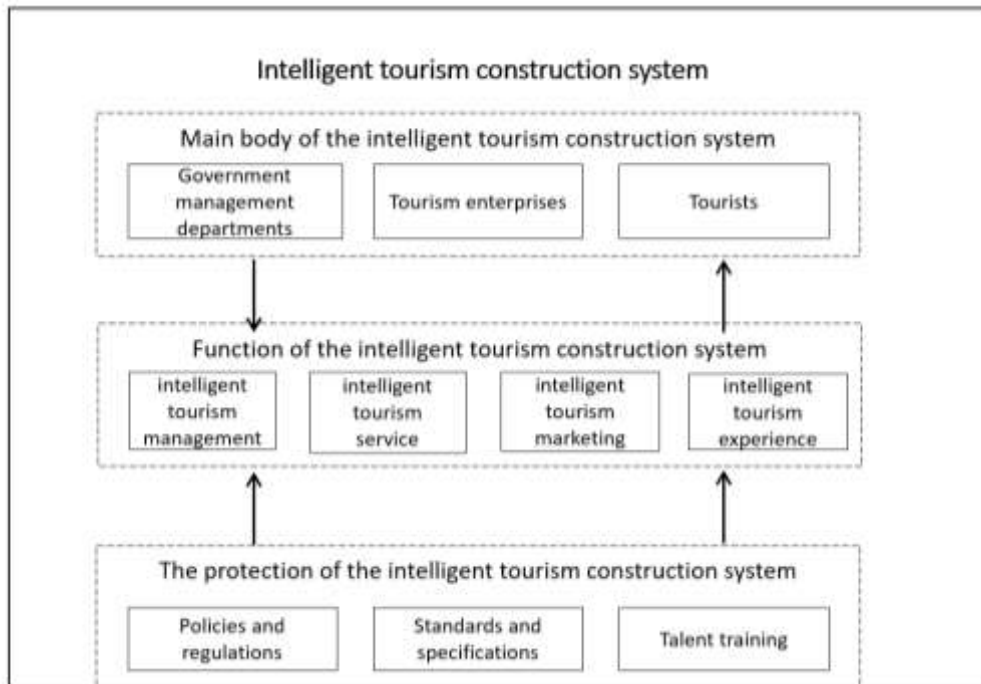
and around the construction target, no matter what type of intelligent tourism construction is promoted in various places, all the three major functions should be met, that is, intelligent tourism management, intelligent tourism service, intelligent tourism marketing, and three major guarantees should be provided, that is, policies and regulations, Standards and specifications, and talent training.


Figure 2   Intelligent Tourism Construction System

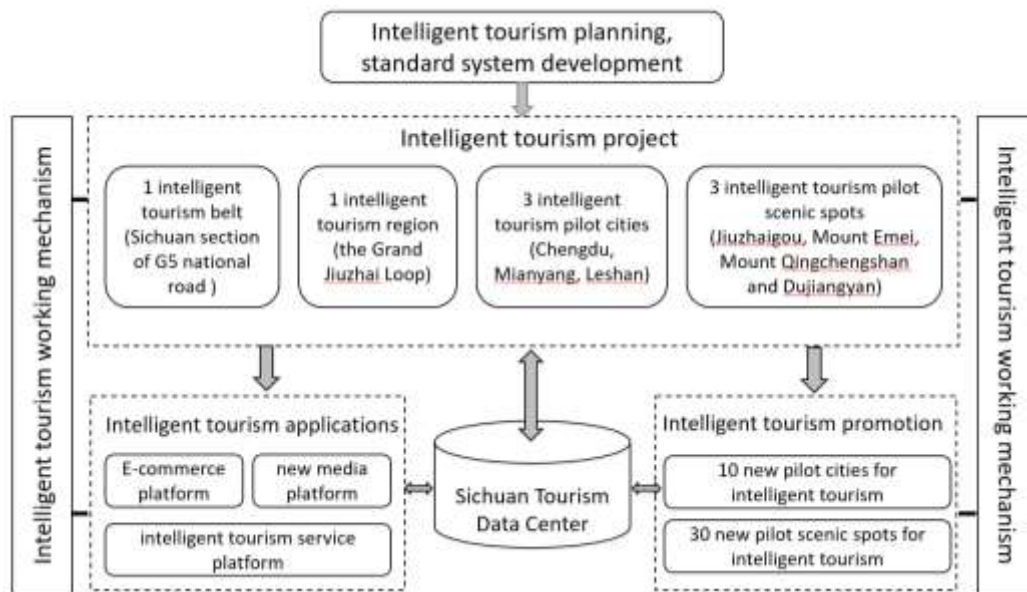
3.3 Innovative mode of intelligent tourism construction system in Sichuan

Sichuan province is located in the western region of China, but in recent years, it has attached great importance to the changing influence of the Internet on the tourism industry, actively complied with the changes of the times, made full use of the new generation of information technology, sped up the innovation of the intelligent tourism construction mode, and played a positive role in promoting the tourism industry to a new level in the whole province. In 2013, Sichuan's total tourism revenue in the country was ranked directly from ninth in 2012 to seventh, and in 2016, the total tourism revenue rose from seventh to fifth throughout China, and has always been the first in the western region. In order to accelerate the development of Sichuan from a province with rich tourism resources to a province with strong tourism economy, the Sichuan Tourism Development Committee (former name Sichuan Tourism Bureau) is closely related to the goal of "promoting the leap of strong tourism economy and building a world-known tourist destination" put forward by provincial Party committee and provincial government. In accordance with the "overall planning, improving the mechanism, government guidance, market leading, overall construction, and strengthening the service, giving full play to the boosting role of intelligent tourism in the transformation and upgrading of the tourism industry, taking information as the main way, comprehensively promoting the development level of modern tourism service industry and accelerating the construction of the world tourism destination"(Sichuan Provincial Tourism Bureau,2012), the committe has established the innovation mode of intelligent tourism construction system which is "taking planning and standard construction as the guide, improving the work mechanism as the basis, focusing on key projects, taking data integration and application promotion as the core, taking first trial and demonstration promotion as a breakthrough. (Figure 3).

Figure 3   Innovation Mode of Sichuan Intelligent Tourism Construction System


The mode includes the following main aspects:

1) Intelligent tourism planning and standard system construction. In order to promote the construction and promote the quality by standard, we should not only compile the development planning of the Sichuan tourism informationization, but also make a breakthrough in the key areas, compile a series of regional intelligent tourism construction plans, establish the standards of all kinds of intelligent tourism construction at all levels, and build a standard system of intelligent tourism.

2) Establish and improve the intelligent tourism working system mechanism. We should construct the intelligent tourism construction system of three levels in the province, the city (state), the county (city and the district), and actively unite the relevant departments, integrate the tourism enterprises, and realize the intelligent tourism construction working mechanism through vertical and horizontal links.

3) Promote the construction of key projects of intelligent tourism. The key projects include the construction of 1 Sichuan tourism data center, 1 intelligent tourist belt (G5 National Road Sichuan tourist belt) demonstration project, 1 Intelligent Tourism Areas (the grand Jiuzhai Loop line intelligence tourism area), 1 tourism operation supervision and safety emergency management linkage command platform.

4) Intelligent tourism application service. We should adhere to the service of tourists as the core, constantly improve the breadth and depth of application of tourism informationization in management, service and marketing, and demonstrate the ability of innovation and development of intelligent tourism at the application level.

5) Demonstrate and promote intelligent tourism. Pilot work of intelligent tourism has be done on 13 cities and 33 pilot scenic spots as a demonstration, and the construction of intelligent tourism in the whole province has been widely applied.

4 Practice and Exploration of the Intelligent Tourism Construction in Sichuan Province

4.1 Clear positioning, overall planning, establishing standards, quality first, and comprehensively speeding up the construction of intelligent tourism

In 2012, Sichuan Province compiled the Sichuan Province "12th Five-Year" Tourism Informationization Development Program (2012-2015) according to the National "12th Five-Year" Tourism Informationization Development Plan and Sichuan Province "12th Five-Year" Tourism Development Program". The overall goal of the Sichuan province "12th Five-Year" tourism informationization construction based on the Outline of the Development Program is "providing e-administration for the functional management departments, providing informationization management and e-business marketing for tourism enterprises and providing intelligent tourism services for tourists".

It has made clear the main task of "building a center, three clusters, five flatforms and a demonstration project" [1] , completed The Overall Plan of the G5 (108) National Road (Sichuan section) and the Grand Jiuzhai Loop, and started the Overall Planning of the 318 National Road Intelligent Tourism Belt (Sichuan Provincial Tourism Bureau, 2014) . Meanwhile, in view of the safety emergency of peak time tourist attractions in peak season, the Standard of Tourist Attractions in Peak Time Period (A++ standard) has been supplemented, the Construction Standard of Sichuan Intelligent Tourism City and the Construction Standard of Sichuan Intelligent Tourist Attractions have been compiled. In addition, some cities of Sichuan like Chengdu, Mianyang, Leshan, Guang'an, etc. have formulated the overall planning of the local intelligent tourism construction, and a batch of 4A and 5A scenic spots such as Jiuzhaigou, Mount Emei, Mount Qingchengshan and Dujiangyan have formulated the planning and implementation plan of the intelligent scenic areas. Through the overall planning and the guidance of standards, Sichuan province has accelerated the construction of intelligent tourism.

4.2 Linkage between upper and lower levels, government and enterprise integration, vertically and horizontally link up, departmental coordination, establishment of the intelligent tourism promotion working mechanism

Sichuan province adhered to the principle of "government guidance, department coordination, enterprise main body and social participation". On the one hand, Sichuan Provincial Tourism Bureau led to establish an integrated intelligent tourism management system consisting of provincial, municipal (state), county (city, district) tourism bureaus and scenic spots (enterprises) in Sichuan province; on the other hand, under the coordination of the leading group of Sichuan Tourism Industry Development, the cooperative working mechanism of intelligent tourism has been established among the Provincial Tourism Bureau, the Development and Reform Commission, the Commission of Economy and Information Technology, the Department of Finance, the Department of Communications, the Meteorological Bureau, the Department of Environmental Protection, the Bureau of Surveying and Mapping, the Public Security Department and other departments. In addition, Sichuan Tourism Bureau has developed the strategic partnership with the three major communications operators including Sichuan Telecom, Sichuan Mobile and Sichuan Unicom, the relevant financial institutions and digitized scenic spots, constructed a mechanism for sharing and exchanging information and cooperation in tourism in order to ensure the effectiveness of intelligent tourism construction through multi-channel, multi-form and diversified cooperative mechanism.

4.3 Platform first, project leading, key breakthroughs, pilot promotion, promoting perfection the function of the intelligent tourism system

4.3.1 Strengthen the construction of intelligent tourism management system

Firstly, the Sichuan tourism e-government administration website system integrating with provincial, municipal (state) tourism administration network has been set up, and the tourism video conference system throughout Sichuan and the intelligent meeting system of Sichuan Tourism Bureau have been built. Secondly, a tourism emergency rescue management system has been established. In 2012, under the support of the Sichuan Provincial Development and Reform Commission, the Commission of Economy and Information Technology, the Development of Finance and the Development of Science and Technology, the Sichuan Provincial Tourism Bureau has completed some major platform projects including "Sichuan tourism operation supervision and safety emergency management linkage command platform", "outdoors emergency rescue platform based on the Beidou compatible system" and "the application of mobile information technology". In November 2013, the emergency command platform was officially launched, which can monitor and warn the daily operation of the tourism market in real time, carry out emergency command and dispatch to the emergency including monitoring the video in scenic spots at any time, tracking the track of the tourist vehicles, predicting the traffic flow in advance and remote distributing tourists, integrating the electronic travel list with the track of vehicles, transmitting mobile emergency communication and other functions to achieve the goal of intelligent construction of "visibility, connection and interaction" in tourism emergency management. During the "National Day" golden week in 2014, the first official operation of the platform gave full play to the emergency command role. Through the comprehensive application of

---

[1] One center: Sichuan tourism data center; three clusters: Tourism e-government website cluster, marketing and consulting service site cluster and e-commerce site cluster; five platforms: tourism operation supervision and safety emergency management linkage command flat platform, tourism industry management platform, tourism standards Management platform, tourism marketing and consulting service platform, tourism e-commerce platform; a demonstration project: G5 freeway (Sichuan) "Intelligent Tourism" demonstration project.

information and large data analysis technology in all aspects, the platform released the passenger flow early warning 1 time, the security early warning 12 times, which effectively promoted the real time monitoring, orderly diversion and safety early warning of the tourism market in Sichuan, therefore it played a positive role in ensuring the rational scheduling and smooth operation of the tourist market in recent years. At the end of 2013, the main function of the outdoor emergency rescue platform based on the Beidou compatibility system was built, popularized and applied in several scenic spots in the whole province, which provided a powerful security service for the tourists to carry out outdoor tourism projects. (Sichuan Tourism Bureau Tourism Information Center, 2014)

4.3.2 Perfect the intelligent tourism service platform system

First, the multilingual Sichuan tourism information website service system (www.tsichuan.com) of "1+21 (21 cities and states) +N (Multilingual)" has been established. Different versions have been launched online including English, French, German, Spanish, Russian, Japanese, Korean, traditional Chinese, simplified Chinese, and so on. The website system has realized the function of self-adaptive language version, and carried out the server image landing in 12 countries and regions. By October 2014, the website had had over 100,000 information of variou kind, 60,000 pictures and 100 videos. Secondly, cooperating with 5 famous tourist network operators such as Ctrip, eLong, Mango, Tuniu and LY.com, the online flagship shop of Sichuan tourism has been established to promote constructing the e-commerce platform of tourism enterprises in Sichuan. Ctrip has developed to be the largest tourist network operator in Sichuan by investing in Chengdu to set up a branch. Thirdly, we should strengthen the management of the multi platform application of the new media by developing "Fun in Sichuan" APP client, Sichuan tourism WeChat subscription, micro-blog service platform, multi-media interactive multi-media intelligent tourist map, scenic spot micro card, intelligent tourism multi-media enquiry terminal along G5 (108) National Road and the broad Jiuzhai loop lines. More than 70% of the cities (states) and major scenic spots in Sichuan province have developed their official micro-blogs and WeChat platforms and APP clients to provide tourists with convenient information and consulting services.

4.3.3 Innovate intelligent tourism marketing mode

First, we should make full use of the advantages of the Internet, focusing on integration and event driven, and plan to integrate and promote marketing activities through the linkage between the official micro-blog and the official WeChat. By October 31 of 2014, the number of the official micro-blog fans of the Sichuan Provincial Tourism Bureau has reached over 140 million, including 620 thousand Sina official micro-blog fans, more than 840 thousand fans of the Tencent official micro-blog, 100 thousand fans of Sichuan Tourism official WeChat platform. The official micro-blog of the Sichuan Provincial Tourism Bureau was awarded "Sichuan Top Ten overnment Affairs Micro-blog of Provincial Departments", "Top Ten Influential Provincial Tourism Bureau Official Micro-blog" and "Southwest Government Affairs Influence Award" both in the year 2013 and 2014. Secondly, the introduction of "Love, in Sichuan" series of micro films, which broke through the traditional form of tourism propaganda, has enjoyed extensive popularity on the Internet, and effectively enhanced the popularity of Sichuan tourism. The official micro-blog's network demand has exceeded 50 million times, which has brought huge download flow and created a new hot spot of tourism information consumption. Thirdly, Sichuan Tourism Bereau promoted the interactive marketing between the traditional media and the new media by launching the first outdoor reality show "Two Days and One Night" in China, implanting tourism elements in the traditional TV entertainment show, which have widely spread through the Internet and the self media, exceeding 300 million times of the network on demand, and it was awarded the "2013 TOP 10 China Tourism Marketing Innovation" at the third annual meeting of China's Tourism Industry Development. Fourth, online and offline interactive marketing was promoted. The activity named Looking for "the most beautiful starry sky in Daocheng Aden" was promoted on Taobao, and more than 1000 products were sold out within 5 minutes after the launch of the activity. At the same time, Sichuan Tourism Bereau launched activies of "filming 365, painting Sichuan", "look for the 100 most beautiful sightseeing and filming spots of Sichuan", collected and published over 40,000 beautiful pictures, thus improved the popularity of the scenic spots that participated in the activities. Fifthly, Sichuan Tourism Bereau cooperated with internationally famous network channels and enterprises in marketing including 20 network platforms like Google, TripAdvisor, Youtube, Baidu, Ctrip, and Taobao to build domestic and foreign network marketing platform and channel system. It also collaborated with the world's largest video website Youtube in producing creative videos on traveling in Sichuan, setting up the video area to present a beautiful image of Sichuan Tourism as a whole via the interactive videos, pictures, text, maps and other multi-media elements, and achieved the click rate nearly 1 million times.

Sixth, Sichuan Tourism Bereau held Global Tourism Network Operators Cooperation and Exchange Conferences for three consecutive times, built exchange and cooperation platforms for tourism enterprises and OTA at home and abroad, and pushed forward the development of the online tourism industry in Sichuan.

5 Conclusion

Internet technology is rapidly changing the patterns of tourists' purchase, which drives the government to promote its service such as launching innovation service, management process re-engineer, marketing models refactor, and new industry formats exploration. 'Internet + tourism' is not only a technological revolution, but also a reformation of smart tourism led by the Internet thinking. The essence of smart tourism is the tourism informatization with the service on tourists as the core, which the 'human wisdom' is the criteria.

In terms of operating smart tourism, Sichuan is at the leading position of China by establishing the '1+3' smart tourism system to link province-city-county government and enterprises, organizing the first provincial-level tourism industry operation supervision and the command platform of safety emergency management, and constructing an outdoor emergency platform based on Beidou compatible system and multilingual travel information service (www.Tsichuan.com)- the '1+21 (21 cities and counties) + N (Multilanguage)'. Moreover, based on the combination of multi-sectoral and multi-domain information resources, Sichuan has initially built up its tourism big data system. Therefore, under the assistant of the Internet platform, Sichuan has obtained many achievements in tourism marketing.

However, in the face of the popularity of the Internet, especially mobile Internet users, there is a need for the government to accelerate the construction of smart tourism from the perspectives of concepts, policies, and measures to ensure the sustainable development of smart tourism：

5.1 Tourism informationization that serves tourists is Intelligent tourism

The essence of intelligent tourism is the application of intelligent technology, including information and communication technology, in the tourism industry. It aims at innovating tourism management, promoting tourism service, improving tourism experience and optimizing the utilization of tourism resources. It is a modernized project to enhance the competitiveness, improve the management abilities and expand the scale of the industry. (Huang Ping, Guo Xirong, Su Qian, He Yuan et al, 2016)

5.2 Top-level designing and overall planning, developing intelligent tourism according to local conditions

The top-level design should be forward-looking, scientific, systematic, suit the local conditions, and conform to the reality to make it feasible in every step of the strategy implementation. We must ensure the continuity, flexibility and extensibility of the construction and implementation of intelligent tourism, making it an integral part of the intelligent city.

5.3 Giving full play to the leading government and market

The "government + market" model should be used to promote the healthy and rapid development of intelligent tourism, and the interaction and cooperation between the government and the enterprises will help construct the intelligent tourism with more vitality and timeliness. The problems should be solved in fund-raising during construction and its use after construction, and the relationship between public service of the government and market management of the enterprises should be handled successfully.

5.4 Building a working promotion mechanism in the integration of provinces, cities, counties and enterprises

The government should take the lead with graded responsibilities; different departments should interact, co-construction and share with one another; enterprises should work as the main body together with the market operation; and the society ought to participate to win from all aspects. The department linkage and information resource sharing mechanism should be established, applying the principle of "not seeking all, but seeking to use", integrating and sharing the existing information facilities and resources by the society and departments.

5.5 Ensure the policy support and create a favorable environment for intelligent tourism development

The second revolution of the tourism industry will be lead by intelligent tourism with the vigorous support at the national policy level, the increasing investment of special funds, and the participation of private capital. A good environment will be created for the development of intelligent tourism as it has received the attention of governments at all levels, support for various departments, active innovation

and the initiative taken by the tourism authorities, participation of the enterprises and the promotion of the whole society.

5.6 Strengthen personnel training and develop strong human resource backup

The essence of intelligent tourism is "people-oriented", which aims to make the tourist experience more intelligent. The intelligent tourism takes into consideration the wisdom management and intelligent service of the government and enterprises. Intelligent talents with intellectual knowledge are the key to the construction of intelligent tourism. The integrated training system of the country -province-city-county-scenic spot (enterprise) should be set up to provided a strong human resource backup for intelligent tourism construction.

Study of the Positive Impact of Intelligence Introduction on the Open Innovation at Chinese Universities

Liu Qiong
International Office, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: lqiong@whut.edu.cn)

Abstract: Intelligence introduction is an important part of promoting internationalization of education at Chinese universities. With the development of globalization and the increasing deepening of educational opening-up, intelligence introduction has become a strategic long-term task at Chinese universities. Based on the theory of open innovation, this article discuses the positive impact of intelligence introduction on the open innovation at Chinese universities from the perspective of the cultivation of innovative talents, the promotion of scientific and technological innovative capacity as well as the reform and innovation of Chinese higher education. It also makes useful exploration about how to develop intelligence introduction and bring the significant role of intelligence introduction into full play, so as to better promote the open innovation at Chinese universities.
Key words: Intelligence introduction; Chinese universities; Open innovation; Positive impact

1 Introduction

Chinese universities bear great responsibilities of scientific and technological research and the cultivation of innovative talents. They make up an important part of Chinese innovative system as the source of knowledge innovation and the major participants in technology innovation (Chen Juan, Li Jianqing, 2015). Under the new circumstances of the globalization of science and technology and the internationalization of education, intelligence introduction becomes not only a necessary requirement for enhancing the level of educational internationalization, but also an important approach to boost the open innovation and increase the core competitiveness of Chinese universities. Since China's reform and opening up, Chinese universities have achieved significant progress in expanding educational opening-up and introducing excellent foreign educational resources. In the new era, with the increasing deepening of opening Chinese higher education to the outside world, intelligence introduction, as a strategic long-term task, has been included into National Program for Medium and Long Term Talent Development (2010-2020) and National Outline for Medium and Long Term Education and Reform (2010-2020). Intelligence introduction is sure to play a unique and significant role in the open innovation at Chinese universities as well as the educational internationalization.

2 The Idea of Open Innovation at Universities

In the beginning of the 21st century, American scholar Chesbrough first put forward the idea of open innovation which is "realized through innovative resources that are complemented internally and externally in the process of innovation" (Yang Murui, Du Huaigang, 2009). Open innovation introduces open strategies into innovation activities. It is a new innovative mode to attract, integrate and share innovative resources. Open innovation aims to promote exchanges, cooperation and integration among all innovative subjects and elements, explore and develop new innovative resources so as to achieve comprehensive collaborative innovation. Open innovation is a necessary requirement of modern economic society and innovative development (Chesbrough, H., 2003).

In the context of globalization, the flow of talents, knowledge and technology is becoming freer. It is hard for traditional closed innovation to get adapted to the development of higher education. By adopting open measures like overseas introduction of talents and intelligence, industry-university-research cooperation and so on, open innovation could attract and share innovative resources including talent resources, knowledge resources, information resources, discipline resources, technical resources, and overseas cooperation resources, etc. To carry out comprehensive collaborative innovation is important for universities to improve educational level, cultivate innovation awareness and abilities and develop innovative achievements. It also enables universities to train internationalized talents who are capable of participating in the international competition with international vision and a good knowledge of international rules.

Intelligence introduction at universities refers to introducing foreign talents resources and foreign intelligence resources (Li Yi, Feng Xinglei, Xu Yao, 2009), which includes the introduction of excellent

foreign experts, professors, specialized talents, advanced foreign scientific and technological knowledge, administration modes, teaching methods, educational ideas, etc. It promotes the open innovation at Chinese universities through the introducing and sharing of the overseas innovative resources.

3 The Positive Significance of Intelligence Introduction to the Open Innovation at Chinese Universities

3.1 Intelligence introduction promotes the cultivation of innovative talents at chinese universities

The fundamental task of higher education is to cultivate talents. Strengthening faculty team construction and curriculum construction by introducing foreign experts and excellent teaching resources is an important way to improve the quality of talent cultivation and promote the connotative development of Chinese higher education. By giving academic lectures, offering international courses to undergraduates and giving academic guidance to young scholars, PhD students or master graduate students, the introduced foreign experts contribute to the work of talent cultivation at universities. Meanwhile, universities introduce overseas high-level experts to jointly establish Chinese-foreign cooperative platforms or high-level Chinese-foreign cooperative innovation teams, which enables more excellent young scholars and PhD students to keep up with international frontiers of science and technology and the development directions of it. Under the joint guidance of introduced overseas academic masters, they improve the scientific and technological innovative abilities and publish papers in international top journals and get influential international academic awards. In general, Intelligence introduction plays an irreplaceable role in promoting the cultivation of innovative talents at universities as well as improving the internationalization ability of the young scholars and talents.

3.2 Intelligence introduction enhances the scientific and technological innovative capacity of chinese universities

As the main driver of the innovation of overseas talent-introduction policies and implementation of the overseas talent-introduction projects, the Ministry of Education and State Administration of Foreign Experts Affairs initiated a series of major talent-introduction projects in recent years to support universities to enhance the scientific research capacity. For example, the "Overseas Expertise Introduction Projects for Discipline Innovation" ("111 project" for short) aims to introduce about 1000 overseas academic masters and academic mainstays from the top 100 universities and scientific research institutes in the world to form high-level innovative teams with Chinese scientific research backbones to carry out high-level scientific research jointly. The overseas academic masters should be academicians from foreign academy of science, academy of engineering or internationally recognized first-class experts and scholars. The overseas academic mainstays are supposed to have innovative ideas and have made innovative achievements acknowledged by the international peers. In face of the needs of national strategic development and the frontiers of international science and technology, the "Recruitment Program for Foreign Experts" ("one-thousand talents program" for short) is targeted at key areas and key technologies, emerging industries and strategic industries to introduce overseas talents engaged in important original innovation and disruptive technology research. The introduced high-level foreign experts based on this long-term project shall work for 3 consecutive years in China with no less than 9 months per year. They shall put forward forward-looking, strategic and innovative scientific conception and construct the innovative teams to reach Chinese leading level and international advanced level in the field. Under the leadership of the introduced experts, the innovative team shall apply for and undertake national major projects, key projects or international cooperation projects.

Relying on various major talent-introduction projects such as "111 project", "one-thousand talents program", "high-end foreign experts' program", Chinese universities introduce high-level overseas talents, build up innovative teams and construct international platforms or bases for international scientific research. By forming high-level international innovation forces, universities will conduct international collaborative research to make breakthroughs in key technologies and solve international difficult problems, thus to promote the innovative capacity, discipline strength and international influence.

3.3 Intelligence introduction advances the innovation reform and development of chinese higher education

Intelligence introduction is an important part of speeding up the process of internationalization and promoting reform, innovation and development of Chinese higher education. To strengthen the construction of international capacity, universities should introduce not only overseas high-level talents, but also the management mode, curriculum system and teaching methods, etc., from foreign universities

to realize the internationalization in curriculum system, team management mode, teaching and scientific research personnel (Sun Xi, 2014). In 2014, "Internationalization Demonstration College Promotion Plan" was jointly launched by State Administration of Foreign Experts Affairs and Ministry of Education. The plan supports universities to recruit foreign experts in groups and introduce internationally standardized modes of management, scientific research and teaching. The recruited foreign experts cover the ranges of management, science research and teaching. Foreign experts who are responsible of teaching or scientific research should be disciplinary leaders or well-known experts and scholars in concerned international fields, while those who take charge of management should have experience of working as management with strong cohesion ability and high international prestige at foreign universities or colleges. The internationalization demonstration college takes the cultivation of top innovative talents as the core and aims to help build the world-class university. Through constructing internationalized curriculum system and management mode, Demonstration College will inevitably play the role of demonstration and promotion step by step. It will continue to carry out the explorative practice to speed up the modernized construction of governance system of Chinese higher education, and to promote the innovation, reform and development at Chinese universities.

4 How to Develop Intelligence Introduction for the Promotion of Open Innovation at Chinese Universities

In the new era, the development of the higher education puts forward higher requirements and new challenges for intelligence introduction at universities. With the forming of a multi-level, multi-channel and wide-ranging development pattern, Intelligence introduction at universities is taking on new development to better promote the open innovation at Chinese Universities.

4.1 Expanding of recruitment fields and promotion of the intelligence introduction level

The focus of intelligence introduction at universities has already transferred from employing foreign language teachers to professional experts. In addition, the professional fields and professional coverage for overseas talents recruitment are also expanding. The introduction direction has changed from "teaching-oriented" to "the comprehensive kind of teaching, scientific research and development" (Liu Sian, 2003). In face of disciplinary development and the needs of talent cultivation, universities take initiative to carry out intelligence introduction which centers on the construction of preponderant and characteristic specialties, key disciplines and emerging disciplines. The proportion of introduced disciplinary leading talents and urgently-needed talents is increasing year by year (Chen Weihua, 2008). By strengthening the leading role of high-end overseas experts, universities carry out talent cultivation and make scientific breakthrough with joint efforts, which contributes to the promotion educational strengths and innovation capacities of the universities.

4.2 The innovation of intelligence introduction mode

Universities shall positively innovate intelligence-introduction modes to introduce excellent teaching resources. Various ways like academic exchanges, lecturing, collaborative research, international conference, Chinese-foreign cooperative education and so on are taken to communicate and interact with international peers to keep in line with the latest developments of international academic and research frontiers, to upgrade professional levels and broaden academic horizons. The forms of foreign experts' recruitment at universities are becoming more diverse: the combination of full-time and part-time jobs, of short-term and long-term employment, and of individual expert and teams of experts. While stressing "bringing in", universities also put emphasis on "sending out "(Guo Jianmin, 2002). Universities need encourage teachers to go abroad to carry out academic exchanges, make academic visits, or attend international academic conferences with a view to promoting interdisciplinary development, speeding up the update of academic ideas, and thus to enhance management experience, teaching methods, scientific research level and innovative ability (Chen Dongli, 2017).

4.3 More attention to the efficiency of intelligence introduction

Attention should not only be paid to the quantity of intelligence introduction, but more to the quality and substantial efficiency. The efficiency of intelligence introduction is the measurement standard for the work of intelligence introduction at universities as well as the foundation of the sustainable development of it. Universities are more and more concerned about the function of intelligence introduction in talent cultivation, scientific research and social services. Through intelligence introduction, universities expect to enhance teaching and scientific research level, promote disciplinary development and speed up the faculty team construction. Meanwhile, as Chinese higher

education develops towards marketing and industrialization, it becomes necessary for the intelligence introduction at universities to serve for the transformation of scientific and technological achievements (Wang lei, 2016). In recent years, based upon the actual intelligence introduction conditions, universities have already begun to explore and establish scientific and effective performance evaluation mechanism and rewarding mechanism for the innovative achievements. A long-term and sustainable working mechanism for talent-and-intelligence introduction should be established.

Figure 1   Features of Intelligence Introduction and Promotion of Open Innovation

4.4 The requirement of innovating management mechanism

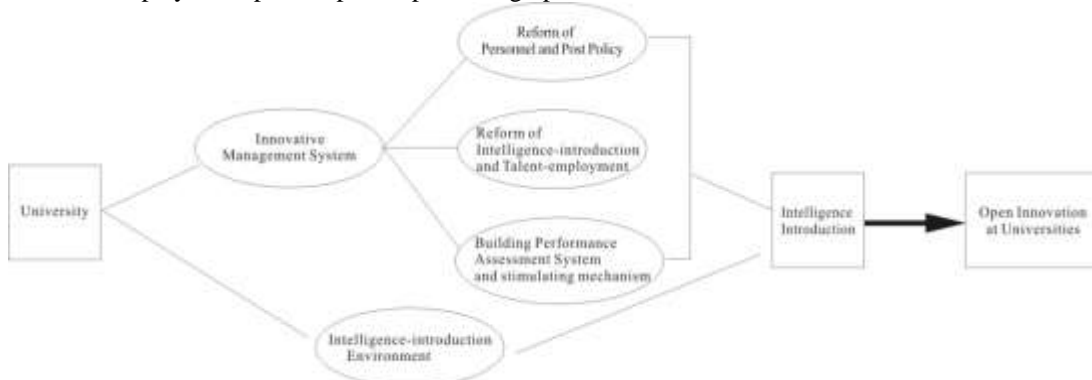
To advance the development of intelligence introduction and push ahead the open innovation at Chinese universities, the government needs to improve policies and regulations concerning introducing of foreign talents and intelligence and set up linkage mechanism among relevant departments. Universities themselves should integrate intelligence introduction into the overall development plan and strengthen overall coordination by innovating management system, exploring and establishing flexible systems and mechanisms in talents introduction and talents employment. Universities should also provide support and guarantee to intelligence introduction with favorable policies, funds, and teaching resources. Still, it is important to create favorable environments for intelligence introduction such as providing high-level scientific research platform, good working and living conditions and international atmosphere. Concrete measures shall be adopted to reform the mechanism of personnel management in professional title evaluation and post employment. Scientific and effective performance assessment and awarding methods shall be implemented to mobilize overseas talents' enthusiasm in order to further improve the efficiency of intelligence introduction. Meanwhile, universities need increase service awareness and enhance the cultural integration among foreign talents (Wang Xiumei, 2013). Only by innovating and reforming the management systems and mechanisms, could universities keep the work of intelligence introduction developing in a stable and sustainable way so that intelligence introduction could better play its important part in promoting open innovation at universities.


Figure 2   Innovative Management System and Development of Talent Introduction

5 Conclusion

In face of the strategic needs for national development and the construction of key disciplines, to actively implement the work of intelligence introduction is an important approach to cultivate innovative talents, promote scientific research innovation and educational reforms at Chinese universities. In an open way, China universities attract and make use of foreign talents and foreign intelligence resources to form innovative educational ideas, management modes and curriculum systems which are in line with the international standards. By means of introducing overseas talents and intelligence, universities also build up joint international platforms and international collaborative innovative teams to carry out high-level collaborative innovation and scientific cooperation in face of

international scientific frontiers, major industry demands and regional innovation development. Intelligence introduction will significantly promote open innovation at Chinese universities in its international collaborative way. In the new era, Chinese universities should speed up the internationalization process and strengthen the work of intelligence introduction by improving quality, innovating introducing modes and reforming the management systems and mechanisms so as to bring into full play the unique and important role of intelligence introduction in the open innovation at Chinese universities.

Statistical Analysis of Academic Papers Published by Colleges and Universities Based on Web of Knowledge: A Case Study of Wuhan University of Technology

Mao Huanhuan

The Personnel Department, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: mhhyue@163.com)

Abstract: According to the high demand of scientific research output of the "National First-class University First-class Discipline Strategy", this paper is based on the database Web of Knowledge which included the SCI papers of Wuhan University of Technology. By using the metrological analysis method, this paper makes a detailed and deep statistical analysis of all the SCI papers during the period of 2000-2017, from the article types, the research directions, hot cooperative organizations and nations, hot source of publications and authors etc. According to the statistical analysis, the total number of papers published by Wuhan University of Technology has been increasing continuously. Especially since 2013, the number of high-level papers has increased dramatically with the introduction of overseas high-level talents. It finds out that the review articles with higher academic level account for less than two percent of the total papers published by this university, and half of its academic papers can be classified into materials science, which testifies that it is the preponderant discipline of the university. The study gives an objective evaluation of the development status and trend on Wuhan University of Technology's research capacity since it was merged in 2000. It can also provide reference for the university on improving teaching and scientific research as well as on publishing scientific papers.

Key words: Web of Knowledge; Reference Statistics and Analysis; Wuhan University of Technology; SCI papers

1 Introduction

Web of Knowledge is the world's largest comprehensive academic information resources, covering the most disciplines and including more than 8700 core academic journals. All are the most authoritative and influential journals in the world. The content covers all fields of research such as natural science, engineering technology and biomedical science (Sun, 2013; Hou, 2017). The published academic papers which are included or cited by Web of Knowledge have been used by many countries in the world as an important reference index to measure the academic level of universities and institutions and to evaluate the academic level of scientific research workers(Sun, 2013). The Times Higher Education World University Ranking is one of the four most influential global universities ranking. Its ranking method is based on five indicators. One of the main indicators 'Citation' of papers accounts for 30%, which mainly investigates the influence of a college or university in scientific research. The factors of U.S. News Best Global Universities rankings are more refined. The journals published and cited indicators account for up to 50% of the rankings (Ren, 2014). The scientific research level is also regarded as an important index in Overall Plan for Promoting the Construction of the World's Leading Universities and First Class Disciplines issued by the State Council.

Therefore, detailed sub–index ranking research is carried out from the viewpoint of reference statistics. It has very important reference significance. And it can be also used as guidance for decision - making and planning in scientific research (Ou, 2010). However, there is not much research focusing on such statistical analysis on journal publications. Nowadays, big data analysis technologies have been extensively improved and being used in many specialties to obtain clear information out of massive data. It could be used to understand basic phenomena of scientific publications of a colleagues and university.

This research is based on the SCI papers included in Wok of Wuhan University of Technology (WUT) in the period of year 2000 – 2017. By using the method of statistical analysis, it can evaluate the development state and trend of scientific research level of Wuhan University of Technology since the year of coeducation in 2000.

2 Database and Research Method

This paper is based on the core collection of Web of Knowledge (WoK) by Thomson Reuters, the world's most famous bibliography and index service provider, and it only takes the papers of Wuhan University of Technology which is included in the database of "Science Citation Index Expanded

SCI-EXPANDED from 2000 to present" as the data source. The data collected from 2000 to September 29, 2017 are analyzed by the method of statistics analysis. By taking "Address: Wuhan Univ Technol" as the key word, a total of 11165 search results were obtained, indicating that 11165 SCI papers have been published under the name of Wuhan University of Technology since the year of 2000.

Figure 1 shows the annual increase in the total number of published papers. It can be clearly found that the annual total number of published papers continues to grow, especially after 2013, with Wuhan University of Technology making great efforts to introduce high-level overseas talents and young talents with overseas doctorate degrees. The number of high-level papers published has risen sharply; the total number of papers published in the year of 2016 has doubled in just three years compared with the year of 2013.
Figure 1   Annual Increase of the Total Number of Published Papers

Figure 2 shows the proportion of open access journal papers in all SCI papers. Although the open access journals include some high level sub-journals of Nature, such as Nature Communications, the open access journals have not gained high international recognition (Huang, 2009; Zhang, 2007; Chen, 2015). Figure 2 presents that the ratio of open access journal papers in Wuhan University of Technology is only 5.5%, which indicates that the researchers of WUT seldom choose open access journals to publish their academic results.
Figure 2   Open Access or Not

3 Research Result Analysis

Based on the retrieval results of WoK, this paper makes a detailed analysis of document types, research areas, countries and regions, organization, source titles, high yield authors and so on. In the following analysis, the sum of the percentage of classifications in the indicators is usually much greater than 100%. It ascribes to the overlap in the classification of papers. For example, a paper can be classified into conventional scientific paper as well as conference paper or review paper.

3.1 Types of article

Table 1 shows the distribution statistics for article types. The proportion of conventional academic articles published by WUT is 96.1%. The following type is conference papers, accounting for about 5.4%, while academic review papers accounts for less than 2%. On the one hand, this indicates that the research achievements of WUT are main originality; on the other hand, it shows that there are few review papers with guiding significance in a certain field. The authors who have higher academic level and higher attainments in their fields must collect and consult a great deal of data. The review paper is

written by classifying and analyzing comprehensively the raw data. The paper needs to reflect the current research progress in this field with strong logicality and foresight. The paper should have general guiding significance and guiding function for the development prospect of this field (Huang, 2009; Lei, 2008; Yang, 2013). That is critical of a review paper to get be published in WoK. At the same time, the review papers can gain more attention from researchers in the same field than the conventional scientific research papers. Therefore, the university should pay more attention to the review papers.

In addition to conventional scientific research papers, conference papers and review papers, the sum of other types of articles does not exceed 3%, which is statistically negligible.

Table 1   Distribution Statistics for Article Types

Article Types	Records	Percentage
ARTICLE	10729	96.10%
PROCEEDINGS PAPER	605	5.42%
REVIEW	216	1.94%
MEETING ABSTRACT	144	1.29%
EDITORIAL MATERIAL	45	0.40%
LETTER	19	0.17%
CORRECTION	12	0.11%
RETRACTED PUBLICATION	4	0.04%

3.2 Research areas

In September 2017, the Ministry of Education, the Ministry of Finance and the National Development and Reform Commission released a selected list of world class universities and first class disciplines (referred to as "double-first class"). The "Material Science and Engineering" discipline of Wuhan University of Technology was selected for the first-class disciplines construction plan. The construction plan is completely consistent with the preponderant research area reflected by the published academic articles of the university. Table 2 summarizes the distribution of SCI papers by research areas, with the number of papers in materials, chemistry, engineering and science occupying the top four respectively. According to the "Implementation Plan for First-class University and First-class Disciplines Construction" of WUT, by the year of 2020, one discipline (material science) of the university will be selected into the forefront of the world's top disciplines (entering 1 ‰ in ESI and the top 20 in the world), and 5 disciplines (material science, engineering, Chemistry, physics, computer science) will be listed in the ranking of the world's top disciplines (entering the top 1% of ESI). The university's implementation plan is highly consistent with the statistical results of the research field distribution in Table 2.

Among them, nearly half of the academic achievements can be classified into material science, reflecting the strong position of material science in Wuhan University of Technology. WUT is the only one university or college which has two national key laboratories (the State Key Laboratory of Advanced Technology for Materials Synthesis and Processing and the State Key Laboratory of Silicate Materials for Architectures) in China. In the field of material science, the university not only owns the innovation research group of the National Natural Science Foundation, but also cultivates many high-end talents, such as several Chinese Academy of Engineering, the scholars of the Yangtze River. As a result, under the influence of the top four disciplines, the following disciplines, metallurgical engineering, new energy devices, computer science, composite materials, electrochemistry, architecture engineering, mathematics, optics, mechanics and etc., also have better academic achievements.

Table 2   Distribution Statistics of SCI Papers by Research Areas

NO.	Research Areas	Records	Percentage
1	MATERIALS SCIENCE	5095	45.63%
2	CHEMISTRY	2910	26.06%
3	ENGINEERING	2411	21.59%
4	PHYSICS	1851	16.58%
5	SCIENCE TECHNOLOGY OTHER TOPICS	967	8.66%
6	METALLURGY METALLURGICAL ENGINEERING	652	5.84%

3.3 Hot cooperation Countries and regions

Based on the features of WoK, by analysis the detailed information of published articles, it can present countries or regions that cooperate most closely with one designated unit. Table 3 shows the distribution of countries or regions that the academic cooperation units with WUT belong to. Table 4 shows the statistical results of the distribution of hot cooperation units with the university. In addition, the data in Table 3 have filtered the domestic records, and only the non-Chinese regions or countries with the most closely cooperative units are statistically analyzed.

It is known from Table 3 that the countries with the closest scientific research cooperation and communication with Wuhan University of Technology are the United States, Japan, the United Kingdom, Australia, South Korea and Canada. Among them, the United States, Japan and the United Kingdom are internationally recognized as the most scientific and technological powers in the world. So far, there are more than 300 Nobel winners in the United States, which is the top of the world. Especially in the field of Natural Science (Physics, chemistry, biology, medicine), the United States is overwhelmingly awarded the Nobel Prize (far more than the sum of the rest of the world). In the top 20 universities of the world, whether it is the Times Universities ranking or QS ranking, the United States usually occupies more than 10 universities (Liu, 2013). After the 21st century, the Nobel Prize winning scientists in Japan were only second to the United States in the world. And in the ranking of top global universities, Japan is only after America and Britain (Wang, 2016). Britain was only second to the United States in the number of Novel Prize, occupying the second position of the world. The University of Cambridge, University of Oxford, and Imperial College London were from the United Kingdom. In addition to the United States, none of the scientific research colleges and universities is comparable to them (Luo, 2008). The three big scientific and technological powers lead the external exchange and cooperation of Wuhan University of Technology.

Germany, a scientific and technological power known for its rigorousness, is not working closely with Wuhan University of Technology, is ranking eighth.

Table 3   Distribution of Article Cooperation Countries and Region

NO.	Country/Region	Records	Percentage	NO.	Country/Region	Records	Percentage
1	USA	953	8.54%	11	FRANCE	100	0.90%
2	JAPAN	272	2.44%	12	RUSSIA	96	0.86%
3	ENGLAND	268	2.40%	13	SINGAPORE	90	0.81%
4	AUSTRALIA	229	2.05%	14	TAIWAN	76	0.68%
5	SOUTH KOREA	205	1.84%	15	MEXICO	60	0.54%
6	CANADA	197	1.76%	16	DENMARK	57	0.51%
7	BELGIUM	192	1.72%	17	EGYPT	34	0.31%
8	GERMANY	115	1.03%	18	PAKISTAN	31	0.28%
9	NETHERLANDS	110	0.99%	19	SCOTLAND	30	0.27%
10	SAUDI ARABIA	109	0.98%	20	ITALY	28	0.25%

As shown in Table 4, among the institutions with the closest cooperation in scientific research with WUT, the top three institutions are all domestic universities, successively Huazhong University of Science and Technology, Chinese Academy of Sciences and Wuhan University. Huazhong University of Science and Technology, Wuhan University and Wuhan University of Technology are from Wuhan,

Hubei Province. It can be seen that the cooperation between WUT and the other universities in the same city is very close. Other domestic institutions with closer cooperation include Hong Kong Polytechnic University (the 5th), Wuhan University of Science and Technology (the 7th), Hubei University (the 10th), Wuhan Institute of Technology (12th), and etc. Apart from the universities of Wuhan city, Hong Kong is the region with the closest scientific research cooperation with WUT. The top institutions in the field of material science in China, such as Tsinghua University, University of Science and Technology Beijing, Harbin University of Technology, Shanghai Jiao Tong University and South China University of Technology, do not have much cooperation with WUT. In this respect, there are still a lot of opportunities for WUT to further the scientific research cooperation with domestic institutions.

Table 4　Distribution of Cooperation Organizations

NO.	Organization	Records	Percentage
1	HUAZHONG UNIV SCI TECHNOL	568	5.09%
2	CHINESE ACAD SCI	497	4.45%

13	UNIV SCI TECHNOL CHINA	72	0.65%
14	CHINESE UNIV HONG KONG	71	0.64%
15	TONGJI UNIV	71	0.64%
16	CITY UNIV HONG KONG	68	0.61%
17	UNIV GHENT	66	0.59%
18	WUHAN TEXT UNIV	66	0.59%
19	HUBEI UNIV TECHNOL	65	0.58%
20	E CHINA NORMAL UNIV	63	0.56%

Among the foreign organizations which have cooperation with WUT in publishing scientific articles, The University of Tokyo ranked the first place for working closely with the State Key Laboratory of Advanced Technology for Materials Synthesis and Processing (the 4th place in overall ranking), following by King Saud University (the 6th), University of Michigan (the 8th in the United States, Delft University of Technology in the Netherlands (the 9th), and etc. As shown in Table 4, there are not only very few top domestic institutions, but also very few top international ones. From this, it can be seen that Wuhan University of Technology needs to vigorously strengthen the cooperation and exchange activities with first-class scientific research institutions at home and abroad for future development. Only by this way, the university can keep pace with the development of international scientific research, and keep abreast of the latest developments in academic research. Then it will have the opportunity to participate in and even to lead the scientific research activities.

3.4 Funding Agencies

Table 5 shows the statistics of the funding agencies that support the scientific achievements publication. The proportion of the achievements funded by the National Natural Science Foundation of China is very high, which exceeds 42%. But the details of the paper need to be strengthened, because National Natural Science Foundation of China has five different annotations. They are National Natural Science Foundation of China (1), Natural Science Foundation of China (4), NSFC (6), National Science Foundation of China (10) and National Nature Science Foundation of China (11). But obviously, the National Natural Science Foundation of China is the only official annotation (Zhang, 2015). The Fundamental Research Funds for the Central Universities (2) is the second major funding for WUT's

scientific research achievements, accounting for 13.3%. National Basic Research Program of China 973 Program is following after, accounting for 6.7%.

Table 5　Distribution Statistics of Funding Agencies

NO.	Funding Agencies	Records	Percentage
1	NATIONAL NATURAL SCIENCE FOUNDATION OF CHINA	3462	31.01%
2	FUNDAMENTAL RESEARCH FUNDS FOR THE CENTRAL UNIVERSITIES	1487	13.32%
3	NATIONAL BASIC RESEARCH PROGRAM OF CHINA	523	4.68%
4	NATURAL SCIENCE FOUNDATION OF CHINA	415	3.72%
5	NATURAL SCIENCE FOUNDATION OF HUBEI PROVINCE	352	3.15%
6	NSFC	284	2.54%
7	CHINA POSTDOCTORAL SCIENCE FOUNDATION	253	2.27%
8	PROGRAM FOR NEW CENTURY EXCELLENT TALENTS IN UNIVERSITY	245	2.19%
9	NATIONAL BASIC RESEARCH PROGRAM OF CHINA 973 PROGRAM	223	2.00%
10	NATIONAL SCIENCE FOUNDATION OF CHINA	222	1.99%
11	NATIONAL NATURE SCIENCE FOUNDATION OF CHINA	202	1.81%
12	973 PROGRAM	196	1.76%
13	WUHAN UNIVERSITY OF TECHNOLOGY	178	1.59%
14	INTERNATIONAL SCIENCE TECHNOLOGY COOPERATION PROGRAM OF CHINA	163	1.46%
15	NATIONAL NATURAL SCIENCE FOUNDATION OF CHINA NSFC	162	1.45%
16	CHINA SCHOLARSHIP COUNCIL	156	1.40%
17	111 PROJECT	133	1.19%
18	INTERNATIONAL SCIENCE AND TECHNOLOGY COOPERATION PROGRAM OF CHINA	131	1.17%
19	MINISTRY OF EDUCATION OF CHINA	128	1.15%
20	NATURAL SCIENCE FOUNDATION OF HUBEI PROVINCE OF CHINA	125	1.12%

Natural Science Foundation of Hubei Province is also an important source of scientific research activities for WUT. The proportion of its achievements is 3.2%, only second to National Natural Science Foundation of China, National Basic Research Program of China and 973 Program. Other foundations such as China Postdoctoral Science Foundation, Program for New Century Excellent Talents in University and etc. are also important sources of scientific research achievements of the university. In addition, International Cooperation Program of China, China Scholarship Council and Disciplinary Innovation recruitment plan in 111 Universities are also reflected in Table 5, which indicates that Wuhan University of Technology has been actively engaged in international scientific research cooperation and has made a series of achievements.

3.5 Source titles

Table 6 presents the distribution of the source titles of the published academic articles. That is the hottest rankings of academic journals that the researchers of WUT are keenest to publish its articles. It can be clearly seen that the most popular academic journal is the Journal of Wuhan University of Technology-Materials, which accounts for an astonishing 8.8% of the papers. It almost equals to 9 in 100 academic papers published by this journal. It is undeniable that Journal of Wuhan University of Technology-Materials, which was founded in 1986, has been continuously included by SCI since 1997 and it was the first university journal included by SCI in mainland China. Currently, it is still one of the seven university journals entering SCI, which shows its strong academic influence. However, the higher education intuitions with the objective of Construction of the World's Leading Universities and First Class Disciplines, should not only focus on the domestic influence, but also aim at the international first-class academic journals.

The second most popular academic journal of the university is Construction and Building Materials (IF3.169), a popular journal in the field of international building materials, especially in the field of concrete building materials, which reflects the advantages of Wuhan University of Technology in the field of traditional building materials and concrete materials. The third is the academic journal of Royal Society of Chemistry (RSC) - RSC Advances (IF=3.108). The fourth is the Q1 journal in metallurgical engineering - Journal of Alloys and Compounds (IF=3.133).

As a traditional advantage subject of WUT, the performance of ceramic in academic papers is mixed. The impact factor of Journal of the American Ceramic Society (IF=2.841) is not high, but it is still considered as the industry's leading journal. This journal ranks 16th place. The journal Ceramics

International (IF2.986) ranks 5th place. The Journal of Inorganic Materials (IF 0.444), sponsored by the Shanghai Institute of Silicate Research of the Chinese Academy of Sciences, ranks the 18th place. There are many academic papers published on these above journals. But the top ceramic journal -Journal of the European Ceramic Society (IF 3. 411), does not appear in the Table 6 ranking list.

On the whole, the paper quality of the university needs to be greatly improved. Because in the statistical ranking of source publications, there are only five journals that are in the Q1 among the top 20 journals in Table 6, according to the Chinese Academy of Sciences SCI journal division (refer to the latest edition of 2016). They are: Journal of Alloys and Compounds, Journal of Materials Chemistry A (IF=8.867, Energy and Fuel), ACS Applied Materials & Interfaces (IF=7.504, Engineering Technology), Journal of Power Sources (IF=6.395 Engineering Technology), and Applied Catalysis B: Environmental (IF=9.446, Environmental Science and Ecology).

It should be noted that key the journal Engineering Materials ranks the eighth place in total, but it only includes papers published between 2000 and 2016, for the journal was kicked out of the SCI list in 2017.

Table 6   Distribution Statistics of Source Titles

NO.	Source Titles	Records	Percentage
1	JOURNAL OF WUHAN UNIVERSITY OF TECHNOLOGY MATERIALS SCIENCE EDITION	978	8.76%
2	CONSTRUCTION AND BUILDING MATERIALS	183	1.64%
3	RSC ADVANCES	178	1.59%
4	JOURNAL OF ALLOYS AND COMPOUNDS	153	1.37%
5	CERAMICS INTERNATIONAL	138	1.24%
6	ABSTRACTS OF PAPERS OF THE AMERICAN CHEMICAL SOCIETY	123	1.10%
7	JOURNAL OF ELECTRONIC MATERIALS	122	1.09%
8	KEY ENGINEERING MATERIALS	116	1.04%
9	RARE METAL MATERIALS AND ENGINEERING	109	0.98%
10	APPLIED SURFACE SCIENCE	105	0.94%
11	JOURNAL OF MATERIALS CHEMISTRY A	99	0.89%
12	MATERIALS LETTERS	97	0.87%
13	ACTA PHYSICA SINICA	92	0.82%
14	JOURNAL OF APPLIED POLYMER SCIENCE	89	0.80%
15	ACS APPLIED MATERIALS INTERFACES	83	0.74%
16	JOURNAL OF THE AMERICAN CERAMIC SOCIETY	83	0.74%
17	JOURNAL OF POWER SOURCES	82	0.73%
18	JOURNAL OF INORGANIC MATERIALS	79	0.71%
19	JOURNAL OF MATERIALS SCIENCE MATERIALS IN ELECTRONICS	77	0.69%
20	INTERNATIONAL JOURNAL OF HYDROGEN ENERGY	76	0.68%
21	JOURNAL OF NON CRYSTALLINE SOLIDS	74	0.66%
22	JOURNAL OF PHYSICAL CHEMISTRY C	74	0.66%
23	INTERNATIONAL JOURNAL OF ADVANCED MANUFACTURING TECHNOLOGY	71	0.64%
24	APPLIED CATALYSIS B ENVIRONMENTAL	68	0.61%
25	JOURNAL OF COLLOID AND INTERFACE SCIENCE	67	0.60%

3.6 Authors of the papers

Table 7 shows the output distribution of individual researcher's SCI academic papers in WUT. It is based only on the authors and does not distinguish the primary author, the corresponding author and the participating author. Excluding some abbreviations referring to several authors, the top ten authors in the number of publications were Yu Jianguo, Zhang Lianmeng, Zhao Xujian, Fu Zhengyi, Shen Qiang, Zhang Qingjie, Liu Hanxing, Mai Liqiang, Tang Xinfeng and Chen Wen in turn. On the one hand, these prolific researchers all come from material science and engineering disciplines, which also support the

dominant position of Wuhan University of Technology in the field of materials; on the other hand, these researchers have been devoting themselves in scientific research for decades and have accumulated a solid research foundation.

Table 7   Distribution Statistics of Authors

NO.	Authors	Records	Percentage	NO.	Authors	Records	Percentage
1	YU JG	499	4.47%	6	ZHANG QJ	266	2.38%
2	ZHANG LM	423	3.79%	7	LIU HX	250	2.24%
3	ZHAO XJ	400	3.58%	8	MAI LQ	239	2.14%
4	FU ZY	275	2.46%	9	TANG XF	229	2.05%
5	SHEN Q	268	2.40%	10	CHEN W	215	1.93%

4 Conclusion

Based on the retrieval results of SCI data in Web of Knowledge, this paper makes a detailed statistical analysis of the literature, and further analyzes the document types, research areas, hot cooperation organizations and countries, source titles, authors of high yield, and so on. The following conclusions are drawn.

(1)Since 2013, with Wuhan University of Technology vigorously promoting the introduction of high-level overseas talents and young scholars with overseas doctorate degrees, the number of high-level papers published has increased dramatically. The proportion of open access journal papers in this university is only 5.5%. It indicates that the researchers of the university generally seldom choose open access journals to publish their academic achievements.

(2)The research achievements of WUT are mainly originality. Therefore, the proportion of academic achievements published in conventional scientific research papers reaches 96.1%, but the academic review papers with higher academic level and scientific research influence only account for 2%. More attention should be paid to review papers.

(3)According to the distribution of scientific research papers, the top four disciplines of Wuhan University of Technology are materials, chemistry, engineering and science. Among them, nearly half of the academic achievements can be classified into materials, reflecting the strong position of materials in Wuhan University of Technology.

(4)The countries that have closest cooperation and exchange activities with Wuhan University of Technology are the United States, Japan, the United Kingdom, Australia, Korea and Canada. Among them, the United States, Japan and the United Kingdom, as the world's most powerful scientific research countries, lead the foreign scientific research exchanges and cooperation of Wuhan University of Technology. Germany, a scientific and technological power known for its rigorousness, is not working closely with Wuhan University of Technology, is only ranking eighth. Tokyo University, King University of Saudi Arabia, University of Michigan, Delft University of Technology in the Netherlands and etc. are the organizations that have closest cooperation with Wuhan University of Technology.

(5)National Natural Science Foundation of China is the most important type of funding for Wuhan University of Technology, and its contribution accounts for more than 42%. The Fundamental Research Funds for the Central Universities (2) is the second major funding for WUT's scientific research achievements, accounting for 13.3%. National Basic Research Program of China 973 Program is following after, accounting for 6.7%. Natural Science Foundation of Hubei Province and China Postdoctoral Science Foundation also provide strong funding support.

(6)Wuhan University of Technology has obvious advantages in the field of traditional building materials and concrete materials, which is especially presented by the number of academic papers published in the hot concrete building materials journal Construction and Building Materials. But in the whole, in the Statistical ranking of source titles, there are only five journals included in the Q1 journal division.

According to the detailed documental information analysis based on the retrieval results in Web of Knowledge, the university can comprehensively, accurately and concretely analyze the specific SCI journal papers under a certain retrieval conditions, which can further guide the scientific research decision and planning well.

Comparative Analysis of Innovations in Operation Mode Between Alliance Francaise in Wuhan and Confucius Institute at the University of Lorraine

Bai Yanyuan

French Research Center,School of Foreign Languages, Wuhan University of Technology,
Wuhan, P.R.China, 430070
(E-mail: lucie629@163.com)

Abstract: With the rapid development of the economic globalization, the transmission and promotion of languages and cultures are paid special attention to by many countries throughout the world and are even recognized as the representation of the impact and the overall strength of a nation, especially for some developed countries with long history. Alliance Francaise, established in 1883 in France, serves to spread French language and French culture, a century of healthy development of which has received worldwide attention and praise. Set up in 2004, The Confucius Institute as an emerging institute of language and culture transmissions also impresses the world with its speed of development and its greatness of influence. By means of interviews, the comparative analysis and the case study, this paper takes Alliance Francaise and Confucius Institute at the University of Lorraine as examples, analyzing the practices and effects of innovations in operation modes of Alliance Francaise as well as the insufficiencies of Confucius Institute at the University of Lorraine under the cultural turn of global competition by looking deep into theiroperation mechanisms and teaching management modes. The paper comes to the conclusion that Confucius Institute of the University of Lorraine may take lessons from Alliance Francaise's innovative practices in terms of the fund-raising, the teacher training and the cultural transmission so as to better achieve the cultural integration and mutualism of languages.
Key words: Alliance Francaise in Wuhan; Confucius Institute at the University of Lorraine; Operation mechanism; Teaching management mode; Comparative analysis; Innovation

1 Introduction

With the advance of globalization, an increasing number of countries are expecting their national thoughts in politics, economies, cultures and educations to spread all over the world, facilitate international understandings, and promote world peace. The importance of languages as one of the carriers of human thoughts is self-evident. Since the establishment of Alliance Francaise in 1883, similar organizations have been set up successively, including the British Council in 1934, The Goethe Institute in 1951, Japanese Research Center in 1985 and Instituto Cervantes in 1991. After a century of quiescence, China's first Confucius Institute was also established in South Korea in the year of 2004. The following fourteen years witnessed the prosperity of the Confucius Institutes sprouting up all over the world.

At present, many scholars have carried out researches on Confucius Institutes at abroad, the main results of which are as follows. First, some mainly study the impacts of the cultural soft power of Confucius Institutes. For example, Guan Xiulan (2015) believes that Confucius Institutes have a positive influence on the process of constructing China's overseas image. Second, some focus on the problems existing in the rapid development of Confucius Institutes, such as Zhou Luming's article that (2011) thinks the strategic orientation and job function of Confucius Institutes to be not clear enough. Besides, Xu Lihua (2016) points out that Confucius Institutes are faced with the lack offunds, venues, and management staff, weak teachers and other problems. Third, others notice problems in the development between excellent foreign language promoting institutions and Confucius Institutes, such as Guan Xiaohong who (2015) puts forward that the school-running model of Alliance Francaisehas a certain significance in the sustainable development of Confucius Institutes, and Lv Dong (2016) who discusses the enlightening effect of the teachingdevelopment of Alliance Francaise on the overseas promotion of Chinese international education. However, in accordance with the present research situation, there are many macroscopic studies, lack of microscopic studies, which focus more on generalization, but lack any deeper investigations. In the context of the global competitive culture shift especially, Confucius Institutes have ushered in an important transition period, marking the change-from the promotion of quantity to the overall optimization of quality, connotation and function. So, it is urgent to carry out an innovative study on the operation and management of Confucius Institutes.

Therefore, this paperselects two representative branches of language promotion organizations, namely-Alliance Francaise in Wuhan and Confucius Institute at the University of Lorraine, and compares the transformation and development of their operation mechanism and teaching models under the new situation, so as to put forward some innovative management measures and suggestions conducive to the sustainable development of Confucius Institutes.

2 Overview of Alliance Francaise in Wuhan and Confucius Institute of the University of Lorraine

Established in Paris, France, in 1883, Alliance Francaise is a global organization devoted to the transmission of French language and culture. At present, it has opened 1040 schools in 136 countries. Affiliated with French Foreign Minister and Wuhan University, Alliance Francaise in Wuhan set up in 2002 is the only officially recognized language training institution in the Mid-South China. Tackling constantly emerging problems in the developing process with great innovation, Alliance Francaise in Wuhan has grown into one of the most influential Alliance Francaise in the nation.

Established by the Chinese government to respond to the intense competition of the international promotion of languages and to meet the huge demand for Chinese language learning in the craze for Chinese language worldwide, the Confucius Institute is a non-profit educational institution abroad aiming at the promotion of Chinese language and culture. There have been 511 branches over 140 countries and regions. In 2011, Confucius Institute of the University of Lorraine was jointly established by Alliance Française in Wuhan and University of Lorraine in France and became the 15th Confucius Institute in France. Both as non-profit independent organizations for culture exchanges, Alliance Francaise in Wuhan and Confucius Institute of the University of Lorraine share the similar principle and policy, making them both temporally and spatially comparable.

3 The Comparison of Operation Mechanism

The paper draws the conclusion from large amounts of first-hand information collected from interviews with the Chinese principals of the two institutes that Alliance Francaise in Wuhan has achieved significant effects by innovating constructing modes, safeguard mechanisms in raising funds and management systems under the new situation, and meanwhile, Confucius Institute at the University of Lorraine is still at the exploratory stage and calls for a joint effort of the government and the partner institute to make a change.

3.1 The way of running schools

Alliance Française takes franchised mode. The headquarters authorizes the franchise license according to set standards and local institutions run schools in an independent way and are responsible for their own profits and losses. Alliance Francaise in China tends to cooperate with prestigious universities to elevate its level and impact. In 1999, the proposal made by Wuhan University to appeal to Alliance Francaise to jointly establish Alliance Francaise in Wuhan was submitted to the headquarters of Alliance Francaise in Paris, France. After series of discussions of its feasibility, the proposal was granted, followed by the establishment of Alliance Francaise in Wuhan and the appointment of the first principal nominated by the French side. In addition to the cooperative relations established with universities in Wuhan, Alliance Francaise in Wuhan also reinforces its cooperation with Wuhan municipal government and other local large-scale enterprises to accelerate its development in Wuhan.

The Confucius Institute takes a partnership mode, set up jointly by the headquarters, the foreign host universities and its Chinese partner institute. Confucius Institute at the University of Lorraine is established jointly by the China National Office for Teaching Chinese of Foreign Language, Wu Han University of Technology and University of Lorraine in France, with each side determining their own efforts and depth of participation in the cooperation.

In terms of the way of running schools, it is evident that both choose to cooperate with local prestigious universities. Nevertheless, Confucius Institute at the University of Lorraine can still take lessons from Alliance Francaise in Wuhan's innovative practiceof working closely with the local government, enterprises and cultural institutions.

3.2 The financial resources

Alliance Francaise in Wuhan is financed mainly through the French government, self-raised funds from enterprises and foundations, and their incomes from French language and culture teaching activities. In order to further the transmission of the French language and culture, the foundation of Alliance Francaise innovates the mechanism to guarantee funding, with the government providing only

initial capital at the start of the operation andthe tuition revenue making up for the major expenditure in running the operation.

When it comes to the Confucius Institute, the annual operating cost is raised jointly by organizers both at home and abroad. According to Confucius Institute Charter, each supplies for the half load. As indicated in the following table, however, despite incomes of language and cultural activities and sponsors of Lorrain district, most expenses of Confucius Institute at the University of Lorraine are paid by the Chinese government.

Table 1　Operation in 2017(€)

details	Expenses			Income		
	Expenses	University of Lorraine	Partners of the University of Lorraine	Income	University of Lorraine	Partners of the University of Lorraine
reception	5,630,23					
Promotion activities	8,305.44					
Traditional festival celebrations	7,512.20					
language and cultural activities	877.79			13,289		
service charge	5,036.82	53,935.47				
Site fee	6,035.05	57,187.06	14,372.40	3,300		
International exchange activities	16,509.77					
Culture experience activities	6,859.87					
office supplies	2,827.54					
Competition(Chinese bridge)	2,434.28					
sponsors of Lorrain district				10,000		10,000
Appropriation of the Chinese government.				38,569.96		
Total	62,028.99	111,922.53	14,372.40	65,158.96	0	10,000

Compared with the market-oriented financing pattern of Alliance Francaise in Wuhan, it is apparent that the guarantee mechanism of funds in Confucius Institute at the University of Lorraine is still to be further innovated.

3.3 The organizational management mode

Table 2　The Organizational Management Mode

	Alliance Francaise in Wuhan	Selection Policy	Confucius Institute at the University of Lorraine	Selection Policy
Administrative and teaching faculty	China Principal	Selected by partner institution	China Principal	Selected by the NOCFL
	French Principal	Selected by French Foreign Ministry	French Principal	Selected by partner institution
	Professional teachers(40) Administrative staff(20) Part-time teachers (10)	Professional teachers with FLE	Chinese teachers (3) Administrative staff Part-time teachers(3)	Chinese major or teachers and students with better French selected by the NOCFL
	Working Area	3000 square meters		60 square meters

As indicated in the above Table 2, Alliance Francaise in Wuhan and Confucius Institute at the University of Lorraine also differ in the management team.Alliance Francaise in Wuhan is jointly managed by the Chinese principal and the French principal. As for Confucius Institute at the University of Lorraine, the Chinese principal and French principal are core members of the management team, which not only helps theinstitution fully integrated into the local customs but also maintains a favorable cooperative relationship with the country of the target language.

In terms of the teaching faculty, Confucius Institute at the University of Lorraine is slightly inferior. For one thing, the number of teachers is less than the one-eighth of that ofAlliance Francaise in Wuhan. For another, only teachers with FLE can be admitted byAlliance Francaise, while pre-service training of six month can make one qualified for a Chinese teacher or volunteer to be selected by the NOCFL.

4 The Comparison of Teaching Mode

With respect to the teaching mode, this paper compares the innovative strategies of the two language institutes under the new situation in terms of thecurriculum and the cultural transmission.

4.1 Curriculum

More than 4000 students are annually enrolled inAlliance Francaise in Wuhan, accomplishing 600 thousand of school hours and ranking first among all teaching bases ofAlliance Francaise in China, the achievement of which is closely related to its diversified curriculum. As shown in the Table 3, the courses ofAlliance Francaise in Wuhan can be further categorized into application-oriented courses and characteristic courses. The orientation of the course is adjusted according to different needs of French language learners under the precondition of combining features of economy and humanity of the three towns of Wuhan. For example, the region where the Zhuankou campus is located is a gathering place of French enterprises in which many employees are exposed to French language for work reasons, especially the highly professional French language like scientific French. Therefore, the Zhuankou campus increases the number of intensive language classes. As for Wuchang which is a center of education and high-tech industries as well as the headquarters ofAlliance Francaise in Wuhan, there are intermediate and advanced interest classes for lovers of French languages, covering a wide range of cooking, wine-tasting, drama, dancing and practical French for traveling and so on. Since 2016,Alliance Francaise in Wuhan has also begun to work with universities in Wuhan in the establishment of off-campus internship bases, extending the new mode of university-enterprise cooperation.

Table 3   Comparison ofConfucius Institute At the University of Lorraine And Alliance Francaise InWuhan In Curriculum

	Test-orientated Courses	Featured Course	Joint Programs
Alliance Francaise in Wuhan	Basic French, Intensive Oral French, French Writing, Tutoring for Interviews, Sprint Courses on TEF/TCF, Sprint Courses on DELF/DALF, Professional French and so on.	Scientific French Pre-intermediate, Intermediate and Advanced Interest Classes for Lovers of French Languages, Experience-Based Winter/Summer Courses for Teenagers.	off-campus internships jointed established by different universities, such as Wuhan University of Technology and Huazhong University of Science and Technology
Confucius Institute at the University of Lorraine	Pre-intermediate, Intermediate and Advanced Chinese, Intensive Courses for Proficiency Tests	Training Courses for the Faculty and Staff of the University of Lorraine in France; Calligraphy, Tai Ji, Weiqi and Tea Art.	Movie Appreciations jointly established with University of Lorraine in France

Five years since its establishment, Confucius Institute at the University of Lorraine has offered intensive language courses including the pre-intermediate, intermediate, and advanced Chinese courses, intensive courses of Chinese language for proficiency tests, and training courses for the faculty and staff of the University of Lorraine in France as well as courses of traditional Chinese culture including calligraphy, Tai Ji, WeiQi and tea art. Multiple ways of advertising and great efforts have won them more than 1100 students.

In conclusion, curriculums of both institutions have their own characteristics. Both fit the customs of local culture and education, achieve the goals of educates and adjust timely to match the features of students.

4.2 Cultural Activities

Both Alliance Francaise in Wuhan and Confucius Institute at the University of Lorraine have achieved transitions of the output content from a language-and-culture-oriented one to a cultural-promotion-oriented one, of target audience from elite education to mass education and of the output style from classroom teaching to mass communication. And both cultural activities have developed into a distinctive journey of culture that accord with their own characteristics and local traditions and conventions.

One of the founding purposes ofAlliance Francaise in Wuhan is to demonstrate French language and culture, and promote the development of local artists and culture. To meet the goal, not only does it form a network of French language training and cultural transmission coving the largest scale in the Central China, it also sees it as its own responsibility to provide the public with cultural activities ofhigh quality. It builds a long-term stabilized partnership with the cultural office of French Consulates General in Wuhan. In addition to its important roles in the China-France Culture Year and the China-France Cultural Spring,Alliance Francaise also holds regular cultural activities in the form of exhibitions, lectures, concerts and meetings throughout the year incessantly. Besides, the "Madames' Club[1]" held by "Transcultural Appointment" at regular intervals has also become a highlight of innovation in the transmission of French culture in Wuhan region.

Apart from the language teaching,Confucius Institute at the University of Lorraine also carries out a series of featured cultural programs, such as the Chinese Summer Camp, the study-tours to China for undergraduates, the celebrations of traditional Chinese festivals, the lecture series of Chinese studies and so on. Each year, the Confucius Institute gives courses on the martial art and Tai Ji but gains little success with only less than 30 students enrolled, not to mention its little impact on promoting and transmitting the traditional Chinese culture.

5 Inspiration

Americanlinguist Sapir once points out in *Languages* that there are things lying behind the language and it is never possible for language to be alive without culture. The reason whyAlliance Francaise in Wuhan can secure a lasting foothold in the region is that it seizes the cultural property of language and makes itself an important media for cultural transmission by closely combining language learning and cultural promotion. There is no denying thatAlliance Francaise in Wuhan and the Confucius Institute at the University of Lorraine function almost in the similar way when it comes to the language and cultural promotion,Confucius Institute at the University of Lorraine established in 2011 is still an uprising brand that is relatively insufficient in the ways of running schools, the fund-raising, the faculty strength and cultural transmission. From the analysis above, we find that there are certain innovative practicesof Alliance Francaise in Wuhan that can be learned byConfucius Institute at the University of Lorraine.

Firstly,Alliance Francaise in Wuhan is a non-profit institution but takes a market-oriented mode of operation. It operates independently and is responsible for its own profits and losses. In contrast, the Confucius Institute at the University of Lorraine regards Chinese government as its major financial resource to guarantee teaching and cultural activities. And the dependence on government usually continues for a long time. In fact,Confucius Institute at the University of Lorraine can attempt to build a mode of an integration of enterprises and schools. Not only should it develop itself by industrializing itself and contribute to local economic development, but also should strengthen the cooperation with local universities, cultural organizations, overseas education agencies and enterprises to achieve mutual benefits.

Secondly, all French teachers inAlliance Francaise in Wuhan are qualified with FLE and all their Chinese teachers have received professional trainings in universities. Although most teachers inConfucius Institute at the University of Lorraine are able to complete teaching tasks, there are still teachers speaking nonstandard Chinese, lacking basic theories and knowledge, knowing little about the feature of foreigners learning Chinese or applying inappropriate teaching methods. What's more, some teachers start teaching only after a short period of training, and thus lack necessary professional quality. As a matter of fact, merely being able to speak Chinese is far from being a real qualified Chinese teacher. Besides, only some of them can speak French but a larger proportion lack the required knowledge of French language.

Consequently, when faced with students, especially the beginners, most teachers lack the ability to communicate and hence the teaching result is unfavorable. Therefore, the development ofConfucius

---

[1] Zhuankou economic and technological development zone in Wuhan has attracted the investment of many French enterprises, bringing large numbers of French employees to work on this fresh foreign land. The Zhuankou campus of Alliance Francaisein Wuhan thus becomes the gathering place for the family of the French employees by setting up Chinese courses to help them better adjust to the new life and understand the local customs. Frenchmadams also voluntarily group together and work with Alliance Francaise, trying to expand and enrich culturalcommunications. At present, they gather once a month to hold activities on the theme of "Transcultural Appointment" to spread French culture, enhance mutual understanding of each other from multiple aspect and promote cultural fusion.

Institute at the University of Lorraine cries out for breaking obstacles of insufficient teachers. It should cultivate a team of Chinese teachers of large number and high quality and of profound understanding of French culture. At the same time, the scale of training programs for local teachers should also be expanded.

Finally, in terms of cultural transmissions,Alliance Francaise in Wuhan aims at presenting French language and culture and promoting the development of local artists and local arts. By comparison,Confucius Institute at the University of Lorraine focuses more on language teaching but is insufficient in cultural activities. Therefore,Confucius Institute at the University of Lorraine should take lessons fromAlliance Francaise in Wuhan to let culture act as the major character on the stage constructed by language. It should also go out of the classroom, make the most of resources both at home and abroad and give full play its own role as the cultural medium in order to promote exchanges and cooperation between domestic and overseas artists and between the home of the Confucius Institute and Chinese cities and regions.

6 Conclusion

The above comparative analysis reveals that both the Confucius Institute at the University of Lorraine andAlliance Francaise in Wuhan cooperate with prestigious universities and enjoy high-class management teams and educational programs that fit their own development. However, in terms of the fund-raising, the faculty team and the cultural transmissions,Confucius Institute at the University of Lorraine is still slightly inferior and thus needs to expand and develop new channels of fund-raising, normalize the structure of teaching faculty and deepen the reform of modes of cultural exchanges so as to solve the problems in its progress and guarantee its sustainable development.

As the first brand of the"going out" of Chinese culture and flagship product of the promotion of Chinese language and culture,Confucius Institute at the University of Lorraine is also the very first attempt of Wuhan University of Technology to cooperate with French universities in running schools. In the current environment of rapid development,Confucius Institute at the University of Lorraine should pay special attention to themaintenance of the rational thinking. Based on reflections on previous experiences and achievements, it should take a reasonable lesson fromAlliance Francaise in Wuhan from all perspectives to secure its benign operation and sustainable development. Only in this way can it play an active and strategic part in China's cultural soft power in a steady and efficient way and promote China-France cultural communications and exchanges.

Research on Influencing Factors of Independent Learning of Undergraduates and Motivation Raising

Liang Xiao

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: liangxiao@whut.edu.cn)

Abstract: The independent learning state of undergraduates has a direct influence on the students' academic performance, construction of study style and talents cultivation quality in colleges. Starting from theoretical research and practical experience of college management and combining the existing findings of domestic and foreign research on independent learning, the research made an aggregate analysis and proposed the prediction indices system for influencing factors of undergraduates' independent learning and compiled questionnaires of undergraduates' independent learning. The factor analysis was adopted for analysis and processing of survey data, and 7 variables were extracted as common factors and respectively named as learning attitude, interest in major, application for college entrance, quality of teaching, examination disciplines, learning objectives and learning environment. The conclusions were drawn after analysis, to provide suggestions for rationalization of improvement on the undergraduates' independent learning in colleges.

Key words: Factor analysis; Independent learning; Influence factor; Motivation raising

1 Introduction

Learning is the bounden duty of students and their principal task. The state of independent learning of undergraduates directly influences the academic performance, construction of study style and talents cultivation quality in colleges. However, in face of restless society, the undergraduates are prone to have blundering psychology, and their state of independent learning is not satisfactory: many of them are learning passively, the online game, smart phone and fragmented media information significantly impact their independent learning, the students lack motivation of actively and voluntary learning, leading to prominent problems such as no learning in normal times but cramming before examination, etc.

As the major learning style of undergraduates, the independent learning is influenced by a great many factors, such as students themselves, campus atmosphere, home environment, teaching level, colleges' management mode, etc. To research the influencing factors of undergraduates' independent learning entails analyzing and processing various factors to explore and pinpoint the major factors to constitute a reasonable system structure.

2 Data and Methodology

With 355 undergraduates in a college as objects of study, the research consulted literature to absorb related indices, instituted preliminary indices system framework model, and interviewed colleges leaders, teachers and counselors to verify and optimize the indices system, to finally form an predictive indices system for influencing factors of undergraduates' independent learning, then preliminarily selected 35 observation indices under six categories of variables such as learning interest, motivation, methods, personal planning, learning climate, teaching condition to fabricate questionnaire.

The objects of research herein were very sensitive to education and teaching condition of school and institute, own learning state, and existing learning problems , which can ensure the reliability and validity of data source. The questionnaire survey was anonymous to ensure the principle of "value neutrality". The questions of questionnaire were all designed using Likert five scale method: for the questions of importance level, 1 represents the least important, and 5 represents the most important; for questions of satisfaction, 1 is the least satisfied, and 5 is the most satisfied. Part of questions data was inverted, and corresponding adjustment was made in data preprocessing stage. The questionnaire is feasible to research the undergraduates' state of independent learning and the influencing factors.

The survey altogether dispensed 355 questionnaires, recovered 348, weeded out 5 invalid ones to lastly obtain 343 valid data. The SPSS software was adopted to analyze and process the data. The paper mainly researches the correlation between the independent learning state of undergraduates and related influencing factors. After data preprocessing, correlation analysis and experimental examination, some indices with lower correlation coefficient were deleted and finally 21 indices under 5 categories were selected for factor analysis.

Table 1   Questionnaire questions for the included analysis objects

Variable	Question index
Interest in major (A1)	Driving factors for selection of the major (A1-1)
	Whether you feel optimistic about prospect of major (A1-2)
	Correlation between the most desired major and the currently learned major (A1-3)
	Whether you are satisfied with your current school (A1- 4)
	Whether you like current major (A1-5)
	The parental influence in filling the application form for college entrance examination (A1-6)
	The teacher influence in filling the application form for college entrance examination (A1-7)
Learning motivation (A2)	Current learning momentum (A2-1)
	Current effort level in learning (A2-2)
	Current general condition of learning (A2-3)
	Class attendance (A2-4)
	Own requirements on attending state (A2-5)
	The opinion on "pass is OK, no matter high or low score" (A2-6)
Learning method (A3)	Cognition about learning objective (A3-1)
	Setting of current learning objectives (A3-2)
	Preview before class for important courses (A3-3)
	After school learning (A3-4)
Climate for learning (A4)	Have you cheated in examination (A4-1)
	Influence of learning state of surrounding students on your learning (A4-2)
Teaching condition (A5)	Evaluation on teachers' teaching attitude (A5-1)
	Evaluation on teachers' teaching method (A5-2)

3 Empirical Research

3.1 Analysis on reliability and validity

The data was preprocessed to weed out the invalid questionnaires and redundant indices before using SPSS17.0 software for reliability and validity analysis. The result shows that the effective rate of samples were 98.56%, and the Cronbach's α coefficient based on total scaling of standard items was 0.787, higher than 0.7, indicating high reliability. Thus, the measurement questions and variable concepts in the questionnaire can be regarded as consistent and the survey result as consistent too.

In the meanwhile, the KMO and Bartlett sphericity test showed that Kaiser-Meyer-Olkin metric value was 0.799, so the initial samples were fit for factor analysis. On the other hand, the significance value in Bartlett test was 0.000, smaller than 0.05 of significance level, indicating that there exists correlation among variables and they are fit for factor analysis.

Table 2   Result of KMO and Bartlett Test

KMO and Bartlett's test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.799
Bartlett's Test of Sphericity	Approx. Chi-Square	2371.598
	df	210
	Sig.	.000

3.2 Variable communality and variance devoting rate of factor

The calculation via SPSS software derives the result of variable communality, which is generally greater than 0.7, indicating that the extracted general factor basically reflects more than 70% of information of initial variable, so the result of factor analysis was satisfactory.

According to result of variance devoting rates of factor (table 3) and scree plot (Fig.1), the initial 21 independent variables' dimensions have been reduced to 7 common factors. It is observed from the

column of cumulative percent variance (CPV) in table that sum of eigenvalues of the 7 common factors accounts for 67.748% of total eigenvalues, i.e. the newly produced 7 latent variables contain 67.748% of information quantity of initial 21 independent variables, so the first 7 can be extracted as principal factor, i.e. latent variable.

Table 3   Variance Devoting Rates of Factor

| Component	Initial Eigenvalues			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	5.179	24.664	24.664	3.674	17.495	17.495
2	2.448	11.659	36.323	2.199	10.472	27.967

Setting of current learning objectives (A3-2)	-0.082	-0.043	0.343	0.029	0.141	-0.671	0.093	Learning objectives
Cognition about learning objective (A2-3)	0.097	0.123	0.301	0.104	-0.211	0.669	-0.094	
Influence of learning state of surrounding students on your learning (A4-2)	0.113	0.255	-0.003	0.348	0.065	-0.132	0.733	Learning environment
Whether you are satisfied with your current school (A1-4)	0.136	0.413	-0.004	0.335	0.272	0.025	-0.62	

The factor load matrix in table 4 shows that the variables have been reduced to 7 factors. According to composition of factors, each factor was explained as follows after logic analysis:

Factor 1 included seven variables such as after school learning (A3-4), current effort level in learning (A2-2), current general condition of learning (A2-3), own requirements on attending state (A2-5), class attendance (A2-4), current learning momentum (A2-1), preview before class for important courses (A3-3), which were summarized and named as learning attitude, being the most important factor. The factor 2 included three variables such as correlation between the most desired major and the currently learned major (A1-3), whether you like current major (A1-5), and whether you feel optimistic about prospect of major (A1-2), which were summarized and named as interest in major. The factor 3

included three variables such as the parental influence in filling the application form for college entrance examination (A1-6), the teachers' influence in filling the application form for college entrance examination (A1-7), driving factors for selection of the major (A1-1), which were summarized and named as application for college entrance. The factor 4 included two variables of evaluation on teachers' teaching attitude (A5-1) and evaluation on teachers' teaching method (A5-2), which were summarized and named as quality of teaching. The factor 5 included two variables of have you cheated in examination (A4-1) and the opinion on "pass is OK, no matter high or low score" (A2-6), which were summarized and named as learning objectives. The factor 7 included two variables such as influence of learning state of surrounding students on your learning (A4-2) and whether you are satisfied with your current school (A1-4), which were summarized and named as learning environment.

Through naming for the 7 factors, it was derived that among the influencing factors of undergraduates' independent learning, the learning attitude and interest in major ranked high, the application for college entrance and quality of teaching came the second, examination disciplines, learning objectives and learning environment had some influence, which, however, were relatively weaker.

4 The Analysis on Influencing Factors of Independent Learning of Undergraduates

There are 7 common factors influencing the independent learning state of undergraduates, whose influence coefficients were respectively 0.175 for learning attitude, 0.105 for interest in major, 0.094 for application for college entrance, 0.090 for quality of teaching, 0.087 for examination disciplines, 0.072 for learning objective, 0.054 for learning environment. We further jointly called learning attitude and interest in major as subjective internal factor and other factors as objective external factors, and analyzed the logical relation among factors, finding without effort that the internal factors are the primary causes while the external factors are the requirements. The external factor influences the internal factors to work. The research data and logical analysis tally with each other, which further proved the scientificity and reliability of analytic result.

4.1 The most critical factor influencing independent learning attitude of undergraduates is learning attitude

Their relatively lasting positive or negative internal response bias. A great many psychologists regarded the learning attitude as the core nonintellectual factor among heaps of factors influencing students' learning, as it determines the learning behavior and learning state of students in a manner, which is in line with the saying that "Attitude is everything". The forming of learning attitude is joint result of external environment factors and personal demands of learners, being the process of value and learning view internalization. To guide the undergraduates to cultivate correct cognition, emotion and intention for learning is of crucial importance to improvement on undergraduates' independent learning state.

4.2 The interest is the best teacher

The interest in major dominates learning enthusiasm of undergraduates and can make them actively input more into learning, thereby further improving independent learning state. In the meanwhile, "failure to fully understand the major before college entrance examination, ambiguous orientation of interest in major and future professional orientation" are the first causes influencing their interest in major. The colleges should intervene in cultivation of students' interest in major as early as possible and always pay close attention to it: In the beginning of learning, the colleges should help students to cultivate interest in major via entrance education, introduction to major, etc., and adjust the students' interest in major through changing major, cultivate interest in major in teaching of professional courses. The colleges should also continuously maintain students' interest in major with deepening of major teaching, to consolidate their interest in major practice.

4.3 The colleges' education and teaching quality

General learning style and examination disciplines, guidance of learning objectives and learning environment, etc. provide conditions and guarantee for undergraduates' independent learning. The quality of teaching has a bearing upon the survival and development of school, so the proportion of evaluation by students should be increased as appropriate in monitoring and examination and the function of teaching link in guiding of learning objectives and cultivation of interest in major should be enhanced, to attract the undergraduates to learn independently. The examination disciplines should be made strict, and the cost for cheating and speculation should be raised to build a good learning style and

satisfactory learning environment, to constrain and infect students, which can power their independent learning. Improvement on students' independent learning is a system engineering which should start from the root, grasp the stress and make internal and external efforts, to build a powerful support system to provide main power and impellent for undergraduates' independent learning, thereby improving learning state and cultivation quality.

5 The Analysis on Raising of Motivation for Undergraduates' Independent Learning

The impact of these factors and analysis of the study, we further jointly called learning attitude and interest in major as subjective internal factor and other factors as objective external factors, and analyzed the logical relation among factors, finding without effort that the internal factors are the primary causes while the external factors are the requirements. The external factor influences the internal factors to work. So as the main body for raising of power for undergraduates' independent learning, the colleges can institute corresponding excitation policies to raise the motivation of undergraduates' independent learning.

5.1 The current evaluation system of "mark first" should be optimized

The examination and assessment mechanism should be combined in teaching, to more powerfully stimulate undergraduates to learn independently to the largest extent to realize the objectives set in school. Furthermore, the introduction, propaganda and training of school resources and introduction activities of independent learning should be increased to better guide the undergraduates in using and understanding the resources and materials of independent learning.

5.2 The education on independent learning and teaching system should be organically fused

Such as actively researching education and teaching that are combined with education on independent learning, actively using new technologies such as multimedia to innovate class form. "Flipped classroom" has become a rising teaching model, in which, information technology serves as support, the teachers' role is the learning guider via the video-based instructional resources, while the students are the major players of learning who watch and learn the video in class and consolidate and explore the knowledge via various classroom activities. In recent years, the concepts of micro-class and flipped classroom have gradually become known to people, so the college teachers and managers should highly value them.

5.3 The independent learning should be combined with career planning

The career planning means an individual combines own practical situation and current opportunities and constraints to set professional objectives for himself/herself, select the path to advance, and define action direction, time and scheme for achieving professional career and ideal life goal.

5.4 Arrange corresponding teacher resources and establish related advisory services

The colleges should arrange corresponding teacher resources and establish related advisory services to timely counsel the undergraduates for the problems and puzzles in independent learning. As the students lack an objective cognition about themselves, leading to overrating or underrating of own capacities, etc., counseling can highlight a direction for their independent learning.

5.5 Lectures and exchange activities of various forms should be held

Such as inviting excellent alumni and professional employees to timely transfer the related information in workplace to the undergraduates, to make them understand the demands for social and enterprises for undergraduates in advance, help them to make planning for independent learning and actively clarify the content scope of independent learning. The colleges should also introduce related resources, opportunities and industry prospect, etc. to make them accumulate more knowledge needed for future professional direction in school.

5.6 The colleges should well educate the freshmen

Taking their entrance as a chance to reasonably indoctrinate them with the concept of learning style in university, to make them take formation of good learning style as a habit, establish a long-term mechanism for construction of learning style. In a dozen of years before entering university, the students are under the traditional educational pattern and aim to be admitted by a good high school and a good university. What is the objective after entrance? Graduate entrance examination? Go abroad? Hunt for a good job? They are at sea. The entrance education can enable them to reflect deeply and realize that they should try to be competent for own work in future, no matter what industry or post, thereby highlighting the university objective.

6 Conclusion

With the undergraduates in a college as objects, the research adopted factor analysis method to study the influencing factors for undergraduates' independent learning, found out the major factors and their influence from a good many predicative indices, and suggested that the 7 common factors of learning attitude, interest in learning, application for college entrance, teaching quality, examination disciplines, learning objectives and learning environment are concentrated manifestations of the undergraduates' state of independent learning, thereby providing a reference frame for compiling the evaluation scale of undergraduates' independent learning state and offering scientific references for colleges to improve students' independent learning. However, the research failed to fully consider the influence of students' family, and the cumulative variance devoting rate of factors needs to be enhanced, which are the direction of future deep research.

Research on the Class Innovation Management Platform

Li Chunmei

School of Transportation, Wuhan University of Technology, Wuhan, P.R.China, 430063

(E-mail: lichunmei315@163.com)

Abstract: Class is the basic unitof college class management, mutual study and further contact.The construction of college class is of great significance to the development of students and student work. From the perspective of the students' development, college management, data sharing and the lifetime classes' construction, this paper studies the shortcomings and causes existing in the college class management. In the paper, we systematically propose the construction plan of the class management platform with respect to the class overview, class notification, basic information, class knowledge, class regulations, regular management, innovations and entrepreneurship, personnel style, career guidance and classmates' friendship. The proposed platform offers reference to the college class management based on big data, promotes the information sharing and the inheritance of knowledge, andprovides benefit for the students' development.

Key words: Management platform; Class; Innovation; Big data; Internet

1 Introduction

With the rapid development of the network technology, big data and cloud computing, especially the rapid spreading of mobile intelligent terminals, the behaviors, attitudes and values of the college students are changing inevitably. With the help of the key technologies such as intelligent sensing, wireless communication, data processing, software programming, website design and assistant decision, it can be desired to take the class as the basic management units. Class, as the basic units and front camps of the campus life, is playing important roles in building dynamic, open and shared data information platform to improve the students' comprehensive quality and their daily management efficiency, optimize their emergency plan and share the experience of class management,and build a lifelong friendship.At the National College Ideological and Political Work Conference, President Xi emphasizedthat we mustadhere toestablishinghigh moral valuesand people's cultivationas the fundamental task of education, stick to implement theideological and political work through the entire process of education and teaching, make endeavor to provide comprehensive education and create a new situation of the higher education development in our country. "Yiban" is an advanced platform for ideological education and class management in colleges and universities.It has set up student work stations in the campus, and also provided topics, photo albums, and network disks for class construction. However, the platform mainly relies on the rich and colorful culture activities, while it lacks thesystem construction of the class information platform. Zeng Linghua (Zeng Linghua, 2015) has constructed class information platform based on school basic data and class appraisal management, and carried out the verification. However, the research mainly focused on the functional department of the primary and middle school class, the subjects' behavior was relatively simple, the scope of activity was relatively small, and it did not conform to the requirements of college students' autonomy, diversity and differentiation. Chen Lili (2018) provided class information platform based on the complete information database, registration system, payment system, class public platform and class WeChat group, QQ Group, etc. The content of the study was not comprehensive, lacking basic knowledge, class system, class activities and systematic thoughts on innovation and employment guidance. Dong Lei (Dong Lei, 2014), Yang Xiaohui (Yang Xiaohui, 2013), Wang Yuanyuan (Wang Yuanyuan, 2011), Lin Yan (Lin Yan, 2017), Sun Weiwei (Sun Weiwei, 2016) and Fei WeiWei (Fei WeiWei, 2018)carried out the research on college student' work from the aspects of the WeChat public platform, promotion of instructors' information literacy, virtual class, class management strategy,class management mode,innovative management method of graduates' classunder the "Internet+" background respectively. However, the researches werelack of thesystematic refinement of the university class information platform. Therefore,from the perspective of the students' development, college management, data sharing and the lifetime class' construction, the author studies the shortcomings and causes existing in the college class management. In the paper, the author systematically proposes the construction plan of the class information platform with respect to the class overview, class notification, basic information, class knowledge, class regulations, regular management, innovations, personnel style, career guidance and classmates' friendship. The proposed platform offers reference to the college class management based

on big data.

2 The Main Problems in Class Construction under the Big Data Environment
2.1 Lack of effective regulatory enforcement
Nowadays, the rules and regulations proposed for class management in colleges and universities are relatively macro and impractical.Classes are required to enrich and improve according to each major characteristic. There are two main problems existing in this area. On one hand, the construction of the rules and regulations in the classes are uneven, and they cannot serve as guidelines to regulate the behaviors of college students. For example, among the students employed in the survey, only 29.7% had class songs, class logos, and class mottos; 39.2% did not have a complete class election system, 32.5% did not have a financial disclosure system (Nie Bangjun, 2014). On the other hand, the construction of the system is relatively independent, existing structural redundancyand lacking information sharing. For example, among the students participated in the survey, 7% knew the rules and regulations of the other classes in the same major, 3% referred the rules and regulations of the senior classes in the same major. The class rules and regulations can't be effectively implemented due to the incompleteness of the regulations, and lack of inheritance and share ability.

2.2 Lack of positive influence of class cadres
Generally, class cadres in the colleges mainly include monitor, secretary of the Youth League branch, organizing committee, publicity committee, psychology committee, art and literature committee, sports committee and class life committee. Generally, themonitor, and the secretary of the Youth League branch are generally appointed in the counselor's organization meeting. Subsequently, the monitor and the secretary of the Communist Youth League branch organize meetings to appoint othermembers. During the tenure of class cadres, the work is mainly reported to counselors, but it lacks feedback from class members. At the same time, the lack of supervision, rewards and punishment system leads to the inaction of some class leaders, which may bring down the positiveeffect of the class cadres.

2.3 Lack of formal innovation in class culture
In colleges, the class culture construction mainly includes cultural and sports activities, community activities, and class conferences. However, those activities do not appeal to the college students under the new media environment. The students are interested in the social networks that aim to emphasize individual differences, and capable of quick sharing and feedback, such as WeChat, QQ and Weibo, rather than the collective activities. This conversion reduces the cohesiveness of the class, and leads to the marginalization of some students' thoughts, behaviors and emotions, thus induces the possible problems such as reluctance to studying, indulging in online games and being disturbed by depressive and anxious motions.

2.4 Lack of long-term mechanism for scientific research and academic research
Among college students, scientific research work is mainly encouraged through the construction of study styles and the scientific research competitions. The construction of study styles mainly focuses on strengthening class disciplines, restricting computer using time, organizing group study, conducting stringent exam rules, and urging students to be self-discipline, forming a good learning atmosphere. On the other hand, the research competition cannot effectively promote the ability of academic research among students. Since it is much more difficult, students are lack of enthusiasm in participating. In terms of the construction of academic style, it shows progress periodically but lacks long-term guiding mechanism. The strict discipline conflicts with the diversification of learning resources and research interests of students under the new media environment.Thenit reduces students' interest in learning and makes them less self-confident and have improper learning attitude.

2.5 Lack of effective guidance in career planning
The education of career planning is initiated through the school entrance training, graduation training and some activities during the period. Career planning education is important for college students in recognizing the self-characteristics, clarifying the current market demand for talents and formulating study plans. Under the new media environment, there is a lack of class-level career planning guidance, career planning information sharing, and typical cases of successful careers. Further, the deficiency results in the college students indulging in the network for a long time, experiencing confusion and sluggishness.

3 The Causes of Problems in Class Construction under the Big Data Environment
3.1 Significant individual differences in technological innovation

In modern society, the development of the new media technology is rapid. There are continuous competitions among internet giants such as Baidu, Alibaba, and Tencent, as well as traditional enterprises such as Gome, Wanda, Suning, Gree. To satisfy the needs of people in every aspect of daily lives,such as food, communication and education, Didi, Alipay, WeChat and other internet products are promoted by the new media technology. The college students are keen on advanced technology and they enjoy the convenience of new media technology. At the same time, they also form a unique characteristic in the new media era. On one hand, they pursue individuality. The easier access to information, materials, transportation, and communication allows college students to have more choices to achieve personal characteristics, and this kind of differentiation is often seen as a sign of maturity and charm. On the other hand,they have weak cognitive ability and are easy to be misled. In a word, the internet technology makes it easier for college students to enjoy global information while bringing information such as gambling, pornography, trafficking, deception and brawl. The ability of students to identify the information during their active age is different, and some students are prone to be affected by negative information.

3.2 Insufficient planning of class information construction

Most college classes use QQ and WeChat to exchange daily work information, school homepages, school forums and query systems to deal with daily business. The class is no longer regarded as a unit in the class construction process.The advantage of new media technology and innovation of the college students have not been made full use to carry out information management in the class construction. The existing problems may lead to the repetition of class rules and lack of inheritance. The annual work plans formulated by class, typical achievements of class cadres, the competition and assessment of class cadres are lack of assessment and feedback. The class activities are outdated and lack of participation. As a result, the cohesiveness and team awareness are reduced greatly (Zhang Tingting, 2011). Moreover, the construction of study styles works to a certain extent, and only a small number of students are eligible to participate academic competition, leading to a lack of long-term mechanisms for academic research in the class. The lack of success achievements in career planning and correct guidance are not positive for the early career planning of college students.

From the above description, a class-level information network platform can be constructed by taking class as a unit. With the informatization and digitization of class construction, sports activities, academic researches and student career planning can be announced in the platform. Repetitive construction can be avoided, and management or learning experience of the same schools, similar majors, and classes can be enhanced. Additionally, the sharing, transmission and precipitation of the working experience can also be improved. Those advantages are of great significance for the college students' development under the new media environment.

3.3 Insufficient emotional communication between teachers and students

In general, colleges and universities should arrange the full-time positions for counselors, with the ratio of counselors to students not lower than 1:200. Actually, the full-time counselors should be dominating, and part-time counselors should also be arranged to cooperate with full-time counselors. Moreover, full-time counselors need to be arranged for each grade level in each department. There should also be a part-time head teacher in charge of each class. Due to heavy teacher-related work, arduous research topics, and the gradual promotion of new media technologies, face-to-face communication between teachers and students are declining. As a result, the interaction between teachers and students are weakened, and the problems of the students cannot be reflected to teachers promptly. To some extent, those problems will definitely affect the class construction work.

4 The Model of Class Management Platform

In the Third Session of the Twelfth National People's Congress, Premier Li Keqiang put forward the "Internet+" action plan for the first time in the government work report. The speed-up of the college class information construction as performing the "Internet + Class" work is a response to the country's policy.

The implementation of the basic management unit for college students and the information construction of the front camps is an integrated project. By making full use of the big data and cloud computing technology, the hardware and software platforms built up by the information center in the university will be helpful for management and maintenance purpose. Undergraduate students record the class work in progress, while graduate students make supplements according to their current situation, forming a virtuous circle for sharing experiences, sharing knowledge and passing on friendship.

4.1 Value the overall planning and build the organization foundation.

The value posed by the leaders of the Ministry of Education and universities and colleges is important for the class information construction program. Based on their individual characteristics, universities and colleges are responsible for the overall planning and establishment of the organizational structure for the class information construction platform. Also, universities and colleges should establish the efficient student work platform, strengthen the publicity and motivation to encourage the participation and execution of the student class information construction and management platform.

4.2 Optimize the information construction structure and build the technical foundation

The technical personnel involved in the class information construction should fully consider the creativity of the undergraduates, the software structure, hardware support, and the convenience of subsequent development and maintenance. In the process of building the software, it is necessary to take the opinions of the students into account. Attention should be paid to the differences and links existing between class APP and enterprise APP, class websites and social websites.The technical staff should contribute to the information expansion, such as texts, pictures, audios and videos, as well as the collection between the undergraduate students and graduate students, and also protect the data privacy and the knowledge accumulation.

4.3 Construct independently and enhance the students' involvement

The class information construction should highlight the related class activities, such as knowledge sharing, accumulation and transmission, and ensure the college students to develop freely. According to the author's educational practice, it is suggested that the information construction of class should include the class overview, class notification, basic information, class knowledge, class regulations, regular management, innovations, personnel style, career guidance and classmates' friendship. The construction framework is shown as Figure 1.

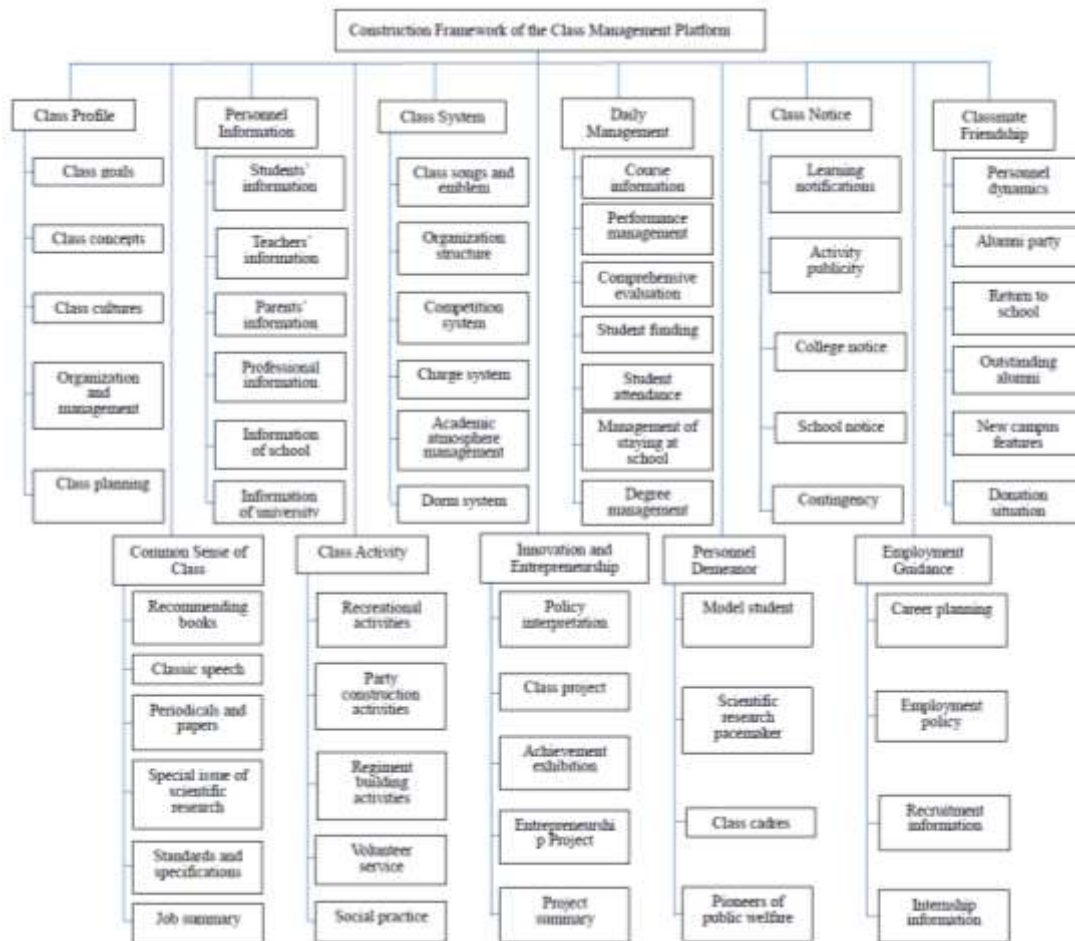

Figure 1   Construction Framework of the Class Management Platform

Four aspects are explained in detail as follows.

(1)Complete the construction of class systems

As the saying goes,nothing can be accomplished without norms or standards. With the class cadres appointed, it is desired to guide each class to complete the design work, i.e., class logos, class songs, mottos and class uniforms and so on, according to the characteristics of their major and format requirements of the Websites or apps. Furthermore, each class should complete the students' information files, and establish the dormitory management system, financial management system, mutual support system,class cadres appointment and deposition system. Moreover, it is also important to select the outstanding classes for rewards and recognitiontaking the schools, colleges and grades as units.

(2) Strengthen the construction of class culture

On behalf of strengthening the class culture cohesiveness, it is necessary to consider the class activities and individual activities as a whole, particularly the personal knowledge sharing demands. Therefore, the class members need to reserve personal videos, photos and dynamic update interfaces when conducting a wonderful video collection and writing record of cultural and sports activities, special group days and other activities. To better integrate the personal life, class cultural construction, and motivate students to enhance the belief of being a part of the class culture construction, it is necessary to create class professional culture and class sharing culture. The cultivated culture will also provide resources for reviewing the campus life.

(3) Build a platform of scientific research

In order to better promote the study style of the students, we can build information sharing and communication platforms among the graduates, school students, teachers and parents in the information construction platform. Under the same platform, the related videos and messages will be shared.The college students get the expectations from family members, teachers, and graduates through videos and messages to help them to establish correct learning attitude and strengthen the ability of independent learning.

On the other hand, it is necessary to share the regulations in the academic competitions to better support the academic abilities of students in the colleges. The unforgettable experiences, the typical moments and reports of the senior students in their academic research can be shared among students, and they should be served as study materials for junior classes. In addition, by contacting with the graduate alumni to share the related technology, knowledge and key difficulties faced in the domestic and foreign industry, students in the university will have a chance to understand the development of the industry in advance.

(4) Build a platform of career planning

To offer better guidance for college students to start their own career planning consciously from the beginning of their studies, the class information platform needs to include the contents of graduates, employers, career planning education, professional disciplines and so on. In the process of implementation, the platform will collect related businesses in our country, career planning and recruitment of the employers, and other related information. At the same time, we have access to get a better knowledge of the graduate alumni's working condition through long-distance interviews or some other ways. Such that students in the university can establish an intuitive understanding of the career planning and development, and it may also promote the students in the university to make the career planning earlier.

5 Conclusion

This paper studies the main problems and causes among the class construction under the big data environment existing in the college class management. Further, the author proposes the construction mode of the class information platform with respect to the class overview, class notification, basic information, class knowledge, class regulations, regular management, innovations, personnel style, career guidance and classmates' friendship. The proposed platform offers guidance to the college class management based on big data. The construction is aimed at promoting the construction of "Internet + class" with the help of big data, cloud computing and other technologies, achieving the connection among schools, classes, students, teachers and families, as well as graduate alumni. Moreover, the proposed measurements will help college students to complete self-positioning, future development plans, and knowledge inheritance in advance, and become a socialist builder and comprehensive successor with continuous self-improvement in knowledge, ability and communication.

Research on the Public Welfare Development of Chinese Youth Palace

Shen Diangang, Wu Peng, Chen Dejian
Wuhan Youth Palace, Wuhan, P.R.China, 430000
(E-mail: 2464341605@qq.com, 4737940@qq.com, 422348199@qq.com)

Abstract：The core of public service is public welfare. The public welfare of the Youth Palace is the focus of education in public off-campus which is widely concerned. At present, there is no clear theoretical and specific explanation for the public welfare of the Youth Palace, either in theoretical research or in practical work. This paper expounds the basic concepts and public welfare connotations of Chinese Youth Palace, and takes Wuhan Youth Palace as an example to introduce the present situation of the public welfare practice of Chinese Youth Palace. At last, this paper puts forward some suggestions to provide guidance and help for the education institutions at home and abroad.
Key words: Youth palace; Off-campus education; Public welfare; Public institutions

1 Introduction

Chinese Youth Palace is an important place to hold youth education events, and also an important carrier to carry out the ideological and moral education of minors, with great educational and political significance (Yuan Xia, 2018). The state attaches the Youth Palace great importance of the off-campus education, and has issued relevant several policy documents to guide the managers to operate the Youth Palace. In 2006, The State Council of the Central Committee of the Communist Party of China jointly issued the Suggestions on Further Strengthening and Improving the Construction and Management of Minors Outside School Activities, which pointed out that the Youth Palace, the juvenile palace, the youth student activities center, the children's activities center, the science and technology museum and other underage public welfare places should be fully exploited, and clearly pointed out the importance of the teenager's palace is a public welfare education institution outside the school. It has been emphasized that the social welfare should always be put in the first place. This article, taking the public welfare of Chinese Youth Palace as the breakthrough point, combines the literature reading and the practice research to define the basic concepts and the public welfare connotation of Chinese Youth Palace, and takes Wuhan Youth Palace as an example to introduce the concrete practice of the development of the public welfare of Chinese Youth Palace, which has a certain reference significance in the development of the public welfare education institutions at home and abroad.

Zhu (2017), Liuzhou Youth Palace, points out that the construction of the modern teenage palace needs to define its nature and content, improve the management system and innovate the service content[1]. Wang (2016), Grammar of Changzhou Open University, studied the operation mechanism of the expansion of out of school education, and mentioned that school, community auditorium, government public facilities and various training bases could be set up as community education activity places outside the campus, and the operation cost was reduced[2].

Cutucache C E, Luhr J L, Nelson K L (2016) found that business employers often complain about students' shortage of critical thinking, problem solving and teamwork[3]. Nebraska developed a STEM out of school education program for poor students, minority students and students who do not perform well in schools. NE STEM 4U introduces college students to participate in public welfare teaching through strict recruitment standards and entry training, STEM model plans courses according to regular school teaching, but pays more attention to improving students' critical thinking and ability to solve problems. This way of teaching helps junior students improve their academic performance and enrich their social experience.

2 A Discussion on the Position of Chinese Youth Palace

In 1987, the State Education Committee and the Central Committee of the Communist Youth League on Strengthening the Work of the Children's Palace clearly pointed out that the Youth Palace (including the young house, and the juvenile palace) is a comprehensive outside school education institution for children. It is an off-campus activity place for young children and an important position for the construction of socialist spiritual civilization. The Youth Palace refers to the teenager's palace, the juvenile palace and the youth activity center, which are established by government and the Youth League Group. Also, Chinese Youth Palace is a practical class to promote the all-round development of young people, and an important position to strengthen the ideological and moral education, and a public

cultural service facility that specializes in providing extra school education for young people, and the platform for the Youth League to serve the youth directly.

The research on the position of Youth Palace is very rich in academia, as shown in Table1. Most scholars believe that the Youth Palace is a place to offer social education and off-campus education to young people, and also a public welfare unit. The concept of the Youth Palace in this article includes the common teenager's palace, juvenile palace, Youth activity center, youth museum of science, which are public service units that offer public education services with non-profit.

Table 1   Position of the Youth Palace

Scholar	Position of the Youth Palace
Shao YueFei (2003)	The Youth Palace is the main venue for young people's off-campus education. It is also a base for young people's activities and a training base for art education.
Chen YingQi (2008)	The Youth Palace is the main position of social education and the extension and supplement of school education.
Zhang LiangXun(2010)	The Youth Palace is an off-campus educational institution providing educational services to young people.
Wei MingLiang (2014)	As the main place for teenager's off campus educational activities, Chinese Youth Palace is an important support and carrier for young people's social education.
Zhang XiaoSheng(2016)	The teenager's palace is a public welfare institution with a certain social security and assistance function, and it is part of the public education system because of its educational and cultural service.
Tan ChuanChuan(2016)	The Youth Palace always has the subject buildings of science and technology, literature and art, training, sports, music and so on, equipped with parking lots and greening facilities and so on. It has offices, personnel departments, teaching and other management departments, literature department, art department, science and technology department, sports department and other business departments.

3 Main Social Functions of the Teenager's Palace

In the aspect of public service research. Tang (2014) believed that we should make full use of volunteer services to improve the service level of the Youth Palace[10]. The public cultural service function of the Youth Palace should be helpful to stimulate interest and spread scientific and technological cultural skills, and explore special talents, and also be a good position to cultivate the consciousness of inheritance. From the perspective of public welfare, combed the discourse changes of the policy of education outside the school. We can found that with the development of society and economy, the host education subject changed from the same quality to the heterogeneity, from the national interests to the individual interests, from the special activities to multiple activities, and from the complex to the convenience. Under the political and cultural background of Chinese characteristics, Chinese Youth Palace is an important place for off-campus education, and an important position to strengthen the ideological and moral education, and a public service institution to provide public education services.

3.1 Important off-campus education place

The Youth Palace is an important place for off-campus education, undertaking the function of social education outside school. Zhang (2011) from the angle of education positioning of the teenager's palace, believed that it has the function of perfecting cognition, developing personality and providing social ability[11]. By organizing kinds of activities, Chinese Youth Palace develops the sociality and personality of teenagers, cultivates social cognition, masters socialized skills and promotes the youth socialized. The Youth Palace education is a purposeful, planned and organized off-campus education with youngsters as the main object. He believes that the education of Youth Palace enriches the off-campus life of young people, makes up for the shortage of school education and promotes the development of quality education. From the angle of social security, the function of the Youth Palace is reflected in social education, social service and social assistance.

3.2 Important ideological and moral education position

Youth Palace is an important position to strengthen ideological and moral education, an important position to promote quality education and build socialist spiritual civilization. Its purpose is to guide young people to set up ideal beliefs, cultivate the consciousness of the rule of law, develop interests and hobbies, promote physical health, enhance the spirit of innovation, improve the practical ability, hammer the moral quality, and practice social responsibility. In April 12, 1957, the Ministry of Education and the

Central Committee of the Communist Youth League formally promulgated the regulations on the work of the children's house and the juvenile house. The article clearly stated that the basic task of the children's palace is to cooperate with the school for communism education for children; to cultivate them with good moral qualities; to help them consolidate and expand classroom knowledge; to enrich their cultural life; to develop their interests and talents in all aspects; to train their skills.

3.3 Public education services institution

The Youth Palace is a public welfare institution to provide public education services. The government clearly points out that the Youth Palace must adhere to the principle of public welfare, emphasizing that the social benefits should always be put in the first place. The Youth Palace, juvenile palace, youth student activity center, children's activity center, science and technology museum, and other places which provide public service for minors, are all public welfare institutions. The social benefits of Chinese Youth Palace are the top priority at the present stage, and economic benefits are only a supplement to social benefits. The teenager's palace, as the important youth outside activity place of the government, is one of the important ways to provide public education service for young people. It has important social responsibility. The property of public welfare is the root of the construction of the Youth Palace management. Zhang Liangxun (2010)pointed out that the Youth Palace education service belongs to the scope of the government youth affairs, has the very strong public nature[12]. However, because of its exclusiveness and competitiveness, it is not a pure public product. Therefore, the Youth Palace education service is quasi public goods.

4 The Concrete Practice of Chinese Youth Palace's Public Welfare Development -- Taking Wuhan Youth Palace As An Example

As one of the earliest built Youth Palace, Wuhan Youth Palace, which is the first-class palace among the whole country, has typical Chinese characteristics, and with large area and long history. Therefore, this article chooses Wuhan Youth Palace as an example to conduct a case study on the public welfare development of Chinese Youth Palace.

4.1 Development background and brief introduction of Wuhan Youth Palace

Wuhan Youth Palace, founded in 1956, covers an area of 200 thousand square meters, with a total building area of 65 thousand square meters. It is a first-class place for youth social education activities. Wuhan Youth Palace adheres to the principle of commonweal and benefits, and insists on adhering to the concept of quality education, strengthening self-construction, expanding service function, creating cultural brand, extensively carrying out practical experience activities. Up to now, Wuhan Youth Palace has cultivated a large number of excellent people, such as Sa Beining, Dong Ming and so on, and won the Ginkgo Award (excellent team award) of education in Chinese youth society for two consecutive years; and won the National Advanced Youth Palace for four consecutive times. It has been awarded honorary titles such as National Demonstration Base for Off-campus Activities for Young People and Education Base for Patriotism in Hubei Province. During the period from 2010 to 2016, Wuhan Youth Palace had been awarded 85 items such as national, provincial and municipal honors and awards, and formed 25 academic research achievements, such as The Sketch Eenlightenment Book, Wuhan Youth Palace Investigation Collection, Wuhan Youth Information Management System and so on. There are more than 1000 reports from various national, provincial and municipal media such as the Children's Palace Association, the Chang jiang Daily and so on.

4.2 The public practice of Wuhan Youth Palace

Wuhan Youth Palace insists on strengthening the ideological and moral education of young people as the core, focusing on the cultivation of innovative spirit and practical ability, focusing on the cultivation of public welfare activities with distinctive features, significant educational benefits and strong influence, constantly strengthening the mechanism and integrating resources, and trying to promote the normalization and diversification of the activities. Significant social benefits have been achieved.

(1) The Wing of Dream Warmth Studio

Wuhan Youth Palace Art Department, built in July 2011, aimed at cultivating artistic imagination and creative ability of children with autism and mental retardation, offered the opportunities and platforms for learning art, building self-confidence, opening self, and integrating into society. From the first 11 autistic children (7-18 years old) in the initial summer training class, the painting guidance was given to more than 60 special children with autism and brain disabilities in 2014. The program has launched a training course worth more than 100 thousand yuan for more than 200 autistic and Down

syndrome children.

(2) Public Welfare Lecture at the Weekend

The program was founded in 2012. Wuhan Youth Palace cooperating with the Wuhan Morning Newspaper invited the top students of the college entrance examination and the city education experts to open up the weekend public welfare lecture for the middle school students and pupils.

Table 2   Public Lecture at Weekends in 2012-2016

Year	Activity quantity	Benefit range
2012	46	More than 100 teenagers and parents
2013	25	More than 100 teenagers and parents
2014	26	More than 100 teenagers and parents
2015	11	Nearly 2000 young people
2016	28	Nearly 2000 young people

(3) The End of the Month Concert

The End of the Month Concert was sponsored by Wuhan Municipal Party committee of the Communist Youth League, Wuhan Education Bureau and Wuhan Culture Publishing and Broadcasting Bureau, which was held in March 2013 for free to offer ethnic, classical, orchestral and percussion music for the majority of youngsters in Wuhan.

Table 3   Concerts at the End of the Month in 2012-2016

Year	Activity quantity	Time	Benefit range
2012	12	The last week of the month	10000 persons
2013	12	The last week of the month	10000 persons
2014	12	The last week of the month	10000 persons
2015	7	The last week of the month	2000 persons
2016	3	The last week of the month	2000 persons

(4) Love Class

For a long time, Wuhan Youth Palace provided free education service for the poor families, children of migrant workers and children of social welfare homes in Wuhan, and organize teaching staff to go deep into the schools of migrant workers' children and the community of migrant workers, and offered children the quality training courses such as painting, calligraphy, vocal music, martial arts and English for free. More than 80 percent of the public welfare activities aimed at all adolescents and vulnerable youth groups. In 2013, 200 children of sanitation workers were offered free training courses, which are worth more than 100,000 yuan.

(5) The World of Water

The program was established in June 2013 and has been held for five consecutive years. Led by the Communist Youth League of Wuhan municipal Party committee, Wuhan Youth Palace, Wuhan Youth Development Foundation, Wuhan Evening News and other related love enterprises, the program jointly organized "summer water tens of thousands of youth water recreation and water lifesaving knowledge popularization activities". The program offers migrant children, impoverished family children, sanitation workers children, military families and children the free tickets, waterproof and safety knowledge training and knowledge of water safety rescue.

Table 4   The Development of the World of Water in 2012-2016

Year	Opening days	Reception of tourists (person time)	Operating income (ten thousand yuan)	Free quantity
2010	50	120 thousand	532.34	—
2011	53	180 thousand	585.60	—
2012	50	150 thousand	738.63	—
2013	50	120 thousand	689.43	10000(value 640 thousand yuan)
2014	50	150 thousand	400.60	10000(value 800 thousand yuan)
2015	50	120 thousand	390.77	10000(value 800 thousand yuan)
2016	50	120 thousand	487.73	10000(value 800 thousand yuan)

Remarks: two lectures on waterproof safety knowledge per week

4.3 Operation and management of Wuhan Youth Palace

Wuhan Youth Palace takes part in the public recruitment of the public agency organized by the Municipal Bureau of people's society. Employees should be recruited through unified written examination, interview organized

by the competent department and publicity examination. The performance assessment of the staff is responsible for the performance of the Wuhan Youth Palace, results of the assessment are mainly used for the evaluation. Furthermore, internal control system in Wuhan Youth Palace is perfect, it formed the Handbook of the common system of Wuhan Youth Palace such as: more work, more merit and better pay; insist on overall planning, pay attention to comprehensive balance, people and post matching, pay attention to career development planning, to ensure the space for improvement.

Wuhan Youth Palace is aimed at building a good and comprehensive learning team through post training, visiting and learning, listening and evaluation classes, business discussions and exchanges, and carrying out various forms of evaluation and competition activities, thus improving staffs and workers' responsibility awareness. Wuhan Youth Palace encourages employees to learn and improve themselves constantly, pay attention to education and scientific research, it closely combine the actual work, organize the work of the workers to carry out the research, enrich the spiritual and cultural life of the staff and workers, and organize a number of staff cultural and recreational activities such as the staff photography competition.

5 Conclusion

At present, the Youth Palace should base on the actual situation of the local area to carry out the exploration and practice, optimize the external and external environment of the school education, strengthen the exchange and study of the concept, the cooperation and guidance of the business, the publicity and guidance of the public opinion.

Chinese Youth Palace is an important carrier of the socialist spiritual civilization. Carrying out public welfare activities, expanding the coverage of public welfare, and constantly innovating the form and content of public service will help to promote the development of Chinese youth education. Through this study, Chinese Youth Palace is defined as a public service unit that provides public education services with non-profit. The connotations of public welfare are mainly as follows:

(1) It is an important activity place for off-campus education.

(2) It is an important position to strengthen ideological and moral education.

(3) It is a public welfare institution to provide public education services.

This article takes Wuhan Youth Palace as an example to introduce the concrete practice of the public welfare development of Chinese Youth Palace, which mainly has the following public welfare characteristics:

(1) The social impact of the brand activity is becoming more and more significant.

(2) The activity public welfare and the educational connotation have been significantly improved.

(3) The activities of the form are more, and the number of activities increases steadily.

Innovative Development Strategy of Publishing Enterprises

Yang Tao
Wuhan University of Technology Press, Wuhan, P.R.China, 430070
(E-mail: 565160304@qq.com)

Abstract: This paper analyzes the general situation of the current publishing industry, and it thinks that the publishing industry is gradually becoming digitalized, networked and multi-media. Based on this, this paper argues that traditional publishing enterprises should not blindly follow the trend, it should think calmly, find their own position, and do the existing work more perfect, more professional to innovate the model through new technology, new media, digital dissemination. Book publishing management system should be innovation and change from inside to outside. Aiming at the development and innovation of the publishing house, the following strategies are proposed in this article: innovation in the selection of book publishing topics; focus on the book publishing brand and indigenous innovation; establish innovative market data and channels; pay attention to talent and team training; and the innovation of transformation to digital publishing.

Key words: Publish; Enterprise; Innovation; Strategy

1 Introduction

With the arrival of the all-media era, outstanding domestic publishing groups have paid more attention to the study of the transformation of the whole media, especially the in-depth study of the all-media business model and successful cases. Because of this, the traditional publishing industry is facing more and more challenges, and the publishing industry is gradually shifting to digital, network and multi-media. The Internet and new media have brought great impact on the traditional publishing industry. People have shifted from browsing paper editions of publications and news reports to news platforms and electronic publishing platforms. The platforms, terminals, and forms of electronic publications are also viewed. Changes are constantly taking place. From PC to tablet, mobile phone, from website to Weibo, WeChat, and multi-screen interactions, multiple forms of communication have gradually become the trend of the publishing industry and even the entire media industry. Facing the new changes in book publishing, many researchers have explored the future innovation and development of traditional publishing industry and the emerging digital publishing status from different perspective. Kui Zhang proposed to build a new content management model for traditional book publishing enterprises based on "Internet +" platform, which represented the attitude of most scholars; Ketao Yin also believed that the innovation of Internet technology has provided a new driving force for the transformation and upgrading of publishing enterprises; However, from the perspective of talent management structure and talent skills, publisher Mingming Yu discussed the innovative strategy of transformation from traditional publishing enterprises to digital publishing; and so on.

The author thinks that the book publishing should have innovation and change from inside to outside. For example, from the perspective of book design, the design of books is more and more personalized, and the selection of materials is more and more exquisite. This not only improves the quality of books, but also substantially increases the added value of books, so that books not only valuable for learning and reading, but also become a new direction for the development of traditional paper books. So paper books aren't going away, it's just that we haven't made them better.

No matter how the new publishing industry evolves and develops at present, it will only change in form. As a traditional publishing industry, it has to find its own positioning to make its existing work more perfect and professional, and upgrade and develop through the new technology and new media digital platform (Wenqi Fu, etc 2018).

2 Innovation in the Selection of Book Publishing Topics

In response to the problems in the selection of book publishing topics, we have conducted many aspects of the topic selection work, mainly including the following:

2.1 Strengthen the management of topic selection

How to manage the topic of book publishing scientifically and effectively is the basis for the development of publishing companies. The management of topics should be comprehensive and all-round, focusing on the management of topics selected, the organization of topics, and policy orientation.

2.2 Pay attention to the programmatic nature of the topic

The topic plan plays an important role in publishing activities. For publishers, their primary and basic work is to make a plan of book publishing topic selection. The topic selection plan, especially the key topic selection plan, plays a guiding role in publishing work, from which one can see the publishing direction and publication level of a publishing press. Publishers should consider the short-term, medium-term, and long-term objectives of the book when considering topics for the publication. They should pay attention to the recent, short-term, book-reading topics that can be put on the market in a timely manner, focus on the layout of the medium-term, and seriously consider the future. The planning of the long-term book publishing topics is not to be neglected. The determination of a publishing plan, that is, the selection of topics for book publishing and the design of a system, is an artificial systematic project that involves many aspects and is an initiative, purposeful, planned, scientific behavior.

2.3 Strengthen the innovation of the topic selection and pay attention to strategy

For the topic plan, new ideas and originality are necessary. The conception and planning of the topic are the reflection of consciousness and creativity of editing work. It is the externalization of innovation consciousness and creative ability of planning editors. At the same time, we should also pay attention to the trajectory of book publishing press topics, get rid of blindness and step into a consciously and orderly manner.

2.4 Strengthen content innovation

Acting as content managers, book publishing press filter, edit and provide high-quality content to the public. And the other way round, the great products and platform can also play a vital role in their long-term development.

3 Pay Attention to the Book Publishing Brand and Indigenous Innovation

Identify the proportion of brands, channels and content in the book marketing process. For example, the price of a book will has a direct impact on the sale of books. It is necessary to maximize the book profits and consider the purchasing power of the readers.

Creating new brands and new channels are the most challenging job. When publishing presses make mid-to-long-term brand planning, they reasonably adjust the structure of their publishing products, vigorously implement the strategy of fine books, and increase the planning and operation of brand books, featured books, double-effect books, and market bestsellers to form their own brand and characteristics. In particular, small and medium-sized publishers should make use of their own professional discipline backgrounds to achieve small and refined, small and special, small and excellent, and gradually form their own leading products, so that their own framework is clear. And some long-term adherence to corporate image, brand logo, and positioning, which is also an important force for readers to purchase long-term and form a brand.

In addition, I believe that we should still adhere to the form of content service, put the contents of the book in the first place, and provide accurate and effective service for readers.

4 Market Data and Market Channels Innovation

According to Paulo Faustino (2013), The purchase and sale of books, using aggressive marketing practices, constitute undoubtedly an integral part of the strategies that contribute to spread more culture and knowledge—that is, we cannot forget that book marketing helps to convey information to everyone and it is accessible to all, after going through the publisher, distributor, retail outlet, finally reaching the end customer—the reader.

4.1 Build a strong reader database

We must establish a reader-service network platform to provide quality after-sales services for readers, and from the outset, we should adhere to the concept of serving the reader. We must grasp and understand the online and offline platforms and resources of the book market, and develop more readers' needs through book clubs, communities, etc., and customize books for readers.

Bezos said: Ford did not know every one of his customers, and I know. So we should also know that each of our readers, we need these databases.

Internally, according to Qiang Huang (Qiang Huang, 2015), we must operate the way the market does. Our selection of book topics are fully justified by market data. Our evaluation of employee performance should also be based on market results.We can implement a set of engineer-like management methods: all speak with data, how much manpower and material resources has been invested in a project and what has been achieved. It is necessary to summarize after each book is

finished.

4.2 Focus on the continuity and periodicity of the promotion content

Firstly, the continuity of extension content should be innovated. Franco Malerba believed that consumer behavior, cognition and ability play a major role in innovation. When books first come into the market, they directly transmit information to the target readers, causing readers to pay attention to this book. After the book enters the smooth period of sales, the promotion content is constantly deepened. Through the discussion and exchange meeting, publishing enterprises should guide the readers to understand the book gradually and constantly seize the readers of different levels.

Then understand the book promotion cycle. From book publishing to the middle of the sale of books, the book-marketing has been running through it. This makes the book-marketing of every stage point can be linked with the last market promotion, and also pave the way for the next market promotion. Sporadic marketing is not only unable to achieve the desired results, but also the cost of marketing is higher every time. On the contrary, the continuous market promotion at all stages has taken advantage of the situation around each stage point and greatly reduced the cost of promotion, and the effectiveness of the market promotion has been kept high level by the superposition of the early promotion effect.

5 Pay Attention to the Training of Talents and Teams

Enterprises should put the personnel structure in the first place, human resource are the root of the enterprises. Different professional talents are necessary in the team, such as talents who are good at the network technology and who are skilled in the text editing and the market planning etc, and there should be a kind of corporate culture that can let them often communicate with each other to combine these talents (Mingming Yu,2016).

At the same time, we should make full use of the innovation of talent structure and talent management. Besides, we need more talents with complex knowledge of business management to realize the seamless integration and deep integration of traditional publishing concepts and digital technology. It is necessary to create a humanistic environment for the growth and development of talent groups that suitable for publication development. A good humanistic environment is conducive to the perfection and development of the whole editing and publishing talents' environment, and it is of great significance to the implementation of talent strategy. We should strive to build an excellent corporate culture, give full play to teamwork spirit, and continuously enhance team cohesion and competitiveness. The personnel structure in publishing enterprises is shown in Figure 1.

Figure 1   Personnel Structure in Publishing Enterprises

6 Innovation of Transformation from Traditional Publishing to Digital Publishing

According to Baoling LI (2016), The current primary task for traditional publishing companies is to develop digital strategy and make it as one part of overall business development strategy. With the social background of digitalization and modernization, the traditional publishing industry must be transformed as soon as possible to seize the current development opportunities and improve the competitiveness of enterprises. Now more and more traditional publications are slowly transforming into digital publishing. Only by realizing publishing digitalization and informatization can we meet the needs of current citizens and promote the Competitiveness.

6.1 Innovating digital publishing development process

With the continuous progress of science and technology, industrial structure and market economy are developing rapidly. The digital publishing industry has gradually updated its industrial structure and

management model, mainly embodied in the following point: finished product, technology, related service, fixed channels and terminal.

6.2 Innovating publishing content

According to Xianrong Huang and Changqing Tian (Xianrong Huang and Changqing Tian, 2014), to improve the international competitiveness of Chinese publishing industry, China should also take the publishing products as the key issue and focus on it, while creating a favorable economic, cultural and policy environment, strengthening the reform and expanding overseas presence, etc.

Publishing industry is a kind of content producing industry, and its main purpose is to provide various types of information products and services for the public. The purpose and value of digital publishing products is to provide readers with detailed content various services. Accordingly, the main innovation content of digital publishing is to combine the specific content of traditional publishing with the market channels and terminal services of different readers' demands in the current science and technology background.

6.3 Innovating value-added service of product

Digital publishing products, to a certain extent, have met the actual needs and value-added services of current users. Compared with traditional publishing products, they have unsurpassable advantages. Therefore, during the transformation, the traditional publishing industry should make the best use of the advantages of digital technology to analyze and manage the product content and the current market demand, to better meet the different needs of different readers and improve the competitiveness of its own enterprises. In order to ensure the sustainable development of China's digital publishing industry, the problems in the transformation process should be clarified and effective solutions should be proposed (Jingmei Jiang, ect 2018).

6.4 Innovating integration service

The public and professional of traditional book publishing enterprises all should firmly grasp the core advantages of content resources in the Internet era. By taking advantage of Internet platform and Internet technology, the "Internet +" content business model based on the extension of content or digital content should be constructed by means of independent cooperation or authorization. Thus, according to Kui Zhang (Kui Zhang, 2017), the transformation from "Internet + " to "content + "can be realized. Content management model of traditional publishing enterprise is shown in Figure 2.

Figure 2   Content Management Model of Traditional Publishing Enterprise

7 Conclusion

In the process of transformation from traditional publishing to modern publishing, we need to make traditional publishing more precise and professional. And at the same time, we also need new technologies and new means to better complement the publishing industry.

It is hoped that the publishing enterprise can find the right direction and strengthen the competitive advantage of the publishing industry by combining the current situation, not closing the door, absorbing advanced management methods and experiences in domestic and overseas, and combining new technology, new means and new media.

Research on the Construction of Service-oriented Primary Organizations of University Teachers from the Perspective of System Science

Guo Ying

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

（E-mail: 63511514@qq.com）

Abstract: The 19th National Congress pointed out that it is necessary to build a learning, service and innovative political organization. Based on the construction of the organization composed of college teachers, this paper adopts the theory of system theory, analyzes the problems existing in the construction of the political organizatio composed of college teachers in China, and combines system theory integrity, relevance, openness and comprehensive optimization. From the four dimensions of overall layout, service content, service brand and long-term mechanism, this paper puts forward the implementation path of building political organization. The research helps to promote the construction of service-oriented political organization of university teachers.

Key words: System theory; College teachers' political organization; Service organization

1 Introduction

As early as the 1930s, American scholar Bertalanffy (American scholar Bertalanffy, 1932) proposed the concept of system science, pointing out that system theory is the fundamental theory of theoretical research on scientific systems such as physics, biology, and social sciences. He Liqin (He Liqin, 2013) pointed out that using system theory to know that primary political organization construction is not only a work innovation, but also a scientific method to solve real problems; Yu Hai (Yu Hai, 2013) used systematic science theory to study the professional training of university counselors, and proposed The training system consists of three subsystems: guarantee, training and quality; Su Chunjing (Su Chunjing, 2015) proposes that pedagogy is a science to be developed with system science characteristics from the perspective of system science; Chen Xueqiang (Chen Xueqiang, 2017) proposes system science to modern Vocational education is very important. It needs to adapt to the needs and design a multi-disciplinary education system. Yang Xiaoli (Yang Xiaoli, 2018) proposes the use of systemic thinking to educate and guide college graduate students to achieve system functions.

In summary, there are many literatures on the construction of system research based on system science theory. The research results all show that system science has good reference and scientific guiding significance for organizational design and organizational construction. However, there is a gap in the related research that targets the primary political organizations of university teachers. Therefore, from the perspective of system science, this paper studies the construction of political rganizations for university teachers.

2 Using System Analysis Primary Political Organizations Composed of University Teachers

2.1 The necessity of creating a teacher's primary organization

As an important part of the social system, the practical significance of the service-based primary party organization construction has exceeded the scope of the campus, affecting social life, creating conditions for the cultivation of talents in the university and deepening reform.

First, the need for universities to adhere to the correct political direction. As a highland of talent, the university is the foundation of university organization. The creation of individual teachers has a positive effect on consolidating the ruling status of political parties in universities and enriching the party building work in the new era. Second, it is the need to promote the scientific, healthy and sustainable development of all aspects of university work. The primary organizations of university teachers are widely distributed, and can convey the policies and policies of political organizationto the teachers and students at the primary level. The scientific, systematic and long-term organizational construction activities can condense the wisdom of the masses, grasp the laws of education, and crack development. The problem is to provide intellectual support for university development. Third, it is the need for socialist market economy reform. The masses' demands for social public services, especially in education and other areas related to people's livelihood, continue to increase. Objectively, universities

are required to transform closed and singular service methods, build multi-level and open platforms, and make innovative demonstrations on service-oriented management. The reform of the whole society has accumulated experience and provided reference. Finally, it is the need for deep dissemination of the core values of socialism. As an advanced stage of national education, universities are an important platform for the dissemination of socialist core values. Through the activities of the organization, teachers and students can resonate and deepen their pursuit of value.

2.2 Problems

As a kind of education, management and service unit, the primary organizations of colleges and universities are an important support for running a good university. In the process of establishment, they need to combine their own characteristics, adapt to the direction of education reform and develop the characteristic highlights of services, but they also face the following dilemmas: The activities are poorly linked and the overall situation is weak. The activities of the formation are basically in the state of their respective administrations; the services provided are not combined with the tasks of personnel training, social services and cultural heritage, and the service connotation of the university characteristics needs to be deepened; The evaluation mechanism is lacking, the orientation of mass satisfaction is not obvious; the degree of service sharing with local governments is low, and the comprehensive social benefits are not high. In response to these problems, the introduction of systematic research methods can provide a comprehensive research perspective for university primary party organizations, and enhance the organization's activities, effects and sustainability.

2.3 The innovation of systematic approach to the construction of primary organizations for university teachers

System theory believes that things are composed of many elements that are organically related to each other, and an orderly and dynamically balanced nonlinear whole that can achieve a certain function. System theory is a brand new methodology. Application system theory, research is no longer limited to the development of a point, a part, but through the synergy, flow, exchange and interaction, to achieve overall optimization, reflecting a dynamic, development, the concept of two-way and related, the application of system theory to the development of service-based primary organizations is of great significance to the organization of university organizations.

The risk of Western political thoughts occupying universities still exists. The primary organizations of some university teachers are relatively scattered and the service functions are weakened. These are the direct threats they face. The holistic and hierarchical theory of application system theory, through comprehensive, systematic and innovative activities, overall planning and overall promotion, awakening its sense of purpose, transforming service into its own pursuit, strengthening the role of primary organizations; applying relevance and hierarchy Theory, through service activities, examine the effectiveness and rationality of the strategic design and organizational structure of university primary organizations, strengthen the function of teachers' primary organizations, and apply the environmental optimization theory of system theory to promote the active reform of the party and government organizations at the university. Change the national conditions and create a good organizational ecosystem.

3 How to Use System Theory to Optimize the Political Organizationsand Government Primary Organizations Composed of University Teachers

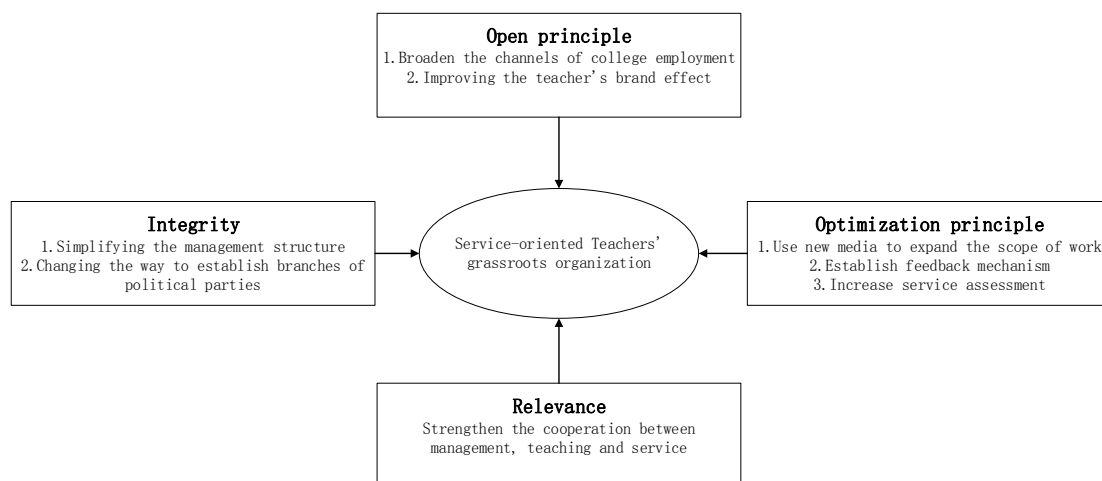
In view of the fact that the primary organizations composed of service-oriented teachers have a strong significance for the development of university systems in the creation activities, the introduction of systematic research methods, the application system's integrity, relevance, openness and comprehensive optimization characteristics, Four optimization proposals for overall layout, rich service content, service brand creation, and long-term mechanism. The implementation path of college teachers' primary organization construction based on system theory is shown in Figure 1 below.


Figure 1   Primary Organization Construction Implementation Path

3.1 Unified layout, inter-related common development, active implementation of organizational activities at all levels

The core of the holistic principle is part of the system, and because of the "connections" that exist between them, "A new property of the sum of the components and components, i.e., the system or the whole," simply put, "the overall effect is greater than the effect of a single element." When the university is studied as a system, it is found that the flow of its elements is not enough and the overall system advantage is not fully utilized. The administrative authority takes precedence over the academic power, the administrative function department has the priority of resources and the service function is weakened. The lack of effective sharing of resources and information between different professions is impeded. The organizations and the government jointly take charge of the implementation of the system is only a formality, the open government affairs is not enough, the teachers' appeal channels are not clear, the responsibility system is not clear, these are the part that should be paid attention to in the creation activities. To adopt the principle of holistic ness, the grass-roots organizations composed of teachers should divide the work clearly and move up and down, and promote the wholeness of the creation activities around the core goal of the long - term development of the school.

Follow the order of the things themselves, adapt to the transition from the level to the flat organization, reduce the middle management interference, and improve the overall management effect. Optimize the construction of primary organizations of politics and government, expand the breadth of service content, expand the scope of service radiation, eliminate blind spots between teachers and students and society, and truly integrate into the masses. In recent years, there has been a group of professional teachers composed of primary organizations, showing strong service-oriented characteristics, with discipline teams as the unit. The Disciplinary Team is a major feature of university human resource management, "operating on the basis of scientific research." Political organization personnel grow up in primary academic organizations such as teaching and research rooms and scientific research teams, transforming service activities into job pursuits, and inspiring organization members' initiative, creativity, and service work in real need of roots in combination with business characteristics. Organizational activities include political science, academic exchanges, and educational talent management. Teachers have special knowledge in different fields and are easy to support each other in interdisciplinary and related disciplines.

3.2 Explore the internal relevance of the system, enrich the connotation of service and enhance the effect of service

Relevance refers to the interdependence and interaction between systems and subsystems, the elements within the system, and the environment between systems and systems. The core of the relevance principle is to find the interrelationship between internal factors, systems and environment in complex systems to achieve their benign interaction. According to the relevant principles, the creation activities of university-based service-oriented teachers' organizations should seek management, cooperation and cooperation between teaching and services in order to achieve a seamless connection, and it is necessary to construct a three-dimensional service network. And expand the service space. We will play an important role in the integration of internal resources such as discipline layout, talent

training, scientific research team building, industry-university research and development, local economic services, and participation. In the process of seeking and absorbing external resources, we will build social culture and other external resources, continuously enrich the service connotation and improve service efficiency.

3.3 Adhering to the concept of openness, the construction of the organizations branch should integrate local conditions and create a service brand

The principle of openness is the law of the dynamic development of the system. In the constant communication with the environment, systems and factors, the system experiences a dynamic development process from low-level to high-level, from simple to complex, from disorder to order. The openness of the primary organizations of political parties in universities and the openness of the university itself complement each other. The spirit of "compatibility" is the embodiment of its own openness. The creation activities carried out in line with the concept of "openness and development" are time, dynamic and persistent. In the process of creation, new ideas, new methods and new information will be continuously integrated into the system, and the creation activities will be summarized and developed in time to form a virtuous circle of effective feedback, improvement, innovation and perfection.

Based on the principle of openness, through the creation of activities to create talent brand, service economic transformation and the development of people's livelihood. In recent years, the channels for selecting and employing personnel have been continuously widened, and the flow of talents between colleges and local governments has been accelerated. The brand effect of college teachers is obvious: the age structure is more reasonable, and the proportion of young and middle-aged talents is higher; Strong professional background, most of them have working experience in studying abroad. The type is rich, have familiar teaching, scientific research academic talented person, also has the coordination ability strong, the rich experience management talented person. The channels of exchange of talents between local governments and universities should be unblocked, and effective long-term mechanisms should be formed to provide intellectual support and organizational guarantee for the creation of service-oriented government.

3.4 Constructing the service system, optimizing the service environment and perfecting the evaluation mechanism

The system optimization principle refers to continuous research and improvement of the system according to the system objectives, and finally the optimal function of the system. This principle requires attention to the construction of the system environment, the creation of an institutionalized, long-term service mechanism to achieve system goals. The organization branch of college teachers should innovate the service carrier, extend the service tentacles, optimize the system environment, and build a networked service system. The focus of work during the social transformation is the grounding gas project. In the era of big data, new media has penetrated into all aspects of social life, and is good at using new media tools, expanding work areas, creatively carrying out party building activities, using the Internet, mobile phones, etc., through WeChat, Weibo, etc. to effectively interact with party members and the masses. Master the hotspots and difficulties of the masses, establish a gridded three-dimensional service system, form a system of synergy, and establish a service mechanism for public opinion listening and public sentiment feedback. It is necessary to establish a sound service-oriented evaluation mechanism, highlight the satisfaction of the masses, establish service assessment projects, weights, and participation in the scope of assessment personnel, increase the use of assessment results, and establish a correct employment orientation.

4 Conclusion

This paper starts from the necessity of establishing the primary organization of teachers in colleges and universities, and analyzes the problems and bottlenecks in the construction. Drawing on the ideas and characteristics of system science, this paper proposes the implementation of optimization path, and elaborates on each dimension in the path, which has certain reference significance for perfecting the development of organization government primary organizations in China. However, in view of the different actual situation of colleges and universities in China and the different lengths of the establishment of teachers' party branches, the relevant viewpoints in this paper need to be adjusted and improved to be more adaptable and scientific.

"Five Thoughts" Promotes the Innovative Development of the University's Ideology and Education

Yuan Hua
Hubei University Of Education, Wuhan, P.R.China, 430070
(E-mail: 3147627@qq.com)

Abstract: the ideology education must be closely around the basic task of enhancing morality and fostering talents. In order to strengthen ideology education innovation, we should attach great importance to the explicit education as well as pay attention to the latent education. The whole process for education centers on 'five thoughts'-student education, teacher education, course education, subject education and environmental education.
Key words: Five thoughts; Ideology education

1 Introduction

In the new period, our country has given prominence to ideology work in universities and made a series of major decisions and arrangements. Colleges and universities have adopted effective measures and actively carried out their work, which has created many successful practices and accumulated many valuable experiences. At present, problems existing in ideology education such as the lack of theoretical innovation and learning initiative of the subject, outdated teaching content, single teaching means, and imperfect evaluation mechanism have caused certain obstacles to carry out ideology educations in colleges and universities. We need to combine teaching in accordance with students' aptitude with dialectical treatment, identify the common point of thinking of college students and the intersection of interests, guide students to analyze, study and solve practical problems with the theory, and improve the work of ideology education (Han Xiping, Zhang Mengfei,2018). The innovation of ideology education follows the general law of development that all aspects should be considered to promote this progress (Xufei, Dairui, 2018).

There are many studies about the work of ideology education. Some people think that with the improvement of china's economic level, higher education has also achieved rapid development, which brings a huge stage for the development of ideology education in universities. However, development and challenges always coexist.In the development of ideology education, it also faces the impact of various trends of thought around the world. Under such circumstances, traditional ideology education is difficult to play its role in promoting social harmony (Su Jing,2014). In 2014 the British government called on schools to promote ideology education to help establish British values. These values include democracy, individual liberty, the rule of law and respect for people of different backgrounds and religions (Janmaat, JG,2018.04). A research at Universidad Autónoma de Chile (Autonomous University of Chile) find that a good university teacher has mainly ethical, moral and affective features that structure the interaction with the students' community, which will promote the innovative development of education work. (Almonacid-Fierro, Alejandro，2018.08). Recent years, some scholars propose that the innovation of cognitive neuroscience can be applied to college students' ideology education through the ideas and methods of nature science and social science research field. According to this study, we designed more effective education and teaching activities and enhanced the effectiveness of ideology education (Li,Fanfan,2018.05).The diversified integration of teaching resources in ideological education in universities is helpful to extend the ideological teaching activities, to update and supplement ideological knowledge, to build a harmonious environment for students（Xu, Jin, Chu Biao, 2018）.

Based on all the research above, we come up with the construction of five thoughts (Tao Hongtan,2018), give full play to the leading role of teachers and the main role of students, promote the reform of ideological courses and the construction of disciplines, optimize the campus fully, and fundamentally solve the problem of 'what kind of people to foster, how to train' in universities.

2 Focus on Promoting 'students' Thinking, Practicing Social Core Values, Stimulating Education in Practice, and Cultivating Students' Spirit of Innovation and Ability to Serve the Society

2.1 The education of ideals and beliefs is the key link of the work of thought education in universities

First, we should highlight the core position of this kind of education in students' ideology work, which also is the core education of students' outlook on world, life and values and can help to solve the fundamental problem of "what kind of people to foster". To conduct the education of ideals and believes for college students, it is crucial to combine the explicit course education, which is mainly conducted through ideology theory courses, with the implicit course education, which is supplemented by campus cultural activities. Secondly, the aim of education should be stressed. We can associate the ideals and beliefs education with career planning to achieve the goal. Finally, we should give full play to the exemplary role of the university party and youth league organization and combine the ideal and belief education with the team building and the party organization construction activities.

2.2 The ideology education should be guided by core values and adhere to moral education

Under the new situation, it is the inevitable requirement for the ideology education in order to support the value guidance, which can be realized through the following five ways: (1) adhere to the concept of people-centered teaching (2) build a new pattern of 'cooperative education' (3) into the Chinese excellent culture, enriching the connotation of the value guidance (4) strengthen the construction of ideological education team (5) the innovation of ideological education and the expansion of the influence the value guidance.

Table 1   Essential Qualities of Students

number	content	percent	number	content	percent
1	Performance in school	12.3%	6	Experience of student cadre	2%
2	college iploma	18%	7	Teamwork spirit	2%
3	Skills certificate	9.8%	8	Presentation skills	2%
4	Practical ability	36.1%	9	Writing ability	0.4%
5	Computer and foreign languageskills	17.2%	10	Development potential	0.3%

3 Actively Carry Out the Formation of Teachers' Ideology Education, Strengthen the Construction of Teachers' Morality, and Foster a Contingent of Teachers with Excellent Ideological Qualities

Ideology education is a systematic job involving all levels of school management and all links of teaching and scientific research. Most teacher staff must establish the philosophy of "whole person education" and closely combine classroom education with scientific research education, practice education, management education, service education, culture education and organizational education.

3.1 Perfect the system for double assessment of teachers' ideological qualities and professional abilities

We will enhance the rules of teachers' theory learning and classified evaluation, and effectively advance their ideological qualities. We will facilitate the institution of tutorial system for young teachers and accelerate the all-round development of themselves.

3.2 Strengthen the construction of teachers' ethics and improve the mechanism of appraisal

The construction of teachers' morality and ethics should be carried out throughout the whole process of moral education and implement the "one vote veto system" in the work of the introduction of teachers, performance appraisal, commendation and reward, professional title evaluation and job appointment and promotion, and perfect the mechanism of teaching evaluation, academic ethics evaluation, incentive and punishment.

3.3 Build a high-level ideological workforce

As the main body of ideology education, university counselors and ideological class teachers must be integrated in the progress to form a great result. At the same time, we will implement the system that young teachers can also be student counselors. Eventually, the full-time and part-time ideological team will bring huge advantages.

4 Promote the Construction of 'Course Ideology' and Boost the Educational Function of Each Course with the Classroom Teaching as the Main Mode

4.1 The essence of 'course ideology'

The essence of this task is to integrate the university's ideology education into all links and aspects of course teaching and reform, focus on the course goal of "the combination of imparting knowledge

and value guidance", reinforce explicit thinking, refine implicit thinking, and build the pattern of whole course education. To complete the transformation of "ideological courses" to "curricular ideology" and maximize the function of ideology education in education teaching of all courses, we need integrate explicit and implicit education which should not only concentrate knowledge in the dissemination of value, but also emphasize value guidance in the dissemination of knowledge.

4.2 The role of course ideology

Play the role of explicit education and infiltration in ideological theory curriculum. The elements of the curricular ideology are fully explored and embedded into the teaching plan to consolidate the ideological foundation of the course.

Integrate the thinking education into the study of professional courses, give full play to the implicit education and value guidance of academic course, and comprehensively promote the ideology of curriculum.

5 Adhere to the Guiding Position of this Association and Implement the "Subject Ideology"Practically. The Ideology Education is Based on the Organization, and the Precondition and Aim for the Construction and Development of This Education Discipline is to Realize the Localization of the Principle in China

5.1 Promote the integration of this group's discipline with the daily ideology education.

The organization's theory of ideology should be a common discipline platform that can connect the main channel of ideological curriculum with the daily ideological education front, which requires that teachers majoring in ideological lesson improve service consciousness.

5.2 Increase the supporting role of the theory discipline on daily ideology education.

Many youth counselors often show a lack of ability when dealing with the problems in ideology education work, so more relevant academic platforms about the organization's theory should be built for the counselor so that they can communicate with others and enhance the ability to solve the major theoretical and practical problem; the counselors themselves also needs to raise the theoretical awareness and actively participate in the theory discipline construction.

6 Perform the Function of 'Environmental Education', Boost Formative Education and Guidance, and Promote the Composition of 'Environmental Ideology'

'Environmental ideology' is an important part of 'five thoughts' and a crucial way to foster people. Achieving the function of education of campus culture atmosphere needs to be promoted from the creation of civilized campus and the production of school spirit. The composition of school spirit is the core of the construction of civilization.

6.1 Establish civilized campus.

The activity of civilized campus establishment has certain guiding impact to the university student's value orientation, has the critical significance of the formation of civilized behavior and the enhancement of students' training quality. It includes the optimization of campus culture, campus civilization, campus network, campus front and the construction of advanced typical education environment.

6.2 Establish school spirit and academic style.

Like sunshine and air, the ethos of college and university determines the improvement of all things. Good school spirit and study style play an imperceptible impact in the growth of students.

The ideology education in university is a strategic project in the new era, facing great opportunities and challenges. This has certain instructiveness to strengthen and improve ideology education by the way of giving full play to the five education of latent and imperceptible function through focusing on five ideas so that organizations can develop the definite effect of college virtue education and further improve the level of job of implementing thought education.

7 Conclusion

Course education, subject education is the first class, students'education is the second class, environmental education is the third class, the teacher education is the key that only through teaching, morality nurturing, personnel training, development and innovation, learn to grow in five aspects, the construction of a three-dimensional, integrated and efficient ideological and political work system,

implement the idea of the whole process of all-round education of the whole, to lay good foundation for the ideological and political education work, create a new situation of ideological and political education work in colleges and universities.

The Design and Implementation of Multi-media Classroom Reservation System Based on Browser /Server Mode

Zhong Shan[1], Zhou Xinmin[2]
1 Office of Academic Affairs, Wuhan University of Technology, Wuhan, P.R. China, 430070
2 School of Automation, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: zhongshan@whut.edu.cn, zhouxinmin2003@163.com)

Abstract: The management ofMulti-media classroom is an important task forMulti-media teaching at University. This paper analyzes the current situation of the multimedia classroom management in Wuhan University of Technology (WUT), which designs and implements multi-media classroom reservation systemusing ASP.NET technology, as well as adopting B/S three-layer design model and .NET platform. The system realizes the informatization of the classrooms management, and greatly improvesthe level of the Multi-media information management and work efficiencyinWUT.
Key words: Multi-media classroom; ASP.NET technology; B/S mode; Design model

1 Introduction

With the rapid development of information technology, teachers' appointment information registration is a relatively heavy and important task in college management. Through the comparison and analysis of the published literature in foreign countries, there are a lot of different types and sizes Multimedia classroom management systems obtained in foreign countries (Zhang N.P.,2014). Foreign universities also pay attention to the management of multimedia classrooms before the multimedia classroom video monitoring management and the network centralization management has realized. The rapid development of technology, information technology has been used in many fields of society, due to the inefficiency and manual management of teaching management, the modernization needs of the school have made it necessary to use information technology to complete the teacher's appointment of the classroom. With the development of computer technology and modern advanced education technology, the Multi-media classroom has become an indispensable part of colleges teaching and universitiesteaching.The Multi-media classroom of Wuhan University of Technology has developed rapidly in recent years. Now it has formed a total of 328 classrooms, including six teaching points and ten teaching buildings.Classroom types contain general multimedia classrooms, voice classrooms and video classrooms for high-quality courses.

More and more teachers use Multi-media and multi-function classrooms to teach.They submit the applications to teaching management officeofcorresponding college, then staff members of the academic affairs office deal withthe applications in a unified and coordinated arrangement way (Hues, 2013). Advancearrangementsin the Multi-media of academic affairs office are used in a fixed time every week, except some sections such as club activities, student employment guidancewhich are not in the courses arranging plan,and unable to be temporary arranged in the original system.Theteachers are required to fill out applications, those will be for approval andpermitted by teaching management office administrator. Next, the staff of the Multi-media classroom management checkand approve the applications and inform the relevant building Multi-media classrooms manager to open the door (Stephen Walther, 2012).If a teacher applies for a freeMulti-media classroom, it can be solved at once.But if there is no suitableroom for allocation, the classroom administratorneeds to notify the teachers.This process is not only lengthy, butalso very tedious.Therefore, some teachers have given up the Multi-media teaching method.For this reason, it is necessary to design anonline Multi-media classrooms reservation system to simplify the application process and raise the utilization and management level of Multi-media classrooms.In addition, in order to avoid conflict with the curriculum scheduleinthe courses scheduling systemof theacademic affairs office, the system should be integrated with the it.The designed system integrates with the original one, importing the arranged schedule curriculumfrom the scheduling system into the online reservation system. Then the occupied classroom will no longer be reserved (TuoM.E., 2017), it not only simplifies the process, but also realizes the cross-campus office, making the multimedia management work convenient and fast, and it truly serves the teaching work and the whole school.

2 The Ideas for the System
2.1 The analysis of system requirements.

The main users of the Multi-media classroom reservation system are system administrators, classroom administrators, ordinary teachers and students. The functions of system administrator mainly include data maintenance, audit and registration of user information, setting of user rights, and various relational tables of management system error log and maintenance of the system (Liu P,2015). The classroom administrator operates on Multi-media teaching points in each campus, according to the user input requirements, then the data resources can be searched and counted, and the report output can be generated and the class printing function can be completed. In order to maintain the relevant information of the management classroom, to review the reservation application of the management classroom and to adjust the curriculum schedule of the management classroom, ordinary teachers may submit, modify or cancel an application for an appointment (Wu P.G.,2016). It is convenient to query and print multimedia classroom buildings, seats, classes and so on. Information such as classroom equipment's can be used for feedback processing.Moreover, students can check the classroom schedule or class schedule anonymously.

The multimedia classroom appointment and inquiry function module enable the teacher to quickly understand the current situation of the multimedia classroom in the university and make a convenient and convenient appointment of the multimedia classroom required by the course (Ying A.H.,2016). According to the appointment of teachers, the classroom administrator will review and make the relevant work log. The user role function permissions are shown in figure 1 below.

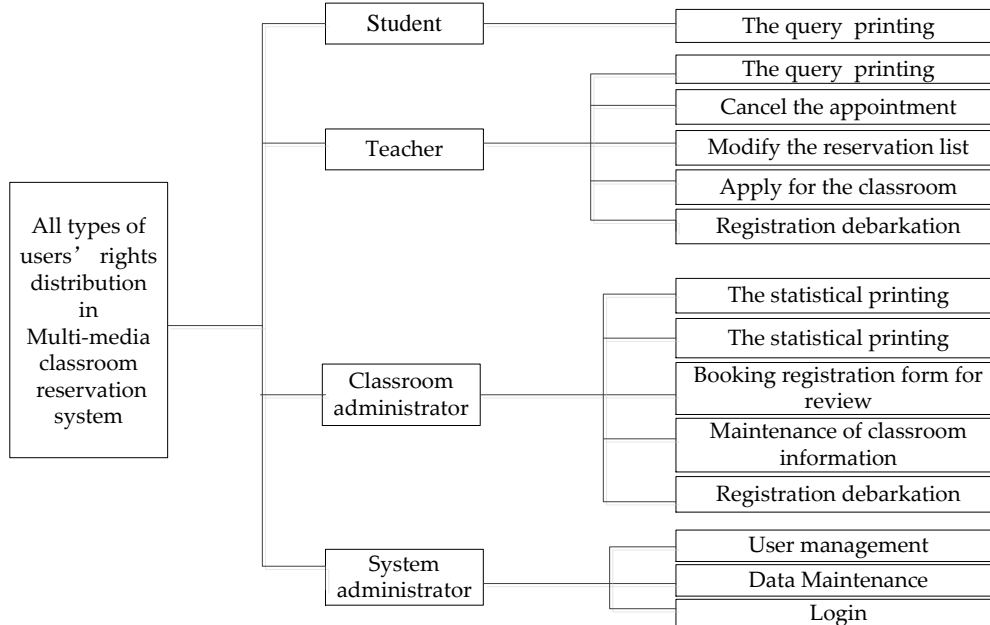

Figure 1   All Types of Users' Rights Distribution

2.2 The design of function

The mission of the Multi-media classroom reservation system in each school is for uniform allocation, making the classroom booking process simple and optimized resource utilization, satisfied the teaching requirement (Yang C.,2013). The primary function of the system is to integrate with the teaching and scheduling system and export the class schedule of each classroom in the teaching and scheduling system into the agreed format, which is imported to the reservation system and displayed.Other main functions are as follows:

(1) According to the requirements of the user, the number of class hours and class members can be inquired into the input parameters, and all available multimedia classroom records can be listed for user selection.

(2) To review the application of teacher's appointment and record the relevant information of the appointee after the approval (teacher's name, course name, class time, class place, etc.) for class use.

(3) Print the class table and statistics class function according to the booking situation and the weekly number, the classroom number and other information.

(4) It has the function of the number of courses and the total number of courses according to the information of different colleges, curriculum types, and building blocks in the campus of multimedia classrooms.

(5) At the end of the semester, we can finally calculate the total amount of class hours that each multimedia classroom teaching point will take in this semester.

(6) The user shall have the ability to modify and cancel the reservation and make a global search according to different input conditions to acquire the satisfied conditions.

(7) The system can log in remotely to maximize classroom resource utilization.

(8) It can edit classroom properties of different teaching points and add new classrooms to complete the update.

3 Development Technique

3.1 Development model

The system is based on B/S (Browser/server) mode architecture, at the front desk to present using HTML and VBScript client language with ASP.NET 2.0, the background and the C# language development, the data layer is stored using the Access Database. This reservation system is designed with a three-layer architecture, which is divided into presentation layer, business logic layer and data access layer .Client presentation layer interacts with the user's browser, which provides user with access to the system of the entrance, the server-side presentation layer is responsible for interactions with components of the business logic layer, in response to the client's request, to generate the results back to the client;The Web server in the business logic layer uses the application to process the user's various operation requests to the database, and returns the results to the user to realize the business logic of the Web service .The data access layer submits the logical view of physical data to the business logic layer, separating the changes from the underlying data store from the business logic layer and ensuring the integrity and reliability of the data. The development pattern structure of the system is shown in figure 2.

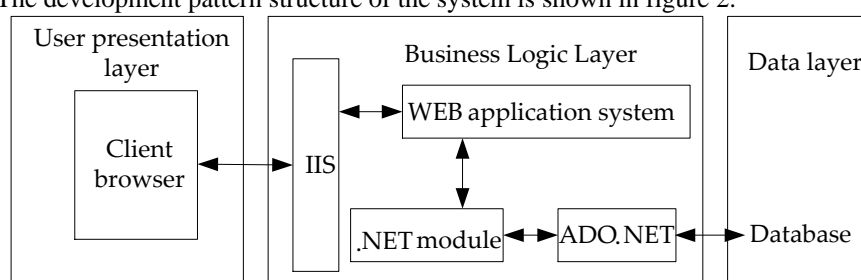

Figure 2   The Development Pattern Structure of the Reservation System

3.2 Key technologies

3.2.1 Realization of user rights.

In order to guarantee the security and stability of this system, the role-based access control model is used to design the authority management module. When a user logs in, its name and authority role are obtained, and the current user has the scope of authorization based on role and authority. Besides, the user has set a functional module to determine the current user from which it can access the collection, and then determine the liston the basis of functional division. The user can login to the default home page of itself.

3.2.2 Data access layer.

The basic role of the data access layer is to hide the data access details, enhancing the portability of the system and accessing the back-end data repository mainly using ADO.NET. The data access layer is implemented mainly by an encapsulated data access class, which provides access data sources for standard interfaces to complete related operations.

3.2.3 User interface.

User interface uses the upper-left-right structure of three parts.The upper part is divided into common operations on the system, the navigation columnon the left is tree structure, where reservation system main function modules, and the right is the operating result of the display area.

4 Design of Main Modules

In the platform of B/S mode, the system uses the advantages of ASP.NET technology and Web database, which is simple and practical, and greatly improves the efficiency of multimedia classroom use and information management.Due to the convenient and practicalinterface of the system, users can

achieve remote, real-time management without the limitation of space and time through access from the server-side browser or real-time information management in multimedia classrooms.

4.1 Classroom and course management module.

The main task of the classroom management module is to manage the Multi-media classrooms of each teaching point. The specific operation includes adding, deleting and modifying the basic information of the classrooms, such as the number of seats and area. This module is also the premise of another module operation (Liu H.,2016). Only after setting the classroom property, we can make reservation inquiry and do other operations. In addition, the course management module is to modify and delete the approved courses.

4.2 Course reservation and enquiry module.

This module mainly provides the distribution and arrangement of Multi-media classrooms for teachers,based on which, teachers can make an appointment and choose the appropriate classroom according to certain input parameters, including the location, time and special requirements of the multimedia classroom (Shao D.h.,2016).The system administrator reviews the appointment status, and the approved classrooms can be used at the appointed time.Otherwise, teachers will be notified to reschedule.Users can easily find out the use information of a classroom in this semester (including classes, time and course names, etc.). According to the class name, the course name and the keywords, such as teachers' name and the conditions of a classroom, it can also print out a list of Multi-media classrooms to teach students during weeks' time.The classrooms in the whole university buildings are used to print arrangement information.

4.3 Statistical function

The classrooms statistics can be used to calculate the utilization rate of the classrooms every semester. This function mainly realizes the statistical inquiry function of the use of multi-media classrooms, which includesthe classrooms usage statistics, departments and curriculum types, for example, a graphic visual representation one. The final statistics summarizes the total classification of schools in the semester at the end of each semester. For the specific algorithm of the above module, ASP.NET and C# language are used to code according to design ideas. This article will not describe them in detail.

4.4 Development environment

(1) The Web server, installed the Windows Server2003 operating system, and IIS6.0 is configured for the system.

(2) Installment of visualstudio2008,and the systemmake use ofASP.NET files to realize various functions of the application and place them in the virtual directory of the Web server which can be accessed by the client browser.

5 Conclusion

The operation of WUT Multi-media classrooms reservation system has been being in good condition since it was officially put into use which brought convenience to the teachers and students of the school.Through this system users can conveniently query to each the details of the Multi-media classroom.The teachers can choose suitable classroomaccording to the teaching timetable, while students can query to the free classroom for self-study. At the same time,this system raises the level of the Multi-media classrooms management, making the Multi-media classrooms resource management become more intelligent and enhance, and reducing the amount of labor as well as bringing the convenience to teachers and students.It also has some extensive applications and promotion value.With the diversification of Multi-media classrooms management and the development of higher education management technology, the Multi-media classrooms reservation system also need to beimproved constantly in order to meet the needs of practical teaching work in WUT.

Application of Analytic Hierarchy Process in Selection of Basketball Players

Sun Rentao

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 2181212707@qq.com)

Abstract: In the selection of basketball players, the important premise of scientific selection is to determine the selection index and the weight of the corresponding index. For this reason, this paper introduced the Analytic Hierarchy Process (AHP). The index system consists of physical fitness, body shape, psychological quality and physiological function of the four criteria level indicators and 17 evaluation indicators. The results showed that the body shape had the highest weight, accounting for 53%, and the weight of physiological function was the lowest, which was only 6.8%. This study provides a reference for the objective evaluation of athletes' ability and scientific selection.

Key words: Basketball players; Scientific selection; Analytic hierarchy process; Index system

1 Introduction

Generally speaking, modern training mainly includes the scientific choice, the long-term systematic scientific training, the best performance in the competition, and scientific management of athletes. Athlete selection is the first step in this process. If a selected athlete is a seed without cultivation prospects, no matter how much human, material and financial input is futile. Therefore, the selection of talent has become increasingly important. The starting training age of modern sports has been advanced, and some sports even begin to select athletes before the age of 7. Selection in the early stage increases the difficulty of accurately predicting athletes' future sports ability significantly, so that people pay more attention to the scientific research of athletes' choice. According to the scientific practice, the choice of scientific materials, scientific management and scientific training have become the three main factors restricting the level of competitive sports from the beginning to the present. As the differences in training methods and training levels gradually narrow, the importance of individual talent for improving athletic performance is more prominent.

Basketball is a comprehensive sport which strives for perfection in athlete's physical fitness, technical ability, coordination ability and on-the-spot play ability（Te Wierike S C et al, 2015）. Physical qualities such as strength, endurance, speed, flexibility, reaction and so on，play an important role in selecting basketball players, the level of which directly affects the basketball player's technical and tactical improvement and development ability（Scanlan A T et al, 2015）. Athletes' psychological ability is the key factor that affects the performance of athletes' competitive ability. Referee's judgment and punishment may affect athletes' performance. Good psychological state and personality characteristics are the guarantee of their victory over their opponents. Genetic research shows that once human psychological processes and personality characteristics are formed, it is difficult to change. Therefore, we should not neglect the diagnosis and evaluation of athletes' psychological ability in selecting talents （Shaffer C T et al, 2015）. The level of basketball competition is constantly improving, technical movements and tactical forms become various, game situation changes randomly, a series of emergence problems require basketball players acquiring higher quality in all aspects, especially the basketball consciousness（Bullock G S et al, 2016）.

In the past, the selection of basketball players was usually based on their daily performance, coach's experience, preferences and simple tests. However, these methods will be limited by coaches' experience, cultural level and subjective consciousness, thus affecting the selection of athletes and the accuracy of the evaluation results（Liu Rui, 2013）. For example, in recent years, some grass-roots sports schools over the country when selecting young basketball guards, mostly simply implement the "clapping bone age", a method used to predict whether reserve talents can grow to 1.95 meters and worth cultivating as a seedling depending on clap bone age. Conceptual bias led to the selection of one-sided emphasis on height, ignoring the importance of technical and tactical awareness and training. Therefore, it is an important issue for coaches and researchers to solve that how to avoid this embarrassment and decide weight distribution of various factors in basketball.

2 Introduction of Analytic Hierarchy Process

The Analytic Hierarchy Process (AHP) was formally established by Thomas L. Saaty, an American operational research scientist（Luo Yingjie, 2017）, in the 1970s. It has the characteristics of combination of qualitative and quantitative, systematic and hierarchical. It mainly deals with complex and fuzzy problems, making decision makers have certain methods to follow when making decisions, especially for those complex problems with multiple objectives and attribute characteristics. Analytic hierarchy process (AHP) embodies the idea of system analysis and system integration in the decision-making process. Because complex problems usually have complex influencing factors and chaotic internal relations, it is necessary to conduct in-depth analysis, and then use quantitative research methods to deduce the information obtained comprehensively, so that qualitative problems can be digitized.

Analytical Hierarchy Process (AHP) needs to make a qualitative analysis of the experts' scores （Zhou Ming et al, 2016）. make a quantitative analysis through the establishment of mathematical model, and then determine the ratio of each index and each level index in the core competitiveness of basketball players, so as to estimate the basketball competitiveness of each basketball player. It makes up for our previous empiricism's evaluation of players' competitiveness. This is a very important reference value for selecting excellent basketball players. The method is simple and easy to use. The application of mathematical theory is relatively simple, but it is still perfect, recognized by many scholars, and widely used in many fields.

The steps of AHP are as follows:

(1) Facing the comprehensive evaluation of the problem to be evaluated, the problem is divided into several single criterion evaluation problems by layer decomposition.

(2) Make a thorough and systematic analysis of the selected problems, select the index factors that affect the system problems accurately and refining, and then establish the hierarchical structure model of the system.

(3) The comparison of each stratification factor 22 shows the importance of the above level factors at this level. The judgment matrices of different levels are constructed.

(4) Consistency check for all levels of matrix.

(5) Calculate the weight of each factor by calculating the level of single sorting.

(6) The consistency test of the judgment matrix established by the whole system is carried out, and the consistency test passes, that is, the weight of the scheme layer relative to the overall objective problem can be obtained.

3 Establishing a Hierarchical Structure Model

The establishment of hierarchy is the systematic expression of decision-making problems, which objectively and accurately reflects the objective of abstract problems by selecting indicators. The more complex the problem, the more indicators need to be chosen to reflect the nature of the target. Various indicators require us to divide more levels, and it will be more difficult to construct hierarchical structures. On the basis of reflecting the objective of the problem, these indicators should be as simple, feasible and representative as possible. This is the key to establishing an independent hierarchy in the analytic hierarchy process. A hierarchical structure is established and a parallel relationship between layers is established. The relationship between these two levels is subordinate. Among them, the upper factor dominates the lower level factors while the lower level is the refinement of the upper level. When we use analytic hierarchy process, we usually divide a problem into three levels.

(1) Target level: the target level is the highest level in the hierarchical model. The goal layer is the goal of our problem, that is to say, this layer is the ultimate goal and result that we want to achieve, and only this factor.

(2) Rule level: this layer is located in the middle of the hierarchical model, so it is called the middle layer. The criterion level is the most critical layer to solve the problem by AHP. The factor of the criterion layer is the decomposition of the target layer, each of which is the specific reflection of the target layer. Analysis and research of standards level can help us achieve the corresponding goals. It can have one or more levels. If necessary, the standard layer can be divided into several sub elements.

(3) Index level: this level is the various solutions we can take to achieve our goals. This scheme can be objective and needs our direct choice. It can also be our subjective design, from which we can choose the best. The scheme layer is generally only one layer, which is in the lowest level of the hierarchy.

We should follow the following principles in building decision models.

(1) In the process of solving and simplifying the problem, we must seize the main factors without omitting too much. When we make decisions, some of the problems we see are very complicated. Many

factors will be found when constructing a hierarchical model. If all these factors are built into a hierarchical model, it makes our decision-making more difficult. According to psychological research, we have a rule that one factor should not exceed nine factors. In order to make a clear judgment, methods of reducing the number of factors and increasing the level can be used according to this principle.

(2) It is better to match the attributes of factors among different levels. Do not put them on the same floor. When constructing the hierarchical decision model, the first layer is the target layer, which is usually only a factor and is easy to choose. But there are many factors in the standard level. According to the preceding principles, each factor should not exceed nine. Therefore, these complex factors need to be redefined. Factors of the same rank or nature are placed at the same level. The factors of affiliation can be stratified and downward. This requires us to analyze the problem in depth and establish an accurate hierarchical module.

The overall goal of selecting high-level basketball players is to improve the technical level of basketball and promote the development of basketball（Meng Pengjun et al, 2015）. After in-depth investigation and preliminary feasibility analysis, we believe that there are many factors affecting the level of basketball, which is not easy to determine. Especially, qualitative problems are often encountered in the selection process, and it is not easy to quantify or completely quantify the indicators, such as differences in physical conditions, physical quality, psychological quality and so on（Liao Luzhen et al, 2016）. These detailed indicators used to be the best choice, only through achievements and experience, the lack of a certain degree of scientific（[10], 2015）. Therefore, according to the principle of Analytic Hierarchy Process (AHP), the decision-making problem should be defined firstly, and then the problem should be hierarchized according to the nature of the problem, the relationship between various factors and the corresponding subordinate relationship, so as to form a multi-level structural model, the same level of each element as a criterion layer to the next element (Zhong Jianping et al,2012). Dominance, which itself is a hierarchy dominated by elements, forms a hierarchical structure under the control of top-down relationships.

According to the above-mentioned principles, in view of the target of selecting high-level basketball players, according to the analysis of data and the visits to experts and through consultation, induction, analysis and collation, four indicators are determined at the criterion level, namely: B1 - Physical quality; B2 - body shape; B3 - psychological quality; B4 - physiological function（Xie Dongming，2016）. At the index level, 17 evaluation indexes are determined. Finally, the hierarchical analysis structure model of selecting high-level basketball players are obtained (see Table 1).

Table 1 The Hierarchical Structure of Selecting High Level Basketball Players

Target level（A）	Criterion level（B）	Index level（C）
Selection of high level basketball players	Physical fitness（B1）	Springing force（C1-1）
		Sensitivity（C1-2）
		Speed endurance（C1-3）
		Strength（C1-4）
		Flexibility（C1-5）
	Body shape（B2）	Height（C2-1）
		Finger distance（C2-2）
		Hand width（C2-3）
		Weight（C2-4）
		Length of lower limb（C2-5）
	Psychological quality（B3）	Judgment ability（C3-1）
		Adaptability（C3-2）
		Self coordination ability（C3-3）
		Willpower（C3-4）
	Physiological function（B4）	heart rate（C4-1）
		Vital capacity（C4-2）
		Comprehensive response（C4-3）

4 Constructing Judgement Matrix and Calculating

Building judgement matrix is the most important step of AHP, and also the starting point of AHP.

The formation of judgement matrix is the quantitative process of subjective thinking and the basic information of problem analysis（Peng Lixia，2015）. Therefore, on the basis of listening to the opinions of the investigation group and the masses, the decision-making level makes two or two comparisons on the various factors in Table l, constructs the judgment matrix from top to bottom, and then makes calculation and analysis. In order to test whether the judgment matrix has satisfactory consistency, it is necessary to compare the consistency CI of the judgment matrix with the average random consistency index RI. For the 1-10 order matrix. The RI value is shown in Table 2.

Table 2　The Average Random Consistency Index RI Value

Judgement matrix order （n）	1	2	3	4	5	6	7	8	9	10
RI	0	0	0.52	0.89	1.11	1.25	1.35	1.40	1.45	1.49

The consistency index CI of the judgment matrix is calculated as follows: $CI = \lambda_{max}/n - 1$

the ratio of the consistency index of the judgment matrix to the average random consistency index RI of the same order constitutes the random consistency ratio CR of the judgment matrix, which can be expressed as CRR = CI / RI.

Generally speaking, the smaller the value of CR, the better the consistency of the judgment matrix. It is generally believed that when CR < 0.10, the judgment matrix has satisfactory consistency. When CR>0.10 is not consistent, the judgement matrix must be adjusted. RI is the average random consistency index, which is only the order of the judgment matrix. The related indexes are shown in Table 2. In fact, when the matrix order n is less than 2, there is no inconsistency in the matrix, so there is no need to test it. The judgment matrix A-B for the relative importance comparison between the criteria layers is shown in Table 3, relative to the overall objective.

Table 3　Target Level Judgement Matrix A-B

A	B1	B2	B3	B4
B1	1	1/3	5	5
B2	3	1	5	5
B3	1/5	1/5	1	2
B4	1/5	1/5	1/2	1

$\lambda_{max} = 4.216$, CI=0.042, From table 2 to RI=0.52, CR=CI /RI=0.08l<0.10 satisfies the consistency. The judgment matrix B1-C comparing the relative superiority of the alternatives is shown in Table 4 when considering the physical fitness of the alternatives.

Table 4　Criterion Level Judgement Matrix B1-C

B1	C1-1	C1-2	C1-3	C1-4	C1-5
C1-1	1	1/3	4	4	5
C1-2	3	1	5	5	6
C1-3	1/4	1/5	1	1/3	3
C1-4	1/4	1/5	3	1	4
C1-5	1/5	1/6	1/3	1/4	1

$\lambda_{max} = 5.403$, CI=0.080, From table 2 to RI=0.89, CRIs / RI=0.090<0.10 satisfies the conformance. The judgment matrix B2-C, which compares the relative superiority of the alternatives, is shown in Table 5 when considering the alternatives in terms of body shape.

Table 5　Indicator Level Judgement Matrix B2-C

B2	C2-1	C2-2	C2-3	C2-4	C2-5
C2-1	1	3	5	5	4
C2-2	1/3	1	4	3	2
C2-3	1/5	1/5	1	1/3	1/3
C2-4	1/5	1/3	3	1	1/2
C2-5	1/4	1/2	3	2	1

$\lambda_{max} = 5.198$, CI=0.0495, From table 2 to RI=0.89, CR=CI / RI=0.056<0.10. satisfies the

conformance. The judgment matrix B3-C, which compares the relative superiority of the alternatives, is shown in Table 6 when considering the choice of alternatives in terms of psychological quality.

Table 6　Indicator Level Judgement Matrix B3-C

B3	C3-1	C3-2	C3-3	C3-4
C3-1	1	7	6	5
C3-2	1/7	1	1/3	1/5
C3-3	1/6	3	11/3	
C3-4	1/5	5	3	1

$\lambda_{max} = 4.237$, CI=0.079, From table 2 to RI=0.89, CR= CI / RI=0.089<0.10 satisfies the consistency. The judgment matrix B4-C of the relative superiority of the alternatives is shown in Table 7 when the alternatives are considered in terms of physiological functions.

Table 7　Indicator Level Judgement Matrix B4-C

B4	C4-1	C4-2	C4-3
C4-1	1	2	1/5
C4-2	1/2	1	1/6
C4-3	5	6	1

$\lambda_{max} = 3.029$, CI=0.0145, From table 2, we know m=0.89, then CR= CI / RI=0.016<0.10, satisfying sex. The above-consistency test proves that the judgment matrices in Table 3-Table 7 have good-consistency, and the total ranking of the alternatives can be obtained, as shown in Table 8.

Table 8　The Local Weight and Global Weight of the Index System

local weight	B	B1	B2	B3	B4	global weight	ranking
	C	0.306	0.530	0.096	0.068		
C1-1		0.272				0.083232	4
C1-2		0.479				0.146574	2
C1-3		0.078				0.023868	11
C1-4		0.128				0.039168	9
C1-5		0.043				0.013158	13
C2-1			0.475			0.25175	1
C2-2			0.231			0.12243	3
C2-3			0.054			0.02862	10
C2-4			0.096			0.05088	7
C2-5			0.144			0.07632	5
C3-1				0.0627		0.060192	6
C3-2				0.051		0.004896	17
C3-3				0.105		0.01008	15
C3-4				0.217		0.020832	12
C4-1					0.172	0.011696	14
C4-2					0.102	0.006936	16
C4-3					0.726	0.049368	8

According to the calculation, it can be concluded that CI = 0.059124, RI = 0.89, CR = 0.066 < 0.10, the results show that the consistency requirements are satisfied. Therefore, the above judgment matrix and the total ranking result are satisfactory. Specifically, in the four indicators determined at the criterion level, the weights are: physiological function (0.068), psychological quality (0.096), physical quality (0.306), body shape (0.530), the results are consistent with the results obtained by qualitative analysis. However, in the selection of high-level basketball players, only the four indicators of the criteria level is not specific, so it is necessary to determine the indicators of the lower level. According to the results of the overall ranking, basketball players'synthetic weight of height is the largest, followed by sensitivity, finger distance, bounce, lower limb length, judgment ability and so on. From this we can see that the advantages of body shape can also reflect the level of other qualities, and other qualities have a certain role in promoting; on the contrary, the level of other qualities have a certain restrictive effect on the

shape of athletes.

5 Conclusion

This paper introduced and analyzed the basic principle of analytic hierarchy process and its application in solving practical problems. Through a simple analysis of the selection index, we carried out the weight distribution of each index in the selection process of basketball players and showed the importance of the composition of the selection goal of players is clear at a glance. Analytical Hierarchy Process (AHP) is used to calculate index weights of various factors influencing selection of high-level basketball players. By ranking, we obtained the best solution and provided an ideal theoretical basis for decision-making. At the same time, a corresponding file library can be established according to the model to record the hierarchical structure, judgment adopted and corresponding ranking result. It is convenient for future applications through changing or adding some new decision results.

Abstract: Human language learning is fundamentally a process that involves the making of errors. Error analysis, which focuses on the systematic study on errors in second language acquisition, is a major area in second language acquisition. This paper employs abundant examples to make a thorough research on the theory of error analysis by analyzing the source, classification of errors and the development of research. It ultimately comes to the conclusion that error analysis is an effective way to learn second language, but it needs further research on various aspects of the theory. It is of great significance for teachers employ error analysis in the second language teaching to help language learners acquire second language in an effective way.

Key Words: Error analysis, Second language acquisition; Development of research on error analysis; Limitation

1 Introduction

In the process of learning, learners tend to make mistakes, which will in turn bring benefits to learners from diverse ways of feedback. As to second language learners, errors are inevitable factors in the process of learning second language. Contrary to some traditional views on errors which claim that the appearance of errors is the symbol of failure and should be eliminated completely, error analysis holds a different perspective to treat errors. (Yu Xiaona, 2014) Researchers and teachers came to realize the importance of errors in second language acquisition. When learners produce correct sentences, they may simply repeat something that they have heard before; when they produce sentences which are different from target language, it may be considered that these sentences reflect the learner's current understanding of the rules and patterns of that language. Errors are not always bad, rather they are crucial parts and aspects in the process of learning a language. They may provide insights into the complicated processes of language development as well as a systematic way for identifying, describing and explaining students' errors. Errors may also help to better understand the process of second and foreign language acquisition. (Agsa et al, 2015)As Corder noted: "A learner's errors are significant in that they provide for the researcher evidence of how language is learned or acquired, what strategies or procedures the learner is employing in the discovery of the language." (Brown, 2014) This view not only change people's attitude towards errors, but also improve the position of "errors" as a way to understand learning process. In this way, after the decline of contrastive analysis, researchers turn to the analysis of errors during 1970s. (Zhong Qiuyuan, 2016)

Error analysis in SLA was established in the 1960s by Stephen Pit Corder and his colleagues. It involves a detailed description and analysis of the kinds of errors second language learners make. Influenced by Behaviorism, Error Analysis can replace contrastive analysis, and it is widely used by linguists to find the difference between the learners' first and second languages to predict errors. (She Ali, 2017) It is proved that contrastive analysis fails to predict a majority of errors in spite of its value in the study of language transfer.

2 Theory of Error Analysis

2.1 Difference between error and mistake

Before we understand the theory of error analysis, it is of great significance to make a distinction between "mistake." and "error". Mistake means speakers make error that is either a random guess or a slip of tongue, because it is a failure to use a known system correctly caused by carelessness and inattention. Everyone can make mistakes in both first and second language. However, an error is a noticeable deviation from the grammar of a native speaker caused by incompetence, reflecting the interlanguage competence of the learner. (Liu Zhenwei, 2016) For example, the question "Dose Mike can sing a song?" posed by a language learner is an error, in that the sentence reflects the learner's interlanguage competence. Learners make errors in the process of learning a second language and these

errors can be observed, analyzed in order to learn and acquire language better. To distinguish an error and a mistake, one useful way is associated with checking the consistency of the second language learner's performance. Besides, another significant method is associated with asking a second language learner to correct his or deviant utterance. (Mohammad, 2016)

2.2 Source of errors

Chomsky's Language Acquisition Device and Universal Grammar can partly explain the source of error. Based on these researches, Corder explains the source of errors in a systematical way. It can be seen in the Table 1. He classified the source of errors into four categories: interlingual transfer, intralingual transfer, context of learning and communication strategies. At the beginning of learning a second language, learners inclined to be affected by interlingual transfer, putting the old rules in first language in new language system. A Chinese may say "I have an apple yesterday" instead of "I had an apple yesterday.", because he does not use past tense of a verb in Chinese. When language learners begin to acquire parts of new systems, they tend to be influenced by intralingual transfer-generalization within the target language. Errors are made when learners overgeneralize the second language system like "He goed to school yesterday" instead of "He went to school yesterday." Here, learners thought that all past tense of a verb is to add "-ed" after a verb, which is a manifestation of negative intralingual transfer—overgeneralization. (Teresa, 2015) The third major source of error, though it overlaps both types of transfer, is context of learning. Under different context, learners may produce errors. In the classroom, teachers or textbooks can lead students to form faulty hypotheses about the language. Because of a misunderstanding of teachers' explanations or inability to contextualize the learning, students may have difficulty in distinguishing two similar words like "point at" and "point out". Finally, the last category of source of error originates from communication strategies. In the sentence 'Let us work for the well done of our country", "well done" is an incorrect substitute for "welfare". These categories are presented by Bindal to identify and describe some of the errors made by a group of 76 first year students of Haryana in selected areas of English grammar, i. e., verb forms and patterns, use of auxiliaries and tense usage. (Bindal, 2015)

Table 1   Corder's Classification of the Source of Errors and Examples

Source of Errors	Examples
interlingual transfer	I have an apple yesterday.
intralingual transfer	He goed to school yesterday.
context of learning	difficulty in distinguishing "point at" and "point out"
communication strategies	Let us work for the well done of our country.

2.3 Classifications of errors

Since we have discussed the source of errors, based on the observations of what the learners do in terms of errors, error analysis is classified into four stages as is shown in Figure 1.The first stage is a stage of random errors, a stage is called "presystematic", in which the learner is only vaguely aware that there is some systematic order to a particular class of items. (Brown, 2014) Sentences like "Tracy cans draw a picture." and "I want eating apple." can emerge in this stage. In the second stage-emergent stage, learners have a growing consistency in linguistic production, but still unable to correct errors when it is pointed out. Dialogues between a language learner and a native speaker may have some misunderstanding. The third stage is a systematic stage in which learner have more consistency in the production of a second language. The last stage is stabilization stage, called by Corder as "postsystematic" stage, when learners make relatively few errors and produce language fluently.

Figure 1   Four Stages of Errors

2.4 Procedures of error analysis

After analyzing the four classifications of errors, we then come to the procedures of error analysis. To acquire the rules of new language from the perspective of language learners, we have to have an effective error analysis. The most prominent task of error analysis is the identification and description of errors.(Rod, 2013) In identifying and describing error, researchers provide overt and covert errors, which are in terms of grammatical errors and context of communication respectively. When learners

realize overt and covert errors, they can try to reconstruct the sentence in a well-organized way with the help of native language. Then, they can compare the original one with the revised one and describe the difference. In this way, learners can make progress with the help of error analysis.

In conclusion, the theory error analysis include the difference between error and mistake, the source of error, the classifications of errors and the procedures of error analysis. After learning the general knowledge of error analysis, we should realized the importance of error analysis in second language acquisition.

2.5 Application of error analysis

Since the publication of the theory of error analysis, it has been applied to diverse aspects and fields, particularly the fields of language teaching and learning. With the development of linguistic theory, the importance and practice of error analysis stands out. Teachers adopt error analysis in various aspects to help language learners to avoid errors and learn from errors. (Ali, 2012) Based on the summary studies on error analysis in recent decades in China, lexical errors are the main topic, followed by errors of grammar, pronunciation, pragmatics, text and others. The research trend has changed from the basic theory to practical application. (Tong Qin, 2018) The application of error analysis in second language teaching and learning has been increasing and diverse in recent years, which is beneficial for language teachers, learners and researchers. (Pooneh, 2012)

3 The Development of Research on Error Analysis

3.1 Early researches on error analysis

The early research on error analysis began in 1960s, when people paid attention to errors in contrastive analysis. Contrastive analysis hypothesis claimed that the leading obstacles to second language acquisition is interference of the first language system, thus a contrast between first and second language system is indispensable to the learning of a second language, such as the discourse analysis and pragmatics. (Malcolm, 2015) Rule-formation of Chomsky thought that second language acquisition, similar to first language acquisition, had a language acquisition device which could build up a language system of the target language. On the basis of these theories, Strevens pointed out that we should not take intralingual errors as obstacles, which need us to overcome, instead errors reflect the process of second language acquisition, which can be used to study the strategies and stages of learners. At this time, the researches on errors were conducted within the framework of contrastive analysis, concentrating on the interference between languages instead of errors themselves. Researches on interlingual errors and intralingual errors are major subjects in second language acquisition. There appeared many essays like input errors caused by first language interference and how to correct errors.(Li Hongmei, 2017)

3.2 Comprehensive researches on error analysis

The conception of interlanguage was put forward by Selinker put forward in 1972, which is a transitional process between native language and the target language. Since then, error analysis became important materials for second language learners. (Larry, 2013) The interlanguage theory holds that a systematic study of errors occur in the learning process together with the reason behind, that is, the error analysis, can reveal the progress and rules in second language acquisition.(Yuan Meng, 2017) The researches on error analysis concentrate on the collection, identification, description, explanation and evaluation of errors, in order to promote teaching methods. The data collection of errors focuses on the definition of errors, while the identification of errors involves the distinction between mistake and error, and the latter is the object of research in error analysis. Language errors are described from two perspectives of linguistics and forms of errors. These descriptions of errors help learners have a better understanding of errors, which in turn improve their study in second language.(Lightbown et al, 2014) The explanation of errors is the principal phase in second language acquisition, involving all possible process in second language acquisition. Richard pointed out three errors, namely interference error, intralingual error and development error, while Shachter and Celce-Murcia classified Richard's categories into transfer error and intralingual error.(Richards, 2015) In addition, Lott divided transfer error into overextension of analogy, transfer of structure and interlingual/intralingual errors. Richard further classified interlingual errors into overgeneralization error, ignorance of rule restrictions, in complete application of rules and false concepts hypothesized. Therefore, the explanation of error is complicated and underwent several changes in classification. At this time, researchers made great progress in error analysis from different perspectives.

3.3 Current research on error analysis

In 1990s, because of the limitation of error analysis, research on error analysis became lesser than that in its peak. The researches on it change from comprehensive descriptions to concrete descriptions of specific subject. Concentrating on the feedback of language errors, researchers endeavor to solve the problems like whether to correct errors, how to correct errors and what errors to correct. (Younghee, 2011)The intent was to determine what instructional implications could be derived from in-depth error analysis. (Mather et al, 2017) Though no consistent conclusions are reached, these researches break the limitation of researches on error analysis. As for the necessity of error correction, most scholars develop the research from the perspective of accuracy, fluency and number of errors after error correction. In terms of how to correct errors, there are direct correction and indirect correction. Research data shows that indirect correction is more effective and appropriate than direct correction in long term and direct correction is suitable for beginners and those who are unable to make correction themselves. Furthermore, researches on what errors should be corrected are relatively less and restrained to the correctness and appropriateness of language use.

All in all, researches on error analysis, to some extent, experienced several waves in second language acquisition. These abundant researches on error analysis help language learners acquire a second language in systematic and scientific way. In this way, researchers should devote more time and energy to the study in error analysis in the future. Though error analysis is effective and useful in second language acquisition, there are also limitations of error analysis, which will be discussed in the next paragraphs.

4 The Limitations of Error Analysis
4.1 Excessive emphasis on error and production
Error analysis, focusing on the analysis of errors in a systematic way, pays too much attention to learner's errors, resulting in ignorance of other aspects in second language acquisition. Though error analysis is effective and useful, second language acquisition is a complicated process including many aspects. Hence, teachers and learners should not stress the importance of errors in second language learning to excess. For example, in the classroom, if the teacher pays to much stress on the correctness and errors in oral class, students may feel nervous and frustrated when they are interrupted by teachers again and again in order to correct error. In this way, fluent, clear and free communications are impeded, which are more important than error correction in oral class. In addition, error analysis is an overstressing of production data and the reliability of error analysis sometimes is not fully supported in special cases.(Fernando, 2016) Language learning is a process of listening, writing, speaking and reading, which includes production as well as comprehension. Error analysis attracts too much attention on language production, oblivious of language comprehension in second language acquisition. Thus, error analysis cannot be applied to the learning of reading and listening, where language comprehension is more significant.

4.2 Failure of comprehensive study on language
Jacquline Schachter and others have shown in research that error analysis fails to account for the strategy of avoidance. (Brown, 2014) In communication strategy, avoidance is an important way to keep the conversation going on. Learners who avoid some certain errors do not manifest a higher level in second language learning. For example, certain English learners are easily to make relative-clause errors in the process of language learning, but native Japanese speaker were largely avoiding that structure, resulting in not as many errors as some native Persian speaker. From this example, we can see that error analysis is not a reliable factor to judge one's level of language acquisition. Beside, error analysis keeps too close research on specific language errors instead of viewing universal aspects of language, which is a complicated language system. Based on papers in CNKI, we can find that most essays center on employing the theory of error analysis to research on language errors in a specific field, such as "The Discussion on Teaching of Writing Based on the Error Analysis of Vocabulary in College Students' English Writing"(Jiasimo, 2016) "The Chinese Tonal Error Analysis and Teaching Method of English-Speaking Students" (YX Gui, 2016) "On the Strengthening of College English Translation Teaching by Using the Theory of Error Analysis "(S Zhang, 2017) and "The Application of Error Analysis in Translation Teaching"(Tang Fang, 2017)etc. These papers reflect the limitation of error analysis, which centers on linguistic elements that are common to all language. The universal properties of language are ignored in this respect.

In a word, though language analysis is effective and useful, there are still some limitations in this research. Aware of these limitations, researchers should spare no effort to overcome the limitation and

make further achievements in this field.

5 Conclusion

Error analysis involves a detailed description and analysis of kinds of errors second language learners make. It is necessary for language learners and teachers to have a good knowledge of error analysis in second language acquisition. This paper firstly analyzes the theory of error analysis from the difference between error and mistake, source of errors, classification of errors and procedures of error analysis. Then, we discussed three stages of research on error analysis. Finally, we come to the limitations of error analysis in second language learning. According to all these analyses, we can draw the conclusion that error analysis is an effective and helpful way of analyzing and learning a second language. Beside, connected with other methods of analysis in second language acquisition, error analysis can be spread to more fields of language learning.

Research on the Path Selection of Enterprise Transformation in Traditional Industrial Cities from the Perspective of Cultural Genes

Ma Xiaoyu, Peng Huatao
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 1245913466@qq.com, penghuatao@whut.edu.cn)

Abstract: Since the reform and opening up, a number of cities have developed rapidly with various advantages. Local enterprises have gradually become industry leaders, while other urban industries have played a major role in the first half of the twentieth century and have played an important role in industrialization. The industrial status of these cities is being replaced, and companies are faced with major corporate transformation path choices. This paper uses a combination of questionnaires and text analysis to study the innovative genes and innovations of some enterprises in Baoji City, Shaanxi Province. The author hopes to provide assistance for the deep research of traditional industrial enterprises in the new era to stimulate innovation potential and break through the bottleneck of innovation, and help the production and management level of China's industrial enterprises to reach a new level.

Key words: Traditional industrial city; Enterprise transformation; Innovative gene; Path selection

1 Introduction

New China has been going through both wind and rain for nearly 80 years. The new journey of reform and opening up has lasted more than 40 years. The development path of Chinese enterprises has undergone several changes. With the advent of the post industrialization era and the pre information era, the industrial status of the city which has played an indelible role in the construction of socialist industrialization in the early 20th century is being replaced. How to transform the local enterprises and how to incubate and innovate new enterprises has become a hot topic for scholars and entrepreneurs. The question of the study.

From the perspective of previous studies, most of the previous studies on enterprise transformation and enterprise innovation behavior were mostly observed in the developed eastern cities (Kong Xiangdou, 2018;Zhao Mengyi, Qu Sunping, Yu Bo, 2018). 2018; Zhao painting, 2014; Zhang Xingan, 2012).Few scholars have studied the path choice of enterprise transformation in traditional industrial cities from the perspective of cultural gene. This research will be based on more than 200 survey results of the key industrial city of Baoji, Shaanxi, which is located in the early days of new China. Based on the survey of enterprises in Baoji Robot and Intelligent Manufacturing Industrial Park, the innovative genes and innovative performance of traditional industrial city enterprises will be explored. This research will be based on Baoji, a key industrial city in the early years of New China. Based on the results of more than 200 questionnaires of Baoji Robot and Intelligent Manufacturing Industrial Park, we will explore the innovative genes and innovative performance of enterprises in traditional industrial cities.

2 Theoretical Basis

2.1 PEST macro environment analysis

Enterprises need to use various production factors to achieve their profit objectives. In the face of different macro environment, enterprises will naturally adopt different development strategies and transformation paths. On the contrary, it is precisely because of the difference of macro-environment that one side of the soil and water makes one side of the enterprise.

Enterprises can follow and study laws, policies and local regulations to standardize operation and innovation in order to seize historical opportunities and avoid future risks. Economic environment, geographical location, population environment and technological factors have a significant impact on the production and marketing of enterprises. On the basis of systematic cognition of the environment of enterprises, we can better grasp the key factors affecting the transformation of enterprises and the long-term driving force of enterprise innovation through the PEST environmental analysis. The study of the relationship between individual behavior and its macro environment is to explore the starting point and foothold of local enterprises in the transformation path selection more historically and prospectively.

2.2 SCP analysis model

Changes in the characteristics of the times and the specific structure of the industry will enable enterprises to choose the path of differentiation in the transformation, and receive different business results. Sort out the internal and external factors and the trend or impact of the industry, analyze the transformation or innovation behavior that enterprises can take, and achieve the adaptation and guidance of enterprises to the new environment of the industry through further innovation in production, operation and management mode.

2.3 Genotypes and phenotype

The enterprise culture and competitiveness formed in the past development process of enterprises are the result of enterprise resource arrangement, coordination and matching. These results are the genetic information that has been formed in the history of enterprises, so as to realize the inter generation inheritance of enterprises. Enterprises retain a lot of cultural genes, but ultimately in the production and operation of enterprises will only be one or several genes. Only dominant genes play an important role in influencing the current development of the enterprise, making the enterprise appear a dominant trait and become a major contradiction that has an important impact on the enterprise.

3 Material Selection and Research Methods

Baoji, Shannxi, is known as the "northwest industrial town" and "China Titanium Valley". The five listed companies such as Beacon electronics, Baotai shares are rooted in Baoji. The high new district in the area has been granted the "state-level high-tech Industrial Development Zone" in 1992, and Baoji is the ancient warehouse with more than 170 kilometers west of Xi'an. In the golden age of "One Belt and One Road" construction, Baoji's enterprises are typical in studying the transformation of traditional industrial cities.

This research adopts the data collection method of questionnaire survey, historical and cultural background data and data analysis. The questionnaire adopted Lester scale to design four variables, namely, innovation performance, innovation culture, innovation strategy and employee participation (Areti Gkypali, etc.; 2018; CesarPino and so on; 2016; Miha kerlavaj, etc.; 2010; Ricarda B.Bouncken, etc.; 2014; Richard Yu Yuan Huang, 2006).From the aspects of innovative sales, innovative products, process innovation and so on, we observe the innovation performance, observe the innovation culture from the management level of the welcome degree of innovative ideas, the risk of innovation, observe the innovation strategy from the relationship between innovation activities and strategies, and observe employee participation from decision making, quality commitment and supervision participation. A total of 227 questionnaires were sent out, 200 valid questionnaires were collected, at the same time, we collect extensive data on the history of Shaanxi Fengdu and Baoji modern industrial enterprises, so this study is feasible.

4 Investigation and Analysis of Questionnaires

4.1 Transplantation and gradualness of enterprise innovation path choice in traditional industrial cities

The Baoji robotics and intelligent manufacturing industry park, which is mainly supported by this research, has begun to take shape. The four research and research enterprises are small and medium-sized enterprises in the intelligent equipment R & D industry, with registered capital ranging from 10 million to 100 million, and the annual output value of the project is expected to be in the range of 10 million to 100 million. By consulting the data and in-situ dialogues, the author finds that the four enterprises are inclined to portability and gradualness in the choice of innovation path. For traditional industrial city enterprises, the choice of innovation path is inseparable from analyzing the environment and solving the problem of survival. Many genes affect the traditional industrial city enterprises to choose a transplant and incremental innovation path.

Table 1   The Attribution of Innovation Path Choice of Enterprise Transplantation and Gradual Transformation in Baoji City

	Economics	technology	Sociology
Opportunity	Located in the Midwest of China, it is an important transportation hub on Bao cheng and Long hai railway lines. The construction of socialist industrialization started early with a complete range of industries; the deputy central city of Guanzhong-Tianshui Economic Belt; and Xi'an was listed as the ninth largest central city in China.	Several specialist technical schools, known as the "Baoji craftsman" brand, have attracted many large enterprises to enter the country, and Baoji titanium industry cluster in China is known all over the country. Cooperation with Northwestern Polytechnical University, Xi'an Jiao Tong University and other famous universities	Introducing relatively mature manufacturing enterprises in the central and eastern regions to take root and provide policy support; attaching increasing importance to innovation
weakness	The inertia of the traditional industrial model of "the ship is hard to turn off"	The core competitiveness of science and technology and the ability of independent innovation generated by elite innovative talents are mostly lacking. The majority of state-owned enterprises are still "iron rice bowl consciousness", and the monopoly advantage of industry makes the past lack of innovation power.	In Guan zhong area, there are only two undergraduate colleges and universities in terms of pragmatism, conservative cultural genes, and innovative atmosphere.
Result	With the increase of attraction, the goal of internationalization and modernization of enterprises becomes clearer, and there is a lack of independent innovation and subversive innovation.	It undertakes the industrial transfer in the eastern and central regions, and maintains a high value of industrial output, but it is congenitally insufficient to carry low added value at the end of the industrial chain	Breakthrough innovation of enterprises is slow, and it is difficult for innovative enterprises to establish traditional industrial cities on the fourth line, with low degree of perfection.

4.2 The motive of the transformation and innovation of the traditional industrial city enterprises

When collecting the results of the same topic, there are obvious differences in the understanding of innovation among different horizontal ownership enterprises. The following chart compares the results of the questionnaire with weighted average method.

When asked about the speed at which new products are launched, the ratio at which new products are produced, the degree of emphasis on innovation in workflow and methods, The answer of private intelligent manufacturing industry in the industrial park shows obvious tendency. No matter senior managers, professional technicians or other administrators, they all have a high degree of recognition for the pursuit of innovation and the innovation behavior of their enterprises. However, the two state-owned design and electronic communication enterprises have scattered recognition results on these issues, and the perceived level of general employees' innovation performance is significantly lower. Similar differences in innovation motivation were also revealed in field visits. In terms of innovation performance, the private intelligent equipment enterprises in the industrial park have a strong sense of urgency for innovation, a great degree of awareness of innovation performance and a strong sense of anxiety.The concept of "iron rice bowl" of employees in state-owned manufacturing enterprises still exists, and the original motive force of enterprise innovation is insufficient.

**Figure 1   The Respondents Were Highly Sensitive to The Potential Risks of Innovation and Transformation**

of Private Enterprises

Figure 2   Comparison of Different Enterprises' recognition of Innovation Variables

Especially the questions about innovation risk in the questionnaire are the most intuitive. The premise of the innovation and transformation of new private enterprises is to ensure the existence and sustainable operation of enterprises. Therefore, the recognition of "many innovative schemes and ideas are too risky because they are not implemented finally" is very high. The identification of the questions is more scattered.

Emerging private enterprises have few monopoly and native advantages. Their survival instinct makes them need to maximize their potential in technology, technology and management performance.It is also due to the fact that private enterprises in traditional industrial cities do not have obvious advantages in the original market competitiveness and occupancy, and private enterprises have strong innovation motivation to develop new markets. Therefore, the environmental genes of traditional industrial cities and the genetic genes of enterprises themselves make the private equipment manufacturing industry have stronger innovation motivation and ability to cultivate and play a stronger role.

4.3 Complexity of enterprise transformation and innovation genes in traditional industrial cities

The results of longitudinal survey show that enterprises with a good cultural atmosphere, a high degree of employee involvement, and systematic planning of innovative strategies are also prominent in terms of innovation performance, some of which directly affect the transformation of innovation achievements.

There are also some subtle influences on enterprise decision making and enterprise performance, which can not be ignored. For example, the majority of enterprise members have undergraduate education, the low proportion of undergraduate education and the large number of young backbone reserves are the relative advantages and disadvantages formed by the interweaving of dominant and recessive genes.

igure 3   Distribution Structure of Dominant Gene (Education, Age) in Enterprises Visited by Industrial Parks

The reason why research enterprises survive and develop is that dominant and recessive genes play a coordinating role. Give full play to the dominant genes to undertake industrial transfer and then homeopathic development of technological innovation potential, using the advantages of recessive genes

to achieve partial compensation. Different enterprises have different degrees of recessive gene expression. The dominant, recessive genes and resources arrangement, coordination and matching intergenerational inheritance of enterprises affect the transformation and innovation of enterprises in varying degrees.

5 Conclusion

The transformation path of traditional industrial cities is accompanied by pains. There are complementary regional, social and cultural genes and complementary bases of corporate culture. In particular, in the face of historical advantages and disadvantages, dominant opportunities and recessive short boards, it is necessary to make use of post exploration and upgrading without delay and impetuous. It is a choice to grasp the main contradiction of the dominant character of enterprises, take the hidden genes, strengthen benign motivation and simplify the steps to take the road of innovation.

Research on Interaction Between Knowledge Management and Independent Innovation in Manufacturing Enterprises

Li Gang
Hubei Communications Technical College, Wuhan, P.R.China, 430070
(E-mail: 761615801@qq.com)

Abstract: This study defines the connotation of knowledge management and independent innovation, analyzes the interactive relationship between knowledge management and independent innovation of enterprises, and puts forward that the independent innovation of enterprises is the result of the mutual promotion and function of knowledge elements. The concept of independent innovation knowledge field of enterprise is put forward from field angle of electromagnetics. It is concluded that the independent innovation knowledge field of enterprise has the properties of force and energy in general field, but also has extensive action and subjective initiative. From the perspective of knowledge field, the process of independent innovation of manufacturing enterprises and manufacturing enterprises are analyzed. The size and influencing factors of the field force are divided into the dominant elements, the neutral elements and the recessive elements of the independent innovation knowledge field of the manufacturing enterprises combined with knowledge field and knowledge management. These factors play the role of the force and energy of the field, and make the manufacturing enterprise independent through the diffusion, transfer, sharing and integration of the knowledge elements. Innovation provides impetus to improve the capability of independent innovation of manufacturing enterprises.

Key words: Interaction; Knowledge management; Independent innovation; Manufacturing enterprises

1 Introduction

Most scholars divide the knowledge management into two kinds of narrow and broad sense. The narrow sense of knowledge management is the management of knowledge itself, including the management of knowledge creation, acquisition, processing, storage, dissemination and application, while the broad knowledge management also includes the management of all kinds of knowledge related resources and intangible assets, involving the knowledge group. Management of weaving, knowledge facilities, knowledge assets, knowledge activities and knowledge personnel.

The impact of knowledge management at the macro level is mainly reflected in the regional economic aspects. The economic growth of the OECD developed regions is more obviously dependent on the generation, dissemination and utilization of knowledge than in the past. The knowledge-based economy has accounted for more than 50% of its GDP. Therefore, knowledge management is of great importance to the political and economic development of a country at the national level.

Knowledge management can maximize the acquisition and sharing of useful experience and reusable knowledge assets, shorten operation time and reduce duplication of labor, while reducing production costs, it can also effectively improve the efficiency of output.

In the process of knowledge management, the employees can learn new knowledge in the process of work, so that employees can improve their personal skills and professionalism in the process of work. In the process of employee learning, they can also effectively promote the development of the enterprise to the learning organization. The characteristics of knowledge management are mainly shown in the following six aspects: one is to attach importance to the role of people and the development of people; the two is to attach importance to innovation; the three is to pay attention to the contribution of knowledge assets; four is to pay attention to the overall development goal of the society, for example, to attach importance to ecological balance and sustainable development, and the five is to attach importance to knowledge integration management; and the six is to value the model of benefit.

2 Concept Definition

This paper divided the key influence factors of the innovative industry clusters knowledge transfer into three dimensions that is enterprise knowledge absorptive capacity dimensions, dimensions of relationship quality and cluster knowledge network dimensions.

2.1 The definition of knowledge management

The function of knowledge management can be summed up in the following four aspects: (1) the externalization function-the management function of knowledge acquisition: (2) internalization function

to the management function of knowledge processing; (3) intermediary function - the management function of knowledge transfer; (4) cognitive function - the management function of knowledge transport, that is, explicit knowledge The ordering function of knowledge can also be called the function of knowledge organization.

2.2 The definition of independent innovation

With the concept of independent innovation put forward, manufacturing enterprises apply it to related research, which greatly improves the competitiveness of manufacturing enterprises. Manufacturing enterprises use their own resources to make technological breakthroughs and constantly improve the production technology of products.

Independent innovation is a kind of innovation activity relative to imitation innovation, that is, the core technology needed by the innovation comes from the internal technological breakthrough. It is to get rid of the dependence on the external technology in the way of technology introduction and technology imitation, relying on its own strength and through independent research and development activities.

The capability of independent innovation of manufacturing enterprises can reflect the market competitiveness and future development potential of the enterprise in the field of industry. Vigorously carrying out independent innovation can not only enhance the corporate image, but also increase customer confidence. The independent innovation of the manufacturing enterprises means that the manufacturing enterprises use their own resources to carry out the related research and obtain the technological breakthrough, which is the leading innovation of their own, including the selection of the project, the raising of funds, the control of the organization, the determination of the progress and the economic indicators, especially the ownership of the intellectual property.

Based on the analysis of enterprise practice and domestic and foreign research, this research is based on the analysis of independent innovation. It holds that independent innovation has unique characteristics, such as creativity, risk, flexibility, benefit and so on. These characteristics are the basis for the identification and management of independent innovation.

3 The Interactive Relationship and Effect Analysis of Knowledge Management and Independent Innovation in Manufacturing Enterprises

3.1 The effect of knowledge management on independent innovation

Innovation often starts from personal cognition. After conscious development and research, it finally transforms conceptual creativity into products, processes and technologies. To some extent, the independent innovation of manufacturing enterprises can be regarded as the innovation of knowledge within an enterprise. In the current innovative research, the process school has great influence. According to the process of innovation, independent innovation can be divided into three stages, namely, the exploratory stage, the development evaluation stage and the execution stage of independent innovation. Knowledge management runs through the three stages of independent innovation of manufacturing enterprises, and plays a supporting role in different stages.

3.2 The effect of knowledge management on independent innovation

(1)The exploration stage of independent innovation in manufacturing enterprises

The main tasks of the exploration stage of independent innovation of manufacturing enterprises are: creation, evaluation, and making innovation decisions. It mainly involves the generation, recognition, acquisition and storage of various new knowledge. Whether it is the original innovation or the two innovation, the independent innovation of the manufacturing enterprises is first appeared in the form of "creative", and creativity can be considered as a new knowledge. Enterprises need efficient, systematic innovative information acquisition methods to promote technological innovation.

The flow of knowledge is not directed. Therefore, in the start-up phase of independent innovation, manufacturing enterprises need to carry out knowledge management to promote the creation of all kinds of creative ideas, and use knowledge to excavate conscious knowledge. In this process, the process of discovery, analysis and selection of creativity is the acquisition of knowledge. Creativity can come from customers, suppliers, cooperation manufacturers, competitors, college research institutes, enterprise technicians and other employees. Creativity can also cover all aspects, can be the design of new products, new technology and technology, etc. Inspiration inspired by design, production, management, sales and training.

(2) Evaluation stage of independent innovation and development of manufacturing enterprises

Creativity needs to be developed by technology, and it can be embodied in the entity after groping and

experimentation. This stage is the development stage of independent innovation. The development stage of the independent innovation of manufacturing enterprises is mainly the development and design of the products or process ideas determined at the start stage, which involves the diffusion and transfer of knowledge. In the process of independent innovation and development of manufacturing enterprises, knowledge management can improve the whole process of technology and product development. It can lay a solid foundation for the original innovation ability, integrated innovation ability and the ability to introduce and absorb and absorb innovation, in order to coordinate the matching degree of various information and technology development, and assist the innovation system to reach the local level. The optimization is also necessary to achieve the overall optimal.

After the completion of the detailed process and product design, the knowledge system of the enterprise will make the technical data information and summary, and determine the purchase or modification of the manufacturing tools and equipment according to the production needs. Then, the trial production of innovative products or the trial operation of innovative technology is carried out. The detailed data in this process will be recorded and collated. After the knowledge base is arranged, the knowledge system will be fed back to the relevant personnel to help the innovators improve their innovation and prepare for large-scale commercial production.

(3) The implementation stage of independent innovation in manufacturing enterprises

The implementation stage of the independent innovation of the manufacturing enterprises is mainly embodied in the independent innovation, which is embodied in the "tangible" achievements, such as products, technology and technology, and is more perfect and can be put into the market relative to the development stage. This stage is mainly concerned with the application and protection of knowledge. Knowledge sharing, dissemination and diffusion always exist in the whole process of the development stage of the independent innovation of manufacturing enterprises. Through knowledge management activities, such as knowledge acquisition and sharing, effective knowledge can activate the knowledge collected and stored in the start-up phase of independent innovation, and create new creation after the integration of the knowledge.

3.3 The influence of independent innovation on knowledge management

To some extent, the independent innovation of manufacturing enterprises can be regarded as the innovation of enterprises' independent knowledge. Knowledge innovation is the foundation of technological innovation and the source of new technologies and new inventions. Because of the close relationship between innovation and knowledge, the process of independent innovation of manufacturing enterprises will inevitably affect knowledge management. Knowledge management is the whole process management of knowledge acquisition, integration, refining, transfer, sharing and application. It not only runs through the whole process of independent innovation of manufacturing enterprises, but also affects other business aspects, such as financial problems, human resources and so on. The independent innovation process of manufacturing enterprises plays an important role in knowledge management, which is mainly related to the system construction and business performance of knowledge management. Knowledge management is a comprehensive process. In this study, knowledge management is divided into four stages: knowledge acquisition and creation stage, knowledge transfer and diffusion stage, knowledge sharing and management stage, and knowledge integration and evaluation stage.

3.4 The analysis of the interaction effect of knowledge management and independent innovation

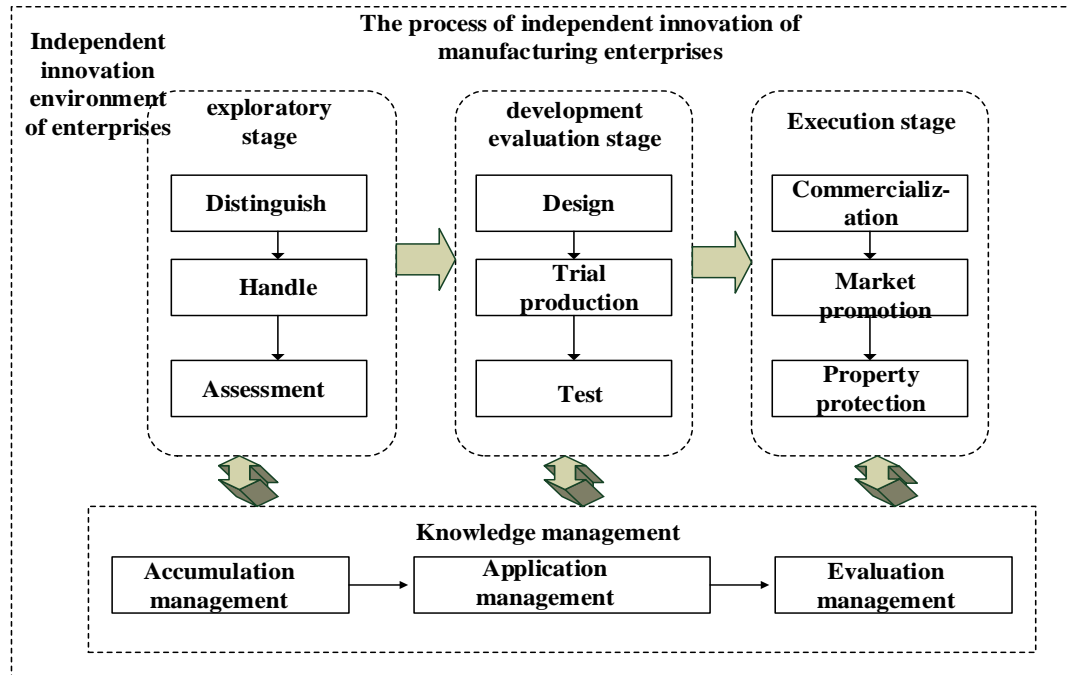
The interaction process between knowledge management and independent innovation in manufacturing enterprises is shown in Figure 1. In the environment of enterprise independent innovation, the interaction between independent innovation and knowledge management exists in all stages of enterprise innovation. On the one hand, the knowledge management of manufacturing enterprises can promote and serve the independent innovation of the enterprise, play a role in the process of innovation. Independent innovation can also produce positive interaction effect on the process of knowledge management. On the other hand, once the enterprise's knowledge management is not properly matched with the independent innovation system, both of them are not properly matched. There is a negative interaction effect.


Figure 1   The Interactive Process between the Knowledge Management and Manufacturing Enterprises

The positive interaction effect between knowledge management and independent innovation is that the enterprise produces "1+l>2" effect through reasonable matching of the two. Enterprise knowledge management and independent innovation are interactive and interactive, and correctly guide the two to cooperate with each other to achieve positive interaction effect. How to coordinate knowledge management and independent innovation, realize its positive interaction and avoid the waste of human, financial and material resources is also the purpose of this research.

In order to realize the positive interaction effect, the manufacturing enterprises can use the virtual knowledge network established by the knowledge management to get the technical help in the innovation alliance of "official one, one, one study and research", improve the independent research and development ability of the enterprise, and upgrade the information system of the enterprise continuously in the process of innovation, and achieve a win-win situation.

3.5 The role and field analysis of knowledge innovation in manufacturing enterprises' Independent Innovation

(1)Knowledge field of independent innovation in manufacturing enterprises

In the manufacturing enterprises' independent innovation knowledge field, manufacturing enterprises are affected by the field of knowledge field. The size of the field force determines the size of the independent innovation power of the manufacturing enterprises. Then we study the size and influence factors of the independent innovation knowledge field force of the manufacturing enterprises. According to Coulomb's law, we know that the force between two stationary point charges in a vacuum is proportional to the product of the charge of the two charges, and is inversely proportional to the square of their distance. The direction of the force is along the line of the two point charges, the same name charges repel, and the special charge is absorbed. Referring to Coulomb's law, we define the formula of independent innovation knowledge field strength of manufacturing enterprises such as formula 1.

$$\vec{F} = K \frac{Qq_0}{r^2} \tag{1}$$

In the form:

K - the independent innovation coefficient of manufacturing enterprises refers to the comprehensive weighted values of factors that affect the independent innovation of enterprises, such as the geographical location, economic level and technical level of the enterprises in the enterprises.

Q - the total amount of knowledge resources, directly or indirectly, can provide power for the independent innovation of manufacturing enterprises at specific time points, including the various

dominant knowledge elements, tacit knowledge elements and neutral knowledge elements mentioned in the previous article.

q_0 - the knowledge stock of manufacturing enterprises refers to the total amount of knowledge resources that can be mastered by the manufacturing enterprises at special timing points, including their own knowledge and knowledge field, and the internal knowledge is mainly reflected in the level of enterprise personnel, equipment, funds, organization and management. ;

　　r - knowledge distance refers to the gap between the knowledge stock of the manufacturing enterprise and the knowledge stock in the knowledge field at the special time point. This gap is not only reflected in the quantity, but also is reflected in the knowledge element information in the acquired knowledge field, and the higher the use of knowledge is obtained.

　　(2) Process model of knowledge field of independent innovation in manufacturing enterprises

Knowledge is a special resource, and its creation and production are realized in the process of its dissemination and application. In essence, the process of independent innovation of manufacturing enterprises is the process of creation and generation of new knowledge. In the knowledge field, the elements of knowledge themselves emit energy, and the knowledge elements are transferred, spread, shared and integrated through effective management, and the comprehensive energy is released. These energy are delivered to the manufacturing enterprises at the same time, and the manufacturing enterprises are driven to create new and rationalized knowledge. Therefore, from the perspective of knowledge field, the process of independent innovation of manufacturing enterprises is a spiral and rising knowledge creation process of knowledge creation, transfer, diffusion, sharing and re creation, and the knowledge field provides the motive force for the independent innovation of the manufacturing enterprises.

As shown in Figure 2, the independent innovation of manufacturing enterprises is the process of knowledge acquisition and recognition, knowledge diffusion and transfer, knowledge sharing and knowledge integration under the joint action of the field energy and the transformation of knowledge elements between the knowledge elements and the knowledge elements.

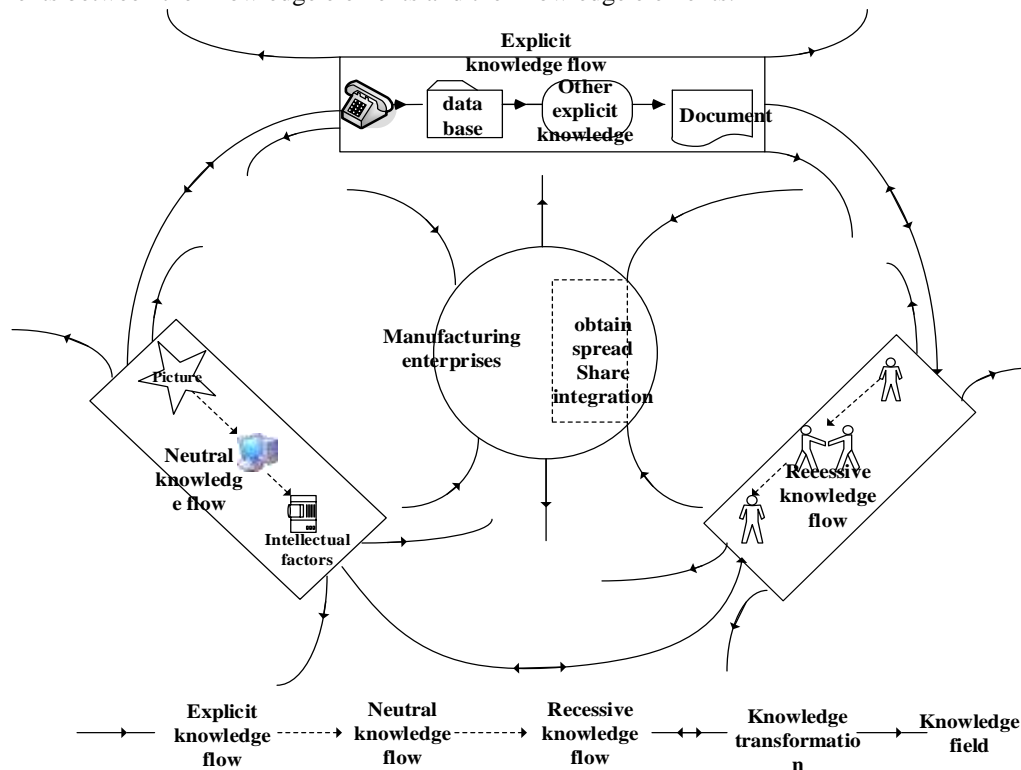

Figure 2　Knowledge Field Model of Independent Innovation in Manufacturing Enterprises

4 Conclusion

　　In the traditional knowledge management, knowledge management includes two kinds of tacit knowledge and explicit knowledge. Based on the characteristics of the independent innovation

knowledge field of manufacturing enterprises, this study divides the elements of independent innovation field into three categories: explicit knowledge elements, neutral knowledge elements and tacit knowledge elements. Explicit knowledge elements refer to the elements that employees can communicate through oral instruction, reference materials, patent documents, software and database access, language, books, text, database and other coding methods to facilitate the formation of new materials, new products, new technologies, new markets and new organizations in manufacturing enterprises. Knowledge matching, policy information, relevant laws and regulations, market demand information, knowledge differentiation, trust, technology, knowledge potential energy, etc. Implicit knowledge elements refer to some unofficial, inexpressible skills, skills, experiences and know-how and insight, intuition, perception, values, mental patterns, tacit understanding and organizational culture of the team to make the enterprise master the unique core technology of its own intellectual property right and to realize the value of the new product on this basis. Such as knowledge motivation, new technology knowledge, product development skills, information processing ability, knowledge structure and so on. The element of neutral knowledge is between the dominant knowledge field and the tacit knowledge field. It refers to the knowledge elements expressed in the way of words, symbols and figures in the process of independent innovation, and the mixture of knowledge elements that can not be expressed in the human brain, such as words, symbols, graphics, etc., such as potential market knowledge and specialization. Family skills, business management knowledge, knowledge recognition ability, knowledge recognition ability, knowledge recognition ability, knowledge application ability and so on.

Research on the Benefits and Risks of Collusion Behavior in Project Bidding

Chen Jie

School of Civil Engineering, Changsha University of Science and Technology, Changsha, P.R.China, 410000

(E-mail:174829398@qq.com)

Abstract: At present, with the rapid growth of China's development, the government's investment in infrastructure and public projects has been increasing. Although good results have been achieved, there are still many problems in the field of engineering projects. This paper adapts the methods of documentary analysis to focuses on the risks and benefits of collusive behavior in project bidding. Not only benefits but also risks are important factors to effect the decision of speculator.

Key words: Project bidding; Collusion behavior; Benefits; Risks; Governance

1 Introduction

There are many reasons for the collusion behavior in the bidding activities of the project. First of all, from the perspective of the owner, the Bidding Law has left a lot of space to owner's discretion. Because the lack of project resources lead to vicious competition market. They will collusion to make more profit naturally. (Chen, 2016) Secondly, from the perspective of bidders, the current legal system can be used to meet the requirements of bidding qualifications, using the means of surround bidding, forging bid and Accompanying-Bidding to achieve the goal of winning the bid. (Alexeev & Leitzel, 1991) ; thirdly, for cities with high market concentration and openness, the qualification requirements of engineering projects can also be tailor-made for bidders, thus forming a huge market. (Perry et al., 2000) In addition, the government is not strong enough in supervision, even individual official use power to carry out black-box operations for personal gain. At the same time, too much intervention make the supervision is pointless, just created more reasons for the crime. The low costs of collusion and punishment make speculators dare to collusion by taking turns to benefit sharing. (Dotoli et al., 2014) Finally, although the market does not set entry barriers, in fact many bidders do not have a competitive advantage in the market, companies that have entered the market early and have a good foundation and performance will use the prior consultation between the owner and the experts. "Several years of operating performance" is a scoring condition that excludes other companies that want to enter the market or the project, thereby achieving monopoly and controlling the market (Benjamin R., 2016) .

2 Research on the Benefits of Collusion Behavior in Project Bidding

The collusion behavior in project bidding may bring benefits to all parties mainly for high economic benefits. All parties involved in the project bidding activities tend to pursue the maximization of interests. In the absence of additional costs, regardless of whether the cost of collusion between the project bidding stakeholders is symmetrical, collusive behavior may occur, and in the symmetry of collusion costs, collusion behavior is more likely; at additional costs When it exists, it can coexist in the case of conspiracy in the case of conspiracy cost asymmetry (Jeanine Miklós-Thal, 2011; Aske & Cantillon, 2008) .

(1) For the bidder, it hopes to obtain the right to build the project in the fierce market competition while ensuring the profit. Therefore, two or more bidders will often find a collusion for the target, and the price will be low. Obtained the target; or the contractor colluded with the bidding agent to obtain the target at a low price (Porter & Zona, 1992) , and then use its own advantages in industry information, engineering technology, etc., to extract high profits from project cuts (Luo et al., 2013) . Although in the engineering project, a certain quality guarantee is often set to constrain the contractor's behavior, it is often difficult to achieve the expected effect because the amount of the quality guarantee is too small.

(2) For the bidding agent, when the bribe provided by the bidder is higher than the reward provided by the bidder, there may be collusion between the bidding agent and the bidder.

(3) For the supervisory party, it played an important role in strengthening fund management and ensuring the progress and quality of the project (Isaac, 1895) , but driven by economic interests. Under the supervision, the supervisor does not always serve the owner according to the contract, and even seeks rent from the contractor for his own interests, intending to loosely manage the contractor's

construction behavior, and the contractor By making bribes to the supervisory party, you can pursue greater economic benefits, especially when the supervisors subjectively judge the government The low success rate of collusion is more inclined to conspire to defraud the owner and damage the interests of the owner.

(4) For the founder, it has rich information on the construction market and resolutely solves the problem of low level of government engineering management specialization. However, "specialization" is a double-edged sword, and the agent can fully utilize it and the contractor. The information advantage and professional advantage between them, deceiving the government or investors to obtain "information rent", and obtaining "rights rent" from bidding agents, bidders and other stakeholders (Rothkopf & Harstad, 1994) , and the establishment of the possibility of finding a gap in the system, to avoid the management of the government or investors.

(5) As an independent third party, the engineering bid evaluation expert will complete the bid evaluation work for the bidding party according to relevant regulations, which plays a vital role in ensuring the standardization of the bid evaluation procedure and the fairness of the evaluation results. In the process of bidding for the project, the bid evaluation expert may accept the benefits of the bidder, leak the bid evaluation before bidding, tend to bid the bidder during the bid evaluation, and even induce other traditional bid evaluation experts as the bidder. Playing high scores (Zhang Hengquan, Wang Hui, 2014) .

(6) In the bidding of engineering projects, there are often cases where government authorities collude (Besfamille, 2004) . Especially in government investment projects, the competent construction department and its subsidiaries constitute a community of interests. The main body of collusion, the competent department does not hesitate to violate the rules for the subordinate enterprises to undertake projects. In government-invested projects, government rights and social capital combine to form an intrinsic social network, which also provides a breeding ground for collusion behavior (Boone & Mulherin , 2011) .

3 Research on the Risk of Collusion Behavior in Project Bidding

The main risks that the project bidding and collusion may bring to the parties are as follows:

(1) Government departments, construction units, bidding agencies, and regulatory authorities have been eroded, do not act according to regulations, or even abandon professional ethics, and use their rights to seek public interests.

(2) Industry norms have been destroyed. The bidding process is unreasonable, the bid evaluation process is arbitrarily large, and the project bidding and collusion behavior has occurred from time to time, which makes the bid evaluation lack of fairness and objectivity. The lack of credibility undermines the open, fair and just competition atmosphere, resulting in the intensive bidding behavior. (Mattos, 2016) .

(3) The parties to the conspiracy are sanctioned by law. When the project conspiracy is discovered, the relevant government personnel may be subject to dismissal and other disciplinary or criminal penalties; the contractor and the agent will face financial penalties or qualifications, market access restrictions, and even criminal penalties but because the conspiracy may gain far more than the cost of collusion, there are still many people involved in the project bidding.

(4) The project construction benefit was damaged. The existing research shows that the correlation between collusive behavior and engineering quality is very strong, which poses a safety hazard for engineering quality problems (Lorentziadis, 2016) . The project's bidding and collusion behavior led to the government's inability to effectively manage the project, increasing construction costs and market costs, but the project quality and investment efficiency were not guaranteed (ZARKADA-FRASER A, 2000; Harrington et al) ., 2016)   . According to statistics, in China's annual 10 trillion yuan bidding project, the cost of corruption accounts for about 8%, which seriously affects the efficiency of the use of social resources.

(5) The reputation of all parties involved in the conspiracy is damaged. When collusion behavior occurs, the industry reputation system will be damaged. The industry level of the bidders, bidding agents, contractors and other parties in the project will be misjudged, making the government not aware of the status quo of various industries (Krep & Wilson, 1982) , the parties to the conspiracy will also bear the risk of being blacklisted by other projects and no longer able to participate in the project, thus being eliminated by the society. Reputation is more important to bidders than bidders (Houser & Wonders, 2006; Zhou, Dresner & Windle, 2008)   , and it takes a long time to build a reputation, and destroying reputation is often only In an instant, the reputation mechanism is a better constraint for it. An effective and sound reputation-restricting mechanism can regulate and guide the behavior choices of market participants, so that bidders can live up to their own interests while not disappointing. The whole society

expects their morality.

4 Conclusion

In summary, the existing research makes a relatively perfect analysis of the benefits and risks of collusion behavior in project bidding. Most of them use evolutionary game theory to describe the surround-bidding behavior in engineering projects. To clarifying the intrinsic link between benefits and risks can be improve the existing project bidding laws and regulated the functions and responsibilities of different stakeholders. Thereby reducing the possibility of collusion behavior in project bidding.
